## THE EMPLOYMENT SITUATION: JANUARY 2008

FRIDAY, FEBRUARY 1, 2008

> CONGRESS OF THE UNITED STATES, JOINT ECONOMIC COMMITTEE, Washington, DC.

The Committee met at 9:30 a.m. in room 216 of the Hart Senate Office Building, the Honorable Charles E. Schumer (Chairman) presiding.
Senators present: Schumer.
Representatives present: Cummings.
Staff Present: Christina Baumgardner, Heather Boushey, Stephanie Dreyer, Chris Frenze, Tamara Fucile, Nan Gibson, Colleen Healy, Tim Kane, Bob Keleher, and Michael Laskawy.

## OPENING STATEMENT OF HON. CHARLES E. SCHUMER, CHAIRMAN, A U.S. SENATOR FROM NEW YORK

Chairman Schumer. Good morning. I am pleased to call this hearing to order, a hearing that resumes the longstanding tradition of the Bureau of Labor Statistics coming before the Joint Economic Committee to present findings of its Monthly Jobs Report.

Given the important information these numbers can provide us on the health of the economy, I am hopeful that this is only the beginning of a conversation that we'll have throughout the course of the year.
I am also pleased to be the first to welcome Dr. Keith Hall to his first hearing on Capitol Hill as the Senate-confirmed Commissioner of the Bureau of Labor Statistics. Congratulations, Commissioner, and welcome.

Today, unlike 6 months ago, everyone, from the board room table to our kitchen table, is keenly aware of our economic problems and looking for ways to secure our economic future.
But now the new worry is jobs, even more troublesome to our economy. In fact, I'm concerned that the last few years of lower-than-expected job growth will look good compared to the shrinkage we may well see in coming months.
First, it was housing, then with the decline in housing prices, lower consumer spending, and a tightening of consumer credit, and now it is jobs.

Our economic problems started last year with the subprime mortgage crisis, but they have expanded outward and gotten much worse as that mess spread to the broader housing market, squeezed credit markets, cut consumer spending, and now has ultimately affected the job market.

The numbers this morning should be a wakeup call for the Administration. Given today's job numbers, the Administration should abandon its ideological opposition to spending stimuli such as unemployment insurance because every economist will tell us that stimulus spending will get into the economy much quicker than a tax rebate which we're all for.

The Administration needs to take off its ideological handcuffs to enact an economic stimulus package quickly, a package that is strong and directed and not limited by ideological constraints.

Any doubts that we're heading into a recession should be erased with today's employment report. This morning we learned officially that the U.S. labor market is faltering.
Today's labor statistics show that job growth, which we already knew was bad, is even worse than we thought. According to this morning's report, annual job growth for 2007 was less than 1 percent for the first time since 2003, and during the month of January, for the first time in 4 years, our economy actually lost 17,000 jobs.

In a normal period of economic expansion, just to keep pace with the growing population, we should expect a monthly jobs report to show that the U.S. economy added 150,000 to 200,000 jobs each month, but this morning's report tells a very different story.

Declines in the housing sector have negatively impacted construction jobs, and workers in the mortgage and credit industry. Over the past year, construction has lost 278,000 jobs, and 104,000 jobs have been lost in the credit industry.

Since 2000 we have seen productivity rising at an average of 2.5 percent a year, but economic growth has not been shared by all. For years, wages have lagged behind the growth in productivity.

While today's numbers might be news to some here in Washington, they're not news to millions of American families trying to make ends meet. As employers have stopped hiring, we've seen millions of Americans struggling to find employment.
Today, approximately 7.6 million Americans are out of work and are actively looking for a new job. Our Nation's unemployment rate was 4.9 percent in January, and that was almost a full point higher than it was when the President took office in 2001.

This rate doesn't even include those who are working part-time but need full-time work or those who have given up their job searches entirely. If we include these Americans, the full underemployment rate would be 9 percent.

The employment picture is particularly bleak in minority communities. The unemployment rate for Blacks was more than double that of Whites, and at 6.3 percent, the Hispanic unemployment rate was also significantly higher than that of Whites.
At the same time, long-term unemployment has soared. Almost 20 percent of the unemployed have been out of work for more than 26 weeks. Under current law, these people are no longer eligible to receive unemployment insurance, making a difficult time even more trying.

While lower than expected job growth has been characteristic of this Administration, if it continues it can be a dangerous situation for a growing population and the global economy.

In the last month in particular, economists-from conservative former Federal Reserve Chairman Alan Greenspan to liberal New York Times columnist Paul Krugman and others-have suggested that we're teetering on the brink of recession.

The data that has been released today seems to bear that out, and the bad numbers are not in jobs alone. This week we have seen new reports showing record drops in home prices, sales, construction, and equity, thrusting Americans into the worst housing market in over 20 years.

On Wednesday we learned that the U.S. economy last quarter just about stalled. The Commerce Department measured a mere 0.6 percent growth in gross domestic product.

All the warnings signs that Washington should give the economy a good shot in the arm are there, and I'm hopeful we can deliver on that very soon.

I was pleased to join my colleagues on the Senate Finance Committee in passing an economic stimulus package that protects those who have been out of work for more than 6 months and are struggling to make ends meet.

I am hopeful the Senate can soon pass a stimulus package that provides quick aid to those who have been most directly affected by the economic downturn, and that the President will quickly approve such a package.

Unemployment insurance is a highly effective form of economic stimulus generating $\$ 1.73$ of economic growth for every dollar spent. We should not abandon this proven stimulus message simply because the Administration is ideologically opposed to such a program.

I look forward to hearing more about today's labor statistics from Commissioner Hall, but I must say that the numbers today are a shot across the bow to this Administration to move quickly, take its off ideological blinders, and do what's best for the economy which includes both tax cuts and spending stimuli.
[The prepared statement of Chairman Schumer appears in the Submissions of the Record on page 15.]

Chairman Schumer. Congressman Cummings.

## STATEMENT OF HON. ELIJAH E. CUMMINGS, A U.S. REPRESENTATIVE FROM MARYLAND

Representative Cummings. Thank you very much, Mr. Chairman, for holding this very important hearing on the employment situation in January of 2008.
We are convened today, having recently learned that economic growth in the last quarter of 2007 fell to just 0.6 percent while prices showed a troubling increase.
The "middle class squeeze" is an expression becoming all too common at dinner tables across the country, as working Americans reflect on their situation. These are precisely the numbers that are putting the squeeze on families' pocketbooks.

At the same time, as we will discuss today, the Bureau of Labor Statistics has reported that in January the economy lost some 17,000 jobs, the first time we have seen such job losses since 2003.

The overall number of unemployed persons stands at 7.6 million people, and unemployment is reported to stand at 4.9 percent.

This situation is even worse among Americans of color. In the third quarter of 2007, the quarterly average unemployment among African Americans was 8 percent. Today, it was reported by the Bureau of Labor Statistics to be 9.2 percent in January.

Additional reports demonstrate that 22 percent of all unemployed workers have been unemployed for 6 months or more.

Even those who are fortunate enough to have steady employment are finding their paychecks will not reach as far as they once did. Thus, though we did experience some wage gains last year, these increases were not nearly enough to keep up with inflation.

During the December congressional recess, many of my constituents told me, often with a look of mixed both determination and anxiety, that they simply cannot make ends meet. Some families are even having to make the difficult choice of which bills to skip this month in order to pay record prices for heat.

Gas prices have risen 10 cents a gallon in the last 3 weeks, and new projections suggest prices could reach a staggering $\$ 3.50$ a gallon by spring. Many of my constituents in Baltimore also confront the possibility that they may lose the homes for which they have been saving their entire lives while those who are not at risk of foreclosure are scared that the value of their homes will plummet.

Earlier this week the House passed an economic stimulus package that makes some important strides in bolstering the U.S. economy. Unfortunately, I believe the House Plan will not reach all of those who are most in need.

Over more than 100 million families will be receiving tax rebates under this plan; two of the most effective and efficient methods for providing a quick economic boost are missing. As the Chairman said, extension of unemployment insurance benefits is one of those and the other one is increases in food stamp benefits.

These two critical measures would provide direct help for workers and families hardest hit by the economic downturn. Indeed, among all the tax and spending stimulus options that CBO examined, the only two that were found to create a large bang for the buck as a stimulus and to have the ability to be put in place fast enough to really boost the economy were unemployment insurance and food stamp provisions.

Both could start injecting more consumer purchasing power into the economy within 1 to 2 months while helping those who have too long been forgotten as the Bush administration focused its economic policies on passing tax cut after tax cut for the wealthiest Americans.

Thus, while the House's economic stimulus plan takes a step in the right direction, we need to make sure that the step our Nation eventually takes lifts all of our citizens up.

It is now up to the Senate, Mr. Chairman, to use our stimulus package as a foundation and extend unemployment benefits and increase food stamps to get money into the hands of those who will spend it the quickest and need it the most.

With that, I look forward to Dr. Hall's testimony and to a closer examination of the troubling unemployment trends in our Nation, and with that, Mr. Chairman, I yield back.
[The prepared statement of Representative Cummings appears in the Submissions for the Record on page 16.]

Chairman Schumer. Thank you, Congressman Cummings. Our Vice Chair, Carolyn Maloney, who attends our hearings religiously, is unable to attend today because of the caucus, but we ask that her entire statement be submitted for the record which I'll place in there without objection.
[The prepared statement of Vice Chair Maloney appears in the Submissions for the Record on page 18.]

Chairman Schumer. Now let me introduce our only witness this morning. I'd like to welcome Dr. Keith Hall to this hearing, his first, as I mentioned, as BLS Commissioner.

Prior to becoming Commissioner, Dr. Hall was the Chief Economist for the White House Council of Economic Advisers for 2 years. He also served as the Chief Economist for the U.S. Department of Commerce, and was on the U.S. International Trade Commission for 10 years.

Before entering Government, Dr. Hall was an economics professor on the faculties of both the University of Arkansas and the University of Missouri. He received his Ph.D. in economics from Purdue University.

You may proceed, Commissioner Hall, and welcome.

## STATEMENT OF DR. KEITH HALL, COMIMISSIONER, BUREAU OF LABOR STATISTICS, U.S. DEPARTMENT OF COMMERCE, WASHINGTON, DC

Commissioner Hall. Thank you, Mr. Chairman and Members of the Committee. I appreciate this opportunity to comment on the employment and unemployment data that we released this morning, and I look forward to working with you in the future.

Non-farm payroll employment was essentially unchanged in January at 138.1 million, as was the unemployment rate at 4.9 percent.

Employment declined in construction and in manufacturing, while the number of jobs increased in healthcare. In 2007, payroll employment grew by an average of 95,000 jobs per month, compared with an average of 175,000 jobs per month in 2006.

Average hourly earnings rose by 4 cents in January, or twotenths of 1 percent. From December 2006 to December 2007, average hourly earnings rose by 3.7 percent, compared with the rise in the Consumer Price Index for urban wage earners and clerical workers of 4.4 percent.

In January, construction employment decreased by 27,000 , with the decline concentrated among residential components. Construction has now lost 284,000 jobs since its employment peak in September of 2006. The residential component lost about 315,000 jobs over that period.

Manufacturing employment fell by 28,000 jobs in January, with small but widespread declines occurring in both durable and nondurable goods.

Manufacturing has lost 269,000 jobs over the past 12 months, and both the factory and work week and overtime were unchanged in January at 41.1 and 4.0 hours, respectively.

In the service-providing sector, employment in healthcare continued to increase in January. Over the year ending in January, this
industry added 367,000 jobs, accounting for more than one-third of the growth in total non-farm employment.

In January, employment rose in ambulatory healthcare, which includes doctors' offices and in hospitals. Food services employment also continued its upward trend over the month, though employment growth in that industry slowed recently.

From November 2007 through January, food services added an average of 16,000 jobs per month; the average growth during the 12 -month period ending October 2007 was 28,000 jobs per month.

Following a large increase in December, employment in professional and technical services was little changed in January. In 2007 this industry added 335,000 jobs.

Within administrative support and services, business support services lost jobs in January.

Elsewhere in the service-providing sector, retail trade employment was little changed both over the month and over the year.

Wholesale trade employment has been flat since October 2007. The industry had been adding jobs for several years. Within financial activities, employment in credit intermediation, which includes mortgage lending, continued to trend down in January and has fallen by 111,000 jobs since its recent high point in October of 2006.

Now, the Establishment. Survey data released today reflects a couple of additional things: It reflects the incorporation of our annual benchmark revisions; it reflects updated seasonal adjustment factors and a minor revision to the industry classification system.

The benchmark revision caused a decrease in the level of nonfarm payroll employment-or caused a decrease in our measurement of that in March of 2007 of 293,000 jobs or about two-tenths of 1 percent.

Over the past 10 years, benchmark revisions have averaged plus or minus about two-tenths of 1 percent.

All these seasonally-adjusted Establishment Survey data from January 2003 forward have been revised to incorporate additional seasonal adjustment factors, and then of course, the last thing that we did change is we updated to the 2007 North American Industry Classification System.

Turning now to some of our measures from the Household Survey, both the number of unemployed persons at 7.6 million and the unemployment rate at 4.9 percent were essentially unchanged over the month.

However, both measures were up over the past 12 months. In January, 18.3 percent of unemployed persons had been unemployed for 27 weeks or longer, up from 16.2 percent the year before.

Civilian employment rose in January, after accounting for an adjustment to the population controls, and the employment-to-population ratio edged up to 62.9 percent.

We also added some updated population controls for the Household Survey. The updated controls resulted in a decline of 745,000 to our estimated size of the civilian non-institutional population of 16 years and over for December so what this essentially did was, this lowered our estimate of the population, the labor force, employment, and the number of unemployed, but it left our unemployment rate the same.

And so to summarize January's labor market developments, payroll employment was essentially unchanged at minus 17,000 as was the unemployment rate at 4.9 percent.

My colleagues and I would now be glad to answer any questions.
[The prepared statement of Commissioner Keith Hall and supporting documents appear in the Submissions for the Record on page 18.]

Chairman Schumer. Thank you, Commissioner Hall. So in January, the actual number went down 17,000 , the number of jobs?

Commissioner Hall. That's correct.
Chairman Schumer. When was the last time we actually had a decline?
Commissioner Hall. It has been something over 50 months.
Chairman Schumer. It's over 4 years?
Commissioner Hall. Yes.
Chairman Schumer. This if the first time in 4 years that we've had an actual decline in the number of jobs.

Commissioner Hall. Correct.
Chairman Schumer. Thank you. OK, how does the-now, I'm troubled by the numbers, obviously, that show that job growth has come to a halt over the last several months so I want to ask you how does this level of job creation compare with the past few years and with the economic expansion in the 1990s?

Commissioner Hall. Sure. Well, over the past year in 2007, we averaged about 95,000 jobs a month, and in the fourth quarter of last year the average was about 95,000 jobs a month.

That's down from about 175,000 in 2006 and about 211,000 in 2005.

Chairman Schumer. Right.
Commissioner Hall. Now, with respect to periods of expan-sion-let me see, I've got some numbers here.
[Pause.]
I apologize for shuffling papers here.
Chairman Schumer. It's OK; we all do it, Commissioner.
Commissioner Hall. OK, great. All right, the job creation during this expansion since the business cycle trough averaged about 97,000 jobs a month.

During the previous business cycle recovery and expansionary period the average gain was about 200,000 jobs a month.

Chairman Schumer. That's it; that's a rather large change. And what would jobs have to grow just to keep up with the population growth in the country?

Commissioner Hall. I don't have that calculation. The number you mentioned, about $150,000-$
Chairman Schumer. Right.
Commissioner Hall [continuing]. Is about-
Chairman Schumer. So actually, this year job growth was slower than in other expansions and also fewer jobs were created than the number that should keep up, if we were keeping consistent with population growth?

Commissioner Hall. That's correct.
Chairman Schumer. OK. So far, is it fair to say that job creation over the economic recovery that began in 2001 has been weak in historical terms?

Commissioner Hall. Yes, with respect to the labor market, certainly the labor market took a bit longer to recover than in past business cycles.

Chairman Schumer. Right. And when it did, it didn't recover as robustly.

Commissioner Hall. The job growth wasn't. The job growth was enough that our unemployment rate went down, as it has in other business cycles. That's an important thing.

And there probably are some things that go into the monthly job growth like the growth in population, the growth in the labor force, et cetera.
Chairman Schumer. Right. In your opinion, is there any reason to believe this situation will improve?

Commissioner Hall. Well, I don't want to speculate since we handle the data. I will say that the labor market data is important data to watch as we go forward in looking to see how we recover out of this.

We want to look at things like the continued job growth and look at the unemployment rate and look at some other things like that.
Chairman Schumer. All right OK, Commissioner, today's report includes several revisions that show job growth is even slower than previously reported; is that correct?

Commissioner Hall. That's correct.
Chairman Schumer. And I'm particularly concerned about the revisions to job creation. Can you tell me what the revised annual rate of job creation for 2007 is now, and what was the number before the revision?
Commissioner Hall. Before the revision in 2007 we averaged about 111,000 jobs per month, and after the revision we averaged about 95,000 jobs per month.

Chairman Schumer. Right, so in percentage terms, the growth was about 1 percent, but now it's .8 percent; is that fair to say?
Commissioner Hall. That sounds about right.
Chairman Schumer. Mr. Rones, is that right?
Mr. Rones. That's correct.
Chairman Schumer. Mr. Rones seems to be your little slide rule over there.
[Laughter.]
Chairman Schumer. OK, wouldn't you agree that a downward revision, regardless of how small, changes our picture of how well the labor market has been performing in recent years and indicates that our overall economy is weaker than previously thought?

Commissioner Hall. Well, it wasn't a really large revision, and I hesitate to judge whether and how much of an effect that's had. It's certainly clear that we've had a slowdown in job growth from 2006 to 2007.

Chairman Schumer. Right.
Commissioner Hall. That's certainly pretty clear.
Chairman Schumer. And I just want to talk a little bit about housing and its effect on job losses. We have known for months that as a result of the subprime crisis, housing-related industries such as the construction and credit industries have experienced large job losses. Have we seen job losses fanning out across industries beyond the housing sector, and if so, where?

Commissioner Hall. We have seen job loss fairly widely spread. I can tell you, for example, that we've done a tabulation of housingrelated jobs. These are jobs that are directly related to residential construction or things related to construction.

In 2007, the housing-related jobs declined by about 440,000 jobs, so that puts it a little bit less than half of the deceleration in job growth in 2007, housing-related, so that meant about half was from other areas.

Chairman Schumer. Right. I mean, I would just add a comment here that, again, a good stimulus package would focus on housing to a far greater extent than this one has done, and the reason, again, is the Administration's sort of ideological view that government shouldn't get involved in any kind of situation.
It's good that we're going to raise the conforming loan limits which I believe will be part of the package, but there's so many more things to do, and housing is at the bull's-eye of this economic crisis, and we're skirting around the edges of it but not attacking it directly, and I think that's wrong. I think we should do much more.

OK, on unemployment, this morning's report shows that the unemployment rate is unchanged from last month, but the trend has been upwards in recent months. It's now half a percent higher than where it was in March of 2007.
Does the unemployment rate typically rise this fast?
Commissioner Hall. It's not atypical for it to rise like that, but certainly a more severe rise over a shorter time period would be a much, much worse signal.

Chairman Schumer. Right. And you mentioned that when it comes to long-term unemployment that the percentage of unemployed without a job for more than 26 weeks has gone up to 18.3 percent. Do you recall when the last time this ratio was that high?

Commissioner Hall. Yes. Actually, it was that high about 2 months ago, but it's about 2 percentage points higher than it was a year ago.

Chairman Schumer. Got it, OK. So, people-in general, the trend in the economy is when people are out of work, they're looking for work over a longer period of time.

Commissioner Hall. Over the year.
Chairman Schumer. Yes. OK, if we look at the employment-topopulation ratio-that is, the fraction of working-age population with a job-we see that it also is lower at .5 percent less than it was 2 years ago; is that right?
Commissioner Hall. [The employment-population ratio, at 62.9 percent in January, was 0.4 percentage points lower 1 year ago and the same proportion 2 years ago.] * Corrected by BLS.
Chairman Schumer. This morning's report also showed that the labor force participation rate remains quite low. In fact, this rate is lower than it was before the start of the recession in 2001; is that right?

Commissioner Hall. Yes.
Chairman Schumer. OK, so let me get this straight: What this morning's employment numbers tell us is that even though unemployment didn't rise last month, we see from the Establishment Survey that the economy hasn't created new jobs in 2 months.

Further, the share of people with a job is lower than it was just a couple of years ago, and more people are having a difficult time finding a new job and becoming long-term unemployed. Doesn't that make it pretty clear that the labor market, at least as of now, is just not creating new jobs, net?

Commissioner Hall. I would say that certainly the job growth has slowed quite a bit, and there have been periods during expansions when there has been a pause in job growth like this so I'd say it's a little early to talk about this being a real issue yet, because it's only one datapoint, but yes.
Chairman Schumer. All right. Now, I'd like to talk a little bit about-well, one other question: Would you agree that all of these factors combined means, at the very least, we're entering a labor market downturn and quite possibly a recession?

Commissioner Hall. I shouldn't speculate on that.
Chairman Schumer. How about the first part? I understand that you don't want to mention the R-word.

Commissioner Hall. Right.
Chairman Schumer. Although it seems clear to me, at least, that it seems that's what the data shows we're headed. But what about-we are entering a labor market downturn; doesn't that seem pretty clear?

Commissioner Hall. Well, I'd say we've had pauses like this before, but we don't want this to continue.

Chairman Schumer. Well, I think we can all agree with that, Commissioner.

Let me go to wages and earnings for a minute. What has happened to growth in wages and earnings recently, compared with what has been happening to inflation? In other words, have workers' paychecks kept up with inflation?

Commissioner Hall. Actually, as I mentioned in my statement, the average hourly earnings in 2007 rose by about 3.7 percent over the 12 months, and the Consumer Price Index for wage earners increased about 4.4 percent.

Chairman Schumer. So actually, it was a loss of .7 percent in earning power?

Commissioner Hall. Correct.
Chairman Schumer. OK. We've seen strong productivity growth over the last few years. Wouldn't we expect to translate that growth into wages keeping ahead of or at least up with inflation?

Commissioner Hall. Yes. Actually, it's widely recognized that productivity growth is an important condition for growth in real wages.

Chairman Schumer. But for some reason-and I'm not asking you to speculate on the reasons here; that's not your job, but for some reason, that productivity growth has not translated itself into wage gains for the average worker.

Commissioner Hall. From 2000 to 2006, productivity grew about 2.7 percent, and during that same time period, real hourly compensation of workers grew about 1.2 percent.

Chairman Schumer. Right. OK, finally on-I think this is my last series-on earnings, I believe that the BLS publishes data on
the usual weekly earnings of full-time workers, including some information about wage distributions; is that right?

Commissioner Hall. That's correct.
Chairman Schumer. OK, our staff at the Joint Economic Committee has done some calculations that show some disturbing trends in that wage distribution.

First, they show that from the fourth quarter of 2000 to the fourth quarter of 2007, median earnings, right in the middle, have fallen by .9 percent or about .1 percent per year after inflation. Does that number seem about right to you?

Commissioner Hall. That's roughly in line with our calculations.

Chairman Schumer. However, over that same period, earnings at the very top of that distribution, the 90 th percentile, have risen by 4.5 percent or .6 percent a year after inflation while earnings near the bottom of the distribution, the 10th percentile, have fallen by 2.3 percent or 3 percent a year after inflation. Does that seem right to you as well?

Commissioner Hall. Yes, it does.
Chairman Schumer. OK. Well, what these numbers bear out is, if you look at average figures, the economy looks a lot better than if you look at median figures, because the distribution, the gains that we have made over the last year-and we can, again, speculate at the reasons-but they have been disproportionate to the highest income earners; is that fair to say by definition?

Commissioner Hall. Well, yes.
Chairman Schumer. Yes?
Commissioner Hall. Yes.
Chairman Schumer. OK, thank you. Congressman Cummings?
Representative Cummings. Thank you very much, Mr. Chairman. Dr. Hall, I just want to ask you a few questions about minorities and the unemployment rate.

A recession hurts everybody, but it especially hurts minorities who are often described as experiencing a permanent recession. The official unemployment rate only includes people who are actively looking for work, and it shows that the unemployment rate for African Americans is about twice as great as the rate for the population as a whole. Is that right?

Commissioner Hall. That seems about right, yes.
Representative Cummings. Is it the case that African American men, especially younger, less educated African American men, are more likely to be detached from the labor force than other population groups according to what you've got? Mr. Rones, you look like you're ready to jump over the table.

## [Laughter.]

Mr. Rones. It is certainly the case that the labor force participation for minorities in general would be lower than it is for Whites, and participation rates for minority men are particularly lower than they are for White men.

Representative Cummings. What does it mean to be detached from the labor force, and does that mean that we should be looking at other statistics besides the unemployment rate to get an accurate picture of labor market outcomes for African American males, especially younger, less educated African American males?

Commissioner Hall. Well, we do produce a number of broader measures of the unemployment rate. I'm not sure they fully fill the bill for what you're talking about.

We do have measures that include marginally-attached and people working part-time for economic reasons.

Representative Cummings. And do you have those figures there?

Commissioner Hall. Well, they've all moved similarly to the regular unemployment rate. Our broadest measure which includes the unemployed, marginally-attached, and part-time, that's about 9 percent.

Representative Cummings. OK. What is the relationship between the unemployment rate, the labor force participation rate, and the employment-to-population ratio?

Commissioner Hall. In a sense, those are the different pieces that you use to calculate the unemployment rate. The unemployment rate is the number of people who are unemployed divided by the labor force.

Representative Cummings. Now, if you know, what happened to African American unemployment rates during the last recession? Did it grow more than the population as a whole? If so, can we expect that to be the case again?

Commissioner Hall. The gap between the African American unemployment rate and, say, the White unemployment rate did in fact decrease during the last recession.

Representative Cummings. And what was that-what kind of gap was there?

Commissioner Hall. It got about 2.2 times as high.
Representative Cummings. So that means that it grows at a greater rate in non-recessionary times than in recessionary times; is that right?

Commissioner Hall. Correct.
Representative Cummings. So I guess that's about twice as much in non-recessionary times?

Commissioner Hall. Yes.
Representative Cummings. In the data of the Bureau of Labor Statistics released today, it showed that the African American unemployment rate increased from 8.4 percent in November of 2007 to 9.2 percent in January of 2008. Meanwhile, Hispanics had an unemployment rate of 5.7 percent in November of 2007 which rose to 6.3 percent in January of 2008.

In comparison, the Caucasian unemployment rate, which hovered at 4.4 percent in December and January, the data for African Americans and Hispanics was strikingly higher. In your opinion, how can Congress assist African Americans and Hispanics from experiencing strikingly higher unemployment rates in comparison to the general population, and what exactly should the Senate consider adding to this economic stimulus package? I guess you want to see more jobs.

I mean I know you keep the records. You're examining the stats. I understand that, but to improve those numbers, what-I would assume that you would want to see more jobs.

Commissioner Hall. Absolutely. I don't want to make too many policy comments.

Representative Cummings. I understand that. That's why I tried to qualify everything I said. But I cannot imagine you looking at these numbers and not having thoughts.

Commissioner Hall. Absolutely, yes. Job growth is extremely important, and I think in some respects, what's important about economic expansions is that they support job growth; they support strong job growth. That's why you'd like to see, among other things, why you would like to see strong economic growth.

Representative Cummings. I want to go back to something the Chairman asked you a few minutes ago. You were talking about in 2007, you said there was a decline of 440,000 housing-related jobs; is that right, 440,000 ? I think that's the figure I wrote down here.

Commissioner Hall. That sounds-yes, that's correct.
Representative Cummings. Now, how does that-what other areas of employment would that affect the most, based upon the statistics that you've seen? Are you following my question?

In other words, if you've got people who are-those are probably earning decent wages, right, pretty livable wages.
So I guess if you don't have people in the housing market doing fairly well and you lose 440,000 jobs, what would you say would be the impact on, say, other types of things like the barber shops and the stores, things of that nature?

Commissioner Hall. Well, the things most obviously directly related are the housing-related like the homebuilding materials, providers of services to homebuilders, et cetera.

But you're correct to a degree that this lowers, generally lowers, economic activity. It can impact jobs across the economy.

Representative Cummings. And so the 440,000 would have quite a bit of impact; is that what you find based upon your statistical reviews?

Commissioner Hall. It's hard to draw conclusions about how much the housing sector affected non-housing sectors.

Representative Cummings. I got you. Mr. Rones, did you want to say something?

Mr. Rones. No.
Representative Cummings. You're making me nervous.
[Laughter.]
Representative Cummings. You just looked like you wanted to say something.
In the past when recessions have occurred in the U.S. economy, how soon after were they later found to have begun? Was their impact registered in the unemployment figures?

Commissioner Hall. To some degree, I think recessions are almost defined by the labor market. At least in my mind, a recession is where economic growth slows enough that you are no longer creating jobs for a sustained period of time.

So for example, if you look at the last recession, the recession started in March, and that's exactly where the job growth turned negative and stayed negative for several months.
Representative Cummings. You know, economists at Goldman Sachs say once the 3 -month average of unemployment rate has risen 0.3 percentage points, the economy has always either been in or about to enter a recession. Do you agree with that assessment?

Commissioner Hall. I'm not familiar with that work, but that sounds about right.
Representative Cummings. OK. Just a few more questions, Mr. Chairman.

According to the data recently released by the Internal Revenue Service, Americans' average income in 2005 was less than in 2000, the fifth consecutive year in which this was the case and the first time since World War II that this has happened.
We also see that the income and wealth are becoming increasingly concentrated in the hands of a very few. Thus, those making more than a million dollars received just under 50 percent of all the income gain that occurred in 2005.

Can you comment on why this is occurring and what you've seen from your review of the stats, and is that-and what potential impact on the unemployment-on the employment rate, does thatyou know, I mean, what do you forecast with regard to trends?

Commissioner Hall. It's hard for me to know what's causing things like that. In part, given my job, I don't want to speculate too much.

Representative Cummings. I understand.
Commissioner Hall. And I don't really want to forecast about the trends, going forward.
Representative Cummings. OK. If the long-term unemployed were counted in the unemployment rate, what would the figure actually be? That's in your purview, is it not?
Commissioner Hall. Actually, they are included for people who are unemployed for 27 weeks or longer.
Representative Cummings. Say that again. You just sort of trailed off a little bit.
Commissioner Hall. I'm sorry. The people who are unemployed for 27 weeks or longer, those are included in our unemployment numbers.
Representative Cummings. OK, I have nothing else, Mr. Chairman.
Chairman Schumer. Commissioner, I want to thank you, and, as I said, the Joint Economic Committee is very interested in these statistics, and we may do this again, but thank you all for coming.
I want to thank you, Mr. Horrigan and Mr. Rones, and my colleague, Congressman Cummings. The hearing is adjourned.
[Whereupon, at 10:14 a.m., the hearing was adjourned.]

# Submissions for the Record 

لロINT ECDNロMIC CロMMITTEE<br>SENATOR CHARLES E．SCHUMER，CHAIRMAN<br>repregentative Carglyn B．maloney，Viee Chair

## Prepared Statement of Senator Charles E．Schumer，Chatrman

Good morning．I am pleased to call this hearing to order－a hearing that resumes the long－standing tradition of the Bureau of Labor Statistics coming before the Joint Economic Committee to present the findings of its monthly jobs report．Given the important information these numbers can provide us on the health of the economy， I am hopeful that this is only the beginning of a conversation we will have through－ out the course of the year．
I am also pleased to be the first to welcome Dr．Keith Hall，to his first hearing on Capitol Hill as the Senate－confirmed Commissioner of the Bureau of Labor Sta－ tistics．
Today，unlike 6 months ago，everyone from the boardroom table to our kitchen table is keenly aware of our economic problems and looking for ways to secure our economic future．
But now the new worry is jobs－even more troublesome to our economy．In fact， I＇m concerned that the last few years of lower than expected job growth will look good compared to the job shrinkage we may well see in the coming months．
First it was housing，then it was consumer credit and consumer spending，and now it is jobs．Our economic problems started last year with the subprime mortgage crisis，but they have gotten much worse as that mess spread to the broader housing market，squeezed credit markets，cut consumer spending，and now has affected the job market．
This should be a wake up call for the administration．Given today＇s jobs numbers， they should abandon their ideological opposition to spending stimuli，such as unem－ ployment insurance，because every economist will tell you that stimulus spending will get into the economy much quicker than a tax rebate，which we＇re all for．
The administration needs to take off its ideological handcuffs to enact an economic stimulus package quickly，which is strong and directed，and not limited by ideolog－ ical constraints．
Any doubts that we are heading into a recession should be erased with today＇s employment report．
This morning，we learned officially that the U．S．labor market is faltering．Today＇s labor statistics show that job growth－which we already knew was bad，is even worse than we thought．According to this morning＇s report，annual job growth for 2007 was less than 1 percent for the first time since 2003.
During the month of January，our economy actually lost 17,000 jobs．In a normal period of economic expansion，just to keep pace with a growing population，we should expect a monthly job report to show that the U．S．economy added 150,000 to 200,000 jobs in 1 month．But this morning＇s report tells a very different story．

Declines in the housing sector have negatively impacted construction jobs，and workers in the mortgage and credit industry．Over the past year，construction has lost 278,000 jobs and 104,000 jobs have been lost in the credit industry．
Since 2000 we have seen productivity rise an average of 2.5 percent per year．But economic growth has not been shared by all．For years，wages have lagged far be－ hind growth in productivity．

While today's numbers might be news to some here in Washington, they certainly are not news to millions of American families trying to make ends meet.

As employers have stopped hiring, we have seen millions of Americans struggling to find employment. Today, approximately 7.6 million are out of work and actively looking for a new job. Our nation's unemployment rate was 4.9 percent in January; almost a full point higher than it was when President Bush took office in 2001.
This rate doesn't even include those who are working part time but need full time work or those who have given up their job searches entirely. If we include these Americans, the full UNDER-employment rate would be 9.0 percent.

The employment picture is particularly bleak in minority communities. The unemployment rate for blacks was more than double that of whites. And at 6.3 percent, the Hispanic unemployment rate was also significantly higher than that of whites.

At the same time, long term unemployment has soared. Almost 20 percent of the unemployed have been out of work for more than 26 weeks. Under current law, these people are no longer eligible to receive unemployment insurance-making a difficult time even more trying.

While lower than expected job growth has been characteristic of this administration, if it continues, it can be a dangerous situation for a growing population and a global economy.

In the last month in particular economists from conservative former Federal Reserve Chairman Alan Greenspan to liberal New York Times columnist Paul Krugman and others have suggested that we are teetering on the brink of a recession. The data that has been released today seems to bears that out.

And the bad numbers are not in jobs alone. This week we have also seen new reports showing record drops in home prices, sales, construction, and equitythrusting Americans into the worst housing market in over 20 years.

On Wednesday we learned that the U.S. economy last quarter just about stalledthe Commerce Department measured a mere 0.6 percent growth in Gross Domestic Product (GDP). All the warning signs indicate that Washington should give the economy a good shot in the arm, and I'm hopeful we can deliver that very soon.

I was pleased to join my colleagues on the Senate Finance Committee on Wednesday in passing an economic stimulus package that protects those who have been out of work for more than 6 months and are struggling to make ends meet. I am hopeful that the Senate can soon pass a stimulus package that provides quick aid to those who have been most directly affected by this economic downturn and that the President will quickly approve such a package. Unemployment insurance is a highly effective form of economic stimulus, generating $\$ 1.73$ of economic growth for every $\$ 1$ spent. We should not abandon this proven stimulus measure because the administration is ideologically opposed to such a program.

I look forward to hearing more about today's labor statistics from Commissioner Hall, and am hopeful that today's hearing will shed even greater light on what we in Washington must do to protect American workers from the sagging economy.

## Prepared Statement of Representative Elijah E. Cummings

Thank you, Mr. Chairman, for holding this important hearing on the employment situation in January 2008.

We convene today having recently learned that economic growth in the last quarter of 2007 fell to just .6 percent while prices showed a troubling increase.
The "middle class squeeze" is an expression becoming all too common at dinner tables across the country as working Americans reflect on their situation-and these are precisely the numbers that are putting the squeeze on families' pocketbooks.
At the same time, as we will discuss today, the Bureau of Labor Statistics has reported that in January, the economy lost 17,000 jobs-the first time we have seen a job loss since 2003.
The overall number of unemployed persons stands at 7.6 million people-and unemployment is reported to stand at 4.9 percent.

This situation is even worse among Americans of color. In the third quarter of 2007, the quarterly average unemployment among African Americans was 8 percent. Today, it was reported by the Bureau of Labor Statistics to be 9.2 percent in January.

Even those who are fortunate enough to have steady employment are finding that their paychecks do not reach as far as they once did. Thus, though we did experience some wage gains last year, these increases were not nearly enough to keep up with inflation.

During the December Congressional recess, many of my constituents told meoften with a look that mixed both determination and anxiety-that they simply can-
not make ends meet. Some families are even having to make the difficult choice of which bills to skip this month in order to pay record prices to heat their homes.

Gas prices have risen 10 cents a gallon in the last 3 weeks, and new projections suggest prices they could reach a staggering $\$ 3.50$ a gallon by spring.

Many of my constituents also confront the possibility that they may lose the homes for which they have been saving their entire lives-while those who are not at risk of foreclosure are scared that the value of their homes will fall.

Earlier this week, the House passed an economic stimulus package that makes some important strides toward bolstering the U.S. economy.

Unfortunately, I believe the House plan will not reach all of those who are most in need.

Although more than 100 million families will be receiving tax rebates under this plan, two of the most important and effective methods of providing a quick economic boost are missing: extension of unemployment insurance benefits and increases in food stamp benefits.

These two critical measures would provide direct help for the workers and families hardest hit by the economic downturn.

Indeed, among all of the tax and spending stimulus options that CBO examined, the only two that were found to create a large "bang-for-the-buck" as a stimulus and to have the ability to be put in place fast enough to really boost the economy were unemployment insurance and food stamp provisions.

Both could start injecting more consumer purchasing power into the economy within one to 2 months while helping those who have too long been forgotten as the Bush administration focused its economic policies on passing tax cut after tax cut for the wealthiest Americans.

Thus, while the House's economic stimulus plan takes a step in the right direction, we need to make sure that the step our nation eventually takes lifts all of our citizens.
It is now up to the Senate to use our stimulus package as a foundation and extend unemployment benefits and increase food stamps to get money into the hands of those who will spend it quickest and need it most.

With that, I look forward to Dr. Hall's testimony and to a closer examination of the troubling unemployment trends in our nation.

## Prepared Statement of Representative Carolyn B. Maloney, Vice Chair

Good morning. I would like to thank Chairman Schumer for holding this hearing on the employment situation in January. It is critically important to fully examine labor market conditions during this downturn. I want to welcome Commissioner Hall and thank him for testifying here today.

The unemployment rate was essentially unchanged at 4.9 percent and the economy shed 17,000 jobs last month. Clearly, danger signs for the labor market remain. Over the last month, new evidence has emerged that a significant downturn in the economy may be underway. Economic growth stalled last quarter, retailers have posted disappointing sales, and manufacturing began to contract again, despite a weak dollar that has spurred exports. Forecasters expect the economy to slow as high energy prices, falling home prices, and stagnant wages squeeze American families.

The housing wealth that consumers once relied on to fuel their spending-and the economy relied on to grow-is quickly evaporating as house prices continue their downward spiral. All of which points to a gathering storm that could drag down the economy, taking thousands of American jobs with it.

This dismal employment report is further evidence that the economy could use a booster shot. The House of Representatives has passed a bipartisan economic stimulus package that is timely, temporary, and targeted. Under the plan, more than 100 million families squeezed by the high costs of basic living expenses will get a meaningful tax rebate, millions of Americans can get help to avoid losing their homes, and small businesses can take advantage of tax cuts to help spur investment and job creation.

This package will provide a boost to the economy by putting hundreds of dollars in the hands of middle- and lower-income families who will generate demand, without the fear of igniting inflation. I welcome efforts by the Senate to enhance this package and hope that it can be accomplished without delay.

Long-term unemployment persists, and evidence of hidden unemployment is reflected in the continued depressed levels of the labor force participation rate and falling fraction of the population with a job. In short, jobs have become harder to find. Providing an extension of unemployment benefits is critically needed.

A stimulus package is an important first step, but there is more to do to blunt the effects of this downturn and to get the economy back on track.
Mr. Chairman, thank you for holding this hearing and I look forward to the continued focus on labor market conditions by this committee.

## Prepared Statement of Dr. Keith Hall, Commissioner, Bureau of Labor Statistics

Mr. Chairman and Members of the Committee:
I appreciate this opportunity to comment on the employment and unemployment data that we released this morning.
Nonfarm payroll employment was essentially unchanged in January, at 138.1 million, as was the unemployment rate, at 4.9 percent. Employment declined in construction and in manufacturing, while the number of jobs increased in health care. In 2007, payroll employment grew by an average of 95,000 per month, compared with an average of 175,000 per month in 2006. Average hourly earnings rose by 4 cents in January, or 0.2 percent. From December 2006 to December 2007, average hourly earnings rose by 3.7 percent, compared with a rise in the Consumer Price Index for Urban Wage Earners and Clerical Workers of 4.4 percent.
Construction employment decreased by 27,000 in January, with the decline concentrated among the residential components. Construction has lost 284,000 jobs since its employment peak in September 2006; the residential components lost 315,000 jobs over that period.

Manufacturing employment fell by 28,000 in January, with small but widespread declines occurring in both durable and nondurable goods industries. Manufacturing
has lost 269,000 jobs over the last 12 months. Both the factory workweek and overtime were unchanged in January, at 41.1 and 4.0 hours, respectively.

In the service-providing sector, employment in health care continued to increase in January $(27,000)$. Over the year ending in January, this industry added 367,000 jobs, accounting for more than one-third of the growth in total nonfarm employment. In January, employment rose in ambulatory health care, which includes doctors' offices, and in hospitals.

Food services employment also continued its upward trend over the month, though employment growth in this industry has slowed recently. From November 2007 through January, food services added an average of 16,000 jobs per month; the average growth during the $12-$ month period ending in October 2007 was 28,000 jobs per month.

Following a large increase in December (49,000), employment in professional and technical services was little changed in January. In 2007, this industry added 335,000 jobs. Within administrative and support services, business support services lost jobs in January.

Elsewhere in the service-providing sector, retail trade employment was little changed, both over the month and over the year. Wholesale trade employment has been flat since October 2007; the industry had been adding jobs for several years. Within financial activities, employment in credit intermediation, which includes mortgage lending, continued to trend down in January and has fallen by 111,000 since its most recent high point in October 2006.

The establishment survey data released today reflect the incorporation of annual benchmark revisions, updated seasonal adjustment factors, and a minor revision to the industry classification system. Each year, we re-anchor our sample-based survey estimates to full universe counts of employment, primarily derived from administrative records of the unemployment insurance tax system. The benchmark revision caused a decrease in the level of nonfarm payroll employment in March 2007 of 293,000 (not seasonally adjusted) or 0.2 percent. Over the past 10 years, benchmark revisions have averaged plus or minus 0.2 percent.

All seasonally adjusted establishment survey data from January 2003 forward have been revised to incorporate updated seasonal adjustment factors. Another change effective with this release is an update to the 2007 North American Industry Classification System (NAICS) from the 2002 NAICS. The update to NAICS 2007 resulted in minor definitional changes. All affected historical time series data for the establishment survey beginning in January 1990 have been reconstructed based on NAICS 2007.

Turning now to some of our measures from the household survey, both the number of unemployed persons ( 7.6 million) and the unemployment rate ( 4.9 percent) were essentially unchanged over the month. However, both measures are up over the past 12 months. In January, 18.3 percent of unemployed persons had been unemployed 27 weeks and over, up from 16.2 percent a year earlier. Civilian employment rose in January (after accounting for an adjustment to the population controls used in the survey), and the employment-population ratio edged up to 62.9 percent.

Household survey data beginning in January 2008 reflect updated population controls. As part of its annual review of intercensal population estimates, the U.S. Census Bureau determined that a downward adjustment should be made to the population controls. This adjustment stems from revised estimates of net international migration and the institutional population, along with updated vital statistics information. The updated controls would have resulted in a decline of 745,000 in the estimated size of the civilian noninstitutional population age 16 years and over for December 2007. In accordance with our usual practice, official estimates for December 2007 and earlier months will not be revised.

A comparison of December 2007 not seasonally adjusted data based on the old and new controls shows that the population adjustment caused decreases in the levels for the labor force ( $-637,000$ ), employment $(-598,000)$, and unemployment $(-40,000)$. The unemployment rate was unaffected by the new population controls; there was a negligible impact on other percentage estimates.

To summarize January's labor market developments, payroll employment was essentially unchanged ( $-17,000$ ), as was the unemployment rate at 4.9 percent.

My colleagues and I now would be glad to answer your questions.

Transmission of material in this release is embargoed until 8:30 A.M. (EST), Friday, February 1, 2008.

## THE EMPLOYMENT SITUATION: JANUARY 2008

Both nonfarm payroll employment, at 138.1 million, and the unemployment rate, at 4.9 percent, were essentially unchanged in January, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. The small January movement in nonfarm payroll employment ( $-17,000$ ) reflected declines in construction and manufacturing and job growth in health care. Average hourly earnings rose by 4 cents, or 0.2 percent, over the month.

The number of unemployed persons ( 7.6 million) and the unemployment rate ( 4.9 percent) were essentially unchanged in January. Over the month, the unemployment rates for all major worker groupsadult men ( 4.4 percent), adult women ( 4.2 percent), teenagers ( 18.0 percent), whites ( 4.4 percent), blacks

## Establishment and Household Data Changes

The establishment survey data in this release have been revised as a result of the annual benchmarking process, the updating of seasonal adjustment factors, and the updating to NAICS 2007 from NAICS 2002. See the note beginning on page 5 for more information on the revisions.

In addition, household survey data for January 2008 reflect updated population controls. See the note on page 6 for more information.

[^0]( 9.2 percent), and Hispanics ( 6.3 percent)-showed little or no change. The unemployment rate for Asians was 3.2 percent, not seasonally adjusted. (See tables A-1, A-2, and A-3.)

## Total Employment and the Labor Force (Household Survey Data)

Total employment and the employment-population ratio edged up in January after accounting for the annual adjustment to the population controls. The civilian labor force also rose when adjustment is made to account for the effect of population control changes. The labor force participation rate ( 66.1 percent) was about the same as in December. (See tables A-1 and D.)

## Persons Not in the Labor Force (Household Survey Data)

About 1.7 million persons (not seasonally adjusted) were marginally attached to the labor force in Januuary, up from about 1.6 million a year earlier. These individuals wanted and were available for work and had looked for a job sometime in the prior 12 months. They were not counted as unemployed because they had not searched for work in the 4 weeks preceding the survey. Among the marginally attached, there were 467,000 discouraged workers in January, about the same as a year earlier. Discouraged workers were not currently looking for work specifically because they believed no jobs were available for them The other 1.3 million persons marginally attached to the labor force in January had not searched for work in the 4 weeks preceding the survey for reasons such as school attendance or family responsibilities. (See table A-13.)

## Industry Paynoll Employment(Establishment Survey Data)

In January, total nonfarm payroll employment was about unchanged ( $-17,000$ ), after edging up in November ( 60,000 ) and December ( 82,000 ). In 2007, payroll employment increased by an average of 95,000 jobs per month. Both construction and manufacturing employment continued to decline in January, and health care employment rose. (See table B-1.)

Construction employment decreased by 27,000 in January and has fallen by 284,000 since its peak in September 2006. Over-the-month job losses occurred in residential building $(-10,000)$ and residential specialty trade contractors ( $-18,000$ ).

Manufacturing lost 28,000 jobs in January. Over the month, small declines occurred among many durable and nondurable goods industries. Manufacturing has lost 269,000 jobs over the past 12 months.

In the service-providing sector, health care employment continued to grow in January $(27,000)$, about in line with average monthly gains over the prior 12 months. Within health care, over-the-month job gains occurred in ambulatory health care services ( 14,000 ), which includes offices of physicians, and in hospitals $(10,000)$.

Food services employment continued to trend upward in January. From November through January, food services added an average of 16,000 jobs per month, compared with an average gain of 28,000 jobs for the 12 -month period ending in October.

Employment in professional and technical services was little changed in January following a large increase $(49,000)$ in the prior month. In 2007, job growth in this sector totaled 335,000 .

In January, employment in financial activities was about unchanged as commercial banking lost 4,000 jobs, and securities, commodity contracts, and investments added 5,000 jobs. Since reaching a peak in December 2006, employment in financial activities has declined by 99,000 .

In January, employment in both wholesale and retail trade was little changed. Within retail trade, employ ment in food and beverage stores was up by 12,000 over the month.

## Weekly Hours (Establishment Survey Data)

In January, the average workweek for production and nonsupervisory workers on private nonfarm payrolls fell by 0.1 hour to 33.7 hours, seasonally adjusted. The manufacturing workweek was unchanged at 41.1 hours, and factory overtime was unchanged at 4.0 hours. (See table B-2.)

The index of aggregate weekly hours of production and nonsupervisory workers on nonfarm payrolls declined by 0.3 percent in January to $107.5(2002=100)$. The manufacturing index was unchanged at 93.7 . (See table B-5.)

## Hourly and Weekly Earnings (Establishment Survey Data)

Average hourly earnings of production and nonsupervisory workers on private nonfarm payrolls rose by 4 cents, or 0.2 percent, in January to $\$ 17.75$, seasonally adjusted. This followed a gain of 7 cents in December. Average weekly earnings fell by 0.1 percent in January to $\$ 598.18$. Over the year, average hourly earnings rose by 3.7 percent, and weekly earnings rose by 3.4 percent. (See table B-3.)

The Employment Situation for February 2008 is scheduled to be released on Friday, March 7, at 8:30 A.M. (EST).

## Revisions to Establishment Survey Data

In accordance with annual practice, the establishment survey data have been revised to reflect comprehensive universe counts of payroll jobs, or benchmarks. These counts are derived principally from unemployment insurance tax records for March 2007. In addition, establishment survey data were updated to the 2007, North American Industry Classification System (NAICS) from the 2002 NAICS basis; this resulted in minor changes to several detailed industry series. Not seasonally adjusted data series affected by the NAICS 2007 update were subject to revision from January 1990 forward. All other not seasonally adjusted data series were subject to revision from April 2006 forward, the time period since the last benchmark was established. In addition, with this release, the seasonally adjusted establishment survey data from January 1990 forward were subject to revision due to the introduction of updated seasonal adjustment factors and NAICS 2007 updates.

Table B presents revised total nonfarm employment data on a seasonally adjusted basis for January through December 2007. The revised data for April 2007 forward incorporate the effect of applying the rate of change measured by the sample to the new benchmark level, as well as updated net business birth/death model adjustments and new seasonal adjustment factors. The Novernber and December 2007 revisions also reflect the routine incorporation of additional sample receipts into the November final and December second preliminary estimates. The total nonfarm employment level for March 2007 was revised downward by 293,000 ( 284,000 on a seasonally adjusted basis). The previously published level for December 2007 was revised downward by 256,000 ( 376,000 on a seasonally adjusted basis).

An article that discusses the benchmark and post-benchmark revisions, as well as all revised historical Current Employment Statistics (CES) data, can be accessed through the CES homepage at http://www.bls.gov/ces/. Information on the revisions released today also may be obtained by calling (202) 691-6555.

Table B. Revisions in total nonfarm employment, January-December 2007, seasonally adjusted

| Year and month | Levels |  | Over-the-month changes |  |  |

## Adjustments to Population Estimates for the Household Survey

Effective with data for January 2008, updated population controls have been used in the household survey. Population controls for the household survey are developed by the U.S. Census Bureau. Each year, the Census Bureau updates the controls to reflect new information and assumptions about the growth of the population during the decade. The change in population reflected in the new controls results primarily from adjustments to the estimates of net international migration and the institutional population, along with updated vital statistics information.

As per usual practice, BLS will not revise the official household survey estimates for December 2007 and earlier months. To show the impact of the updated population controls, however, some December 2007 estimates were recalculated using the new controis. The differences in selected December estimates based on the old and new controls are shown in table C. The new controls decreased the estimated size of the civilian noninstitutional population in December by 745,000 , the civilian labor force by 637,000 , and employment by 598,000 ; the new population controls had a negligible impact on unemployment rates and other percentage estimates. Table $D$ shows the effect of the introduction of new population controls on the over-the-month changes between December 2007 and January 2008. More detailed information on the population adjustments and their effect on national labor force estimates are available at http://www.bls.gov/cps/cps08adj.pdf on the Internet.

Table C. Effect of the revised population controls on December 2007 estimates by sex, race, and Hispanic or Latino ethnicity, not seasonally adjusted
(Numbers in thousands)

| Category | Total | Men | Women | White | Black <br> or <br> African <br> Ameri- <br> can | Asian | Hispanic or <br> Latino ethricity |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Frequently Asked Questions about Employment and Unemployment Estimates

## Why are there two monthly measures of employment?

The household survey and establishment survey both produce sample-based estimates of employment and both have strengths and limitations. The establishment survey employment series has a smaller margin of error on the measurement of month-to-month change than the household survey because of its much larger sample size. An over-the-month employment change of 104,000 is statistically significant in the establishment survey, while the threshold for a statistically significant change in the household survey is about 400,000 . However, the household survey has a more expansive scope than the establishment survey because it includes the self-employed, unpaid family workers, agricultural workers, and private household workers, who are excluded by the establishment survey. The household survey also provides estimates of employment for demographic groups.

## Are undocumented immigrants counted in the surveys?

Neither the establishment nor household survey is designed to identify the legal status of workers. Thus, while it is likely that both surveys include at least some undocumented immigrants, it is not possible to determine how many are counted in either survey. The household survey does include questions about whether respondents were born outside the United States. Data from these questions show that foreign-born workers accounted for about 15 percent of the labor force in 2006 and about 47 percent of the net increase in the labor force from 2000 to 2006.

## Why does the establishment survey have revisions?

The establishment survey revises published estimates to improve its data series by incorporating additional information that was not available at the time of the initial publication of the estimates. The establishment survey revises its initial monthly estimates twice, in the immediately succeeding 2 months, to incorporate additional sample receipts from respondents in the survey. For more information on the monthly revisions, please visit http:/www.bls.gov/ces/cesrevinfo.htm.

On an annual basis, the establishment survey incorporates a benchmark revision that re-anchors estimates to nearly complete employment counts available from unemployment insurance tax records. The benchmark helps to control for sampling and modeling errors in the estimates. For more information on the annual benchmark revision, please visit hitp://www.bls.gov/web/cesbmart.htm.

## Has the establishment survey understated employment growth because it excludes the selfemployed?

While the establishment survey excludes the self-employed, the household survey provides monthly estimates of unincorporated self-employment. These estimates have shown no substantial growth in recent years.

## Does the establishment survey sample include small firms?

Yes; about 40 percent of the establishment survey sample is comprised of business establishments with fewer than 20 employees. The establishment survey sample is designed to maximize the reliability of the total nonfarm employment estimate; firms from all size classes and industries are appropriately sampled to achieve that goal.

## Does the establishment survey account for employment from new businesses?

Yes; monthly establishment survey estimates include an adjustment to account for the net employment change generated by business births and deaths. The adjustment comes from an econometric model that forecasts the monthly net jobs impact of business births and deaths based on the actual past values of the net impact that can be observed with a lag from the Quarterly Census of Employment and Wages. The establishment survey uses modeling rather than sampling for this purpose because the survey is not immediately able to bring new businesses into the sample. There is an unavoidable lag between the birth of a new firm and its appearance on the sampling frame and availability for selection. BLS adds new businesses to the survey twice a year.

Is the count of unemployed persons limited to just those people receiving unemployment insurance benefits?

No; the estimate of unemployment is based on a monthly sample survey of households. All persons who are without jobs and are actively seeking and available to work are included among the unemployed. (People on temporary layoff are included even if they do not actively seek work.) There is no requirement or question relating to umemployment insurance benefits in the monthly survey.

## Does the official unemployment rate exclude people who have stopped looking for work?

Yes; however, there are separate estimates of persons outside the labor force who want a job, including those who have stopped looking because they believe no jobs are available (discouraged workers). In addition, alternative measures of labor underutilization (discouraged workers and other groups not officially counted as unemployed) are published each month in the Employment Situation news release.

## Technical Note

This news release presents statistics from two major surveys, the Current Population Survey (household survey) and the Curtent Employment Statisties survey (establishment survey). The household survey provides the information on the labor force, employment, and unemployment that appears in the A tables, marked HOUSEHOLD DATA. It is a sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics (BLS)

The establishment survey provides the information on the employment, hours, and earnings of workers on nonfarm payrolls that appears in the B tables, marked ESTABLISHMENT DATA. This information is collected from payroll records by BLS in cooperation with state agencies. The sample includes about 160,000 businesses and govemment agencies covering approximately 400,000 individual worksites. The active sample includes about one-third of all nonfarm payroll workers. The sample is drawn from a sampling frame of unemployment insurance tax accounts.

For both surveys, the data for a given month relate to a particular week or pay period. In the household survey, the reference week is generally the calendar week that contaiss the 12 th day of the month. In the establishment survey, the reference period is the pay period including the $12 t h$, which may or may not correspond directly to the calendar week.

## Coverage, definitions, and differences between surveys

Household survey. The sample is selected to reflect the entire civilian noninstitutional population. Based on responses to a series of questions on work and job search activities, each person 16 years and over in a sample household is classified as employed, unermployed, or not in the labor force.

People are classified as employed if they did any work at all as paid employees during the reference week; worked in their own business, profession, or on their own farm; or worked without pay at least 15 hours in a family business or farm. People are also counted as employed if they were temporarily absent from their jobs because of illness, bad weather, vacation, labor-management disputes, or personal reasons.

People are classified as unemployed if they meet all of the following criteria: They had noemployment during the reference week; they were available for work at that time; and they made specific efforts to find employment sometime during the 4 -week period ending with the reference week. Persons laid off from a job and expecting recall need not be looking for work to be counted as unemployed. The unemployment data derived from the household survey in no way depend upon the eligibility for or receipt of unemployment insurance benefits.

The civilian labor force is the sum of employed and unernployed persons. Those not classified as employed or umemployed are not in the labor force. The unemployment rate is the number unemployed as a percent of the labor force. The labor force participation rate is the labor force as a percent of the population, and the employmentpopulation ratio is the employed as a percent of the population.

Establishment survey. The sample establishments are drawn from private nonfarm businesses such as factories, offices, and stores, as well as federal, state, and local government entities. Employees on nonfarm payrolls are those who received pay for any part of the reference pay period, including persons on paid leave. Persons are counted in each job they hold. Hours and earnings data are for private businesses and relate only to production workers in the goods-producing secror and nonsupervisory workers in the service-providing sector. Industries are classified on the basis of their principal activity in accordance with the 2002 version of the North American Industry Classification System.

Differences in employment estimates. The numerous conceptual and methodological differences between the household and establishment surveys result in important distinctions in the eraployment estimates derived from the surveys. Among these are:

- The household survey inciudes agricutural workers, the self-employed, unpaid famity workers, and private household workers among the employed. These groups are excluded from the establishment survey.
- The household survey includes peopie on unpaid leave among the employed. The establishment survey does not.
- The household survey is limited to workers I6 years of age and older. The establishment survey is not limited by age.
- The housethold survey has no duplication of individuals, because individuals are couned only once, even if they bold more than one job. In the establishment survey, employees working at more than one job and thus appearing on more than one payroll would be counted separately for each appearance.

## Seasonal adjustment

Over the course of a year, the size of the nation's labor force and the levels of employment and unemployment undergo sharp fluctuations due to such seasonal events as changes in weather, reduced or expanded production, harvests, major holidays, and the opening and closing of schools. The effect of such seasonal variation can be very large; seasonal fluctuations may account for as much as 95 percent of the month-to-month changes in unemployment.
Because these seasonal events foliow a more or less regular pattern each year, their influence on statistical trends can be eliminated by adjusting the statistics from month to month. These adjustments make nonseasonal developments, such as dectines in economic activity or increases in the participation of women in the labor force, easier to spot. For example, the large number of youth entering the labor force each June is likely to obscure any other changes that have taken place relative to May, making it difficult to determine if the level of economic activity has risen or declined. However, because the effect of students finishing school in previous years is known, the statistics for the current year can be adjusted to allow for a comparable change. Insofar as the seasonal adjustment is made correctly, the adjusted figure provides a more useful tool with which to analyze changes in economic activity.

Most seasonally adjusted series are independently adjusted in both the household and establishment surveys. However, the ad-
justed series for many major estimates, such as total paytoll employment, employment in most supersectors, total employment, and unemployment are computed by aggregating independently adjusted component series. For example, total unemployment is dcrived by summing the adjusted series for four major agesex components; this differs from the unemployment estimate that would be obtained by directly adjusting the total or by combining the duration, reasons, or more detaited age categories.

For both the household and establishment surveys, a concurrent seasonal adjustment methodology is used in which new seasonal factors are calculated each month, using all relevant data, up to and including the data for the current month. In the household survey, new seasonal factors are used to adjust only the current month's data. In the establishment survey, however, new seasonal factors are used each month to adjust the three most recent monthly estimates. In both surveys, revisions to historical data are made once a year.

## Reliability of the estimates

.Statistics based on the household and establishment surveys are subject to both sampling and nonsampling error. When a sample rather than the entire population is surveyed, there is a chance that the sample estimates may differ from the "true" population values they represent. The exact difference, or sampling error, varies depending on the particular sample selected, and this variability is measured by the standard error of the estimate. There is about a 90-percent chance, or level of confidence, that an estimate based on a sample will differ by no more than 1.6 standard errors from the "true" population value because of sampling error. BLS analyses are generally conducted at the $90-$ percent level of confidence.
For example, the confidence interval for the monthly change in total employment from the household survey is on the order of plus or minus 430,000 . Suppose the estimate of total employment increases by 100,000 from one month to the next. The 90 -percent confidence interval on the monthly change would range from - 330,000 to 530,000 $(100,000+/-430,000)$. These figures do not mean that the sample results are off by these magnitudes, but rather that there is about a 90 -percent chance that the "true" over-the-month change lies within this interval. Since this range includes values of less than zero, we could not say with confidence that employment had, in fact, increased. If, however, the reported employment rise was half a million, then all of the values within the 90 -percent confidence interval would be greater than zero. In this case, in is likely (at least a 90 -pereent chance) that an employment ise had, in fact, occurred. At an unemployment rate of around 5.5 percent, the 90 -percent confidence interval for the monthly change in unemployment is about $+/ 280,000$, and for the monthly change in the unemployment rate it is about $+/$-. 19 percentage point.

In general, estimates involving many individuals or establishments have lower standard errors (relarive to the size of the estimate) than estimates which are based on a small number of observations. The precision of estimates is also improved when the data are cumulated over time such as for quarteriy and annual averages. The seasonal adjustment process can also improve the stability of the monthly estimates.

The houschold and establishment surveys are also affected by nonsampling error. Nonsampling errors can occur for many reasons, including the failure to sample a segment of the population, inability to obtain infomation for all respondents in the sample, inability or unwillingness of respondents to provide correct information on a timely basis, mistakes made by respondents, and errors made in the collection or processing of the data.

For example, in the establishment survey, estimates for the most recent 2 months are based on incomplete returns; for this reason, these estimates are labeled preliminary in the tables. It is only after two successive revisions to a monthly estimate, when nearly all sample repors have been received, that the estimate is considered final.

Another major source of nonsampling error in the establishment survey is the inability to capture, on a timely basis; employment generated by new firms. To conrect for this systematic underestimation of employment growth, an estimation procedire with two components is used to account for business births. The first component uses business deaths to impute employment for business births. This is incorporated into the sample-based link relative estimate procedure by simply not reflecting sample units going out of business, but imputing to them the same trend as the other firms in the sample. The second component is an ARIMA time series model designed to estimate the residual net bith/ death employment not accounted for by the imputation. The historical time series used to create and test the ARIMA model was derived from the unemployment insurance universe micro-level database, and reflects the actual residual net of births and deaths over the past five years.

The sample-based estimates from the establishment survey are adjusted once a year (on a lagged basis) to universe counts of payroll employment obtained from administrative records of the unemployment insurance program. The difference between the March samplebased employment estimates and the March universe counts is known as a benchmark revision, and serves as a rough proxy for total survey enror. The new benchmarks also incorporate changes in the classification of industries. Over the past decade, the benchmark revision for total nonfarm employment has averaged 0.2 percent, ranging from less than 0.05 percent to 0.4 percent.

## Other information

Information in this release will be made available to senisory impaired individuals upon request. Voice phone: (202) 691-5200; TDD message referral phone: 1-800-877-8339.

${ }^{1}$ See footnote 1 , table 8-2. Pa prolimitiary.
NOTE: The indexes of aggregate weekly payrolls art catculated
by dividing the currant nonths eatimates of aggregate payrolls by the corresponding 2002 annual average tovels. Aggreguto payron eatimates are the proouct of estimates of averaga hourty earmings, average weekjy hours, and production and nonsupervisory
worker employment. Data have been revised to ratast march 2007 benchmark tevets and updated seasonal adjustment factors. Data reflect the corversion to the 2007 version of the North Amarican tndustry Classification Syatem (NALCS) as the basis for the assifniment and tabutation of ecorornic data by industry, reptacing NAICS 2002. See http://nww.bls.gov/ces/cesnaicso7.hth for more detalls.
