THE EMPLOYMENT SITUATION: OCTOBER 2005

FRIDAY, NOVEMBER 4, 2005

CONGRESS OF THE UNITED STATES,
JOINT ECONOMIC COMMITTEE,
Washington, DC

The Committee met, pursuant to call, at 9:30 a.m., in room 2226, Rayburn House Office Building, the Honorable Jim Saxton, Chairman of the Committee, presiding.

Representatives present: Representatives Saxton, McCotter,

and Maloney.

Senator present. Senator Reed.

Staff present: Chris Frenze, Robert Keleher, Colleen Healy, John Kachtik, Brian Higginbotham, Emily Gigena, Chad Stone, Matt Salomon, and Daphne Clones.

OPENING STATEMENT OF HON. JIM SAXTON, CHAIRMAN, A U.S. REPRESENTATIVE FROM NEW JERSEY

Representative Saxton. Good morning. It is a pleasure to welcome Commissioner Utgoff before the Committee once again to tes-

tify on the employment situation.

The employment figures released today may reflect the indirect affects of the recent hurricanes. Payroll employment increased by 56,000 in October to a total level of 134.1 million workers. According to the separate household survey, the unemployment rate edged down to 5.0 percent, a decrease of one tenth of a percentage point.

Other standard economic indicators reflect the health of the U.S. economy. Figures released last week indicate that the economy grew at a 3.8 percent rate in the last quarter of this year, despite

the massive regional destruction wrought by the hurricanes.

So far in 2005, the economy has expanded at a 3.6 percent rate, roughly in line with the Federal Reserve expectations as well as the Blue Chip Consensus indicators. Equipment and software investment, which has bolstered the economy since 2003, continues at a healthy pace. This component of investment responded especially sharply to the incentives contained in the 2003 tax legislation.

Employment has also gained over the period, with 4.2 million jobs added to business payrolls since May of 2003. The unemployment rate, as I said a minute ago, is at 5 percent. Consumer spending continues to grow. Home ownership has reached record highs. Household net worth is also at record levels. Productivity growth continues at a high pace, although higher energy prices have raised

business costs and imposed hardship on many consumers. These

energy prices have not derailed the expansion.

In summary, the economy has displayed impressive flexibility and resilience in absorbing many shocks. Monetary policy and tax incentives for investment have made important contributions in accelerating the expansion in recent years. The most recent release of Fed minutes indicates that the central bank expects the economic growth to continue through 2006. The Blue Chip Consensus of private economic forecasters also suggests that the economy will grow in excess of 3 percent next year, and that employment will continue to rise.

[The prepared statement of Representative Saxton appears in the Submissions for the Record on page 15.]

OPENING STATEMENT OF HON. JACK REED, A U.S. SENATOR FROM RHODE ISLAND

Representative Saxton. I would like to ask our Ranking Mem-

ber if he would like to make a statement at this point.

Senator Reed. Thank you very much, Chairman Saxton, thank you, Commissioner and your staff, for joining us this morning. This hearing gives us the opportunity to continue examining the impact of the recent hurricanes on the jobs data and to try to discern underlying trends in the labor market. I want to commend Commissioner Utgoff for the hard work her staff at the Bureau of Labor Statistics has put into producing these statistics under extraordinary circumstances, particularly the hurricane.

As measured by initial claims for unemployment insurance, the number of people who have lost their jobs due to Hurricanes Katrina and Rita has now exceeded the half million mark, and more job losses are expected from Hurricane Wilma. In the coming months I hope the reconstruction efforts will stimulate a recovery

in jobs throughout the region.

Beyond the hurricane-affected areas, the labor market showed signs of losing strength. For the economy as a whole, this month's BLS report shows that only 50,000 net jobs were created. It appears high gas prices may be squeezing employers as well as consumers.

Even before the hurricanes, the labor market was still feeling the effects of the most protracted job slump in decades. Cumulative payroll employment growth has been modest by the standards of most economic recoveries, and we continue to see evidence of hidden unemployment, with labor force participation and the fraction of the population with a job still at depressed levels.

The typical worker's earnings are not keeping up with rising living expenses, which is squeezing family budgets. Gasoline prices have been high, and home heating costs are expected to be substantially higher this winter than they were last winter. In the past year, real wages have fallen throughout the earnings distribution with the largest declines in the better helf

tion, with the largest declines in the bottom half.

I am pleased that President Bush reversed his unwise decision to suspend the Davis-Bacon Act in the hurricane-ravaged areas and restored Federal wage protection for workers on Federal contracts. But the President's steadfast refusal to support an increase in the minimum wage still makes it hard to take seriously his rhetoric about wanting to lift families out of poverty.

I look forward to the Commissioner's statements and further dis-

cussion of the October employment situation. Thank you.

[The prepared statement of Senator Reed appears in the Submissions for the Record on page 16.]

Representative Saxton. Commissioner Utgoff, we will be pleased to hear from you at this time. Thank you.

STATEMENT OF KATHLEEN P. UTGOFF, COMMISSIONER, BUREAU OF LABOR STATISTICS, U.S. DEPARTMENT OF LABOR; ACCOMPANIED BY JOHN M. GALVIN, ASSOCIATE COMMISSIONER FOR EMPLOYMENT AND UNEMPLOYMENT STATISTICS AND JOHN S. GREENLEES, ASSOCIATE COMMISSIONER FOR PRICES AND LIVING CONDITIONS

Commissioner Utgoff. Thank you very much, Mr. Chairman and members of the Committee. I appreciate this opportunity to comment on the labor market data we released this morning. I would also like to say that I have with me Jack Galvin, who is Associate Commissioner for Employment and Unemployment, and John Greenlees, who is Associate Commissioner for Prices.

Turning to our data that we released this morning, nonfarm payroll employment was little changed in October, and the jobless rate was 5.0 percent. Payroll employment was flat in September, minus

8.000. That was a revised figure.

Before discussing the payroll survey data in detail, I would note that the October estimates were prepared using the same modified procedures that were introduced in September to better gauge employment developments in areas affected by Hurricane Katrina. We will continue to evaluate our data collection and estimation procedures and will resume standard survey operations when it is ap-

propriate.

You will recall that in our analysis of the September employment data, we concluded that the weakness was largely due to the job loss in areas devastated by Hurricane Katrina. This conclusion was based on an estimate of the change in payroll employment excluding all of the sample units in the disaster areas. That exercise showed that job growth outside the disaster area was in line with the average monthly increase for the Nation as a whole during the

prior year.

We did a similar exercise for October and concluded that the relatively weak increase was not attributable to the areas directly affected by Katrina. Rather, job growth in the remainder of the country appeared to be below trend in October. In addition, the direct impact of Hurricane Rita on the national employment data for October was judged to be minimal. It is possible, of course, that the employment growth for the Nation could have been held down by indirect affects of Hurricane Katrina and Rita, for example, because of their impacts on gas prices. I will note that Hurricane Wilma made landfall after the October survey reference period, so we may not see effects of that until next month.

Turning to the national developments by industry, leisure and hospitality employment edged down in October. This follows a substantial decline in September, at least some of it which was hurricane-related. Employment in retail trade was basically unchanged in October after a large decline in September. In addition, there was little job growth in professional and business services in October. The number of jobs in its temporary help component showed little movement over the month as well.

A few major industries posted notable gains in October. Employment in the construction industry rose by 33,000 over the month compared with average growth of about 21,000 per month during the first 9 months of the year. Some of the October gain reflects post-hurricane rebuilding and clean-up efforts.

Employment and financial activities continue to increase, rising by 22,000. About half of this gain occurred in credit intermediation. Employment, health care, and social assistance also continued to

expand in October.

Elsewhere in the economy, employment in the information industry fell over the month, mostly because of a large decline in motion

picture and sound recording.

Factory employment edged up in October because of the return of aerospace workers from a strike. The manufacturing workweek rose by an unusually large amount, four tenths of an hour. Increases in the factory workweek occurred throughout most of the component industries. Average hourly earnings of private production for nonsupervisory workers on private nonfarm payrolls rose by \$0.08 in October to \$16.27 following a 2-cent increase in September. Over the year, average hourly earnings were up by 2.9 percent.

Looking at some of the household survey indicators, the jobless rate was 5.0 percent in October. The unemployment rate basically has held steady since May of this year. Both the labor force participation rate and employment-population ratio were little changed in October.

I would also like to discuss some preliminary findings on the employment status of persons directly affected by Hurricane Katrina. Shortly after the hurricane struck, Bureau analysts together with our colleagues at the Census Bureau devised a short series of hurricane-related questions for inclusion in the October Current Population Survey. These questions were designed to identify and solicit information from survey respondents who were evacuated from their homes even temporarily because of Hurricane Katrina.

It is important to note that the estimates based on these questions are not representative of all evacuees, but only those who were interviewed through normal household survey procedures. Some evacuees reside outside the scope of the survey, such as those

currently living in hotels or shelters.

Based on information collected by CPS-sampled households, there were 791,000 persons aged 16 and over who had evacuated from where they were living in August due to Hurricane Katrina. About 300,000 of these persons had returned to the home from which they evacuated, and the remaining 500,000 had not returned to their August residences.

Of the 800,000 evacuees, 55.7 percent were in the labor force in October, and their unemployment rate was 24.5 percent. The jobless rate among those who have not been able to return home was substantially higher than the rate for those who returned to their

August place of residence. Again, these figures do not reflect the situation of persons still residing in shelters, hotels or other places

out of the scope of the household survey.

Even with these limitations we believe that these data provide useful information about the employment status of those persons affected by Hurricane Katrina. As people make the transition to more permanent housing, the estimates may be more representative of the situation of all evacuees. We plan to keep these special Katrina-related questions in the survey at least through January 2006.

Summarizing labor market developments for October, nonfarm payroll employment was little changed over the month, and the unemployment rate was 5.0 percent.

My colleagues and I will now be glad to address your questions. Representative Saxton. Thank you, Commissioner, for your

very concise and informative statement.

[The prepared statement of Ms. Utgoff appears in the Submis-

sions for the Record on page 17.]

Representative Saxton. Commissioner, in your statement you have a lot to say about the weather events that occurred, namely Hurricane Katrina and Rita, which were back-to-back storms at the

end of August and the beginning of September.

In looking at the employment numbers from the month of September and now, of course, the month of October, we see a much different trend than we had been seeing for the months in the first half of the year. In January, we had job growth of about 124,000 jobs; in February, 300,000 jobs; in March, 122,000; in April, 292,000; and that trend continued June, July and August. The numbers were 175,000, 277,000 new jobs, and in August, 211,000 new jobs.

When we get to September and see the effects of, for some reason—and I assume that you have talked about weather events significantly because you think that had something to do with it—all of a sudden the September numbers were down to a negative 35,000, which have just been revised back up to a negative 8,000,

and this month's numbers were also on the weak side.

Can you venture some opinion, venture some reasoning that would support the notion that the hurricanes have had a lot to do with this?

Commissioner Utgoff. We have come to the conclusion that in October, Hurricane Katrina, which is the hurricane that has most affected employment, did not cause additional losses, that the weak employment situation is throughout the country. I think it is fair to speculate that things such as higher gas prices have influenced people's behavior in a way that has dampened the employment situation.

The employment in discount stores and supercenters was weak, as was employment in leisure and hospitality. These are the kinds of places where people are not spending their money because they

may be spending their money on higher gas prices.

Representative Saxton. Not spending because they are spending it on higher gas prices, that decision that an individual or a family has to make about where they are going to spend their dollars.

Commissioner Utgoff. Yes.

Representative Saxton. In addition to that, wouldn't it discourage people to see \$3 on the pump? So that affects people's behavior, and that negative behavior may be an indirect result of the hurricane that we see the resulting weakening of the numbers, which occurred simultaneous with the occurrence of these weather events.

Commissioner Utgoff. Yes, yes. There are many strong economic numbers that have come out this month, but the employment numbers reflect an economy that is not growing as rapidly as it has been before.

Representative Saxton. Are there any other indicators in the data that you have seen that would say that there are other factors

at play here?

Commissioner Utgoff. I would like to point out that manufacturing showed a small gain because of return from a strike, but there was also a 0.4 percent gain in hours in the manufacturing industry spread throughout the entire industry, which is often a sign that employers are on the cusp of bringing back additional people. First they add hours, and then they add additional people. So that may be one positive sign, for this month for employment to be stronger next month. We also have the lingering effect of Hurricane Rita and Wilma, which really did not show up this month in the data because of the timing of the survey and may show up in later months.

Representative Saxton. So the results of Rita are not in this

Commissioner Utgoff. They are, but we had good response rates from employers who were affected by the hurricane. Next month there may be rebuilding, there may be other activities that go on that will affect the employment situation.

Representative Saxton. Can you shed any light for us on the difficulties that may have resulted from the devastating storms that occurred in having an effect on your ability to collect and ana-

lyze this work-related data?

Commissioner Utgoff. The last 2 months have shown a real effort by dedicated public servants to get out the best numbers possible so that we could judge what was happening in the economy. The Census Bureau made every opportunity to get to every household that they could. There were two parishes that they were not able to get into because they were completely evacuated. They got back into those parishes this month. There was a higher response rate. That is for the household survey.

In the payroll survey, Herculean efforts were made to get responses from people that when normally they would do things like many people who do touchtone entry, where they pick up the phone and they just push-call a number and push a few buttons, and that is their response, we called all those people individually. People worked long hours to contact virtually every person they could

in the hurricane-affected areas.

Jack Galvin, Associate Commissioner for Employment.

Mr. Galvin. That covers it pretty well. We also had cases of establishment survey respondents seeking out different numbers to reach us and report their information via touchtone data entry.

Our 1-800 numbers were down for a while, but these employers thought it important to report their numbers.

Representative Saxton. I see. The lack of communication that resulted in the couple of weeks immediately after Katrina seemed to have been a very significant impediment to me in regard to your ability to collect data. I had a friend who still lives in New Orleans, who ended up in Baton Rouge, and I tried to call him for 2 weeks with no luck, and he was in Baton Rouge. It must have posed some real challenges.

Commissioner Utgoff. We didn't change the definitions of employment for the payroll survey, but as we discussed last month, we did change the statistical analysis of those numbers. For your friend who may have owned a business, if he didn't report, in normal months we would have assumed that in first closing if you didn't report, in the first period you didn't report, that you looked like other people in your class, size, industry, area, and we didn't assume that this time. We assumed that people who reported zero employment did have zero employment. We went through all of our procedures for estimating employment and changed many of them.

Representative Saxton. Yesterday Chairman Greenspan was here to testify before the Joint Economic Committee, and he was pleased to reflect on the 3.8 percent growth that we saw in the last quarter; he was pleased to project that growth will continue in the next year or so at a rate, GDP rate, above 3 percent. He was pleased to talk about low long-term interest rates. He was pleased to see that in spite of Katrina and Rita and Wilma, and in spite of uncertainties created by the Gulf War, by the war on terror, and in spite of the interest rate increases that the Fed has deemed necessary, that he expects the economy to continue to grow.

Do you see anything in the numbers that would speak contrary

to that view?

Commissioner Utgoff. The numbers that we are putting out, many of them are very strong. The only cause for concern is this month's employment situation is relatively weak compared to the very strong employment growth that we have been seeing earlier.

Representative Saxton. In that regard previous Commissioners always have warned us about reading too much into the monthly data release. Would you say that this month's data is statistically significant, or is it something that we need to wait and see as we move forward?

Commissioner Utgoff. I will say the same thing as every other Commissioner: One month data is not something that you want to make a significant judgment on.

Representative Saxton. We have got the weather events that could have a temporary affect here, and we know from past experience that the statistical significance of 1 month's numbers are not always particularly meaningful.

Commissioner Utgoff. Yes.

Representative Saxton. Thank you, Commissioner.

Mr. Reed; I'm sorry, Senator Reed. My friend.

Senator Reed. Jack.

Thank you, Commissioner, and thank you, Mr. Chairman.

We were seeing what appeared to be sustained job growth over the last several months, but I understand the August number was revised down from the initial report; is that correct?

Commissioner Utgoff. Yes, that is correct.

Senator Reed. The initial report for August jobs was?

Do we recall a revised number?

Commissioner Utgoff. Just a moment.

Mr. Galvin. When we reported August back in September, we reported it at 169-, then in our second closing last month we re-

vised it up to 211-, and now we are reporting 148-.

Senator Reed. We went from 211- to 148-, and that was before Katrina and Rita and Wilma; is that correct, before the hurricanes?

Commissioner Utgoff. Yes, the August number would not have been affected by the hurricanes.

Senator Reed. So what we were seeing was growth, and something suddenly might have happened in August to cause a revision downward. Then we have this month's report, which I thought was interesting, because in response to the Chairman's question, you point out you did not really see the primary affects of the hurricane because the weakness was nationwide; is that a fair statement?

Commissioner Utgoff. Yes.

Senator Reed. And so, we saw revised numbers downward in August, we had a hurricane, and now we are seeing very. I think being polite, modest growth in jobs in this month, which is nationwide and not targeted to the hurricane effects.

The other aspect here I think is interesting is labor force participation. That seems to be consistently poor. In fact, I think there was a slight increase—I should say a slight decrease in labor force participation in October?

Commissioner Utgoff. Down one tenth of a percent. Senator Reed. Down a tenth. Not statistically significant, but indicating there is a huge reservoir of people who are not counted in the unemployment rolls because they are not actively seeking work, and that seems to be stable at high levels. I guess historically in terms of a recovery from a recession, these levels of workforce participation seem to be high; is that accurate, too?

Commissioner Utgoff. The decrease in labor force participation that occurred with the recession that started in 2000 was signifi-

cant and has not returned to prerecession levels.

Senator Reed. I think that is a significant issue when it comes to the truth of the situation of American families across the coun-

We have been talking about payroll growth and job growth, et cetera, but unemployment claims for this month seem to be growing also; is that fair?

Commissioner Utgoff. I believe that the initial claims were-

Mr. Galvin. Overall initial claims declined, 12,000.

Senator Reed. How about in terms of, again, talking in terms of the hurricanes; are those claims still coming out of the hurricane areas?

Commissioner Utgoff. Yes.

Mr. Galvin. ETA has reported that the number has gone above 500,000 of initial claims related to the hurricanes.

Senator Reed. What is your expectation with respect to additional claims coming out of those regions? Let me step back for a second. Is there a delay because people have difficulty because they

have been uprooted in filing their claims?

Commissioner Utgoff. There has been a concerted effort to have additional places to file unemployment insurance in all the areas that have been affected and to make sure that the places where evacuees have gone in large numbers have the ability to file for both employment insurance and disaster unemployment assistance.

Senator Reed. Do you expect a significant number of people have not yet filed?

Commissioner Utgoff. I can't opine on that.

Senator Reed. Let me turn to a final topic. One of the things that is both interesting and in a sense disturbing is we have an increase in productivity which is substantial, yet wages seem to be not reflecting those increases in productivity. Productivity went up, wages seem still to be rather anemic, and in real terms, wages are falling. If that is a trend that is going to continue, that has ominous implications for the economy. People are working harder and harder, and the overall economy is more productive, and yet they are not receiving any increase in wages.

How does that work for most of the people that work in this

country? Do you have a comment on that dilemma?

Commissioner Utgoff. Over the long run we normally see that productivity and wages move in the same direction; not always, but normally. That has not happened in the last few years. Produc-

tivity has increased faster than wages and compensation.

Senator Reed. That might be the long run, but that is—2 years of data is a significant amount of data, which suggests that this is a huge problem, because I think the premise that we all have in our market economy is that increased productivity will be shared in some sense with increased wages. If there is a disconnect between productivity increases and wage increases, that is, again, an ominous development in the country and I think something we have to be terribly concerned about. Thank you.

Representative Saxton. Mr. McCotter.

Representative McCotter. Thank you for being here.

Along similar lines, I am just curious if we have ever had a study, because I come from Michigan. Just so you know, we hear a lot in Michigan about the outsourcing of jobs, jobs lost. One question I can't seem to get answered because I don't know if anybody keeps track of it, and if you don't, nobody does, is what jobs are lost overseas as opposed to what jobs are lost to other States. Is

there anywhere I could go find that?

Commissioner Utgoff. We have a survey that addresses part of that for large layoffs where there have been 50 or more people laid off in a 5-week period and the layoff lasts more than a month. We call back the company and ask where the movement of jobs has been, and it is far more common for job loss to be the result of movement of a company's activities to another State or another area than it is for it to be moving out of the country. So that outsourcing—there is outsourcing, but it represents a relatively small fraction of job loss due to the movement of work either with-

in the company or to a different company and within the United States and outside the United States.

Representative McCotter. Where can I get that?

Commissioner Utgoff. We will be happy to send you more material. We have both quarterly reports and a year-end report that talks about that.

Representative McCotter. Can I get the latest year-end report and the latest quarterly?

Commissioner Utgoff. Yes.

Representative McCotter. Along the lines of what the Senator talked about, the increase in productivity and the stagnation of wages to match that rise, is there any analysis of how the flood tide of globalization is causing that? It seems to me that one of the problems would be that if you have to compete globally with any nation, not simply developed democracies, what happens is you will try to do everything you can to be more productive, and one of the things that you can't because it increases prices of your products would be to reward your employees for their increased productivity. Is there anywhere to find a correlation between those two? Because it is an ominous trend to find people working harder because they are forced to compete globally with any country which may or may not have similar protections for their people and find out at the end of the day that is merely to tread water and to survive economically, not to grow and prosper and pursue your American dream. Is there anywhere that can be found?

Commissioner Utgoff. We have data on the increase in wages and compensation benefits for the people over the 2-year period that you are talking about, and for people who do not have significant education, wages have been stagnant or falling. It is a stark example of why we really need to have a good educational and training system to prevent wage stagnation in a world of global

competition.

Representative McCotter. Relative to Michigan specifically from what you were just saying, then, is that it is probably statistically borne out that the people who are hurt the most will be in such areas as manufacturing, it would seem to me, because the history has been that you do not need an advanced degree although the work is very technical to go into a very well-paying job, to be able to produce, and then what we are seeing now is that that no longer is a career path, the statistics bearing out the people who get the degrees generally don't go work at Ford on the assembly line, or they don't work in the manufacturing area. Are we seeing then from the statistics a special problem within the manufacturing sector because of this trend?

Commissioner Utgoff. The manufacturing executives have told the Department of Labor that they have help wanted signs up not for assembly-line workers, but for workers who have more training and more education; that manufacturing has become much more of a high-tech industry where productivity has reduced the need for

workers with limited education.

Representative McCotter. If you would indulge me one last question. Are they also telling you that they are able to take the people who are engaged in the manufacturing sector currently and then bring them into those jobs?

Commissioner Utgoff. They are all very interested in training programs either on their own or with the help of the Department of Labor and the Department of Education to make sure that people graduate from high school with the skills that they need to enter the high-tech manufacturing workforce, because that is where manufacturing is headed, and to retrain their workers to take new jobs.

Representative McCotter. The high tech.

Commissioner Utgoff. In higher tech.

Representative Saxton. Good questions. Thank you.

Mrs. Maloney.

Representative Maloney. Welcome. Commissioner Utgoff. Thank you.

Representative Maloney. What fraction of the population actually has a job?

Commissioner Utgoff. Let me get to the numbers.

Representative Maloney. If you want you can get back to me later.

Commissioner Utgoff. No, no, no. We have all these numbers. The employment to population ratio in October 2005 was 62.9

percent.

Representative Maloney. What would the unemployment rate be if you included people who want to work but have given up? They are not officially in the labor force, they have been turned down 10 times, and are not actively looking? What would the unemployment rate be if you included those people?

Commissioner Utgoff. In October 2005, our broadest measure

of labor utilization, U6, was 8.7 percent.

Representative Maloney. What would the unemployment rate be if you included people working part time for economic reasons? Commissioner Utgoff. U6 includes those working part time for

economic reasons.

Representative Maloney. This also includes people who would like to work but have given up?

Commissioner Utgoff. It includes discouraged workers.

Representative Maloney. I would argue the real unemploy-

ment rate is 8.7 percent.

Anyway, I would like to ask you to clarify for me—first of all, I want to go back to the numbers that you gave us. You said that there was a net gain of 56,000 jobs in October and a loss of 8,000 jobs in the revised September reading. How many of those net gain jobs at 56,000 are filled by women, and how many are filled by men? Likewise, I think it is important to see who it is that is losing a job. How many of the net loss of 8,000 jobs in the revised reading had been filled by women, and how many had been filled by men?

Commissioner Utgoff. The number that you refer to, 56,000, is net. They are both people who have gotten jobs and people who

have lost jobs.

Representative Maloney. How many of them were women, and how many were men?

Commissioner Utgoff. We don't have that statistic.

Representative Maloney. Did you at one time keep that statistic?

Commissioner Utgoff. Yes, we did.

Representative Maloney. I find that an important statistic to have. In fact, Senator Kennedy with the help of Senator Reed, proposed an amendment to put it back into the payroll data, and I would just like to clarify why the Bureau has discontinued the women workers series on the current employment statistic survey. Why did you discontinue it? It is half the population. That is an important number to study.

Commissioner Utgoff. The statistic that you are talking about would not be available to me to report to you for October

because—

Representative Maloney. That wasn't my question. My question is why did you stop—why did you discontinue keeping that statistic.

Commissioner Utgoff. The decision was made based on the fact that the burden on employers for collecting that statistic was not worth the amount of use that statistic was getting. We know that because we can measure the hits on the Web site. We know that in the last 10 years that 6 articles have been written that partially use that data, and we have calculated that if it takes employers a minute apiece to answer that question, and you use a relatively low bookkeeper salary, that the cost of those 6 articles is almost \$3.5

million apiece.

Representative Maloney. I would like to request a copy of those six articles. According to the research that we looked at, that question has an 86 percent response rate. It is the second highest responded-to question of any on the survey; the only one being higher is how many employees do you have. The only business organizations that responded supported collecting the data. There was no business that went on record being opposed to collecting the data. They all came out in supporting it. Researchers use this data. The Federal Reserve Bank of New York has used it, and many others use it.

So, I cannot understand why in the world you have removed it. There is no substitute. Businesses don't seem to have a problem with it since they all responded to the comment period at OMB, in the original comment period, in support of it. Researchers use it, and there seems to be overwhelming support for it. The comments submitted to BLS ran 9 to 1 in favor of it, and I believe the Senate just voted overwhelmingly, in a bipartisan way I might add, to continue collecting it. I must say I have signed numerous letters in a bipartisan way in support of it, and I have spoken to professional researchers who tell me that they use it, that it is valuable. I can't understand why getting the number of women employed is not important.

Now in your breakdown of these numbers by industry, how many

industries do you break it down by? **Mr. Galvin.** Over 1,000 industries.

Representative Maloney. Eight hundred industries.

Mr. Galvin. That is the national numbers. The women's workers numbers were broken down to a high level of industry detail of about 40 high-level sectors.

Representative Maloney. Forty high-level sectors. I would like to look at how you collected it in the past. I might say that I went to your Web site in the past, and I have never seen it mentioned,

it is never in your press releases. If people don't know about it,

then they won't be using it.

I would just like to ask you; it was my understanding that the New York Federal Reserve testified to the usefulness of this data; is that correct, about the New York Federal Reserve Bank?

Commissioner Utgoff. There was a written response from the

Federal Reserve bank that they had used the data.

Representative Maloney. If they are using it, I think we need

to give them the data they need.

Does collecting this data impose a large burden on BLS, or is there some compelling reason why we should not continue to collect this data since the response was 9 to 1 in support of continuing it?

Every business that wrote in wrote in in support of it.

Commissioner Utgoff. First, let me make an important point. The data on industry by women is available in the Current Population Survey. We are making that more useful to our users by producing a longer-time series. It is just the nature of when you ask an employer do you want to put this data down, when they spend 12 minutes a month—excuse me, 12 minutes a year responding to it, they are not going to write a letter.

It is our job as a statistical agency to make the judgment that 12 minutes a month for 400,000 employers is a very large burden

compared with 6 articles in 10 years.

Representative Maloney. Commissioner, if no one writes in in opposition, why are you even having a comment period if you are going to make a decision not based on the comments? Nine to one the comments were in support of continuing the data, and researchers have told me, that the other data that you are using is not the same. They have told me that the CPS data comes from a different source, individuals rather than employers, and has a smaller sample size. BLS states that—you have stated that it is less reliable for month-to-month employment changes. The Federal Reserve uses this data. I would respectfully urge you to continue collecting it.

Now, if Congress passes a bill forcing you to collect it, would you

collect it?

Commissioner Utgoff. Yes.

Representative Maloney. I would urge in a bipartisan way that we put in such a bill. I know that Senator Kennedy and likeminded people will be working in the conference committee to keep the legislation in, and, quite frankly, I am absolutely appalled that of all the things to cut out, it is keeping data on employed women. I think that women's data should be kept, and I urge you on your own to make this correction.

Commissioner Utgoff. We produce voluminous data on women; earnings, use of their time, and when they are displaced from the workforce. We cover every aspect of women in the labor force.

Representative Maloney. Maybe I should wait until the second

round.

Representative Saxton. Actually, Senator Reed and I have tentatively agreed not to have a second round.

Representative Maloney. May I have a follow-up question.

Representative Saxton. The gentlelady has made her point, and you are rapidly approaching the 10-minute—your red light has

been on for 5 minutes. If you would ask another question and conclude, I would appreciate it.

Senator Reed. I have one more question.

Representative Maloney. What is the Bureau doing to study the wage gap specifically, and what are you doing to determine how much of the wage gap is attributed to discrimination by employer, and are you designing any surveys on this issue, or do you have any surveys on this issue?

Commissioner Utgoff. We just produced a lengthy report, I will send everybody on the Committee a copy, on highlights of women's earnings. We publish earnings by age, race, all kinds of groups, to compare them to men so that we know in what industries women are making progress relative to men, in what educational groups women are making progress relative to men, occupations. This is a 40-page report that was just recently produced and will continue to be produced.

The data that you say are being dropped were never used by the BLS to evaluate women's earnings and the progress of their earn-

ings and are not suitable for doing that.

We will continue to be a major source of information on women in the workforce and how women in the workforce are doing rel-

ative to men by numerous categories.

Representative Maloney. \bar{I} thank you for your testimony, and you may not be using the information, but other researchers, including the Federal Reserve, are using the information on the number of women employed, or losing jobs, and that is valuable information and I would respectfully urge BLS to place that back in their column of items.

Representative Saxton. Commissioner, I would like to thank you for being here with us this morning. We appreciate it very much. We always enjoy these sessions, but we enjoy them even more when you bring us good news. Hopefully next month we will have some good news.

Commissioner Utgoff. We have had a spate of hurricanes, and hopefully that will die down. And no snow storms next month.

Representative Saxton. Thank you.

[Whereupon, at 10:22 a.m., the Committee was adjourned.]

PRESS RELEASE

For Immediate Release November 4, 2005

STATEMENT OF CHAIRMAN JIM SAXTON

Contact: Christopher Frenze Executive Director (202) 225-3923

OCTOBER EMPLOYMENT SITUATION

WASHINGTON, D.C. - It is a pleasure to welcome Commissioner Utgoff before the Committee once again to testify on the employment situation.

The employment figures released today may reflect the indirect effects of the recent hurricanes. Payroll employment increased by 56,000 in October to a level of 134.1 million. According to the separate household survey, the unemployment rate edged down to 5.0 percent.

Other standard economic indicators reflect the health of the U.S. economy. Figures released last week indicate that the economy grew at a 3.8 percent rate last quarter, despite the massive regional destruction wrought by the hurricanes. So far during 2005, the economy has expanded at a 3.6 percent rate, roughly in line with Federal Reserve expectations as well as the Blue Chip Consensus.

Equipment and software investment, which has bolstered the economy since 2003, continues at a healthy pace. This component of investment responded especially sharply to the incentives contained in the 2003 tax legislation. Employment has also gained over this period, with 4.2 million jobs added to business payrolls since May of 2003. The unemployment rate is 5.0 percent.

Consumer spending continues to grow. Homeownership has reached record highs. Household net worth is also as a record level. Productivity growth continues at a healthy pace. Although higher energy prices have raised business costs and imposed hardship on many consumers, these prices have not derailed the expansion.

In summary, the economy has displayed impressive flexibility and resilience in absorbing many shocks. Monetary policy and tax incentives for investment have made important contributions in accelerating the expansion in recent years. The most recent release of Fed minutes indicates that the central bank expects this economic growth to continue through 2006. The Blue Chip Consensus of private economic forecasters also suggests that the economy will grow in excess of 3 percent next year, and that employment will continue to rise.

> CHAD STONE STAFF DIRECTOR

Opening Statement Senator Jack Reed Joint Economic Committee Hearing November 4, 2005

Thank you, Chairman Saxton. This hearing gives us the opportunity to continue examining the impact of the recent hurricanes on the jobs data and to try to discern underlying trends in the labor market. I want to commend Commissioner Utgoff for the hard work that her staff at the Bureau of Labor Statistics (BLS) has put into producing these statistics under extraordinary circumstances.

As measured by initial claims for unemployment insurance, the number of people who have lost their jobs due to hurricanes Katrina and Rita has now exceeded the half-million mark, and more job losses are expected from Hurricane Wilma. In the coming months, I hope the reconstruction efforts will stimulate a recovery in jobs throughout the region.

Beyond the hurricane-affected areas, the labor market showed signs of losing strength. For the economy as a whole, this month's BLS report shows that only 56,000 net jobs were created. It appears that high gas prices may be squeezing employers as well as consumers.

Even before the hurricanes, the labor market was still feeling the effects of the most protracted jobs slump in decades. Cumulative payroll employment growth has been modest by the standards of most economic recoveries, and we continue to see evidence of hidden unemployment, with labor force participation and the fraction of the population with a job still at depressed levels.

The typical worker's earnings are not keeping up with rising living expenses, which is squeezing family budgets. Gasoline prices have been high and home heating costs are expected to be substantially higher this winter than they were last winter. In the past year, real wages have fallen throughout the earnings distribution, with the largest declines in the bottom half.

I am pleased that President Bush reversed his unwise decision to suspend the Davis Bacon Act in the hurricane-ravaged areas and restored federal wage protections for workers on federal contracts. But the President's steadfast refusal to support an increase in the minimum wage still makes it hard to take seriously his rhetoric about wanting to lift families out of poverty.

I look forward to Commissioner Utgoff's statement and to a further discussion of the October employment situation.

Statement of

Kathleen P. Utgoff
Commissioner
Bureau of Labor Statistics

before the

Joint Economic Committee

UNITED STATES CONGRESS

Friday, November 4, 2005

Mr. Chairman and Members of the Committee:

I appreciate this opportunity to comment on the labor market data we released this morning.

Nonfarm payroll employment was little changed in October (+56,000), and the jobless rate was 5.0 percent. Payroll employment was flat in September (-8,000), as revised).

Before discussing the payroll survey data in detail, I would note that the October estimates were prepared using the same modified procedures that we introduced in September to better gauge employment developments in areas affected by Hurricane Katrina. We will continue to

evaluate our data collection and estimating procedures and will resume standard survey operations when it is appropriate.

You will recall that in our analysis of the September employment data, we concluded that the weakness was largely due to the job loss in areas devastated by Hurricane Katrina. This conclusion was based on an estimate of the change in payroll employment excluding all of the sample units in the disaster areas. That exercise showed that job growth outside the disaster areas was in line with the average monthly increase for the nation as a whole during the prior year (about 200,000). We did a similar exercise for October and concluded that the relatively weak increase was not attributable to the areas directly affected by Katrina. Rather, job growth in the remainder of the country appeared to be below trend in October. addition, the direct impact of Hurricane Rita on the national employment data for October was judged to be minimal. It is possible, of course, that employment growth for the nation could have been held down by indirect effects of Hurricanes Katrina and Rita, for example, because of their impact on gas prices. (Hurricane Wilma made landfall after the October survey reference period.)

Turning to the national developments by industry, leisure and hospitality employment edged down in October. This followed a substantial decline in September, at least some of which was hurricane related. Employment in retail trade was basically unchanged in October after a large decline in September. In addition, there was little job growth in professional and business services in October; the number of jobs in its temporary help component showed little movement over the month.

A few major industries posted notable job gains in October. Employment in the construction industry rose by 33,000 over the month, compared with average growth of about 21,000 jobs per month during the first 9 months of the year. Some of the October gain reflects post-hurricane rebuilding and clean-up efforts. Employment in financial activities continued to increase, rising by 22,000; about half of this gain occurred in credit intermediation. Employment in health care and social assistance also continued to expand in October, rising by 23,000.

Elsewhere in the economy, employment in the information industry fell by 15,000 over the month, mostly because of a large decline in motion pictures and sound recording.

Factory employment edged up in October because of the return of aerospace workers from a strike. The manufacturing workweek rose by an unusually large amount, 0.4 hour; increases in the factory workweek occurred throughout most of the component industries.

Average hourly earnings of private production or nonsupervisory workers on private nonfarm payrolls rose by 8 cents in October to \$16.27, following a 2-cent increase in September. Over the year, average hourly earnings were up by 2.9 percent.

Looking at some major household survey indicators, the jobless rate was 5.0 percent in October. The unemployment rate basically has held steady since May of this year.

Both the labor force participation rate and employment-population ratio were little changed in October, at 66.1 percent and 62.9 percent, respectively.

I'd also like to discuss some preliminary findings on the employment status of persons directly affected by Hurricane Katrina. Shortly after the hurricane struck, Bureau analysts, together with our colleagues at the Census Bureau, devised a short series of hurricane-related questions for inclusion in the October Current Population Survey. These questions were designed to identify and solicit information from survey respondents who had

evacuated from their homes, even temporarily, because of Hurricane Katrina.

It is important to note that the estimates based on these questions are not representative of all evacuees, but only those who were interviewed through normal household survey procedures. Some evacuees reside outside the scope of the survey, such as those currently living in hotels or shelters.

Based on information collected from CPS-sampled households, there were about 800,000 persons age 16 and over who had evacuated from where they were living in August due to Hurricane Katrina. About 300,000 of these persons had returned to the home from which they had evacuated, and the remaining 500,000 had not returned to their August residence.

Of the 800,000 evacuees, 55.7 percent were in the labor force in October, and their unemployment rate was 24.5 percent. The jobless rate among those who have not been able to return home (33.4 percent) was substantially higher than the rate for those who had returned to their August place of residence (10.5 percent). Again, these figures do not reflect the situation of persons still residing in shelters, hotels, or other places out of the scope of the household survey.

Even with their limitations, we believe that these data provide useful information about the employment status of those persons affected by Hurricane Katrina. As people make the transition to more permanent housing, the estimates may become more representative of the situation of all evacuees. We plan to keep these special Katrina-related questions in the survey at least through January 2006.

Summarizing labor market developments for October, nonfarm payroll employment was little changed over the month, and the unemployment rate was 5.0 percent.

My colleagues and I now would be glad to address your questions.

THE EMPLOYMENT SITUATION: OCTOBER 2005

Nonfarm payroll employment was little changed (+56,000) in October, and the unemployment rate was essentially unchanged at 5.0 percent, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls rose by 8 cents over the month.

Hurricanes Katrina, Rita, and Wilma

In October, interviewing for the household survey resumed in Orleans and Jefferson parishes in Louisiana. Interviews were not conducted in those areas in September because they were under mandatory evacuation orders. Otherwise, normal data collection and estimation procedures were used in the household survey for both months.

For the October establishment survey estimates, several modifications to the usual estimation procedures were again used to better reflect employment in Katrina-affected areas. The changes included: (1) modification of procedures to impute employment counts for survey nonrespondents in the most heavily impacted areas, (2) adjustments to sample weights for sample units in the more broadly defined disaster area to compensate for lower-than-average survey response rates, and (3) modification of the adjustment procedure for the business net birth/death estimator to reflect likely changes in business birth/death patterns in the disaster areas.

Hurricane Rita made landfall on the Gulf Coast near the Louisiana and Texas border in late September. For October, the number of responses to the establishment survey was only slightly below normal in the areas affected by Rita. Therefore, no special estimation procedures were used for those areas.

Hurricane Wilma struck Florida after the October survey reference periods, but during the survey collection periods. As with Hurricane Rita, the impact on data collection for the establishment survey was minimal, and no special estimation procedures were used for the affected areas. Because the reference periods for both surveys occurred before Hurricane Wilma struck, any impact of this storm would not be reflected in October's employment and unemployment estimates.

For more information on household and establishment survey procedures and estimates for October 2005, see http://www.bls.gov/katrina/cpscesquestions.htm on the BLS Web site or call (202) 691-6378 for information about the household survey, and (202) 691-6555 for information about the establishment survey.

3

Unemployment (Household Survey Data)

Both the number of unemployed persons, 7.4 million, and the unemployment rate, 5.0 percent, were little changed in October. The unemployment rate has ranged from 4.9 to 5.1 percent since May. The unemployment rates for adult women (4.6 percent), teenagers (15.9 percent), whites (4.4 percent), and blacks (9.1 percent) showed little or no change over the month. The jobless rates for adult men (4.3 percent) and Hispanics or Latinos (5.8 percent) both declined from September. In October, the unemployment rate for Asians was 3.1 percent, not seasonally adjusted. (See tables A-1, A-2, and A-3.)

After increasing by a similar magnitude in September, the number of persons unemployed due to job loss fell by 201,000 in October to 3.5 million. Since December, the number of unemployed job losers has decreased by 585,000. (See table A-8.)

Total Employment and the Labor Force (Household Survey Data)

Total employment, 142.6 million, and the civilian labor force, 150.1 million, were little changed in October. The employment-population ratio (62.9 percent) and the labor force participation rate (66.1 percent) also were little changed. (See table A-1.)

In October, persons employed part time for economic reasons—those who are available for and would prefer full-time work—decreased by 330,000 to 4.3 million. This number had been trending up in recent months. (See table A-5.)

Persons Not in the Labor Force (Household Survey Data)

The number of persons marginally attached to the labor force was 1.4 million in October, down from 1.6 million a year earlier. (Data are not seasonally adjusted.) These individuals wanted and were available to work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed, however, because they did not actively search for work in the 4 weeks preceding the survey. There were 392,000 discouraged workers in October, little changed from a year earlier. Discouraged workers, a subset of the marginally attached, were not currently looking for work specifically because they believed no jobs were available for them. The other 1.0 million marginally attached persons had not searched for work for reasons such as school attendance or family responsibilities. (See table A-13.)

Industry Payroll Employment (Establishment Survey Data)

Total nonfarm payroll employment was little changed (+56,000) in October at 134.1 million. Employment growth was flat in September (-8,000, as revised), due in part to the effects of Hurricane Katrina. In the first 8 months of the year, payroll employment had increased by an average of 196,000 per month. In October, construction, financial activities, and health care added jobs, while employment in most other major industries showed little movement. (See table B-1.)

Over the month, construction employment increased by 33,000, with much of the gain (20,000) occurring in residential specialty trade contracting. Prior to October, construction employment had been expanding by an average of 21,000 per month in 2005. October's gain may partly reflect rebuilding and clean-up efforts following Hurricane Katrina. Mining continued to trend upward, adding 5,000 jobs over the month.

Manufacturing added 12,000 jobs in October. Employment in transportation equipment increased by 22,000, largely due to the return of 18,000 striking workers in the aerospace industry. This gain in transportation equipment employment was partly offset by job losses in computer and peripheral equipment (-2,000), electrical equipment and appliances (-3,000), and miscellaneous manufacturing (-4,000) in October.

4

Employment in financial activities continued to grow in October, rising by 22,000. Employment gains in credit intermediation accounted for about half of the over-the-month increase. Over the year, credit intermediation has added 107,000 jobs. Employment in insurance edged up in October.

Health care employment also continued to grow in October, increasing by 17,000. Ambulatory health care services, which include doctors' offices and outpatient clinics, added 11,000 jobs. Hospitals also contributed to the employment gain with an increase of 6,000 jobs.

Employment in the leisure and hospitality industry edged down in October, after declining by 63,000 in September. Within the industry, food services—which includes restaurants and drinking places—accounted for the weakness over the month. Prior to September, food services had been adding about 26,000 jobs per month in 2005.

Retail trade employment was essentially unchanged in October following a large decline in September. In October, there were job losses in department stores (-18,000) and automobile dealers (-9,000). Following large declines in August and September, employment in food stores edged up by 9,000 in October. Sporting goods, hobby, book, and music stores also added 9,000 jobs over the month, largely offsetting a decline in September.

Professional and business services employment was little changed in October. Over the last 12 months, however, the industry has added 442,000 jobs. Over the month, employment in computer systems design and related services increased by 8,000.

In October, employment in information decreased by 15,000. Much of this decline was due to a job loss of 11,000 in the motion picture and sound recording industry. Despite the October decline, employment in the information industry was about unchanged over the year.

Weekly Hours (Establishment Survey Data)

The average workweek for production or nonsupervisory workers on private nonfarm payrolls was unchanged at 33.8 hours in October, seasonally adjusted. The manufacturing workweek increased by 0.4 hour to 41.0 hours, and factory overtime was unchanged at 4.5 hours. (See table B-2.)

The index of aggregate weekly hours of production or nonsupervisory workers on private nonfarm payrolls was unchanged in October at 103.2 (2002=100). The manufacturing index was up by 1.3 percent over the month to 95.1. (See table B-5.)

Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of production or nonsupervisory workers on private nonfarm payrolls rose by 8 cents in October to \$16.27, seasonally adjusted. Average weekly earnings increased by 0.5 percent over the month to \$549.93. Over the year, both average hourly and weekly earnings increased by 2.9 percent. (See table B-3.)

The Employment Situation for November 2005 is scheduled to be released on Friday, December 2, at 8:30 A.M. (EST).

Explanatory Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Current Employment Statistics survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS).

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. The sample includes about 160,000 businesses and government agencies covering approximately 400,000 individual worksites. The active sample includes about one-third of all nonfarm payroll workers. The sample is drawn from a sampling frame of unemployment insurance tax accounts.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contains the 12th day of the month. In the establishment survey, the reference period is the pay period including the 12th, which may or may not correspond directly to the calendar week.

Coverage, definitions, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unemployed, or not in the labor force.

People are classified as *employed* if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had no employment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4-week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unemployed persons. Those not classified as employed or unemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employment-population ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as federal, state, and local government entities. Employees on nonfarm powolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing sector and nonsupervisory workers in the service-providing sector. Industries are classified on the basis of their principal activity in accordance with the 2002 version of the North American Industry Classification System.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the employment estimates derived from the surveys. Among these are:

- The household survey includes agricultural workers, the self-employed, unpaid family workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes people on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers 16 years of age and older.
 The establishment survey is not limited by age.
- The household survey has no duplication of individuals, because individuals are counted only once, even if they hold more than one job.
 In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted sepanately for each appearance.

Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the monthto-month changes in unemployment.

Because these seasonal events follow a more or less regular pattern each year, their influence on startistical trends can be climinated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as declines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each lime is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Most seasonally adjusted series are independently adjusted in both the household and establishment surveys. However, the adjusted series for many major estimates, such as total payroll employment, employment in most supersectors, total employment, and memployment are computed by aggregating independently adjusted component series. For example, total memployment is derived by summing the adjusted series for four major ago-sex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detailed age categories.

For both the household and establishment surveys, a concurrent seasonal adjustment methodology is used in which new seasonal factors are calculated each month, using all relevant data, up to and including the data for the current month. In the household survey, new seasonal factors are used to adjust only the current month's data. In the establishment survey, however, new seasonal factors are used each month to adjust the three most recent monthly estimates. In both surveys, revisions to historical data are made once a year.

Reliability of the estimates

Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 430,000. Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90-percent confidence interval on the monthly change would range from -330,000 to 530,000 (100,000 +/- 430,000). These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90-percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90-percent confidence interval would be greater than zero. In this case, it is likely (at least a 90-percent chance) that an employment rise had, in fact, occurred. At an unemployment rate of around 5.5 percent, the 90-percent confidence interval for the monthly change in unemployment is about +/- 280,000, and for the monthly change in the unemployment rate it is about +/- .19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relative to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarterly and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The household and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, trability to obtain information for all respondents in the sample, inability to inwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample reports have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the insbility to capture, on a timely basis, employment generated by new firms. To correct for this systematic underestimation of employment growth, an estimation procedure with two components is used to account for business births. The first component uses business deaths to impute employment for business births. This is incorporated into the sample-based link relative estimate procedure by simply not reflecting sample units going out of business, but imputing to them the same trend as the other firms in the sample. The second component is an ARIMA time series model designed to estimate the residual neb tirth death employment not accounted for by the imputation. The historical time series used to create and test the ARIMA model was derived from the unemployment insurance universe micro-level database, and reflects the actual residual net for births and deaths over the past five years.

The sample-based estimates from the establishment curvey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the memployment insurance program. The difference between the March sample-based employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey error. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from less than 0.05 percent to 0.5 percent.

Additional statistics and other information

More comprehensive statistics are contained in Employment and Earnings, published each month by BLS. It is available for \$27.00 per issue or \$53.00 per year from the U.S. Government Printing Office, Washington, DC 20402. All orders must be prepaid by sending a check or money order payable to the Superintendent of Documents, or by charging to Mastercard or Visa.

Employment and Earnings also provides measures of sampling error for the household and establishment survey data published in this release. For unemployment and other labor force categories, these measures appear in tables 1-B through 1-D of its "Explanatory Notes." For the establishment survey data, the sampling error measures and the actual size of revisions due to benchmark adjustments appear in tables 2-B through 2-F of Employment and Earnings.

Information in this retease will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone: 1-800-877-8339.

¹Based on seasonally adjusted data for 1-, 3-, and 8-month spans and unadjusted data for the 12-month span. Psymplential programs of the percent of Industrias with employment

increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

U. S. Department of Labor

Commissioner Bureau of Labor Statistics Washington, D.C. 20212

NOV 30 2005

The Honorable Jim Saxton U.S. House of Representatives 2217 Rayburn House Office Building Washington, D.C. 20515

Dear Congressman Saxton:

At the November 4 hearing of the Joint Economic Committee, I was asked if the Bureau of Labor Statistics had any studies on earnings of women and men.

I am pleased to provide you with a copy of Highlights of Women's Earnings in 2004 which was released on October 7. This annual report presents earnings for wage and salary workers from the Current Population Survey (CPS), a monthly survey of about 60,000 households.

In 2004, median weekly earnings for women who were full-time wage and salary workers were \$573, or 80 percent of the \$713 median for their male counterparts. This ratio was about the same in 2003. In 1979, the first year in which comparable data were collected, women's earnings were 63 percent of men's. The updated Highlights of Women's Earnings provides 2004 earnings for women and men by various characteristics, including age, race, educational attainment, occupation, marital status, and presence of children. In addition to the 2004 earnings data, the report includes inflation-adjusted median earnings back to 1979.

Highlights of Women's Earnings in 2004 is available on the Internet at www.bls.gov/cps/cps/wom2004.pdf. In addition to this annual report, we also issue data on women's and men's earnings from the CPS in our quarterly news release, Usual Weekly Earnings of Wage and Salary Workers. A copy of the most recent release is enclosed for your information. The Bureau, of course, will continue to make these important data available in the future.

If you have any additional questions, you or your staff may contact Mr. Thomas Nardone, Assistant Commissioner for Current Employment Analysis at 202-691-6379.

Sincerely yours,

KATHLEEN P. UTGOFF Commissioner

USUAL WEEKLY EARNINGS OF WAGE AND SALARY WORKERS: THIRD QUARTER 2005

Median weekly earnings of the nation's 105.4 million full-time wage and salary workers were \$649 in the third quarter of 2005, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This was 2.7 percent higher than a year earlier, compared with a gain of 3.8 percent in the Consumer Price Index for All Urban Consumers (CPI-U) over the same period.

Data on usual earnings are collected as part of the Current Population Survey, a nationwide sample survey of households in which respondents are asked, among other things, how much each wage and salary worker usually earns. (See the Explanatory Note.) Highlights from the third-quarter data are:

- —Women who usually worked full time had median earnings of \$585 per week, or 81.7 percent of the \$716 median for men. The female-to-male earnings ratios were higher among blacks (95.5 percent) and Hispanics or Latinos (86.5 percent) than among whites (80.6 percent) or Asians (79.0 percent). (See table 1.)
- —Median earnings for black men working at full-time jobs were \$533 per week, 72.3 percent of the median for white men (\$737). The difference was less among women, as black women's median earnings (\$509) were 85.7 percent of those for their white counterparts (\$594). Overall, median earnings of Hispanics or Latinos who worked full time (\$462) were lower than those of blacks (\$520), whites (\$667), and Asians (\$761). (See table 1.)
- —Among men, those age 55 to 64 and age 45 to 54 had the highest median weekly earnings, \$858 and \$848, respectively. Among women, earnings were highest for 45- to 54-year-olds and 55- to 64-year-olds, \$640 and \$639, respectively. (See table 2.)
- —Among the major occupational groups, persons employed full time in management, professional, and related occupations had the highest median weekly earnings—\$1,103 for men and \$812 for women. Men and women in service jobs earned the least. (See table 3.)
- —Full-time workers age 25 and over without a high school diploma had median weekly earnings of \$413, compared with \$583 for high school graduates (no college) and \$1,014 for college graduates holding at least a bachelor's degree. Among college graduates with advanced degrees (professional or master's degree and above), the highest-earning 10 percent of male workers made \$2,729 or more per week, compared with \$1,858 or more for their female counterparts. (See table 4.)

Explanatory Note

The estimates in this release were obtained from the Current Population Survey (CPS), which provides the basic information on the labor force, employment, and unemployment. The survey is conducted monthly for the Bureau of Labor Statistics by the U.S. Census Bureau from a scientifically selected national sample of about 60,000 households, with coverage in all 50 states and the District of Columbia. The earnings data are collected from one-quarter of the CPS monthly sample and are limited to wages and salaries. The data, therefore, exclude self-employment income.

Information in this release will be made available to sensory impaired individuals upon request. Voice phone: 202-691-5200; TDD message referral phone number: 1-800-877-8339.

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than the entire population, is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the 90-percent level of confidence.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in the collection or processing of the data.

For a full discussion of the reliability of data from the CPS and information on estimating standard errors, see the "Explanatory Notes and Estimates of Error" section of Employment and Earnings.

Definitions

The principal definitions used in connection with the earnings series are described briefly below.

Usual weekly earnings. Data represent earnings before taxes and other deductions and include any overtime pay, commissions, or tips usually received (at the main job in the case of multiple jobbolders.) Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, bivecekly, twice monthly, monthly, annually, other) and how much they usually earn in the reported time period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of usual,

interviewers are instructed to define the term as more than half the weeks worked during the past 4 or 5 months.

Medians (and other quantiles) of weakly earnings. The median (or upper limit of the second quartile) is the amount which divides a given earnings distribution into two equal groups, one having earnings above the median. Tem percent of a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings); 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings); 75 percent have earnings below the upper limit of the first quartile (10 percent have earnings below the upper limit of the third quartile (25 percent have ligher earnings); 31 of 90 percent have earnings below the upper limit of the third quartile (10 percent have higher earnings).

The estimating procedure places each reported or calculated weekly earnings value into \$50-wide intervals which are centered eround multiples of \$50. The actual value is estimated through the linear interpolation of the interval in which the quantile boundary lies.

Over-the-year changes in the medians (and other quantitie boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are: (1) There could be a change in the relative weights of the subgroups. For example, the medians of both 16-to-24 year olds and those 25 years and over may rise; but if the lower-earning 16-to-24 group accounts for a greatly increased share of the total, the overall median could setually full. (2) There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This could be caused by survey observations that are clustered at rounded values, e.g., \$250, \$300, \$400. An estimate lying in a \$50-wide centered interval containing such a cluster or "spike" tends to charge more slowly than one in other intervals.

Wage and salary workers. Workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both the private and problic sectors but, for the purposes of the carnings series, excludes all self-employed persons, regardless of whether or not their businesses are incorporated.

Full-time workers. Workers who usually work 35 hours or more per week at their sole or principal job.

Part-time workers. Workers who usually work fewer than 35 hours per week at their sole or principal job.

Constant dollars. The Consumer Price Index for All Urban Consumers (CPI-U) is used to convert current dollars to constant (1982) dollars.

Hispanic or Latino ethnicity. This refers to persons who identified themselves in the enumeration process as being Spanish, Hispanic, or Latino. Persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Highlights of Women's Earnings in 2004

U.S. Department of Labor U.S. Bureau of Labor Statistics September 2005 Report 987

In 2004, median weekly earnings for women who were fulltime wage and salary workers were \$573, or 80 percent of the \$713 median for their male counterparts. This ratio was about the same in 2003. In 1979, the first year of comparable earnings data, women earned 63 percent as much as men did. (See chart 1.)

The women's-to-men's earnings ratio varies significantly by demographic group. The ratio was about 89 percent for blacks and 87 percent for Hispanics or Latinos in 2004. For whites, it was 80 percent, and for Asians it was 76 percent. Young women, those 16 to 24 years old, earned almost as much (94 percent) as young men did, while women 35 years and older earned about 75 percent as much as did their male peers.

This report presents earnings data from the Current Population Survey (CPS). The CPS is a national monthly survey of approximately 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. Information on earnings is collected from one-fourth of the CPS sample each month. Users should note that the comparisons of earnings in this report are on a broad level and do not control for many factors that can be significant in explaining earnings differences. For a detailed description of the source of the data and an explanation of the concepts and definitions used, please see the Technical Note in this report.

Highlights

Following are some highlights of women's and men's earnings in 2004.

Full-time workers

• Among women, 45- to 54-year-olds had the highest median weekly earnings (\$625), followed closely by 55- to 64-year-olds (\$615), and 35- to 44-year-olds (\$608). Men's earnings also were highest among 45- to 54-year-olds (\$857) and 55- to 64-year-olds (\$843). The difference between women's and men's earnings was much larger among middleaged and older workers than among younger workers. For instance, among workers aged 45 to 54, women earned 73 percent as much as men did. By comparison, among 16- to 24-year-olds, women earned 94 percent as much as their male counterparts, and, among workers 25 to 34 years old, women earned 88 percent as much as did men. (See table 1.)

- Between 1979 and 2004, the earnings gap between women and men narrowed for most major age groups. The women's-to-men's earnings ratio among 35- to 44-year-olds, for example, rose from 58 percent in 1979 to 76 percent in 2004, and that for 45- to 54-year-olds rose from 57 percent in 1979 to 73 percent 25 years later. The earnings ratios for teenagers and for workers 65 years old and older, however, showed no consistent movement over the period. (See table 12.)
- Asian workers of both sexes earned more than their white, black, or Hispanic or Latino counterparts did. Asian women's median weekly earnings (\$513) were 5 percent higher than white women's earnings (\$584), 21 percent more than black women's earnings (\$505), and 46 percent higher than the earnings of Hispanic or Latino women (\$419). In comparison, Asian men's earnings (\$802) were 10 percent higher than the earnings of white men (\$732), 41 percent greater than the earnings of black men (\$569), and 67 percent higher than those of Hispanic or Latino men (\$480). (See tables 1 and 13 and chart 2.)
- Earnings differences between women and men in 2004 were widest for whites and Asians. White women earned 80 percent as much as white men did, and Asian women earned 76 percent as much as Asian men did. Both black women (89 percent) and Hispanic or Latino (87 percent) women had earnings that were much closer to those of their male counterparts. (See table 1.)
- Growth in earnings for white women has outpaced that for their black and Hispanic or Latino counterparts. Between 1979 and 2004, inflation-adjusted earnings for white women grew fairly steadily, rising by 32 percent. Earnings over the period grew by 24 percent for black women and by 11 percent for Hispanic or Latino women. In contrast, real earnings for white and for black men rose only slightly, while those for Hispanic or Latino men fell by 9 percent. (See table 13.)

- Median weekly earnings in 2004 varied significantly by level of education. Among women, those with less than a high school diploma earned \$334 per week, compared with \$860 for those with a college degree. Among men, high school dropouts earned \$446 a week, compared with \$1,143 for college graduates. (See table 6.)
- At all levels of education, women have fared better than men with respect to earnings growth. Although both women and men with less than a high school diploma have experienced a decline in inflation-adjusted earnings since 1979, the drop for women—9 percent—was significantly less than that for men—27 percent. Earnings for women with college degrees have increased by 35 percent since 1979 on an inflation-adjusted basis, while earnings for male college graduates have risen by 20 percent. (See table 14 and chart3.)
- Women working full time in management, business, and financial operations occupations earned a median of \$812 per week in 2004. This was more than women earned in any other major occupational category. The second highest paying job group was professional and related occupations, in which women earned \$767 per week. Within management fields, the highest paying occupations for women were chief executives, computer and information systems managers, human resources managers, purchasing managers, medical and health services managers, and management analysts. Within professional occupations, women working as pharmacists, lawyers, computer software engineers, computer programmers, and physicians and surgeons had the highest median weekly earnings. (See table 2.)
- Within occupational groups, women and men tend to work in different occupations. In professional and related occupations, for example, women were much less likely than men to be employed in the highest paying occupations engineers and computer and mathematical scientists. Women were more likely than men to work in lower paying education, training, and library occupations. (See table 2.)
- The ratio of female-to-male earnings varied by place of residence, from a high of 87 percent in California to a low of 66 percent in Wyoming. The differences among the States reflect, in part, variations in the occupations and industries found in each State and in the age composition of each State's labor force. In addition, sampling error for the State estimates is considerably larger than it is for the national estimates; thus, one should be especially careful when comparing State estimates. (See table 3.)

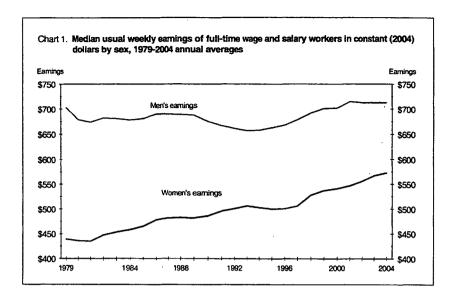

- Just 5 percent of women earned \$1,500 or more per week, compared with 13 percent of men. Not surprisingly, given their higher earnings overall, Asian women were more likely than other women to earn at least \$1,500 per week. (See table 7.)
- Median weekly earnings of married women with children under the age of 18 were 21 percent higher than the earnings of unmarried mothers. The difference was even greater for men: married fathers earned 33 percent more than unmarried fathers did. (See table 8.)

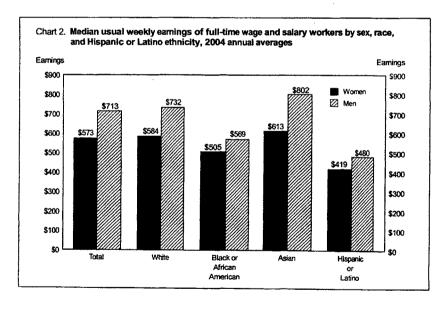

Part-time workers

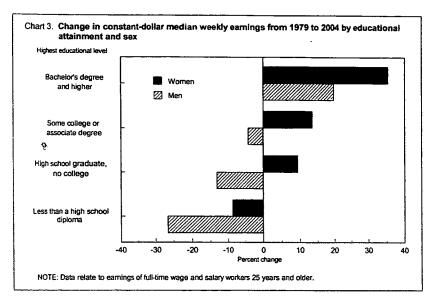

- Women who worked part time—that is, less than 35 hours per week—accounted for 25 percent of all female wage and salary workers in 2004. In contrast, just 11 percent of men in wage and salary jobs worked part time. (See tables 4 and 5.)
- Median weekly earnings of female part-time workers were \$201, compared with \$183 for male part-time workers. The men have lower earnings than the women because male part-time workers are more highly concentrated in the youngest age groups, which typically have low earnings. Half of male part-time workers were 16 to 24 years old, compared with just under a third of female part-timers. (See table 4.)

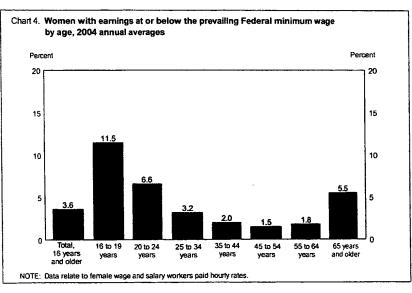

Workers paid by the hour

- About 63 percent of women and 57 percent of men employed in wage and salary jobs were paid by the hour in 2004. Women in this category had median hourly earnings of \$10.17, or 85 percent of the median for men paid by the hour (\$12.02). (See tables 5, 9, 10, 15, and 16.)
- Among women who were paid hourly rates in 2004, about 4 percent reported hourly earnings at or below the prevailing Federal minimum wage of \$5.15 an hour. This share compared with 2 percent of men who were paid by the hour. (See tables 11 and 17 and chart 4. Also see the Technical Note for information about workers with earnings below the Federal minimum wage.)
- As would be expected, 16- to 19-year-old women and men paid by the hour were the most likely to have earnings at or below the minimum wage. Workers 25 years of age and older were very unlikely to earn the minimum wage or less, although for women aged 65 and older the incidence of minimum wage work rose. (See table 11 and chart 4.)

⁵ These figures are computed using unrounced medians and may differ, signly from percents computed using the rounded medians displayed in this table.
**COTE: Data refer to the sole or principal job of full- and part-time workers.

Detail for the above "hours vary" groups will not sum to totals because data are not presented for a small number of multiple jobticities whose usual number of hours on the principal job is not identifiable.

Table 6. Quartiles and selected deciles of usual weekly earnings of full-time wage and salary workers by selected characteristics, 2004 annual averages

NOTE: Mourly-paid workers account for approximately three-fifths of all wage and salary workers. Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not

presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Table 11. Wage and salary workers paid hourly rates with earnings at or below the prevailing Federal minimum wage by selected characteristics, 2004 annual averages

NOTE: Estimates for the above race groups (white, black or African American, and Asian) do not sum to totals because data are not presented for all races in addison, persons whose arthinity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race.

Detail may not sum to totals due to rounding. Percents are based on unrounded data.
 The distinction between full and part-time workers is based on hours usually worked. These data will not sum to totals because full- or part-time status on the principal job is not identifiable for a small number of multiple jobholders.

The comparability of historical tabor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Explanatory Notes and Estimates of Error saction of the February 2005 and subsequent issues of Employment and Earnings, a monthly BLS pencicial

² These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians displayed in this table. NOTE: The Consumer Proc Index research series using current methods (CPU-U-RS) is used to convent current dollars to constant dollars. See Technical Note.

Table 13. Median usual weekly earnings of full-time wage and salary workers in constant (2004) dollars by sex, race, and Hispanic or Latino ethnicity, 1979-2004 annual averages

Year and sex	Total, 16 years and over	White	Black or African American	Asian	Hispanic o Latino

The comparability of historical labor force data has been affected at The comparability of historical labor force data has been affected at a bus times by methodological and conceptual changes in the Current actualism. Survey (CPS). For an explanation, see the Exclanatory Notes and Estimates of Error section of the February 2005 and subsecuent issues of Employment and Earnings a monthly BLS periodical.
2 These figures are computed using unrounded medians and may differ slightly from percents computed using the rounded medians ospilated in this table.

group are not included. Prior to 2003, persons who reported more than one race were included in the group they denthed as the main race. Estimates for the race groups with not sum to this's resulted feath are not presented for all races. Persons whose entwon is identified a Hispanic or Latan may be of any race and, therefore are disselfed by ethnicity as well as by race. Data for 2000-12 are for the category. Asians and Papafic Islanders. Starting in 2003. Asians constitute a separate category. For more information, see the Explanatory Notes and Estimates of Error section of Employment and Estimates. Data for Asians were not tabulated prior to 2000. The Consumer Price Index research series using current methods (CPI-I-RS) is used to convert current poliars to constant idolars. See Technical Note

objulye an initial battle.

- Data not a allable.

- 1/2/15. Beginning in 2003, estimates for the above race groups.

- 1/2/15. Beginning in 2003, estimates for the above race groups.

- 1/2/15. Beginning in 2003, estimates for the above race groups.

- 1/2/15. Beginning in 2003, estimates for the above race groups.

The comparability of histonical labor force data has been affected at various times by methodological and conceptual changes in the Current Population Survey (CPS). For an explanation, see the Evolanatory Notes and Estimates of Error section of the February 2005 and subsequent issues of Employment and Earnings, a monthly BLS resolution.

group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race. Estimates for the race groups will not sum to totals because data are not presented for all races. Persons whose ethnicity is identified as hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Data for 2000-02 are for the category. Asians and Pacific Islanders. Starting in 2003. Asians constitute a separate category. For more information, see the Englanatory Notes and Estimates of Error section of Employment and Estimates. Data for Asians were not tabulated prior to 2000. The Consumer Price Index research series using current methods (CPL-LAS) is used to convert current dollars to constant dollars. See Technical Note.

subsequent issues of employment periodical.

The comparability of historical labor force data has been affected at vanous times by methodological and conceptual changes in the Current Population Suvey (CPS), For an explanation, see the Explanation Notes and Estimates of Error section of the February 2005 and subsequent issues of Employment and Errimigs, a normality BLS periodical.
 Data for 1990-91 and 1998-97 reflect changes in the minimum wage that

took place in those years

NOTE: The prevailing Federal minimum wage was \$2.90 in 1979, \$3.10 in
1980, and \$3.35 in 1981-69. The minimum wage rose to \$3.80 in April 1990,
to \$4.25 in April 1991, to \$4.75 in October 1998, and to \$5.15 in September
1997. See Technical Note for more information about minimum wage
workers.

Technical Note

The estimates in this report were obtained from the Current Population Survey (CPS), which provides a wide range of information on the labor force, employment, and unemployment. The survey is conducted monthly for the Bureau of Labor Statistics (BLS) by the U.S. Census Bureau using a national sample of about 60,000 households, with coverage in all 50 States and the District of Columbia. The earnings data are collected from one-fourth of the CPS monthly sample.

Material in this report is in the public domain and, with appropriate credit, may be used without permission. This information is available to sensory-impaired individuals on request. Voice telephone: (202) 691-5200; Federal Relay Service: 1-800-877-8339.

Concepts and definitions

The principal concepts and definitions used in connection with the earnings data in this report are described below.

Usual weekly earnings. Data are collected on wages and salaries before taxes and other deductions and include any overtime pay, commissions, or tips usually received (at the principal job in the case of multiple jobholders). Self-employed workers are excluded, regardless of whether their businesses are incorporated. Prior to 1994, respondents were asked how much they usually earned per week. Since January 1994, respondents have been asked to identify the easiest way for them to report earnings (hourly, weekly, biweekly, twice monthly, monthly, annually, other) and how much they usually earn in the reported period. Earnings reported on a basis other than weekly are converted to a weekly equivalent. The term "usual" is as perceived by the respondent. If the respondent asks for a definition of usual, interviewers are instructed to define the term as more than half of the weeks worked during the past 4 or 5 months.

Medians (and quantiles) of weekly earnings. Most of the earnings estimates shown in this report are medians. The median (or upper limit of the second quartile) is the amount that divides a given earnings distribution into two equal groups, one having earnings above the median, and the other having earnings below the median. Ten percent of workers in a given distribution have earnings below the upper limit of the first decile (90 percent have higher earnings); 25 percent have earnings below the upper limit of the first quartile (75 percent have higher earnings); and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings); and 90 percent have earnings below the upper limit of the ninth decile (10 percent have higher earnings).

The BLS estimating procedure for determining the median of an earnings distribution places each reported or calculated weekly earnings value into a \$50-wide interval that is centered on a multiple of \$50. The actual value of the median is estimated through the linear interpolation of the interval in which the median lies.

Over-the-year changes in the medians (and quantile boundaries) for specific groups may not necessarily be consistent with the movements estimated for the overall quantile boundary. The most common reasons for this possible anomaly are:

- There could be a change in the relative weights of the subgroups. For example, the medians of both 16- to 24-yearolds and those 25 years and older may rise, but if the lower earning 16-to-24 age group accounts for a greatly increased share of the total, the overall median could actually fall.
- · There could be a large change in the shape of the distribution of reported earnings, particularly near a quantile boundary. This could be caused by survey observations that are clustered at rounded values, for example, \$250, \$300, or \$400. An estimate lying in a \$50-wide centered interval containing such a cluster, or "spike," tends to change more slowly than one in other intervals. For example, medians measure the central tendency of a multipeaked distribution that shifts over time. As the distribution shifts, the median does not necessarily move at the same rate. Specifically, the median takes relatively more time to move through a frequently reported interval but, once above the upper limit of such an interval, it can move relatively quickly to the next frequently reported earnings interval. BLS procedures for estimating medians (and other quantile boundaries) mitigate such irregular movements of the measures; however, users should be cautious of these effects when evaluating shortterm changes in the medians and in ratios of the medians.

Constant dollars. The Consumer Price Index research series using current methods (CPI-U-RS) is used to convert current dollars to constant dollars. BLS has made numerous improvements to the Consumer Price Index (CPI) over the past quarter-century. Although these improvements make the CPI more accurate, historical price index series are not adjusted to reflect the improvements. For a historical series that measures price change consistently over the entire period, the CPI-U-RS provides an estimate of the CPI incorporating most of the methodological improvements made since 1978 into the entire series. For more information, see "CPI research series using current methods, 1978-98" by Kenneth J. Stewart and Stephen B. Reed, Monthly Labor Review, June 1999, pp. 29-38; and "Questions and Answers: Consumer Price Index Research Series Using Current Methods" on the Web at www.bls.gov/epi/epirsde.htm.

This report uses the most recent version of the CPI-U-RS available at the time of production. Users should note, however, that the CPI-U-RS is subject to periodic revision. As a result, the rate of inflation incorporated into the constant-dollar earnings estimates in this report may differ from that in previous reports in this series or in other publications.

Wage and salary workers. These are workers who receive wages, salaries, commissions, tips, payment in kind, or piece rates. The group includes employees in both private and public sectors but, for purposes of the earnings series, excludes all self-employed persons, whether or not their businesses are incorporated.

Full-time workers. Workers who usually work 35 hours or more per week at their sole or principal job are defined as working full time for estimates of earnings.

Part-time workers. Workers who usually work fewer than 35 hours per week at their sole or principal job are defined as working part time for estimates of earnings.

Workers paid by the hour. Workers who are paid an hourly wage make up approximately three-fifths of all wage and salary workers. Workers paid by the hour are, therefore, included in the full- and part-time worker tables in this report, along with salaried workers and other workers not paid by the hour. (Data for workers paid at hourly rates are presented separately in tables 9 to 11 and 15 to 17.)

Workers paid at or below the Federal minimum wage. The estimates of the number of workers with reported earnings at or below the Federal minimum wage in tables 11 and 17 pertain only to workers who are paid hourly rates. Salaried workers and other workers who are not paid by the hour are not included, even though some have earnings that, when converted to hourly rates, are at or below the minimum wage. Consequently, the estimates presented in this report likely understate the actual number of workers with hourly earnings at or below the minimum wage. Research has shown, however, that the degree of understatement is small. BLS does not routinely estimate hourly earnings for workers not paid by the hour because of data quality concerns associated with such an estimation process.

The prevailing Federal minimum wage was \$2.90 effective January 1979, \$3.10 effective January 1980, \$3.35 effective January 1981, \$3.30 effective January 1980, \$3.35 effective April 1990, \$4.25 effective April 1991, \$4.75 effective October 1996, and \$5.15 effective September 1997. Data for 1990-91 and 1996-97 in table 17 reflect changes in the minimum wage during those years.

The presence of workers with hourly earnings below the minimum wage does not necessarily indicate violations of the Fair Labor Standards Act, as there are exemptions to the minimum wage provisions of the law. In addition, some workers might have rounded their hourly earnings to the nearest dollar in response to survey questions. As a result, some might have been reported with hourly earnings below the minimum wage when, in fact, they earned the minimum wage or higher. This may be more likely to occur in years during which the minimum wage level is just above a whole dollar value, as has been the case since September 1997 (\$5.15).

Reliability

Statistics based on the CPS are subject to both sampling and nonsampling error. When a sample, rather than an entimpopulation, is surveyed, the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses generally are conducted at the 90-percent level of confidence Estimates of earnings and their standard errors can be used to construct approximate confidence intervals, or ranges of values that include the true population value with known probabilities.

The CPS data also are affected by nonsampling error. Nonsampling error can occur for many reasons, including the failure to sample a segment of the population, inability to obtain information for all respondents in the sample, inability or unwillingness of respondents to provide correct information, and errors made in data collection or processing.

For a full discussion of the reliability of data from the CPS and information on estimating standard errors, see the "Explanatory Notes and Estimates of Error" section of Employment and Earnings, on the BLS Web site at www.bls.gov/cps/ eetech_methods.pdf.
