PANEL DISCUSSIONS

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

MONDAY, JANUARY 24, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

(This hearing was held in executive session of the committee, but is made a part of the printed record by mutual consent)

The joint committee met at 2 p. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, and Senators Sparkman, O'Mahoney, Flanders, and Watkins, and Representative Patman, vice chairman, and Representatives Bolling, Mills, Kelley, Wolcott, Talle, and Curtis.

The CHAIRMAN. The meeting will come to order.

I should like to welcome the new members of the committee, Congressman Mills of Arkansas, Congressman Kelley of Pennsylvania, and Congressman Curtis of Missouri, and Senator O'Mahoney who was on the committee when it was first organized, and who served as chairman during two sessions of Congress. We are happy to have you with us.

You probably have received the plan we have for the hearings. It is in the notebook which was prepared for you on Wednesday.

Might I say we have fixed rules of procedure, parliamentary rules, and the rules of gentlemen with respect to the rights of each other and of witnesses.

We have made an informal agreement with Mr. Burns for today, which I will announce, as to certain ground rules for questioning which I would suggest.

Representative CURTIS. As I understand your explanation of the rules of procedure, they are unwritten, and as we go along if anyone feels that a matter of procedure becomes important, I presume the chairman would entertain discussion of it.

The CHAIRMAN. It was the sense of the committee that we invite representatives of the Council of Economic Advisers to appear. A transcript will be made of the questions and answers which is a different procedure than that which prevailed last year.

I had a conference with Dr. Burns on this and we have worked out an agreement which I would like to have him confirm. Then we will see if it meets with the committee's approval.

This is a meeting in executive session and, of course, we should respect an executive session and not make any statements outside about what transpires in executive session.

Dr. Burns will testify and will have the right to correct the transcript as far as his own answers are concerned, and that corrected transcript will then become a part of the printed record, the printed record of the hearings, which I think is more satisfactory than having a transcript made available only for members and the staff.

Senator SPARKMAN. Mr. Chairman, may I ask whether each member of the committee, likewise, will have a chance to check his own questions?

The CHAIRMAN. Yes.

Vice Chairman PATMAN. Well, should we adopt the rule—I think it is the rule in the Senate and the House—that that will be done as long as it does not change or render meaningless the import of the question and answer in relation to each other?

The CHAIRMAN. I think that rule of the Senate and House is a good one. It is sometimes stretched a little, and we will not hold anyone rigidly to it, but people should observe it as sort of a moral guide.

Representative WOLCOTT. Mr. Chairman, going backward a little on this, I understand that you and Dr. Burns have talked this over, and it is agreeable with Dr. Burns, but I think we should have some doubts in our mind as to whether this constitutes a precedent.

If you recall, several years ago this question of whether the Council of Economic Advisers should appear and testify before the committee was the indirect, if not the direct, cause for a major split in the Council of Economic Advisers resulting in the resignation of one.

So last year when the new Council of Economic Advisers was set up we agreed that it would be left to Dr. Burns' discretion as to whether he should have a transcript made of his initial statement.

We thought at that time that Dr. Burns might feel more at liberty to discuss the matter more freely than he would otherwise, if no transcript was made, and the committee members would perhaps feel freer to question and get background on economic thinking at the White House level if it was not on the record. That was the genesis of that issue, and I was a little disappointed, frankly, that this agreement has been made, whereby we would make a transcript of Dr. Burns' testimony, because I think it might cramp our style somewhat, and I am sure it will cramp his style, because he speaks for the President, you know. He is adviser to the President. He cannot divorce himself from that position. He cannot talk as a taxpayer. He cannot talk as just an economist. He must talk as an adviser of the President, and whatever he says will have to, of course, be considered as coming from the President himself, and as being the President's viewpoints, so I wondered if perhaps we were not defeating our purpose in putting him on the record. Would he feel as free to talk to us and as frank to talk to us as he would otherwise?

Senator FLANDERS. Mr. Chairman, I think the question goes a little bit deeper than that, because in the case that resulted in the resignation of Dr. Nourse, it seemed that the basic question was: Was the Council giving advice to the President or speaking for him?

Now, if the Council is giving advice to the President, the President does not necessarily take it. If he does it is very fortunate, and there is no dichotomy in the situation. But if the President receives advice, and does not take it as he has a perfect right to, it puts the Chairman of the Council in a very difficult situation in regard to having a record made of what he says. I hope that has been in Dr. Burns' mind in agreeing to speak. I do not know whether we ought to ask him whether he speaks for the President or whether he speaks to him.

The CHAIRMAN. Senator Flanders, I was going to mention, when the gentleman from Michigan brought up this matter, that I told Dr. Burns privately I thought there were certain questions which would be improper. I think that no committee has the right to inquire of a confidential adviser to the President what advice he has submitted.

I know this is not military affairs or foreign affairs, but, generally, I think communications between the Council and the President, and between the Council and other governmental agencies, between other governmental agencies and the President, are privileged, and are not matters for inquiry, but I thought that questions might be addressed to the body of the report.

Are there motions?

Representative BOLLING. Mr. Chairman, I do not like to prolong this. As those who were present at the other meeting of the committee know, I have definite feelings on this matter. But I am prepared to let the modus vivendi that has been developed operate without any further pressing of my point. However, I would want the record to show that I felt, if the thesis that has been propounded in various fashions is the correct interpretation of the law, that we were in a very peculiar position of being a committee by law required to advise the Congress on matters which give to its opposite number in the executive a right to express its opinions at it wishes in public statements and speeches, to be examined by us as to those same opinions. Furthermore, it leaves the country in the position of having a Cabinet officer who is responsible to the President for each of the separate segments of an economic program, but of having nobody in the executive who speaks for the President on the details of the general economic picture.

The Secretary of the Treasury has certain economic responsibilities. The Secretary of Commerce has certain economic responsibilities. But there is nobody in the executive—since we cannot ask the President to come here and speak—there is nobody in the executive who is responsible for discussing with the Congress the overall problems of the economy.

I just raise those points simply for the record.

Representative CURTIS. Will the gentleman yield just a minute for a question? This is just for information, but do members of the Council of Economic Advisers require senatorial approval?

The CHAIRMAN. Yes.

Representative CURTIS. They do? So they are in exactly the same category. I did not know.

The CHAIRMAN. Any motions?

If not, is the agreement which I have outlined satisfactory?

Representative BOLLING. To make it formal, I move that it be the proceeding under which the committee operates.

Senator SPARKMAN. I second the motion.

The CHAIRMAN. Is there discussion?

Representative WOLCOTT. I think I have stated my position, and I think the other positions are clear. We do not want to have this established as a precedent. In voting the affirmative, it will be with the understanding that this will not be cited as a precedent which might be taken by this committee later on both, with respect to Dr. Burns and Cabinet members.

I think under those circumstances perhaps personally if the vote is taken I shall pass.

Senator SPARKMAN. It seems to me that this relates purely to this one agreement, and certainly it would not be a precedent. This is an agreement worked out which is satisfactory both to the chairman and to Dr. Burns.

The CHAIRMAN. If Dr. Burns wants to add anything, the opportunity is given to him.

ARTHUR F. BURNS, CHAIRMAN, COUNCIL OF ECONOMIC ADVISERS, EXECUTIVE OFFICE OF THE PRESIDENT

Dr. BURNS. I would like to add a word.

Senator Douglas, you have reported accurately the understanding that you and I reached. I only wish the committee to know that I entered into that agreement with some feeling of regret. I was faced with a choice of testifying with a transcript or not testifying at all.

May I recall that when I came up for confirmation before the Senate Banking and Currency Committee, Senator Sparkman asked me the question whether I would ever return to testify. What I told him then is still valid today, namely, that I feel that every citizen, no matter what the circumstances might be, when called upon by a congressional committee to testify, should respond to that request.

I did not choose to request the committee to excuse me from testifying. I will testify for the record, because I deem it better to do that than to have a transcript taken that is restricted to the members of the committee. But I feel that an unwise decision has been reached in insisting on a transcript, and that the purpose that we all have in common, namely, to further the goals set by the Employment Act, may not be promoted by this decision.

Senator FLANDERS. Mr. Chairman, there is one point that surprised me just a little in the agreement. I had thought that we had discussed having a record made, but not having it published.

The CHAIRMAN. That is correct.

Senator FLANDERS. In many of the proceedings of the Foreign Relations Committee, and in many of the proceedings of the Armed Services Committee, with which I am more familiar, a record is made which is available to committee members only, and which is held as a confidential document.

The CHAIRMAN. I think that was the motion and agreement which was reached by the committee, and that was the proposal which I made to Dr. Burns to which he took very strenuous exception. It was in an effort to accommodate Dr. Burns that I accepted the other proposal, namely, that he have a chance to correct the record. And that it be printed as a part of the published proceedings.

Now, if Dr. Burns wishes to return to the earlier proposal, namely, that it not be printed, that was a decision made, and, of course, that is acceptable to me. I want to make clear that the alteration was made at his request. It was agreed to in order to be as accommodating as possible.

Vice Chairman PATMAN. Mr. Chairman, is not this comparable to something like when the President extends for 3 years the Reciprocal Trade Act; then his Cabinet member who is responsible for that appears before a committee that is investigating the subject matter, and testifies even openly and publicly, and answers all questions relating to it?

Now, there are other situations. For example, Mr. Wilson may recommend a certain amount for national defense. Well, he and his assistants come to the Hill. They testify publicly for the record, and they answer any kind of a question that anyone wants to propound, and in view of the fact that the President, himself, even goes before representatives of the press and voluntarily answers any question that the members of the press may want to ask him, it occurs to me that this is very much in order.

Dr. BURNS. May I comment on that, Senator Douglas?

The CHAIRMAN. Surely.

Dr. BURNS. I do not think that the position of a member of the Council is comparable to that of a Cabinet officer. A Cabinet officer has administrative duties that are prescribed by law. The Council of Economic Advisers has no operating or administrative duties whatsoever. Its sole function——

Vice Chairman PATMAN. Now let us drive down a peg there. You say that the Council of Economic Advisers has no administrative duties.

Dr. BURNS. The sole function of the Council is to advise and assist the President. The Council has no other operating or administrative responsibilities.

Vice Chairman PATMAN. But are you not supposed to follow through, like the Cabinet officers and go before the committees. You know when you file your report at a certain time, we are supposed to have hearings and make our report also within a limited time.

Dr. BURNS. You see, a Cabinet officer has duties that are prescribed by law, administrative duties that are prescribed by law, and in that sense is accountable to the Congress. To the best of my knowledge and understanding, the Council has no such function.

The CHAIRMAN. Well, Dr. Burns, I want to say this gently and in all kindness. I can understand the position which you have apparently taken and the logical conclusion of that is that you should not testify before any congressional body at all. Now that is a perfectly legitimate position to take, and had you taken that position, I would have made it clear that there was no bad motive on your part in not wishing to testify. We would have been glad to make a public statement respecting your right not to testify.

But if you do testify, then it is certainly true that it is for this body to prescribe the rules under which you testify. We will try to be as accommodating as possible, but we have to proceed under the rules upon which we agreed.

Dr. BURNS. I take no exception to that, Senator.

Senator SPARKMAN. Mr. Chairman, may I say just this word to Dr. Burns. I said this in the meeting the other day, you will recall. I had thought that perhaps the happy solution to it would be the thing that was mentioned a few minutes ago, and that is making a transcript but keeping that transcript as a part of this committee's files, available to the individual members to see in the committee room and not a part of the record. We follow that in the Foreign Relations Committee all of the time. I suppose 90 percent of our testimony there is taken in executive session, and it is never released unless the committee votes specifically to do so, and even in that event, it would not be done without allowing those from the executive departments who testified to edit it so as to take out those parts they did not want made public.

As far as I know, it has never been violated in our committee. And I thought perhaps that that would be the happy way here, because it would give all of us a chance to pry into this thing, to probe as deeply and as far as we want to, and yet it would give you freedom to discuss the thing as if it were off the record, and the only written part would be for the benefit of the members of this committee, and not for publication in any form whatsoever.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. Mr. Chairman, do I understand that the sense of the motion would include what Senator Sparkman has just outlined? I did not understand that.

Representative BOLLING. No; the motion was to ratify the agreement reached between the chairman and Dr. Burns.

Representative CURTIS. So it would not include that.

Representative BOLLING. Which would provide for a correction and then publication.

Vice Chairman PATMAN. May I say this, Mr. Chairman: It occurs to me it is a wonderful opportunity afforded the President to make clear and plain some things in this report that will be very much misunderstood and even disturbing if not explained.

In other words, we will bring out any criticism that could possibly be offered, and Dr. Burns can explain it, and that is helpful to the President. They should want that opportunity and if denied that opportunity, they would have a right to object.

Representative TALLE. Mr. Chairman, I was present at the meeting on the 12th of January, and likewise in 1953 when this matter was discussed. My personal choice is that we operate as we have in the past, and I want to state the reason for it. I think if we operate as we have in the past, the Chairman of the Council of Economic Advisers will not feel the degree of restraint that he will feel if we operate under the second method, and since he will not feel that restraint, I think his testimony for the members would have greater value.

That is simply how I feel about it.

The CHAIRMAN. There is a motion before the committee.

Representative CURTIS. Senator Sparkman, did you have in mind offering your suggestion as an amendment?

Senator SPARKMAN. No; I made that proposal before the committee the other day, and I think the committee was favorably impressed and I understand from the chairman that he discussed it with Dr. Burns, but that Dr. Burns preferred the second form rather than this.

Dr. BURNS. If faced with those two choices.

Senator SPARKMAN. Yes, that is my understanding; I mean as between the two.

The CHAIRMAN. Are we ready for the motion?

(A vote was taken and the motion carried.)

Senator FLANDERS. I must say I voted for it, but I do not understand why Dr. Burns is for it. That is what puzzled me.

Senator O'MAHONEY. Mr. Chairman, may I have a word?

The CHAIRMAN. Yes.

Senator O'MAHONEY. Who was it that once said economics is not an exact science. I have listened to this discussion on both sides and I have the feeling that it is a purely technical discussion, based upon fears of things that probably will never arise. I have not any doubt in the world that the President of the United States has the authority, as he has exercised it from the time of George Washington down to the present, to deny certain information to the Congress, but we are here dealing with matters of opinion, and I doubt very much whether any question will be asked at any time that will cause the members of the Council of Economic Advisers the slightest embarrassment, as to what they said to the President on such and such a date and what he said in response to that, so we are not likely to get into that sort of discussion.

The CHAIRMAN. If such a question is asked, the Chairman will rule it out of order.

Vice Chairman PATMAN. And properly so.

Senator O'MAHONEY. So what we are dealing with here are matters of opinion dealing with the economy of the United States, which I think the members of the committee and the members of the Council can discuss with perfect poise and lack of fear.

Representative WOLCOTT. I say very lightly, is the judgment of whether it is to be embarrassing or not to be left solely to Dr. Burns? Is that very likely? He was explaining the objection, he said, if he was asked an embarrassing question.

The CHAIRMAN. I said I would sustain any objection to a question which went into a confidential relationship.

Representative WOLCOTT. I said very lightly, will that be left to the discretion of Dr. Burns?

The CHAIRMAN. The Chair will make a ruling, but of course, the rulings of the Chair are always subject to correction, so the gentleman from Michigan will have an opportunity to correct the Chair.

Representative WOLCOTT. I am getting a little enlightened on the question, because I think Dr. Burns will be given to understand by this colloquy that if there is anything which is of a very confidential nature he can suggest that part and you will not require him to answer.

The CHAIRMAN. I do not think the questioning will go beyond the text of the report, which I assume is not confidential since it has been published.

Senator WATKINS. Mr. Chairman, it seems to me it opens up some possibilities where if we insist on an answer from Dr. Burns it might reveal that he is in opposition to the President's view on this particular matter. If I am a lawyer, an adviser to a man in a professional capacity (and I think an economist will probably admit to the same class), I give advice to my client, he may choose not to follow that advice.

The CHAIRMAN. May I ask this: Would you regard it as permissible to question the members of the Council upon the report which they, themselves, wrote?

Senator WATKINS. Well, I do not know that they prepared it.

The CHAIRMAN. Oh, yes.

Senator WATKINS. The final work, and the final authority for it, is the decision of the President.

The CHAIRMAN. The two reports are the letter of transmittal of the President to the Congress, which I take it is the first one, and then there is the report of the Council to the President.

Dr. BURNS. I must correct that, Senator Douglas.

Senator WATKINS. The opening statement, Mr. Chairman, begins, "I am hereby presenting my economic report * * *," and that is signed by the President.

The CHAIRMAN. Is part 2 signed by the President? Did the President prepare this or did the Council of Economic Advisers?

Dr. BURNS. It is submitted by the President as his report, and naturally in writing that report he had the advice and assistance of the Council.

The CHAIRMAN. Dr. Burns, is it your understanding then that if we question the members of the Council upon the report which is printed this will be a violation of the confidence between the President and the Council, though the report is printed and made a matter of public record? Is it your contention that this should be insulated from questioning?

Dr. BURNS. No; I would not want to make a blanket statement on that, Senator. There may, however, be some questions concerning this report that might prove embarrassing, because this is the President's report and I am his confidential adviser.

The CHAIRMAN. Well, I would say that under those conditions it would be quite proper for you to say "For various reasons I think it inadvisable for me to reply to the question," and in that event we would not put you under oath nor would we say that you would have to plead the fifth amendment in order to try to avoid the question.

Dr. BURNS. I think my presence here and what I have said before should make it very clear that I do not seek cover under the fifth amendment or under any other provision of the law.

The CHAIRMAN. That is understood.

Vice Chairman PATMAN. Suppose we proceed and wait until a real question appears rather than a hypothetical one.

The CHAIRMAN. Are we ready for the question? We are.

(A vote was taken and the motion carried.)

Representative CURTIS. Mr. Chairman, point of order. Did we not vote on that once?

The CHAIRMAN. We voted on a similar motion, I think, but I am not certain. We voted on the transcript, but I am not certain that we voted on this point of the questioning of Dr. Burns.

Representative CURTIS. I do not know whose motion it was that we were voting on.

The CHAIRMAN. If it is held that the previous motion carried with it both of these motions, I would be very glad to ask to cancel the last motion.

Representative BOLLING. Mr. Chairman, I may be confused at this point. I think there was just the one motion that I made, that the agreement between Dr. Burns and the chairman would prevail. I was not aware that Senator Sparkman made a motion. I thought that the reason that the motion was put again was that there was further discussion before any announcement on the motion.

The CHAIRMAN. Have we voted on this motion?

Representative BOLLING. Well, it was not announced that the motion had carried.

The CHAIRMAN. I will announce that it has carried. I wonder if we could proceed with the examination. I understand that Dr. Burns does not have a formal statement to submit.

Dr. BURNS. That is correct.

The CHAIRMAN. He is going to answer questions on the report. May I say that in order that everyone may have a chance to question, I propose to begin by limiting myself to 5 minutes and then we will proceed with alternate questions from the Republican side and the Democratic side with each person limited to 5 minutes.

Vice Chairman PATMAN. May I ask a question, Mr. Chairman? Does that mean 5 minutes of time that you take up or that the witness takes up?

The CHAIRMAN. Well, let us say that is a total of 7 minutes, with the understanding that the witness should be brief, too.

Vice Chairman PATMAN. Well, I have known witnesses on this subject to take up more than 5 minutes. I am thinking of days gone by in the Banking and Currency Committee.

The CHAIRMAN. Let us be expeditious and not monopolize the questions. Let us distribute it between sides with reasonably concise questioning and answers.

Dr. Burns, I would like to raise some questions about the year 1954, if I may. I want to verify certain statements. On pages 15, you state:

> While the physical body of nondurable manufactures declined 6 percent between July 1953 and March 1954, the production of durables declined 14 percent, and manufacturing production as a whole 10 percent.

I take it that that is correct.

Dr. BURNS. To the best of my knowledge.

The CHAIRMAN. And there was substantially no increase in production as evidenced by table B–1 on page 77 between March of 1954 and August of 1954?

Dr. BURNS. That is correct.

The CHAIRMAN. Therefore, there was a decline of 10 percent in industrial production from July of 1953 to August of 1954?

Dr. BURNS. That is right.

The CHAIRMAN. Now, may I ask a question about the volume of employment, table B–7 on page 87: There is a statement that from July 1953 to March 1954 there was a total decline in nonagricultural employment of 1,464,000. Is that correct?

Dr. BURNS. That is correct, on the basis of seasonally adjusted figures.

The CHAIRMAN. Yes. And from March 1954 to August a further decline of 496,000?

Dr. BURNS. That is again correct on the basis of seasonally adjusted figures.

The CHAIRMAN. So that the total decline in employment from July 1953 until August of 1954, was 1,960,000 or virtually 2 million?

Dr. BURNS. As shown by the Bureau of Labor Statistics' figures. The decline is somewhat smaller according to the census figures.

The CHAIRMAN. And during this time the working population was increasing in size?

Dr. BURNS. During that period the working population increased in size; yes.

The CHAIRMAN. Do you have an estimate as to the probable increase?

Dr. BURNS. Well, let me look up the figures.

The CHAIRMAN. Does it amount to about 700,000 for the year?

Dr. BURNS. I will have to consult the record on that. Historically the increase in the labor force has varied a good deal from year to year.

The CHAIRMAN. I know, but the average is roughly about 700,000.

Dr. BURNS. The average in recent years has been between 600,000 and 700,000. However, if I am to testify about the last year, 1954, I would have to consult the figures on that.

The CHAIRMAN. Now then, you have a decline, in other words, of 10 percent in production?

Dr. BURNS. Not in total production, but in industrial production, that is manufacturing and mining combined.

The CHAIRMAN. And a decrease of virtually 2 million in the numbers employed?

Dr. BURNS. In numbers employed in nonagricultural establishments, as measured by the Bureau of Labor Statistics, when adjusted for seasonal variations.

The CHAIRMAN. That is correct. Now, the former definition of the phases of the business cycle by Wesley Mitchell, who was your teacher and mine, was that the phases of the business cycle were revival, prosperity, recession, and depression. Leaving out the naughty word "depression," would you characterize this period then as a period of revival?

Dr. BURNS. I must first make a technical point, Senator Douglas. The four phases of the business cycle to which you referred by name were used in the manner you indicated by Wesley Mitchell for a certain period of time. I worked with Mitchell for a good many years, as you know. In the course of this work at the National Bureau we tried out a variety of concepts and plans of measurement. For the purpose of working out a chronology of business cycles, we finally distinguished troughs, expansions, peaks, and contractions.

We first tried the earlier scheme, namely, revival, prosperity, recession, and depression. We found, however, that it was very difficult to apply this scheme to historical intervals. So from about the middle 1930's, in the course of our efforts to develop a chronology of business cycles, we used the classification that I have just named, that is, trough, expansion, peak, and contraction.

Now, turning to your specific question as to the year 1954——

The CHAIRMAN. The period July 1953 to August 1954.

Dr. BURNS. The period from July 1953 to August 1954 was, using the Bureau's terminology, a period of business cycle contraction.

The CHAIRMAN. Business contraction?

Dr. BURNS. That is correct.

The CHAIRMAN. Now, I notice an article by Professor Schlichter in the current Business Review, in which he speaks of the recent recession.

Dr. BURNS. That is a widely used term.

The CHAIRMAN. Do you think recession and contraction are fundamentally the same?

Dr. BURNS. I think that it is a matter of linguistic preference. The term "recession" is very widely used. It has no precise scientific meaning. The reason the National Bureau adopted the term "contraction" and its affiliates is that these terms are descriptive of economic movements and do no more than that.

The CHAIRMAN. Would you say that the term "recession" is descriptive, too, of contraction?

Dr. BURNS. Well, the difficulty with the term "recession" is that it lacks a unique descriptive meaning.

Let me tell you a little of the history of the term, as used at the National Bureau. The first definition that we gave to the term "recession," for the purposes of measurement, was that of an interval from the midpoint of expansion to the midpoint of contraction, so that the phase of recession overlapped upon the phases of expansion and contraction.

Later on we found ourselves using the term "recession" in another way. Recession was the month which followed the peak in activity, or the quarter which followed the peak in activity, or the year which followed the peak in activity. This usage also seemed unsatisfactory. We finally gave up the term in describing historical intervals.

Now, let me add that I have no quarrel with anyone who wishes to speak of the interval from July 1953 to August 1954 as a period of recession. I have spoken of it that way myself, and you will find that in one or two or three places in this year's Economic Report the term is used that way. It is not a scientific term, but it is popular, is used widely, and when applied to recent events this term is not likely to lead to serious misinterpretation.

The CHAIRMAN. I thank you for that statement. The comment which I am going to make is not addressed to you, but I wish that a similar restraint in language were observed by others who took umbrage at the characterization of this period as being one of recession, because the use of that term was denounced as a treason toward the American people and an attempt to get the United States into a depression. But waiving that question, there is one omission in your report which somewhat startled me, and that was the fact that there was virtually no mention made of agriculture. Perhaps I may have been in error, but as I read the report through 2 or 3 times I did not find any reference to farming. There were tables in the rear about farming, but there is no textual statement about farming; am I correct in suggesting that there is little discussion of farming?

Dr. BURNS. You are correct in suggesting that there is relatively little discussion of farming.

The CHAIRMAN. I think no discussion of farming.

Dr. BURNS. No, that is incorrect. There is some discussion in the text, and much more in the appendix. You will find farming taken up in various places in the report.

The CHAIRMAN. I think there were four sentences about farming.

Dr. BURNS. Well, I am not in a position at this moment either to confirm or deny your precise count of the number of sentences. The important thing is what they say.

The CHAIRMAN. Now, you have prepared some very valuable statistical tables in the rear of your report, table D–37 on page 177 gives the parity ratio, and I find that in December it was 86.

Dr. BURNS. That is correct.

The CHAIRMAN. Which is the lowest, I may say, as far as I can find, that this ratio has been since 1940.

Dr. BURNS. 1940 or 1941, I cannot remember.

This relationship between prices paid by farmers and prices received by farmers is commented on in the text of the report. The numerical figure you have cited is shown in a chart which is contained in the report. It is commented on later in the report itself, and, of course, it is reported in the table you have just quoted from.

The CHAIRMAN. Do you think that this is a situation to which the committee should address itself, or is that an improper question?

Dr. BURNS. I think the committee should address itself to all important economic questions, Senator.

The CHAIRMAN. Well, is this an important issue?

Dr. BURNS. I think it is a question that certainly deserves the attention of your committee, just as it deserves and is receiving the attention of the executive branch.

The CHAIRMAN. I was somewhat surprised that I found, I think, almost no recommendations on this subject, and no analysis of this problem in the report.

Dr. BURNS. There is some analysis in the report. As for recommendations, may I remind you that the Congress last year passed several basic agricultural bills, and that it is the recommendation of the President, as stated in his state of the Union message, that the bills that were passed by the Congress be allowed to take effect. It is important that the new program for agriculture be given a chance to prove its worth.

The CHAIRMAN. Did the Council take into consideration the drought which has hit the southeastern portion of the country, and which has now gone up into the central agricultural belt?

Dr. BURNS. From time to time we have considered what is happening in that area of agriculture and we have taken the drought into account as best we could.

The CHAIRMAN. I cannot find references to drought. Perhaps I am in error.

Dr. BURNS. This report, Senator Douglas, does not contain, to the best of my recollection, any reference to the drought. May I say, however, that this report is not a record of all of the council's thinking on all of the economic questions facing the country. It couldn't very well do that, as you must know.

The CHAIRMAN. I think I have taken up my share of the time. Mr. Wolcott.

Representative WOLCOTT. I find, Mr. Chairman, on page 78, discussion of the agricultural production problem that is quite voluminous.

The CHAIRMAN. Yes; but I was speaking of prices.

Dr. BURNS. There is a discussion of prices as well, Senator Douglas. I can find the page for you if you would like it.

The CHAIRMAN. Do you have further questions?

Represenative WOLCOTT. In evaluating the gross national product you have taken into consideration agricultural income, have you not?

Dr. BURNS. Yes; definitely.

Represenative WOLCOTT. That is all.

The CHAIRMAN. Mr. Patman.

Vice Chairman PATMAN. Mr. Chairman, I do not believe I could ask any question and get the answer in 5 minutes. I do not object to your rule. I am heartily in favor of giving all the members a chance and being in favor of the rule, I think I will read off some statements that I have marked out here in the form of questions and then since a record is being made, just let Dr. Burns answer them for the record later on.

The CHAIRMAN. If he is willing to do that, that will be fine.

Dr. BURNS. Does that mean that I am to answer the questions now or after the meeting? I am not clear about that.

Vice Chairman PATMAN. You can answer the questions after the meeting. I do not think we would have the time during the meeting.

Dr. BURNS. I see.

Vice Chairman PATMAN. Suppose I just go ahead. I have about 3 pages here. Most of it is double spaced. It would take about 5 minutes, and if you want to answer then, it would be all right with me, but I would like to raise them.

Representative WOLCOTT. May I suggest that perhaps Dr. Burns does not understand our procedure of allowing a witness or a Member of the Senate or House to revise and extend his remarks; that is what he is getting to, is answering a question in the revision of the remarks. Will that be what you want?

Vice Chairman PATMAN. Yes. Of course, I assume after we go around the table we will be given another opportunity.

The CHAIRMAN. Oh, yes.

Vice Chairman PATMAN. And when I am reached next time it is possible I will ask some of them, individually.

Although the Economic Report notes "the income shares of both farm and business proprietors in 1954 were at postwar lows," there is no further discussion of this economic development elsewhere in the report. The implications of this fact are that the terms of trade which are reflected in the movements of prices went against the farmers and the small-business man in 1954.

What significance does this have upon the so-called flexible monetary and stable price policies? Does the mere stabilization of a wholesale price index——

Dr. BURNS. I did not hear that question. Does it what?

Vice Chairman PATMAN. Does the mere stabilization of a wholesale price index or the retail price index mean that there are no imbalances developing in the economy? Does not the experience of the 1926–29 period raise questions concerning the validity of this assumption? Does not the experience of 1953–54 indicate that unsound structural dislocations have taken place underneath the cover of a stable-price level?

The Economic Report mentions the farm problem briefly as follows:

> The introduction of flexible price supports for basic crops and the modernization of the parity formula will facilitate the adjustment of our farming enterprises to changing markets and thus help to improve the outlook for the farmer.

How will the outlook for the farmer be improved? Will his share of the personal income disbursements which the report notes is at a postwar low be raised? How much will it be raised and how will this increase occur?

Farm income fell at an annual rate of $2 billion from the first to the fourth quarter of 1954, or 15 percent. Will the improved outlook for the farmer restore this $2 billion drop in farm income? The farm partity ratio in the fourth quarter was 87, the lowest level in 14 years. Will it be restored to 100 percent of parity?

The Economic Report cautions that the "continued economic recovery must not be jeopardized by overemphasis of speculative activity." When the Federal Reserve Board moved to reduce margin requirements by 33 percent in early 1953, did it thereby overemphasize speculative activity? When the Treasury and the administration urged a reduction in the taxes on excess profits, on dividend income, and an acceleration of the rate of recovery, tax free, of investment expenditures, did it encourage speculative activity? Is the economy more or less stable today than it was at the beginning of 1953 prior to the inflation of stock prices?

Much of the postwar prosperity has been attributed to the fact that income has been widely distributed in the hands of all of our families. The narrowing of inequality in income distribution in the 20 years since 1929 has been hailed as a modern revolution by economists of varied views. What significance for income distribution and the inequality of distribution is there in the behavior of personal income shares in 1953 and 1954? For example, the Economic Report shows that labor income from wages and salaries fell as did farm and other proprietor shares. However, investment income shares rose; particularly impressive was the rise in the personal interest share which rose 10 percent in the last 2 years. Do these trends not indicate a redistribution of income that favors a relatively small group at the expense of a relatively large number of income receivers? In brief, are we moving toward greater inequality in income distribution?

Maintenance of a stable price level seems to be given the highest priority in administration declarations dealing with economic policies. Does the mean that the behavior of some price index rather than, say, the amount of unemployed, is used as a guide for economic policy decisions?

In formulating the stable-price policy and in implementing it, what thinking has been done about the implications for price relationships within a stable level of average prices? For example, what consideration has been given to problems arising from the fact that certain prices, notably those for agricultural commodities, are highly sensitive and tend to fluctuate far more frequently and freely than the prices of most manufactured goods and some industrial raw materials? In implementing the stable-price policy, are the effects of price changes considered in combination with each other and with the behavior of noncommodity prices such as services, rents, wages, interest rates? How was this done, for example, in evaluating the prospects of inflation in early 1953? How is this done in evaluating the prospects for price changes currently? For example, prices of industrial supplies have been rising recently while the prices of the farm commodities that business buys have been dropping. What consideration has been given to these divergent moves by the monetary authority in implementing the stable-price policy?

If you do not know, what are your ideas on it? I suspect I have taken up my time. I will not insist on the answer to any of them now because my time has expired, Mr. Chairman. When you get back to me I will pick out 1 or 2 of them.

The CHAIRMAN. Congressman Talle.

Representative TALLE. Mr. Chairman, my mind goes back to the 83d Congress when Dr. Colin Clark, a Britisher, was here for what I think was a rather informal colloquium, and he proposed at that time that our country proceed to spend $20 billion immediately; otherwise the British Empire would probably go bankrupt. Subsequently Dr. Crowther, editor of the London Economist, was here, and he did not go along with that idea.

Later on came a professor from The London School of Economics to whom the staff put what I thought was a very interesting question, inasmuch as it was a reversal of a former question: What effect would a depression in the British Empire have upon the United States? Commenting on the thoughts of Professor Slichter, whom the chairman mentioned, I noticed that he made a statement some time ago about the possibility that perhaps the old ideas about the business cycle are no longer valid, that you do not have now familiar four phases, but on the customary business cycle curve there may be a number of smaller cycles, because he showed that in the recent slowdown of business some industries reemained stable; others declined; and others expanded.

He pointed to the expansion in the British Isles, and in Europe, so he raised the question about the validity of our former adherence to the four phases of the business cycle, saying that perhaps that concept no longer has any validity, or at least less validity than before, because of certain things that can now be done, and have been done, to obviate a depression.

If you choose to comment on that, Dr. Burns, I would be glad to have your ideas, whether you think there is validity to Professor Slichter's views on that or not.

Dr. BURNS. I hesitate to address myself to Professor Slichter's views, not being entirely sure what those views are. Let me say only that I think that it is premature to conclude that the business cycle has been ironed out, that it is premature to conclude that we will not have business fluctuations in the future.

However, there are reasons for believing that if we continue to pursue the policies that have been pursued in recent years, business fluctuations can be kept within moderate compass. More than that, I do not think that either economists or Government officials can safely assert at the present time.

Representative TALLE. Mr. Chairman, may I ask another question?

The CHAIRMAN. Certainly.

Representative TALLE. Dr. Burns, I should like to ask if the Council is satisfied with the steps taken to improve economic statistics in the 1956 budget?

Dr. BURNS. The Council is pleased by the increased emphasis on statistics that is given in the President's budget message for 1956. Congressman Talle, your committee has rendered a great service in emphasizing the limitations of Federal statistical programs. The work of your committee has had a very large influence on the Executive in planning an improved statistical program for the coming year.

Representative TALLE. For the other members of the committee, Senator Carlson, Mr. Bolling, and myself, I say thank you, Dr. Burns.

The CHAIRMAN. Congressman Bolling.

Representative BOLLING. Mr. Chairman, I would like to submit for inclusion in the record of an editorial in Business Week of January 8, 1955, Forecasting: How Good Is it?

Also a speech of Stephen K. Bailey of Princeton University, on Political Elements in Full Employment Policy, on December 9.

I would like to have these included in the record at the appropriate place.

The CHAIRMAN. Without objection, these materials will be included in the record.

(The material referred to is as follows:)

[Business Week, January 8, 1955]

FORECASTING: HOW GOOD IS IT?

All the economic forecasts on the outlook for 1955 are now in, and the predictions provide a remarkable picture. Not one economist of any note foresees a decline ahead, and at the same time, very few are predicting a sharp and sudden rise to boom conditions. The consensus is that the next 12 months will see business activity climb above 1954's level and perhaps over the peaks reached in 1953.

Rarely have so many predictions been so substantially in agreement, a fact that focuses attention on the current state of economic forecasting.

Forecasting has assumed enormous importance in our economic system. The Federal Government, for example, must base its policies on assumptions about the future. In fact, the terms of the Employment Act of 1946 specifically charge the President's Council of Economic Advisers with the task of gathering information on prospective trends in order to make constructive recommendations.

Business, too, bases its decisions on forecasts. In a new booklet titled "Business and Economic Forecasting," the United States Chamber of Commerce points out that the business executive, "even if he has little faith in forecasting," is nevertheless "constantly engaging in an art that he claims to be of dubious merit."

THE RECORD IMPROVES

Until last year, forecasting was considered by most economists as extremely perilous. In general, their postwar record left them little to boast about.

But last year, came a change for the better. There were some forecasters, like Colin Clark, who prophesied doom, and some, like W. S. Woytinsky, who predicted a continuation of the boom. The overwhelming majority, however, predicted that 1954 would see a mild decline, while many went further out on a limb and said that there would be an upturn in the latter part of the year.

The fact that actual activity was in line with predictions has given forecasters confidence in their analytic tools. At the annual meetings of the American Economic Association (p. 104), for instance, delegates were no longer so reluctant to talk about their record. R. C. Turner of Indiana University spoke for many of his colleagues when he declared that "much of the pessimism regarding the potentialities of forecasting" is "exaggerated or outdated."

There is no doubt that last year's record was impressive, and many have marked a turning point in short range—6 months to a year—forecasting. The economists themselves freely admit that they have benefited by greater comprehension of the changes that have taken place in our system and continual improvement in statistical data.

Forecasters also admit a debt to the statistics on intentions to spend, such as the McGraw-Hill survey of business plans for new plant and equipment (Business Week—Nov. 6, 1954, p. 30) and the Michigan Survey Research Center reports on consumer intentions (Business Week—Nov. 27, 1954, p. 124).

Considering the variety of tools at the disposal of our forecasters, it may appear easy to chart the immediate future. But our economy is so complex and changes so quickly that it takes great skill and judgment to forecast with any accuracy.

Even the most self-assured forecasters at the AEA meetings made plain that their predictions depend for the most part on good statistics. They feel that the

Government must continue to improve its statistical information, particularly in such fields as construction, inventories, and unemployment.

Moreover, most economists, including those who have faith in their short-range forecasts, agree that their medium- and long-range predicting is still little better than informed guesswork. In fact, most of the predictions that we have for 1960 or 1965 are merely projections of desirable objectives. Yet the AEA emphasized that both Government and business need to know more about long-term conditions if we are to avert the cyclical fluctuations we have experienced in the past.

If economists get better data and improve their methods, the bright record made in the last year will undoubtedly be improved. This is essential if we are to achieve a full measure of progress and stability.

Political Elements in Full Employment Policy

A paper delivered before the American Economic Association, Detroit, Mich., December 29, 1954, by Stephen K. Bailey, Princeton University

Earlier in this century, a distinguished economist wrote a book the last chapter of which was entitled, "If I Were Dictator." It was a glowing account of what economic measures would save society if only politicians were not around to louse things up.

My theme today is built around the dismal forecast, now widely shared by most economists, that politicians are likely to be around for some time to come. Let me hasten to add, however, that there are stabilizing factors at work and that the secular trend is bullish, although the rate of development may not be great enough to guarantee in the short run the maximum utilization of all the resources of the American Economic Association and the American Political Science Association.

It is 10 years, almost to the day, since a group of economists, political scientists, and politicians sat around a table on Capitol Hill and drafted a so-called full employment bill. In the eyes of history, this temporary confluence of professions may have been of more importance than the Employment Act itself. For one of the central problems before both economists and political scientists is how to make politicians as smart as we are and (if I may be pardoned a heresy) vice versa. This is what Lord Macauley had in mind when, referring to currency reform in the reign of William II, he said, "It would be interesting to see how the pure gold of scientific truth found by the two philosophers was mingled by the two statesmen with just that quantity of alloy which was necessary for the working."[1]

The problem is not new. What is new is the degree of our own self-consciousness that an interdependency exists. One of the salutary results of the Employment Act has been the forcing together of professional economists and professional politicians on a scale hitherto unknown in this country. In Mr. Nourse's felicitous expression, "the research division, the engineering division, and the sales division," have been constrained to sit down together. Even if Mr. Nourse himself found this confluence at times an unhappy one, he has enormously increased our sum of knowledge about the pitfalls of this necessary collaboration.

I do not wish this morning to attempt a detailed summary of the obvious. You are more fully aware than I of the political elements in full employment policy. In fact, the most sophisticated writing in this field has been done by economists, not by political scientists. I need only refer to the writings of Mr. Blough and Mr. Nourse to make my point. They, and others, have listed the tough ones.

But purely as a preliminary catechism, let me recapitulate a few major points:

1. America is a vast and highly pluralistic society. There is no hand, seen or unseen, which is capable of homogenizing all of the diverse political and regional appetites of our country into a uniform, grade A public interest. This frequently leads to shifting compromises and second-bests in economic as in most other policies.

2. Full employment in a free society is an aggregate concept. The constituent pressures on a Congressman are often highly "unaggregate."

3. Politicians, like some other people who shall remain nameless, occasionally differ on the subject of what policies actually will produce a condition of full employment. The difference between politicians and others in this respect is that

---

[1] Quoted in C. H. Hankin, The Mental Limitations of the Expert: India, Butterworth & Co., Ltd., 1921, p. 27.

if politicians guess wrong, they run the risk of losing their jobs. They have a tendency, therefore, to do a very cowardly thing: they hedge.

4. There is in America a tradition of what Burt Marshall has called "serendipity." Serendip is an ancient term for Ceylon. Mythology recalls that there were once three princes of Serendip. In Mr. Marshall's words, these three princes were "special favorites of benign fortune. Things never worked out as the princes planned them, but they always worked out remarkably well, nevertheless, and the princes went through life blessed with unintended and unforseen happy consequences." [2] The principle of serendipity accounts for whatever truth there is in Grover Ensley's claim that, on the whole, congressional action in the economic field during the past 10 years has been sounder than the advice of economic experts. Serendipity makes some Congressmen smug—more smug, perhaps, than is warranted by an uncertain future.

5. The phrase "full employment policy" seems to imply a consistent and coordinated Federal effort. That coordination is made remarkably difficult by the extraordinary jogs in Pennsylvania Avenue from 17th Street, NW., to Second Street, SE. Twists of institutional jealousies and prerogatives in the tax and appropriations lanes alone make driving hazardous and destinations uncertain.

6. Even within the executive branch, departments like Agriculture, Labor, Commerce, Interior, Treasury, and the Veterans Administration do not always see eye to eye with each other—or with the President. And there is of course the problem of independent and quasi-independent agencies like the Federal Trade Commission, the Interstate Commerce Commission, the Federal Reserve, and Mr. Wright Patman.

7. Even within the Executive Office of the President, there is no assurance that all those who should, actually will meet together in the lobby of the Sherman Adams hotel.

8. State and local governments make decisions about spending and investment on the basis of political considerations frequently ignored by department heads and Presidential advisers in Washington. I happened to be mayor of Middletown, Conn., when Mr. Humphrey, with the help of some friends in the Federal Reserve, slammed on the brakes in the spring of 1953. Fortunately for Middletown (and perhaps for Mr. Humphrey and the United States), his foot slipped. We would have built the schools anyway, but an interest rate of 1.90 is a lot easier on the books and the ballots than 3.25. And never underestimate the power of local officials. Representative Seely-Brown is a Republican and I am a Democrat, but I called him Seeley and he called me Steve.

9. State and national elections come periodically. It is becoming increasingly obvious that a healthy readjustment is easier in odd years than in even.

10. Finally, the apocalyptic spectrum known as international relations is in the hands of politicians, here and abroad. Full employment policy is mightily conditioned by international events; even if the reverse is also true.

These are some of the major political variables which stand between the scientific economist and consistent economic policy. They are what I would call the centrifugal forces in our Government. The search of both economists and political scientists in the past two decades has been for countervailing, centripetal forces which might increase the rationality of decisionmaking in the field of economic policy. We have a long way to go, but I think we ought to count our blessings. Progress has been made, and the progress is impressive.

The first centripetal force has been in the field of economics itself. Through brilliant analytical work, the economics profession has narrowed to its own areas of disagreement. There are few economists left, for example, who would argue for a tax rise in a major depression, as Roosevelt did. The crystallizing orthodoxies of the economics profession make their way into both branches of the Federal Government, and after a slight delay have an enormous impact upon policies. As Lord Keynes wrote so brilliantly: [3]

"The ideas of economists and political philosophers, both when they are right and when they are wrong, are more powerful than is commonly understood. Indeed the world is ruled by little else. Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually slaves of some defunct economist. Madmen in authority, who hear voices in the air, are distilling their frenzy from some academic scribbler of a few years back. I am

[2] Charles Burton Marshall, The Limits of Foreign Policy: Henry Holt & Co., New York, 1951, p. 46.

[3] J. M. Keynes, General Theory of Employment, Interest, and Money: Macmillan & Co., Ltd., London, 1936, pp. 383–384.

sure that the power of vested interests is vastly exaggerated compared with the gradual encroachment of ideas."

There has been a heartening increase in agreement among the members of the Joint Committee on the Economic Report during the past 6 years, and I submit that this increase would have been impossible without the establishment of prior agreement within the economics profession itself.

The second centripetal force has been at the level of executive organization. The tentative, and almost accidental, character of executive branch interest in problems of economic stabilization 40 years ago is reflected in a letter written to President Wilson by his Secretary of Commerce dated May 7, 1913. The letter reads as follows: [4]

"SIR. There is much practical wisdom in the suggestion made by you to Secretary McAdoo yesterday, respecting the advancement of public works under present conditions, that I venture to add a word in the same line.

"The point of attack in the matter will not be with the executive departments. These, inspired by you, will act quickly when authorizations and appropriations allow. It is the chairmen of the two Appropriations Committees who control the situation. I would suggest a conference, at early convenience with these chairmen and with Mr. Underwood, and others if you prefer, to point out to them the practical value to us now (not at a future date, but today) of such appropriations as wil permit the progress during this summer and fall of contract work as fully as possible.

"The Department of Commerce has asked appropriations for lighthouse and other work already authorized, aggregating something over a million dollars, at many different points. They are no more needed than other public works, but they would add to employment and the distribution of funds, and if appropriations were deferred to the next session of Congress a year would be lost, during which much might happen. Practical commonsense would seem to indicate the wisdom not only of appropriations for needed public works, but the political expediency of having those appropriations quickly, for the reason so cogently stated by the Secretary of Labor yesterday.

"Respectfully."

In regard to Executive-legislative relationships, this letter is as hot as tomorrow's headlines. Many of the problems it raises are still unanswered. But there have been major changes in the institutional mechanisms for appraising the President of what he can or should do. The great landmarks in this development have been, of course, the Budget and Accounting Act of 1921; the Reorganizations Acts of 1939, which established the Executive Office of the President; the Employment Act of 1946; the National Security Act of 1947; and the subsesuent administrative additions and changes which have been made within the Executive Office framework itself. The executive departments and agencies still ride off in a variety of directions; strategic and tactical moves in relation to Congress are still handled gauchely at times; but the clearance and advisory mechanisms in the Executive Office have markedly increased the chances that policy freewheeling will be a matter of political choice not of staff default. And these mechanisms are constantly being refined. The reconstitution of the Council of Economic Advisers in 1953, for example, established an Advisory Board on Economic Growth and Stability under the chairmanship of Arthur Burns. This interdepartmental Board includes representatives, at the Under or Assistant Secretary level, of Treasury, Agriculture, Commerce, and Labor. It also includes a member of the Board of Governors of the Federal Reserve System, the Assistant Director of the Bureau of the Budget, and Dr. Gabriel Hauge of the White House staff. There is no necessary magic in interdepartmental committees. Washington probably suffers from too many of them. But in this particular case, an interdepartmental advisory committee may be an extremely useful educational and policy coordinating device.

A third series of centripetal forces have developed in Congress and in the structure of political parties. The Legislative Reorganization Act of 1946 was not an unmixed blessing in this regard, but it did result in the establishment of majority and minority party policy committees in the Senate, it did cut down on the number of standing committees, and it did focus attention on the problem of diffusion in congressional activity. The very existence of the Joint Committee on the Economic Report and the Joint Committee on Internal Revenue Taxation

---

[4] Letter from William C. Redfield, central records of the Department of Labor in the National Archives.

with their respective staffs indicates that Congress is aware of the need for a more unified appraisal of fiscal and economic programs.

Both Republican and Democratic National Committees have increased their research services to Congress, and have sincerely tried to find common denominators of agreement on economic issues within their respective parties.

Regularized channels of communication between the President and the Congress have increased in quality and quantity during the past two decades. I refer not only to the care now taken in the preparation of the three annual Presidential messages: The state of the Union message, the budget message, and the Economic Report; but to the new liaison status given to the Vice President, the weekly meetings between the President and his congressional leaders, and the more systematic use of department heads in defending the President's program before the Congress.

These are all encouraging signs. But, unfortunately, centripetal mechanisms, no matter how carefully they are designed are not enough. As J. S. Mill once said, "In politics, as in mechanics, the power which is to keep the engine going must be sought for outside the machinery." In the final analysis, economic stabilization like any other policy goal depends upon the system of value priorities and the political skills of those who wield political power. No matter where we turn in government we find that economic goals are conditional. Man does not live by bread alone. The goals of physical survival and of freedom itself are not necessarily in conflict with, but they are certainly antecedent to, and higher on the value ladder than, any circumscribed economic goal, no matter how desirable. To get at these value interrelationships we need a lot more than a Council of Economic Advisers or a Joint Economic Committee. We need political leadership at both ends of Pennsylvania Avenue—leadership which is capable of performing the highest task of statesmanship: the mobilizing of power behind articulated goals. In the kind of governmental system we have in America, this is an extraordinarily difficult assignment. Lines of responsibility and accountability are not clear cut. The vast and frequently competing congeries of power represented by interest groups in our society are not easily moralized or even contained. The shifting sands of public opinion and the swiftness of changing events makes the very task of goal-setting and political implementation extremely hazardous. And yet the mobilization and harnessing of political power is the only master key to the development of consistent programing in the economic or any other field.

This puts an extraordinary burden upon the President of the United States. Mr. Truman realized this when, without prophetic insight as to his successor, he stated that the President's desk is like a general's. Truman outlined what he called the five vital steps of strategy: (1) Estimate your own resources; (2) estimate your enemy's resources; (3) form a judgment as to what is to be done; (4) implement that judgment with a plan; (5) persuade your leaders of the value of that plan, and mass your forces for the attack.

This is almost a perfect description of what most Presidents have not done, or have done badly. Presidential leadership means what human leadership has always meant: taking account of multiple forces and interests in a more subtle and forceful way than traditional, formal procedures generally permit. Possibly the greatest single weakness of the present administration is its faith that institutional arrangements, secretariats, and rationalized divisions of labor in the executive branch are by themselves adequate to deal with the complex and diverse value configurations of our national polity. The setting and dramatizing of goals, especially in the economic field, has been intermittent, often contradictory, and almost casual. It was not until the exigencies of a political campaign forced the issue, that the President was willing to set economic goals for longer than a month or two in advance. I only hope and trust that this reluctance to perform the highest function of Presidential leadership was not due to staff suggestions that because forecasting is not economically "scientific," the President should ignore his prophetic role. If this was the case, it only lends fuel to the fire of my own conviction that untainted, professional, scientific economists belong back in a dark corner of the Budget Bureau, not at the level of direct advice to the President. However hard it may be on the egos of some economists, the Council of Economic Advisers was not set up to please the American Economic Association. The Employment Act is quite clear about the policy functions of the Council. The act states explicitly that each member of the Council shall be a person who, and I quote, "As a result of his training, experience, and attainments, is exceptionally qualified to analyze and interpret economic developments, appraise programs and activities of the Government in the light of the policy declared in section 2, and *to formulate and recommend national economic policy* (not "alternative economic policies," but "national economic policy") to promote employment, production and purchasing power * * *." [Italics supplied.]

The Council, in short, was established to help the President perform his goal-setting function; to help him as a sorter of values, and to help him in his role as a mobilizer of political power. This makes the Council, inevitably, a participant in the political process, not an adjunct thereto. The act implies that members of the Council should be something more than economists, that they should be in tune with the value premises of the President, and that like the President they should be politically expendable with changes in administration.

I am aware that this is a controversial subject among economists—and that I am taking an unpopular position. But I must, as a political scientist, state my position with some emphasis. I do not believe that economists have any right to participate in high policymaking without running the risks of political involvement and political compromise. Those who will not play unless they are guaranteed immunity against politically tailored value commitments remind me of the early Fabian socialist, Joseph Burgess, who refused to compromise on some issues during a general election and thereby lost his seat in Parliament. George Bernard Shaw complained bitterly as follows:[5]

"When I think of my own unfortunate character, smirched with compromise, rotted with opportunism, mildewed by expediency * * *, putrified by permeation * * * I do think Joe might have put up with just a speck or two on those white robes of his for the sake of the millions of poor devils who cannot afford any character at all because they have no friend in Parliament. Oh these moral dandies, these spiritual toffs, these superior persons. Who is Joe anyhow that he should not risk his soul occasionally like the rest of us?"

If an economist wishes to limit his activities to objective economic analysis, he has a perfect right to do so; but that right should be exercised about 3 steps or 3 blocks removed from the President. What some economists call the "scientific" function is an indispensable function in modern government, but it is a totally different function than that prescribed for the Council of Economic Advisers by the Employment Act. If the Employment Act had established the Council as a Supreme Court of Economic Truth, it would have created an administrative monstrosity. The Presidency creates a magnetic field which structures everything it touches with the electricity of politics. An economist has no option. He must either escape the field completely, or he must be drawn into the magnetic orbit. The economics profession cannot have it both ways. It cannot claim political immunity for Mr. Burns and at the same time ignore the fact that he made a major public speech in Detroit, Mich., 2 weeks before a national election.

With all due respect to Mr. Nourse, the tortured early history of the Council was in part his own making. He attempted to make the Council into something it was never intended to be, and at its peculiar level, never can be: an oasis of pure economic science. Mr. Burns, with rare and notable deviations, has doubled in spades. This perspective has tended to make the Steelman's and the Hague's, the Snyder's and the Humphrey's the true economic advisers to the President, and his stringently limited the Council as a true policy arm of the Chief Executive. Mr. Keyserling may have carried the logic of his own position and personality to unnecessary extremes, but this was in part an understandable reaction to the sincere but pristine myopia of his distinguished predecessor.

The present sorry and bitter hiatus between the Council and the joint committee is more than a matter of personalities. It is a direct outcome of a misreading of the proper role of the Council. There may be good tactical reasons for keeping the Council away from public hearings before congressional committees, but there is every reason in the world to keep constant and friendly informal contacts rolling between the Council and the joint committee. There is every reason, that is, if both the Council and the joint committee are policy-oriented. If the Council is not policy-oriented—if it conceives of its chief function as that of adding up freight car loadings to give the President a Monday morning statistical summary of current indexes and short-run projections—the joint committee is inevitably left high and dry as a potential weapon of Presidential influence in the field of economic policy.

---

[5] Hesketh Pearson, G. B. S. (Harpers Bros., New York, 1942), p. 156.

Goal setting, although the supreme task of a President, is not worth much unless there is political followthrough. In the economic field, unless the Council helps—at least covertly—in this followthrough, the President must depend upon ad hoc expedients which lack both the strength of considered strategy and the ideological force of economic sophistication. A little recent history is perhaps germane at this point:

In November 1947, the Council of Economic Advisers reported to the President and the Cabinet that the then inflationary dangers were serious to both the short-run and the long-run stability of the economy, and suggested a 10-point legislative program to handle the situation. The 10-point program was submitted to a special session of the 80th Congress with neither proper bill drafts nor executive branch clearance on testimony to back it up. As far as I can judge from a study of the records, there was not even a suggestion of strategic thinking about pressure groups and congressional support. In January 1948, the President reiterated this demand for anti-inflation legislation in his state of the Union message. Again there was no conscious strategic planning in the Executive Office or elsewhere for the active mobilization of a working coalition to get results. In the summer of 1948, President Truman called a special session of Congress and again submitted an anti-inflation program. Virtually, the only concession to strategic thinking this time was a hurried call to Paul Porter to testify after a superficial briefing, before a congressional committee on behalf of the President's program.

After the November elections, and in preparation for the 81st Congress, the President appointed Dr. Nourse, then Chairman of the Council of Economic Advisers, as head of an ad hoc Cabinet committee to work out an omnibus economic stabilization bill. In January 1949, after much of the technical preparatory work had been finished, Secretary of Agriculture Charles Brannan took on the job of developing agency and congressional support for the bill. Here, after 15 months of virtual futility was the first serious attempt to look at the economic stabilization program in terms of building effective consent behind it. But even here, the strategic planning was pitifully inadequate.

All this adds up to the fact that the development of a consistent economic policy in the Federal Government cannot even be approximated without the central formulation of a political program and the mobilization of a successful coalition of power to carry the program through.

I cannot conclude without pointing out that Presidential leadership—even with the aid of a policy-oriented Council—is only one facet of this problem. Congress must respond with a more consistent power focus than it has developed up to now. That focus can never be as clear as the President's for the kaleidoscopic representative function of the Congress interferes—and probably should interfere. But the tolerance for programmatic anarchy should, in my estimation, be narrowed. Insofar as the force of ideas is important here, the Joint Economic Committee even now performs a significant function; although that function could be strengthened if a more sophisticated provision were made for a "legislative clearance" liaison between the members and the staff of the joint committee on the one hand, and the member and staffs of the standing committees dealing with major economic legislation on the other. It is possible that a Joint Economic-Budget Committee, as suggested by Mr. Colm, might help in the development of more consistent economic policies; although, if the Congress went that far, I think I should prefer a Joint Committee on the State of the Union which might operate each year for not longer than 3 weeks, and whose sole job it would be to hear testimony on the interrelationships of the three Presidential messages.

But again, the real key here is not minor institutional changes to help spread the cold light of reason. The Spanish writer, Unanumo, thinking of Goethe's dying words, "Light, light, more light," declared passionately, "No, warmth, warmth, more warmth; for we die of cold not of darkness. It is not the night that kills but the frost."

The great job of the Congress and of our political parties is to build responsible communities of interest around the major value goals of our society; not to reflect, but to refract and moralize, the divisive pressures in our democracy. Whoever, through personal leadership or through refining the administrative and political instruments of government, is able to develop more cohesive and responsible power behind more coherent and intelligently constructed programs will have solved the key political elements in full employment policy.

Representative BOLLING. Then there are some excellent questions which have been prepared by the staff, and since I am going to leave in a few minutes I would like to ask that the questions not answered at the session be presented to Dr. Burns so he can respond in writing to those that he thinks appropriate. (See p. 42.)

Then somewhat facetiously and exceding any legitimate authority, I would like, on behalf of the chairman, Senator Douglas, and myself, to welcome the cosponsorship of the President for that proposal the Senator and I made last year for a coordinator of public works, and get some comment from Dr. Burns as to—and this is one of the questions prepared by the staff—as to the administrative machinery for Coordinator of Public Works, and the execution of the public works program that already exists. To throw in as a second question here: Wasn't this program on public works actually handled by the Council, and was this not an operating function of the Council?

Dr. BURNS. I would like to answer your questions concerning public works to the very best of my ability. You have asked several questions, and I will do my very best with the questions as I have understood them.

Let me say at the start that I think the members of this committee, in urging the coordination of public works planning, have rendered a very useful service. A unit was established in the Council for public works planning last April. A Coordinator of Public Works Planning was first appointed to the Council's staff. Then a small group of experts was assembled to assist him in that work. This is an activity in which members of the Council have taken a very keen interest.

We feel—I personally feel, and so do my colleagues—that this activity is so important that it should be enlarged and put on a semipermanent basis. The President's recommendation in his state of the Union message, and once again in the Economic Report, is designed to do that.

For many years we have gone along in our country making ad hoc decisions about public works. At long last we now have the beginnings of a mechanism for doing systematically, within the Federal Government, what many States and municipalities have been doing for years. I think it is a progressive step.

The CHAIRMAN. I may say that I also wish to thank the Council of Economic Advisers, and the President, for adopting the principles of the Bolling-Douglas bill, and I ask that it be made a part of the record.

(The material referred to is as follows:)

[S. 2913, 83d Cong., 2d sess.]

A BILL To establish an effective program for the planning and construction of needed public works and to create the Office of Public Facilities Administrator

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That this Act may be cited as the "Public Facilities Act of 1954".

SEC. 2. It is hereby declared to be the purpose of this Act, in the interest of maximum economic and military security, (1) to provide a means whereby the Federal Government can more effectively take advantage of available manpower and productive capacity, in a manner consistent with the declaration of policy of the Employment Act of 1946 (and particularly with respect to cooperation with State and local governments), to develop needed public facilities for the general welfare, safety, and productivity of the people of the United States, and (2) to offset declines in private investment, production, and employment by the construction of carefully planned and needed public facilities to contribute to continued economic stability and growth.

SEC. 3. (a) To assist in carrying out the purpose of this Act, the President is authorized to appoint, by and with the advice and consent of the Senate, a Public Facilities Administrator in the Executive Office of the President (hereinafter referred to as the "Administrator"). The Administrator shall receive compensation at the rate of $17,500 per annum.

(b) The Administrator shall be Chairman of an Advisory Committee consisting of the following: Commissioner of the Bureau of Public Roads; Commissioner of the Office of Education; the Surgeon General of the United States Public Health Service; Chief of Engineers; Chief of the Forest Service; General Services Administrator; Housing and Home Finance Administrator; an Assistant Secretary of the Interior; an Assistant Secretary of Labor; an Assistant Postmaster General; an Assistant Secretary of Defense; Director of Defense Mobilization, and the Chairman of the Atomic Energy Commission.

SEC. 4. The President, with the assistance of the Administrator and the Advisory Committee, shall devise programs for submission to the Congress, consistent with the purpose of this Act, to aid in the construction of needed public facilities by the Federal Government, State and local governments, and authorities set up under the jurisdiction of State and local governments. In developing Federal programs for the assistance of State and local governments, and public authorities set up under the jurisdiction of State and local governments, consideration shall be given (among other means) to the desirability of providing (1) direct financial assistance, (2) a secondary market for securities, (3) loan guarantees, (4) reimbursable loans for advance planning, or (5) technical assistance.

SEC. 5. Whenever the President, after consultation with the Council of Economic Advisers and the Administrator, determines that acceleration or contraction of the construction of needed public facilities will be consistent with the purpose of this Act, he may designate the fields and areas in which Federal public-works programs and Federal assistance to State and local government programs should be increased or decreased, and any money authorized and appropriated for use in these fields and areas shall be allocated or placed in reserve by the Bureau of the Budget accordingly.

SEC. 6. The President shall include in his Annual Economic Report to the Congress (1) specific information on the reservoir of public facilities needed and planned by Federal, State, and local jurisdictions, (2) a statement of the policy of the Federal Government with respect to the construction of such facilities, and (3) recommendations for such legislation to implement that policy as he may deem appropriate.

SEC. 7. There are hereby authorized to be appropriated such sums (not to exceed $100,000 in any one fiscal year) as may be necessary to provide for the compensation and operating expenses of the Administrator.

Representative BOLLING. That is all I have, Mr. Chairman. Thank you.

The CHAIRMAN. Congressman Curtis.

Representative CURTIS. No questions.

The CHAIRMAN. Congressman Mills.

Representative MILLS. Dr. Burns there were some questions suggested for the Council, or 1 or 2 of them, on which I would like to have comment, now, before I forget them.

What rates of national economic growth should Government economic policy attempt to facilitate?

Dr. BURNS. That is a question to which neither I nor, if I may be so bold as to say that, any other person can give a responsible quantitative answer.

I am inclined to think that we ought not to be satisfied with any rate of growth that we attain. We ought to try to better it. But I would hesitate about expressing that thought in a numerical phrase.

Representative MILLS. Well, let me ask you this question: What is the objective of the President with respect to balancing the budget, and which budget, the cash budget, or the administrative budget, and so on?

Dr. Burns. At this particular point, Senator Douglas——

The Chairman. Congressman Mills.

Dr. Burns. Yes, but I must address a question to the chairman now. I have been asked a question concerning the President's personal objectives as to the budget, and it is not clear to me that that is a question I should try to answer.

Representative Mills. Well, it was leading up to another question, so I will withdraw that one and ask another one.

The Chairman. You assume, Mr. Mills, the policy that has been announced heretofore. I think the President has announced his policies on that.

Representative Mills. That is not really important to the question I had in my own mind.

I am wondering if in the opinion of the Council a continued program of deficit financing in 1956 will affect the soundness of the very sound American dollar?

Dr. Burns. Well, as I see it, in fiscal year 1956, we are likely to have in a practical sense a balanced budget. Let me explain that. The President's budget message indicates a prospective deficit, when the budget is taken on the conventional basis, of $2.4 billion, if I recall the figure correctly. It also indicates a surplus of $600 million, again if my memory is correct, for fiscal year 1956, on the basis of the cash budget.

Now, these are the figures presented in the budget message, and repeated in the Economic Report.

May I——

The Chairman. Go ahead. I was just thinking of another question, but that was improper of me and I rule myself out of order.

Dr. Burns. Well, you are perfectly in order, as far as I am concerned, Senator.

The Chairman. No; go ahead, please.

Dr. Burns. It is my expectation and hope that the budget showing for fiscal year 1956 will be better than the figures I have cited. A continued effort to reduce expenditures will be made, so that the projected figure on expenditures for fiscal year 1956 may well turn out to be a little on the high side. As I see it, we are in the immediate vicinity of a balanced budget.

I have not yet answered your question. I wanted the arithmetical aspects of the budget to be perfectly straight, or as straight as I can make them, before doing that.

Representative Mills. Dr. Burns, I am hopeful that your optimism with respect to the budget will be realized, but in the event that it is not realized, and deficit financing continues into fiscal year 1956, and may be even projected into fiscal year 1957, would that not be inflationary and therefore affect the soundness of the dollar as it exists today?

Dr. Burns. I find it impossible to answer that question in the abstract.

The existence of a budget deficit, as such, may or may not generate inflation.

In the first place, you have to draw a distinction between the conventional budget, on the one hand, and the cash budget, on the other. My opinion is that Federal finances are neutral, by and large, with respect to the economy when the cash budget is in balance, and that nowadays means a deficit of 2 or 3 billion dollars in the conventional budget.

This general statement, however, is of limited value. In practice you have to look at the particulars of any given year or any given economic situation. At a time when there are extensive unused resources, the existence of a deficit, even on a cash basis, need not mean that inflationary pressures exist. It may mean just the contrary. The very fact that you have unused resources may well mean that there is a downward pressure on prices, even though you have an unbalanced cash budget.

Representative MILLS. Well, do I understand, then, Dr. Burns, that it might be possible for the Congress to further reduce taxes on individuals without necessarily constituting a threat of inflation?

Dr. BURNS. You will have to specify particulars before I could answer that question responsibly. If you are thinking of conditions as they are today, I should think that a reduction in taxes at the present time by the Congress would be extremely unwise and that——

Representative MILLS. I did not mean unwise now. I may be able to agree with you on the wiseness of it.

Dr. BURNS. I am coming to your point.

Representative MILLS. All right.

Dr. BURNS. And it might incite inflationary pressures.

Representative MILLS. Well, you have confused me a little bit now.

Dr. BURNS. I would be very glad to clarify, if I may.

Representative MILLS. I might say that it is not difficult for me to be a little bit confused in the field of economics, but I am trying to rationalize the situation.

Now, if an unbalanced budget of $2.4 billion would not be inflationary for the coming fiscal year and would not make unsound the sound American dollar we have, another $2½ billion of deficit financing might be inflationary; is that your point?

Dr. BURNS. I have not expressed any opinion as to whether a deficit of $2.4 billion in fiscal year 1956 will or will not be inflationary. Before I could express an opinion on that, I would have to specify the economic shape that is assumed for that year.

Representative MILLS. Well, on the assumptions that you make for the year, I assume that you make certain economic assumptions upon which you base your predictions.

Dr. BURNS. My judgment on the basis of those assumptions, as of the present, is that the budget for fiscal year 1956 will not be inflationary. That is my present view.

Representative MILLS. Well, on the basis of the same assumptions, would it be inflationary if the deficit were increased by two or two and a half billion dollars, if that $2½ billion represented a decrease in personal income taxes which would be expected to enter into the normal channels of trade?

Dr. BURNS. If the budget deficit were increased beyond the present estimate of $2.4 billion, which, as I stated, I think is probably on the high side, we would be taking a risk of exciting inflationary pressures.

Representative MILLS. But if your optimistic hope is realized, and I say I concur in your hope that it is realized, that we get definitely into a balanced situation, on the basis of the estimates of our future economic situation, and reduction in expenditures, then the $2½ billion loss in tax reduction would not be inflationary because it would just take the place of the $2.4 billion which is now estimated in the budget.

Dr. BURNS. Well, if my present optimism is fulfilled, Congressman, the national income will be even a little larger than the figures that underlie the present budget estimate. To set about and create a budgetary imbalance at a time of very high employment involves, I think, taking a grave risk with the country's money.

Representative MILLS. That is all, Mr. Chairman.

The CHAIRMAN. I may say, that in the discussion of the 1954–55 budget, last January, at that time the adminstration estimated that the deficit for 1954–55 would be $2.9 billion, and they now estimate that it will be $4.5 billion, so as it was there was an underestimating of the deficit for this year of $1.6 billion.

Dr. BURNS. Yes, that is true; and it was due to two factors. One was a decline in economic activity and the other was a larger tax reduction than the President recommended in his budget message.

Representative MILLS. Well, Mr. Chairman, that arouses a further question on that point, if I may.

The CHAIRMAN. Go ahead, please.

Representative MILLS. What reductions other than a billion dollars of excises did we vote last year that the President did not recommend?

Dr. BURNS. I do not believe that there was any in addition, but there was that.

Representative MILLS. Well, that would not make that difference.

Dr. BURNS. Well, the difference between the two figures cited was less than $2 billion, and $1 billion is one-half of $2 billion. Beyond that, and putting to one side what was done to reduce expenditures below the original estimate, we did have a decline in economic activity.

Representative MILLS. Well, that is the main reason for it. I would think that is the main reason for the difference in the earlier estimate and the later realization.

Dr. BURNS. It was certainly a factor in the situation.

The CHAIRMAN. Congressman Curtis.

Representative CURTIS. No, I have no questions.

The CHAIRMAN. Senator O'Mahoney.

Senator O'MAHONEY. Thank you, Mr. Chairman.

Mr. Burns, my concept of this report, as all reports of the Council of Economic Advisers, is in the nature of a recommendation to the Congress for its guidance in approaching the problems that will have to be met on the economic side. I would like to ask, if I may, what assumptions you made or were made in the preparation of this report and its recommendations, as to whether it is a report on a peacetime economy, a defense economy, or an international cold-war economy.

Dr. BURNS. Your last term is perhaps the most nearly descriptive. We have a peacetime economy at the present time, but a peacetime economy with military budgets vastly larger than any that we have been accustomed to associate with a state of peace.

Senator O'MAHONEY. Then you would agree that if the military budget were severely cut there would have to be substituted for it substantial expenditures of a civilian nature, a public-works nature, or something in the normal category of peacetime operations to maintain employment and profits on anything approximating their present levels?

Dr. BURNS. Well, as you put the question, it is purely a matter of arithmetic, is it not?

Senator O'MAHONEY. I think so.

Dr. BURNS. That if one part of the Nation's total of expenditure, namely, that devoted to military purposes, is reduced, then if we are to maintain economic activity at an unchanged level, then surely other parts or other categories of expenditures will have to show increases. If this is what you mean, of course, you are right.

Senator O'MAHONEY. Then to maintain an international cold-war economy, I take it you would agree that we must be prepared to continue those expenditures which are necessary to keep our defense flowing and, at the same time, to shade toward balancing the budget in order to maintain the strength of our own capitalistic economy?

Dr. BURNS. I know nothing about military matters—but it is perfectly clear to me that we must spend whatever is required to maintain the defensive strength of our country.

Now, as for the budget, we should strive by and large for a balanced budget, but we should also be prepared for deficits at certain times, and for surpluses at other times, depending upon economic conditions.

Senator O'MAHONEY. To what extent can we safely hold out to the people, and I am asking now on the part of the economy, the hope of further tax reductions while we hope to maintain or strive toward a balanced budget?

Dr. BURNS. Let me say this, Senator: We have a tax structure at the present time that was built up to meet the Korean threat. I fear that if our present taxes are continued for a very long time, they would constitute a drag on the economy.

Senator O'MAHONEY. Well, we now have the Formosan threat presented to us today in a message from the President. We cannot disregard that, can we?

Dr. BURNS. I do not think we can disregard anything that in any way threatens the security of our Nation. I think we must start from that, since nothing is more important than that.

Senator O'MAHONEY. I think we all agree on that. Yesterday the Secretary of the Treasury, Mr. Humphrey, on Meet the Press, responding to the pointed inquiries of representatives of the press, spoke of the possibility of continuing decreased expenditures and he discussed the likelihood that expenditures would continue to fall.

Is that the assumption on which this budget is based?

Dr. BURNS. The assumptions concerning expenditures are stated in the budget message, and repeated in the Economic Report. Certain figures concerning prospective expenditures are put down. Now, those of us who are concerned with these matters in the executive establishment continue to hope that a little less than that will be spent, though we all recognize that additional cuts in expenditure from now on are going to be very much harder to make than the cuts that were made during the past 2 years.

Senator O'MAHONEY. Secretary Humphrey also stated in that interview that it would be necessary for the Treasury to ask Congress for a higher debt limit toward the end of this fiscal year. You, of course, had that in mind in the preparation of this economic budget. There are expenditures in this budget amounting to $14 billion plus, estimated as obligations which must be paid no matter what happens, as, for example, the interest on the national debt, social-security payments when unemployed, when people are thrown out of employment, and the like.

And now there is talk of a very large broad-gage road program which is highly necessary, but which is to be financed in a manner by which the Government, the Federal Government, will guarantee the bonds and the moral obligation, certainly not a constitutional obligation, would be imposed upon the Congress during 30 years to make appropriations necessary to cover the interest upon those bonds.

Have you taken that interest cost into consideration in your thinking about the interest on the national debt?

Dr. BURNS. Well, of course we have considered the economic implications of the highway program. I must say this, Senator, that the precise shape of the program and its proposed financing will not be known until the President's message on that subject is presented to the Congress.

Senator O'MAHONEY. Well, let us not tie it to the President.

Dr. BURNS. The reason I say that, Senator, is that I am not at all sure that some of the remarks that you made concerning the financing of the highway program will turn out to be valid when the President's recommendations on this subject are submitted.

Senator O'MAHONEY. My remarks will not be valid?

Dr. BURNS. I say, they may not be.

Senator O'MAHONEY. I did not get the negative. I was wondering whether you were making that statement. I wanted to make it clear.

I cited it merely as an illustration and not as a basis for argument because a similar proposal was made last year, or the year before, if I remember correctly—and this I think originated in Congress—but with respect to the building of post offices, it was an attempt, by the issuance of bonds, to authorize an expenditure of Federal money without increasing the national debt, and that has always seemed to me to be a pure illusion.

If the Congress of the United States is under obligation to make appropriations to meet obligations, no matter what the legal form that was used to create the obligation, it becomes part of the debt; do you not agree with me?

Dr. BURNS. I think there is a great deal of force to your observations, Senator.

Senator O'MAHONEY. Well, now, do you have recommendations in this report which will enable the Congress to take efficient means of keeping the national debt down, or is the situation which confronts the Nation one that will require us to continue to raise the debt?

Dr. BURNS. I can only say this: If we are to modernize our highways on the scale which seems required by current conditions, we have a choice between taxing ourselves very heavily for the purpose or borrowing the money for the purpose. My guess would be that if we decided to do it on a pay-as-you-go basis, year in and year out, the modernized highway program which we all agree is desirable, if not necessary, would be much delayed.

Senator O'MAHONEY. Well, I have always been an advocate of the pay-as-you-go program. The reason I feel that way is not only because of old-fashioned ideas of living within one's income, whether one is an individual or a State, although I recognize that the State can do what an individual cannot do with respect to neglecting the payment of its debts, but it was all based upon the fact that experience teaches us that the cost of things that we are now paying and feel compelled to buy has increased by such leaps and bounds that unless we do follow the pay-as-we-go program and let the people know the cost of what they are buying, we are likely to increase the burden of the debt, whether it is concealed by bonds, supposedly revenue bonds, or bonds such as suggested by the post-office bill last year, so as to make it impossible for the country to meet this obligation.

Dr. BURNS. Well, you have raised, I think, an interesting and fundamental question. I only wish we had the time and opportunity to unravel this problem.

Senator O'MAHONEY. This I know, Dr. Burns. Let me say this: I sat on the Defense Appropriations Committee, and I saw the figures showing the tremendous increase in instruments of war that we were buying. Now, that cost has been increasing. I remember when Secretary Lovett appeared before our Subcommittee on Defense Appropriations, and compared the number of electrical wires in a modern plane, the plane that we were trying to finance then, with the number of wires in the best and most destructive plane that we had at the end of World War II, and my recollection is that the new plane which we were building had about 25,000 wires as compared with about 5,500 of the other. In other words, the increasing cost of war is just multiplying beyond all imagination, and I feel, therefore, that an economic report must make these things absolutely clear when we talk about debt and the financing the debt, and the interest on the debt.

Dr. BURNS. There is one sentence in the Economic Report that perhaps should have been expanded upon that deals with the very basic question which you have raised. With your permission I would like to read it.

Senator O'MAHONEY. Surely.

Dr. BURNS (reading):

> Although a steady pace of construction financed through the sale of bonds to the public would normally be the best procedure, expenditure and financing plans could be adjusted in the interests of general economic stability.

Now that I look at it, I would like that sentence better if it read "should be" adjusted.

Senator O'MAHONEY. What page is that?

Dr. BURNS. This is on page 62.

In other words, there may well be times within the next 10 years when in view of the state of the economy the only wise course would be to pay for the highway program by taxation rather than by issuing bonds.

Senator O'MAHONEY. Or by tolls?

Dr. BURNS. Yes. Well, tolls, after all, are a form of taxation.

Senator O'MAHONEY. Surely, but the fellow who is using the road knows he is paying for it.

Dr. BURNS. That is right, and that form of taxation, I think, is one to which the Congress would be well advised to give very serious attention.

Senator O'MAHONEY. Now, let me ask you to turn your attention to pages 18 and 19 of the report. The third sentence on page 18 reads as follows:

> Consumers not only maintained their spending at a consistently high level, but reduced their rate of saving during 1954.

Is there any information as to whether that reduction of saving was a matter of compulsion because other sources of income had disappeared, or was it because savers had come to the conclusion that there was no cold war, and no great economic problem, and that they were free to spend their savings?

Dr. BURNS. Well, what actually happened during the year is that the disposable income of the people increased, and the proportion of that income which was spent on consumer commodities and services increased.

Senator O'MAHONEY. No, I am referring to the statement that the rate of saving was reduced. In other words, the average citizen must have come to the conclusion that he did not have to save as much or he was compelled to reduce his savings.

Dr. BURNS. Well, the rate of savings was reduced in the sense that the proportion of dollar savings to the total disposable income of the people fell somewhat during the year. Now, why people acted in that fashion is a question that——

Senator O'MAHONEY. Well, I did not ask you to speculate on it. I wanted to know whether you had gathered any information as to what the real reason was.

Dr. BURNS. I have no information that I would regard as authoritative as to the reasons for this decline in the rate of saving.

Senator O'MAHONEY. Well, now, let me skip to page 19 and I will close my questioning with this: In the second paragraph on the top of page 19 you are discussing the fact that the Government was not satisfied with the passive role; it tried to act definitely to bring about the results it had in mind:

> One of the earliest acts of the new administration, after taking office in January 1953, was to remove price and wage controls in order to restore the functions of the competitive markets. With a boom psychology existing at the time, and unemployment at a vanishing point, this reform carried the danger of inducing fresh inflation. A precautionary policy of restricting credit expansion was therefore adopted. The aim was to prevent a reckless increase of investment and a deterioration in the quality of new credits, such as had often characterized the closing stages of economic booms in our history.

There follows a discussion of credit restraint, and why later on in the year it became evident that that was no longer necessary.

That is all preliminary to the statement that yesterday in the New York Times, in the business section, I read, and today, on the first page of the New York Journal of Commerce, the statement that the Treasury is now contemplating issuing another long-term high-interest bond.

Does that mean, if it is true, that the Treasury is contemplating another move toward the restraint of credit, or does it feel that inflation is pending?

Dr. BURNS. I feel, Senator O'Mahoney, that that question should be answered by the Secretary of the Treasury.

Senator O'MAHONEY. Well, I asked it only because the first phase of that policy is discussed at length here, and after having explained the abandonment of the policy——

Dr. BURNS. I merely mean that I do not now feel free to discuss policy further.

Vice Chairman PATMAN (presiding). We will state for the benefit of the gentleman from Wyoming, Friday and Monday we will hear the Secretary of the Treasury.

Senator O'MAHONEY. May I ask one further question, then?

On page 7 you have a paragraph entitled "Enlarging the Opportunities of Competitive Enterprise." The first sentence refers to private enterprise. The second paragraph deals with the Government's action in redrawing the line separating private and public empires.

I wonder if you would give us the definitions that you have in mind of the competitive enterprise, private enterprise, public enterprise, whether all private enterprise is competitive or whether public enterprise is competitive at any time, and so forth.

Dr. BURNS. I wish I could say, Senator O'Mahoney, that all private enterprise is competitive. Unhappily I cannot. I do feel, however, that it is an ideal that is well worth striving for.

Senator O'MAHONEY. And you wish this report to be interpreted as being inspired by the desire to promote competitive private enterprise, not monopolistic private enterprise?

Dr. BURNS. You have expressed my thought completely, Senator, and I wish to thank you.

Senator O'MAHONEY. Well, I will end on that note.

Vice Chairman PATMAN. I believe we have gone around the table now. Do any other members desire to ask questions? Mr. Mills, did you have something?

Representative MILLS. Mr. Chairman, I hesitate to pursue the matter. I had one other thought. Senator O'Mahoney has gone into it in part.

Dr. Burns, in this matter of issuing bonds, debentures which are not included as a part of the public debt, does that seem to be a growing tendency, and, if so, is it a sound proposition?

Dr. BURNS. It certainly is a growing tendency on the State and local levels.

Representative MILLS. I mean in the Federal Government now.

Dr. BURNS. To the best of my knowledge there is no such tendency within the Federal Government.

Representative MILLS. Well, I had in mind certain bonds and debentures authorized, I believe, by the distinguished gentleman over here, in the Commodity Credit Corporation, which, of course, have been issued for some time.

Representative WOLCOTT. I will call attention to the fact that at one time we had 18 billion outstanding in RFC debentures, so when Dr. Burns said there might be some contractions on our activity, I think we should have in mind as to what has been going on in these lending agencies.

Representative MILLS. I did not like it then, Mr. Wolcott, as to that being outside of the Government debt. You know of no trend, then, on the part of the Government to issue notes and debentures and not have them considered in the public debt?

Dr. BURNS. I am not aware of any significant trend in that connection, except that the question has come up in connection with the new highway program. It has been variously discussed in that connection.

Representative MILLS. Those of us who may say that it may be handled that way may be wrong, I remember you suggested to Senator O'Mahoney, so I will not pursue it.

Senator O'MAHONEY. May I ask, Dr. Burns, whether you have personally given any thought to the suggestion that has been made numerous times in the past that the Federal budget should be cast in a new form and consideration be given to capital investment and current expenditures, dividing the two, and if so, if you care to express any opinion about it?

Dr. BURNS. I have considered that question over the years and I have considered it since I have been here in Washington. I feel it would be desirable to shift emphasis from the present conventional budget to a cash budget. I think the cash budget is more significant from the viewpoint of the impact that Federal operations have on the economy.

As for a capital budget, I could make out an excellent case for it theoretically, but life being what it is, and people being what they are, and all of us being subject to temptation, I would be very reluctant indeed to recommend at the present time the adoption of a capital budget. It is not enough to be able to argue the theoretical side of that case to one's own satisfaction and perhaps that of others.

Senator O'MAHONEY. Thank you, sir.

Representative MILLS. Mr. Chairman, Dr. Burns, let me get your views as an economist on certain recommendations which have been made to the Congress with respect to taxes.

As a prelude to my question, I call attention to the fact that in 1954, when the President requested a continuation of the corporate tax rate at 52 percent for the year, I voted against it in the Ways and Means Committee, as my colleague from Missouri will remember. You have indicated already that certain rates of taxation, if continued indefinitely, might well become a burden. I suppose you mean a regressive operation. How long can we continue this 52 percent corporate rate on the basis of your present estimates without it becoming an undue burden upon business so as to prevent expansion?

Dr. BURNS. I wish I knew enough to answer your question precisely. Unhappily, I do not. I think we are subjecting our economy to a severe test in imposing a rate of taxation on business firms which is that high; and I do not deem it wise to continue to subject our economy to that test for very long.

On the other hand, there are considerations of fiscal prudence that we also cannot ignore. At a time when business activity is as good as it is at present, and when we are still operating at a deficit, it would be unwise, I think, to give up, right now, any taxes.

Now, to be sure, one might reduce the corporate tax and then make up the revenue that is lost in some other way, but you know as well as I do that this would be very difficult to accomplish, so that for the coming year, taking things all in all, I think we should continue with the present excessively high rate of taxation on corporate firms.

Representative MILLS. In other words, you do not expect any serious economic consequences?

Dr. BURNS. Not over the coming year.

Representative MILLS. Extended to April of 1956, would you not expect any serious consequences?

Dr. BURNS. No.

Represenative MILLS. Do you consider as an economist that it would be possible during the course of the next year for this tax rate to be passed on to the consumers as a part of the price?

Dr. BURNS. Well, this is a very interesting and very difficult question. During the next year I would expect business conditions on the whole to be highly competitive and, therefore, the ability of business firms to pass on the corporate profits tax would be restricted.

The ability of corporations to pass on that tax depends, among other things, on the intensity of business competition. Expecting, as I do, business to be highly competitive, I would also expect, and for that reason, the ability of corporations to pass on that tax to consumers to be relatively restricted.

Representative MILLS. Then does not that mean that it becomes more onerous under those circumstances than it has been in the past year or the past several years?

Dr. BURNS. Well, I would not say that it would become more onerous. Business has been highly competitive during the past year. With our economy recovering I would expect corporate profits after payment of taxes to be appreciably higher than they have been in the recent past.

Representative MILLS. But I am thinking in terms, Dr. Burns, of whether or not during the course of the coming year we may reach a point where this rate of taxation will be so onerous that business will not be able to keep pace with the rate of growth that is needed economically in the country.

Dr. BURNS. No, I do not expect that to happen.

Representative MILLS. You do not?

Dr. BURNS. You must remember that while the corporate tax has remained at 52 percent, business has profited from recent legislation. The excess-profits tax went off. Further, the tax reform bill, which was passed last year, liberalized depreciation allowances and improved the climate for making business investments as well as the means for doing so.

Representative MILLS. Dr. Burns, I am afraid that sometimes we lose track of the fact that the excess-profits tax affected only about 50,000 of our corporations, and I think there are some 400,000 corporate taxpayers. I think we also overlook the fact that under the bill passed last year there are many corporations that will not receive any benefit from the so-called fringe benefits in the legislation. The depreciation provision that you referred to in the report will be of advantage, of course, to a corporation desiring to expand, but I am thinking in terms of smaller businesses who have not yet had any material benefit from a discontinuance of the excess-profits tax.

Now, how much longer can we expect them to live under these heavy rates of taxation and the need that exists for expansion?

Dr. BURNS. You are quite right in saying that many of our small businesses did not have excess profits and, therefore, were not subject to that tax, so that the removal of that tax was of no advantage to them.

On the other hand, some of the provisions in the Internal Revenue Code passed last year, such as liberalized depreciation, and the allowing of business firms to treat research and development expenditures as current expenses, are very favorable to small-business firms. Beyond that, it is worth keeping in mind that in the case of very small businesses a large part of the profits is frequently paid out in the form of salaries.

Representative MILLS. I am glad to hear that this bill that was passed last year may help small businesses some in the case of depreciation.

Dr. BURNS. I think it will.

Representative CURTIS. Mr. Chairman.

Vice Chairman PATMAN. Mr. Curtis.

Representative CURTIS. Could I ask a question or questions? Mr. Mills' line of questioning has suggested these.

The CHAIRMAN. Certainly.

Representative CURTIS. Dr. Burns, along the lines of the discussion Mr. Mills went into, of course you do adhere to the theory that any tax can get to the point of being so high that it produces diminishing returns, but I assume that from your answer you do not feel that this 52-percent corporate tax has reached that point?

Dr. BURNS. No, I do not feel that it has as of the present. However, I would not like to look forward to continuation of that tax in the indefinite future.

Representative CURTIS. I have already discussed a little bit with some of my colleagues on Ways and Means, and one of the staff members of this committee, a situation that exists in three specific instances in the city of St. Louis, and I know exists throughout the country, where due to the corporate tax structure we find—I will mention specific names, because I am not entirely sure what the reason is—take the Medart Co. of St. Louis, an established concern over a period of some 75 years, making pulleys and transmission machinery, and I understand that they were filling a very vital economic function. However, due to a little change in the corporate ownership set up, and and solely because of taxes, I understand that company was bought out not for the purpose of operating it but solely for the purpose of junking it, getting rid of all of the trained personnel that had been collected together.

Just the other day a big dry-goods firm in St. Louis was purchased, Rice Stix, and although they claim they are not going to junk the company, it looks like they are going to.

I saw in the paper just the other day, I think it is the Follansbee Steel Co. in West Virginia, the same procedure exactly, and we had it called to our attention—I think Mr. Mills will remember when we were discussing this—that other people knew of situations where the scavenging industry was going around and picking up these going concerns.

Now, I may be wrong, but I have an idea that that might be to a large extent the result of our corporate tax, and, if it were, I suggest that we might well be at this point of diminishing returns, I think it is something on all of these tax rates, that the economists should be looking into, whether we have not reached the point of diminishing returns, and do not quite realize it. Maybe that is the reason for this increase in bigness that we see going on in the automotive business where small companies are going down because it is the consolidations that become necessary in order for them to survive this climate.

Contrary to Mr. Mills' suggestion on this excess-profits tax, I fought against the continuance even for the 6 months, having been on the Small Business Committee for 2 years, of the House, which held hearings in some 40 cities throughout the country, and if there is one thing that we saw it was the effect of the excess-profits tax on your new type of industry, your growth industry, and, as I expressed it, it was a tax on growth, and I felt clearly that that tax had gone way beyond the point of diminishing returns, and by our elimination of it we probably gained more taxes.

Well, I could not help but make those remarks in view of his discussion, because, in my opinion, these taxes are so high now that any time we alter one phase of it we begin to have a tremendous economic effect, one way or another, and I think we need an awful lot of help in studying what we are doing whenever we do tax a thing in a certain manner or relieve a tax in another manner.

Representative MILLS. Have you yielded that point?

Too much emphasis, it seems to me, Mr. Chairman, taxwise, is placed on the necessity for revenue at the given moment. That is the reason I was prompted to ask Dr. Burns these questions that I did ask him.

Representative CURTIS. Let me close this statement by emphasizing a specific tax that there has been no study on, I regret to say, and I wish there was. The liquor tax of $10.50 a gallon, and at the same time the industry says—I do not know the truth of it, or not—but says that illegal liquor manufacture is going rampant throughout the country, so that your legal industries where we collect the tax are making less and less of the goods that are being sold.

Now, if that is so, the cost of collection, and also the fact that we do not collect, might actually be such that we are beyond the point of diminishing returns on that.

That makes a neat little package for study. I asked the Treasury if they would not make a real study of that, because I do not know whether it is true or is not true, but somewhere we should be able to get these economic facts.

Thank you, Mr. Chairman.

Senator O'MAHONEY (presiding). Are there any other questions?

Well, if there are no other questions, the Chair will express the appreciation of the committee to Dr. Burns, and his colleagues, for their appearance here. I am sorry that our session has been so short. I think it could have been made much longer to the benefit of the members of the committee.

Dr. BURNS. If there is any statement called to my attention that is inaccurate, or needs further amplification, I shall be only too happy to admit to error.

Senator O'MAHONEY. If error is committed.

Dr. BURNS. If error is committed.

Senator O'MAHONEY. Thank you very much.

The committee will reassemble Wednesday morning, 10 o'clock, in the Senate Office Building, room 318.

(The following materials were subsequently submitted for the record:)

JANUARY 25, 1955.

DR. ARTHUR F. BURNS,
Chairman, Council of Economic Advisers,
Washington, D. C.

DEAR ARTHUR: In accordance with the procedure agreed upon, I enclose a copy of the stenographic transcript of the committee hearing of yesterday at which you testified. It is my understanding that after you have made such corrections as you believe desirable to clarify your testimony, the transscript will be returned for publication as a part of the record of the hearings.

The questions which Vice Chairman Wright Patman wished you to answer later for the written record are on page 39 and following pages of the transcript. The additional questions on the enclosed sheet are those which Congressman Richard Bolling requested be submitted to you for the record. This list contains only those questions which were not covered yesterday.

In order to give you as much time as possible but still meet our deadline for processing the printed record, I am requesting the return by Saturday, February 5, of your corrected transcript, with your answers to the additional questions submitted.

Sincerely yours,

GROVER W. ENSLEY, *Staff Director.*

THE CHAIRMAN OF THE COUNCIL OF ECONOMIC ADVISERS,
Washington, February 9, 1955.

Mr. GROVER W. ENSLEY,
Staff Director, Joint Committee on the Economic Report,
Congress of the United States, Washington, D. C.

DEAR MR. ENSLEY: I am enclosing a corrected transcript of my testimony before the Joint Committee on the Economic Report on January 24, 1955. I am also enclosing replies in triplicate to the questions submitted by Vice Chairman Wright Patman and Congressman Richard Bolling.

I believe it to be the sense of the joint committee that my testifying for the record on January 24 will not be treated as a precedent. Since the written replies to the submitted questions are merely a continuation of matters that could not be covered at the hearing, I trust that I am right in thinking that this part of the proceedings also does not establish a precedent.

With sincere appreciation of the courtesy extended to me and my Council colleagues by the joint committee, I am,

Very truly yours,

ARTHUR F. BURNS.

REPLIES TO ADDITIONAL QUESTIONS SUBMITTED BY REPRESENTATIVE WRIGHT PATMAN

Question. Although the Economic Report notes "the income shares of both farm and business proprietors in 1954 were at postwar lows," there is no further discussion of this economic development elsewhere in the report. The implications of this fact are that the terms of trade which are reflected in the movements of prices went against the farmers and the small-business man in 1954. What significance does this have upon the so-called flexible monetary and stable price policies?

Answer. The maintenance of a healthy agriculture and the continued prosperity of small business are vital objectives of economic policy. Their importance was stressed in the Economic Report for January 1954 and again in this year's Economic Report. Both farmers and small businesses have special problems in financing their needs, and special provisions have been made by the Government to serve these needs.

The monetary and credit polices of the Federal Reserve Board are designed to serve the needs of the economy at large. Their aim is to promote the growth, at high levels of employment and production, of the economy as a whole, not of this or that segment of the economy. In order to realize this aim, monetary policies must be flexible, that is, they must be adjusted so as to help check recessionary developments at certain times and inflationary developments at other times. Furthermore, the debt management policies of the Treasury and the credit policies of the Federal Reserve Board must be in harmony with each other. The problems of individual sectors of the economy can often be traced to their special circumstances and are dealt with best through measures designed to cope with these circumstances.

Two major factors are responsible for the reduced share of income disbursements going to farm proprietors in recent years. One is the decline in the number of farm proprietors and unpaid family workers engaged in agriculture relative to the total labor force. This reflects a long-standing and persistent trend in our economy, namely, the shift of employment away from agriculture and toward industry, trade, and the services. Even in the absence of changes in agriculture's terms of trade, the share of the national income earned by farm proprietors would have declined.

The other factor is the decline that has occurred during the postwar period in the farm parity ratio. Prices received by farmers have declined each year since 1951, though the decline from 1953 to 1954 was much smaller than during the 2 preceding years. Prices paid by farmers rose from 1951 to 1952 and then declined somewhat. These contrasting movements reduced the parity ratio from 107 in 1951 to 89 in 1954 and contributed to the recent decline in farmers' share of income disbursements.

The movement of farm prices and incomes in 1954 should be viewed in historical perspective. The inflationary rise in farm prices late in 1950 and early in 1951 reflected the sharply increased demand for farm products which followed the outbreak of hostilities in Korea. Prices of some farm products receded shortly afterward, reflecting an abatement in speculative demand as buyers came to realize that their fears of grave shortages were unjustified. Later the sharp decline in agriculural exports and the expanded output of basic crops, the latter stimulated by high and rigid price supports, contributed to a general decline in agricultural prices.

The bulging surpluses of farm products which have accumulated in recent years constitute a burden on the agricultural price structure. They clearly reflect an imbalance between production and markets which requires correction in the long-run interests of agriculture. The farm program enacted by the Congress in 1954 was designed to correct this condition.

Turning now to the self-employed outside agriculture, it should be noted that their total dollar income was higher in 1954 than in any previous year except 1953. The decline from 1953 to 1954 was a little over 1 percent. This decline is much too small to serve as a basis for any conclusion that an imbalance has developed between self-employed business and professional persons and other income recipients. It is true that the share of the Nation's total income disbursements received by self-employed business and professional persons has declined fairly steadily during the postwar years; but that fact must be read in the light of another fact, namely, that this trend has closely paralleled the decline in the proportion that this self-employed group constitutes of the Nation's labor force.

Statistics on the share of a given group in the Nation's total income can be highly misleading if we do not stop to examine what changes may have occurred in the number of persons participating in that share.

Question. Does the mere stabilization of a wholesale price index or the retail price index mean that there are no imbalances developing in the economy? Does not the experience of the 1926–29 period raise questions concerning the validity of this assumption? Does not the experience of 1953–54 indicate that unsound structural dislocations have taken place underneath the cover of a stable price level?

Answer. Mere stability of an average of prices, whether at wholesale or at retail, does not of itself give assurance that there are no serious imbalances in the economy. This has been made clear more than once in our history and not only by the experiences of 1926–29. In fact, no single indicator can be used as a test of the degree of balance or imbalance.

The fact remains, however, that approximate stability in the general level of commodity prices contributes significantly to economic stability. Readjustments in individual parts of the economy are more readily made when there are no general disturbances in commodity prices, because such disturbances can and commonly do give rise to the need for still further adjustments. To quote from the Economic Report: "Because of the overall stability of prices, the inventory adjustments during 1953–54 were not aggravated by adverse expectations concerning prices, such as often tend to develop when economic activity declines." (P. 95.)

The fact that there was a stable price level during 1953–54 did not obscure the need for economic readjustments, nor did policy decisions rest on any such invalid assumption. Changes that took place in the economy during 1953–54 were in part the result of the termination of hostilities in Korea, and in part the result of adjustments in consumer and related markets, as explained in detail in the Economic Report.

Structural, episodic, or cyclical changes are always taking place in a dynamic and progressive economy and they are often accompanied by divergent movements in the prices of particular commodities and services. Price changes are a vital part of the mechanism by which a free enterprise system adapts itself to other economic changes. They may reflect altered competitive conditions, lower costs of production achieved by new and more efficient technologies, shifts in consumer demands and preferences, or other factors. In some cases, and this is true of the prices of some farm and other raw products in recent years, they may represent an adjustment of temporarily inflated prices to levels that are more nearly in keeping with the state of long-run demand.

Question. The Economic Report mentions the farm problem briefly as follows: "The introduction of flexible price supports for basic crops and the modernization of the parity formula will facilitate the adjustment of our farming enterprises to changing markets and thus help to improve the outlook for the farmers."

How will the outlook for the farmer be improved? Will his share of the personal income disbursements which the report notes is at a postwar low be raised? How much will it be raised and how will this increase occur?

Farm income fell at an annual rate of $2 billion from the first to the fourth quarter of 1954, or 15 percent. Will the improved outlook for the farmer restore this $2 billion drop in farm income? The farm parity ratio in the fourth quarter was 87, the lowest level in 14 years. Will it be restored to 100 percent of parity?

Answer. It must be borne in mind in interpreting the Department of Commerce series on farm proprietors' income by quarters that farm income, like many other economic magnitudes, shows greater variation on a quarterly than on an annual basis. Furthermore, the estimate of $11 billion for the fourth quarter of 1954 was necessarily based on incomplete data and even the first quarter figure of $13 billion is subject to revision. In any case the methods of adjusting net farm income for seasonal variation are rather rough, particularly when major changes are taking place in the composition of farm output. In an industry like farming, with its annual cycles of production, estimates of net income on an annual basis are much more significant. These show a small decline from $12.2 billion in 1953 to $11.9 billion in 1954.

The Department of Agriculture has estimated that farm operators' net income in 1955 will be close to that of 1954. This implies an average 1955 income level well above the figure previously cited for the fourth quarter of 1954.

The number of farm proprietors and unpaid family workers engaged in agriculture will probably continue to decline during the next few years, while the Nation's total labor force continues to grow. This trend may prevent any rise in the percentage of total income disbursements going to farmers as a group. However, income per farmer and per family member engaged in agriculture may be expected to rise during the years ahead, as increases in productivity and income per worker occur in the economy as a whole. This trend in agriculture will be facilitated by the maintenance of a high level of employment in the nonfarm sector.

At present, as in immediately preceding years, accumulated surpluses continue to be a major hindrance to a recovery in the level of farm prices. In the absence of inflationary developments, the surpluses of several major crops must be reduced before prices can rise appreciably, and this process requires time. The flexible price-support program enacted last year was designed to facilitate this adjustment process. After existing surpluses have been worked off, and especially under conditions of high employment, an improvement in the relation of agricultural to industrial prices may be expected. The precise level of the parity ratio cannot be responsibly predicted at this time.

Question. The economic report cautions that the "continued economic recovery must not be jeopardized by overemphasis of speculative activity." When the Federal Reserve Board moved to reduce margin requirements by 33 percent in early 1953, did it thereby overemphasize speculative activity? When the Treasury and the administration urged a reduction in the taxes on excess profits, on dividend income, and an acceleration of the rate of recovery, tax-free, of investment expenditures, did it encourage speculative activity? Is the economy more or less stable today than it was at the beginning of 1953 prior to the inflation of stock prices?

Answer. Margin requirements on stock exchange transactions were reduced in February 1953 from 75 to 50 percent. The 75 percent requirement had been established in January 1951 with the object of preventing an excessive use of credit in stock-market transactions during an inflationary period. The 1953 action, on the other hand, was taken in the belief that even a 50-percent margin requirement would provide sufficient assurance against an unwise use of credit in the situation then prevailing. The increased amount of credit used by purchasers of securities after the margin requirements were lowered, does not support the conclusion that the effect of the February 1953 action was to encourage undue speculative activity. It may also be recalled that stock prices declined during the greater part of 1953.

The tax reductions and the tax reforms of 1954 were parts of an economic program aimed at increasing business and consumer confidence and thus contributing to the resumption of economic growth. The elimination of the excess-profits tax, the reduction of personal income taxes, the reduction of the double taxation of dividends, the provision for liberalized depreciation for tax purposes, and the removal of various inequities in the taxation of personal income were simply the tax portions of a comprehensive program for promoting economic growth and for strengthening the resistance of the economy to inflationary or recessionary influences. A judicious appraisal of any part of this program requires that account be taken of the other parts of the program that were simultaneously proposed and subsequently enacted.

The proposals to remove the excess-profits tax, to reduce the double taxation of dividends, and to liberalize depreciation allowances on new capital investments were designed to strengthen the willingness of investors and businessmen to put funds into risk-taking and job-creating investments. Other parts of the tax, social security, housing, and related programs were designed to strengthen more directly the confidence of consumers in their own and their country's economic future. The effects of the overall program are traced and appraised in the economic report. Suffice it to say here that the measures that bore directly on investor and business groups would have been less efficacious if they had not been accompanied by other measures that impinged directly on consumers, and that the same would be true of the latter measures if they had not been accompanied by the former.

The rise of stock prices during the past 15 or 16 months, which occurred despite a decline of corporate profits below their early 1953 levels, fundamentally reflects our generally improved prospects for economic growth, to which all of the economic programs enacted last year contributed. Although the tax changes constitute an important element in this overall program, it would be incorrect to regard them as the sole or the principal cause of the rise in security prices.

In view of the adjustment which has already been made to lower levels of defense expenditures and of the balance that now exists between production and sales, the economy is less vulnerable to recessionary influences today than it was in the spring of 1953. The rise of stock prices which began in September 1953 has, thus far, been a factor making for economic expansion. On the other hand, as the Economic Report points out, the recovery movement must not be jeopardized by excessive speculation. It was for this reason that the Federal Reserve Board acted in January 1955 to limit the use of credit in stock market purchases. Developments in the securities markets should and will be closely watched.

Question. Much of the postwar prosperity has been attributed to the fact that income has been widely distributed in the hands of all of our families. The lessening of inequality in income distribution in the 20 years since 1929 has been hailed as a modern revolution by economists of varied views. What significance for income distribution and the inequality of distribution is there in the behavior of personal income shares in 1953 and 1954? For example, the Economic Report shows that labor income from wages and salaries fell as did farm and other proprietor shares. However, investment income shares rose; particularly impressive was the rise in the personal interest share which rose 10 percent in the last 10 years. Do these trends not indicate a redistribution of income that favors a relatively small group at the expense of a relatively large number of income receivers? In brief, are we moving toward greater inequality in income distribution?

Answer. Statistical records of income distribution show a long-continued tendency for the labor share of total income disbursements to increase and for the investment share to decrease. Minor fluctuations from year to year that run counter to these trends, such as occurred in 1954, cannot be regarded as a reversal of long-run tendencies. It is apparent from table B-4 (p. 82) of the Economic Report that year-to-year variations often occur without changing such underlying trends. The increase in the investment share from 1948 to 1950 and the decline in the labor share from 1949 to 1950 are examples of such temporary shifts.

In connection with the most recent changes, the following figures should be kept in mind: Labor income constituted 69.3 percent of total personal income in 1952, 70.5 percent in 1953, and 69.5 percent in 1954. The corresponding percentages for transfer payments are 4.8, 4.8, and 5.4; for proprietors' incomes 14.5, 13.3, 13.0; for investment income (which includes dividends, interest, and rents) 11.4, 11.5, 12.1.

While the group receiving wages makes up the largest single income group, it would be a mistake to assume that those who receive investment income make up only a small group in the population. For example, a substantial proportion of the rent component of investment income accrues to homeowners, who are credited with the rental value of their dwellings in national income totals. In view of the wide distribution of homeownership, a large proportion of the higher rental incomes accrued to families of modest means.

Similarly, interest incomes are widely distributed. A large part of the total stems from interest on United States savings bonds and on savings deposits, returns on shares in savings and loan associations, and net earnings on life-insurance policy reserves. Since the owners of these assets are numbered in the tens of millions, it is clear that a substantial part of the 1954 increase in interest incomes was either received by, or accrued to the benefit of, persons with moderate incomes.

Unfortunately, the available data do not provide an adequate basis for measuring the changes in income shares received at various income levels. Certain recent surveys, however, indicate that there has been no trend toward greater inequality in the size distribution of incomes during the postwar period. In fact, the proportion of total income before taxes that is received by the top fifth of the Nation's spending units is estimated to have declined from 48 percent in 1947 to 46 percent in 1953. Although no figures for 1954 are as yet available, it seems reasonably certain that no appreciable change occurred between 1953 and 1954.

Question. Maintenance of a stable price level seems to be given the highest priority in administration declarations dealing with economic policies. Does that mean that the behavior of some price index rather than, say, the amount of unemployed, is used as a guide for economic policy decisions?

Answer. The Economic Report stresses the need for maintaining high and satisfactory levels of employment as well as the desirability of general price stability. These are not inconsistent goals of policy. Both are necessary elements of a program to promote the objectives of the Employment Act. As every student of economic history knows, price inflation has often been followed by severe unemployment. For this reason, if for no other, close attention must be paid to what is happening in the sphere of prices.

In reaching decisions concerning economic policy, consideration must be given to a large number of factors. These include the state of employment, unemployment, prices, production, sales, inventories, new orders, credit, interest rates, business investment, consumer spending, the rate of saving, and many others. Neither prices nor unemployment, important as they each are, can be taken as the sole guide for economic policy. To confine attention to an index of prices or to the level of unemployment would impede the search for adequate measures to reduce unemployment or to prevent its increase.

Question. In formulating the stable price policy and in implementing it, what thinking has been done about the implications for price relationships within a stable level of average prices? For example, what consideration has been given to problems arising from the fact that certain prices, notably those for agricultural commodities, are highly sensitive and tend to fluctuate far more frequently and freely than the prices of most manufactured goods and some industrial raw materials? In implementing the stable price policy, are the effects of price changes considered in combination with each other and with the behavior of noncommodity prices such as services, rents, wages, interest rates? How was this done, for example, in evaluating the prospects of inflation in early 1953? How is this done in evaluating the prospects for price changes currently? For example, prices of industrial supplies have been rising reasonably while the prices of farm commodities that business buys have been dropping. What consideration has been given to these divergent moves by the monetary authority in implementing the stable price policy? If you do not know, what are your ideas on it?

Answer. The long-range objective of monetary policy is to promote stable economic progress at high levels of employment and production. The stabilization of any single average of prices is not the primary aim of monetary policy.

However, Government officials who are responsibly concerned with monetary matters must give close attention to thhe movements of general prices and of changing price relationships, since such movements may affect economic growth and stability.

Although major sectors of the economy often show diverse movements, not only with respect to prices, but also as to wage rates and other market phenomena, it is beyond the scope of monetary policy to undertake to influence specific prices or groups of prices. The basic aim of monetary policy is to help create conditions that are favorable to the maintenance of general economic activity at high levels, thereby facilitating the readjustments that may be required by any imbalances in the economy.

In addition to the policies that are aimed at influencing general credit conditions, it is important during periods of serious readjustment in any part of the economy to make certain that an adequate supply of credit at reasonable rates is available to the industry making the readjustment. This was done with reference to agriculture during 1953–54, when ample credit was available to the producers and processors of farm commodities. When the purpose is to modify the relation between prices received and prices paid by farmers, other means than general monetary measures must be adopted. It was for this reason that flexible price-support legislation was enacted during 1954.

At a time when part of the economy is experiencing great prosperity while another part is undergoing serious readjustment, it is obviously desirable that the policies pursued by Government do nothing to accentuate the lack of balance. During the early months of 1953, the plant and equipment of many industries were utilized to full capacity, labor was working overtime, unemployment was approaching a vanishing point, and the demands for credit kept increasing. While wholesale prices of farm products were declining, the prices of industrial commodities were edging up. Furthermore, price and wage controls had recently been removed, with a view to restoring the functioning of competitive markets. In these circumstances, a continued rapid expansion of credit could not effect an appreciable increase in production or employment but could bring about a substantial increase in prices of industrial commodities. It was in the light of this situation that a precautionary policy of monetary and credit restraint was adopted.

Subsequent events during 1953–54, both with reference to credit and business, are set forth in some detail in the Economic Report in chapter 2, entitled "A Year of Economic Transition." This chapter also describes the actions taken by the Federal Government and the effects of the policies pursued during the period.

A moderate rise in both industrial and farm prices, reflecting strong demands both at home and abroad, has recently occurred. Interest rates and bond yields have also increased somewhat. At present, monetary policy is fostering increases in output and employment, so as to realize our full productive potential, but it is also seeking to avoid the strains and excesses which often accompany a recovery movement of the type we are now experiencing.

Replies to Additional Questions Submitted by Representative Richard Bolling

Question. In its report to the President on its activities during 1954, included in the Economic Report as appendix C, the Council of Economic Advisers refers to the various public and private groups or agencies utilized in preparing the Economic Report. Would you expand upon this, particularly the following points: What use was made of private research agencies? Were advisory committees of representatives of industry, agriculture, labor, consumers, State and local governments, and other groups used by the Council of Economic Advisers?

Answer. In its report to the President, the Council did not refer to "various public and private groups or agencies utilized in preparing the Economic Report." The Council merely expressed its appreciation of the assistance it had received from public and private groups in carrying out its varied responsibilities during the calendar year 1954.

Numerous private research agencies advised the Council on particular problems or made available to the Council the results of their investigations, often prior to their publication. The institutions that deserve special mention are the National Bureau of Economic Research and the Brookings Institution.

The National Bureau of Economic Research made continuously available to the Council the results of its business cycle studies, especially the results of its experiments with techniques of short-run economic forecasting. The Bureau submitted from time to time special statistical reports at the Council's request. At the Councils' request the Bureau also organized a special conference on business-cycle policies, for which numerous university and government specialists prepared papers. None of this work involved any expense to the Council.

The Brookings Institution rendered a very useful service, also without any expense to the Council, by organizing meetings with economists to help the Council in its appraisals of the economic situation and of desirable paths of policy. Two such meetings were held last year. Most of the participants, numbering about 20, came from the great centers of learning in different parts of the country.

The Council has found it more helpful to meet informally with groups or committees of a changing composition than to work with formal committees of fixed composition. The full Council or one or more of its members met from time to time during the past year with representatives of the Committee for Economic Development, the Chamber of Commerce of the United States, the Business Advisory Council for the Department of Commerce, the American Federation of Labor, the Congress of Industrial Organizations, the United Steelworkers of America, the International Association of Machinists, the Governors Conference, the American Farm Bureau Federation, the National Grange, the Conference of Business Economists, and many other organizations or groups.

Question. Did the Council of Economic Advisers, in cooperation with other executive agencies, develop a set of economic assumptions with respect to the coming year to be used to assure internal consistency in the President's program? According to the New York Times of January 18, 1954, Secretary Humphrey announced that the budget estimates assume that personal income will rise from $286.6 billion in calendar 1954 to $298.5 billion in calendar 1955 while corporate profits before taxes are assumed to rise from $36 billion to $38.5 billion. What levels of gross national product, national income, prices, employment and unemployment would be consistent with these assumptions as to personal income and corporate profits? It is recognized, of course, that these are not predictions or forecasts, but assumptions for purposes of preparing an internally consistent program.

The Council could not very well function without making judgments, assumptions, and projections concerning the economic future. Much of this estimating has been expressed in formal, arithmetical terms for the year 1955. The results of these intricate labors have been made available to the agencies of the Government that are especially concerned with the development of the President's program. It would be difficult to go beyond this statement without disclosing how the Council's confidential advise to the President and the members of the Cabinet was presented and used.

Question. What interpretation does the Council give to the declaration of policy of the Employment Act of 1946? What relative weight does it attach to the act's requirement that the President define "levels needed" of "employment, production, and purchasing power"?

Answer. In brief, the Council interprets the declaration of policy of the Employment Act as follows: (*a*) It is a continuing policy of the Federal Government to promote high and expanding levels of production, employment, and national income; (*b*) the Federal Government has a continuing responsibility to help keep our Nation's economy firmly on the narrow road of reasonably full employment without price inflation; and (*c*) the specific policies pursued in working toward these objectives should strengthen our system of free and competitive enterprise. A fuller statement of the Council's position can be inferred from the Economic Reports of the President for January 1954 and January 1955, and can be obtained more directly from addresses by the Chairman of the Council. Copies will be gladly supplied to the Joint Committee, if desired.

It is clearly of the utmost importance that the Economic Report analyze the existing economic situation, that it indicate whether the economy is on the upgrade or declining, that it appraise the prospects for the coming year, if not for a longer period, and that it set forth a program of policies and actions that seems likely to insure a high and satisfactory level of employment and production, without price inflation. This statement is amplified in the response to the next question.

Question. The Employment Act, in section 3 (a), states that the Economic Report of the President shall set forth "the levels of employment, production, and purchasing power obtaining in the United States and such levels needed to carry out the policy declared in section 2." The President's Economic Report, on page 24, states: "With economic activity continuing to expand, it is reasonable to expect that the Nation's output within the coming year will approximate the goals of 'maximum employment, production, and purchasing power' envisaged by the Employment Act."

What are these levels or goals for 1955 in terms of employment, unemployment, production, and purchasing power?

What specific forces do you see operating in the economy that will raise levels of demand sufficient to meet the goals of the Employment Act?

Answer. Section 3 (a) of the Employment Act states that the Economic Report of the President shall set forth "the levels of employment, production, and purchasing power obtaining in the United States and *such levels needed to carry out the policy declared in section 2.*" [Italics added.] The act does not clarify the italicized phrase. Its interpretation is left to the President and his Council of Economic Advisers. The phrase can be interpreted as calling for a numerical specification of economic goals, or it can be interpreted as calling for as good a specification of objectives, whether in terms of numbers or otherwise, as can be made. In the former case, one would assert that "to carry out the policy declared in section 2," employment must be X, production must be Y, etc. In the latter case, one might assert that "to carry out the policy declared in section 2," employment must be a little higher, or substantially higher, etc.; the drop in employment and production, if any, during the recent past, after allowing for an increment of growth, would suggest the general order of the magnitudes that are involved.

For internal purposes the Council utilizes and makes all sorts of quantitative estimates. It seems unwise, however, to publish near-term estimates that rest heavily on assumptions and conjecture, and that is bound to be the case with numerical "goals" or "targets." The use of such estimates by the President in his Economic Report would not render a useful service to the nation.

The present Economic Report, like its predecessor, does not specify numerical goals for the coming year. If these had been presented, neither the economic analysis of the report, nor its recommendations of policy, would have been improved in any way. The impression might, however, have been created that economists or Government officials can reliably esimate how much our economy is able to produce under conditions of full employment, that they can reliably judge what the numerical magnitude of employment should be, and that they can reliably estimate the quantitative effects of specific public policies or programs. All this may become true in the future; it is not true today.

It is important to recognize the limitations of economic knowledge, and how difficult it is to make useful economic predictions or projections. Serious uncertainties surround even historical descriptions, such as the average rate of growth of production during the past decade or the gross national product during a particular year or quarter. Under ideal conditions of measurement, the gross national product should be the same, whether measured from the expenditure side or the income side. In current practice the two figures are sometimes very different, and it is impossible to tell which is the more accurate. According to the figures from the expenditure side, the annual rate of the gross national product decreased $14.4 billion between the second quarter of 1953 and the third quarter of 1954. If, instead, we take figures estimated from the income side, we find that the drop in the gross national product was at a rate of $7.4 billion during this period.

Economists who are familiar with statistical vagaries such as this, and who know how difficult it is to measure with tolerable accuracy even experiences of the past, will hesitate to specify numerical goals for the Nation's economy over the next 6 months or year or two. They know that in setting goals some arbitrary assumptions must be used and that alternative assumptions, which often are no less reasonable than the particular ones selected, can lead to such a wide range of results that the calculated goals cannot have great value for policy decisions.

For example, if we are to specify numerically what the gross national product would be in a later period under conditions of full employment, we must rely on a great variety of assumptions. The most important of these relate, first, to the increment of the labor force, second, to the increment of productivity, using this term in the sense of a ratio of output to labor input. The basis for such assumptions is past experience, very largely. But what do statistics tell us about the increment of the labor force between, say, the final quarters of successive years? For the civilian labor force, the figures range from about 100,000 to 1.4 million between 1947 and 1954, excluding the drop between 1950 and 1951. For the total labor force, the figures range from 50,000 to 1.5 million. If we attempt to look a year ahead, which figure within the indicated range shall we use? Not being content with any of them, we might take their average, but what reasons have we for supposing that the year ahead will be an average year? This variability of economic experience is, of course, reflected also in the case of productivity increments. We might assume that the gain in productivity will be 2.5 percent, as some historical averages suggest. But statistical estimates recently made by the staff of the Joint Committee show that in years that have immediately followed business-cycle troughs since 1911, the increment in productivity has ranged from a minus 4.4 percent to a plus 7.9 percent.

We must always remember that ours is a free economy. In such an economy the number of women who decide to look after their homes rather than seek gainful employment varies from year to year, and so it is also with the number of youngsters who decide to continue with their schooling rather than locate a job. Suppose, for example, that the Economic Report set forth in numerical terms the level of the gross national product "needed" during the coming year. May not the goal be missed merely because the increment to the labor force or the productivity gain turns out to be much smaller than expected? In that event, may there not be some pressure to embark on policies that will make a misjudged piece of arithmetic come true? On the other hand, suppose that the goal is realized, but that this happens because an unexpectedly large increase in productivity compensates for a failure of employment to rise sufficiently. May not the realization of the prescribed goal blind some people to the need for coping with the unemployment that actually exists? These are some of the many questions that the Council has had to consider in interpreting the italicized phrase of the Employment Act that was quoted earlier.

The Council's appraisal of the economic outlook for 1955 is indicated in the Economic Report. After noting that the economy has recently been operating at a high level and analyzing the forces now at work, the report proceeds to appraise what seem to be the likely developments. It points out that the annual rate of the gross national product increased by about $5½ billion (6½ according to more recent estimates) between the third and fourth quarters of 1954, and that the current recovery has some momentum. It describes the economic forces now in motion and concludes: (*a*) That they hold out the promise that we shall achieve a high and satisfactory level of employment and production within the current year, and (*b*) that if this expectation is not fulfilled the Government must be ready to revise its policies so as to help to bring this result about as promptly as feasible. This is a reasonably clear indication of how the economic situation is judged. It admittedly leaves room for discussion concerning the interpretation of some of the phrases used, but this difficulty could not be overcome by specifying numerical targets.

In handling problems of economic policy, nothing is more important than full recognition of the limitations of economic forecasting, and therefore of the need, first, for flexible policies, second, of being in a position of preparedness to meet various economic contingencies. These are the matters that the Council has repeatedly stressed. And let it be said here that, although 4 percent of the labor force is nowadays widely regarded as an approximate measure of the average amount of frictional and seasonal unemployment, the Council has not favored this or any other rigid figure to serve as a trigger to governmental action or as a measure of good performance. When the President's Economic Report of January 1954 was presented, the latest figure of unemployment then available stood at 3 percent. Yet that report counseled the Congress that it was essential "to avoid the adverse consequences that existing uncertainties might generate," that "it makes a vital difference whether an unemployment rate of 3 percent is reached by rising up to that figure or declining to it," and that "prudence as well as zeal for economic improvement require that public policy contribute both to the immediate strength of the economy and to its long-term growth" (pp. 72, 75).

Question. On page 21, the report says:

"This remarkable result—namely, a rise in disposable personal income accompanying a 10 percent decline of industrial production—has no parallel in our recorded economic history."

This statement has been widely quoted. For example, it is one of the important points in a column by Carroll Kilpatrick, Bases of Recovery: A Slump Analyzed, in the Washington Post and Times-Herald of January 25. In view of the wide publicity that has been given to this statement, would you clarify its meaning.

According to the tables, D–11, page 148, and D–26, page 164, industrial production declined 14 percent between 1944 and 1945, but disposable personal income rose from $146.8 billion in 1944 to $150.4 billion in 1945, or 2.5 percent. Again, in the following year, 1945 to 1946, industrial production declined by 16 percent, but disposable personal income went up from $150.4 billion to $159.2 billion, or almost 6 percent. These are comparisons of annual averages.

If the comparison rests on gross national product in constant dollars rather than on the index of industrial production, then it still appears contrary to the facts. According to table D–2, page 138, of the Economic Report, and table D–3, page 140, gross national product in constant prices declined between 1.5 percent and 2 percent between 1944 and 1945, and about 11 percent between 1945 and 1946, although disposable personal income rose between each of these years as indicated above.

Answer. The statement quoted from the Economic Report should be clarified. In the first place, it rests on the assumption of a generally stable price level, such as prevailed in 1953–54. In the second place, it refers to a phase of business-cycle contraction.

Quite clearly, a rise in disposable money income that merely reflected higher prices could be accompanied by a fairly sizable decline of industrial production. This happened in numerous countries during World War I and during other inflationary episodes. A rise of disposable income that merely reflects higher prices has little or no significance.

Approriate figures for the period 1944–46, which was characterized by contraction when viewed in terms of annual data, do not contradict the quoted statement. Since this was a period of rising prices, the dollar figures on disposable income are inflated. After allowance is made for the rise in prices, as should be done, the disposable income in 1946 turns out to be lower than in 1944, just as industrial production was lower. The disposable income in 1944, when deflated by the Consumer Price Index with 1954 as base, is $224.4 billion; the corresponding figure for 1946 is $219.3 billion. When the Department of Commerce price index for consumer expenditures, with 1954 as base, is used instead, the figures for disposable income in 1944 and 1946 are $215.6 and $208.6 billion, respectively.

Annual figures for 1944–46 distort the cyclical movements of this period. That is a common failing of annual data except when they are used to describe farming or other very special economic situations. For purposes of business-cycle analysis, it is usually necessary to observe records for shorter time units. Thus, according to the chronology of business cycles developed by the National Bureau of Economic Research, a peak in economic activity was reached in the first quarter of 1945; the trough came in the fourth quarter of that year; and the next year was a period of expansion. There was, to be sure, a moderate reduction and subsequently a mild increase of industrial production between the last quarter of 1943 and the first quarter of 1945. But these flutterings during 1944 are not indicative of a general cyclical fluctuation; the gross national product continued its wartime rise throughout that period.

Let us now compare the movements of industrial production and disposable personal income during the business-cycle contraction that extended from the first quarter of 1945 to the fourth quarter of 1945. During this interval the Federal Reserve index of industrial production (1947–49=100) fell from 125 to 87. The disposable personal income, even when no adjustment is made for price changes, fell from an annual rate of $152.3 billion to an annual rate of $147.8 billion. These comparisons rest, as they should, on seasonally adjusted data. The disposable income would, of course, show a steeper decline if the figures were expressed, as they should be for the present purpose, in dollars of constant purchasing power.

Question. The economic report, on page 13, states: "The primary contractive factor during the latter part of 1953 was the adjustment of inventories. This role shifted to defense spending after the turn of the year."

Is it correct that the decline in defense spending began simultaneously with, if not somewhat before the adjustment of inventories? Is it correct to say that military orders to industry for future deliveries began declining even earlier? Furthermore, hasn't the adjustment in inventories been concentrated largely in the durable goods industries, particularly those affected directly or indirectly by the planned reduction in defense spending which got under way not later than the spring of 1953?

If these beliefs are correct, then would not the council conclude that the primary factor in the contraction of 1953–54, from its beginning to the present, was the change in the direction and magnitude of defense spending combined with a reduction in business fixed investment, with inventories merely reflecting these underlying forces?

Answer. The statistical facts that underlie the quoted statement are as follows: The annual rate of the gross national product declined $9.4 billion between the second and fourth quarters of 1953. National security expenditures fell $3.7 billion over the same interval, while inventory investment declined $9.6 billion. Clearly, the adjustment of inventories was the primary contractive factor during this period. However, between the last quarter of 1953 and the first quarter of 1954, the rate of inventory liquidation remained unchanged, whereas a reduction of security expenditures accounted for nearly four-fifths of the $4.7 billion decline in the annual rate of the gross national product. Moreover, there was little change in the rate of inventory investment in the second and third quarters of 1954. Meanwhile, expenditures for national security continued to decline materially; but this decline was offset by increases of private domestic investment in fixed capital, personal consumption expenditures, State and local expenditures, and foreign investment, so that the gross national product remained virtually unchanged. Thus, after the turn of 1954, inventory adjustments exerted little additional contractive influence on economic activity; and after the first few months of the year, the contractive influence of reduced security expenditures was counterbalanced by expanding outlays in other sectors of the economy. By the early fall of 1954 the balance shifted in the direction of expansion and a new upswing of economic activity got under way.

The questions raised concerning the quoted statement do not deal with the problem treated in the text at that point; namely, the relative impact of inventory adjustments and reductions of national security expenditures during the period of declining production that preceded the stabilization of aggregate economic activity in the spring and summer of 1954. The questions that have been posed seem to be concerned with the problem of whether the entire contraction, which extended from July 1953 to August 1954, was in some basic sense a response to declining expenditures for defense. Let us turn to this problem.

The onset of contraction during 1953 was the result of a combination of causes, including the decline in the flow of new defense contracts. However, it appears that the principal factor at the beginning of the contraction was an imbalance which developed in the early months of 1953 between the production and sales of consumer goods. In the words of the economic report:

"In our economy, or in any other of which we have definite knowledge, occasional imbalances between production and sales are virtually bound to occur. Such a condition developed in 1953. After the steel strike in the summer of 1952 was settled, production, employment, and incomes increased sharply. So, too, did consumer spending, though at a somewhat lower rate than the increase of personal incomes. The rate of general economic expansion was reduced, but continued to be fairly rapid, during the early months of 1953. Total spending by consumers roughly kept pace with their rising incomes during these months; however, spending on commodities, as distinct from services, tapered off. Inventories, therefore, kept rising, particularly those held by retailers. About the same time the flow of new defense contracts, which tie up inventories of factories on a larger scale than civilian production, diminished sharply. In view of these developments, as well as the general quickening of deliveries, many business firms deemed it prudent to bring their inventories into better balance with sales and incoming orders. The effort to adjust inventories led to scattered declines in production, which became visible in the Nation's aggregate of industrial production after July 1953" (pp. 11–13).

Thus, the process of inventory adjustment in the civilian sector got under way before defense spending began to fall in the third quarter of the year. However, as the Economic Report points out:

"This economic readjustment was complicated and aggravated by the close of hostilities in Korea. With the war at an end, the need for many types of defense goods diminished. At the same time, basic defense plans were being modified to strengthen our economy for what might prove a very long period of "cold war." The changed situation in Korea, the revisions of military programs, and improvements in the administration of our Defense Establishment brought about a sizable drop of military and related expenditures. A larger reduction was carried through during 1954 than had been anticipated, and it called for further readjustments by the economy. For the decline of defense spending not only reduced the Nation's stream of expenditures for final use; it also accentuated the efforts of businessmen to cut inventories" (p. 13).

The recent contraction impinged on numerous industries, not only those engaged in the production of defense goods. To quote once more from the Economic Report:

"The impact of inventory liquidation and of the cuts in defense expenditures was heaviest on those engaged in the manufacture of durable goods. Other factors added to the downward pressure on this sector of the economy. Although total spending by consumers was virtually unchanged between the second quarter of 1953 and the first quarter of 1954, their outlays on durable goods were considerably reduced. Investors in fixed capital likewise reduced their outlays on equipment, though not on construction. In consequence, while the physical volume of nondurable manufactures declined 6 percent between July 1953 and March 1954, the production of durables declined 14 percent and manufacturing production as a whole, 10 percent" (pp. 13, 15).

Changes in inventory investment are not merely passive responses to current or expected changes in sales. A decline in production stemming from inventory adjustments releases contractionary impulses which are capable of spreading through the economy with cumulative impact. This did not happen during the early stage of the contraction of 1953–54 because, as the Economic Report explains in detail, the confidence of businessmen and consumers remained high. When the demand for final products is well maintained, the cumulative depressing influence of inventory reductions is avoided. The process of bringing inventories into better balance with sales is therefore facilitated; the decline of total production remains moderate; and inventory change accounts for a large proportion of the decline that occurs in production. This was the essential character of the 1953–54 contraction in its early stage, and that is why it was described as an inventory adjustment in the Economic Report for January 1954. But as this year's report makes clear, a substantial decline of defense spending was later superimposed on the inventory contraction. This complicated and aggravated the decline; nevertheless, final sales, taken in the aggregate, continued to be well maintained, for reasons that are explained in the Economic Report for January 1955. No simple characterization of the entire contraction, such as is suggested by the question that has been posed, would be accurate.

(Whereupon at 4:30 p. m. the committee adjourned to reconvene at 10 a. m., Wednesday, January 26, 1955.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

WEDNESDAY, JANUARY 26, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a.m., Senator Paul H. Douglas (chairman) presiding.

Present: Senator Douglas, Representative Patman (vice chairman), Kelley, Talle, and Curtis.

The CHAIRMAN. This is the second meeting of the committee during the current hearings. The first meeting was held with the Council of Economic Advisers in executive session, but it will be made a part of the printed record by mutual consent.

Let me state for the record that the committee also invited a member of the Council of Economic Advisers, or its staff, to participate in this panel, but the invitation was declined.

The topic today is the appraisal of the economic philosophy and facts underlying the President's Economic Report. We have specifically asked the members of the panel to discuss four questions.

I will make the rounds on the first question, and then members of the committee can ask questions briefly of the participants. When that is finished we will start on the second question, and similarly through the third and the fourth.

I may say that we invited Mrs. Wickens and Mr. Paradiso to testify as individuals. We did not go through the respective Secretaries of Labor and Commerce, so that I do not think that they should be questioned on policy, but merely on facts.

Vice Chairman PATMAN. Mr. Chairman, it is a little after 10. What is your plan with reference to the hearings this afternoon? Do you expect to continue on if we do not finish before 12, and obviously we will not?

The CHAIRMAN. Yes.

Representative CURTIS. Mr. Chairman.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. I would just like to ask, as I did in our previous meeting, being a new member I am very much interested in the procedures to be followed, and I was wondering, apparently this panel technique has been used before. What is the situation in regard to interrogation of Government officials from the standpoint of the panel itself, rather than members——

The CHAIRMAN. I would say this morning, in view of the fact that Mrs. Wickens and Mr. Paradiso were invited as individuals, and since they are subordinates in the Department, that we should not question them on policy. They are not, strictly speaking, policymaking officials. Since they are not responsible for policy they should not be asked to express their opinion on policy, but I do think that it is proper to question them on the facts which they state, or on the legitimacy of any forecasts which they may make.

Representative CURTIS. Well, Mr. Chairman, I was more concerned with who will be permitted to ask questions. As I understand it, there was an informal agreement between you and one of the members of the committee in regard to that point.

The CHAIRMAN. You will certainly be permitted to ask questions.

Representative CURTIS. Oh, I understand that I will be because I am a member of the committee.

The CHAIRMAN. Just what is it that you are trying to establish?

Representative CURTIS. I will be very blunt, then. What I am trying to establish is whether or not you intend to have the members of the panel ask questions of the various Government officials.

The CHAIRMAN. Well, I think that would be proper. My tentative ruling is that that would be proper, but that would only be after the members of the committee have asked their questions.

Representative CURTIS. I am not worrying about the timing as much as I am about the propriety, because this is a congressional committee, a joint committee, and I might state here for the record that I am even more disturbed about the fact that this committee has had no discussion in executive session of these procedures or I would have had an opportunity of expressing things that disturb me on it.

In fact, everything that has been done to date by this committee has been done ahead of time, and has not been done with the opportunity of members of the committee having an opportunity to express their views. It puts me in an embarrassing spot. Here we are ready to proceed. I hate to hold up proceedings. I am fully aware of the fact, Mr. Chairman, that you have the votes to go ahead and do anything you please, but I think that many of these things should be discussed ahead of time, at committee meetings, and these have not been discussed, and I have had no opportunity of presenting views. In order to make the record complete, Mr. Chairman, I want to point out that this entire agenda of what is to be done, who is going to be called, who is on the panel, has been done ahead of time. I have had no opportunity, and many of the other members have had no opportunity, of suggesting names of those who might be on the panel. The procedures—and I am not asking that my views be carried out—I am simply saying that I have had no opportunity of expressing my views, and I am going to register a formal protest on the manner in which this committee has been set up and the working procedure.

Vice Chairman PATMAN. May I answer Mr. Curtis, Mr. Chairman?

Representative CURTIS. I would be happy for that.

Vice Chairman PATMAN. I admit that a lot of what you say is true, and it came about by necessity and the law. The law sets up certain deadlines. The President's report is presented at a certain time, and this committee must act on it within a certain time.

The CHAIRMAN. March 1.

Vice Chairman PATMAN. March 1, to be exact.

In order to meet those deadlines it is necessary that planning commence very early, even in December.

Representative CURTIS. Will the gentleman yield?

I am not objecting to the planning, I am objecting to the fact that the planning became an actuality without anybody having an opportunity to discuss it.

Vice Chairman PATMAN. It was absolutely necessary, Mr. Curtis; it could not have been done any other way.

Now, we expect this thing to be a continuing thing, not just 1 year, but next year, and so on.

Representative CURTIS. I understand.

Vice Chairman PATMAN. And for this year it was absolutely necessary.

Representative CURTIS. Well, I might state that I disagree that it is absolutely necessary to disregard orderly procedure, and I think that is what has been done.

The CHAIRMAN. May I say the tentative plans were discussed with the two ranking members of the majority, the gentleman from Michigan, Mr. Wolcott, and the Senator from Vermont, Mr. Flanders, and, as I understand it, was approved by them. The gentleman from Missouri was not appointed to this committee, I believe, until last Wednesday.

Representative CURTIS. And the committee did not exist, sir, until I was appointed.

And I might say this: I am not raising this point because I am the gentleman from Missouri, or anything else. I am here representing, as I see it, the House of Representatives. I am also representing the other members of my body, and I say that if my views are not being given an opportunity of being presented, then you are disregarding proper procedure.

The CHAIRMAN. Does the gentleman from Missouri recommend that the hearings be canceled until proper procedure is followed?

Representative CURTIS. I think that would be very proper.

Vice Chairman PATMAN. I hope the gentleman will not insist on that, and I suggest as an alternative that if he feels that there is a certain viewpoint not represented by members of the panel, and he wants someone particularly summoned for this committee, or requested to come, we will do that, if it can be agreed upon, and I believe the chairman will agree to it.

Representative CURTIS. I appreciate that point.

A more major point, of course, is this technique, and something that does involve policy of what position the members of the executive branch of the Government are in. If they are called before a committee of the House and Senate, a joint committee, and asked to answer questions propounded to them by people who are not members of the committee, or members of the staff of that committee, and that is a matter that I would like to have discussed in an executive session.

I understand, though, that you had some discussions, Senator, with Senator Watkins on that, and it was my understanding that there was a tentative agreement that questions by the panel would not be propounded to the executive department people.

Now, I am anxious, of course, to get as much information as this committee can, but I am concerned about the techniques.

Vice Chairman PATMAN. Mr. Chairman, in order to satisfy the gentleman, if it can be agreed upon, we will not only permit him, if it is all right with the chairman, to have any other person he wants after these hearings, if he feels that certain viewpoints are not represented, but we can have an executive session before the panel interrogates one another.

Now, I understood awhile ago that that was one point the gentleman was insisting on, that the panel not interrogate each other.

Representative CURTIS. No, I was not insisting on anything. I was mainly pointing out that I did not know what your procedures were, but the one particular thing that is of concern to me right now is the question of the propriety of members of the panel who are not members of the committee or of the staff asking questions of the executive department members.

I know they are concerned about it, Senator, and their concern does not lie to the standpoint of not wanting to cooperate with this committee. I know—at least I hope you feel that is not in this picture. It is a question of where do the executive department's prerogatives and rights begin and end, and where does the congressional board begin.

Vice Chairman PATMAN. That has been discussed for years.

Representative CURTIS. I understand that, Mr. Patman, but I also understand that this is a committee that is only organized and becomes a new committee each time, and as a member of that committee, even though I might be the junior member, which I certainly am, as a member of that committee I feel that it is important for me to understand these basic things, and actually have the committee vote on it.

The CHAIRMAN. Does the gentleman from Missouri propose that we suspend the meeting so that the committee can go into executive session now?

Vice Chairman PATMAN. I would object to that, Mr. Chairman. I hope the gentleman will not insist on it.

Let us get started and then have an executive session before we permit the members of the panel to interrogate one another. I understand that is your point, sir.

Representative CURTIS. Yes; that is the only thing that concerns me right now.

May I ask the chairman, Is that the way we work the procedure?

The CHAIRMAN. What is the question of the gentleman?

Representative CURTIS. I was asking the question in reference to what Mr. Patman, of Texas, just said, that the idea would be for the panel to go on with their discussion, but before the members of the executive department begin to participate, or were asked questions, that we go into an executive session, and I ask the chairman if that was the way that he intended it.

The CHAIRMAN. Well, I had not intended it, but if the gentleman from Missouri desires it I will be very glad to favor it.

Representative CURTIS. Yes; I would appreciate it if we do before we come to that point because that is the only point I have immediately in mind.

Now, Mr. Chairman, I have one other matter because we have not had an organizational meeting, this has just been called to my attention, this question of staff. I received your letter of January 22, 1955, in which you have advised us that you, as chairman, are just going ahead and discharging one of the staff members, and made a decision——

The CHAIRMAN. I think we should deal with that question in executive session.

Representative CURTIS. Well, I would have thought so, sir, but you have already done it, sir, and that is why I was raising the point. This is the only opportunity I have had because you have not called an organizational meeting.

The CHAIRMAN. I shall be very glad to call a meeting to consider this matter at 12 o'clock, if there is not pressing business on the floor of the Senate.

I do not think that is a matter for discussion in a public meeting.

Representative CURTIS. Well, I had hoped that it would not be, and I hoped that I would have an opportunity before now to discuss some of the procedures and the techniques and, indeed, what powers the chairman is going to have, because, to date, sir, it almost looks as if it is a one-man committee, and I cannot participate in such proceedings.

Vice Chairman PATMAN. I am sure the gentleman is mistaken about that, and I think when he knows all of the facts concerning it it he will retract that statement.

Representative CURTIS. I did not make a positive statement; I said it appears to be at the present time. If there is further information on the subject that would change my opinion I certainly will be very happy to have further information.

Vice Chairman PATMAN. There is lots of further information.

The CHAIRMAN. Does the gentleman from Missouri wish to raise other points?

Representative CURTIS. No.

The CHAIRMAN. Does the gentleman from Missouri wish to move that this meeting adjourn?

Representative CURTIS. No, in light of the Chairman's statement that we would have an executive session before the witnesses are interrogated by the panel, and since the chairman said that we would have an executive session with respect to the staff, then I will not ask that.

The CHAIRMAN. The first question is: What are the facts respecting population force, labor growth, employment, unemployment, layoffs, part-time employment, productivity, production, private investment, consumption, Government demand for goods and services, and savings since 1952?

That is a rather large order, and I would imagine that various members of the panel will wish to speak on specific questions.

I am going to begin with Mrs. Wickens who is Acting Commissioner of the Bureau of Labor Statistics. I imagine that she will probably want to discuss the earlier questions here. These are purely factual questions.

OPENING STATEMENT OF MRS. ARYNESS JOY WICKENS, ACTING COMMISSIONER, BUREAU OF LABOR STATISTICS

Mrs. WICKENS. Mr. Chairman, that is correct. I have a somewhat longer statement than I believe your time will permit, which I would appreciate an opportunity to insert in the record.

I would like to deal with the facts in connection with labor force, employment, unemployment, labor turnover, and hours of work, and I have a number of charts which are also before the members of this committee in connection with my statement.

There has been a subtantial growth in the labor force of the United States over the past 8 years, amounting to nearly 7 million workers, or more than 10 percent. This is shown on the first chart which is also displayed behind me for the members of the committee. The labor force is largest in the summer months when children are out of school, and smallest in the winter months when outdoor activities are curtailed.

The total labor force in the year 1954 averaged 67.8 million people. The Armed Forces are counted as a part of the Nation's labor force since they represent employment for many men who would otherwise be in the civilian labor force.

In the early years of the period shown on the chart, 1947–50, Armed Forces numbered about a million and a half. In the last 3 years they have exceeded 3 million, with the result that this type of employment has absorbed a part of the growth in the labor force, so that the peak annual average of 63 million in the civilian labor force, which was reached in 1950, was not again exceeded until 1953.

This past year the civilian labor force averaged 64½ million.

Now, looking to the future, on the basis of the growth of the population and recent trends in labor force participation by men and women of different age groups, it is estimated that in this year, 1955, the net growth of the total labor force will be about 700,000. If there is a decline of 340,000, as scheduled, in the Armed Forces, and some of those men go to school instead of coming into the labor force, it may be that there will be a further addition to the civilian labor force of about 275,000. Taking these two elements together, then, there may be an increase of as much as a million in the civilian labor force. However, this is by no means a fixed figure. This is the first point I wish to emphasize.

In the United States it is every man's choice whether he will or will not work at a particular time, and this choice is conditioned by a number of factors, including the economic climate. The makeup of today's labor force is illustrated by the second chart. This is as of April 1954, Mr. Chairman, and comes from the census.

This is a chart, a small copy of which you have before you. (The charts referred to appear on pp. 117–122.) You will see that the great majority of men from 20 to 55 are consistently in the labor force. The participation rates of the other groups shown in the chart are much more likely to vary with economic conditions, and they provide flexibility in the labor force. I am referring to the teen-agers, to the adult women who are housewives, and come and go from the labor force, and to men and women over 65.

For example, during World War II it was to these groups that we looked for enormous expansion in the labor force. They left their other pursuits. Under other conditions, as of now, if there are no marked patriotic incentives, these people do not come into the labor force. So that what happens in 1955 cannot be predicted with accuracy.

What I have indicated is that a million is the expansion we might estimate. It might be a little more than this. It is more likely to be a little less.

Now, how is this flexible labor force employed? Here I have to make two general points because they concern trends we expect will continue. The first is the decline in agricultural employment and the rise in nonagricultural employment, and the second is the trend toward the production of services and away from the production of goods.

In the years between 1947 and 1954 you will see the narrowing of the blue bar. Agricultural employment declined from 8¼ million to 6½ million, while nonagricultural employment expanded from less than 50 million in 1947 to over 55 million in 1953, which was its peak.

Now, coming back to the point of goods and services, at the turn of the century 2 out of every 3 workers in the United States were engaged in producing goods, and 1 of 3 engaged in producing services, but by 1950 this proportion had been reversed, and over half, 53 percent, produced services and 47 percent were engaged in the production of goods.

We, therefore, as we look ahead, must realize that certain types of occupations have been consistently increasing. The next chart shows in more detail the makeup of employment in industry. These are payroll employees. The figures are somewhat smaller than the census figures because they do not include unpaid family workers, domestic servants, and self-employed people. These figures come from the Bureau of Labor Statistics.

Now, the rise in employment, which is not shown on the chart as a whole from 1947 to 1954, amounted to 4.8 million; and excluding the bulge in 1953, only three-quarters of a million of this rise was in manufacturing. Trade alone accounted for 1⅓ million of this rise.

Now, we would anticipate that there would be a continuing rise in employment, in trade, and in the service occupations, as shown in more detail on the chart.

However, let us take the specific development in 1953 and 1954. We find that employment in manufacturing shows the greatest fluctuations. It always has. For 1954 as a whole the total number of employees declined by a net of 1.4 million; 1.2 million of this was in manufacturing. About 300,000 was in mining and transportation, closely allied with manufacturing.

On the other hand, those other types of industries which have been expanding since the end of World War II either held their own or expanded slightly with a net growth of about 170,000.

These annual averages obscure the fluctuations during the year.

The crux of the employment situation has been in manufacturing; in fact, in hard-goods manufacturing, where the number of people employed is still well below earlier levels, but as the year closed the trend was upward.

I want to make one general point, and that is that the peaks which we reached in manufacturing employment in 1953 are not necessarily meaningful goals. The peak in 1953, you will see by the bulge on the chart here, was affected by a number of special circumstances, rather than the normal and orderly flow of demands in the civilian economy.

It was a confluence of developments: Pent-up consumer demand was released by easing of credit restrictions. And there was the steel strike in the summer. Defense-production expansion reached its climax in early 1953. I am now talking about the actual production of the goods. At the same time, business outlays for long-run capital expenditures based on earlier plans also enlarged. Therefore, I wish to say that I think we had a somewhat unusual peak. We had unusual peaks like this in World War I, in World War II, in the boom period of 1929, and it took some time for the economy's production to come back to those levels.

The current levels of durable goods employment, that is if you take December 1954, are as high as in any postwar month before early 1952. Now, I do not mean that this level is optimum or desirable, but I just want to emphasize that I think this peak was an exception.

In the final months of 1954 there was increasing strength in the nondefense sectors of the economy. Manufacturing was better sustained than could be expected for the season, not merely in automobiles but in other consumer hard goods. Furniture, construction supply industries, even the shoe industry, trade, commerce, finance, and Government, especially the State and local governments, were at high levels, and there is every reason to anticipate continued growth in these types of employment.

Now, a more sensitive indicator of the current well-being of the nonfarm economy, is the factory workweek.

The remaining point I want to make has to do with unemployment, which is covered by the last chart. The rates were higher for 1954 than they have been for the earlier years; however, you will note that the 1954 rate declined as the year went on, and in the last quarter of the year we had 2.8 million unemployed, or 4.4 percent of the labor force.

The CHAIRMAN. These are Department of Commerce figures?

Mrs. WICKENS. Yes, all Department of Commerce figures, Bureau of the Census.

The second point in this connection is the duration of unemployment. The number of people out of work for a relatively long period (15 weeks or more) was highest in the spring and diminished as the year went on, so toward the end of the year there was a substantial reduction in long-duration unemployment.

I would like to point out that there is a great deal of mobility into and out of employment, not only from and to housework, but from and to schools.

Now, Mr. Chairman, I would like to make one final point: We are now nearing the seasonal peak of unemployment and I have presented some figures to the committee as to what unemployment may total within the next 12 months with only seasonal factors operating. The main point is it may go up by a million from December to February merely because of the seasonal factors. In summary, I would say that the recovery of this autumn-winter has reversed the downward trend in employment, and that there is considerable improvement in the labor market, but there remain, of course, areas and industries in which unemployment is serious. The extent of the recovery will be discussed by other members of this panel.

The CHAIRMAN. Thank you very much, Mrs. Wickens.

Vice Chairman PATMAN. One question to clarify, Mr. Chairman, please.

On this unemployment chart I notice that in 1954 for the first 4 months, January, February, March, and April, the unemployment was higher than in 1949.

Mrs. WICKENS. Yes, sir.

Vice Chairman PATMAN. And it is up close now to 1949.

Do you anticipate it will go above 1949 before the end of the year?

Mrs. WICKENS. No, sir; I would not.

The CHAIRMAN. Any other questions of Mrs. Wickens?

(Mrs. Wickens' prepared statement appears at p. 116.)

The CHAIRMAN. Mr. Paradiso.

Vice Chairman PATMAN. Mr. Chairman, don't you think it would be a little fairer to the panel if we permitted them to proceed even without the slightest interruption, or at least for a certain number of minutes each, to let them get their statements in, their preliminary statements, before noon, and then after noon we could make other arrangements about putting their whole statement in.

Ask the panel what they think about that.

The CHAIRMAN. Well, we are taking up four questions, each one at a time.

Vice Chairman PATMAN. All right. I was just looking at it from the standpoint of the panel in order to be fair to them, to not permit them all to be heard under the circumstances.

The CHAIRMAN. I think they should be permitted to file this morning for the record and for the afternoon papers, but that we should proceed with the questioning by topics. They certainly should be permitted to make any general statements that they want to make.

Mr. Paradiso.

Representative CURTIS. Mr. Chairman, may I ask a question? I was concerned about your remark. The purpose of the panel is to inform the committee, is it not, or is this purpose a publicity stunt?

The CHAIRMAN. Well, that was probably a facetious remark.

Representative CURTIS. Oh, I am sorry.

The CHAIRMAN. I may say that in this connection, that same purpose has not been unknown on the part of Members of both Houses of Congress, and both parties.

Representative CURTIS. And I might state, Mr. Chairman, that is exactly my concern about how the panel is set up and so forth, because we do know from a practical standpoint, that has been done and why I felt it was important that the matter be discussed ahead of time.

The CHAIRMAN. It has even been known to be done by Cabinet officers, and quite recently I might say.

Mr. LUEDICKE. If I understood your questions, wasn't the idea that each of the panel members would be limited to 2 minutes or so——

The CHAIRMAN. Three to five minutes.

Mr. LUEDICKE. And we should talk to, and add something to the written statements on any of the four questions individually, rather than all four at the same time.

The CHAIRMAN. Mr. Paradiso.

STATEMENT OF LOUIS PARADISO, CHIEF STATISTICIAN, OFFICE OF BUSINESS ECONOMICS, DEPARTMENT OF COMMERCE

Mr. PARADISO. Mr. Chairman, I want to thank the committee for asking me to come here and discuss these questions. I am going to confine myself, however, to the Government sector, and I will do this very briefly in two parts.

In the first part I will discuss the recent trend in the Government transactions from the point of view of the national income and products accounts. Later I am going to try to translate into the same accounts the implications of the President's budget on the economic situation.

So now I want to give a very brief discussion of the recent past in terms of Government transactions in these accounts. Just prior to the outbreak of hostilities in Korea, the total Federal purchase of goods and services amounted to annual rate of about $21 billion. Of this total, $17 billion represented national-security purchases. This was about 6 percent of the total value of the Nation's output as measured by the gross national product, as compared with 42 percent during the peak of the World War II effort.

Following the outbreak of the Korean war in June 1950, expenditures mounted very rapidly with the result that the Federal Government purchases of goods and services reached a peak annual rate in the second quarter of 1953 of $62 billion. Of this total, national security purchases amounted to an annual rate of $54 billion, or more than 14 percent of the total output. The rise in these expenditures had a very important direct and indirect impact on the private economy. I need not cite these effects since they are well known.

Suffice it to say that the impact was felt throughout the entire economy and, together with the expansion in major sectors of private demand lifted production, employment, investment, and purchasing power to new highs.

With the truce in Korea and the reappraisal of defense programs, Federal purchases of goods and services were reduced in the past year and a half from the post-Korean peak annual rate of $62 billion in the second quarter of 1953, to an estimated annual rate of about $47 billion in the half year just past. Most of the drop occurred in national-security purchases and centered in the hard-goods categories, especially tanks, noncombat vehicles, and ammunition.

This reduction was one of the factors in the decline in production and employment in the manufacturing sectors. The details of these developments are clearly portrayed in the Economic Report of the President transmitted to the Congress a few days ago.

Turning to the current and the next fiscal year, the Federal programs reflected in the President's budget shape up as follows in terms of the national income and product accounts.

For fiscal 1955 the President's budget implies an estimated total purchase of goods and services amounting to $47 billion. This is about equal to the first half of fiscal 1955, at annual rate, as published in table D–1 in the President's Economic Report. Thus, the President's budget implies that Federal purchases of goods and services will show little change from recent rates during the remainder of the current fiscal year.

Furthermore, for fiscal year 1956, government purchases of goods and services are estimated to be about half a billion dollars lower than in fiscal 1955. Thus, little change is implied in these purchases during the next fiscal year as well for the total, and for national security and other types of purchases.

Government expenditures other than purchases of goods and services based on the national income and product accounts show a moderate rise during fiscal 1955 and 1956, with the increases taking place primarily in higher benefit payments under the OASI program and in veterans' educational and training benefits.

Federal receipts in fiscal year 1955 will be lower than in fiscal year 1954, reflecting primarily the lower rates of taxation. Receipts are projected to rise in fiscal 1956 as a result of a higher level of business.

In terms of the administrative budget, the budget message set forth a deficit in both the current and next fiscal years, although the size of this deficit in fiscal 1956 is almost cut in half from the 4.5 billion estimated in fiscal 1955.

On a cash basis, the budget message estimates the 1955 deficit at $2.4 billion which shifts to a $0.6 billion surplus in fiscal 1956.

In the framework of the national income and product statistics published by the Department of Commerce and included in the Economic Report, Government receipts and expenditures are recorded on a somewhat different basis than either in the administrative budget or in the cash statement. For instance, two major differences from the cash statement are that business taxes are reported on a accrual rather than on a payment basis, and purchases from business are recorded when delivered rather than when paid for. Details of these differences and an explanation of the concepts are given in the 1954 National Income supplement to the Survey of Current Business, United States Department of Commerce, pages 143–149.

In the current and ensuing fiscal years, these differences are of minor importance. Thus, the net budgetary position of the Federal Government on a national income and product basis is very similar to that shown by the cash statement.

The following table presents estimates of Federal receipts and expenditures on the basis of the administrative and cash budgets and the national income and product accounts.

TABLE I.—*Federal Government receipts and expenditures: 1953–56 administrative budget, cash budget, national income accounts*

[Billions of dollars]

	Fiscal years			
	Actual		Estimated	
	1953	1954	1955	1956
Administrative budget:				
Receipts	64.8	64.7	59.0	60.0
Expenditures	74.3	67.8	63.5	62.4
Surplus	−9.4	−3.1	−4.5	−2.4
Cash budget:				
Receipts	71.5	71.6	66.6	68.8
Expenditures	76.8	71.9	69.0	68.2
Surplus	−5.3	−.2	−2.4	.6
National income accounts:				
Receipts	70.5	66.6	64.3	68.1
Expenditures	75.3	75.6	67.9	67.7
Surplus	−4.8	−9.0	−3.7	.4

Source: Administrative and cash budget data for 1954–56 from the Budget of the United States Government for the Fiscal Year Ending June 30, 1956; 1953 data from the Budget for fiscal year 1955. National income accounts data from the U. S. Department of Commerce; estimates for 1955 and 1956 are based on the estimates in the budget for fiscal year 1956.

NOTE.—Detail will not necessarily add to totals because of rounding.

Mr. PARADISO. I shall rest at this point with respect to the very brief summary of the recent 18 months and later I shall make a brief statement on the translation of the President's budget in these same terms.

The CHAIRMAN. Thank you very much, Mr. Paradiso.

Mr. Colm.

OPENING STATEMENT OF GERHARD COLM, CHIEF ECONOMIST, NATIONAL PLANNING ASSOCIATION

Mr. COLM. Mr. Chairman, I appreciate very much having been included in this panel. I would like to say at the beginning I am expressing my own views and not necessarily those of the organization by which I am employed. If I have 2 minutes for comments covering the period from 1952 through the end of 1954, on the American economy, then I would like to characterize what has happened in that time as follows:

During this period we have turned from a national-security buildup to what I perhaps might call a continued war-preparedness economy. I think that this transition is the most important fact of the period from 1952 through 1954. How much of that transition has been accomplished? From the second quarter of 1953, which was the peak of the national-security program, to the fourth quarter of 1954, national-security expenditures of the Government have declined by an annual rate of $14 billion. At the same time we also had a decline in private national-security expenditures, that is, defense-supporting investments, by an annual rate—we have no exact figures—which we estimate at $4 billion.

That means a total decline in private and public national security outlays by $18 billion.

Now in the same period of time, the productivity of the economy has increased. Starting from the second quarter of 1953, assuming that in that quarter we had what we may call moderate overemployment, we estimate that the increase in potential production to the end of the year has been at least $12 billion. That leads me to the conclusion that in order to shift from a full employment buildup economy to a full-employment, continuing-preparedness economy, we needed an increase in nondefense public and private activities by about $30 billion.

Now the actual increase, excluding the temporary change in inventories, was $16 billion; $7 billion in consumer spending; a $3 billion increase in residential construction; perhaps—this is a very vague estimate—a $2 billion increase in business outlays other than for defense-supporting facilities; and a $4 billion rise in State and local government outlays. That gives me $16 billion.

So, Mr. Chairman, with respect to the one question I wanted to discuss under this first item, I have reached the conclusion that in the transition from a full employment national security buildup economy to a continuing-preparedness economy, we have made the adjustment about half way—$30 billion goal, $16 billion accomplished. This accomplishment in the past year and a half is cause for satisfaction. It speaks for the vitality of the American economy, but it also states the fact that one-half of the adjustment is still ahead of us.

(Mr. Colm's prepared statement appears at p. 124.)

The CHAIRMAN. Thank you very much.

Mr. Keezer.

OPENING STATEMENT OF DEXTER M. KEEZER, DIRECTOR, DEPARTMENT OF ECONOMICS, McGRAW-HILL PUBLISHING CO.

Mr. KEEZER. Mr. Chairman, I do not think I have anything to say on this question which would be helpful to the committee. I interpret "the facts" to mean what actually has happened. We accept the statistics of the Government, broadly speaking, on all of these matters and I accept the Economic Report of the President as a competent and honest statement of the facts.

(Mr. Keezer's prepared statement appears at p. 127.)

The CHAIRMAN. Mr. Butler.

OPENING STATEMENT OF WILLIAM F. BUTLER, CONSULTING ECONOMIST, CHASE NATIONAL BANK

Mr. BUTLER. It seems to me the most significant point about recent economic trends in this: The curve of business activity turned up smartly in the fourth quarter of last year. Total activity recovered in 3 months over one-third the ground lost in the preceding 15 months.

The upturn was not only vigorous but also broadly based. If you run through the catalog of economic statistics, you'll see that the vast majority of series was moving up in strong fashion in the final months of 1954. In past recovery periods, upturns in various areas of the economy were spread over a considerable period. This time almost everything—production, employment, man-hours, new orders, consumer expenditures, corporate earnings—moved up at once.

Now it seems to me there are a number of other important trends discernible in recent experience. To save time I will merely list them: First, consumer markets have been showing increasing strength. The ratio of consumer spending to posttax income moved up from 91.4 percent to 92.8 percent during 1954. That is a seemingly small, but very significant change. The University of Michigan's survey of consumer buying plans also point upward. People's evaluation of buying conditions have increased from an index of 100 in September–October 1953 to 118 in October 1954.

Second, while private debt has risen rapidly in the postwar period, ratios of debt to income still seem reasonable. Thus we seem to be in a position to handle a moderate rise in all types of debt.

Third, stock market price averages rose more than 40 percent last year. As measured by past relationships to earnings and bond interest rates, common stock prices were very low when the rise began. At the end of 1954 they stood somewhat above their long-term relationship to these basic factors. However, common stock prices are not as far out of line with earnings, dividends, interest rates, and book values as they got in past periods that preceded a major break in the market.

Fourth, the recent surge in business activity was partly due to a very high level of auto production and construction of new homes. In both areas, current activity seems to be higher than basic demand factors would justify. In autos, the current high level of output is largely a seasonal phenomenon—it's the normal rush to get ready for heavy spring sales.

Our statistics may be overstating the extent of the housing upsurge. Nevertheless, it is important to watch the housing market as the months go by.

To sum up: The record shows that the economy has successfully negotiated the difficult shift from a defense boom to a more normal prosperity. In the process, the decline in production and employment was remarkably moderate. And, in large part because of appropriately timed tax cuts, buying power in the hands of consumers and businesses was maintained at a high level. What is more, economic activity is on the upgrade now. When all the statistics are finally compiled, they should show a sharp upturn in production and employment in the fourth quarter of 1954.

Thus, the economic atmosphere is clearing up rapidly.

(Mr. Butler's prepared statement appears at p. 133.)

The CHAIRMAN. Thank you very much.

Mr. Hoover.

OPENING STATEMENT OF CALVIN HOOVER, PROFESSOR OF ECONOMICS, DUKE UNIVERSITY, AND FORMER PRESIDENT OF THE AMERICAN ECONOMIC ASSOCIATION

Mr. HOOVER. Mr. Chairman, I do not wish to add or to try to add anything to the factual material before us and I do not wish to question any of the estimates which have been made. I also accept the Economic Report of the President as a competent, workmanlike job. I shall have comments to make on the other questions, particularly the third and fourth. Thank you.

(Mr. Hoover's prepared statement appears at p. 137.)

The CHAIRMAN. Thank you, Mr. Hoover. Mr. Luedicke. I may say that Mr. Luedicke has prepared a very thorough statement amounting to 42 pages, for which we thank him. But it will be impossible to deliver it in the course of a few minutes so I wonder if you would be willing to summarize your views on this first topic.

OPENING STATEMENT OF HEINZ LUEDICKE, EDITOR, JOURNAL OF COMMERCE

Mr. LUEDICKE. I don't think, Mr. Chairman, I have to add very much to the first question except perhaps to draw attention to the question of inventories as one factor in recent developments. We have heard a great deal about it; inventories have been declining to be sure, but they have not been declining at such a rapid pace as has been generally believed.

(Mr. Luedicke's prepared statement appears at p. 139.)

The CHAIRMAN. Thank you very much, Mr. Luedicke.

Mr. Ruttenberg.

OPENING STATEMENT OF STANLEY RUTTENBERG, DIRECTOR, DEPARTMENT OF EDUCATION AND RESEARCH, CONGRESS OF INDUSTRIAL ORGANIZATIONS

Mr. RUTTENBERG. Mr. Chairman, If I were to take just a minute or two, I think there are five points which I should like to make and I shall make each of them very briefly.

First, I should like to point out that the monthly average of nonagricultural employment in 1954 was less than in 1953 and in 1952. The same is true of manufacturing employment, being less average monthly in 1954 than the average monthly figures for 1953 and 1952. It is also true of mining. It is true that in construction, interestingly enough, in spite of the continued large scale expenditures for construction, that construction employment average for December 1954, was less than for December 1953. And the average figure for the year 1954 was about equal to the average figures of 1953 and 1952, even though construction expenditures have gone up.

The second point that I would like to direct the attention of the committee to is that unemployment averaged in 1954, 3.2 million. It averaged in 1953, 1.5 million; unemployment more than doubled over the year. The December figure of 2.8 million, compares to 1.8 million in the previous December 1953, although by some peculiar method of correcting the December 1953 figure, we have gotten it revised upward to 2.3. I think the explanation accompanying this upward adjustment of the December 1953, figure is one that I could characterize as being straight guesswork, because there was no real way to adjust it upward.

Thirdly, I should like to call the attention of the committee to another problem, the answer to which I don't have, but it is a problem that disturbs me in terms of current employment. Agricultural employment, over a great many years has shown a continual decline. The year 1954 figure shows a considerably lesser decline than in previous years.

I don't know the explanation for this. In many areas throughout the United States—workers have a farm, they raise a few products, but they also work in an industrial plant. There was a study made, by the Census Bureau, 1949–50, relating to this same situation. The study indicated as I recall that there was a tendency for industrial workers who may have lived on a farm but who also worked in a plant, to be classified as industrial employees, but when they were laid off of their industrial job, they went back to their little farm where they raise what they raised the year before, and as a result they were classified as being employed on a farm.

Secondly, I think another possibility could well be that industrial workers laid off, returned to their family, to their fathers and mothers who have farms, and they sit on the farm and they are waiting there and when something has to be done on the farm they move out and help their father or they help their brother or their family, and as a result the Census Bureau enumerator classifies the employee as on the farm.

This shows up, it seems to me, and it is something that deserves careful attention. If this is true, the decline in employment and the rise in unemployment is greater than the figures indicate.

Now the fourth point which I should like to make relates to the field of productivity. I note with a great deal of interest something which disturbs me no end in the President's Economic Report. On page 5 of that report is a series of 5 lines, 5 graphs. The heading is output per man-hour in major industries, 1909–53.

These five lines indicate what we term productivity or increases in output per man-hour. It is interesting to note at the bottom the source of this material is the Council of Economic Advisers based on data from various Government and private sources. There is no Government data published now that is available that deals with the problem of manufacturing-mining productivity. There are some productivity figures for specific industries. The Department of Labor is engaged in preparing this material, but there is a very careful preparation taking place in the Department of Labor of a statement of limitation.

That document indicating the limitations of the productivity figures has not been published. The Department of Labor is holding up release of the figures on productivity until the statement of limitation is available.

It seems to me that the Council has released those figures or comparable figures based upon such material of the Department of Labor without the qualifying statements which the Department of Labor is now engaged in preparing.

Secondly, I should like to point out in connection with the productivity figure, that nowhere in this report are the lines that appear on page 5 discussed. There is no table in this report relating to productivity. There is nothing, in other words, in this report that I can find that in any way discusses these five lines. The third point which I should like to make is that this chart is prepared in such a way as to lead the non-technician astray. It is a semilogarithmic chart. It does not show arithmetic proportions.

I am not saying that the technician can't interpret this chart correctly. He can do that. Let me edirect your attention to the line on manufacuring. Notice the chart. Notice the bottom line is labeled 25. Then there is a 50 figure. Then a hundred. Then 2 lines, and then the top line is 250. The distance between 25 and 100, 75 points, is less than the distance between 100 and 250, which is 150 points. So that you tend to show a large increase below the line of 100 and a small increase above the line of 100.

Now as I say, I am not saying that a nontechnician will not properly interpret this chart in terms of trend, but a layman or the average Congressman excluding, let us say, the fine economists that are on this committee—but the average individual and Congressman will misinterpret these figures.

Now the fifth point which I should like to make very briefly is that certainly it is true that consumer income, consumer disposable income after taxes, has gone up. Consumer expenditures have continued to rise during 1954. I should just like to call the attention of the committee to the fact that per capita disposable income, disposable income available to each individual after taxes, has declined, because of the rising population. While we might take solace temporarily in the overall figure of disposable income going up, we can take little solace, it seems to me, in the fact that per capita it has gone down. Population has gone up and incomes haven't kept pace with rising population.

Let me say in conclusion, sir, that I am fully aware of the position that Mr. Butler has taken, that there has been an increase in the economy in the last quarter of 1954. I think a great deal of this is peculiar in terms of the automobile industry, and steel rates reflect the automobile upturn. Whether or not this will continue into 1955 remains to be seen. I am not so sure, but I would urge that in looking at the upturn of the last quarter that we do it at least with a bit of skepticism.

(Mr. Ruttenberg's prepared statement appears at p. 156.)

The CHAIRMAN. Thank you very much.

Mr. Gainsbrugh.

OPENING STATEMENT OF MARTIN GAINSBRUGH, CHIEF ECONOMIST, NATIONAL INDUSTRIAL CONFERENCE BOARD

Mr. GAINSBRUGH. Mr. Chairman, I feel honored to be asked back again and, as in the past, I would like to confine my comments to trends and to the outlook and refrain policy recommendations.

First, in my opinion I find the 1955 Economic Report several cuts above its predecessors in the quality of its analysis. I think there will be professional agreement on that position. I am particularly delighted with the extended statistical appendix contained——

Vice Chairman PATMAN. I didn't understand that statement. Will you repeat it?

Mr. GAINSBRUGH. I am impressed with the professional competency of the 1955 Economic Report. I think it is a cut above any we have had.

The CHAIRMAN. You think it was an improvement over 1954.

Mr. GAINSBRUGH. 1954, yes. I would particularly direct the attention of the committee to the table which appears on page 85. For the first time, to my knowledge, the Council has looked at current gross national product figures and called attention to the differences in these highly important figures that are used by all of us in terms of current analysis, when you look at them from the charges against the national product and then when you look at them from the expenditures side.

I found it hard, Mr. Chairman, to come to grips with question No. 1. I would like to deal with it primarily on the basis of what the battery of statistics indicate from 1952 on, rather than deal with each series seriatim. In my mind they reveal 4 major differences over the past 2 years. First, the economy since 1952 has been undergoing a broad shift of activity and resource allocation away from Government and toward the private sector.

Secondly, within the private sector there has been a shift away from capital formation and toward consumption. In combination these shifts have acted to move the composition of national output toward a sustainable normal peacetime balance.

Third, there has been a steady relatively rapid rate of national growth in terms of population, creating increasing pressure upon the market.

Fourth, there has been a complete cycle in the inventory demands of business, starting with the sudden exhaustion of steel and automobile inventories in mid-1952, running through accumulation, then through rapid liquidation and now we begin 1955 with a new phase of inventory accumulation. The restraining impact of inventory liquidation in 1954 is removed as a contracting factor as we enter 1955. The rest of my comments are directed to factors contributing to the favorable economic climate which has increasingly prevailed during the past 2 or 3 years, and I spell these out under 6 headings.

First, tax reductions, and what that has done to support consumption and investment.

Second, flexible monetary policy and how that helped offset the inventory cycle.

Third, the strength of foreign economies and what this has meant in terms of dampening down our domestic recession. And now three major points at the close, some of which do not necessarily agree with the position of the previous speaker.

In the last 2 years wage adjustments in the American economy for the first time in more than a decade have been more reasonably in line with the rate of increase in productivity. In the aggregate, unit labor costs have not changed to any significant degree. As a result pressures on prices from the cost side have been only moderately upward and there has been a relative degree of price stability. This has led to a restored sense of value among consumers and business enterprises.

As a result of price stability, both consumers and business appear over the past 2 years to have attained a reasonable degree of confidence, as to prospective returns on investment and as to the report.

(Mr. Gainsbrugh's prepared statement appears at p. 159.)

The CHAIRMAN. Thank you. Mr. Keyserling.

OPENING STATEMENT OF LEON H. KEYSERLING, ECONOMIC CONSULTANT, PRESIDENT OF CONFERENCE ON ECONOMIC PROGRESS, AND FORMERLY CHAIRMAN, COUNCIL OF ECONOMIC ADVISERS

Mr. KEYSERLING. I hope that the committee will reward my waiting until last with patience with respect to my remarks. My friend sitting on my left has said this Economic Report is the best written ever. That reminds me of the Texas millionaire——

The CHAIRMAN. He qualified that later, that it was the best since the last year.

Mr. KEYSERLING. That was under pressure from the chairman. It reminds me of the Texas millionaire who said that if he was the richest man in the United States, he was sorry for the second richest. By the same token, if this is the best Economic Report ever written, I am sorry about the jobs we did earlier.

I think we are threatened by a long-term trend of rising chronic unemployment. I see no signs of improvement sufficient to reverse this trend, without more effective policies. I would like to cite a few facts in support of this proposition, and then correlate them with other economic developments. In 1954, compared with 1953, the level of full-time Census Bureau unemployment rose from 2.5 to 5 percent of the labor force, or from 1,620,000 to 3,230,000.

Allowing for seasonal variations, a 200,000 allowance, I would say that at the end of 1954, the level of full-time Census Bureau reported unemployment seasonally adjusted was in the neighborhood of 3 million, and the level of true unemployment in the neighborhood of 3.7 million. By true unemployment, I include the full-time equivalent of part-time unemployment, shorter hours, temporary unemployment, and so forth.

In addition, there have been profound changes in the structure and utilization of the labor force, which incidentally explains the great variant between the deficit in unemployment and the deficit in output. The deficit in output in the fourth quarter of 1954 was about $30 billion (annual rates) or about 7.7 percent of the full production level. The excess unemployment was about 3.1 percent of the labor force. The difference betwen those figures is explained by the changes in the composition of the labor force. The most striking example is that in 1954 agricultural employment remained relatively stable. Manufacturing employment dropped by more than a million. That happened in many other parts of the economy, so that you had a progressive shifting of people to lower paid, less productive jobs.

A still more striking fact is that in December of 1954, with a level of production in construction, manufacturing, and mining combined, higher than at the end of 1953, unemployment was 1.1 million higher —in other words employment was 1.1 million lower; you don't have unemployment breakdowns for sectors of the economy. So you had the startling factor of a 5 percent decrease in the employment of labor with an increased product, which is about equivalent to about a 5 percent productivity increase.

Now, I ask, where are the people going next year. Mrs. Wickens has said that we may look forward to an increase of about a million in the labor force. Add to that, depending upon what one regards as the optimum level of unemployment, a million and a half desired reduction in unemployment, and you have a job of creating 2½ million new jobs, plus this problem of the composition of the labor force.

Are they going back into manufacturing, which has disemployed 5 percent of its labor with an increased product? Are they going into agriculture, in the face of mounting talk of agricultural surpluses? Or are they going into trade?

Now, let's look at trends in national output—resulting as of now in a $30 billion deficit in national product (annual rate). I regard those trends as highly unfavorable; they need to be measured, not against the levels of 2 or 3 years ago, but against maximum employment and production levels now, which manifestly must change with growing productivity and a growing labor force. In the fourth quarter of 1954—and I think we would all agree that the recent upturn has ben caused primarily by a seasonal spurt in automobiles, much similar to the 1953 spurt—the level of output in the fourth quarter of 1954 was only about 1 percent higher than for the year as a whole.

According to my calculations, which may be wrong, we would need in 1955 an expansion of about 6 percent in total output about the 1954 level to reduce unemployment to what I would regard as tolerable levels under the standards of the Employment Act.

Where is is coming from? Personal income before taxes rose only about $5 billion from the first quarter of 1953 to the fourth quarter of 1954 (annual rates). The increase in consumer spending of about $9 billion was supported almost entirely by tax reductions and by a change in the rate of savings, which I believe went down too rapidly—the savings of middle- and low-income families—even if the now attained rate is sustainable for a long run.

I do not believe that tax reductions and further reductions in savings can make up the current deficit of about $13½ billion in the annual level of consumer spending. The level of business investment tends to portend a slightly moderate decline. The levels of Government expenditures are projected budgetwise to decline substantially.

Therefore, I would expect, with growing productivity, that the true level of unemployment in 1955 would be considerably higher than in 1954. The most optimistic forecasts are that the economy overall may expand about 3 percent in 1955. If it expands only 3 percent, and that is an optimistic forecast, I would expect the true level of unemployment sometime within 1955 to rise by 1 to 2 million. How much of this would be shown by the Census Bureau recorded figures would depend on how much of the unemployment was concealed through forced reductions in the workweek to share unemployment, through further adverse changes in the composition of the labor force, through the further saddling upon agriculture of the burden of carrying too large a percentage of the labor force, and so forth.

Finally, I think that the Economic Report masks and avoids these questions because it rejects the statutory mandate of the Employment Act to define needed levels of employment, and in the absence of that definition cannot make a really penetrating analysis of our present economic situation or where we ought to be going.

(Mr. Keyserling's prepared statement appears at p. 162.)

The CHAIRMAN. Thank you very much, Mr. Keyserling.

The chairman is going to waive the asking of questions to Mr. Patman.

Vice Chairman PATMAN. Thank you, Mr. Chairman.

Mr. Gainsbrugh, I wanted to ask if you believe that the farmers have profited along with industry?

Mr. GAINSBRUGH. They have not. The 1954 picture shows a reduction in income of the agricultural sector. The outlook is for further reduction of the income of the agricultural sector in 1955.

Vice Chairman PATMAN. Do not you consider that a disturbing picture?

Mr. GAINSBRUGH. There are numerous elements of weakness in 1955. The agricultural sector is one of the primary areas of weakness.

In addition to its current weakness flexible price supports introduced in 1954 may further endanger their position. Fortunately they have a strong balance sheet position. They did not expand their debt in World War II as they did in World War I. Their debt levels are barely above where they were pre-World War II. Their savings and asset position has remained strong over the past decade or more ever since the beginning of World War II.

There has also been an increased flow of population away from the farms. Income per capita and income per farm family has not been as markedly reduced as the overall agricultural income figures indicate.

Vice Chairman PATMAN. Now, this report that you have commended, and I commend the tables and the information, I think it is a devastating report for the administration if you analyze it and evaluate it—for instance, on page 83, it says the income shares of both farm and business proprietors in 1954, 4.1 percent and 8.9 percent, respectively, were at postwar lows.

Now, although the report admits this terrible condition of the farmer, and the small-business man, being at the lowest point since the war, can you point out to me any remedy that is suggested, or anything that is offered in the way of hope as being held out to these two classes and groups who are admittedly in the postwar low in this report?

Now, where is there anything in this report that offers them any hope of any kind whatsoever?

Mr. GAINSBRUGH. In my response to question 4, as distinct from question 1, I in general follow the same lines you presented, namely, that the council was derelict in its appraisal of the agricultural sector. It has too quickly disposed of the problems of the economy in 1955, largely on the basis that we have entered the recovery phase of the business cycle and that momentum alone will carry us through 1955.

Vice Chairman PATMAN. Here is a chart that I prepared a couple of months ago. It is very similar to the one on page 42 of the President's report. I means it contains information that is comparable.

Now, if you will notice there in 1951, about the time of the so-called accord—you know what I mean by that, the shotgun wedding or something—the prices of the farm products, the prices of things that the farmers sell—you see the farmer sells in the wholesale market and buys in the retail market—the things that the farmers sells, the line has gone down ever since, and is still going down. And you recognize in the President's report that he admits that it is much lower than it has ever been.

In other words, it is now about 86, parity ratio, compared to 100 in 1952.

Now, where is there in this report anything that offers any hope or encouragement to the farmer?

Mr. GAINSBRUGH. I assume that may be a separate message.

Vice Chairman PATMAN. A separate message; however, the separate message is not in here, and that is just an assumption of yours. What do you believe caused that line to consistently go down since the monetary policy became effective on March 4, 1951?

Mr. GAINSBRUGH. You have another session devoted to agriculture, but in response to your question I would say the ills and evils of agriculture now are directly attributable to the policies that were pursued in terms of rigid support, in terms of overexpansion of agriculture in the earlier years.

Vice Chairman PATMAN. Overexpansion of agriculture?

Mr. GAINSBRUGH. That is correct.

Vice Chairman PATMAN. Is it not a fact that the reason farm prices have consistently gone down is because farm prices respond very quickly to changes in monetary policy, more quickly than any other segment of our economy, and in view of the fact that they respond so quickly, the farmers take nearly all of the beating in a change of monetary policy for the reason that there are so many of their fixed charges that are inflexible?

You take the things that the farmers buy, like utilities, electricity, gas, water, telephone, freight rates, and things like that: They are fixed, and they are constant. And the industrial prices, as shown on page 42 of the President's report, of finished goods and semiprocessed materials, which, of course, are in the so-called monopoly groups, they remain steady and even rise.

Don't you see in that convincing evidence that the monetary policy that has been in effect has hurt the farmers more than any other group except perhaps, the small-business man?

Mr. GAINSBRUGH. Frankly, Mr. Patman, I would place my emphasis upon the economic characteristic of agriculture, its relative inelasticity of supply in periods of war and in periods of crisis. It takes a while for nature to come to our rescue and meanwhile, there is pressure upon the price structure which drives agricultural prices up.

Vice Chairman PATMAN. I know. You are expecting the farmer to wait for nature to take care of him. But what about these other groups? You see the Government is taking care of them.

Mr. GAINSBRUGH. We gave them a while to readjust postwar levels of consumption. We also gave them rigid supports for the basic commodities. We recognized that the prices of agricultural commodities would be driven up in World War II. We wanted maximum production for the farms, and we pledged for a period of years after World

War II we would continue to support agricultural prices at levels above their warrant relative to the current market. Production did not come down to market levels. It did not adjust to existing levels of demand.

Vice Chairman PATMAN. That is right, they did not. But don't you think we should do something about it?

Mr. GAINSBRUGH. I think we are in the flexible price program.

Vice Chairman PATMAN. I know, but the farmer is tired of this flexing. He has been flexed too much, flexing farm prices downward and flexing interest rates upward, so he has felt it both ways. Getting less for what he produces and paying more.

Don't you feel that agriculture represents such a major part of our country in purchasing power, and those who are dependent upon the farm products that are produced, that they represent such a major part of the purchasing power of this Nation that it makes restoring agriculture one of our No. 1 problems, a must problem, commencing right now.

Mr. GAINSBRUGH. I agree, but I doubt that it can be done through monetary methods.

Vice Chairman PATMAN. At least they can pull the monetary dogs off and help them a little in that way, in other words stop the squeeze by reason of monetary policy?

Mr. GAINSBRUGH. I think the more basic problem, however, is the readjustment of agriculture to the existing levels of demand in postwar, postdefense markets.

Vice CHAIRMAN. And don't you find that the monetary policy has definitely been detrimental to agriculture in that you take, for instance, the early part of 1953, and when the hard money, high interest policy, was effective at its worst, it reflected an unfavorable light on farm products, most unfavorably?

Mr. GAINSBRUGH. If you look at your own chart, however, you will see that the break began back in terms of prices received as early as 1948. There was an upsurge following Korea, but prices had been going downward quite a long period before the change in monetary policy.

Vice Chairman PATMAN. That was when they were tampering with the short-term monetary rates, when they arbitrarily raised the rates, in 1947.

But, of course, they went up in 1951, and then when they had that famous accord, and then they have been going steadily downward since.

But you do recognize that agriculture represents the No. 1 economic problem for the country to give economic attention to?

Mr. GAINSBRUGH. I would put it high on the list.

Vice Chairman PATMAN. And in view of the President's report here, on page 83, the economic shares of both farm and business properties in 1954, 4.1 percent and 8.9 percent, respectively, were at postwar lows—don't you think that the small-business man is entitled to consideration, too, as a major problem?

Mr. GAINSBRUGH. May I have that reference again?

Vice Chairman PATMAN. Yes, on page 83, near the top of the page, the second sentence, I believe.

If you will notice the last 2 years, the income of the large concerns has increased, but the income of the small-business man has decreased.

WHAT THE PRESIDENT'S 1955 ECONOMIC REPORT SHOWS

The President's Economic Report clearly shows that farmers and small-business men have been severely damaged by the economic policies of the administration the past 2 years. On page 83 of his report there is the following statement:

The income shares of both farm and business proprietors in 1954—4.1 percent and 8.9 percent, respectively—were at postwar lows.

Earlier in the report the President casually dismissed the economic crisis that confronts the American farmer in the following words:

The introduction of flexible price supports for basic crops and the modernization of the "parity" formula will facilitate the adjustment of our farming enterprises to changing markets and thus help to improve the outlook for the farmer (p. 7).

The falling income position of the farmer is clearly revealed in an appendix table on page 147 of the President's Economic Report. It shows that the income of United States farm proprietors fell in every quarter of 1954. Here are the figures adjusted to annual rates.

1st quarter	$13, 000, 000, 000
2d quarter	12, 200, 000, 000
3d quarter	11, 600, 000, 000
4th quarter	11, 000, 000, 000

These figures show a $2 billion or 15 percent fall in the annual rate of farm proprietor incomes from the beginning of 1954 to the end of the year. As against the deteriorating economic position of farmers and small-business men the Economic Report shows a clear gain for investors in 1954. From the opening to the closing quarter of 1954 the annual rate of income receipts from investment sources—rental income, dividends, and interest—rose by $1.5 billion. As a percentage of total personal income disbursements in 1954 interest income amounted to 5 percent, the highest share since the end of World War II. Since 1952 the interest share of personal income has risen by 11 percent while the income share of farm and other unincorporated proprietors has fallen by 10 percent.

The CHAIRMAN. Mr. Talle.

Representative TALLE. Mr. Chairman, without prejudice or invidious comparison, I should like to pay a compliment to Mr. Gainsbrugh. I have had the opportunity of hearing him on a number of occasions. I am pleased with his presentation and his clarity as well as depth of thought.

Mr. Gainsbrugh, you have pointed your finger straight at the target when you call our attention to the nature of agriculture. Government took the farmer's sons, and industry attracted his hired men as World War II progressed. Therefore, the war forced the farmer to mechanize. That would have come about in time anyway, I think, but war forced mechanization on him sooner than under conditions of peace. because of the high investment, modern farm machinery requires the size of a farm in relation to manpower to become larger than before. Otherwise it would not be an economical unit to operate.

A farm paper the other day raised the question—How big is a farm? I think it is a very good question.

So I would say that we should at this time expect more stability in employment on our farms for the reason that there is relatively little opportunity for a decline. If you have one able-bodied man operating a farm of, say, 160 acres, by employing much machinery, there is no opportunity for unemployment on that farm unless the farmer decides to quit. This is true of many farms today.

I am not surprised at all at the stability of employment in agriculture.

Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Chairman, as a new member of this committee, I am impressed with one fact often in listening to these renowned economists, that economics is not an exact science. I may be provincial when I say this: I come from the great State of Pennsylvania where manufacturing and mining are very prominent. I do know that there is a great deal of unemployment, and there has been, since the beginning of 1953, with the advent of the increase in interest rates. I cannot see that there has been much improvement in employment in the great State of Pennsylvania when you have 950,000 people, Mr. Chairman, receiving surplus food in that great State. You know that there is something wrong with the economy, and there is a great deal of unemployment, a great deal of underemployment, too, by the way. I am not optimistic enough to think that there is going to be a great deal of improvement in 1955, Mr. Chairman. I hope I am wrong.

I have been engaged in industry all of my life, and I have been affected by it as many others have, who were in my same position, but I am not very hopeful for 1955.

That is all.

The CHAIRMAN. Mr. Curtis

Representative CURTIS. Yes, Mr. Chairman, I have 3 questions in mind, and I think the first 1 I would like to address to Mr. Gainsbrugh because he raised the question, but any other comments from the panel I would appreciate.

I was very interested in your comment on the failure of the report to refer to the capital-gain situation that exists in the economy.

Now, I might state that my interest lies primarily from the tax angle of the thing, just what economic effect some of our tax laws are having. One thing that I have observed, of course, is the relationship of equity capital as a method of financing our industrial expansion in regard to borrowing, and I am disturbed by that ratio.

Of course, borrowing escapes the 52 percent corporate tax, and naturally if industrial expansion is done through borrowing the equity interest remains proportionately the same, but as the venture succeeds the value of the equity holdings, of course, increase, increase tremendously, as a matter of fact, and those that have these equity holdings realize an ample gain, and that is held at a 25-percent rate.

I was wondering whether you felt that our tax laws were contributing at all to this economic situation that you have mentioned?

Mr. GAINSBRUGH. I think without question the volume of securities that are held in the box, if we had such figures, would be far higher, relatively as well as absolutely, than at any time in our Nation's history. I think the primary reason why so much remains in the box—and by remaining in the box thinning the supply so the pressure drives stock prices up—the primary reason so much remains in the box is the capital-gains tax. The fact is even if investors hold for 5 or 10 years, even if they are not in the market for quick speculative profit, they are still subjected to just as high a tax, should they attempt to realize their capital gains.

I will bow to other members of the panel on this question, though.

Representative CURTIS. Coupled with that is the question of whether the 52 percent corporate rate actually is not contributing to this situation, also, because, after all, bank borrowing and the interest paid on bank borrowing or on corporate bonds, is exempt from the 52-percent tax. In fact, it is a deductible item from the taxable income of the corporations, and I know many situations where corporations already because of the tax structure have called in a pro rata of their equity stock and refunded through the technique of borrowing or from issuing bonds, again theoretically, I suppose, to escape the 52-percent tax.

I was wondering whether or not you did not feel that that was a contributing factor to this economic picture that you have suggested.

Mr. GAINSBRUGH. I have not given any study to that problem. I do think there is a corollary to it, that as a result of the rise in the value of equities, equity financing may be more readily accomplished now than it was several years past when some of the corporations were driven into debt contracts in order to secure their capital requirements.

Representative CURTIS. I am very happy that you refer to the fact of this omission. I feel, too, that it is a very important factor in our economy, and I suggest that probably taxes have a great deal to do with it.

Now, the second question, and I will again address it to you because you started the comments on it, or the questions were asked of you:

In this farm picture nothing was mentioned much about the decline in farm exports, and it has always been my observation—I may be wrong—but after world wars where the production abroad in agricultural products has, of course, declined during the war period, where many of their fields were actually battlefields, and certainly their farm labor was engaged in military occupation, that this country not being subjected to that, has found that they could be the producer for those markets that have been relinquished.

I wonder if you would comment on that. Is it a fair observation to say that a great deal of our farm problem today comes from the decline in the export market, and that export market no longer exists as a result of these countries that were at war having gone back into their normal agricultural production?

Mr. GAINSBRUGH. I think there can be no question that in the immediate postwar years one of the primary outlets for our agricultural production was to provide food and sustenance to those nations that had not yet reconstructed their agricultural economy. Increasingly they have become more and more self-sufficient, and as a result that outlet for our surplus is not so large as it was.

I think there is another factor, too: In supporting agriculture, pegging prices, we may have dried up part of the markets that were traditionally ours pre-World War II, and that are no longer open to us on a competitive price basis.

Representative CURTIS. You mean because we have pegged them they cannot flow, because of the differential in the world market and the market here?

Mr. GAINSBRUGH. It is adverse to us; yes.

Representative CURTIS. Thank you.

Now, I have a third question and I would direct this to Mrs. Wickens.

I was on the subcommittee of Ways and Means studying our social-security laws, and we had testimony at that time by our census people, and I had my eyes opened as to what the actual census figures in regard to labor force were.

Now, it is my understanding that a labor-force figure actually has no relation to the potential labor force in this country; does it, Mrs. Wickens?

Mrs. WICKENS. Well, people coming into the labor force are, of course, by their own appraisal, either considered as available for jobs, looking for jobs actively, or they are out of jobs.

Now, in the sense of potential, sir, I tried to point out that the potential size of the labor force is very much greater than the number who at any one time may include themselves as out of work, looking for work, or at work. Many people, older women, for instance, will come into the labor market if there are incentives to bring them in. Thus, it is not a fixed figure. It depends upon the attitudes of individuals with reference to their attachment to the labor force.

Representative CURTIS. I see, and it is based upon the people who are actually working and perhaps going back a few years as to whether they had worked.

Mrs. WICKENS. No, sir; they are asked the question as of a particular week, whether they were at work, whether they had a job, but were not at work, but expected to be called back, or whether they were unemployed, and actively seeking work during that period.

Then there are additional questions about their age, and their status, for example, a woman who is a housewife, and children, whether they are at school, and it is from a series of questions of this kind that these figures are derived. You know that there is also a table that shows the proportion of people working part time, but who would like to have full-time employment. There are a variety of additional details here, so that many more facts are available about employment than the total figures suggest, but the labor force in the United States is a highly flexible figure which varies in any one year by about 3 million, seasonally.

The CHAIRMAN. I would like to mention in connection with a question of Mr. Curtis, that on page 160, in the first column it is stated that on a seasonally adjusted basis the number employed outside of agriculture, in July 1953, was 49,905,000, or approximately 49.9, and for December, 48.349, let us say 48.4, or a net decline in employment of 1½ million.

Mrs. WICKENS. Are you referring to table A-22 sir?

The CHAIRMAN. That is right, page 160, if those figures are correct.

That is my first point, that there has been a decline in employment on a seasonally adjusted basis from the peak to December of 1½ million.

Your testimony indicated that the normal increase in the size of the working population—I do not say working force, but working population—is at a rate of a little less than 700,000 a year.

Since there was a passage of a year and a half of time here you would expect, therefore, an increase in the working population of a million persons?

Mrs. WICKENS. Well, somewhat less than that—oh, in a year and a half, that is right; yes, sir.

The CHAIRMAN. So that in December the economy fell short of employing—fell short by 2½ million of employing—the same proportion of the working population as it had been able to achieve at the peaks?

Mrs. WICKENS. I want to check the arithmetic.

The CHAIRMAN. Well, it is rather simple, 1.5 to 1.

Mrs. WICKENS. I was trying to figure a percentage in my mind.

The CHAIRMAN. Well, in absolute numbers, then.

We will waive the question of percentage.

In absolute numbers, it fell short by 2½ million.

Mr. GAINSBRUGH. May I offer a comment in that connection, Mr. Chairman.

The CHAIRMAN. Yes.

Mr. GAINSBRUGH. On page 160, it is indicated that the figures of the BLS relate to a more limited segment than the census. Domestics, self-employed, etc., are all excluded from this BLS table. They are, however, included in the census table on page 153, which shows total nonagricultural employment.

I am delighted that you have used the seasonally adjusted figures because I would like to see every series, wherever possible, shown on a seasonally adjusted basis. In this particular series we do not have the seasonally adjusted figures. However, the figures that are shown fail to reveal the gap that appears in the BLS series.

That may be due to seasonal fluctuation, but I cannot tell since the seasonal figures are not shown. The figure for the first half of 1953, on page 153, for nonagricultural employment, is 55.5 million, and for December 1954, on page 154, is 55.3 million.

The CHAIRMAN. Is this based on the sample of 25,000 families?

Mr. GAINSBRUGH. This is based on the census reports.

The CHAIRMAN. I do not think we should take up our time with elaborate discussion of that sample, but I would say that because of an insufficient sample, and the definition of whether a person is seeking work or not makes this point highly subjective and conjectural. While I do not want to take up too much time with that point I think we should not place too great credence upon the Bureau of the Census figure.

Mr. GAINSBRUGH. It does, however, have this qualification, if I might give it: The BLS figures are picked up from employees' records as distinct from the census figures which are obtained through individual sample approach. An individual could have conceivably had dual employment in July 1953 and be reported twice by BLS. The number of dual jobholders may have been reduced from July to the present without signifying an increase in unemployment.

The CHAIRMAN. Mr. Keyserling.

Mr. KEYSERLING. Mr. Chairman, I would like to call the attention of the committee to just a few figures on a seasonally adjusted basis in the fourth quarter. These are official Government figures—Reserve Board. I do not make up figures of my own.

Taking total nonagricultural wage and salary employment, that is as distinguished from agricultural, the seasonally adjusted figure on employment for nonagricultural wage and salary employees as a whole showed almost no change in the fourth quarter of 1954, despite the heralded business upturn. The index was 110 in December. This was lower than the index for 1954 as a whole. It was much lower than the 113.3 index for 1953, as a whole.

The picture is much more striking with respect to manufacturing production work. Here the seasonally adjusted index of employment was 101.8 in December, or no higher than in November. It was lower than 1954 as a whole, and distressingly below the 112.0 index for 1953 as a whole.

Now, the question I ask is this: If the seasonally adjusted index of employment for such wide sectors of the economy as manufacturing production workers and total nonagricultural wage and salary employment showed no improvement in the last quarter of the year, therefor, then the level of unemployment must have been—because of the figures that the chairman gave on labor force growth—very much higher. Unless we assume that more and more people, relatively, are going into agriculture, what is going to happen in 1955, when the average rate of increase in output, according to most estimates, will approximate the fourth quarter, 1954, rate of increase? Even the gentleman here who referred to the fact that business was on the up and up said that the level of increase in automobiles and steel was much higher than could be sustained.

With the labor force expanding, with automation increasing the rate of productivity, with the rate of productivity now much higher than it was in 1953, though masked by a change in the labor force, where are the increasing number of workers, the increasing number of unemployed, going to be absorbed?

Mr. RUTTENBERG. Mr. Chairman, may I add a word here?

The CHAIRMAN. Certainly.

Mr. RUTTENBERG. Mr. Gainsbrugh points out that the BLS employment, as contrasted to the Census Bureau figures on nonagricultural employment, excludes self-employed persons, domestic servants, and unpaid family workers. If we were to assume complete accuracy of the BLS nonagriculture figure, and complete accuracy of the census figure on nonagriculture, it seems to me that we could take little satisfaction from the fact that the Census Bureau figure does not show such a large decline. It shows, if I interpret this correctly, the transfer of workers from the nonagriculture categories as those indicated by the BLS, to the categories of unpaid family workers, domestic servants, self-employed, and proprietors. In the main, these categories would reflect income levels to the individuals at a much lower level than their incomes would have been had they been retained in the nonagriculture employment of manufacturing, mining, transportation, trade, etc.

An important comparison would be what has happened to the income receipts and not necessarily to the employment.

I would just like to point that out.

Mrs. WICKENS. Mr. Chairman, may I say a word at this point: There are two things we need to keep in mind. The seasonally adjusted figures for wage and salary workers, as reported on page 160, do show a rise from the low point. Secondly, however, there is no question whatsoever but that they are substantially lower than they were at the peak.

Now, another question was raised about the seasonal movement in the last quarter of the year on unemployment. I have some seasonally adjusted unemployment figures here—which are census figures adjusted by us for internal use and are not as precise as we wish they were—but they also show a continuing decline in unemployment, seasonally adjusted, beginning in September of 1954 and continuing through December.

Of course, again, this total is substantially below the peak, or substantially above the low—I will turn it around the other way.

Now, Mr. Ruttenberg earlier raised a point about the validity of the Census Bureau's revision of its December 1953 figures from its first published figure of 1.8 to a revised figure of 2.3.

I do not wish to discuss this in detail, because I am not familiar with the process, but there is a basis in fact for this revision, in that the Census Bureau, in introducing its new and enlarged sample in January 1954, had previously conducted sample surveys on that same new basis in November and December, and there is general agreement among statisticians that the unemployment figures for the latter part of 1953 were understated, both as regards the size of employment and the size of the labor force, because of the field enumeration techniques then being used.

In other words, I think we must accept the census revision as more nearly comparable to the figures we are using today.

The CHAIRMAN. Thank you, Mrs. Wickens.

Well, now we are almost at 12. If people believe that question 2 can be speedily answered in one word by each of these members of the panel we could finish question 2. If, however, there are a lot of qualifications which must be attached to each word, I think we better adjourn until 2 o'clock.

What is the feeling of the group? Can you deal quickly with this subject? If we can deal quickly with it I think perhaps we will leave out the two Government officials here, lest they be placed upon the spot in characterizing 1954.

Mr. Colm, the question was: "On the basis of economic developments in 1954, how would you classify the calendar year 1954 with respect to the four phases of the business cycle"—and I again refer to the earlier volumes of the Bureau of Economic Research—"of expansion, recession, contraction, and revival?"

Mr. COLM. Mr. Chairman, I am afraid it will take 2 sentences rather than 1 word, you permitted.

According to the definitions of the National Bureau, a distinction is made between phases in the business cycle and transitions, which are more nearly a turning point. According to that the 1954 phase would be called mainly, excluding the last quarter, a period of contraction, and we are now at the point of a revival, and there may be controversy whether we are in a real phase of expansion already or still at the point of revival.

The CHAIRMAN. What is the difference between recession and contraction?

Mr. COLM. The difference between recession and contraction, according to—that is not my terminology—according to the National Bureau—is that the recession is really the turning point, contraction is a phase in the cycle.

The CHAIRMAN. You mean the contraction is a continued recession?

Mr. COLM. Contraction extends over a period of time.

The CHAIRMAN. Contraction is recession intensified.

Mr. COLM. Pardon me, the intensified recession is called a crisis.

The CHAIRMAN. Well, contraction is recession prolonged?

Mr. COLM. That is correct, Mr. Chairman.

The CHAIRMAN. Then it is a prolonged recession.

Mr. COLM. Expansion and contraction are relating to a phase and recession and revival to the turning point.

The CHAIRMAN. Does that suggest the possibility that some gentlemen downtown in proposing to substitute the term "recession" for "contraction" have jumped out of the frying pan into the fire?

Mr. COLM. I think he is taking his lead from a book published in the year 1927.

The CHAIRMAN. You say that a contraction is a prolonged recession. Therefore, it is a naughtier word than "recession," is it not, if understood?

Mr. COLM. Well, Mr. Chairman, in Mitchell's book of 1927 it is not the question of more severe or less severe; it is only the question of the turning point or a phase.

The CHAIRMAN. Well, I do not want to be accused of badgering the witness, but if the witness does not choose to answer the question, that is all right.

Representative CURTIS. I think the witness has answered it.

The CHAIRMAN. Mr. Keezer.

Mr. KEEZER. Since this involves concepts invented by the National Bureau, I asked the National Bureau to answer the question, and the National Bureau says it does not answer this question any more, that it has abandoned these concepts of expansion, contraction, recession, and revival, and use simply expansion and contraction.

In that terminology I was informed by one of the senior members of the Bureau's staff that, in his judgment, we were in a period of contraction until August of 1954 when we turned to a period of expansion.

The CHAIRMAN. Mr. Butler.

Mr. BUTLER. I would agree with that analysis. I think that the outstanding feature of the business situation since about August has been that activity has started to move up.

The CHAIRMAN. And before August?

Mr. BUTLER. Well, it moved down the first quarter; held level in the second and third quarters; and turned up in the fourth quarter.

The CHAIRMAN. Mr. Hoover.

Mr. HOOVER. Mr. Chairman, I am relieved to know that the National Bureau refuses to answer this question because I did not look it up myself, what they had formerly said even.

Mr. KEEZER. If I used the word "refused," I probably exaggerated. They said they did not care to answer it.

Mr. HOOVER. I did the exaggerating.

It will take me more than a sentence, but it will not be long.

We were apparently in a period of contraction during the first half of 1954. The national economy apparently definitely entered a period of recovery during the last quarter of 1954. The crucial and obvious question is whether the forces behind this rate of recovery are strong enough to carry us to the attainable trend line of annual increase in national product, and whether we can in the future maintain this rate of production increase upon the basis of present economic policies.

Now, I am afraid that sentence sounds as though I were sharply critical of present policies. It is not so intended at all. It may well be that we can attain and maintain these rates of increase, but this is a matter which could be discussed more appropriately under the other questions.

The CHAIRMAN. Mr. Luedicke.

Mr. LUEDICKE. I think it is true, as Professor Hoover said, that these answers really should come under question No. 3, rather than here.

I am at a loss to give you a specific answer on it, but I am intrigued with one thing, that we actually probably do not know enough as yet about the 1953–54 recession, or the bump, or whatever you want to call it, and I am further intrigued with the similarity to 1948 and 1949 in trying to explain the 1953–54 recession. The similarity is that we had in early 1950 a pretty smart recovery, and we cannot be for sure whether, if it would not have been for the start of the Korean war, that the upturn in 1950 would not have been abortive.

I am very much in doubt, in my own mind, about whether we are not in very much the same situation now. In other words, we have a smart recovery, the smart recovery, however, has a number of artificial features which are not to my liking, and I have an idea that by mid-1955 we may be very much in the same position as we were in mid-1950.

So that actually we have had two small bumps since the end of World War II. We have proven that, through Government policy, we were able to handle those two bumps very satisfactorily, because we stopped them without getting any worse. But we still have not had the showdown test as to the solidity of the expanding economy that started with World War II.

The CHAIRMAN. Mr. Ruttenberg.

Mr. RUTTENBERG. Might I just help to correct Mr. Luedicke's implication which I am sure he did not mean, by mid-1950 we had a Korean incident. I hope by mid-1955 we do not have a Formosa incident.

Mr. LUEDICKE. That is, of course, my sincere hope also.

Mr. RUTTENBERG. We will leave that aside.

I shall leave to the more competent theoretical analysts on the panel the answer to this question. They will probably come up with the answer in the terms of National Bureau, probably by 1958 or 1960.

The only thing I know, sir, is that the economic situation as it stands today is in a slight upward trend, not nearly having recovered the downturn that occurred in the 1953–54 period. Whether or not the economic policies as now projected by the administration will bring us back in 1955 to anyways near maximum employment production purchasing power remains to be seen.

The CHAIRMAN. Mr. Gainsbrugh.

Mr. GAINSBRUGH. I, too, went back to the records. This will add additional confusion. This is Arthur Burns' definition of terms in one sentence:

> A cycle consists of expansions occurred at about the same time in many economic activities, followed by similarly general recessions, contractions, and revivals, which merge into the expansion phase of the next cycle.

My own appraisal would lead me to believe that an inventory recession began in July of 1953. It continued through August or September of 1954. In the fourth quarter of 1954 we moved definitely into the expansion phases of that new cycle, and on the basis of our Economic Forum's forecast and our survey of business expectations of Board Associates, 1955 ought to be a year of expansion sustained throughout the year.

The CHAIRMAN. Mr. Keyserling.

Mr. KEYSERLING. Mr. Chairman, with all due respect to the Bureau, I think that the four classifications undermine clear economic thinking. I will give a simple illustration.

Suppose in any year the rate of productivity increase and the growth in the labor force required a 4-percent increase in total output to maintain maximum production. Suppose that year's output actually grew by 2 percent, would that be a year of expansion, revival, contraction, or recession?

Now, what has actually happened since the beginning of 1953 is that our economy has shown what I firmly believe to be a long-term chronic trend of failure to absorb increases in productivity and increases in the labor force.

Further, I believe that in the first three quarters of 1954 that disparity was intense; and in the fourth quarter of 1954 the expansion was less than enough to cure the disparity even in the fourth quarter, so that we had in the fourth quarter a slower rate of falling behind, but a falling behind, nonetheless.

The CHAIRMAN. Thank you very much.

I may announce that at 9:30 tomorrow morning we will have an executive session in room 324.

(Whereupon, at 12:06 p. m., a recess was taken until 2 p. m. of the same day.)

AFTERNOON SESSION

The joint committee met at 2 p. m., the Honorable Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, and Senator Sparkman, Representative Patman, vice chairman, and Representatives Bolling, Mills, Kelley, Talle, and Curtis.

Senator SPARKMAN (presiding). Let the committee come to order, please. Senator Douglas is delayed for a short time in getting here, so I will start the meeting off in his place until he does come. I am sorry that I was not here this morning, but our Foreign Relations Committee was wrestling with another subject that kept us pretty well tied down, this Formosan declaration. I understand you finished the first two items this morning and we are down now to the third one: "What purpose, in terms of carrying out the objectives of the Employment Act, is served by defining the needed levels of employment, production, and purchasing power, and for how far ahead should they be defined?"

Mrs. Wickens, will you comment on that?

Mrs. WICKENS. Mr. Chairman, I should like to make two comments on that. They have come from my experience as a statistician. In the first place, it is far safer to predict or shall we say, to analyze long-run trends than it is the very short-term. A variety of unexpected circumstances may readily alter a situation in a short term whereas over the long run you have such factors as population, and so on, which can be more safely predicted.

Secondly, I think we should caution that the kinds of figures that we are working with here are subject to wide margins of variability. I would not use the term "error," because I do not mean arithmetic mistakes, but failure to have adequate information upon which to make precise estimates. Therefore, none of these projections can be precise; and finally I want to say with particular reference to the year just ahead of us, that there have been changes in the makeup of the industrial structure of the country, that is, the employment structure of the country, in 1954.

There may be changes in 1955 which will affect the rate of output and of participation in the labor force and hence, make forecasting very difficult.

The CHAIRMAN (presiding). Mr. Paradiso.

Mr. PARADISO. Mr. Chairman, I do not think I have anything more to contribute on that than what Mrs. Wickens has said, so if you do not mind, I will pass.

The CHAIRMAN. Mr. Colm.

Mr. COLM. Mr. Chairman, I think this is a very important question. The question raised is significant for the change in philosophy and thinking on the business cycle. In this respect the wording of the Employment Act, I think, can be regarded as a milestone in our thinking. The act was designed to aid in the growth and stability of the economy and of the social system of competitive enterprise. It states that it is a policy of the United States Government to use all practicable means within the provisions of the act to promote maximum employment production and purchasing power. In simple language this means satisfactory levels of employment and production and purchases.

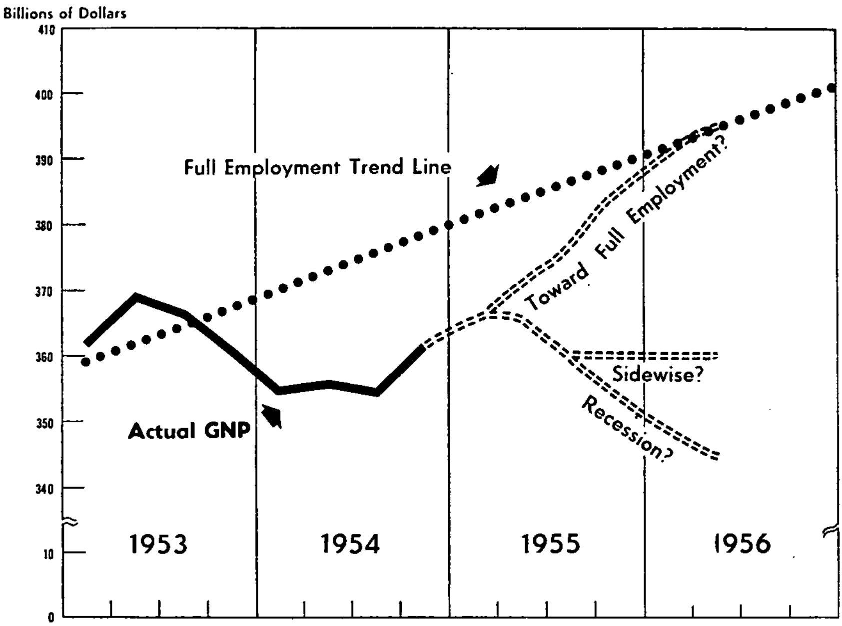
The act recognizes that satisfactory levels cannot be ascertained by reference to the past and here, I think, Mr. Chairman, we have the deeper reasons why these concepts of contraction and expansion which were discussed before lunch, why these concepts which were formulated during the 1920's are inadequate with respect to our present thinking.

We are not using the past, but we are using what a satisfactory level is as our standard. The act, therefore, prescribes specifically that the President's Economic Report should set forth the "needed levels" and also a program for carrying out the policy declared in the act—in effect, for reaching these needed levels. In a period of rapid increase in the labor force and in labor productivity, it makes a great difference whether existing levels of employment and production are evaluated against past levels or needed levels.

For instance, by comparison with the past, one can come to the conclusion that 1954 "will go down in history as one of our most prosperous years," as it is expressed in the President's Economic Report on page 11. By comparison with needed levels, it becames apparent that 1954 was a year in which production was about $20 billion below a level of satisfactory employment.

(The following chart demonstrates actual levels of production during the last 2 years and alternative courses for the coming years—seen in the perspective of "maximum production.")

GROSS NATIONAL PRODUCT



Sources: Actual GNP—Department of Commerce
Full Employment Trend Line—Derived from "The American Economy in 1960"

Mr. Colm. The wisdom of the forward-looking orientation of the Employment Act was most dramatically demonstrated when in 1950 a large defense program was under discussion. Those who measured the effect of the proposed defense program against the past came to the conclusion that it would necessitate a drastic curtailment in consumption. Those who measured it against the growing potential of the ensuing year recognized that a rise in the defense program plus a rise in the levels of consumption and investment would be feasible, which gives you an entirely different appraisal of one particular program.

It is perhaps the most encouraging fact in our modern economy that business managers are increasingly adopting the same sort of forward-looking point of view in their investment planning. Thus I believe that the work done by the Council of Economic Advisers, by the joint committee, and by private research groups in implementing the provisions of the Employment Act, not only results in more adequate Government policies, but also aids business planning and thereby reduces the burden of the Government's stabilization job.

The fact that last year's Economic Report did not posit needed levels of production and purchasing power caused considerable disappointment—this year's Economic Report takes a step in that direction, though it falls short of what was envisaged in the Employment Act in my judgment.

The question 3 which is here under discussion also requires a statement about the time period, for which needed levels of employment, production, and purchasing power should be projected. On this question the Employment Act itself is silent. The National Planning Association has made a recommendation in this respect in a joint statement. It recommended that this committee, the Joint Committee on the Economic Report, be renamed the Joint Committee on Economic and Fiscal policy, and consider needed levels of employment, production, and purchasing power extending over an extended number of years together with the budget outlook covering the same number of years.

This statement is available to the committee if it wishes to have it.

The CHAIRMAN. Do you want to make it a matter of the record?

Mr. COLM. Yes.

The CHAIRMAN. It will be so done.

(The information referred to follows:)

THE NEED FOR FURTHER BUDGET REFORM

A Joint Statement unanimously adopted by the NPA Board, Agriculture, Business, Labor, and International Committee Members Present at the 20th Anniversary Joint Meeting of the National Planning Association Held in Washington, D. C. on December 13 and 14, 1954

I

The budget is a means and not an end. It is a means for aiding in the formulation and execution of those Government programs for national security and well-being which the country needs and can afford. It is a means for developing revenue and debt policies. Expenditure, revenue, and debt policies should be so interrelated that they promote national economic growth and help in counteracting inflation or deflation. Budget presentation, guides for budget policies, and the budget process should all contribute to reaching these ends with a minimum of cost to the Nation.

II

Over the last decades considerable progress has been made in presenting the Federal budget in a more meaningful and more understandable manner. For instance, steps have been taken to transform the budget from the old "line item" appropriation system to the more meaningful "performance" or "program" budget recommended by the Hoover Commission. Nevertheless, the budget still adds together incommensurable items without proper classification. Cash and noncash items, outlays for acquisition of assets and operating expenditures, expenses for semicommercial transactions and administrative expenditures are not always clearly separated. Furthermore, certain activities which used to be financed with public funds are now financed, at least temporarily, by private funds (e. g., certain farm price support operations and lease-purchase contracts for the construction of post-office buildings). Therefore, the budget totals and subtotals have little economic or financial significance. Arbitrary changes in definitions and the organization of programs could result either in substantially higher or substantially lower expenditure totals. We need a budget presentation which gives clearly defined totals and economically significant subdivisions.

III

In recent years it has been increasingly recognized that adherence under all circumstances to the rule of an annually balanced budget in its conventional form would in all likelihood lead to serious economic disturbances. This is particularly true in a period such as the present when the budget has to bear the extraordinary expenditures necessitated by the cold war. In these circumstances, considerations, in part emotional and in a measure realistic, prevent the levying of taxes adequate to cover budgetary requirements.

To move in the direction of meeting this situation, as well as to give effect to the growing realization that fiscal policy can exercise a profound influence in resisting both inflationary and deflationary movements in the economy, several advances have been made or proposed during the last decade for relaxing the rigidity of the annually balanced budget rule.

First, some progress has been made in the use of the so-called consolidated cash budget instead of the conventional budget when considering the budget totals from an economic aspect.

Second, there has been wide acceptance of the idea that expenditure and revenue programs should be so formulated that the consolidated cash budget would be balanced or show a surplus under conditions of high employment. This would automatically lead to deficits if employment and production remained below a full employment level. Such a policy would preclude the taking of perverse fiscal measures—that is, measures which would aggravate business fluctuations.

Third, without taking a position we note that proposals have been made from various sources that the budget which should be balanced or have a surplus under conditions of high employment should be the cash budget of current expenditures. This would mean that certain capital outlays of the Federal Government could be financed by borrowing.

While these various proposals may move in the right direction, they do not establish a close and direct relationship between the economic analysis which the President is obliged by the Employment Act to include in his Economic Report and the budgetary and fiscal proposals which are to be presented in the budget message under the Budget and Accounting Act. The following paragraphs present for discussion a proposal which would aim at a formulation of budgetary and fiscal policies in a longer range economic perspective. Also, it would aim at permitting such changes in expenditure and tax programs as would be desirable in order to counteract economic fluctuations.

IV

We propose that, in line with the intent of the Employment Act of 1946, each Economic Report should contain an economic projection (including estimates concerning the Government sector of the economy) covering a number of years and showing where imbalances might be likely to develop in the national economy. Correspondingly, each budget message should contain a budget outlook covering the same number of years and demonstrating the changes in expenditures, revenue, and debt policies which would be needed to meet the Government's responsibilities under the Employment Act and to promote a better balance in the economy. These estimates would permit deliberation of budget policy for the ensuing year in the longer range perspective of several years, and would help insure that economic trends were taken into consideration. Experience with informal economic and budget projections made within and without the Government justifies the proposal that they be made a regular feature of official documents.

V

Consideration of the budget in a longer range perspective might make possible a greater steadiness in expenditure and tax policies. However, it should be recognized that changes in tax legislation or expenditure programs might be necessary in order to counteract business fluctuations and, further, that such changes should be adopted at early stages of fluctuations in order to forestall as far as possible an inflationary or deflationary spiral.

VI

In order to increase the flexibility of the budget it would be desirable for Congress to make some appropriations for nonroutine programs (mainly public works) without stringent limitation on the time during which such appropriations should remain available for spending. The Executive would be authorized to speed up or slow down various projects in this category depending on the economic outlook. An improved coordination between Federal, State, and local policies is needed in order to develop a national public works policy which embraces activities of all levels of government.

VII

A serious deficiency in the budget process is that, at the present time, no congressional committee gives specific consideration to the budget as a whole. This function should be given to the Joint Committee on the Economic Report which, under its present assignment, has to concern itself with budgetary and fiscal policies anyway. It might then be renamed the Joint Committee on Economic and Fiscal Policy. The joint committee would then concern itself with the overall aspects of the financial program of the Government. It would examine the long term budget outlook proposed by the President in his budget message and also any changes in expenditure programs and tax legislation recommended by the President for the purpose of counteracting business fluctuations. The joint committee could either approve or modify the President's recommendations or recommend changes of its own in existing programs.

VIII

It would be desirable if the Congress would adopt each year a concurrent resolution which would outline the broad order of magnitude of the budget over a period of years and the recommended principles of financing. Such a resolution could state that there should be an excess of revenue over total expenditures, or a balance, or that a part of the expenditures should be financed by loans. It could also set forth the changes in the longer range program, if any, which are considered necessary for the purpose of counteracting business fluctuations.

Although such a resolution could not deprive Congress of its power to make changes in expenditure programs and tax laws at any time and independently of each other, it would encourage a determination of budget policy in line with economic requirements and at the same time maintain the awareness of the relationship between changes in expenditures and changes in taxation or debt policies.

IX

There may well be a different of opinion as to whether steps toward further Federal budget reform should be taken by Executive order or by legislation. But such differences should not be permitted to delay the thorough revision of budgetary concepts and methods without which vital decisions affecting national security and economic health cannot be made successfully.

Members of the NPA Board of Trustees and the Agriculture, Business, Labor, and International Committees, who were present when this statement was unanimously adopted at the NPA 20th anniversary meeting on December 13 and 14, 1954, are:

H. Christian Sonne (chairman, NPA board of trustees), chairman of the board, Amsinck, Sonne & Co., New York, N. Y.
Stanley Andrews, executive director, national project in agricultural communications, Michigan State College, East Lansing, Mich.
Frank App, president, Northeastern Vegetable & Potato Council, Bridgeton, N. J.
Frank Altschul (chairman, NPA International Committee), chairman of the board, General American Investors Co., New York, N. Y.
John A. Baker, legislative secretary, National Farmers Union, Washington, D. C.
Solomon Barkin, director of research, Textile Workers Union of America, New York, N. Y.
William L. Batt, Philadelphia, Pa.
Laird Bell, Bell, Boyd, Marshall & Lloyd, Chicago, Ill.
Murray R. Benedict, professor of agricultural economics, University of California, Berkeley, Calif.
John D. Black, professor of agricultural economics, Harvard University, Cambridge, Mass.
Louis Brownlow (vice chairman, NPA international committee), Washington, D. C.
Eugene Burgess, department of economics and social sciences, industrial relations section, Massachusetts Institute of Technology, Cambridge, Mass.
Harry B. Caldwell, master, North Carolina State Grange, Greensboro, N. C.
John F. Chapman, associate editor, Harvard Business Review, Boston, Mass.
Harry W. Culbreth, vice president, public relations, Farm Bureau Insurance Cos., Columbus, Ohio
Joseph W. Fichter, farm consultant, Oxford, Ohio
Clinton S. Golden (chairman, NPA labor committee), executive director, trade union program, Harvard University, Boston, Mass.
David Heaps, New York, N. Y.
Marion H. Hedges (vice chairman, NPA labor committee), Washington, D. C.
Oscar Heline, president, Farmers Grain Dealers Association of Iowa, Marcus, Iowa
Peter Henle, assistant director of research, American Federation of Labor, Washington, D. C.
A. C. Hoffman, vice president, purchasing, Kraft Foods Co., Chicago, Ill.

Joseph D. Keenan, secretary-treasurer, building and construction trades department, American Federation of Labor, Washington, D. C.
Murray D. Lincoln, president, Farm Bureau Mutual Insurance Cos., Columbus, Ohio
John C. McClintock, assistant vice president, United Fruit Co., Boston, Mass.
John K. Meskimen, Director, Office of Labor Affairs, Foreign Operations Administration, Washington, D. C.
C. Clyde Mitchell, chairman, department of agricultural economics, University of Nebraska, Lincoln, Nebr.
Arthur Moore (vice chairman, NPA agriculture committee), the Washington Bureau, McGraw-Hill Publications, Washington, D. C.
Donald R. Murphy (chairman, NPA agriculture committee), editor, Wallaces' Farmer and Iowa Homestead, Des Moines, Iowa
George Nebolsine, Coudert Bros., New York, N. Y.
Eric Peterson, general secretary-treasurer, International Association of Machinists, Washington, D. C.
Clarence E. Pickett, honorary secretary, American Friends Service Committee, Philadelphia, Pa.
Morris S. Rosenthal, New York, N. Y.
Harry J. Rudick, Lord, Day & Lord, New York, N. Y.
Stanley Ruttenberg, director, Department of Education and Research, Congress of Industrial Organizations, Washington, D. C.
Beardsley Ruml (chairman, NPA business committee), New York, N. Y.
Theodore W. Schultz, chairman, department of economics, University of Chicago, Chicago, Ill.
Ted F. Silvey, National Congress of Industrial Organizations headquarters, Washington, D. C.
Lauren K. Soth (vice chairman, NPA agriculture committee), the Des Moines Register and Tribune, Des Moines, Iowa
Robert C. Tait, president, Stromberg-Carlson Co., Rochester, N. Y.
Wayne Chatfield Taylor, Heathsville, Va.
Howard R. Tolley, Alexandria, Va.
Marcel J. Voorhies, vice president emeritus, American Sugar Cane League, Baton Rouge, La.
Ralph J. Watkins, director of research, Dun & Bradstreet, Inc., New York, N. Y.
Edward H. Weyler, secretary, Kentucky State Council of Carpenters, Louisville, Ky.
Clarence A. Wimpfheimer, chairman of the board, American Velvet Co., Stonington, Conn.
David J. Winton, chairman of the board, Winton Lumber Co., Minneapolis, Minn.
Arnold S. Zander, international president, American Federation of State, County, and Municipal Employees, American Federation of Labor, Madison, Wis.
J. D. Zellerbach, president, Crown Zellerbach Corp., San Francisco, Calif.

Mr. Colm. It is important that projections be presented for the more distant future, perhaps 5 or even 10 years ahead. We need also projections for the more immediate future. We need goals but also a consideration of the path that promises to lead to those goals.

The Chairman. Thank you, Mr. Colm. Mr. Keezer.

Mr. Keezer. I would like to offer a footnote on the usefulness of long-distance projections. I suspect that in my office we have broken the record for long-distance projections. We have gone to 1970. I shall give you a copy of the report.

The Chairman. The question is how do you get there?

Mr. Keezer. We get there, of course, by a technique with which you are thoroughly familiar, Mr. Chairman, but we have reason to believe that these long-range projections are influential in encouraging long-range planning of investment by business firms.

We have been making surveys of plans for business investment for the past 7 years. Seven years ago considerably less than half of the companies which cooperated in our surveys had any long-range plans at all for investment. Last year over 90 percent of the respondent companies—and there was a much larger group of companies than there were 7 years ago—had plans which enabled them to give us some kind of an estimate of their investment over a period of 4 years. I think there is a causal relationship between the extensive development and use of long-range projections and the increase in long-range planning of business investment. I think it is also fair to add that the development of long-range plans produces a tendency to stick to what is planned.

In 1954 there was only a slight decline in business investment as compared to the previous years. The plans announced were fulfilled to a very high degree and I believe it is reasonable to say that——

The CHAIRMAN. What was the difference between the actual investments and your projected investment?

Mr. KEEZER. Well, it is not modest to say so, but I think what I said a year ago turned out to be almost exactly right—that business investment in new plant and equipment would be about 5 percent off in 1954, as compared to 1953. When we come to the fourth question I will have something to say about plans for 1955.

I think short-range projections are also useful and necessary. I do not think that it would contribute anything if I were to say that they have to be used with caution as a guide to action by the Government because of unexpected short-run developments. For the long run, I do think we have rather persuasive evidence that these projections are serving a decidedly constructive rule in our economy.

The CHAIRMAN. Mr. Butler.

Mr. BUTLER. In my opinion, projections of past trends in employment, productivity, production, and consumer and business purchasing power are invaluable for analytical purposes. You need to know what the economy's potential is in order to understand where you are at any given time.

Having said this, let me now stress the importance of interpreting all such projections most carefully. As one of my colleagues says, these figures are fine as long as you do not believe them fully.

Now in interpreting such projections, three things should be kept in mind. First, in the current state of the art of economic forecasting, there is a margin of error involved in all projections. I personally think the margin has been narrowing steadily. The more competent practitioners have come amazingly close to the bull's-eye in the postwar period.

Nevertheless, most economists would agree that there should be a margin of tolerance of at least 5 to 10 billion in all estimates of what gross national product will be in a year in the future. Moreover, all economic projections are based on a set of assumptions which are not always explicitly set out. Some of the key assumptions frequently made are no change in the international scene, no wave of speculative psychology, no prolonged and widespread labor management disputes, no large shifts in Government monetary or fiscal policies.

Now economists generally say that changes in any of these assumptions require a reappraisal of the business outlook. However, those who are repsonsible for framing policy—in a world as uncertain as that we now live in—should keep a wary eye on the things that economists assume to be equal.

The second point is that all projections of our economic growth potential are based on long-run trends. Yet in looking at the next year or 2, short-run factors may be most important. There is the old saying that in the long run we are all dead.

All of this applies with greatest force to the assumption in these projections that productivity will rise at the rate indicated by its long-run trend. The record shows that productivity increases have been anything but regular. In some years there was little advance. In others productivity leaped ahead at more than twice the long-run average. To make the point in specific terms the growth in gross national product resulting from the long-term rate of increase in productivity now amounts to about 9 to 9½ billion a year.

Suppose, first, that the Government were to adopt fiscal and monetary policies on the assumption that this amount of growth would be forthcoming and suppose, second, that no rise in productivity occurred. If the economy had already enjoyed reasonably full employment, the result would be a large dose of inflation.

The point is that in the present state of our knowledge about short and long-term trends in productivity we should treat projections with great caution.

Now a third point about projections of our economic potential relates to the period that should be considered in formulating economic policies. We are below our potential now, but business activity is moving up. If the projections for the year ahead show that activity will continue to increase, should we take steps now to accelerate the advance?

For all of these reasons, I believe projections of the economy's potential are an important and a necessary tool.

However, I believe they must be interpreted with great care. If they show a large gap between expected production and the potential, either on the side of inflation or deflation, then I believe economists should point this out and indicate what steps might be taken to close the gap.

We have powerful weapons against both inflation and deflation. We can reduce taxes and make credit available if deflation threatens; and we can check an inflationary move by running a surplus in the Government cash budget and restraining credit.

However, the area that lies between inflation and deflation may be much broader than most analysts suspect. When we are in that area, as I believe we are today, Government policies should be directed at encouraging private economy's long-run growth potentials. But we need to be always alert to economic developments. If, as the year progresses, it should become clear that the current rise in business activity will be short-lived, we should be ready to cope with the situation. And, if the area between inflation and deflation is fairly broad—say on the order of $15 to $29 billion—there is elbowroom in which to operate.

Thus, in the unlikely event that the private economy should need bolstering, we can apply the appropriate monetary and fiscal measures. Now in this connection, I am intrigued by the suggestion of a number of economists that tax cuts designed to stimulate the economy should be made for temporary periods, for instance, a year.

Thus, Congress would have the opportunity to review the economic situation later on—if the economic winds had shifted to the inflationary side, the tax cut could be permitted to expire.

The CHAIRMAN. Mr. Hoover.

Mr. HOOVER. Mr. Chairman, the purpose of defining needed levels of employment, production and purchasing power is to provide benchmarks by which we can judge whether monetary, fiscal or other policies should be more or less stimulative, restrictive or merely stabilizing in their effects on the economy and thus, to judge whether or not the objectives set forth in the Employment Act are being effectively pursued.

I think it is quite clear that we have the physical capability of increasing our gross national product by some 4 or 5 percent per year. Incidentally, that estimate is higher than I think most people would agree with. This would mean, as outlined in the report of this committee's staff, that our gross national product 10 years from now would be some $530 billion, assuming substantially unchanged prices. Here again, I should say that I believe the compound percentage rate that the committee uses would not be as large as the one I have mentioned although on a simple basis it would be 5 percent over the whole period.

I think that it is useful to make successive 10-year projections of this sort in order to enable us to judge whether or not the general trend is in line with our potentialities. However, these projections would need to be supplemented by continuing annual studies in which new estimates of attainable levels of employment, production, and purchasing power, for periods immediately ahead would be made, and of course, new ones for longer periods also.

Particularly at a time when we are likely to need all our resources in our struggle with the Soviet tyranny, either for the provision of means of armed defense or to keep our standard of living as much in advance of that of Soviet Russia as it now is, we cannot afford to let our national income lag substantially behind that which we are capable of achieving.

Projections of the sort made by the staff of this committee and similar projections are most useful in enabling us to do just that.

The CHAIRMAN. Mr. Luedicke.

Mr. LUEDICKE. Mr. Chairman, I believe that we are now really getting into the subject we are mostly concerned with here and rather than just follow my notes, I would like to throw caution to the wind and stick my neck out although I know there are at least two gentlemen on my right who will take me up sharply on these subjects.

The CHAIRMAN. Do not believe that the world is unfriendly before it actually turns out to be so.

Mr. LUEDICKE. First of all with respect to long-range projections: I have looked into some of them. As it just happened, a very good friend of mine, an economist up in New York, has just made a comparison of seven of these recent long-range projects. He is Julius Hirsch, and with the chairman's approval he would very much like to submit his study on these various long-range projections for the record of these hearings. I think his study is rather interesting and if it is in order I would like to submit it for the record.

There are some very large differences among these seven long-range projections. By the way, Dexter Keezer's study is not the longest one. The Paley report went to 1975. But it is a bit disturbing if you see those very large differences in these projctions. Secondly, when you do try to make such long-range projections, you have to average things such as the annual increment of the labor force or the annual productivity gain, and so far I do not think the economists have come up with any usable method for this. So here you are working, even on the long-range projections, with a number of uncertain factors, but as the chairman said, the important thing is not where we'll be in 1970 or 1975, but how we are going to get there, and that, of course, brings us directly to the purposes and the aims of the Employment Act: specifically the Employment Act, section 3 and section 2. These are the sections we are most concerned with. Section 3 is being interpreted by some of my friends as really requesting the Council to specify needed levels of expansion for a year or for 2 years in advance.

Well, I find it extremely difficult to reconcile section 3 and section 2. Here in section 3 we are supposed to set exact figures on what to aim at and yet in section 2 we have a declaration of purpose of the act which is rather, well, let us say a bit on the fuzzy side, inasmuch as it contains at least 3 or 4 important qualifications in what to do about reaching maximum employment.

The way it looks to me, the one thing we must avoid is overstimulation of the economy because of inflationary dangers. The opposite extreme is the necessity of having the Government take over increasingly more functions in the economy because private enterprise is not willing or not able because of existing profit conditions, to fulfill the investment function.

I think there is general agreement to this extent that those two extremes are not good. Now, we come to the question of what purpose can actually be served by stating at this particular time of year, whether at the end of this year, gross national product should be 370 or 380 billion dollars or any other specific figure.

I personally have more confidence in a policy that watches economic trends and adopts policies according to the general trends as they develop. Both under President Truman and under President Eisenhower we have had able economists to advise the President and to submit programs that actually worked out rather well first in cushioning the 1948–49 decline and then in cushioning the 1953–54 decline.

I think it is not always understood just how much has been done, for instance, this past year, in order to stabilize the economic level. So here we have had two different administrations, certainly showing the bipartisan nature of this type of problem, who have both been successful in smoothing out a minor recession.

Mr. Gainsbrugh this morning used for both these recessions, the term "inventory recession." I wish I could feel sure that that was all we had in those 2 years. I am rather intrigued with the possibility than in 1948 and again in 1953, we had two periods where underlying vulnerabilities in the economy started to break through so that we were actually acting to stabilize and smooth out these vulnerabilities that tried to break through.

High inventories were 1 of these vulnerable points in 1948; the decline in farm prices was the second 1. There are 4 or 5 different vulnerabilities that developed in the course of 15 years of overstimulation and the question I would like to pose, rather than answer, is "How are we to know at this particular time, where the economy really ought to be now? How far has the overstimulation of two wars, then the cold war, then the unprecedented consumer-goods boom that we had after World War II, how far have these factors really pushed us up?" As a matter of fact, have they not pushed us up so fast that if we were to try to equal that pace, we would certainly have to do things that would not be sound from a current point of view?

I am posing that question because I have argued the point several times and I have been getting the answer from other economists, for instance, Mr. Ruttenberg, and Mr. Keyserling, that it is wrong to assume that stimulation of this sort will necessarily lead to inflation.

I am not sold on their confidence, because in order to equal the two wars, plus all of these other factors, we would have to go to town in such monumental efforts to stimulate the economy, that I am afraid the purchasing power of the dollar could not be defended successfully.

Actually I do not agree with the administration's premise, that we have successfully completed the transformation from a war to a peace economy. I cannot quite see it that way because, of course, at the moment the economy still rests very largely on defense. And my good friend, Professor Slichter, who has just written about this in Harvard Business Review, says that in his opinion, if defense does go down, we will have to replace it with something real big in the way of natural-resources development.

Now, doesn't this suggest that we are really getting to the point where we are providing the economy with a permanent cushion on which it can build, on which it can overdo expansion if no check of some sort exists there? I would rather see it firmly established once again that we are still having an economic system that is not only based on proper rewards, and I think at the moment incentives are not big enough for the individual as well as for the corporation, but that also includes a system of penalties. Unless you have rewards and penalties, you will not have the basis for dynamic growth in this country.

All that, I think, is much more important than to argue about whether the goal for this year should be $5 billion higher in gross national product or $5 billion lower, and unless we have confidence in those who are shaping economic policy during the year, and your committee most certainly plays a very leading role in that picture, I think the figures which we put down on paper are not going to mean much.

The CHAIRMAN. Mr. Ruttenberg.

Mr. RUTTENBERG. Mr. Chairman, a great deal of what I want to say is in my prepared statement, and has in part been said by Gerhard Colm. I should like to add just a few additional words.

I agree wholeheartedly with the purpose and intent of the Employment Act of 1946. I think that the Council of Economic Advisers and the President in the Economic Report have advocated their responsibilities under the terms of that act. I do not see how it is possible to intelligently evaluate the kinds of economic policies which are essential in our economy unless we have some framework or some guidepost against which to test them. The Employment Act of 1946 is very clear. It specifically says in section 3, that—

> the President shall transmit to the Congress, etc., an Economic Report setting forth, one, the levels of employment, production, and purchasing power obtaining in the United States, and such levels needed to carry out the policy of section 2.

The policy of section 2 is, of course, as we all know, "to promote maximum production, employment, and purchasing power."

This the Council has not done. This the President in his Economic Report has not done. In going through the President's report there is only one reference to this problem, maybe two. One reference is on page 4, where he says, if I can pick it up in the middle of the sentence, within the very top paragraph of the page:

that our country can within a decade increase its production from a current annual level of about $360 billion to $500 billion or more, with the figures expressed in dollars of the same buying power.

This is the only reference to this problem in the entire report. If one were to project this and assume that within a decade, 10 years, 1965 or 1964, we will be at $500 billion, this actually means if this were spelled out, that in 1955 we would attain a level of gross national product a little higher than 1954, but about equal to or slightly higher than in 1953.

The other reference in this report to this problem, and it is an indirect reference, is on page 48. If I might quote and I hope not out of context, the top paragraph of the page, which says in the beginning of the second sentence:

The vigor of the recent recovery taken in conjunction with investment and expenditure plans already set in motion, suggests that economic expansion will continue during the coming months.

Then it goes on to say:

It holds out the promise that we shall achieve a high and satisfactory level of employment and production within the current year.

What is that high level we are going to attain? What is a satisfactory level in the judgment of the Council and the President? I do not think it is possible to really know the answer to this until you have sat down and observed what is the potential growth in the American economy.

There are certain things we know and which are essential. The labor force is growing. We can make projections on that basis that are fairly accurate, certainly within a period as far as the labor-force figures are concerned, within a period of 14 or 15 years in the future because we know of children that are already born.

Second, we can make projections in terms of productivity and particularly of automation and I wish there were time to discuss the problems of automation further here.

I would like to inject at this point just parenthetically that I think the problems of automation in the future years and even currently are so phenomenal and so extremely significant that it would be well worth the time, energy, and expenditure of funds by this committee, to engage in an investigation of the problems of automation.

What are the effects of this new technique of displacing manpower with machines, displacing human intelligence with a computer? What are the implications of this for the future economy? I just inject that at this point to say that I think an investigation of these problems would be worth while. Maybe not of the scope of Senator O'Mahoney's temporary National Economic Committee—probably not of that scope, but of that general nature. I think it is important. Well, aside from that digression—

The Employment Act of 1946, section 3.1, says:

A program for carrying out the policy declared in section 2, to promote maximum employment, etc., together with such recommendations for legislation as we may deem necessary or desirable—

this is the purpose, this is the function of the President, and the Council—in order to do this, in order to develop a program, it is essential to know the framework, the guideposts against which you are going to set that program.

I should like to make a distinction between what I think Mr. Butler had to say and what I think is in reality what we are talking about.

There is a difference between predictions of what is going to happen in 1955 and projections of the potential growth that should occur within the economy.

The only way that you can judge in 1955 and 1956 whether economic policies are attaining maximum employment is to have some framework against which to set it, and it is for that very basic and fundamental reason that I would think it extremely important for the Council of Economic Advisers, for the President to set forth projections for next year, for the year after, and for a period of 10 to 15 years into the future. I do not think it is unreasonable to do this. The Paley Commission did, and Mr. Paley himself, recently revised those figures, and he said that by 1975 it will take "a whopping $700 billion" to provide full employment opportunities. I do not think that is unuseful. To the contrary, I think it is very helpful that such a projection be made.

I would hope that just because the Council and the President have abdicated this responsibility that the Joint Committee itself will continue to do what it has in the past and continue to put out pamphlets such as the potential economic growth of the United States during the next decade setting forth what the potential growth should be in the economy. It is against these potential growths that we judge the success or failure of economic policies.

The CHAIRMAN. Thank you very much, Mr. Ruttenberg.

Mr. Gainsbrugh.

Mr. GAINSBRUGH. Mr. Chairman, I would like to reserve my time for question 4 on the outlook, and have only a few short comments on question 3.

The first is that it helps us to appraise the diagnosis and prognosis of the Council if they do offer a few quantifications of what their appraisal of the economy promises at the start of the year in terms of subsequent activity. I have read the Council's report intensively from cover to cover and yet I got far more out of a few figures in the budget message than I did out of the Council's entire report in terms of the administration's expectations for 1955. In the budget message the Treasury does specifically state it anticipates that personal income will be at $298½ billion in calendar 1955, continuing into the first 6 months of 1956. (See correspondence, page 1146, for further details.) That immediately gives us the dimensions of the anticipations of the administration.

I think those figures and the accompanying profits estimate set a boom characteristic, a boom pattern to the economy in a way that is not made at all clear by the language used in the report. A single figure is in this instance worth two or three chapters of text. However, and this is my second comment, I am not as concerned as some of my colleagues seem to be about the fact that this model building is not being done by the Council. We owe a great deal to this committee for taking on the assignment which was not previously performed by any governmental agency of building up economic models as you have done for the year immediately ahead. You show on the basis of stated assumptions what the probable level of production would be at high employment and what the foreseeable levels of demand would be. I would recommend that the Joint Committee continue its work and issue three types of forecasts and keep revising them, reviewing them quarterly in the case of the short-range, every 1 or 2 years in the case of the middle-range, and every 5 or 10 years in the case of the long-range. The types of projections already worked out by the committee—the short-range projections done for 1955, and as you contemplate for 1956 and the middle-range for the decade 1965—are very helpful in analyzing economic growth.

I know of nothing that has been more influential in helping shape business confidence over the long run than the explorations that have gone on of market potentials through the work of your committee, through the work of the National Bureau, the Conference Board, the 20th Century Fund and of other economic research institutions.

Businessmen are now convinced as they never were before of the long-range economic growth, the long-range market potential of our economy. I, for one, would like to see you expand what you are doing. And if I might offer one fleeting comment on policy I would much rather see it done here than done within the Council, because here the staff is sheltered by the fact that this is a congressional committee; that it has a majority and a minority viewpoint; and that both of those viewpoints can be voiced in developing models for the short-range, the long-term, and even the middle years.

The CHAIRMAN. Mr. Keyserling.

Mr. KEYSERLING. Mr. Chairman, I think this is the most important question that could possibly be before the committee. The reason that the question may not have seemed too important is that most of the discussion with respect to it is not directed to the question. There is no question here as to whether one believes that the Government should intervene at a particular stage or another in the economic process. There is no question here as to proper policies for fighting inflation or deflation. There is only one simple question: What is the difference between a forecast and defining a need, and in what respect are the two relevant to the making of economic policy, which this Congress must do, and which the President must recommend.

Now, the difference between a forecast and defining a need is plain and simple. If you say that there is likely to be more trouble in the Far East, that is a forecast. If you start devising a national policy as to how our defense forces can be employed and expanded or contracted to meet that problem, that is a matter of defining a need, and of national policy. If you say that unemployment is going to be too high or too low, after the level has been forecast, that is a matter of defining a need, and of national policy, and not a forecast. All national policy is designed to change forecasts. No law is ever needed except to change what the maker of the law thinks would happen if the law were not enacted.

Now let's apply that to this specific year. Suppose the true unemployment level is 3.7 million. I think it is. If the executive branch of the Government and the Congress do not define a need—in other words, if they make no judgment as to whether that level of employment or unemployment is too high or too low, if they make no judgment as to whether they take 4½ million rather than 3.7 million or 1½ million rather than 3.7 million as consistent with maximum employment and a healthy economy, there is no basis on which to rest immediate policies, quite aside from whether different people would agree as to what the policies should be.

Similarly with respect to national output, if the forecast indicates that national output is likely to rise 1 or 2 or 3 percent, until one moves on to the question of what changes in the national output are likely to accomplish the desired policy with respect to the level of employment, there is no basis for evaluation of policy.

Let me take the case of agriculture, which Congressman Patman raised as a striking example. Agricultural income has declined $4 billion at an annual rate since 3 years ago. A forecast might tell us whether it was likely to decline further. I think it will. But that has nothing to do with the definition of need in the making of national policy, because those who believe that agricultural income should decline further, they would say "Sure, the forecast shows it is going to decline further, but we don't need to do anything." The only way one could devise an agricultural policy would be to make an analysis of the economy which indicates whether a billion dollar agricultural decline is consistent with the national economic interest that you want to preserve and maintain.

Therefore, there is an absolute difference between the determination of needs and the making of forecasts, and I would challenge anybody to find in this Economic Report on any central problem of the American economy, a definition which sheds light on what adjustments we need to make in the economy during 1955 and consequently what policies should be adopted. And yet the act specifically says first make the forecast, then correlate the forecast with the need, and then devise policies to close the gap between the forecast and the need.

There is no delineation in the Economic Report of what the level of unemployment ought to be. There is no delineation of what the level of production ought to be. There is no delineation of what farm income ought to be. Thus there is no basis on which to carry out farm policy, housing policy, or any other policy which the Congress must meet.

The CHAIRMAN. Mr. Talle, do you have a question?

Representative TALLE. No questions at this time.

The CHAIRMAN. Mr. Patman?

Vice Chairman PATMAN. I would like to comment briefly on what Mr. Keyserling said about the farmers' income. The falling income position of the farmer is clearly revealed in an appendix table on page 14 of the President's report. It shows that the income of United States farm proprietors fell in every quarter of 1954 and here are the figures on an annual basis. First quarter, 13 billion; second, 12.2; third, 11.6; fourth quarter, $11 billion.

Now, as Mr. Keyserling says, we have the forecast and we must do something to meet the need. In other words, to adjust that. And do you see anything in this report, Mr. Keyserling that offers a remedy?

Mr. KEYSERLING. One of the issues of national policy is whether we should do anything to meet the need. If this report said that the declining level of agricultural income was making for a better adjustment in the American economy, I would say that they were fulfilling their responsibilities, although I would not agree with their conclusions. But they do not evaluate the trends in terms of needs at all, and therefore they are derelict.

Vice Chairman PATMAN. Now, I would like to ask this question of anyone who will answer it, Mr. Chairman. It is on small business. This morning we mentioned about farmers and small business suffering more than any other two groups in our economy. Now, the records disclose a corporation with total assets of under $250,000, the profit late last year was 4.1 percent on stockholders equity after taxes. Now that profit rates goes on up according to assets to over $100 million; it is 12 percent. It gradually goes up. The big corporations had a greater profit rate than the small ones last year. Now, as to the change in profit rate, the corporations with total assets of less than $250,000, they suffered a decline of 61.4 percent, from the first half of 1952 through the first half of 1954, whereas the corporation with assets of over $100 million had an increase of 6 percent. It shows that the smaller they were, the more they suffered, the larger they were the more they profited.

Now, I would like to know if any member of the panel would like to comment on that and suggest anything in this report that offers any remedy for that terrible condition.

The CHAIRMAN. Are there any comments by members of the panel upon that statement? Mr. Luedicke.

Mr. LUEDICKE. One might say that in the sphere of small or medium-sized businesses the question of insufficient incentives is now getting perhaps the biggest demonstration. I have watched with some concern now for the past few years that what you might call a profit squeeze is really being reflected much more sharply in the case of the smaller companies than the bigger ones. Taxes and probably overhead costs are largely responsible for that. They are getting out of hand with respect to the small businesses. The danger is very real to lose sufficient incentives to exist and grow properly. Some people are afraid whenever "profit" is being mentioned. I am not a bit afraid of that. The economy as we want it and as we have to have it, has to function on profit. It is a profit system, and I think the smaller businesses at the moment are in a very dangerous squeeze on their profit margins.

Vice Chairman PATMAN. Well, you raised a question there that disturbs me. You are afraid that they just do not work hard enough. You do not think they have the incentive or that the larger they are the more efficient they are?

Do you say that the larger concern is more efficient than the smaller concern?

Mr. LUEDICKE. I did not mean to give the impression that they do not work hard enough, Senator. I was thinking more of the tax situation.

There is nobody in this economy that works harder than the small-business man. We all know that. But the present tax structure probably takes too much away from the incentive for hard work.

Vice Chairman PATMAN. Well, it is a fact that the larger concerns can fix their own prices pretty well and the last year they have profited greatly by repeal of the excess-profits tax, for instance. Now, they did not reduce their prices by reason of that. They just kept on charging the same prices, and they got a sort of windfall out of that.

Now, the smaller concerns that are not in a position to maintain their prices, some of them had to lower their prices, and, furthermore, the larger concern in buying the raw materials, don't you think they are in a position of advantage over the smaller concern?

Mr. LUEDICKE. Well, on the price angle, Mr. Patman, anybody who did buy an automobile in the latter part of 1954 knows darned well that he did not pay the full list prices. Actually, I believe that the price stability, as it was reflected in our prices indexes, was not quite as "stable" as it appeared in the indexes. We have also heard of increasing trouble with fair trade price maintenance. We are getting greater pressure on the prices of big companies, too.

When it comes to the ability of small business to compete with large business, I will say that I think there are disadvantages in size, as you say raw material purchases and so on, but there are also advantages. And, lest we forget the small-business man is trying to become a bigger businessman, and ultimately a big-business man. The tax system should help him, not hinder him.

Vice Chairman PATMAN. But aren't you disturbed about this merger movement? Take a small concern that is struggling along in competition with a larger concern. Don't they have a great incentive to sell out to the larger concern because the larger concern can bring them into their social security system that they have in the larger one, and give them real security; whereas they do not have good security in the smaller concern, and do not you think that is a great incentive and talking point for the officers and directors and principal owners of a small concern to sell out to the larger one?

Mr. LUEDICKE. That again probably would depend on the individual situation rather than on a generalization. When we are talking about the present merger movement, obviously the mergers in the automobile industry are of a different character than if a steel company were to buy out a small steel company, or any other large company were to absorb some small local company.

One thing that seems to be a very strong factor in the present economic system is that there is this trend to bigness, and that this bigness is not necessarily creating monopoly, but, rather, intensified competition.

I am intrigued with the idea that in the automobile industry the only workable basis for competition is to have a number of equally strong companies to compete.

Vice Chairman PATMAN. A number, you mean a half dozen or a dozen?

Mr. LUEDICKE. Well, I did not want to mention any definite number.

Vice Chairman PATMAN. You know it would be dangerous to have 2 or 3; wouldn't you? Wouldn't you think that would be a short step to socialism?

Mr. LUEDICKE. Well, I do not know, Mr. Patman. This is a leading question.

Vice Chairman PATMAN. Anyway, Mr. Chairman, I will not take up any more time, but I just want to return to this one statement in the President's report, which is really disturbing to me:

The income shares of both farm and business proprietors in 1954, 4.1 percent and 8.9 percent, respectively, were at postwar lows. Now, after making that statement, which is really admitting a lot, I am really surprised and disappointed that something has not been suggested in here to remedy this alarming situation.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. Yes; I would like to pick up some of the line of questions of Mr. Patman.

One thing I would like to know: In the figure you quoted, Mr. Patman, of the ratio of profits of small to large business, you mentioned 1 year. I wonder if that is a trend? My observation would be this, and if anyone on the panel has the information I would be happy to be set straight as to what it actually is. My information is that the ratio of earnings of large business to small business has always been considerably greater because the industrial deaths occur more in the smaller concerns, and I am wondering whether the figures you have in this year, Mr. Patman, are an indicated trend that is becoming more so or simply an observation that we do have this difference between small and large?

Vice Chairman PATMAN. I think that is a good question.

Now, the figures that I have read represent a trend between the first half of 1952 and the first half of 1954. In other words, there was a reduction for corporations with total assets of under $250,000, during that 2-year period from the first half of 1952, and the reduction of the profit rate is disturbing. It was 61.4 percent, just in that 2-year period, and I have it here broken down into several categories.

Corporations with total assets of:	*Profit rate, percent*
Under $250,000	4.1
$250,000 to $1 million	6.4
$1 to $5 million	5.7
$5 to $10 million	7.6
$10 to $50 million	8.7
$50 to $100 million	8.6
Over $100 million	12.0
All sizes	9.9

Similarly, the changes in profit rates, after taxes, between the first half of 1952 and the first half of 1954 were as follows:

Corporations with total assets of:	*Change in profit rate, percent*
Less than $250,000	−61.4
$250,000 to $1 million	−28.8
$1 million to $5 million	−28.8
$5 to $10 million	−10.6
$10 to $50 million	−8.5
$50 to $100 million	−9.5
Over $100 million	+6.1
All sizes	−2.0

	Profit per dollar of sales	Change in profit rate from 1st half of 1952
Corporations with total assets of—	*Cents*	
Less than $¼ million	0.9	−60.9
$¼ to $1 million	1.9	−17.4
$1 to $5 million	2.1	−19.3
$5 to $10 million	3.4	−2.9
$10 to $50 million	4.0	0
$50 to $100 million	4.0	−2.5
Over $100 million	6.3	+10.5
All sizes	4.5	+7.1

Annual rates of profits (as percent of stockholders' equity) of manufacturing corporations, by size of corporation

BEFORE TAXES

	1st half of 1952	1st half of 1953	1st half of 1954	Change 1952 to 1954
Corporations with total assets of—				
Less than $¼ million	18.0	17.5	8.1	−55.0
$¼ to $1 million	18.5	19.6	13.2	−28.7
$1 to $5 million	20.5	20.7	13.3	−35.2
$5 to $10 million	21.8	26.4	17.3	−20.7
$10 to $50 million	23.4	25.4	18.1	−22.7
$50 to $100 million	22.3	24.6	17.7	−20.7
Over $100 million	24.2	27.9	22.1	−8.7
All asset sizes	22.8	25.7	19.2	−15.8

AFTER TAXES

	1st half of 1952	1st half of 1953	1st half of 1954	Change 1952 to 1954
Corporations with total assets of—				
Less than $¼ million	10.6	10.1	4.1	−61.4
$¼ to $1 million	7.8	9.1	6.4	−18.0
$1 to $5 million	8.0	8.9	5.7	−28.8
$5 to $10 million	8.5	10.6	7.6	−10.6

Over $100 million	11.8	12.1	12.0
All asset sizes	10.3	10.5	9.9

Representative CURTIS. Well, of course, I was thinking more of a broader trend. I am very much interested in the point as we served together on the Small Business Committee, and I know we share a great concern about the welfare of small business, but I would be interested in knowing what the overall trend is.

One other observation: In reference to the excess-profits tax, our committee, the Ways and Means Committee, conducted hearings, of course, on the extension of that, and if you recall in our Small Business Committee, Mr. Patman, we had hearings throughout the country, the year you were chairman. That was one matter that the smaller businesses were presenting at all times, and the Small Business Committee stated, I believe, as a matter of fact in one of their reports, that that was the tax that was hurting small business, and our observation after our studies was that it was a tax on growth of the companies, and actually that was encouraging this very tendency of merger with larger companies you speak of.

You have a new company going into a new kind of business, a new device, and because it could not expand through keeping its capital it was a very easy mark for a very large concern buying them up, particularly if they had tax credits on their books. It, to me, is very——

Vice Chairman PATMAN. I was not trying to justify the tax; I was justifying it as an illustration.

Representative CURTIS. The only reason I point it out is you mention larger corporations getting more profits as a result of the tax going off when what I think we did is save the lives of many good small companies by eliminating it. But it goes back to this basic thing that we mentioned this morning, and the one concern that I have on this economic report: Our tax rates in all fields now are so high that the slightest variation of tax language has an economic effect, and I wish that more attention were paid to this problem of the effect of tax laws on the economic course in the country.

Mr. GAINSBRUGH. May I offer this comment, Mr. Chairman: I think if you were to examine the history of the profitability of the smaller enterprise, and of the larger enterprise, you would find this cyclical characteristic: In the upswing business profits move up more rapidly for small-scale business than they do for large-scale business, and, conversely, in a period of contraction or recession, or whatever other descriptive phrase we want to use, small-business profits go down more markedly than do large business. The comparison of mid-1952 with mid-1954 therefore may not be directly pertinent because the periods are in two different stages of the business cycle.

Secondly, the recession did hit particularly hard the apparel industry, textiles, the needle trades, and so forth. They are more typically small scale in character than the durable-goods industries. Your figures may likewise reflect the particular impact of recession upon specific sectors of the economy, particularly specific sectors of manufacturing.

The CHAIRMAN. How could that be in view of the fact that the decline in the durable-goods industries was much more severe than in consumers' goods? If the decline was less in consumer's goods, why would it be that the profits of the consumers' goods industries would fall more rapidly?

Mr. GAINSBRUGH. I do not have the answer to that too clearly in my own mind, Senator. There may have been some relief from excess profits situations in durable goods tax carryovers and textile prices were especially weak—but my comment was to suggest you would get further if you broke this down by particular types of industries and then compared the results for like phases of business cycles.

Vice Chairman PATMAN. Would it not be more favorable to the typical large concern because a larger concern has stable prices more than a smaller concern, and the durable goods industry, all of them, of course, I think the records show that their prices were pretty stable, particularly in the large concerns.

Mr. HOOVER. Actually, Mr. Chairman, if I may say so, I was going to make very much the same comment that Representative Patman has now made, that this is indeed characteristic that during a boom period while the soft consumer goods industries do quite well both with respect to prices and as far as volume of production and employment is concerned. Indeed, prices in the small-scale consumer goods industries may rise further than they do in the large-scale producer's goods industries or in the durable consumer goods industries. On the down side while the small-scale consumer goods industries may maintain production and employment pretty well, prices fall off. I am only repeating what Representative Patman says, but it is very characteristic of this kind of cyclical movement.

The CHAIRMAN. Senator Sparkman.

Senator SPARKMAN. Mr. Chairman, I do not know whether this is the best place to raise this question or not, but it seems that this discussion has developed into a general appraisal of the whole situation, and some criticism of the report, itself. When the report came out, and all of the comments were made, I could not help but wonder at what seemed to me to be a contradiction. Everything was pretty and rosy, and yet I knew that at that same time 10 percent of the people of my State were on emergency rations, and that there were many spots throughout the country where unemployment was really serious, and people were suffering. At the same time we had this condition in agriculture that as far as I know no one disputes is very, very bad, and we have a bad condition in small business. Both groups are caught in the squeeze.

Now, are we getting a correct, honest, full appraisal of the economic situation when we get a report that carries a picture to the country that everything is pretty and on the upgrade, when we know there is suffering and misery and considerable despair in many segments of the economy?

I shall just welcome some comment on that.

The CHAIRMAN. We are going to have a session tomorrow on unemployment in specific areas of industry that will take up some of those questions. I have been getting the figures on the numbers of emergency food orders in various States, and they are really very startling.

In justice to the Council, I think we should say that they did prepare a chart showing percentages of unemployment by States, which is reproduced there, and, of course, that shows that the coal-mining States have been hit the hardest.

Senator SPARKMAN. It is true, Mr. Chairman, that many charts appear in the appendixes, but I refer particularly to the publicity that went out over the country, and it was to the effect that we were in an unusually good economic condition. It seems to me the report should have been more realistic.

At any rate, I invite suggestion on that, and it seems to me in view of the discussions we have had on these other points it would be appropriate at this time.

The CHAIRMAN. Mr. Keyserling.

Mr. KEYSERLING. I think that Senator Sparkman is basically right. I think that basically the report presents a distorted picture. The reason gets back to the very point we were discussing a few minutes ago, about the difference between trends and needs.

Now, in view of the rate of the productivity of the American economy, and the growth of the labor force, par for the course changes every year. In other words, the amount of demand for goods and services, the amount of employment that you have to have, goes up from year to year to maintain maximum employment and production. When it does not go up enough, the people who are hit first and hit hardest are those unable to protect themselves, small business, agriculture, and the unemployed.

Now, that is what has been happening. In the first three quarters of 1954, in the main, the economy was fairly stable if you look at the indexes of business activity; if you look at the stock market, or if you look at the profits of large concerns, it was booming upward. If you thought in terms of needs, in terms of par for the course, it was going backward.

Therefore, you had more unemployment, progressive decline in farm income, progressive rise in the failures of small business.

Now, I think this report makes the wrong basic measurements of what is prosperity, and what are the conditions of maximum employment and production, for the very reason that you cannot find in the body of the report the measurements of need which respond to the Employment Act of 1946, which I think is a good law.

There is nothing in the report which says what the needed level of employment is. There is nothing in the report which says what the needed level of production is. There is nothing in the report which says or analyzes seriously what the needed level of farm income or consumer income, or of business income, might be to restore a lower level of unemployment. On none of those points is there any comment. That is the difference between needs and forecasts.

Mr. KEEZER. Mr. Chairman, I am not particularly prepared to debate the report on as broad a basis as has been indicated. But I think I would be remiss if, in the light of the turn the discussion has taken I did not say that all of my studies indicate that the statement that 1954 was our most prosperous peacetime years is true. I think it is clear that we had a very mild recession, that since August, roughly, the economy has been expanding. I think we all know that there are areas of agriculture and industrial districts, and pockets of unemployment. But I think that to suggest—after all, we are dealing with a broad picture—that there is something wrong with the report on this account would be quite unjustified. I take it to be a demonstrable fact that we are in a prosperous period; this is the record.

This ought to be the group to check on it. We are here as technicians, not as statesmen.

Is there any question that that is true?

Mr. KEYSERLING. I do not think that is responsive to the Employment Act. The Employment Act does not set the target of having a reasonably good economic year for some people. It sets a target of good conditions for the great majority of the people in our country, and no serious hardship for the others.

Now, I think that is an attainable goal. I could say we did have a generally prosperous year in 1954. But it was a declining year for agriculture, it was a declining year for labor in terms of rising unemployment. It was a declining year for small business. It was a year when consumers in middle and low income groups had to draw on their very limited savings to buy the necessities of life, and I think we have to focus on those things because those are the breaking points in the ice, the smooth ice, of the economic outlook.

If we do not watch them, because they are small, or because the act calls for, namely, not to wait until everybody falls through the ice.

I think if you let unemployment rise, if you let farm income go down further, the time will come when the big business as well as the small, the employed worker as well as the unemployed, the retail worker as well as the farmer, will also fall through the crack. If you want to wait until then to define the condition as calling for action, very well, but I do not think that is what the Employment Act calls for. I do not think there is a difference in definition of the current situation. I think there is a difference in interpretation of the act.

Mr. RUTTENBERG. Mr. Chairman, I would like to respond to Senator Sparkman's question in this way:

As I read this report, I think it might be correct to say on page 2 you find the philosophy of the Council and the President. Here in the first 2 paragraphs on page 2 is a discussion of 2 alternatives, and

I think it might be well to direct your attention to them. Beginning in the second sentence it says:

Some citizens lacking faith in the abililty of the private economy to generate a high level of activity espoused a steadily increasing role of Government.

Then it drops down and says:

Other citizens adherent to what they regard as the ultimate economic verities are critical of any Government, which is designed to prevent or minimize the rigors of depressed income and employment.

It says these are two doctrinaire positions. Then it sets up the alternatives. "The American people believe firmly that economic freedom will not passively accept depression or inflation" what they are saying here, it seems to me, is that those who advocate Government action are for inflation, those who say that the Government should stay out are for depression.

In 1954 we had neither depression nor inflation, therefore we must have done a pretty good job, and I think it is with that philosophy in mind that they come to the conclusion that everything is rosy. Mr. Keyserling points out, everything cannot be rosy if the figures we talked about this morning, which everybody agrees to, are accurate. That is, that unemployment over the year has doubled, that industrial production having returned to its last year's level in December has done so with employment below last December, a million below last December, a million below the peak.

These, it seems to me, are the facts. It is accurate to say that gross national product in the fourth quarter of this year showed a rise from the third quarter, things looked good, automobile production is booming, steel production is currently booming, booming relatively to the year 1954, and, therefore, things look rosy. We have avoided depression, on the one hand, we have avoided inflation, on the other; let us not rock the boat. This is a failure to recognize the basic objective of the Employment Act, which is to promote maximum employment, not partial employment.

The CHAIRMAN. Congressman Mills.

Representative MILLS. Mr. Chairman, I am not certain that the question I have in mind is apropros at this time. However, I do desire the panel to discuss in connection with the next question, if they will, this thought: What rates of national economic growth should Government economic policy attempt to facilitate in the coming year?

The CHAIRMAN. That is a very good question.

Does anyone want to reply to it?

Mr. HOOVER. Mr. Chairman.

The CHAIRMAN. Mr. Hoover.

Mr. HOOVER. I have already stated that we should try to maintain a rate of something like 4 or 5 percent. I think we may need more stimulus than present policies provide if we are to attain this rate of growth. Having said that, fairness compels me to go on and say that we should not forget that this is a very delicate matter, to know how stimulative or how restrictive our economic policy should be in order to attain this growth rate. I could be quite wrong in my estimate of what degree of stimulation the economy needs just now. It must be noted, too, that at one time there was, I think, quite a real problem of stopping inflation.

Now, you carried out a particular anti-inflationary policy, and along with stopping inflation you also got a recession.

The CHAIRMAN. When did you think that the problem of stopping inflation occurred? Was it in 1953 or had it been in 1951?

Mr. HOOVER. It well may have been 1951, but on my part this is largely hindsight. If you had asked me in 1951 I doubt whether I would have given that answer.

I hope everybody else knows the answer better than I do on these matters, you see, because unfortunately I do not. I have to admit a very large margin of error. Yet we must repeatedly make value judgments and act or refrain from acting on the basis of very imperfect knowledge. It is simply impossible to avoid the exercise of judgment because a decision to refrain from lowering the interest rate or to refrain from increasing the budgetary deficit or to do the opposite will alike affect the rate of growth in national income.

The CHAIRMAN. A very wise man. But you would say a failure to grow at a rate of 4 or 5 percent should be a matter of concern.

Mr. HOOVER. Yes. However, I would point out that you cannot be sure about it. If my recommendation were followed, it might well turn out that you would get more inflation than we would want. As you ask me right now, I gave a recommendation. That recommendation might result in action which would be wrong. I do not think so or naturally I would not make such a recommendation.

The CHAIRMAN. Does anybody want to comment on that statement?

Mr. KEEZER. Mr. Chairman, I would like to ask a question which might throw some light on this. It might be addressed to Mrs. Wickens, and perhaps there is no answer, but a rough calculation seems to be that productivity increased in 1953 at the rate of about 4 percent. In 1954 an equally rough calculation indicates it increased about 1 percent.

Is there some validity in those figures?

Mrs. WICKENS. In reply to that, Mr. Chairman, I do not think that there is any good over-all measure except the ratio of the number of persons employed to gross national product. Any rough measurement of that kind will indicate the wide fluctuations from year to year. And while I am speaking, I might point out that the Council, in discussing long-term growth, would not have to asume it would be the same rate every year. We are talking about long-term growth. There will be years below and years above. It is expecting too much of a free-enterprise economy to expect it to adjust to a rate of growth in a straight line.

Mr. KEEZER. Mr. Colm favors me with some figures on this subject which are about what my rough figures indicated. Productivity increased at a rate of 4 percent in 1953, and at a rate of 1.2 percent in 1954. I bring up the point because it seems to me to have some bearing.

The CHAIRMAN. Are you speaking of total productivity?

Mr. KEEZER. Output per man-hour.

The CHAIRMAN. That is a very different thing.

Mr. KEEZER. But it seems to me it has an important bearing on the possibility of having a precise year-to-year growth figure.

Mr. COLM. Mr. Chairman, if I may add a comment on my own figures, I do think that the low productivity per man-hour for the year 1954 is a function of the recession, that the figures for 1952 and 1953 and previous years which are all between 3, 4 and 5 percent, are more indicative of a longer run trend than the figure for 1954 which is extraordinarily low, one of 1.2 percent. This is comparable with what happened when we had a decline in 1949. It dropped from 4.9 percent in 1948 to 1.5 percent in 1949.

(The following table was subsequently supplied for the record.)

Annual productivity increases

	Civilian employment			Average weekly hours	Average annual hours	Total man-hours	Gross private product	Output per man-hour	Increase over previous year
	Total (A)	Government (B)	Private (C)	(D)	(E)	(F)	(G)	(H)	(I)
	Millions	*Millions*	*Millions*			*Millions*	*1947 dollars*	*1947 dollars*	*Percent*
1939	45.8	3.7	42.1	42.7	2,220.4	93,479	145.0	1.551	----------
1940	47.5	3.8	43.7	43.0	2,236.0	97,713	158.6	1.623	+4.6
1941	50.4	4.1	46.3	43.9	2,282.8	105,694	181.7	1.719	+5.9
1942	53.8	4.8	49.0	45.1	2,345.2	114,915	198.7	1.729	+.6
1943	54.5	5.5	49.0	47.4	2,464.8	120,775	209.0	1.730	+.1
1944	54.0	5.5	48.5	45.1	2,345.2	113,742	222.0	1.952	+12.8
1945	52.8	5.5	47.3	44.3	2,303.6	108,960	218.0	2.001	+2.5
9146	55.2	5.1	50.1	42.5	2,210.0	110,721	211.2	1.907	−4.7
1947	58.0	5.0	53.0	41.6	2,163.2	114,650	215.6	1.881	−1.4
1948	59.4	5.1	54.3	40.8	2,121.6	115,203	227.3	1.973	+4.9
1949	58.7	5.3	53.4	40.3	2,095.6	111,905	224.0	2.002	+1.5
1950 [1]	60.0	5.5	54.5	----------	----------	----------	246.6	----------	----------
1951	61.0	5.8	55.2	40.3	2,095.6	115,677	259.9	2.247	[2] +12.2
1952	61.3	6.1	55.2	40.5	2,106.0	116,251	269.3	2.317	+3.1
1953	62.2	6.1	56.1	40.1	2,085.2	116,980	281.9	2.410	+4.0
1954	61.2	5.9	55.3	38.9	2,022.8	111,861	272.9	2.440	+1.2
1939–54 average	----------	----------	----------	----------	----------	----------	----------	----------	+3.1

[1] Output per man-hour in 1950 could not be computed because the Census Bureau's figures on average weekly hours for that year are distorted by the fact that the weeks during which surveys were made that year included an unusually large number of holidays.

[2] Percentage increase from 1949 to 1951.

The CHAIRMAN. I do not want to interrupt, but I think that what Congressman Mills is asking about and what Mr. Keyserling and Mr. Hoover dealt with was productivity for the economy as a whole, not productivity per man-hour. As a matter of fact, very frequently in a recession productivity per man-hour rises quite appreciably even though the total index of production is falling and I think what Mr. Mills meant was, at what rate should the economy grow?

Mr. HOOVER. Furthermore, Mr. Chairman, if I may say so, the gross national product would have to advance at a greater rate than the per man-hour rate, you see, if the two were to move as they ordinarily would do.

The CHAIRMAN. The population is growing, I assume at a rate of about 1.2 or 1.3 percent a year. Mr. Keyserling.

Mr. KEYSERLING. I have a point in response to Congressman Mills' question. If you start from a maximum employment economy, your economy needs to grow each year by the rate of productivity growth plus the growth of the labor force, minus long-term desirable reductions in hours, once you have decided what you regard as an optimum level of employment.

Now if the economy had grown from the first part of 1953 at a modest rate of productivity growth, measured over the record of the few years before, then plus the absorption of this labor force, we would have been by the end of 1954, at a gross-national-product level of about $391 billion, or about $30 billion higher than we actually were (annual rates).

Therefore, one might say that to restore full maximum production by next year, we would have to grow by that same rate projected from early 1953, and get a level above $400 billion in 1955. However, that would be an inflationary rate of growth, which is another way of saying in 1 year you cannot pick up what you have lost through 2 or 3 years of what I would regard as neglect. Therefore, it would be fair to set as a need—I call it a need—a considerably lower rate of growth than would bring us to where we would have been in 1955 had nothing happened. It certainly must be sufficient to pick up the growth in the labor force, or unemployment will rise. It certainly must be sufficient to pick up the excess number of unemployed.

Well, how big is that excess number? That depends on your national-need definition of what level of unemployment national policy should regard as consistent with maximum employment. So if you do not define that need, you haven't any basis on which to rest.

I don't see how we could get the level of unemployment down to what I would regard as the maximum employment level without the economy growing by about 6 percent above the 1954 level in 1955, and about 8 percent in the fourth quarter of the year above the fourth quarter of 1954 level. Now, that does not really disagree with the figures that Mr. Hoover stated, because the 4 to 5 percent figure that he gives is the growth figure at full employment. We have an additional job, this year, because if we only pick up productivity and the new labor force, we would not be making up anything on the excess unemployment, and we would not be bringing the kind of advance in the economy which would stall the downtrend in agricultural decline and remedy the small-business problems.

So my estimate is, and others may have different estimates, that if you really want to reduce unemployment to the neighborhood of 2 million, you would have to expand about 6 percent over the course of the year. Until you make some such framework of the need—somebody else might take a different figure, 3, 5, or 7—there is no basis for evaluating national policy.

It is like saying you should not make an estimate of tax revenues, and should not make an estimate as to the extent you want to balance the budget, because you may be wrong on the estimates of revenues and also on your policy determinations with respect to the need to balance the budget.

However wrong you may be, you can't exert any national policy without, (1) making a forecast, and (2) bringing in between that forecast and the policy determination an estimate of need. You can't jump from the forecast to the policy. You have to forecast, then say here is what we need to do, and then here is how we hope to get there. It seems to me that is explicit.

Representative MILLS. Just one further question of Mr. Keyserling. As I understand it, you do not see anything in the report which would bring about Government economic policy to facilitate that growth, that rate of growth.

Mr. KEYSERLING. I say first that the report makes no analysis of the basic needs and, therefore, does not relate the policies to needs, which I think any national economic analysis directed toward a policy should do.

It does not set the Federal budget or any other policy in the framework of the need and, therefore, the policy is completely unrelated to the need. Furthermore, it does not even state the need. It makes no commitment whatsoever as to what the level of unemployment ought to be, or the level of production, or the dispersion of purchasing power.

For all that you could gather from this report, the report might be intimating that we ought to have a million higher level of unemployment, or a million lower level of unemployment. If you don't take a position on that, you have no basic policy.

The CHAIRMAN. Is there any further discussion on this point and in particular does anyone want to comment on Mr. Hoover's statement that if the economy fails to grow at the rate of say 4 or 5 percent a year, that it should be a matter of concern?

Mr. GAINSBRUGH. I for one must take reservation at a figure that is pitched as high as 4 percent or 5 percent. I find nothing in our past that says we have made sustained progress at so high a rate. Much of this discussion, it seems to me, has been concentrated on the hole in the doughnut rather than on the doughnut, itself. The level of retail trade in December continuing into January is the highest we have ever had. We have a highly active automotive industry, a booming construction industry. I think the Council is basically right when it says the policy pursued in 1954 gives promise of further recovery in 1955.

I may quarrel with them on the basis of their expectations for boom dimensions in the economy by 1955, but at all previous periods of prosperity there have been declining industries at the same time there was expansion. National policy has tried to deal with the problems of the peripheral, the fringe groups that are being disadvantaged in the process of economic expansion. But national policy has also been centered on seeing to it that the healthy sectors of the economy were not interfered with.

Special programs are suggested in the Economic Report to deal with the problems of depressed areas. There has been a Presidential message designed to deal with the problem of agriculture. There have been numerous other attempts to deal with the problem areas. But the basic point of this Economic Report, if I can repeat it, is that recovery has begun; as best it can be discerned by the Council it anticipates this recovery will grow in dimensions during the course of the year and that by the year end, contrary to Mr. Keyserling's opinion, we will be at levels which they state will approach reasonably full employment.

Mr. KEEZER. Mr. Chairman, I do not see how anybody could possibly take exception to the statement that if the economy is not growing at a rate which reflects the increased labor force and increased productivity, it is a matter for concern. But should not we perhaps make a distinction between concern and action, because we do have these unexpected fluctuations from time to time and if each dip were immediately made the subject of action to bring it up to a steady rate of growth, I think that might——

The CHAIRMAN. How long would you say this dip would have to continue before you thought action would be justified?

Vice Chairman PATMAN. Farm prices in particular, may I add, Mr. Chairman.

The CHAIRMAN. I am speaking of production and Mr. Patman is speaking of farm prices.

Vice Chairman PATMAN. Well, that is an outstanding example.

The CHAIRMAN. You say do not worry about a year. Would you worry about 2 years, would you worry about 3 years, would you worry about 4 years?

Mr. KEEZER. I don't believe I said I would not worry about a year. I intended to say I could see dangers in using a hair trigger which, upon the first dip, would bring immediate action to have something done about it. I think it would be foolish to give a formula answer in days, months, or weeks.

Vice Chairman PATMAN. But would you excuse me, Mr. Chairman, on farm prices do you not think something should be done now in view of the fact that they have gone down so consistently so long over a period of years? Do you not think it is going to upset our entire economy eventually in some way if something is not done to correct that situation?

Mr. KEEZER. Well, I wish we had an expert on agriculture on our panel to deal with that question.

Representative KELLEY. I do not know whether the matter has been discussed or not, but I think this mater of public works should have been given some attention.

As you say, there are areas of depression, there have been and are great areas of depression in the last year, and I wonder why something has not been done in the matter of public works. Certainly the legislation was proposed in the House and in the Senate. I think the depressed areas, so many of them and so severe, would warrant something of that sort.

The CHAIRMAN. Is there comment on that?

Mr. GAINSBRUGH. I think some initial attempts were made. One of the difficulties of Government action is the time required to move in, including a program of public works and very frequently your program of public works comes along at a later time when it is no longer needed. It may take 6 months or a year to get actual production under way. There were also steps taken toward the placement of defense contracts in depressed areas.

That type of activity did go on. In this problem of depressed areas and depressed communities, I think much could be said for the need for self-help of the affected community. Some of them have done far better jobs than others of appraisal of their economic resources, in attracting new industries and in trying to adjust to the changing pattern of markets. There is a limit in my mind to the desirability of Federal action pivoted around the sustaining of a depressed area.

It may be more desirable in some instances to have your resources fluid, to retrain these people, to move or attract them into other areas and into other industries in which they can make a more effective contribution to national output than they can in their particular location.

Representative KELLEY. Of course, that presents a very serious social problem. Most of these families have built their homes, they have raised families, they have established themselves in a community, and they cannot very readily be moved. And besides, it is difficult—you take a whole group of workingmen and their families and transport them some place and find jobs for them. As a rule there are not any jobs in this kind of a period even where you have areas of fairly good employment. There are not so many jobs waiting for people. It is a human problem.

Senator SPARKMAN. Someone has facetiously said that it would create a traffic jam. People going from the coal-mining sections in my State, would meet the people coming from the plants in the Northern States.

The CHAIRMAN. Have we finished discussing topic 3?

How many expect economic activity to be higher in 1955 than in 1954? Could we take a poll on that?

(Show of hands.)

The CHAIRMAN. Apparently, all of you. I do not know whether Mr. Gainsbrugh is more assertive or more optimistic. His hand went up higher than anybody's. It was unanimous though, I think. How many expect economic activity to be higher in 1955 than it was in 1953?

Mr. GAINSBRUGH. For the year 1953 or for peak rate in the second quarter?

The CHAIRMAN. For the full year.

(Show of hands.)

The CHAIRMAN. There are three. The others, I take it, do not expect it to be higher.

Senator SPARKMAN. Well, Mr. Chairman, those who expect 1955 to be higher than 1954——

The CHAIRMAN. That was everybody.

Senator SPARKMAN. That was everybody. I wonder how many of them think——

Mr. LUEDICKE. I am not so certain.

Senator SPARKMAN. I noticed two hands just barely went up. I was wondering since we have devoted a good bit of time to the discussion of this productivity factor, if they would likewise hold up their hands to the question, do they believe that the increase in 1955 would be enough to make up for the productivity factor, the increase that would be normally expected and needed?

Mr. GAINSBRUGH. That phrase, productivity, bothers me. If you will rephrase your question to how many believe unemployment will be higher or lower, because I think that is the area we want to deal with, we might be able to answer.

The CHAIRMAN. Let us start with economic productivity. How many expect economic productivity to be higher; I think everybody agrees it will be higher in 1955 than in 1954. How many expect productivity to be higher in 1955 than in 1953?

Mr. LUEDICKE. Are you talking about gross national product?

The CHAIRMAN. Yes.

Mr. GAINSBRUGH. Not just output per man-hour.

The CHAIRMAN. That is not involved.

Mr. LUEDICKE. Gross national product, it is then?

The CHAIRMAN. I do not like it myself, but everybody is expressing it that way.

Senator SPARKMAN. But is it enough just to expect gross national product to be greater?

The CHAIRMAN. No, John, we are just taking one step at a time.

Senator SPARKMAN. I was wondering if you would take that other step.

The CHAIRMAN. Oh, yes. How many expect gross national product—I personally think national income ought to be the test, but that is neither here nor there. How many expect gross national product to be higher in 1955 than in 1953?

Mr. RUTTENBERG. Was not that what you intended the first question to ask?

The CHAIRMAN. No, the second, the first dealt with 1954.

(Show of hands.)

The CHAIRMAN. The others apparently do not. Now may I ask those who believe that 1955 will be higher than 1953, do you expect it to be more than 3 percent higher?

Mr. RUTTENBERG. Senator, could I be presumptious enough to suggest this question?

The CHAIRMAN. No; I would like to have my question go further.

Mr. RUTTENBERG. This would be a kind of a paraphrase of that question.

The CHAIRMAN. Well, how many believe it is going to be more than 3 percent higher than 1953?

Mr. GAINSBRUGH. What is the figure for 1953?

The CHAIRMAN. 365 billion.

Senator SPARKMAN. That would be about 11 billion more.

Mr. GAINSBRUGH. Our Economic Forum believes the GNP in the fourth quarter of 1955 will be about $370 billion.

The CHAIRMAN. Well, it would have to go up for the year to about 376 to be 3 percent higher.

Senator SPARKMAN. That is the average of the year.

The CHAIRMAN. Well, apparently no one seems to believe that. Mr. Butler.

Mr. BUTLER. I think that the annual rate at the end of the year will be 3 percent above the 1953 average, but the average for the year will not.

The CHAIRMAN. Of course, in the meantime, the population has increased, the working population has increased, and the output per man-hour has increased, so that that would still indicate a very appreciable amount of unemployment at the end of the year, even if the most optimistic estimates were to be made.

Senator SPARKMAN. Mr. Chairman, I wonder if you would include in your predictions what is going to happen in one segment of the economy in which I am greatly interested, and all of those who come from primarily agricultural States, and that is what is going to happen to the farmer. His condition is going to improve or continue to go down.

The CHAIRMAN. All right, we would like to hear comments on that. I don't want to make a partisan statement, but as I understand it——

Senator SPARKMAN. That is gross income for the farmer, his share of the dollar.

Mr. LUEDICKE. I expect pressure on prices to continue, though moderately.

Senator SPARKMAN. You mean going down?

Mr. LUEDICKE. Yes, moderately.

Mr. GAINSBRUGH. Acreage restrictions and greater resort to flexible price supports indicate lower levels of farm income.

Senator SPARKMAN. At the same time is the price of the products he has to buy going to continue to rise? In other words, is the squeeze going to become tighter and tighter?

Mr. GAINSBRUGH. It has not been rising in recent months. I would anticipate price stability in the prices paid by farmers.

Mr. LUEDICKE. I would expect some pressure in that area too, especially later in the year.

Senator SPARKMAN. If you have another steel rise——

Mr. LUEDICKE. Well, steel always comes late.

The CHAIRMAN. Mr. Patman suggested another question on the farm situation. How many believe that the net income of the farmers, the net income of the farmers, which I suppose is price times quantity minus expenses, will be higher in 1955 than it was in 1954?

Senator SPARKMAN. Net income?

The CHAIRMAN. Yes.

Vice Chairman PATMAN. It was down to about 11 billion at the last report, on an annual basis.

Senator SPARKMAN. You do not expect it to be higher?

Vice Chairman PATMAN. No; I am asking them.

The CHAIRMAN. How many expect it to be lower?

Mr. LUEDICKE. Not much lower, but some.

The CHAIRMAN. Nearly everyone, I think, expects it to be lower.

Representative MILLS. Mr. Chairman, may I propose a question. Does that mean then that you anticipate that the farmers, the percentage of farm income as measured by the total income will be less this year than last year?

The CHAIRMAN. They all seem to think that national income or gross national product for the country as a whole will be higher, but they all seem to believe that the farmers' income will be lower.

Representative MILLS. As a percent of national.

The CHAIRMAN. In absolute terms, so the percentage terms would be still lower.

Representative MILLS. Right at that point, if I may, I was just going to suggest that my recollection of the percent of the farmers' income as measured in percentage of the total income this year, or for 1954, was less than it was in 1932, is that right, the percent of farm income of the income of the whole country was less than it was in 1932?

Mr. RUTTENBERG. Of course, there were fewer farmers.

Representative MILLS. We can't alibi it too much, though.

Mr. GAINSBRUGH. You drew one inference from our consensus that I would like to take a reservation on. You said on the basis of a show of hands it seemed apparent that the expansion in the economy in 1955 would not be sufficient to diminish the level of unemployment. I think that was the tenor of your comment.

The CHAIRMAN. No, would still leave an appreciable amount of unemployment and less employment and more unemployment than there was in 1953.

Mr. GAINSBRUGH. Than there was in 1953?

The CHAIRMAN. Yes. Of course, we shouldn't necessarily take these predictions as being gospel truth.

Mr. Colm.

Mr. COLM. Mr. Chairman, your last statement—that we should not take these predictions as gospel truth—is in line with a comment I would like to make. I participated in the show of hands because I wanted to be responsive to the question of the chairman, but I have some hesitation in making outright predictions without more specifically formulating the assumptions under which they are made. I do not believe that we are able really to make such absolute, unqualified predictions.

The CHAIRMAN. We assume that the international situation will not change, which is a very dubious assumption in view of what is going on. There is a hot battle on the Senate floor on this very issue now.

Mr. COLM. Mr. Chairman, this is a very important qualification, but there is a second one. I personally expect that the business revival underway will continue for several more months, but I am somewhat dubious as to whether that revival will continue for the rest of the year.

I could imagine that the Congress, recognizing that situation, might adopt measures or speed up measures which are not now contemplated for this year, for instance, a tax reduction, or a public roads program which under present plans would only start in the subsequent year. I would like to say that at least my vote was under the tacit assumption that there would be no change in present policies. Now, this, I think, is a very important second qualification.

Mr. KEEZER. Mr. Chairman, I have a piece of good news I hope I am going to be able to give the committee.

The CHAIRMAN. Well, we are very glad to hear it. We want to hear good news.

Vice Chairman PATMAN. We are all ears on that.

Mr. KEEZER. In October we made a check on business plans for investment in new plant and equipment in 1955. I think historically that range of investment has been the most unstable part of our economy. This check of preliminary plans indicated that investment in 1955 in industrial plant and equipment would be down approximately 5 percent from 1954.

In anticipation of coming here today and meeting with this committee, we made another check of the larger companies and we found no downward revisions and we found several very substantial upward revisions. So it now appears that between the time we made our preliminary check and the time of this hearing that the outlook for investment in industrial plant and equipment has improved and that if one had to make a judgment at this time it would be that there would be little or no decline in 1955 as compared with 1954.

Vice Chairman PATMAN. Did you also determine whether they are going to get their money for expansion?

Mr. KEEZER. We are constantly looking at that. Depreciation allowances alone will provide about 60 percent of the money required by nonfinancial corporations to finance the investment in new plants and equipment they now seem to be planning for 1955.

Vice Chairma PATMAN. What about the fast amortization? Would that provide quite a bit of it?

Mr. KEEZER. That is lumped in the total depreciation allowance, and I think, Mr. Patman, there is a little indication of one development in this field which you will find encouraging. It is that the smaller companies which had declines in their capital investment over a period of years are beginning to increase them again.

Vice Chairman PATMAN. How much will they get for the expansion program from retained earnings which, of course, I would assume would include the factors that you mention?

Mr. KEEZER. The amount in percentage?

Vice Chairman PATMAN. Yes.

Mr. KEEZER. I would have to check the figures.

Vice Chairman PATMAN. Well, practically all of it, wouldn't they, in retained earnings?

Mr. KEEZER. I say between depreciation allowances and retained earnings there is enough to pay the bulk of the planned investment of industry in new plant and equipment in 1955; that is correct.

Vice Chairman PATMAN. Yes. Now, what chance has a small concern in this country that does not have that advantage against a large concern with this enormous costless capital? In other words, most of their capital or expansion comes about from prices, that by reason of their secure position and their monopolistic position they are able to fix their prices, and the consumers will pay these prices at a rate that will give them their capital for expansion purposes?

Now, that is really costless capital to them. The consumers have paid it. Now, what chance has a small concern that must go into the money market and borrow its money and pay a pretty high rate of interest on it, and keep on paying interest on it, and keep on borrowing? What chance has that small concern against the branch of a big concern across the street that has available all of this costless capital?

Mr. KEEZER. It is my impression that we have more small business enterprises in the United States today than we have ever had.

Am I correct in that?

Vice Chairman PATMAN. What is your feeling about the outlook for this year? You know this report is not very optimistic about small concerns.

Mr. KEEZER. Well, limiting myself to the one thing about which I have some factual information, I could say that our recent survey gave some indication that the smaller companies are increasing their capital investment. These are smaller companies, not tiny companies.

Representative MILLS. Mr. Chairman, may I propound a question which you went into just a little bit. It is a slight variation of your question, but I would like to know of the panel whether or not a rise in gross national product anticipated in 1955 over 1954 will be enough, in your opinion, to reduce 1954 levels of unemployment, or will unemployment be higher in 1955?

The CHAIRMAN. Mr. Keyserling.

Mr. KEYSERLING. My guess would be that if the growth in the national product is held within the limits suggested, that the level of unemployment in 1955 would average considerably higher than in

1954, which was twice as high as in 1953. This is another way of saying, with the growth in gross national product at less than 3 percent, 1955 would be a worse year than 1954, and not a better year, as measured against par for the course.

Mr. COLM. Mr. Chairman, I would like to bring to your attention the most recent survey by Dun & Bradstreet on business expectations.

For the second quarter of 1955, as compared with the second quarter of 1954, 71 percent of all concerns interrogated expect an increase in sales, but only 16 percent expect a rise in the number of employees.

Now, those are business expectations for the second quarter of 1955.

Mr. GAINSBRUGH. Mr. Chairman, on page 73 of the Business Outlook, our 15-man economic forum came up with this anticipation of unemployment, second half of 1955. The arithmetic average of $2.8 million is close to our existing levels of unemployment. They were of the belief that by the second half of 1955 unemployment in the light of the rising tendencies of the economy throughout 1955 would be no higher than it is currently.

Mr. RUTTENBERG. Mr. Chairman, might I just add, when you asked the first question about the 1955 rise in gross national product over 1954, I raised my hand only very slightly.

I think there will be a rise. The rise will be relatively insignificant. I think unemployment in 1955 will average a million to a million and a half higher than the average of unemployment in 1954. While I answered the question affirmatively that gross national product in 1955 will be up over 1954, it will be up not near enough to prevent unemployment from rising about a million to a million and a half.

Mrs. WICKENS. Mr. Chairman, I believe that the answer to this question will vary with the members of the panel in terms of their views on three things: First, the rate of productivity; second, the additions to the labor force; and, finally, their assumptions about the gross national product.

If you take, for example, the figure of 2½ percent a year as the long-term average increase in what we loosely called productivity, that is the output per man-hour, and you assume an addition to the civilian labor force of about a million people, it would take about $375 billion of gross national product in 1955 to absorb a million additional persons.

Now, Mr. Keyserling some time ago talked about an increase of $30 billion. His figure of $30 billion was estimated from the peak of 1953, which would give you much higher levels than if you begin with the end of 1954.

Mr. KEYSERLING. I do not project 1955 needs from the 1953 peak. As I have said, I project them from where we are now.

The CHAIRMAN. Yes; Mr. Butler.

Mr. BUTLER. My analysis of the business outlook leads me to the conclusion that activity will reach a rate at the end of this year of around $375 billion. That will be just about enough to absorb the growth in the labor force. However, I think there is beginning to be some evidence that this advance will continue into 1956. If so, in 1956 will begin to make progress in reducing unemployment.

The CHAIRMAN. In other words, would you expect an increase in unemployment in the first part of the year, a decrease in unemployment the last half of the year, so that at the end of the year the average would be approximately where it was and permanent rises in production would have to wait until 1956?

Mr. BUTLER. Yes. I am thinking in terms of seasonally adjusted figures.

Vice Chairman PATMAN. I want to ask Mr. Keezer one question, please.

In view of the sharp drop in profits for the small- and medium-sized concerns the last 2 years, what factors should be an incentive to the small concerns to increase their capital now; increase their investment?

Mr. KEEZER. Well, you increase your investment in the light of your expectations.

Vice Chairman PATMAN. In other words, they would have to disregard the past were their profit rate was very low, that is the last 2 years?

Mr. KEEZER. I think that in recent years there was this large expansion in defense facilities that was accomplished mostly by the larger companies. When we come back to another type of economy the smaller companies see opportunities that did not exist earlier. This evidence I offer I don't offer as powerful and conclusive. We simply see a little evidence that smaller companies which had been decreasing their investment are now increasing it slightly.

Representative CURTIS. Mr. Chairman, could I just ask a question on these figures on unemployment?

In these answers I gathered the impression that you were using absolute figures rather than percentage figures, ratio of unemployed to the employment; is that correct? Of course, I realize that the differential is not too much, but what we are really concerned about is the percentage.

The CHAIRMAN. Does anybody want to volunteer any information on that?

Mr. Kelley, are there any questions you wish to ask?

Representative KELLEY. No, Mr. Chairman.

The CHAIRMAN. We want to thank you for coming. We do not want to shut the meeting off if people think there are other subjects to be explored. Does anyone have any comment that they want to make, either a member of the committee or the panel?

Representative MILLS. Mr. Chairman, I do not know that this has been focused exactly. We have discussed it in connection with the rate of unemployment anticipated in 1955, but I wonder whether or not in the opinion of the panel unemployment will be higher in 1955 than in 1954, on the average, or even in the last quarter?

The CHAIRMAN. Is anyone willing to make a statement on that?

We will take a poll on that. How many think it will be higher, unemployment?

(There was a show of hands.)

The CHAIRMAN. Thank you very much, indeed.

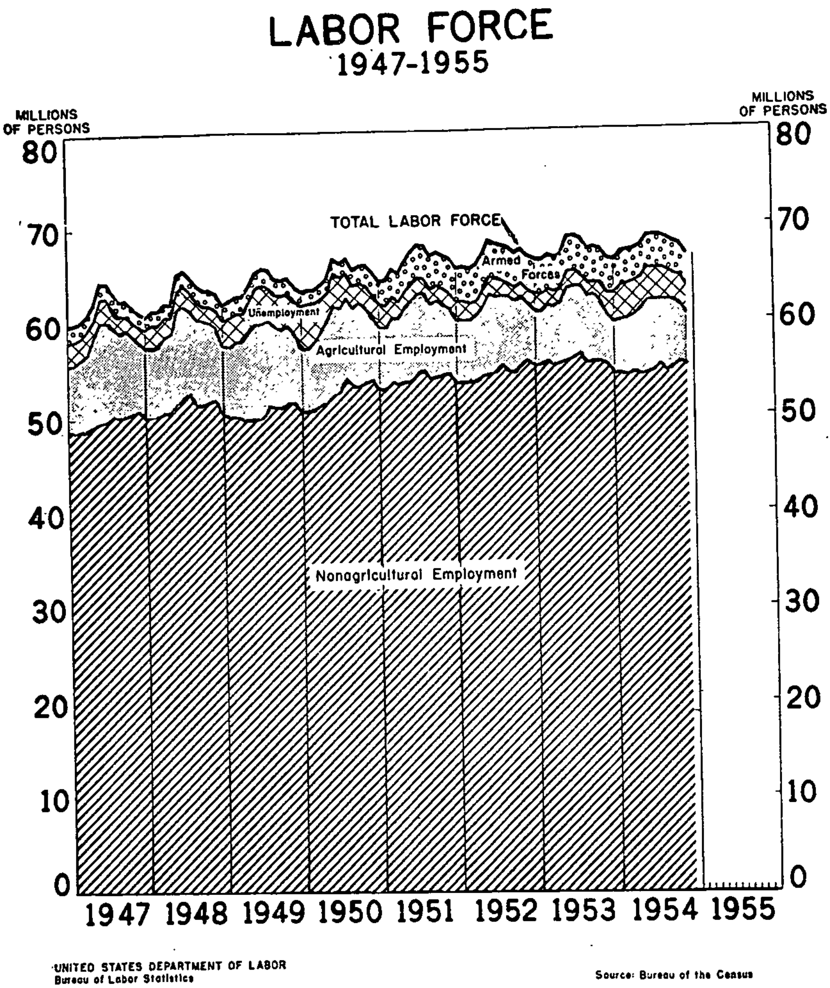
(The extended statements of the panel are as follows:)

RECENT CHANGES IN EMPLOYMENT AND UNEMPLOYMENT

Statement by Aryness Joy Wickens, Acting Commissioner of Labor Statistics, before the Joint Committee on the Economic Report, considered the President's Economic Report

You have requested the members of this panel to answer a series of questions on the state of the Nation's economy in the light of the objective of the Employment Act of 1946 to "promote maximum employment, production, and purchasing power." I shall address my observations to your first question, namely, what have been the economic developments since 1952. I shall discuss them in terms of the labor force, employment and unemployment, labor turnover, and hours of work. I have here with me several charts which illustrate these developments.

Our first major concern is the working population of the country. There has been a substantial growth in the labor force in the United States over the past 8 years, amounting to nearly 7 million workers, or more than 10 percent (see chart 1). This growth is sometimes obscured by the marked ups and downs within each year. The labor force is largest in the summer months when school children enter the labor market and lowest in the winter, with a range of around 3 million from the high to the low. In 1947 the total labor force averaged 61.8 million; in 1950, 64.7 million; and in 1954, 67.8 million.



The Armed Forces are counted as part of the Nation's labor force since they represent employment for many men who would otherwise be in the civilian labor force. Also, of course, a large proportion of the members of the Armed Forces return to the civilian labor force after some years of service. In the early years of the period shown on the chart, 1947–50, the Armed Forces numbered roughly 1.5 million. In the later years, 1951–54, they exceeded 3 million. As a consequence of this expansion in the Armed Forces after the Korean incident began, the civilian labor force has not grown in every year. As a matter of fact, the peak annual average level of 63 million in the civilian labor force in 1950 was not again reached until 1953 because the expected net addition was absorbed in the Armed Forces. This past year the civilian labor force averaged 64½ million.

With these facts as background, I should like to discuss the expectations for 1955. On the basis of the growth of the population and recent trends in labor-force partcipation by men and women of different age groups, it is estimated that the net growth of the Nation's total labor force in the next 12 months will be about 700,000. At the same time a decline of 340,000 is anticipated in the Armed Forces, according to a recent statement by the President. It is likely that about one-fifth of these men will return to school, with the other 275,000 becoming available as civilian workers during the year. Taking these two elements of increase together, then, there may be a net addition to the civilian labor force of something close to a million persons during 1955.

However, this is by no means a fixed figure. It depends upon the decisions of millions of people as to whether they will or will not actually seek work. In the United States, it is every man's and woman's choice whether he or she will or will not work, and that choice is conditioned by changes in the economic climate.

The makeup of today's labor force can be illustrated by the chart which shows the labor force by age and sex in April 1954 (chart 2). You will notice that the great majority of men from 20 to 55 are consistently in the labor force. The participation rates of the other groups shown in the chart are more likely to vary with economic conditions, thereby providing considerable flexibility in the labor force.

In April 1954 a majority of teen-agers were in school, a majority of adult women reported themselves as housewives, and the bulk of the men and women over 65 were out of the labor force because of retirement or inability to work. However, large numbers of these groups do have jobs, and the proportions which are in the labor market depend to a large extent on circumstances. For example, during World War II millions of persons who ordinarily did not work, took jobs. Under other conditions, when there are no patriotic incentives or when jobs are hard to get, many students, housewives, and older workers do not bother to seek work.

Because labor-force participation varies with circumstances and the choice of individuals, one cannot say with complete certainty what the net additions to the labor force will be. I have estimated that the net addition to the civilian labor force for next year will be nearly a million workers but it could vary either way.

EMPLOYMENT DEVELOPMENTS

Now, how is this flexible labor force employed? Since the end of the war, and indeed over the last half century, there have been two distinct trends. The first has been the decline in agricultural employment and the rise in nonagricultural occupations. The second has been the trend toward the production of services and away from the production of goods. As a matter of fact, in 1900, 2 out of 3 workers in the American labor force were engaged in the production of goods and 1 out of 3 in the production of services. By the midcentury mark, the American economy reached the point where more workers (53 percent) were actually engaged in the production of services than in the production of goods (47 percent).

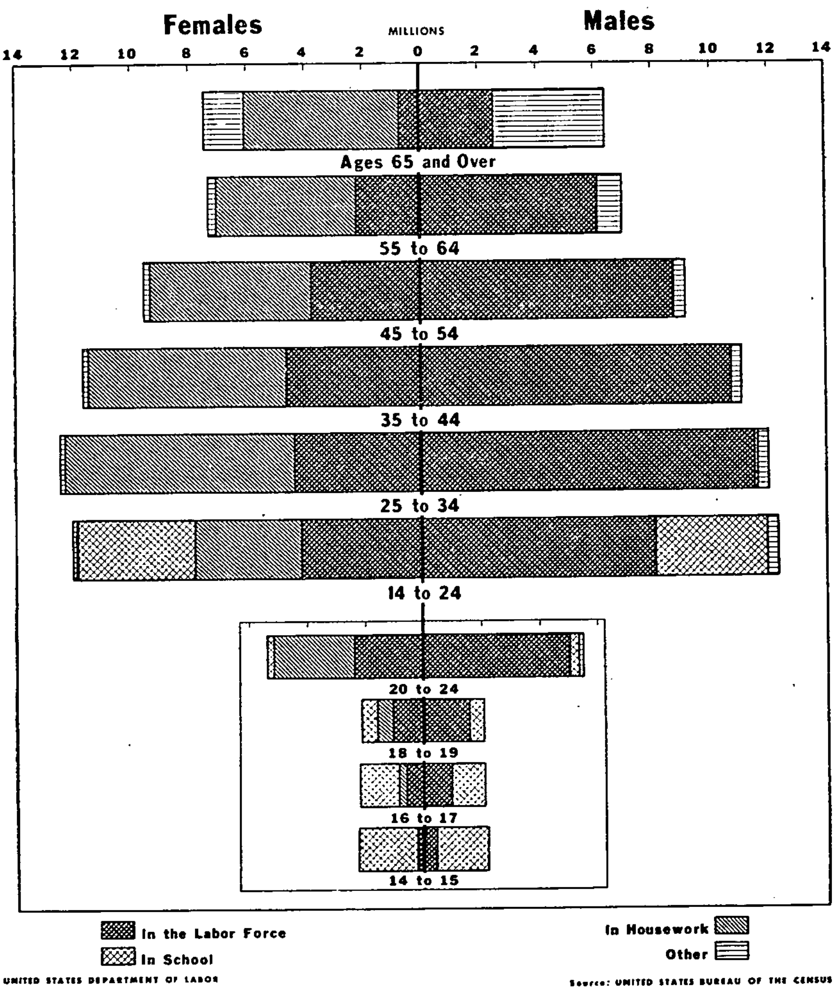
In the years between 1947 and 1954, shown on chart 1, agricultural employment has declined from 8¼ million to 6½ million, according to reports from the Bureau of the Census. Nonagricultural employment has expanded from less than 50 million in 1947 to over 55 million in 1953.

My next chart (chart 3) shows in more detail the makeup of nonagricultural employment and illustrates the shift in emphasis from goods to services. These data are based upon payroll reports to the Bureau of Labor Statistics by a large group of American establishments. In 1953, these employees numbered slightly less than 50 million. (This is a smaller level than the census total by about 5 million because the census includes domestic servants, self-employed and unpaid family workers who are not covered in payroll reports from employers to the Bureau of Labor Statistics.) Of the rise since 1947, amounting to 4.8 million, only three-fourths of a million was in manufacturing. The rest was concentrated in trade, finance, services, and government. Trade alone accounted for 1⅓ million of the increase since 1947.

POPULATION AND LABOR FORCE

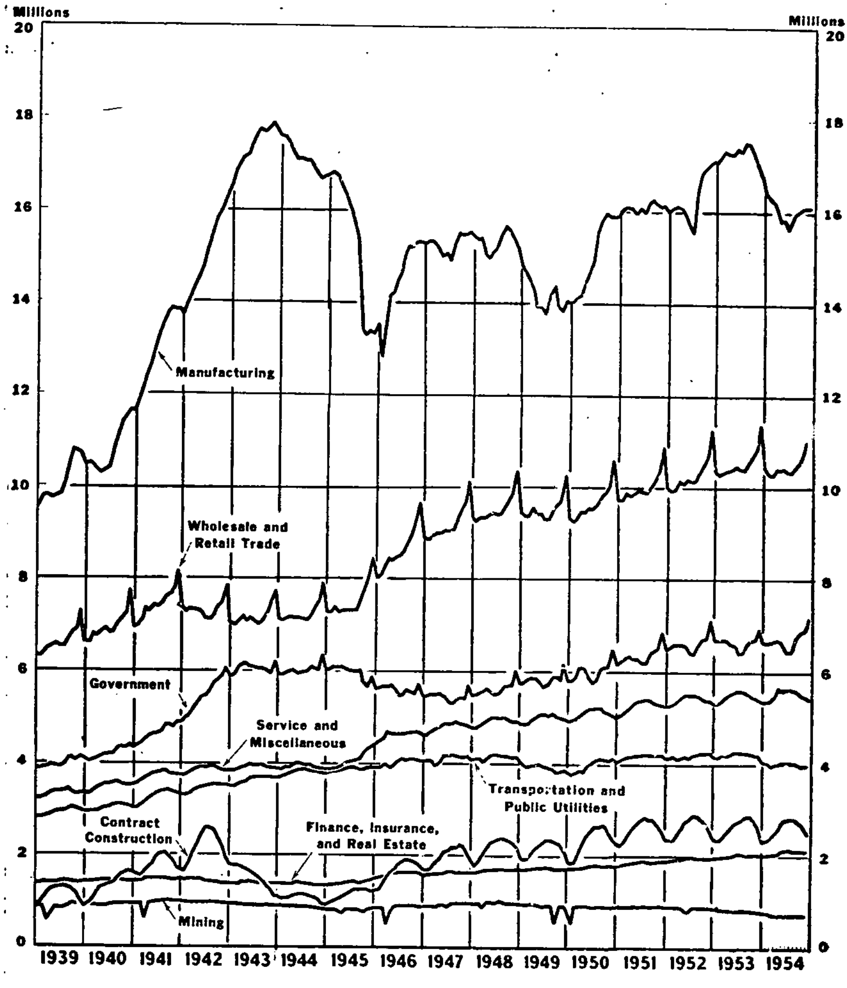
BY AGE AND SEX

April 1954



EMPLOYEES IN NONAGRICULTURAL ESTABLISHMENTS

BY MAJOR INDUSTRY DIVISION, 1939-1954



UNITED STATES DEPARTMENT OF LABOR
BUREAU OF LABOR STATISTICS

Coming down to the specific developments of 1953 and 1954, we find employment in manufacturing and allied activities showing the greatest fluctuations. For the year 1954 as a whole, the number of employees declined by a net of 1.4 million from 1953. Most of this decline (1.2 million) was in manufacturing. About 300,000 was in mining and transportation which are closely associated with manufacturing. On the other hand, the industries which have been expanding since the end of World War II either held their own or continued to make small but significant gains. There was an increase of about 170,000 employees in finance and services and government combined.

The annual averages which I have been using are excellent for revealing the long-term movements and general levels. They obscure the contours, however, the ups and downs within the year. Manufacturing employment, for instance, reached a low point on a seasonally adjusted basis in late summer and has been rising since.

The crux of the present employment situation, obviously, is manufacturing, especially hard-goods manufacturing, where the number of jobs is still well below earlier levels, although the trend now is upward. Previous peaks, I must emphasize, are not necessarily meaningful goals in any sense of the word. When hostilities broke out in Korea, for instance, when we were anxious to rebuild our defense economy in a hurry, there was a lavish hiring of manpower in anticipation of needs, some of which never actually materialized. As a result, the metal goods industries increased employment very sharply in the first 8 months after the Korean outbreak, and then made no substantial gains thereafter until the upturn which began in the fall of 1952.

The bulge in employment levels, starting at that time and continuing until the downturn in mid-1953, was not the result of a normal and orderly flow of demands. Instead, the increase resulted from a series of special developments, all of which came to a head almost simultaneously. Pent-up consumer demand was released by the removal of credit restrictions in May 1952, but the effect was delayed by the steel strike in the summer and thus was concentrated in the final months of 1952 and early 1953. Relaxation of materials controls in late 1952 gave an added fillip to demand. Coinciding with this great surge of consumer demand, the defense production expansion reached its culmination in early 1953, at the very same time that business outlays for new plant and equipment also were rising rapidly as a result of long-range plans.

The current levels of durable goods employment (December, seasonally adjusted) are as high as in any postwar month before early 1952. This is not to say that the present levels are optimum or desirable. But I do want to point out that the peaks from which we descended were abnormal in the sense of a smoothly functioning economy whose major impetus is an orderly flow of consumer and investment demand.

During the final months of 1954, there was increasing strength in the nondefense sectors of the economy. Manufacturing employment was better sustained than could be expected for the season. Trade, commerce, finance, and government, especially State and local government, were at high levels and there is every reason to anticipate continued growth in these types of employment.

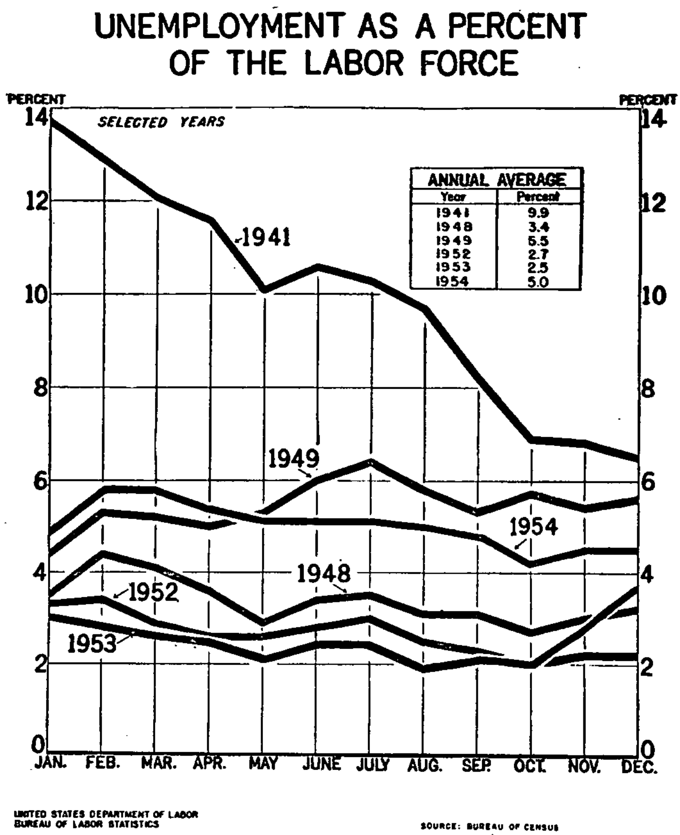
Hours of work

A more sensitive indicator of the current well-being of the nonfarm economy is the workweek. Hours of work began to fall in the spring of 1953, several months before the general downturn in employment. The year 1954 began with a substantial decline in the average factory workweek which brought the January figure below the 40-hour workweek for the first time since January 1950. The workweek began to rise in the spring of 1954, also several months before the recent employment upturn. By the end of the year factories were once again averaging a little more than 40 hours a week.

Because information on the workweek in American industry is such an important indicator of the general state of the economy and because it so often leads other economic developments, we expect to develop additional information on the extent of overtime hours and part-time work in American industry in this coming fiscal year.

UNEMPLOYMENT

The result of the business declines of 1953–54 was an increase in unemployment, which is portrayed in the next chart (chart 4), which shows unemployment as a percentage of the labor force. Because there is considerable seasonable variation in unemployment during the year, the chart shows the percentages on a month-by-month basis for certain selected years. Note that the rates are substantially higher for 1949 and 1954 (5.5 and 5 percent) than for the high prosperity years of 1948, 1952, and 1953 (3.4, 2.7, and 2.5 percent respectively). Note also that while the 1954 unemployment rate was higher than in 1949 in the early months of the year, it was lower throughout the second half of the year. We ended 1954 with approximately 2.8 million unemployed, or 4.4 percent of the labor force in the last quarter.



A certain amount of unemployment exists in any rapidly changing economic system. So long as we have free enterprise and free labor, there will be situations under which workers are laid off or, as often happens in prosperity periods, they voluntarily quit to look for better jobs. In boom years, such as 1952 and early 1953, the voluntary quits run some 2 to 3 times as high as layoffs. As soon as business begins to turn downward and jobs are less plentiful, quits fall rapidly as layoffs increase. So the total separation rate often remains high under both conditions.

The other side of labor turnover is the accession rate. In times of expanding employment, the hiring rate goes up—not only to add to staff but to replace quits. Conversely, in times of business contraction the employer does not try to replace all the workers who leave. Nevertheless, at all times, even in deep depressions, some hiring is going on.

This constant turnover of jobs necessarily results in some workers being out of work for certain periods of time, even if the employment level is stable or rising. If employment conditions are good, the length of unemployment for individual workers will be short; it does not take long for a worker to find a job.

In this past year, the Census Bureau reports that the number of persons experiencing long-duration unemployment (15 weeks or more) reached a peak of 1 million in the spring. This figure has been declining since then, and the year ended with a total of 700,000 long-term unemployed—about one-third less than at the 1954 peak.

The same general developments are shown by data from the Department of Labor's Bureau of Employment Security which indicates a decline during the latter part of the year in the average duration of joblessness among persons receiving unemployment compensation.

There is one more aspect of unemployment which should be carefully noted. In a gross figure of, say, 2.8 million unemployed, there are many different kinds of workers. At one extreme there are heads of families in the prime of life, experienced workers whose unemployment has the most serious consequences for themselves and their families, as well as for the Nation's economy. At the other extreme, the unemployed person may be a worker who never works more than part-time and who voluntarily leaves the labor market from time to time. Ranged in between are men and women of all age groups and with varying attachments to the labor force. Some people work only during the summer months, others over the period of Christmas trade.

Thus, of the 2.8 million unemployed in December 1954, as many as 1¼ million, or 40 percent, had become unemployed only since November. These people—2 out of every 5 unemployed persons in December—had been seeking jobs for 1 month or less. Moreover, not all of these short-term unemployed had lost jobs during the month. Of the 1¼ million in this category, 350,000 had moved into unemployment from keeping house, going to school or some other activity outside of the labor force. The remainder had been working in some farm or nonfarm job the previous month.

During the very same time (between November and December) a large group of persons moved out of the unemployed category. In fact, the number leaving unemployment (1⅓ million) was as large as the number moving into unemployment status (1¼ million). Of those who left the ranks of the unemployed, some 800,000 found jobs and about 500,000 withdrew from the labor force.

Despite these figures I have given, we know much too little about the unemployed—their industrial attachment, their previous service in the labor market, their age, sex and other characteristics. The Department of Labor is now planning to expand its program of current statistical reports and analytical studies of the unemployed. We need more information from time to time on where unemployment is developing, in what locations and from what industries, on the composition of the unemployment load at any one time, and particularly on the characteristics of those workers who are outside the unemployment compensation system, either because they have exhausted their benefit rights or have not been covered under the system.

No matter what the level of unemployment may be, this last group is a matter of serious concern. It is among this group that skills are being lost and morale is being destroyed by prolonged unemployment and destitution. Apart from all other community or Government programs designed to create jobs, there ought to be special effort made to meet the needs of these particular individuals for whom unemployment has such serious consequences, whether in good times or in bad.

So far as the immediate future is concerned, the outlook, apart from seasonal factors, is improving. The turnover data from the Bureau of Labor Statistics show that accession rates have been rising in recent months, as I indicated earlier. Layoff rates have been declining. The hours of work in factories have lengthened. In December, factory employment held steady although it usually drops.

Due to seasonal factors, however, there is almost certain to be a sharp increase in unemployment during the winter months. The heaviest unemployment of the year usually occurs in January and February. Thereafter the spring revival in agriculture, construction and other industries normally produces jobs which again reduce unemployment. As we have already indicated, the year 1954 ended with a total of 2.8 million unemployed. Starting with that figure, for December, here is what the unemployment picture would look like during 1955 if seasonal changes were the only factors operating during the year.

TABLE 1.—*Volume of unemployment in 1955 if seasonal influences were the only factors operating during the year*

[In millions]

January	3.5	July	3.3
February	3.8	August	2.8
March	3.5	September	2.7
April	3.1	October	2.5
May	2.8	November	2.8
June	3.4	December	2.8

This, of course, is not a forecast of unemployment. I have introduced it only to emphasize the marked effects of seasonal factors on the level of unemployment.

Thus, in sumary, the recovery of this autumn and winter has reversed the downtrend in employment and there has been considerable improvement in the labor market. There remain, of course, areas and industries in which unemployment is serious. The extent of the recovery and of the absorption of the potential additional workers will depend upon a number of factors which other members of this panel will analyze.

STATEMENT IN RESPONSE TO FOUR QUESTIONS ON THE ECONOMIC PHILOSOPHY AND FACTS UNDERLYING THE PRESIDENT'S ECONOMIC REPORT

(By Gerhard Colm, chief economist, National Planning Association)

Question 1. What are the facts respecting population growth, labor force, employment, unemployment, layoffs, part-time employment, productivity, production, private investment, consumption, Government demand for goods and services, and savings since 1952?

The following appear to me as the most important facts respecting the American economy since 1952:

1. Defense expenditures dropped sharply between the second quarter of 1953 and the fourth quarter of 1954. Federal purchases of goods and services for national security declined from their peak of $54 billion (annual rate) in the second quarter of 1953 to about $40 billion in the fourth quarter of 1954. We estimate that private defense-supporting investments, measured by facilities put in place under the rapid tax amortization program, declined in the same period from about $6 billion (annual rate) to perhaps $2 billion. Thus, over a period of a year and a half, the annual rate of public and private demand connected with the national-security program declined by about $18 billion.

2. During this same period of a year and a half the productive capacity of the economy has increased. Allowing for a normal rate of inventory accumulation, I believe that aggregate "final demand" would have had to increase by about $12 billion if we were to have had a satisfactory level of employment in the final quarter of last year. This is a conservative opinion which assumes that we had something like overemployment in the second quarter of 1953.

3. To maintain a satisfactory level of employment, a large increase in nondefense demand would have been needed—to offset the decline in defense demand and to absorb the potential output from the increase in productive capacity. Using the above estimates of $18 billion and $12 billion respectively, this would have required an increase in private and public nondefense demand of about $30 billion.

4. The increase in nondefense demand which actually occurred was not sufficient to bring about a satisfactory level of employment by the final quarter of last year. An increase of about $16 billion, or a little over half of the needed increase, took place. (This figure again excludes the change in the rate of inventory accumulation.) The rate of consumer buying went up by about $7 billion, residential construction by about $3 billion, business investment in plant and equipment other than for defense by about $2 billion, and State and local purchases by about $4 billion.

It appears that we have accomplished a little over half of the transition from full employment with a defense buildup to full employment with a continuing cold-war preparedness program. That we have accomplished this degree of adjustment is a cause for great satisfaction. It proves the vitality of our economic system. On the other hand, it is important to recognize that about one-half of the needed transition still remains to be accomplished.

Basis of figures used in reply to question 1:

Annual rates of expenditures

[Billions of dollars]

	2d quarter, 1953, actual	4th quarter, 1954		Change	
		Actual	Full employment	Actual	Needed
Defense expenditures:					
Federal	54	40	40	−14	−14
Private	6	2	2	−4	−4
Total defense demand	60	42	42	−18	−18
Final nondefense demand	305	321	335	+16	+30
Total final demand	365	363	377	−2	+12
Inventory change	+5	−2	+3	−7	−2
Gross national product	370	361	380	−9	+10

Question 2. On the basis of economic developments since 1952, how would you classify calendar year 1954 in respect to the four phases of the business cycle identified in the earlier volumes of the National Bureau of Economic Research—as expansion, recession, contraction, and revival?

If I understand correctly the terminology used by the National Bureau of Economic Research in describing business cycles, "expansion" and "contraction" refer respectively to the upswing and downswing; a "recession" is the transitional phase between an expansion and a contraction; and a "revival" is the transitional phase between a contraction and an expansion.

On this basis I would say that a recession occurred early in the second half of 1953, followed by a contraction which extended through the first half of 1954. A revival occurred early in the second half of 1954 and we are at present in the expansion phase of the cycle.

In addition, the national bureau uses different terms for a different intensity of the movement. A severe recession was called a crisis, a severe downswing a depression. These latter terms would not apply to the events of the year 1954.

Question 3. What purpose, in terms of carrying out the objectives of the Employment Act, is served by defining the needed levels of employment, production, and purchasing power, and for how far ahead should they be defined?

The Employment Act was designed to aid in the growth and stability of the economy and of the social system of competitive enterprise.

It states that it is the policy of the United States Government to use all practicable means, within the conditions of the act, to promote "maximum employment, production, and purchasing power." In simple language, this means satisfactory levels of employment, production, and purchasing power.

The act tacitly recognizes that satisfactory levels cannot be ascertained by reference to the past. It prescribes that the President's Economic Report should set forth the needed levels and also a program for carrying out the policy declared in the act—in effect, for reaching the needed levels.

In a period of rapid increase in the labor force and in labor productivity, it makes a great difference whether existing levels of employment, etc., are evaluated against past levels or needed levels. For instance, by comparison with the past one can come to the conclusion that 1954 "will go down in history as one of our most prosperous years" (President's Economic Report, p. 11). By comparison with needed levels, it becomes apparent that 1954 was a year in which production was about $20 billion below a level corresponding with satisfactory employment.

The wisdom of the forward-looking philosophy of the Employment Act was most dramatically demonstrated when in 1950 a large defense program was under discussion. Those who measured the effect of the proposed defense program against the past came to the conclusion that it would necessitate a drastic curtailment in consumption; those who measured it against the growing potential recognized that a rise in the defense program plus some rise in the levels of consumption and investment would be feasible.

It is perhaps the most encouraging fact in our modern economy that business managers are increasingly adopting the same sort of forward-looking point of view in their investment planning. Thus, I believe that the work done by the Council of Economic Advisers, by the joint committee, and by private research groups in implementing the provisions of the Employment Act not only results in more adequate Government policies but also aids business planning and thereby reduces the burden of the Government's stabilization job.

The fact that last year's Economic Report did not posit needed levels of employment, production, and purchasing power caused considerable disappointment. This year's Economic Report takes a step in that direction though it falls short, in my judgment, of what was envisaged in the Employment Act.

With respect to the time period for which needed levels of employment, production, and purchasing power should be projected, the Employment Act is silent. The National Planning Association made a recommendation in this respect in a unanimously adopted joint statement by members of the various committees (board of trustees, agriculture, business, labor, and international committees) who were present at the recent annual meeting. It recommended that the Joint Committee on the Economic Report be renamed the Joint Committee on Economic and Fiscal Policy and consider projections of needed levels of employment, production, and purchasing power extending over a number of years together with a budget outlook covering the same number of years.

In general, it may be said that it is important to give benchmark projections for 5 or 10 years ahead, but it is equally important that projections be presented regularly for the immediate future. We need goals but also a consideration of the path that promises to load to these goals.

Question 4. What are the implications of recent trends and present indications for employment, unemployment, hours of work, productivity, total production, private investment, levels of consumption, Government demand for goods and services, and savings for the coming year?

The rise in economic activity during the last 3 months is most encouraging. If the same rate of growth should continue over a period of a year or two, it would bring us to a full employment level.

The economic report expresses this hope (p. 24) but does not state whether the factors responsible for the current upswing are likely to continue or what other factors are likely to come into play. The biggest single change which occurred between the third and fourth quarters of 1954 was the reduction in the rate of inventory liquidation. The first quarter of this year may well see a change from liquidation to accumulation of inventories. This suggests a continuation of the present expansion for several more months. Of course, each expansion creates its own markets—to some extent. However, we cannot rely on this factor to support expansion for more than a short period of time. Inventory liquidation did not cause a spiraling deflation—correspondingly we cannot expect the end of inventory liquidation in itself to cause sustained expansion. It is true that an increase in production creates an increase in employment and in earnings and spending. However, employment does not rise quite in proportion to production because labor output per man-hour continually increases. This is borne out by the experience of the recovery movement in 1949–50 and also by the experience of recent months.

Perhaps the most important fact of the current economic scene is that industrial production (in manufacturing and mining) was in December 1954 3 percent above the previous December while employment in these industries was 4 percent, or 800,000, lower. In the construction industry the number of employed workers was about 3-percent lower although construction activity rose substantially. It is true that labor income as a whole has remained about the same as it was a year ago because wage-rate increases made up for the decline in employment. However, the fact that consumption actually increased in the face of the recession was mainly due to tax reductions and a rise in unemployment compensation and other social-security payments. Thus, we have no assurance that the current expansion by itself will generate the markets needed for continued expansion.

Looking ahead a year or so, it appears that business investments in plant and equipment will most likely move on an even keel. Government activities also promise to move on an even keel, at least until the new road-construction program and school-construction program which are recommended in the President's message get underway. The outlook for consumer buying is good. Consumer attitude surveys and observations of the retail trade indicate that consumers think it is a good time to buy. Also, the rise in residental construction will help in lifting purchases of furniture and household equipment.

Many of these purchases will be financed by installment credit which is rising again. Thus, even though some of the facors presently making for expansion are of a temporary nature, other factors may life total activity in the year 1955 above the 1954 level.

However, we should remember that an expansion which would bring us close to a full employment level by the end of the year would necessitate an increase in consumption of about $20 billion (annual rate). Even a quite optimistic evaluation of the expansionary factors which are now foreseeable does not make such a rise appear likely unless one assumes that further policies designed to promote expansion, and particularly to expand consumers' markets, will be adopted.

Considerations like these led the NPA group to which I referred before to recommend that Government measures for increasing consumer purchasing power to the extent necessary should include:

"Further reduction in taxes, particularly those affecting consumption; and further improvements in social-security legislation.

"Acceleration of badly needed public undertakings, including construction of roads, schools, and hospitals.

"Further measures designed to facilitate the purchase and renovation of homes, urban and rural; the modernization of farms and farm equipment; and the improvement of diets of low-income groups.

"Among possible non-Government measures for maintaining purchasing power, we consider the most important to be a rise in wage rates and a reduction in prices in accord with increases in productivity."

Statement to the Joint Committee of the Economic Report on the Outlook for Private Investment With Special Reference to New Industrial Plant and Equipment

(By Dexter M. Keezer, vice president and director of the department of economics, McGraw-Hill Publishing Co., Inc., New York City)

My special assignment as a member of this roundtable is to discuss the outlook for that segment of gross national product represented by private investment. It is that segment which includes new industrial plant and equipment, additions to business inventories, new residential, commercial and other private construction, farm equipment and equipment and vehicles for use by doctors and other professional men.

It is only the outlook for that part of private investment represented by new industrial plant and equipment which I have any special competence to discuss. This competence grows out of the fact that, in my department of the McGraw-Hill Publishing Co., we make surveys of plans for new industrial plant and equipment. We also maintain a monthly index of new orders for machinery, which reflects the new business obtained by suppliers of new equipment. Our latest checkup on business plans was made in October 1954, with a partial recheck earlier this month (January). Our latest index of new orders is for December 1954. Except in this special field of new industrial plant and equipment, my comments on the outlook for private investment simply represent my roundup of estimates made by those whom I believe to be competent authorities.

New industrial plant and equipment accounted for $21.8 billion of an estimated $46 billion of gross private domestic investment in 1954. (This $21.8 billion includes only outlays charged to capital account, except in the oil industry, where all expenses of drilling oil and gas wells have been included. Certain other outlays charged to current account are included in estimates of private domestic investment but are not included in the plans reported by companies in our surveys.)

It now appears that industry is planning to invest very close to the same amount in new plant and equipment in 1955 that it did in 1954. This conclusion is based primarily on an extensive check on the plans of manufacturing, mining, transportation, and utility companies which we conducted in October 1954. This check showed that industry (as represented by the above categories) had preliminary plans to spend $20.7 billion on new plant and equipment in 1955, or within 5 percent of the 1954 total.

Here is a table which shows the principal results of our checkup. The full details are attached as an appendix.

Industry's plans for capital spending in 1955

[Millions of dollars]

Industry	1953, actual [1]	1954, estimated [1]	1955, planned	Percent change, 1954–55
All manufacturing	$10,026	$9,249	$8,598	−7
Petroleum industry	4,600	4,875	4,920	+1
Mining	506	380	311	−18
Railroads	1,312	851	769	−10
Other transportation and communications	2,954	2,922	2,640	−10
Electric and gas utilities	4,548	4,274	[2] 4,206	−2
All industry [3]	23,271	21,784	20,727	−5

[1] U. S. Department of Commerce; Chase National Bank; McGraw-Hill department of economics.
[2] Electrical World, American Gas Association.
[3] Petroleum refining, included under both manufacturing and petroleum, is included only once in the total.

When these figures were first made public, many persons expressed surprise that the indicated decline for 1955 was so small. However, I think we may be reasonably confident that if present plans are carried out expenditures on new plant and equipment in 1955 will actually come very close to 1954, as indicated.

During the 7 years that we have been taking these surveys, they have proved remarkably accurate in indicating the trend of investment for the year ahead. Actual investment has been within 4 percent of plans reported by the survey in every year, except 1950, when all plans were altered by the Korean war.

We do not conclude from this experience, however, that we have a sure-fire forecasting instrument. We recognize that—

The years during which the surveys have been conducted have, with two brief interludes, been boom years and years when there has been specially heavy demand for capital goods.

The surveys of plans have never been through the test of a severe recession or depression.

The investment performance of individual industries has sometimes missed the mark indicated by the survey of plans considerably further than the investment performance for industry as a whole. We haven't had enough experience to know whether we can confidently expect the errors in individual industries to cancel out as well as they have thus far.

Until the surveys are tested by a lot more experience we are reserving judgment on their forecasting value. In the meantime, we claim nothing for them except as a report of recent plans. Instead we heavily emphasize the proposition that our survey reports potential capital investment and is no promise of what is actually going to happen.

All of our earlier surveys were made in January and February of the year for which plans were reported. This year, in an effort to provide early information we have made this preliminary check in October. We do not yet know whether plans reported as early as October will always prove to be as accurate as plans reported later. For a more conclusive indication, we must await the regular McGraw-Hill survey and the annual survey conducted by the United States Department of Commerce and Securities Exchange Commission, to be made in February.

However, a recheck of larger companies participating in the October survey, which we have just made in the past 2 weeks, indicates that any large revisions to date have been upward. Some increases have also been indicated by public announcements of plans.

Most of the upward revisions we have noted are in manufacturing. There have been some upward revisions in the field of "other transportation and communications." In the utility field, our magazine Electrical World has now completed a more comprehensive survey covering about 95 percent of the electric power industry, in terms of present capacity, and finds little change from the October estimates.

An improved outlook for investment in new industrial plant and equipment since October is also confirmed by the improvement in the McGraw-Hill index of new orders for industrial machinery. For the last 3 months of 1954, the average of this index is 11 percent higher than in the last 3 months of 1953.

I would be glad to provide the committee with a detailed description of the McGraw-Hill new orders index if it is desired.

Finally an ample supply of funds available to finance plant and equipment expenditures at a high level appears to be in prospect. In 1955, depreciation funds alone will amount to approximately $14 billion for all nonfinancial corporations. This is over 60 percent of planned expenditures for new plant and equipment, adjusted to a corporate basis. There is the benefit that in 1955 earnings after taxes will be somewhat higher than in 1954; and the position of security markets gives promise of being favorable for new issues. Thus, for corporations as a whole the realization of present plans does not seem threatened by financial obstacles.

From all this information, it seems probable that industry's expenditures on new plant and equipment will be within 5 percent of 1954, as indicated by our October survey, and may very well show no decline at all. Moreover, as indicated by the behavior of the new orders index, the rate of these expenditures is likely to increase as the calendar year 1955 goes on. This is the most important single phase of the outlook for private domestic investment, since industrial plant and equipment accounts for almost half of all domestic investment, and is far larger than any other item in the total.

I now turn briefly to a discussion of the other investment sectors:

RESIDENTIAL AND COMMERCIAL CONSTRUCTION

The United States Departments of Labor and Commerce have jointly made a forecast that in 1955—

Expenditures for residential construction of all kinds will be 13 percent higher than it was in 1954 (about $15 billion as compared to about $13.5 billion); and

Expenditures for commercial construction of all kinds will be 7 percent higher than in 1954 (about $2.3 billion in 1955 compared with $2.16 billion in 1954).

Several private agencies have made comprehensive forecasts of construction activity in 1955. All of them indicate an increase this year. Recent statistics on contract awards, which lead actual construction by some time, lend support to the expectation that construction activity will carry on into 1955 at a high level. For the last 3 months of 1954, contracts for residential and commercial construction collected in the 37 Eastern States by the F. W. Dodge Corp. were substantially higher than they were for the same period in 1954 ($1,979 million compared to $1,772 million).

Contract awards for new residential and commercial construction, as compiled by Engineering News-Record, are at the highest level since this series was started in 1925. For the months of October, November, and December, 1954, these awards totaled $1,428 million, compared with $950 million in the same months of 1953. The recent awards data indicate that the value of construction for some months ahead will be well above the same period in 1954.

The contract award figures compiled by Engineering News-Record cover only large-scale projects, with a relatively long construction time span. They do not cover smaller commercial projects or construction of individual homes other than that by mass builders. Where the construction time span is shorter, as in the case of small-scale construction of individual residences, activity is subject to relatively rapid change. Some experts in this field are fearful that the present state of home building cannot be sustained through 1955 without creating widespread vacancies and thus prompting a reduction of activity. However, there seems to be general agreement that for the year 1955 as a whole the volume of residential construction will exceed that of 1954.

FARM EQUIPMENT

This is not a field we follow closely. I have merely noted the forecast of the Department of Agriculture that purchases will be about as high in 1955 as in 1954 (The Farm Cost Situation, U. S. Department of Agriculture, 1955 outlook issue. October 1954).

INVENTORY

For the past year, business has not been adding to its inventories. It has been drawing them down, and this component of investment has been negative by about $4 billion. The latest figures published by the Department of Commerce show that this rate of decline continued through the third quarter of 1954.

As to what happened in the fourth quarter, we can only guess. It is our impression from conversations with businessmen that the desire to reduce inventories has been substantially less in recent months. In some industries, there have evidently been attempts to rebuild stocks to a level more consistent with the increased volume of business. However, sales have been higher than many people expected; and, on balance, it seems entirely possible that total business inventories were again reduced in the fourth quarter.

Since this seems to have been involuntary in many cases, and since many producers now claim that inventories are low in relation to expected sales volume, we think it probable that there will be some addition to business inventories in 1955. The change from a substantial negative to even a moderate positive figure for this component would mean an addition to private domestic investment.

CONCLUSION

Considering the overall outlook for investment, which includes plant and equipment, residential and commercial construction and inventories, our study of these categories leads us to expect some increase in 1955 over 1954, and a rising trend throughout the calendar year 1955. The tables below are intended to illustrate this trend. Estimates for the fourth quarter of 1955 are included to be as helpful as possible indicating the prospective situation in the Government's fiscal year 1956. The figures are not presented as precise estimates, but to indicate the general magnitude of investment demand, based principally on our own surveys of business plans. In the other sectors, we have simply tried to reflect other expert opinion and to be conservative.

Private domestic investment

[Billion dollars]

	1953 actual	1954, estimated	1955, estimated	1955, 4th quarter annual rate, estimated
New industrial plant and equipment [1] (covered by McGraw-Hill survey)	23.3	21.8	20.7	21.2
Other nonresidential construction and equipment [2]	14.7	14.3	14.9	15.0
Residential construction	11.9	13.3	14.1	13.7
Change in business inventories	1.5	−3.4	2.3	3.0
Gross private domestic investment	51.4	46.0	52.0	52.9

[1] Includes all expenditures charged to capital account and current account expenditures of the oil industry ($600 million in each year).

[2] Current account expenditures of all other industry, commercial plant, and equipment, farm construction and equipment, professional automobiles and construction of private schools, hospitals, churches.

APPENDIX

SUMMARY OF THE OCTOBER 1954 M'GRAW-HILL SURVEY OF BUSINESS PLANS FOR NEW PLANTS AND EQUIPMENT

Industry now plans to spend $20.7 billion on new plants and equipment in 1955, compared to an estimated expenditure of $21.8 billion in 1954. Manufacturing companies plan to spend $8.6 billion for new plants and equipment next year—7 percent less than in 1954. Mining, electric and gas utility, railroad and other transportation, and communications industries also expect to reduce their capital spending in 1955. But petroleum companies now plan to increase capital spending slightly next year.

Survey results indicate that capital spending by manufacturing companies may level off in 1955, ending the decline that started late in 1953. A majority of manufacturing companies now expect to invest as much in 1956 as in 1955, and about as many companies plan to increase capital spending in 1956 as plan to reduce it.

Capital spending in manufacturing

Companies in most of the major manufacturing industries report plans for a somewhat lower level of capital investment in 1955. Increases are indicated for only two of the major categories of manufacturing—primary metals, up 1 percent, and miscellaneous manufacturing, up 5 percent. Miscellaneous manufacturing includes lumber, apparel, furniture and other industries not covered by the other major manfacturing classifications. Most of the declines expected in major manufacturing groups are small; textile companies plan to reduce capital spending by 1 percent, chemical processing firms by 2 percent, food and beverages by 10 percent. The only large decline expected for a major manufacturing group is in metalworking—17 percent (table I).

A much wider range of plans appears when these major industrial classes are broken down into smaller parts. Within chemical processing, for instance, stone, clay, and glass companies plan to increase their capital spending by 23 percent in 1955, whereas chemical, paper, rubber, and petroleum-refining companies all expect lower capital expenditures. Plans in metalworking range all the way from an increase of 9 percent for "other metalworking"—including instruments, fabricated metal products, and ordnance—to a tremendous decline of 40 percent for the automobile industry. Automobile companies invested an estimated record $1,350 million last year, bue expect to cut that sharply to $811 million in 1955. The 1954 figure included unusually high expenditures for new tools and body dies in connection with model changes at all major companies. This type of expenditure will not be repeated in 1955. (Note: This is a field in which revised programs may eventually bring 1955 expenditures closer—but not up to—1954.)

End of the defense boom?

There are clear signs in the survey results that the post-Korea boom in defense industries no longer has a major effect on their capital spending. Most of the manufacturing industries that expanded rapidly in connection with the defense expansion programs of 1951–53—steel, nonferrous metals, machinery, electrical machinery, chemicals, petroleum refining, transportation equipment—cut their capital expenditures fairly sharply in 1954. Next year, most of them plan to reduce capital spending by less than the average for other, nondefense industries. There are exceptions to this rule. But, in general, capital expenditures by the defense industries show a tendency to level off after coming down from the peak of their defense expansion.

Plans in other industries

The petroleum industry is the only major nonmanufacturing industry fully covered by this survey that anticipates a higher level of capital spending in 1955 (table II). Petroleum companies report plans to spend about 1 percent more for new plants and equipment in 1955 than in 1954. This is because they expect to increase capital spending for crude-oil production by 7 percent, to $3,473 million. Capital expenditures for refining and transportation of petroleum and petroleum products are expected to decline.

Present plans call for a reduction of 18 percent in capital expenditures in mining. The decline is mainly in coal mining—where planned investment is off 40 percent, to $121 million. Capital spending for iron mining, other than taconite, is expected to decline by 13 percent. Companies are putting more of their investment into taconite developments and iron ore developments outside the United States. (No figures on these are yet available.)

In nonferrous mining, where expenditures dropped sharply in 1954, present plans call for spending 17 percent more next year. This may reflect more favored tax treatment, as well as improving market conditions, and a special factor in the uranium boom.

Railroads, which cut capital spending sharply in 1954, expect to reduce it by another 10 percent in 1955, to $769 million. Other transportation and communications industries—shipping, trucking, airlines, telephones—also expect a cut of 10 percent, to $2,640 million. The electric and gas utilities plan a small reduction of 2 percent in their outlays for new plants and equipment in 1955.

The McGraw-Hill survey does not regularly cover the majority of commercial establishments, which account for almost one-quarter of business' capital expenditures as reported by the United States Department of Commerce. However, this year a limited sample of major chain and department stores was included on a trial basis. The result indicates that their capital expenditures will be substantially increased in 1955 over the 1954 level. Because the sample was small, this figure has not been included in the overall statistics presented in this report. But it can be regarded as a favorable element.

End of decline in sight?

Results of the survey indicate that capital spending by manufacturing companies may level off in 1955, ending the decline that started late in 1953. The majority of manufacturing companies—57 percent—now expect that they will spend about as much for new plants and equipment in 1956 as in 1955. The number of companies that expect to increase capital spending in 1956—21 percent—is about the same as the number that expect to cut it—22 percent. (See table III.)

Plans for 1956 are, of course, highly tentative. But past surveys have indicated that companies are inclined to underestimate their capital spending for more than 1 year in advance, so the response to this survey is distinctly favorable to the prospect of capital spending by manufacturers at a level at least as high in 1956 as in 1955.

A somewhat larger proportion of companies in nonmanufacturing industries currently expect to cut their capital spending in 1956. About 25 percent of companies in the mining business think that they will reduce capital spending in 1956, while 16 percent expect to increase it. About one-half the railroads and 57 percent of the other transportation and communications companies now think they will reduce capital spending in 1956. But as many petroleum companies expect to increase as cut it. Taking all industry together, more than one-half—55 percent—of companies now expect to spend about as much for new plants and equipment in 1956 as in 1955, while 21 percent expect to increase capital spending, and 24 percent to cut it down.

How the survey is made

Companies cooperating in the survey employ more than 60 percent of all workers in the group of industries where capital spending is highest. Coverage in other industries is not so complete, but companies are carefully chosen to represent an accurate cross section of their industry. Companies in the survey employ between one-quarter and one-third of all the workers in industry.

The estimate of capital spending by electric utilities was supplied by Electrical World. The American Gas Association provided figures for gas utilities. Correspondents for Business Week personally interviewed many company executives, and other McGraw-Hill magazines helped in conducting the survey in their own fields.

TABLE I.—*Capital spending plans of manufacturing companies for 1955*

[Millions of dollars]

Industry	1953 actual [1]	1954 estimated [1]	1955 planned	Percent change 1954–55

[1] Compared with 1955.

STATEMENT OF WILLIAM F. BUTLER, CONSULTING ECONOMIST, THE CHASE NATIONAL BANK

Question 1. What are the facts respecting population, growth, labor force, employment, unemployment, layoffs, part-time employment, productivity, production, private investment, consumption, Government demand for goods and services, and savings since 1952?

Since I assume that other members of this panel will deal with specific trends in the items listed, I shall confine my remarks to overall economic developments.

It seems to me that the best way to characterize what has been happening to the economy in the past 2 years is in these terms: "The economy has been coping vigorously with the problem entailed in shifting from a defense boom to a more normal prosperity."

National security expenditures more than tripled between 1950 and the second quarter of 1953—when they reached a peak rate of $54.3 billion. In the final quarter of 1954, national security expenditures were down to a rate of $40.6 billion. That's a drop of $13.7 billion in a year and a half. And $10 billion of the drop came during 1954.

The widely advertised inventory readjustment in 1953 and 1954 was to a considerable extent a result of the sharp decline in defense outlays. The shift from building inventories to cutting them placed a $10.2 billion drag on the economy (as measured from the second quarter of 1953 to the third quarter of 1954).

Consequently, the truly remarkable fact is that the 1953–54 recession was one of the mildest on record. In face of a $24 billion decline in national security expenditures and inventory buying, gross national product dropped only $14.4 billion from top to bottom. That's a real tribute to the resiliency of the private economy.

A second significant point about recent economic trends is this: the curve of business activity turned up smartly in the fourth quarter of last year. Total activity recovered in 3 months over one-third the ground lost in the preceding 15 months.

The upturn was not only vigorous but also broadly based. If you run through the catalog of economic statistics, you'll see that the vast majority of series was moving up in strong fashion in the final months of 1954. In past recovery periods, upturns in various areas of the economy were spread over a considerable period. This time almost everything—production, employment, man-hours, new orders, consumer expenditures, corporate earnings—moved up at once.

A third significant fact—of which I am sure much will be more this morning—is that the current level of economic activity is below the economy's potential. Gross national product is $10 billion to $15 billion below the joint committee staff's estimate of potential output. But, as I just attempted to demonstrate, business activity is moving up.

Now, it seems to me that there are a number of other important trends discernible in recent experience. To save time I'll merely list them:

(1) Consumer markets have been showing increasing strength. The ratio of consumer spending to posttax income moved up from 91.4 to 92.8 percent during 1954. That's a seemingly small, but very significant, change. The University of Michigan's surveys of consumer buying plans also point upward—people's evaluation of buying conditions have increased from an index of 100 in September to October 1953 to 118 in October 1954.

(2) While private debt has risen rapidly in the postwar period, ratios of debt to income still seem reasonable. Thus, we seem to be in a position to handle a moderate rise in all types of debt.

(3) Stock market price averages rose more than 40 percent last year. As measured by past relationships to earnings and bond interest rates, common stock prices were very low when the rise began. At the end of 1954 they stood somewhat above their long-term relationship to these basic factors. However, common stock prices are not nearly so far out of line with earnings, dividends, interest rates and book values as they got in past periods that preceded a major break in the market.

(4) The recent surge in business activity was partly due to a very high level of auto production and construction of new homes. In both areas, current activity seems to be higher than basic demand factors would justify. In autos, the current high level of output is largely a seasonal phenomenon—it's the normal rush to get ready for heavy spring sales. And our statistics may be overstating the extent of the housing upsurge. Nevertheless, it's important to watch the housing market as the months go by.

To sum up: The record shows that the economy has successfully negotiated the difficult shift from a defense boom to a more normal prosperity. In the process, the decline in production and employment was remarkably moderate. And, in large part because of appropriately timed tax cuts, buying power in the hands of consumers and businesses was maintained at a high level. What is more, economic activity is on the upgrade now. When all the statistics are finally compiled, they should show a sharp upturn in production and employment in the fourth quarter of 1954. Thus, the economic atmosphere is clearing up rapidly.

Question 2. On the basis of economic developments since 1952, how would you classify calendar year 1954 in respect to the four phases of the business cycle identified in the earlier volumes of the National Bureau of Economic Research—as expansion, recession, contraction, and revival?

It seems to me that my earlier statement answers this question. Economic activity declined in the first quarter of calendar 1954, leveled out in the next two quarters, and turned up in the final quarter. I'm not sure that the National Bureau categories are fully adequate to describe a readjustment in which a massive decline in defense spending was the initiating factor. However, it seems to me that the evidence shows that we have been in the revival stage of the cycle since the fourth quarter of last year.

Question 3. What purpose, in terms of carrying out the objectives of the Employment Act, is served by defining the needed levels of employment, production, and purchasing power, and for how far ahead should they be defined?

In my opinion, projections of past trends in employment, productivity, production and consumer and business purchasing power are invaluable for analytical purposes. You need to know what the economy's potential is in order to understand where you stand at any given time.

Having said this, let me now stress the importance of interpreting all such projections most carefully. As one of my colleagues says: "These figures are fine so long as you don't believe them fully."

In interpreting such projections three things should be kept in mind:

(1) In the current state of the art of economic forecasting, there is a margin of error involved in all projections. I personally think the margin has been narrowing steadily—the more competent practitioners have come amazingly close to the bull's-eye in the postwar period. Nevertheless, most economists would agree that there should be a margin of tolerance of at least 5 to 10 billion dollars in all estimates of what gross national product will be a year in the future.

Moreover, all economic projections are based on a set of assumptions which are not always explicitly laid out. Some of the key assumptions are in some instances: No change in the international scene; no wave of speculative psychology; no prolonged and widespread labor-management disputes; no large shifts in Government monetary or fiscal policy. Economists generally say that changes in any of these assumptions require a reappraisal of the business outlook. However, those who are responsible for framing policy in a world as uncertain as that we now live in should keep a wary eye on the things that economists assume to be equal.

(2) A second point is that all projections of our economic growth potential are based on long-run trends. Yet in looking at the next year or two, short-run factors may be most important. As the saying goes: "In the long run we are all dead."

All this applies with greatest force to the assumption in these projections that productivity will rise at the rate indicated by its long-run trend. Now the record shows that productivity increases have been anything but regular. In some years there was little advance; in others productivity leaped ahead at more than twice the long-term average.

To make the point in specific terms, the growth in gross national product resulting from the long-term rate of advance in productivity amounts to about 9 to 9½ billion dollars each year at the present time. Suppose the Government were to adopt fiscal and monetary policies on the assumption that this amount of growth would be forthcoming and suppose no rise in productivity occurred. If there had already been reasonably full employment the result would be a large dose of inflation.

The point is that, in the present state of our knowledge about short- and long-term trends in productivity, we should treat projections with great caution.

(3) A third point about projections of our economic potential relates to the period that should be considered in formulating economic policies. We are below our potential now, but business activity is moving up. If the projections for the year ahead show that activity will continue to increase, should we take steps now to accelerate the advance? This is another way of asking how close we can expect to come in any given year to the ideal of continuous high-level production.

To sum up: I believe projections of the economy's potentials are an important and necessary tool. However, I believe they must be interpreted with great care, for reasons which I have attempted to explain. If they show a large gap between expected production and the potential—either on the side of inflation or deflation—then I believe economists should point this out and indicate what steps might be taken to close the gap.

58422—55——10

We have powerful weapons against both inflation and deflation. We can reduce taxes and make credit available if deflation threatens; and we can check an inflationary move by running a surplus in the Government budget and restraining credit. However, the area that lies between inflation and deflation may be much broader than most analysts suspect. When we are in that area, as I believe we are today, Government policies should be directed at encouraging the private economy's long-run growth potentials.

However, we need to be alert to economic developments. If, as the year progresses, it should become clear that the current rise in business activity will be short-lived, we should be ready to cope with the situation. If the area between inflation and deflation is fairly broad—say on the order of 15 to 20 billion dollars—there is elbowroom in which to operate. Thus, in the unlikely event that the private economy should need bolstering, we can apply the appropriate monetary and fiscal measures.

In this connection, I am intrigued by the suggestion of a number of economists that tax cuts designed to stimulate the economy should be made for temporary periods, for instance for a year. Thus, Congress would have the opportunity after some such period as a year to review the economic situation—if the economic winds had shifted to the inflationary side, the tax cut could be permitted to expire.

Question 4. What are the implications of recent trends and present indications for employment, unemployment, hours of work, productivity, total production, private investment, levels of consumption, Government demand for goods and services, and savings for the coming year?

As I interpret this carefully worded question it asks the panel members for their view of the business outlook in the coming year. I can sum up my answer this way: I believe 1955 will be a year of high-level activity and also a year of lively competition. I expect that gross national product will rise about 4 percent this year—and that's a good increase, even measured against the economy's performance in recent years. However, the economy has the capacity to turn out an even greater volume of goods—so competition for markets should be almost as intense this year as last.

For the benefit of those who like to see an economic projection laid out in neat numerical fashion, here is how the major components of gross national product seem to line up on the basis of a set of assumptions I shall set forth. (The figures I am about to give will be expressed in seasonally adjusted annual rates.)

With the information now at hand, it seems to me that you can project both Government expenditures, and private expenditures on fixed investment, with a reasonably high degree of assurance.

Government expenditures on goods and services should go up from $74.3 billion in the fourth quarter of 1954 to $77.1 billion at the end of this year. State and local governments will account for the $2.8 billion rise.

Next, private fixed investment should increase about $800 million. I would interpret the McGraw-Hill survey, plus trends in things like new orders, as pointing to no change in the level of business investment in new equipment. Construction is one of our strongest areas today. Though I suspect that homebuilding is running at a rate that exceeds basic demand, I still look for an increase of $500 million in total construction by the end of the year. And net foreign investment should show a $300 million plus. All in all, fixed investment should rise from $50.7 billion in the fourth quarter of 1954 to $51.5 billion by the final quarter of 1955. Thus, both the Government and private fixed investment areas promise to expand moderately this year.

Economists used to debate at length over trends in Government spending and private fixed investment. While the debate involved a lot of esoteric words, the two main issues were: First, what were business and Government plans for the period ahead; and, second, how would these plans be altered if business activity went up or down.

With the new tools available—a realistic Federal budget plus surveys of business investment plans—we can project these areas of the economy with a high degree of assurance. For instance, the Commerce Department's surveys of business plans to invest in new plants and equipment have come within 5 percent of actual results in the postwar period.

Moreover, there is good reason to expect that plans will remain resonably firm this year if business activity increases. The Federal budget assumes a 4 percent rise in disposable income. According to McGraw-Hill and Dun & Bradstreet surveys, businessmen are planning on an increase in sales.

In looking ahead of business trends, the difficult areas to protect—and at the same time, the most important ones—are inventories and consumer expenditures. And the key item is consumption, for there seems to be no reason to expect any important change in the ratio of inventories to sales. In other words, inventories will trail along with any change in sales.

Here is where we badly need better data, better statistics. We need more survey work—like the Michigan surveys of consumer buying intentions, some of which are financed by the Federal Reserve. And we need much more information on inventories.

Our lack of precise knowledge about these key areas can be dramatized by reference to Mark Twain. After listening to a series of estimates of the length of the Mississippi River, he marveled at the fascination of a science where one gets such wholesale returns of conjecture out of such a trifling investment of fact.

In that vein, here are my conjectures about consumer expenditures and inventories for 1955. Such meager evidence as we have—through surveys, recent trends, and analysis of past trends—seems to point to an increase in consumer spending. As a rough guess, the ratio of consumer spending to disposable income might rise from 92.8 percent in the fourth quarter of last year to around 94 percent late this year.

With income rising—in part because of the increase in consumer expenditures—that would mean a rise in consumer buying of about $8 billion. To keep inventories in line with this increase in sales, business would have to increase them by $2.5 billion. Clearly, trends in the consumer area will be of crucial importance in determining the level of general business in 1955.

Thus, under all the assumptions I have set forth, the numbers line up this way:

	Fourth quarter 1955	Fourth quarter 1954
		Billion
Government	$77.1 billion, up $2.8 billion from	$74.3
Fixed investment	$51.5 billion, up $0.8 billion from	50.7
Consumption	$245.5 billion, up $8.0 billion from	237.5
Inventories	Up $2.5 billion from	−1.5
Total	$376.6 billion, up $15.6 billion from	361.0

As I pointed out earlier, projections in such specific terms tend to exaggerate the precision that surrounds business forecasts. There seems to be no way to determine just what the margin of error may be. But, granted no changes in the international and domestic scene that cannot now be discerned, it seems to me that this can be said:

The odds are very high that gross national product in the fourth quarter of 1955 will stand somewhere between $370 and $380 billion.

Statement of Calvin B. Hoover

January 21, 1955.

Senator Paul H. Douglas,
Chairman, Joint Committee on the Economic Report.

My dear Senator Douglas: Herewith are my answers to your four questions as set forth in the sheet accompanying your letter of January 19:

Answer to question 1: The facts having to do with the subjects mentioned are in general as the are set forth in the President's report or in the reports of other governmental agencies available to the committee. I have no wish to dispute any of the data presented nor do I feel that I have other data to add to those available to the committee.

It is in the interpretation of the facts, the recommendations for action or for refraining from action and the timing of action, if any, that the factor of personal judgment enters.

For example when statistics show that personal saving continued high although diminishing slightly in 1954, what conclusions are we to draw from this? Should we conclude that if less had been saved less would have been available for investment in industry and more would have been consumed while total national income would have remained unchanged? Or should we draw the conclusion from the data that the maintenance of savings in proportion to consumer expenditures at as high a rate as that of 1954 was in itself a factor in limiting national income? This is only one exampleof what I mean by differences in interpretation of the facts.

Answer to question 2: We were apparently in a period of contraction during the first half of 1954. The national economy apparently definitely entered a period of recovery during the last quarter of 1954. The crucial and obvious question is whether this rate of recovery is great enough to carry us to the attainable trend line of annual increase in national product and whether we can in the future maintain this rate of production increase upon the basis of present economic policies.

Answer to question 3: The purpose of defining needed levels of employment, production and purchasing power is to provide benchmarks by which we can judge whether monetary, fiscal or other policies should be more or less stimulative, restrictive or merely stabilizing in their effects on the economy and thus to judge whether or not the objectives set forth in the Employment Act are being effectively pursued.

It is quite clear, I think, that we have the physical capability of increasing our gross national product by some 4 or 5 percent per year. This would mean, as outlined in the report of this committee's staff, that our gross national product 10 years from now would be some $530 billion, assuming substantially unchanged prices.

I think that it is useful to make successive 10-year projections of this sort in order to enable us to judge whether or not the general trend is in line with our potentialities. However, these projections would need to be supplemented by continuing annual studies in which new estimates of attainable levels of employment, production and purchasing power for periods immediately ahead would be made.

Particularly at a time when we are likely to need all our resources in our struggle with the Soviet tyranny either for the provision of means of armed defense or to keep our standard of living as much in advance of that of Soviet Russia as it now is, we cannot afford to let our national income lag substantially behind that which we are capable of achieving. Projections of the sort made by the staff of this committee are most useful in enabling us to do just that.

Answer to question 4: Recent trends do indeed show that the contraction which began in the second half of 1953 has been halted and that some recovery has taken place. We are, indeed, just approaching the levels of national-income productivity reached in 1953. The peak level of 1953 would not, however, be an acceptable goal for 1955. As I have pointed out, our failure to attain and maintain a trend rate of increase per annum of some 4 or 5 percent would be serious from the standpoint of our national security.

Unfortunately the statistical data which we have does not enable me to answer the really crucial questions in this connection with certainty and precision. These questions are: First, will consumer purchasing power, plus governmental demand for goods and services plus private and corporate investment be large enough to keep the productive forces of our national economy operating at their practicable capacity? Second, if the prospect is that "offsets to saving" will not be great enough to absorb all the saving which people would like to do if they were fully employed, what additional measures beyond those proposed in the President's report might be taken? Third, what should be the magnitude and timing of these measures?

The legislative measures proposed by the President appear well balanced in their design to encourage the expansion of business activity and of consumer purchasing power while attempting to balance the budget and to maintain a stable price level. It may well be that nothing more will be required to attain the desired rate of increase in our national income. If so, we can be devoutly thankful.

We must recognize, however, that we may have to make the hard choice between a further stimulus to business through decreased taxation or increased expenditures for national defense or other necessary expenditures and attaining a balanced budget. It is not easy to make such a choice. What makes the matter even tougher is that we cannot be certain as of this moment which our choice should be. There are no simple or precise statistical indicators to give us the answer. We can only look at the rates of increase in our working population, the rates of increase in productivity per man-hour, the expected increases in consumption and in saving and investment and then make our own estimate. Most of the really critical data upon which we must make our estimates, however, reflect the effects not of independent but of dependent variables. (For example, the volume of savings is dependent to a large extent upon opportunities for investment.)

If I had to make an estimate, mine would be that a greater stimulus to consumption and investment than is now apparent will probably be required if we are to attain and maintain the desired levels of increase in gross national product. But I would be less than honest if I did not point out that if my estimate turns out to have been wrong, Government policy based upon it would result in a further unbalancing of the budget accompanied by inflationary pressures. The evil most recently suffered seems to us always to be the worst. It is a major accomplishment to have attained the price stability which we now have. I fully realize that this stability should not be lightly jeopardized. Yet on balance I think a further stimulus to our economy is likely to be needed.

It should be noted that the successful implementation of the President's recommended policies and measures in the fields of agriculture and international trade are likely to depend upon the maintenance of adequate purchasing power in our domestic market. Trade not aid can be substituted for governmental grants-in-aid to foreign countries only if domestic purchasing power is available to take off the market the additional imports which are received in payment for our formerly unrequited, i. e., unpaid for, exports.

Similarly, we must depend upon the maintenance of substantially full employment in industry if we are to be able to avoid high and rigid price supports and comprehensive and complicated controls in agriculture and if we are to avoid the accumulation of burdensome agricultural surpluses.

Respectfully yours,

CALVIN B. HOOVER.

APPRAISAL OF THE ECONOMIC PHILOSOPHY AND FACTS UNDERLYING THE PRESIDENT'S ECONOMIC REPORT, 1955

ANSWERS TO PREPARED QUESTIONS AND GENERAL BACKGROUND MATERIAL PRESENTED TO THE COMMITTEE BY DR. HEINZ E. LUEDICKE, EDITOR, THE JOURNAL OF COMMERCE, NEW YORK

QUESTIONS TO ANSWERS PREPARED BY SENATOR PAUL H. DOUGLAS, CHAIRMAN, JOINT COMMITTEE ON THE ECONOMIC REPORT

Question 1. What are the facts respecting population growth, labor force, employment, unemployment, layoffs, part-time employment, productivity, production, private investment, consumption, Government demand for goods and services, and savings since 1952?

Answer. The statistical record for the period from 1952 to the start of 1955 shows a pattern from boom to superboom; the culmination of this trend by mid-1953; followed by a period of readjustment lasting until mid-1954; then a slow recovery start and a rather pronounced speedup in the recovery since late October 1954.

Significant features in this pattern were the turn from virtual full employment in the first half of 1953 (which was an overtime economy) to a level of unemployment of about 4 millions by early 1954. This was smaller than the unemployment peak in late 1949 and early 1950, but thus far unemployment has shown a marked degree of stickiness. It has not reacted promptly to the upturn in production. This is probably in part a byproduct of rising productivity.

The period also brought the culmination of the post-Korean plant expansion boom. For the past 2 years, plant and equipment expenditures have been gradually declining. The decline does not seem to be over as yet.

By mid-1953 it was evident once again that the then prevailing rate of industrial output was supportable only by substantial production for inventory. This was the second time since the end of World War II that inventories had become topheavy in the opinion of businessmen.

A $10 billion swing (annual rate) occurred from inventory accumulation to inventory liquidation, but at no time did the rate of inventory liquidation become panicky. Chief reasons for this were the continuing stability in the commodity-price level and the easy money market that did not make it necessary for banks to call inventory loans. By the same token, however, the inventory situation has not improved sufficiently to be regarded as an element of strength in the 1955 outlook. The current rush for some steel items and the appearance of a few scattered commodity-price increases probably are temporary repercussions of the speededup automobile boom.

The picture at the start of 1955 is characterized by the prevalance of buyers' markets in virtually all sectors of the economy: there is moderate pressure on commodity prices; likewise no inclination to add to inventories or to lengthen commitment ranges; finally, greater accent on productivity gains because of competitive pressures which discourage the translation of higher wages into higher prices.

Continued strong spots are construction and consumer spending both to a large extent dependent on continuation of the current high level of cosumers' confidence in the economic outlook.

Question 2. On the basis of economic developments since 1952, how would you classify calendar year 1954 in respect to the four phases of the business cycle identified in the earlier volumes of the National Bureau of Economic Research—as expansion, recession, contraction, and revival?

Answer. Any categorical classification of 1954 might be misleading. Looking at the 1953–54 pattern, certain similarities with 1948–49 are unmistakable. Both these periods started off with pressure to lighten inventories; neither did get much beyond the stage of a mild inventory recession, but in both instances the termination of the inventory liquidation was sparked by the injection of artificial (inflationary) stimulants. It is frequently overlooked that the Eisenhower administration in 1954 followed a quite aggressive policy of nudging business along, considering the cumulative impact of tax cuts, liberalized real-estate mortgage provisions, pronounced credit ease and a number of secondary steps.

Even so, the situation likely to prevail by mid-1955 should resemble the situation just prior to the outbreak of the Korean war. There are reasons to believe that the 1955 recovery start, just like early 1950, will prove abortive, and that, currently just like then, Government intervention merely served to postpone the showdown about the solidity of the overstimulated combined hot- and cold-war boom plus the unparalleled postwar consumer-goods replacement boom after the end of World War II.

The postwar record of both the Democratic and the Republican governments indicates considerable success in postponing, if not preventing, any postwar recession of serious proportion. This has been done primarily by freezing into the economy numerous inequities and maladjustments developed during the active phase of the two war booms.

The two "bumps" in 1948–49 and 1953–54 were exactly that. They helped to alleviate a few troublesome spot situations, but it would appear premature to be lulled into a false sense of security by them.

The question of whether we'll get by without a typical postwar recession that might really test the Employment Act defenses still remains unanswered.

It is important to know, therefore, that the human impact of any such period of adjustment, if and when it comes, will be cushioned by the "security floor" that has been created since the mid-1930's for the individual and the American family.

Question 3. What purpose, in terms of carrying out the objectives of the Employment Act, is served by defining the needed levels of employment, production, and purchasing power, and for how far ahead should they be defined?

Answer. No economic planning can function without a certain degree of economic forecasting.

However, the pinpointing of annual employment and production or GNP goals uder the Employment Act seems an extremely hazardous and objectionable procedure.

Even the development of long-range normal-growth projections is subject to criticism because it necessitates the use of more or less arbitrary "averages" for such key factors as the annual increment of the labor force or annual productivity gains. These averages are based either on past performance or on personal "hunches." Neither method is satisfactory. It is therefore not surprising that existing long-range GNP projections show considerable variations.

The margin of error is compounded if an attempt is made to translate such long-range projections into near-term goals for 1 or 2 years ahead. In that case, they are not only useless, but psychologically and politically dangerous.

The forecasting neded for a reasonable interpretation of the Employment Act goals for any short period, can best be accomplished by an intelligent and openminded study of available business indicators and their behavior against the background of the whole economy. Unemployment and related figures must, of course, be given a high priority in such evaluation of current trends and nearby prospects.

Uninformed use of GUP projections is apt to cause more harm than good. These projections should be taken with a grain of salt. But long-range projections for 10, 15 years, or even longer ahead are not nearly as objectionable as their use in short-term forecasting.

The use of long-range GNP projections as guideposts for industrial expansion will be limited until this statistical yardstick is further refined. Meanwhile, investment spending will remain dependent on sales and profits prospects.

It would be highly dangerous if the feeling were to spread that industry might as well go ahead taking chances, because the Government won't have any choice but to bail it out in case of trouble. The spread of such an attitude would jeopardize the preservation of a free and competitive-enterprise system because such a system can function dynamically only as long as a system of rewards and penalties exists.

Question 4. What are the implications of recent trends and present indications for employment, unemployment, hours of work, productivity, total production, private investment, levels of consumption, Government demand for goods and services, and savings for the coming year?

Answer. The key question for 1955 is whether or not the current upturn in industrial production will carry through. This appears rather dubious in view of the fact that the automobile industry at the start of the year was running at an annual rate of production of somewhere between 8 million and 9 million cars and trucks. Part of this production is for "protective" purposes and it seems likely that production will level off as soon as the industry's labor problems are solved. Steel, rubber, glass, and a host of other industries will take their cue from automobiles. In addition, the textile cycle—now on the upswing—may have passed its peak by early fall.

Hence, industrial production is likely to level off and probably sag moderately by mid-1955.

Much will depend on construction. Should construction, and particularly home building, waver in the latter part of the year—and such a possibility cannot be ignored, what with mortgage credit now being overstimulated and perhaps requiring corrective action before long—business activity could well resume the 1954 decline, unless the administration acts promptly to hold any new decline to mild proportions.

Regardless of the element of further Government stimulation, indications are that the recovery pattern this time may prove to resemble a W rather than a V. The second bottom of the W may occur in mid-1955. This would be before the initial repercussions of the new highway program can make themselves felt.

The combination of a possible production lag by midyear and continued efforts to push productivity higher probably will result in an average level of unemployment for the year slightly higher than 1954.

Without additional stimulation, both defense spending and business spending will tend to drag lower in 1955. As far as defense spending is concerned, increased State and municipal spending will offset further defense cuts and may even result in a small net increase in total Government spending.

Business spending will tend lower because plant and equipment expenditures probably will slide off further and inventory policies will remain ultraconservative. Chances are that total business inventories by the end of 1955 will be lower rather than higher than at the start of the year.

Consumer spending this year is not likely to receive another lift from additional tax cuts. It is closely tied to the factor of "confidence." Unless there is a serious shock to public confidence—and a sharp break in the stock market or Government action to tighten up on real-estate credit could cause such a shock—it is reasonable to expect consumer spending to continue at a high level.

Perhaps the most critical single feature to watch for in 1955, is the possible appearance of some saturation in consumer demand for durable consumer goods, including homes.

Temporary as such saturation would be, and despite the fact that there still are large population groups with substandard living conditions, it could put a serious damper on near-term business prospects.

And it certainly would play havoc with the theories of those economists who believe that all we have to do to insure prosperity is to put more money into the hands of the consumer.

PRESENTATION OF BACKGROUND MATERIAL

I. The Aim of the Employment Act
II. Maximum Growth versus Stable Price Level
III. The Function of "Maximum Employment and Production" Goals
IV. The Future of the Business Cycle

I. The Aim of the Employment Act of 1946

The established aim of the Employment Act of 1946 is "to promote maximum employment, production, and purchasing power?

This goal—partly because of its legislative history—is often confused with "full employment." Congress rightly shied away from the phrase "full employment" because of its economic and political implications. The phrase still survives as a political argument, but not as the basis of responsible economic debate.

A goal of "full employment" actually could be accomplished relatively easily if it were interpreted to mean merely to provide a "job" for everybody able to work.

Various dictatorships have successfully accomplished this. In that process, they have even dropped two of the personal qualifications of the Employment Act. As it is, the Employment Act speaks only of persons "able, willing, and seeking to work." These latter two qualifications spell the difference between a free economy and a dictatorship.

IMPORTANT CONSTRAINTS

Actually, the Employment Act mandate "to promote maximum employment, production, and purchasing power" is couched in language which places considerable constraints on the choice of methods to be used by any administration in applying the act. These are threefold:

(1) The act charges the Federal Government to provide "useful" employment opportunities, including self-employment, for those able, willing, and seeking to work;

(2) The Federal Government is to use only such means as are "practical" and "consistent with its needs and obligations and other essential considerations of national policy"; and

(3) Its actions under the Employment Act are to be used "in a manner calculated to foster and promote free competitive enterprise and the general welfare."

These restrictions, imposed by the Employment Act, rule out:

(1) Heavy reliance on makeshift work of the leaf-raking variety;

(2) Any large-scale exercise of additional economic functions by the Federal Government—such as the replacement of private enterprise in the field of capital investment unless private enterprise cannot fulfill certain functions; and

(3) Any policies that would ultimately result in a further debasement of the currency.

The third qualification—falling under the "general welfare" term—is the most important one. Yet it is the one which, wittingly or unwittingly, all too often is shrugged off or ignored.

II. Maximum Growth Versus Stable Price Level

Is a policy of insisting at all times on maximum employment, production, and purchasing power compatible with the maintenance of a stable currency?

Liberal economists, such as Mr. Leon Keyserling, have consistently denied that the discharge of the Federal Government's obligations under the Employment Act necessarily involves the danger of inflation.

Others, such as Prof. Sumner H. Slichter, have admitted the existing conflict between these two objectives, but have boldly resolved it by claiming that "in the kind of economy possessed by the United States a slowly rising price level is actually preferable to a stable price level." [1]

RECORD STILL INCONCLUSIVE

The record for the period from the enactment of the Employment Act of 1946 through 1954 still is inconclusive as far as the problem of maintaining maximum employment, production and purchasing power without a gradual rise in the price level is concerned.

[1] Reprint of a discussion on How Bad Is Inflation? between Prof. Sumner H. Slichter and the editor of the Journal of Commerce, September 1952.

Starting from the fantastic degree of overstimulation during World War II that permeated the whole economy—not by choice but by necessity[2]—our economy has been under the influence of strong upward forces. Following the war, there was first the unequaled consumer goods replacement boom and, starting in mid-1950, the Korean war and now the need of maintaining a high level of defense expenditures so long as the cold war persists.

Twice during this period of overstimulation, the economy broke stride and faltered—once in 1948–49 under Democratic leadership and then again in 1953–54 under Republican leadership.

In both instances, artificial stimulants were applied. These were far more potent than generally realized, particularly in 1953–54, and they were sufficient, in both instances, to cushion the decline before it attained serious proportions and speed.

The remedial measures taken in both instances must be classified as inflationary. The fact that none of the two episodes was followed by any pronounced rise in the price level does not disprove this. It merely confirms that, in both instances, buyers' markets conditions blocked any immediate increase in the price level. Moreover, there will always remain some doubts with respect to the solidity of the recovery in 1950. The possibility cannot be ruled out that, without the start of the Korean war, business activity once again would have declined during the latter part of the year.

Similarly, the solidity of the 1955 recovery still remains open to some doubt. It will be tested during the latter part of the year.

Summed up, it still is by no means proven that a reasonable maximum employment level can be maintained by props that are not strong enough to lead to an increase in the price level.

Consequently, the controversy over which is the lesser of two evils—some "hard core" unemployment or a continually rising price trend—still is far from resolved.

THE ARGUMENT FOR INFLATION

Professor Slichter believes that—once the element of war and defense overstimulation is removed from the economy—the only feasible way of maintaining maximum employment, and production and purchasing power, is by a policy deliberately designed to result in an annual average increase in the price level of 2 to 3 percent.

While Professor Slichter admits the "obvious injustice of even a slow long-term rise in prices, he claims that the maintenance of a stable price trend—

(1) would require that the country considerably relax its efforts to keep business recessions as mild as possible;

(2) would require the acceptance of chronic unemployment or drastic intervention by the Government in the relations between employers and employees; and

(3) would severely handicap the United States in its efforts to contain communism by building up the economies of the free world.[3]

Professor Slichter argues that since some form of "injustice is inescapable * * * policies that produce a slowly rising price level spread the injustice thinly over a large part of the population. The policies necessary to keep prices stable create unemployment and thus concentrate injustice upon a few."

There are two major objections against such a policy:

(1) It is extremely doubtful that a deliberate long-range inflationary policy can be sufficiently "controlled" at all times. If it is to take the place of hot or cold war stimulation, it is likely to gather speed and culminate in a flight from the currency into goods—which still is the classical demonstration of inflation. While rapidly rising productivity provides a natural defense against inflation, it would involve a considerable risk to base long-range national policy on such a Maginot line.

---

[2] CIO–UAW President Walter P. Reuther describes this labor overstimulation as follows: "When the war came along * * * factories began to boom; we put every able-bodied man and woman to work. After we had all the able-bodied people on the job we got the grandfathers and grandmothers out of retirement and we put them to work, and every major company had a very simple employment policy—the employment director was instructed, when somebody applied for a job, not to ask any questions, but just to feel them, and if they were warm, put them on the payroll." Speech before the Economic Club of New York, January 17, 1955.

[3] See the reprint mentioned above. To the best of our knowledge, Professor Slichter has not subsequently denounced or materially amended these views.

(2) The idea that slow inflation would "spread injustices thinly over a large part of the population" is unacceptable as basis of national economic and social policy. A far better solution, in the case of temporary economic balances, is to rely on what is now commonly described as the "security floor" for the individual citizen or the American family.

It may be questioned whether or not the present "security floor"—primarily consisting of unemployment insurance, old-age and disability insurance—is adequate. At any rate, it would appear to be sounder economic policy to strengthen the "security floor" than to impose a general tax in the form of inflation, because inflation is the most cruel and vicious form of taxation ever devised by man. It is obvious that inflation would hit those depending on fixed incomes particularly hard. But the typical American "small capitalist" type of wage earner also would not escape the ravishes of such a policy.

AN ULTIMATE COLLAPSE?

It is rather significant that there is a growing concern over the stability of the currency. This concern shows up in the form of a more and more often repeated question. This question is being asked not only by businessmen—perhaps not even primarily by businessmen—but by the "public," including wage earners, and it runs bluntly like this: "Is there any chance of escaping an ultimate currency breakdown if we keep on stimulating the economy?"

The answer to this question still is that no such currency collapse is likely in this country.

However, the reason for this belief is not the simple assertion that "it cannot happen here," but something far more significant.

While in each economy there are groups who obviously would profit by inflation—who actually have a vested interest in continued inflation—the overriding consideration in this country is that we—and particularly our labor force—is rapidly becoming a nation of homeowners, savers, holders of life insurances, and beneficiaries of private and social-security pensions.

Since these people with a newly found vested interest in a stable currency also have political votes, it is almost a foregone conclusion that any administration whose policies were to be recognized as a threat against the interests of these small capitalists, would promptly be turned out of power.

This is the most potent factor against a policy of continued overstimulation, even though it is designed to prevent any economic "adjustments."

A number of liberal economists and union spokesmen have repeatedly declared that we cannot hope to, and should not try to, equal the hot- and cold-war overstimulation of the past 15 years. Nevertheless, there are some who still are aiming that high.[4]

Such an aim would necessitate a massive program of inflationary stimulants. If superimposed on a reasonably sound economy—and we would so classify the economy today—there is no reason to doubt that it would be a reasonably simple matter to strain the boom to the proportions of a superboom once again.

But any policy aimed at superboom conditions would run contrary to the general aim of the Employment Act. Economists of both a Democratic and a Republican administration—while serving on the President's Council of Economic Advisers—have repeatedly gone on record as being opposed to inflationary overstimulation.

Any policy of economic intervention that does not respect the "integrity of the currency" is bound to prove harmful in the long run.

Hence the specific problem in economic planning today is to find the dividing line between sound economic growth and artifical overstimulation.

And more specifically the question arises: Is there any way of determining this dividing line other than by trial and error which means by maintaining an economy from which all self-regulating features (or safety valves) have not been removed by well-meant, but unsound experimentation?

III. THE FUNCTION OF "MAXIMUM EMPLOYMENT" GOALS

The desire to popularize the Employment Act and to draw it into politics has led to a number of practices which are scientifically questionable.

---

[4] Steelworkers and the National Economy, a special report by David J. McDonald, president, United Steelworkers of America, p. 12: "When, however, a substantial demand for goods and services disappears—as is now the case in the Government and private investment sectors of the economy—it should be perfectly clear that the slack must be taken up by an increased demand elsewhere."

Specifically, they have led to a second-best-is-not-good-enough attitude which claims that to fulfill the purposes of the Employment Act, the economy must expand every single year.

The statisticians among the followers of this economic cult believe that it is not only possible, but necessary to calculate and to maintain a normal-growth line and to measure growth against such a line from year to year in order to determine whether or not the economy is gaining or losing ground against the norm of maximum employment, production and purchasing power.

This type of "model building" has become very popular among union leaders and liberal economists.[5]

THE ROLE OF LONG-RANGE PROJECTIONS

All economic planning involves a certain degree of economic forecasting.

Regardless of how an administration defines the maximum employment production and purchasing power level of the Employment Act, the formulation of its policies for the attainment of that level necessitate a number of economic trend evaluations and projections.

Obviously, no administration can base its policies on arbitrary forecasts because economics are not an exact science which permits any "hedgeproof" forecasting.

Actually, the difficulties are even more basic than that because even the projection of long-range normal growth lines defies any scientific approach.

Long-range growth projections admittedly serve a useful double purpose:

(1) Psychologically: They are an effective reminder that there is no call for dusting off the theory of "economic maturity" that dominated economic thinking in the early thirties with devastating results; and

(2) Economically: They offer certain guideposts for the formulation of industrial and communal expansion programs and regional plant location decisions which, following further refinements may prove quite valuable.

Meanwhile, there is an acute danger of statistical misuse of these projections because they have not yet been sufficiently perfected .

This danger is particularly acute if an attempt is made to formulate near-term expansion goals by using a long-term trend line. The fact of the matter is that at least two of the most important specific factors in the construction of any normal-growth line are highly variable. They are:

(1) The annual increment to the labor force; and

(2) The annual gain in productivity.

It is easy enough to go back and calculate average growth figures for the past 20 years or even longer periods. In such calculations, year-to-year increases in the labor force and productivity can be averaged out and not lose their meaning.

However, such percentages, based on previous experiences, are hardly valid when it comes to a projection of the future.

Calculations for future growth must rely on estimated increases in such items as population, size of labor force, workweek, productivity gains, disposable income, and consumer expenditures.

The difficulties in making such estimates are clearly demonstrated by comparing some of the recent calculations of long-range economic growth.[6]

By far the most critical point of difference among these projections are the sharp differences in calculating future productivity gains (in percent of cumulative annual increase).

Some of these productivity estimates are as follows:

---

[5] The term "liberal" economists is used in a rather loose sense throughout. It is used to indicate the opposite of conservative but is not supposed to have any political connotations. It has become general usage to describe these economists as "Fair Dealers."

[6] Julius Hirsch has just completed a comparison of seven long-range growth projections. It is available in manuscript form under the title: "Our Economic Future. A Comparison of Seven Long-Term Projections." New York, 52 Wall Street, January 7, 1955.

	Percent
In forecasts for 1960:	
Low projection, Weyerhaeuser[1]	+1.5
Medium projection, Colm[2 3]	+2.5
High projection, Leon Keyserling	+3.5–4
In forecasts for 1975:	
Low projection, Weyerhaeuser	+1.5
Medium projection, Paley Report	+2.5
High projection, Julius Hirsch	+2½–3

It is obvious that such differences in the calculation of future productivity gains will have an important bearing on the future projects of gross national product.

The comparison made by Julius Hirsch shows the following estimates for the gross national product for various target dates:

Gross national product estimates

[In billions of dollars]

	1951	1952	1960	1965	1970	1975
Julius Hirsch		345	440	530		763
Colm	329		425			
Ensley[1]				525–535		
Weyerhaeuser		248	412	465	527	586
Keyserling			500–600			
McGraw Hill			415		562	
Paley report	329					634

[1] Joint Committee on the Economic Report: Potential Economic Growth of the United States During the Next Decade, October 1954.

Under these circumstances, it is obvious that the fixation of annual progress "goals" under the Employment Act is not only useless, but highly questionable.

Whenever pressure is exerted on an administration to pinpoint its economic goal for any specific year, the suspicion is that this is done for political rather than economic reasons.

The determination of the degree of success or failure in attaining the goal of maximum employment, production and purchasing power, defies the use of mathematical or rigid statistical yardsticks. Such determination can be accomplished only by flexible use of available business indicators and their proper interpretation against the background of the whole economic process. Unemployment trends, of course, will have to get a high ranking in the selection of these yardsticks.

To repeat: There is nothing in the Employment Act—nor in the parliamentary proceedings prior to its enactment—that can be interpreted as a mandate to bring about uninterrupted annual growth.

Actually, the American economy has never experienced any period of consequence during which such a pattern prevailed—except under the stress of a dominating war emergency.

Those economists who develeped the "second-best-is-not-good-enough" theory of economic growth cannot cite the Employment Act as authority for their views.

As has been shown, they are not on solid ground, either economically or statistically. All current attempts to demonstrate a "gap"—annual and cumulative—between an arbitrary maximum growth line and the actual performance of GNP are not scientifically supportable, because they are working with invalid yardsticks.

From a long-range point of view: the overriding goal of current economic policy has to be the return from a pattern of overstimulated to supportable growth and not the continuation, and further aggravation of overstimulated growth. From this point of view a roughly sidewise business movement would appear satisfactory. It would give the economy a chance to grow into its current productive plant without harsh transitional pains, but also without further jeopardy to the economic and ideological basis of our free and competitive economy.

MISUSE OF GNP

Those economists who are pleading for an immediate closing of the "gap" between what they consider the maximum employment-growth line and the actual performance of GNP, base their policy recommendations on what probably is an objectionable use of gross national-product figures.

Their argument runs something like this: Since GNP roughly corresponds to consumer spending, business spending, and Government spending, a decline in any, or any two, of these categories can be made up by increases in the other one or two, as the case may be. Since we are now confronted with a decline in Government and business spending—their argument continues—it follows that consumer spending must be boosted. That can best be done by increasing the amount of money in the hands of consumers through higher wages and higher social-security benefits.

This type of economic reasoning sounds simple and attractive, but it is faulty. It amounts to a very crude formulation of the so-called purchasing-power theory which ignores the fact that there is an important difference between business and Government spending on the one hand and consumers spending on the other.

This faulty interpretation of the role of consumer spending received its greatest impetus when a group of economists and statisticians started to compute the gross national product (a relatively new concept in economics that took the place of national income) from the expenditures—rather than the income side.

Although the totals, regardless of the method used, theoretically should come out at least very close, that is not the case. After the end of war, the GNP figure, computed from the expenditures side, came into almost uniform use.

This statistical procedure—perfectly logical in its conception and most of its uses—seems to have encouraged the popular belief that all three major types of "spending" are functionally of equal importance.

That led to a dangerous oversimplification, because it obscured the important fact that consumer spending actually is the function of the two other types, Government and business spending which have a high multiplying effect. (The role of savings and dissavings is deliberately eliminated in this discussion.)

There is no such thing as to raise consumer expenditures indefinitely by cutting up the available national income "pie" in such a way that consumers are getting more and management is squeezed further.

Such a policy of raising consumer funds, and presumably consumer expenditures, may be effective in a depression when investment spending is at a standstill and some push is needed to start at least some wheels turning again. It also may do the trick of augmenting consumer spending for a short period of time when a feeling of confidence prevails and some companies, despite competitive pressures, are willing to take a chance on higher wages in the hope that they can avoid strike interruptions and thereby hold their competitive positions.

As a matter of long-range policy, this approach is faulty because a policy aimed at continued redistribution of national income to benefit workers alone will soon undermine the incentives for further growth.

Labor must share in the fruits of greater productivity. That, after all, has been the formula for American industrial success all along. Labor must not, however, be permitted to monopolize these productivity gains.

Personal, as well as managerial "incentives" must be maintained—"restored" is perhaps an even better word—if our economy is to keep on functioning as a free and competitive enterprise system.

IV. The Future of the Business Cycle

When the authors of the Employment Act charged the Federal Government with the task of promoting maximum employment, production and purchasing power, they wisely added that this was to be done within the scope of a "free enterprise system."

This qualification can hardly be ignored as an empty phrase, as it reflects a firm conviction on the part of the authors of the act that no amount of economic experimentation is worthwhile unless our economic system maintains its dynamic character.

Those responsible for the formulation of economic policy under the past two administrations—one a Democratic one and one a Republican one—have repeatedly stated that their aim was not directed toward the elimination of all, even minor, business fluctuations.[7]

Nevertheless, the popular belief that the Federal Government is charged with the responsibility of preventing any interruptions in the economic growth of the country persists.

The fact that—without respect to party lines—the economy suffered two "bumps" in the postwar period, does not seem to discourage those who live in the happy dream that the economic millenium has arrived.

Both these "bumps" were terminated rather quickly and without damaging after-effects, with the help of a number of positive economic measures inaugurated by the Government in office. There is an inclination now to classify both of them as relatively minor "inventory"—recessions.

The ease with which these two recessions were stopped has had two unfortunate results as far as the development of contemporary economic thought is concerned.

The feeling is now widespread that all similar business slowdowns can be quickly halted so that busineses as well as consumers can proceed securely in the belief that "nothing can go wrong." And

(2) This, in turn, is leading to the political clamor for affirmative action by the Government "at the slightest sign of trouble."[8] This obviously reflects the philosophy that as long as the Government can prevent setbacks, it has a moral obligation to do so.

The economic progress since the end of World War II and the ease with which the two recessions of 1948–49 and 1953–54 were overcome have led to a widespread feeling that the economy is basically "sound" and that, now that the 1954 decline has been reversed, progress will be resumed from a "solid base."

Actually, it may well be that the progress made under the stimulus of World War II, the postwar consumer goods replacement boom and the Korean war plus all of its cold-war implications has not yet been sufficiently "digested."

Under the influence of the unparalleled overstimulation of the past 15 years, a number of vulnerabilities have developed under the surface of the economy that have not yet been tested and that may yet break through the surface to create some real postwar readjusment problems.

Chief among these vulnerabilities are:

(1) The rate of plant expansion since the early forties;

(2) The accumulation of inventories;

(3) The sharp expansion in personal indebtedness, particularly in the home mortgage field;

(4) The artificially high support of farm prices without adequate production or marketing curbs; and

(5) The possibility that we are far closer to a temporary saturation of consumer demand for consumer durables than most observers seem to think.

Two of these vulnerabilities have already broken through the surface:

(1) There have already been two waves of inventory liquidation—and even now the widely held optimism that we are at the threshold of another period of inventory accumulation seems rather premature.

(2) Farm prices and farm incomes have been declining since 1948—without showing any partiality to the party in control. Yet even so, agriculture today can hardly be regarded as on a sound base.

Vulnerabilities, by definition, are weak spots that do not necessarily have to break out into the open. There is constantly a threat that they may—but it is not beyond the realm of posibility that, through orderly adjustment processes, these weak spots disappear.

Most of the current literature about the elimination or destruction of the business cycle is predicated on the fact that thus far the Government has succeeded—once again without respect of party lines—to stabilize the economy at a level that seems to have frozen in the overstimulation of the past 15 years rather successfully—and that, therefore, continuation of this millenium can be achieved.

---

[7] Conclusive evidence to this effect can be found in the annual and (originally) semi-annual economic reports signed by Mr. Leon Keyserling and the President's reports, since Dr. Arthur F. Burns took over the chairmanship of the Council of Economic Advisers.

[8] Steel Workers and the National Economy, p. 7: "Thus, the monumental Employment Act reposes both the power and responsibility upon the Federal Government to assist the national economy at the first sign of difficulty, even before distress overtakes us."

PAST AND FUTURE CYCLE PATTERNS

This type of reasoning still seems to take too much for granted.

Theoretically, it would be possible to equal the artificial stimulants of the past 15 years though at a price of falling back on unsound budget and wage policies.

One of the most dangerous fallacies behind this reasoning is the expectation that increases in consumer demand brought about by profit squeeze will induce industry to keep up plant and equipment expenditures at a sufficiently high rate.

This is usually described as the trickle-up theory which, in the opinion of union economists and leaders, is far more effective than the trickle-down theory, which seeks to maintain adequate investment incentives as the spark of our free competitive enterprise system.

There is ample historical proof that prosperity depends on an adequate level of investment spending. But there is no statistical record of any period in which the trickle-up theory pulled the economy out of a slump.

Looking over the record of past recessions, it is quite obvious that we have learned successfully how to lock a barn after the horse was stolen.

After each depression legislation was passed to make a recurrence of that particular type of depression next to impossible. In that process we have also learned that no two depressions are alike.

The one thing we have not yet conquered, however, is the ingenuity of man to get himself into trouble.

We may be successful in the future in keeping speculative excesses out of such fields as stock market credit, mortgage credit or consumer credit. We may even halt the deterioration of the farmer's purchasing power and we may succeed in maintaining a reasonably high level of investment spending.

After all the array of props at our disposal for all of these things is impressive. It includes margin regulations, housing regulations, farm price supports, stockpiling of metals, minerals and other materials, all the instruments of credit policy and a shelf full of public works programs, including the new highway program.

And yet what would happen if the next recession—instead of being set into motion by a cut in plant expenditures, or another cut in inventories, or another drastic drop in farm prices, or by credit excesses in one of the 3 or 4 vulnerable major fields—were to be generated by a temporary saturation of consumer demand for all kinds of durable consumer goods, including housing?

There are signs that people are becoming less gadget-minded than they were. That could mean a sign of saturation.

While it is true that a large part of the population still is living at substandard levels, nothing short of a gigantic giveaway program could create effective demand among this group overnight and any attempt of accomplishing this goal through a policy of boosting minimum wages further would certainly result in serious economic dislocations.

Maintenance of the dynamic character of the economy does not only require the existence of sufficient profit incentives—for the individual as well as for the corporation.

It also means that there must be penalties for errors in economic judgment.

Only an economic system based on rewards and penalties can remain truly dynamic and free.

It is for this reason that economic intervention on the part of the Government must not attempt to eliminate the need for all corrections. It is one thing—and an eminently necessary one—to cushion the human impact of economic maladjustments—such as chronic unemployment in areas with a displaced industry. The proper way of accomplishing this is by wise social measures. The wrong way is the use of well-meant, but fuzzy economic legislation that freezes such inequities and maladjustments into the economic structure.

APPENDIX TO STATEMENT BY H. E. LUEDICKE

EVALUATION OF THE 1955 ECONOMIC REPORT

I. AN INTERPRETATION OF THE REPORT

(From the Journal of Commerce of January 21, 1955)

By H. E. Luedicke

Economic planning in 1955 should be concentrated "on basic policies fostering long-term economic growth," rather than "seek to impart an immediate upward thrust to general economic activity."

This statement from the President's economic report to Congress best sums up the current thinking on economic growth within the Eisenhower administration.

It is based not only on the administration's view that "our economy is now undergoing a cumulative expansion of some strength," but also on its belief that there is inherent danger in continued overstimulation of the economy.

As the report puts it: "Our economic policies must be designed not merely to foster growth, but to foster a rate of growth that can be sustained."

NO ONE-WAY STREET

"As we proceed," the report warns, "we must keep in mind the historical fact that growth has generally been attained by spurts of activity, followed by pauses or setbacks."

If we are to escape the "risk of generating overconfidence and subsequent reaction," it is important to keep in mind the limitations of Government intervention for the purposes of smoothing out business fluctuations.

In what was billed in advance as the first complete discussion of the Eisenhower administration's philosophy on economic growth—developed by the President and his chief economic advisers—the economic report flatly acknowledges the Government's responsibility for intervention under the Employment Act of 1946, but just as flatly states that such intervention must be kept within limitations and should not be expected to accomplish the miracle of eliminating all business fluctuations.

Says the report: "We have learned from experience that the Government can do a great deal to moderate economic fluctuations, but there is as yet no good basis for the belief that it can entirely prevent them. A democratic government needs time, especially when current reports are conflicting, to meet a given economic situation. Moreover, the effects of its actions—whether in augmenting or restraining demand—require time to work themselves out.

"Government ought not to continuously be veering its course, although it should act promptly and decisively when a threat to economic stability emerges."

CANNOT STAY ALOOF

"The economic effects of Government operations are now so large and so pervasive that it is no longer reasonable to suppose that Government either can or should remain aloof from what goes on in the private economy.

"We have learned from experience that Government can pursue policies that not only promise to bring a stabler prosperity to economic life, but also to expand the scope and add to the vigor of private enterprise.

"Our aim must be to build on this experience, to pursue policies that will facilitate the growth of private enterprise, and to equip ourselves with better tools for checking any recession or inflation that might develop."

THE NO. 1 SAFEGUARD

The most striking difference between the economic philosophies of President Eisenhower and his advisers on the one hand and former President Truman and his Fair Deal advisers on the other hand lies in the emphasis with which (1) avoidance of inflation and (2) preservation of the free enterprise system are stressed.

Basic as the Government's obligation to promote the objective of maximum employment and maximum production is (under the Employment Act), the act states that the means used to fulfill this obligation must be (and here we again quote from the report) "consistent with the 'needs and obligations' of the Government and 'with other essential considerations of national policy.'

"In other words, in implementing the Employment Act, the Federal Government is subject to certain constraints. Among other things, it must honor the constitutional rights of individuals; it must respect the authority of the States; and it must protect the integrity of the money in which contracts are expressed and payments made."

This emphasis on the "integrity of the money" is repeated several times in the report.

POTENTIAL THREAT

In this connection, the point is being made that inflation as well as depression "carries the danger of undermining, sooner or later, our system of free competitive enterprise."

Dealing with critics on the right as well as on the left, the report goes on to say: "The obligation of the Federal Government under the Employment Act to 'promote maximum employment, production and purchasing power,' and to do so by means that are consistent with 'other essential considerations' of national policy, is not always remembered.

"Some citizens, lacking faith in the ability of the private economy to generate a high level of activity, espouse a steadily increasing role for Government. They urge new public undertakings and unbalanced budgets as devices for augmenting private demand, often with little regard to the cause or magnitude of any deficiency in demand.

"Other citizens, adhering to what they regard as the ultimate economic verities, are critical to any Government action that is designed to prevent or to minimize the rigors of depressed incomes and unemployment.

WARNS ON EXTREMES

"These are extreme and doctrinaire positions. If the one is insensitive to the inequities of inflation, the other is insensitive to the misfortunes of depression. Each carries the danger of undermining, sooner or later, our system of free competitive enterprise * * *.

"The need of our times is for economic policies that, in the first place, recognize the proven sources of sustained economic growth and betterment and, in the second place, respect the need of the people for a sense of security as well as opportunity in our complex and industrialized economy."

BASIC ECONOMIC TENETS

In an explanation of the current and future policies of the Eisenhower administration, the Economic Report says that these policies rest on the following six basic propositions:

1. Competitive markets, rather than governmental directives, are as a rule the most efficient instruments for organizing production and consumption.
2. A free economy has great capacity to generate jobs and incomes if a feeling of confidence in the economic future is widely shared by investors, workers, businessmen, farmers, and consumers.
3. The Federal Government creates an atmosphere favorable to economic activity when it encourages private initiative, curbs monopolistic tendencies, whether of business or labor, avoids encroachment on the private sector of the economy, and carries out as much of its own work as is practicable through private enterprise.
4. The Federal Government generates confidence when it restrains tendencies toward recession or inflation, and does this by relying largely on indirect means of influencing private behavior rather than by direct controls over people, industries, and markets.
5. The Federal Government contributes to economic growth when it takes its part at the side of the States, in promoting scientific research and in providing public facilities, such as highways, hospitals, harbors, and educational institutions, on which the expansion of the private economy heavily rests.
6. The Federal Government strengthens the foundations of the economy when it widens opportunity for its less fortunate citizens and, working in cooperation with the States and localities, helps individuals to cope with the hazards of employment, illness, old age, and blighted neighborhoods.

58422—55——11

STRONG AND HUMANE

"These economic tenets are basic and inseparable. They constitute guides to policies which, if pursued persistently, will advance us toward the goal of an increasing national income, shared equitably among those who contribute to its growth, and realized in dollars of stable buying power.

"In broadest outline, they constitute the framework of an economic system that is at once strong and humane, a system that can provide both greater material abundance and a better quality of living."

ROLE OF INCENTIVE

The two chief goals of public policy are defined in the report as strengthening the "floor of security for individuals and families" and, "to protect incentives and encourage a spirit of enterprise and innovation among people.

"The man or woman who, in the hope of personal betterment, works harder, designs a new product, creates a new method, invests in a new business, moves to a new job, or suggests a new idea to his employer, must believe that the rewards of initiative and effort are worthwhile." Through all of its policies the Government must encourage enterprising action by business managers, investors, and workers, in an environment that is kept basically free and competitive.

TIED TO TAX POLICY

The Eisenhower administration still sticks to its guns as far as the use of tax cuts for the strengthening of corporate incentives is concerned.

The report stresses that, assuming a further tax cut is in order next year, Congress should "continue the program which was begun last year of reducing barriers to the free flow of funds into risk-taking and job-creating investments."

This would be in continuation of the 1954 tax law, as the report puts it, "to promote the vigor of competitive enterprise," such as the liberalization of depreciation allowances, the extension of the period over which business losses can be carried back for tax purposes, the liberalization of the rules for plowing back of earnings for expansion purposes, the encouragement of research and development expenditures, and the limited tax credit on dividends received by shareholders.

WHAT ABOUT THE CYCLE?

While the economic report stresses that Government planning at the moment is primarily directed toward long-range growth, it also emphasizes that "the Government must remain ready to deal with any setback that might develop."

A good deal of confidence is expressed that, in view of past experiences and the weapons in the administration's antirecession kit, the "business cycle is now under reasonable control."

This does not mean, however, that the administration believes it has conquered the cycle. To the contrary, the report stresses that even an expanding economy "does not escape the need for moderating the business cycle."

Says the report: "A view fundamental to the economic program presented in this report is that the best way to avoid economic recessions is to have the economy growing vigorously. Yet it is necessary to recognize that, at times, growth processes may falter, and that on other occasions the forces of growth may generate inflation * * *

"Hence the program recommended in this report has been formulated not only to foster economic growth, but to foster a reasonably stable process of growth."

II. A Philosophy of Growth

(An editorial in the Journal of Commerce, of January 21, 1955)

Economic growth is sound only, says President Eisenhower's 1955 economic report to Congress, if it prevents both deflation and inflation, if it is held to a rate that can be sustained, and if it does not destroy incentive as the chief motivating force in the economy.

This declaration clearly defines the economic philosophy of the Eisenhower administration and demonstrates that its economic policies differ not only in degree, but in principle, from those followed by former President Truman and his Fair Deal advisers.

For this reason, this year's economic report is a valuable contribution to the development of contemporary economic thought in this country. It will leave its mark—even if some of the specific economic predictions prepared by the Council of Economic Advisers for the President should not fully stand up as the year progresses.

* * * * * * *

The economic report pledges the Eisenhower administration to full support of the Employment Act of 1946 under which any administration in power—be it Republican or Democratic—is committed to promote "maximum employment, production, and purchasing power." The Eisenhower administration will "act" whenever need for economic action appears and will act "promptly and decisively."

But—and this is the all-important qualification in its commitment—it has very definite ideas as to what the Employment Act meant when it stated that the methods to be used in promoting maximum employment, production, and purchasing power must be consistent with the "needs and obligations" of the Government and with "other essential considerations of national policy."

These "other essential considerations" are primarily the protection of the "integrity of our money" and the prevention of economic overstimulation, merely for the purpose of living up to a preconceived and more or less arbitrarily determined growth pattern.

* * * * * * *

The Eisenhower economists do not deny that further progress can be made in smoothing out the fluctuations of the business cycle—but the report states emphatically that "experience affords no good basis for a belief that the Government can entirely prevent fluctuations."

As a matter of fact, the report contains a poignant reminder that historically our growth has generally been attained "by spurts of activity followed by pauses or setbacks."

This does not represent a callous acceptance of the human miseries that accompany any economic setback of consequence, but it does reflect—at least by strong implication—a conviction that no economic system can be kept "dynamic" if all self-regulatory features are removed from it.

No system of free competitive enterprise can long endure even if it, grudgingly, admits the justification of "rewards" for incentive and success, unless it also maintains penalties for economic failures and does not try to soften these for social reasons.

Now that we have, over the past two decades, built in this country a strong "floor of security for individuals and families," it should be recognized that this degree of protection enables us to pursue sound economic policies with far greater assurance than would have been the case without the existence of these forms of protection for the individual and the American family.

* * * * * * *

The trouble is that many of those primarily interested in social rather than economic progress are not satisfied with the gradual strengthening of this "security floor." They want to make sure that this floor never becomes effective and they are willing to substitute "security" for incentive as the key motivating force in the economy.

Any economic policy based on such an attitude, sooner or later, will lead to the destruction of the dynamic character of our economy, as it will lead either into inflation or into a planned economy. Such a planned economy could develop under any of half a dozen names, from managed economy down the primrose path to outright socialism, but regardless of its specific label, it would still add up to the end of dynamic economic progress.

* * * * * * *

The President's Economic Report clearly accepts the premise that overstimulation compounds the danger of generating inflation—which, in the final analysis, would not only negate what our social reformers try to accomplish, but actually would lead to a rapid deterioration of the standard of living for large parts of the population—not only those who depend on fixed incomes but the majority of our working force as well—because our workers are rapidly moving into the category of small capitalists with huge vested interests in homes, insurance, savings, and pensions.

Those pushing for year-to-year, mathematically determined, economic gains usually deny that their policies involve the danger of further deterioration in the purchasing power of the dollar. They have never proven their point, largely, of course, because their reasoning defies any proof in the mathematical sense.

That is why they will find it quite easy to make converts for their ideas—until the inflationary consequences of their policies become apparent. That could be the case if, following a change in administration, they would once again find a sympathetic ear in Washington.

We feel confident that in such a case there would be a dollar revolt—strictly through the ballot box—before any real inflation tragedy becomes inevitable. The days of any administration playing with the inflation match most certainly would prove numbered.

It is for this reason that the Eisenhower administration's strong commitment to protect the "integrity of our money" deserves strong commendation.

III. Goals and Programs

(An editorial in the Journal of Commerce, of January 24, 1955)

The President's Economic Report, submitted to Congress last Thursday, is a candid document, even if the administration's critics once again are clamoring that it is too evasive.

The 1954 Economic Report was severely criticized by Democrats, union economists and assorted other Fair Dealers because the President did not specifically estimate the size of the output increase required to maintain "maximum employment, production and purchasing power" as envisaged in the Employment Act of 1946 and then offer a precise program for achieving such an output goal.

Despite these attacks, the President and his economic advisers once again decided against pinpointing an annual goal—and they are just as right about the omission this year as they were a year ago.

* * * * * * *

One of the key sentences in the report states that "it is reasonable to expect that the Nation's output within the coming year (1955) will approximate the goals of maximum employment, production and purchasing power envisaged by the Employment Act."

No attempt is made to say whether this goal for the current year should be a gross national product of $365 billion, $370 billion, or $375 billion; not even a relatively wide range is given to indicate what approximate level of business activity, in the eyes of the administration's economists, should be attained this year.

This refusal to offer a specific forecast does by no means reflect a coy attitude on the part of the President's economic advisers. After all, there is nothing cagey about their general forecast of continuing improvement in economic activity. They do see the current upturn "powerfully supported by underlying forces of economic growth."

Their only hedge concerns the likely duration of the current upturn. In this respect, they refused to go on record for the whole year. Instead, they merely stated that economic expansion will continue "during the coming months."

* * * * * * *

This qualification, it seems to us, is particularly important for a correct interpretation of the Eisenhower approach to the problem of economic planning.

What the 1955 Economic Report says in effect is this: The administration believes that the recovery forces now at work will prove strong enough to give us a satisfactory year within the meaning of the Employment Act of 1946. With this in mind, the administration is proposing a program of economic legislation designed to strengthen the long-range soundness of the economy. Should it become apparent during the course of the year that the administration's evaluation of 1955 was too optimistic, it then will become necessary for the administration to switch the emphasis in its program to measures designed for greater near-term effect. In such a case, care will be taken, however, that such measures do not cause a new wave of overstimulation.

It is quite clear that at the moment the administration's economists are concerned about overstimulation rather than a resumption of the decline. The complex issue of what to do about curbing overstimulation without knocking the props out from under the economy, is now under serious study.

* * * * * * *

The advice against use of a crystal ball in pinpointing the economic goal for the current year, given to President Eisenhower by his economic advisers, is absolutely sound.

It shows a refreshing degree of candor in backing away from what can only be described as the statistical numbers game.

There is nothing wrong with the use of fairly general, long-range growth goals—such as President Eisenhower's $500 billion gross national product projection for 1965. When it comes to 1-year projections of this type, however, the door is wide open to statistical abuse.

What earthly purpose can be served by putting down any specific number that cannot be scientifically supported? And the truth of the matter is that there is no formula, method, or procedure available to economists today to determine what our economic growth should be from one year to the next.

It is one thing to calculate long-range averages for past performances in order to dramatize what has happened but any attempt to use these percentages—with respect to such factors as the increase in the labor force or the annual productivity gain—for the purpose of pinpointing near-term expansion goals is just so much statistical flimflam.

* * * * * * *

It is of course only too obvious what the administration's critics really have in mind in trying to make the administration put down a specific goal for the current year.

They want such a figure not for purposes of economic analysis but rather for purposes of political attack. What could be sweeter for the opposition than to have the administration "on the hook" by naming any specific figure—if it does not prove right at the mark?

Instead of falling into this trap, the Economic Report offered a piece of pertinent advice to all of those who have a tendency of rushing in with economic predictions where angels fear to tread. Said the report: "At this juncture of our economic life, when confidence is running especially higher, it is well to keep in mind the sobering fact that there is no way of lifting more than a corner of the veil that separates the present from the future. * * * How far the expansion will carry, it is impossible to say with great assurance."

Based on this sober appraisal of the science of forecasting, the 1955 Economic Report sums up the administration's obligation under the Employment Act as follows: "The uncertainty of economic predictions requires that the Federal Government be prepared to adjust its policies promptly if economic events should not bear out current expectations."

This is all the assurance, we believe, that is necessary at this time—and all that can be given.

IV. That Certain Extra

(An editorial in the Journal of Commerce of January 25, 1955)

The old saw that you can lead a horse to water, but that you cannot make it drink, has a direct application in economics.

The President's Economic Report to Congress, in one of its key sentences, draws attention to the role played by confidence in the shaping of economic progress and in the success or failure of specific economic policies.

* * * * * * *

This paragraph deserves far greater attention than it has found thus far. Here it is: "It is well to recognize that the reasons for the success of recent policies are not to be found in them alone.

"Tax reductions, however attractive they may seem when the economy is declining, will not necessarily lead to an increase of spending or investing.

"Easier credit conditions, larger bank reserves, even a larger money supply will not necessarily put new money to work in industry.

"Management of the public debt so as to avoid competition with mortgages and other capital issues will not necessarily increase private capital formation.

"If such policies are to be of material help in stemming a contraction, there must be a pervasive feeling of confidence on the part of the people.

"The effectiveness of a particular policy, whatever be its sphere or expression, is conditioned by the mood of the time, and this is bound to reflect people's attitudes toward Government policies at large. It is not merely the intrinsic merit of the individual policies that were pursued but also the fact that each was part of a cohesive program for strengthening the confidence of the people in their own and their country's economic future, that accounts for our recent success in curbing economic contraction."

* * * * * * *

This is not a startling new discovery, but it is a valuable piece of homespun economic philosophy that all too often has been ignored in the ideological controversies of our time.

In effect, the President's emphasis of the important role played by confidence in our economic life, is one of the strongest possible arguments for his middle-of-the-road economic policies.

It negates the rather arbitrary point of view—so strongly defended by union economists and other adherents of the purchasing power theory in its crudest form—that the trickle-up theory is always good and the trickle-down theory is always bad for the economy.

These two terms have become quite popular in recent years. The distinction between the two lies in the determination of the starting point for any economic intervention by the Government: should the purchasing power be boosted first in the expectation that the prospect of larger sales will then automatically induce industry to expand at a rapid enough pace to support a rising economic trend.

Or should the economic policy of the Government be directed at the restoration and maintenance of adequate personal and corporate (profit) incentives because such a pattern would be the soundest way of bolstering wage and salary incomes and thereby keep purchasing power and consumer expenditures on a solid basis?

* * * * * * *

The answer of the Eisenhower administration to this dilemma is that neither of these theories is sound per se; neither is applicable at all times.

Once confidence has been destroyed, businessmen will pull in their horns and any attempts to stimulate investment spending will be rather hopeless. Similarly, measures designed to stimulate consumer expenditures during a period characterized by a general lack of confidence will not be automatically successful. Nevertheless, under such conditions the only practical policy to be followed by a Government is to channel more purchasing power into the hands of the consumer because this at least promises to get the wheels slowly spinning again.

* * * * * * *

From this, it follows that the prime consideration of a government must be to prevent any such loss of confidence.

In this the Eisenhower administration was singularly successful when in mid-1953 storm clouds started gathering. At that time, it made it clear that its future economic policies would be governed by keeping the currency sound, restoring and maintaining adequate economic incentives for the individual and the corporation and working toward a sounder financial structure of the Federal Government.

Not all of its initial goals were immediately reached. For instance, balancing of the budget proved rather more difficult than anticipated.

However, the important thing was that the proclamation of these principles created an atmosphere in which the peddlers of gloom found it extremely difficult to sell their wares.

* * * * * * *

By the same token, confidence remains one of the key factors in the shaping of 1955 business trends.

Chances are that the intangible, and yet so real, factor of confidence this year will have to absorb a few unpleasant shocks. Things are not likely to go quite as smoothly as the President and his economic advisers hope.

The crucial question then will be whether or not the Eisenhower administration—and all of us who believe in the current system of free and competitive enterprise in the United States—have succeeded in selling the idea that adherence to these principles is a safer bet for our long-range future than to chase the pot of gold at the end of some beautiful rainbow.

Statement Before the Joint Committee on the Economic Report on the Economic Philosophy and Facts Underlying the President's Economic Report, Presented on Behalf of the Congress of Industrial Organizations, by Stanley H. Ruttenberg, Director, Department of Education and Research, CIO, January 26, 1955

When some economic analysts see neither depression nor inflation in sight, they conclude that the economy is healthy. Under the guise of avoiding these two economic extremes, they complacently assume that nothing needs to be done about the economy's failure to provide "maximum employment, production, and purchasing power." By following this complacent approach, they also ignore the legislative intent and statutory mandate of the Employment Act of 1946.

In his Economic Report, the President seems to have followed their fallacious reasoning: He states:

"Some citizens, lacking faith in the ability of the private economy to generate a high level of activity, espouse a steadily increasing role for Government. * * * Other citizens, adhering to what they regard as the ultimate economic verities, are critical of any governmental action that is designed to prevent or to minimize the rigors of depressed incomes and unemployment.

"These are extreme and doctrinaire positions. If the one is insensitive to the inequities of inflation, the other is insensitive to the misfortunes of depression. * * * The American people believe firmly in economic freedom, but will not passively accept depression or inflation."

However, these two economic bogeymen are not the only alternative economic problems facing the American people. During the past year, no one has predicted a serious depression. Nor has anyone been advocating a policy that will lead to runaway inflation.

At the moment, the economy is operating at relatively high levels compared with those of the 1940's, but in 1954 it was still lagging behind 1953. With a growing and expanding economy and the need for further expansion, we cannot afford to be smug about past achievements. Nor can we gloat over the fact that a depression has been avoided. A realistic appraisal recognize that the serious economic downturn has been prevented, for the most part, because of the many, built-in stabilizers adopted during New Deal and Fair Deal days. But in spite of these builtin stabilizers, the economy still lags behind the levels necessary "to promote maximum employment, production, and purchasing power."

Employment in manufacturing industries is still running more than a million behind a year ago. Unemployment, on the average in 1954, was more than double the average of 1953. Industrial production has advanced in the last few months, but it is still 5 percent below the 1953 peak. Steel production in 1954, at 88 million tons, was the lowest sonce 1949. Auto production, in spite of the spurt in the last 2 months of 1954, was still a little more than 10 percent behind 1953 and almost 20 percent behind peak production. Business expenditures for new plant and equipment for 1954 ran 6 percent behind 1953 and will continue to lag behind during the early part of 1955. Gross national product, while advancing in the fourth quarter of 1954 to an estimated $361 billion, is still 3 percent below the peak reached in the second quarter of 1953. These are just a few examples of the economic factors that indicate that 1954 was below the levels of 1953.

Of course, there are some examples of factors which showed a rise in 1954: Construction, both of new homes and of other types, personal consumption expenditures and expenditures by State and local governments. But these encouraging increases were not enough to offset the declines. As a result, the economy operated at lower levels in 1954 than in 1953.

Within the last 2 or 3 months, there have been signs of an upturn in the economy: Industrial production has regained half of its 1954 loss. Auto production is currently running at a rate higher than at any time during the last 50 months. Steel production is above a year ago, but unfortunately, less than 2 years ago. There has been a slight strengthening in the employment picture, resulting, for the most part, from improvements in the production of automobiles, but unemployment remains a million above a year ago, with part-time employment still greater.

The optimists now conclude that all is well and nothing needs to be done, because the economy was prevented from drifting too far downward in 1954 and now shows signs of improving. Such a conclusion is highly questionable.

The President, in his Economic Report, says, "The vigor of the recent recovery * * * holds out the promise that we shall achieve a high and satisfactory level of employment and production within the current year." If this is the underlying objective of the administration's program for 1955, it shows a disregard for the welfare of the American people. After all, a high level may not be satisfactory.

The President continues: "* * * the wise course for Government would be to concentrate this year on basic policies for fostering long-term economic growth. We should direct our program for 1955 principally to this purpose, rather than seek to impart an immediate upward thrust to general economic activity."

Even though one might agree with the overall intent of this objective, one cannot help sensing the callous disregard for the problems of those hundreds of thousands and millions of workers who are still unemployed or whose skills are being only partially utilized by the American productive processes.

The implication of the President's policy seems to be that an upward thrust now would be inflationary, or in some way, injurious to our economy. As long as capacity is in excess of existing production levels, an upward thrust will not be inflationary. As long as unemployment is in excess of 1¾ million to 2 million workers, an upward thrust is absolutely essential.

To the unemployed worker or to the worker drawing only a partial week's pay, nothing—absolutely nothing—is more important than a job and an income on which he can support himself and his family. To direct economic policies toward the long run is important, but to disregard simultaneously economic policies to alleviate the short-run problems is dangerous. We do not ask the President just to look at the trees and forget the woods. But we do ask him to realize that the woods are made up of very important trees, and that they should be considered of equal importance to the total forest.

It is argued, in the economic report, that we must watch our rate of economic growth because if it is too fast, or if we develop maximum employment, production, and purchasing power year in and year out, the result will be inflationary. Because of this fallacious assumption, the administration fails to take cognizance of the scope of the economic problems confronting the Nation. Emphasis is placed on the negative: Avoid inflation at all costs. Only lip-service is paid to the positive goals of promoting maximum employment, production, and purchasing power. Nowhere in the report can one find—and I have looked rather carefully—a statement of the objectives and goals necessary to the attainment in 1955 and the years immediately following of maximum employment, production, and purchasing power.

Thus the President and his Council have refused to carry out the legislative intent and purpose of the Employment Act of 1946.

In order to set goals for 1955 and succeeding years, two important factors must be considered:

1. Growth in population and labor force: The net increase in the labor force ranges from 600,000 to 800,000 each year. This figure will increase further in the years immediately ahead, because there will be more people in the age categories included in the labor force.

2. Rapid advance of productivity: Large scale expenditures for new plant and equipment in the immediate post-World War II years has brought a great growth in the rate of productivity, a rate equal to, if not in excess of, any period in American history.

With the development of automation and the further application of its basic principle of displacing human labor with machines for nonroutine processes means that productivity growth will be even greater in the immediate future. With the application of automation to the already advanced techniques of technological development, the rate of growth may well be currently, and in the immediate years ahead, close to 4 to 4½ and perhaps even 5 percent.

(As an aside, I should like to insert a recommendation: The possible effect of automation upon the American economy is so far reaching that a serious study and interpretation of the problem should be immediately undertaken by Congress. I recommend that a full-scale investigation of the problems which will accompany automation be undertaken by the Joint Committee on the Economic Report.)

To project future rates of growth of the economy on the basis of only a 2-to-2½-percent increase in productivity (as the administration and even the joint committee—in The Potential Economic Growth of the United States During the Next Decade have done) to come up with a $500-billion gross national product over the next decade, is to fail to provide the goals necessary for "maximum employment, production, and purchasing power."

If the administration looks toward a $500-billion gross national product by 1965, their economic policies during the present year are designed to attain only a gross national product about equal to that of 1953. The administration regards this as a successful reversal of the 1954 downturn. But to return only to 1953 levels will be far short of the levels necessary to provide job opportunities for all Americans able and willing to work.

But the President and the Council seem to gloat over the possibility of a 1955 gross national product in excess of 1954's or even as high as 1953's. We, as Americans interested in the welfare of all our people, cannot be content with such a slow rate of advance in America's economic activity. We cannot see how one can believe in a growing and expanding economy and be satisfied with the possibility of attaining levels of 2 years ago. In 1955, we should have a gross national product in excess of $400 billion. In 1954, we should have had something like $380 to $385 billion. The failure to attain this rate of growth is a failure to meet the obligations of the Federal Government established by the Employment Act of 1946.

To reach at least a $400 billion goal for gross national product in 1955 requires an increase in the rate of consumer expenditures considerably above that anticipated even in the joint committee's own report, The Potential Economic Growth of the United States During the Next Decade. An increased rate of consumer expenditures will necessarily be accompanied by an increased rate of business expenditures.

Therefore, economic policy must be designed to increase consumer income, to establish incentives for American consumers to fill their needs by buying the products of American industry. It should not be designed, as the Republican administration insisted in 1954, to stimulate business incentives first, and thus put the cart before the horse.

As a first step by the Government, individual income taxes must be cut. The best method for accomplishing this reduction is by increasing personal individual income-tax exemptions.

In addition, the minimum wage should be raised to $1.25 per hour and the coverage under the law should be extended. The administration's recommendation for a 90-cent minimum for certain workers and extended coverage with a lower minimum for other workers is not adequate to meet the needs of 1955.

Unemployment compensation benefit amounts, duration, and coverage must be increased. Reliance on State action to meet these goals, as the President and the administration have advocated and practiced, is unrealistic. The States' failure to take adequate action in the past has already brought about the deterioration of our unemployment compensation system—that is, the decline in benefits as a percent of wages, referred to in the President's Economic Report.

In addition, Federal programs designed to provide improved public roads, additional homes, schools, hospitals, and airports, as well as many new community facilities, must be immediately instituted. Efforts to get the construction done by State and local governments, as the administration apparently intends, will not produce the necessary results. The financing of the Federal Government's share through public authorities needs to be examined very carefully before it becomes accepted Government policy.

Collective bargaining in 1955 will make a major contribution toward stimulating the economy through negotiation of wage increases, the guaranteed annual wage, and improved health, welfare, and pension programs.

The combination of these programs will go a long way toward filling the existing gap between current levels of economic activity and those necessary for the attainment of maximum employment, production, and purchasing power.

Statement of Martin R. Gainsbrugh, Chief Economist, National Industrial Conference Board

The 1955 Economic Report, in my opinion, is several cuts above its predecessors in the quality of its analysis, and particularly in the detail with which it describes the rapidly changing current scene. The extended statistical appendix will be appreciated by all concerned with current economic analysis. A comparison with the appendix published with last year's report discloses at least 8 entirely new tables, and at least 4 which have undergone major improvement. The expanded statistical section is of special value at a time when the trend of business is changing so rapidly. In fact, the report draws conclusions which do not seem entirely justified unless they are viewed in the light of the report's own estimates of extremely current figures. The broadly optimistic tone of the report, and the pace of the recovery described therein, rests heavily upon the rough estimates the council draws for the closing months and final quarter of 1954.

Turning to question No. 1, I propose to describe briefly the half dozen or so major influences which to my mind underlie the specific trends in individual statistical series in the period since 1952. Four of these influences were of overriding importance.

First, the economy since 1952 has been undergoing a broad shift of activity and resource allocation away from Government and toward the private sector.

Second, within the private sector there has been a shift away from capital formation, and toward consumption. In combination, these shifts have acted to move the composition of national output and expenditures toward a normal peacetime balance.

Third, there has been a steady and relatively rapid rate of secular national growth in terms of population, and in terms of productive assets.

Fourth, there has been a complete cycle in the inventory demands of business, starting with the sudden exhaustion of steel and automobile inventories in mid-1952, running through rapid accumulation in mid-1953, and rapid liquidation in the first three quarters of 1954. By all indications, 1955 begins with a new phase of inventory accumulation. These basic trends in the economy have been working themselves out in an economic climate very favorable to stability. Six important elements in this favorable institutional environment are:

(1) The shift of activity from the Government to the private sector was facilitated by a balanced program of tax reduction. This acted to cushion th demands of the business sector against the consequences of inventory recession. It similarly cushioned consumption, notably for durables, against the income losses associated with inventory recession.

(2) The consequences of the inventory cycle were offset, to some degree, by a complete and parallel cycle in monetary policy.

(3) Foreign economics were gradually regaining their strength. Improvement in economic conditions abroad meant increased competition in many markets for American exports. But it has also meant that the relatively shallow decline in American imports did not precipitate or accentuate recession abroad. This, in turn, has meant that the world markets have acted to dampen domestic recession, rather than to amplify it.

(4) In the last 2 years, wage adjustments in the American economy have been more reasonably in line with the rate of increase in productivity than previously. In the aggregate, unit labor costs have not changed to any significant degree, although, of course, significant changes have occurred in individual industries. As a result, upward pressures on the general price level from the cost side have been relatively moderate, and the price level itself has been characterized by an extraordinary degree of stability.

(5) In an atmosphere of price stability, both consumers and business over the past few years appear to have developed a substantial degree of confidence, not only in prices, but in the future of general business conditions, in prospective returns on investment, and in their prospective incomes. Documenting this confidence statistically is, of course, rather difficult, although we should know something more about it after the release of first-quarter surveys of anticipated business expenditures for plant and equipment, and the survey of consumer finances. However, I think that the current level of business outlays for plant and equipment, viewed in the light of the rapid decline in the rate of such outlays associated with the accelerated amortization program, is an indication of business confidence in the future. It is also an indication of the increasingly widespread practice of budgeting capital outlays over the longer term, and this practice in itself betokens confidence in the economic future.

(6) Finally, I would stress the favorable background of substantial liquidity in the private sector. While our knowledge of the balance-sheet position of business and consumers is not nearly as well developed as our operating statements for these sectors, I believe that the relative stability reflected in the Nation's operating statements owes much to the strong net-worth position of business and individuals, as reflected in aggregate balance sheets. In this connection, the almost total lack of reference to balance-sheet data is one of the few prominent analytical shortcomings of the Economic Report. As a result, the report ignores what I consider to be one of the substantial influences on personal spending in 1954–55, namely, the huge capital gains, most of them unrealized, accruing to individuals as a result of the advance in security prices during the year.

REPLY TO QUESTION NO. 4

Under this question, I propose to confine my remarks to some agreements and some disagreements, with positions taken in the Economic Report, and then to express some reservations about the confidence of the report in our ability to control the business cycle in the future.

Our economic forum and survey of the board associates' opinions support the view taken in the report that business is now in the recovery phase of a short-term business cycle. The pace of the recovery may be somewhat exaggerated in the latest available figures published with the report, but I do not contest the report's conclusion that the recovery is vigorous. That expansion is now notably concentrated in a few areas—in automobiles, in steel, and generally in inventory demand. Fully three-fifths of the rise in gross national product from the third quarter to the fourth quarter of 1954 was accounted for by the lessening of the rate of liquidation of business inventories. It seems entirely probable that the further rise now occurring in the first quarter of 1955 reflects a swing of inventory policy into significant accumulation. It also seems likely that the rate of accumulation will mount throughout the first half of 1955. Speculative inventory accumulation is, of course, characteristic of the recovery phase of the short-term business cycle; it may well be accentuated this year, in view of the reopening of several pivotal wage contracts.

Residential construction activity is another area in which the recovery is concentrated, and here, too, the vigor of the recovery owes much to the speculative building on easy credit. Construction contract awards are now overwhelmingly concentrated in one-family dwellings built for sale rather than for occupancy.

Without disputing the reality of the recovery, it seems to me essential to point out these speculative elements already present in the recovery. And I believe the Economic Report is somewhat remiss in not pointing to a corollary of this proposition, namely, that in many nonspeculative areas, recovery has not begun, and is not yet evident. In agriculture, for example, incomes are apparently still in a declining phase as a result of price weakness and crop restrictions. Capital goods are still undergoing a period of digestion after the enormous production of the last several years (much of it related to defense demands).

Finally, in one nonspeculative area, retail trade, very rapid recovery may taper off. Inventory accumulation and rising rates of residential construction will generate additional income to bear on retail markets, but the sudden expansion of consumer demand between November and January has brought the personal saving rate to about its lowest level of recent years. It may therefore be reasonable to expect henceforth a somewhat lower marginal propensity to spend in the consumer sector.

This suggests certain reservations about those sections of the report which imply that our control over the business cycle has risen to such a degree that painful fluctuations are now extremely improbable. The evidence favoring the proposition that we now hold virtually complete control over the cycle can be drawn only from the experience of 1953–54. The recovery of 1949 was so dominated by the continuing strength in housing and automobiles, to mention only two of a whole range of postwar backlogs, that it is inapplicable to the atmosphere of the late 1950's; and the experience of 1953–54 while certainly encouraging, is still far from conclusive. Control of the business cycle implies the ability, and the willingness, to control booms as well as recessions. The American record on controlling booms is not notably good.

One remaining acute problem in the fiold of Government-business relations is how to make a Government program effectively counterrecessionary during recession, without distorting ensuing recovery into inflation.

The Government messages of this January illustrate how difficult is this matter of tools and timing. For while the Economic Report describes a recovery which has obviously speculative components, the budget message still includes a number of expansionary programs instituted more than a year ago, when the administration was under extreme pressure to alleviate unemployment.

This illustrates a proposition which was apparently lost sight of in the more enthusiastic sentences about our control over the business cycle: the legitimate range of tools at the disposal of Government for combating business recession is significantly narrowed if it is borne in mind that inflation tomorrow is as inequitable as unemployment today.

Statement of Leon H. Keyserling[1]

HIGHLIGHTS OF STATEMENT

The true level of unemployment, counting not only full-time unemployment but also the full-time equivalent of part-time unemployment and temporary layoffs, rose from 1,844,000 in 1953 as a whole to 4,083,000 in 1954 as a whole, an increase of more than 120 percent. It rose from 2.9 percent to 6.3 percent of the labor force. There has not been much significant improvement in recent months. Allowing for seasonal adjustment, the true level of unemployment in December 1954 was about 3,700,000.

Moreover, a large part of the labor force has been forced to shift from more productive and highly paid work to less productive and less well paid work, which is a burden upon the whole economy. Agricultural employment was fairly stable in 1954, but nonagricultural employment fell by almost 1.4 million, manufacturing employment by about 1.2 million, and mining employment by about 11.7 percent.

Combining manufacturing, mining, and construction, production in the fourth quarter of 1954 was higher than in the fourth quarter of 1953, but employment was down more than 1.1 million, or more than 5 percent. With automation and technology on the march, hard-core unemployment is bound to increase greatly well within 1955 unless the economy expands more rapidly than any current signs now indicate, and much more rapidly than the more optimistic forecasters indicate.

Total output in the fourth quarter of 1954, while about the same as in the first quarter of 1953, was at an annual rate about $30 billion below maximum output—due to growth in productivity and in the labor force. This deficit in output correlates well with the excess amount of true unemployment plus the bad utilization of the labor force caused by the recession.

The Council of Economic Advisers, through the medium of the President's Ecomonic Report, have furnished a good historical account of past events. But they have overlooked the explicitly stated responsibility under the Employment Act (and also the requirements of sound economic analysis as a guide to policy) that they define needed levels of employment, production, and purchasing power. The report offers almost no indications as to whether the advisers believe that unemployment is too high or too low or about right; as to how much total output would need to grow to restore maximum employment and production; or as to what adjustments in purchasing power throughout the economy would help to restore maximum employment and production. Evading this central task, the advisers provide no basis on which to evaluate whether recommended policies and programs are too big or too small, well-directed or misdirected.

The economic advisers make a few forecasts, surrounded by many hedges. But the Employment Act did not set up a forecasting agency. It set up a national economic policy coordinating body, with forecasting to be used mainly as one tool for the formulation of policies. To be sure, there are a number of random policies and programs set forth in the Economic Report. But they do not stem from the economic analysis, because the analysis does not define needs.

Under the circumstances, although the meaning of the Employment Act is unmistakably clear, the joint committee might consider advising the advisers to carry forward the responsibilities which the act imposes upon them.

If the American economy in 1955 averages a 3 percent higher level of output than in 1954, which is in accord with optimistic forecasts, this would not be nearly enough growth to reduce unemployment sufficiently, absorb new entries into the labor force, and keep up with advancing technology. With only a 3 percent rate of growth, the true level of unemployment for 1955 as a whole might average around 6½ million, contrasted with slightly above 4 million in 1954. The level of full-time Census Bureau unemployment might be considerably below 6½ million, due to forced reductions in hours of work to share unemployment, temporary layoffs, etc.

All this can be changed by appropriated policies and programs.

To restore maximum employment and production by the end of 1955, the level of total output for 1955 as a whole needs to be in the neighborhood of $378 billion, or about 6 percent above the $357 billion level for 1954 as a whole. Total output would need to reach an annual rate of about $390 billion in the

---

[1] Chairman, President's Council of Economic Advisers, 1950–53; vice chairman, 1946–50. Consulting economist and attorney. President, Conference on Economic Progress.

fourth quarter of 1955, or more than 8 percent above the $361 billion level in the fourth quarter of 1954.

Unemployed manpower and other idle resources are a progressive threat to our economy if their realities are ignored. But unemployed manpower and other unused resources are an enormous potential asset, because they give us the power if brought back into use to enlarge our economic strength, and thus without excessive strain to place a large enough offering upon the altar of freedom. The fact that we could now produce at an annual rate $30 billion higher than we are now producing, and can raise this much further in the year ahead, makes it folly in the face of the rising Communist threat to let any of our fields lie bare. This is the challenge of the Employment Act; and it is as important or more important now than ever before to rise to the challenge and not to evade it.

Answers to the specific questions raised by the joint committee are as follows:

Question 1. What are the facts respecting population growth, labor force, employment, unemployment, layoffs, part-time employment, productivity, production, private investment, consumption, Government demand for goods and services, and savings since 1952?

To answer this question in full would require a complete economic history of the past 3 years; consequently, I shall stress the items which according to my analysis seem to me of greatest significance in the current economic situation and with respect to the economic outlook.

EMPLOYMENT AND UNEMPLOYMENT

Total employment in 1954 averaged about 1 million lower than in 1953, and more than 450,000 lower than in 1952. But unemployment grew faster than employment fell because the labor force grows from years to year.

Full-time unemployment, as shown by the official figures of the Census Bureau, rose from 1,602,000 in 1953 to 3,230,000 in 1954. It rose from about 2.5 percent of the labor force to 5 percent.

I use the term "true level of unemployment" to include not only full-time officially reported unemployment, but also temporary unemployment, part-time unemployment, reduction in hours of work to share unemployment, etc., translated into their equivalent of full-time unemployment. In doing this, I allow for the long-term trend toward reductions in the workweek, at about 0.7 percent a year. On this basis, I estimate that the true level of unemployment rose from 1,844,000 in 1953 to 4,083,000 in 1954, an increase of more than 120 percent. It rose from 2.9 percent to 6.3 percent of the labor force.

In addition, due to scant work opportunity, the labor force in 1954 grew by about 400,000 less than normal growth in a maximum-level economy. So the denial of work opportunity was considerably higher than shown by the figures on unemployment. Furthermore, the years 1953 and 1954 caused millions of people to move from more productive and better paid work to less productive and lower paid work. For example, in 1954 agricultural employment was almost stationary, while nonagricultural employment fell by almost 1.4 million; employment in manaufacturing fell about 1.2 million; mining employment declined about 11.7 percent.

This deterioration in the utilization of the labor force can be shown as follows: In the fourth quarter of 1954, our total national output was running at an annual rate almost 7.7 percent below the maximum production level. But the true level of unemployment was only about 3.7 million, seasonally adjusted. This was only about 2 million, or about 3.1 percent of the labor force, above the maximum employment level of unemployment. The disparity between the production deficit and the surplus unemployment shows that a very large number of workers were being underused and underpaid in agriculture, and in trade and industrial work unprotected either by (*a*) collective bargaining, or (*b*) an adequate—or any—minimum wage base.

The employment and unemployment picture has not changed much for the better in recent months. Total employment declined almost 700,000 from the third quarter of 1954 to the fourth quarter. There is usually a seasonal decline in the final quarter, but total employment in fourth quarter 1954 was still about three-quarters of a million below the level in the last fourth quarter (1952) before the recession started. And these employment figures take no account of the great growth in the labor force in 2 years.

Total full-time unemployment in the fourth quarter of 1954, as officially recorded by the Census Bureau, was 2,825,000, compared with 3,230,000 in the third quarter. But seasonally adjusted, the drop in total full-time unemployment was only about 200,000, and thus seasonally adjusted full-time unemployment in the fourth quarter of 1954 was about 3 million. Full-time unemployment remained more than 1,450,000 higher than in the fourth quarter of 1952, and more than 1 million higher than in the fourth quarter of 1953.

Due to a reduction in temporary layoffs, and some increases in working hours, the true level of unemployment in the fourth quarter of 1954 was reduced to about 3½ million, or about 3.7 million when seasonally adjusted. This contrasted with less than 2½ million, seasonally adjusted, in the fourth quarter of 1953.

There has been little or no real improvement in the most recent months. Total full-time unemployment fell less than 300,000 from September to December, but much of this was due to seasonal factors. In December, full-time unemployment of 2,833,000 was about the same as in November, higher than in October, 1.4 million higher than in December 1952, and about 1 million higher than in December 1953. Seasonally adjusted, full-time unemployment in December 1954 was about 3 million, and the true level of unemployment was about 3.7 million.

In the fourth quarter of 1954, manufacturing employment was about 250,000 higher than in the third quarter. This was due largely to the upswing in new model auto production and its impact upon steel; the maintenance of this rate of upswing is highly dubious. In any event, manufacturing employment in the fourth quarter remained about 1 million lower than in the fourth quarter of 1953. There was practically no improvement in manufacturing employment from month to month during the fourth quarter of 1954. Mining and construction employment in December were lower than in November, and lower than for the fourth quarter as a whole.

The available seasonally adjusted figures are most revealing. The adjusted index for total nonagricultural wage and salary employment showed almost no change in the fourth quarter of 1954; this index stood at 110.3 in December, which was very slightly lower than in the index for 1954 as a whole, and much lower than the 113.6 index for 1953 as a whole. The seasonally adjusted index of employment for manufacturing production workers was 101.8 in December 1954, or no higher than in November. It was lower than the 102.1 index for 1954 as a whole, and distressingly below the 112.0 index for 1953 as a whole.

These figures are most alarming because a sizable increase in production has been accomplished without a comparable increase in employment, due to technological advance. Combining manufacturing, mining, and construction, production in the fourth quarter of 1954 was higher than in the fourth quarter of 1953, but employment was down more than 1.1 million, or more than 5 percent.

With automation and technology on the march, hard-core unemployment is bound to increase greatly well within 1955, unless the economy expands much more rapidly than any current signs now indicate, and much more rapidly than the more optimistic forecasters indicate.

PRODUCTIVITY

The outlook for unemployment is greatly influenced by productivity trends. Higher productivity displaces workers, unless the economy expands sufficiently.

In the postwar years 1947–53, the annual average rise in productivity for the economy as a whole was about 3.7 percent. Generally speaking, years of maximum prosperity have registered an accelerating rate of productivity advance, more so in peacetime than in wartime. Hence, it is fair to conclude that in early 1953, before the recession started, our potential for productivity advance for the economy as a whole was not less than 3.7 percent per year. The recession reflected the failure to expand total output enough to absorb this productivity potential, plus growth in the labor force.

In 1954, according to preliminary estimates, productivity growth for the economy as a whole was much lower. This was due to recessionary influences, and to shifts in the composition of the labor force, as workers were forced into less productive work. But there was no slackening of technological progress; just the contrary. Preliminary estimates for 1954 indicate that the annual rate of productivity gains in manufacturing averaged about 4 percent for the year as a whole, and reached an annual rate of growth of about 6 percent in the fourth quarter.

Technology is still on the march. Any movement toward economic expansion will make the average productivity picture for the economy as a whole come closer to the technological picture. Automation accentuates all this. Thus the true productivity potential of the American economy is higher than ever before. This obviously enlarges vastly the amount of expansion of output and demand required to restore maximum employment and production.

TOTAL PRODUCTION

The annual rate of gross national product was $361.8 billion in the first quarter of 1953. It rose considerably in the second quarter, then dropped sharply through the first quarter of 1954, then stabilized for the 2 middle quarters of 1954 at about $355.5 billion, and then rose to $361 billion in the fourth quarter.

The fourth quarter 1954 annual rate of gross national product, while about the same as the first quarter 1953 level, was about $30 billion below the maximum employment and production level for the fourth quarter of 1954, i. e., about $391 billion. This results from projecting, from the first quarter of 1953, at a 3.7 rate of annual growth in productivity, plus an 0.8 percent rate of increase in total working hours (resulting from a 1.5 percent annual growth in the labor force under maximum conditions less a reduction of 0.7 percent per annum to take account of normal long-range trends in working hours).

This $30 billion deficit in the annual rate of total output, in the fourth quarter of 1954, correlated well with the excess amount of true unemployment plus underutilization of labor due to undesirable shifts in the composition of employment caused by the recession.

CONSUMER EXPENDITURES

To maintain maximum employment and production, consumer expenditures would have needed to rise, at annual rates, more than $21 billion from the first quarter of 1953 to the fourth quarter of 1954. Actually, they rose only about $9 billion, resulting by the fourth quarter of 1954 in a deficiency of consumer spending at an annual rate of about $12.4 billion.

Comparing the same two periods, personal incomes before taxes rose only $5.3 billion, at annual rates. In the absence of the big changes in taxes and in the rate of savings which took place, personal incomes before taxes would have needed to rise about $19.6 billion more than they actually did, or by about $25 billion, to have maintained an adequate level of consumer spending. This $19.6 billion deficiency in consumer incomes before taxes was reduced to a $12.4 billion deficiency in consumer spending by changes in taxes and in the rate of savings having an annual value of about $7.2 billion in the fourth quarter of 1954.

Whether or not the big changes in taxes and in the rate of savings were desirable, these "shots in the arm" cannot indefinitely and in huge magnitudes take the place of the necessary growth in consumer incomes.

The failure to expand consumer incomes and savings sufficiently was central to the onset and maintenance of the recession. There are as yet no signs of the sources for even a nearly sufficient expansion of consumer incomes. The President's economic advisers do not appraise needed levels of consumer incomes; this is the most striking example of their failure to comply with the mandate of the Employment Act that they set forth needed levels of purchasing power.

GOVERNMENT DEMAND FOR GOODS AND SERVICES

Even if consumer outlays had expanded sufficiently, public outlays for goods and services—Federal, State, and local—in the fourth quarter of 1954 were at an annual rate about $10.7 billion below the requirements for maximum employment and maximum production. This was because public spending declined about $8.7 billion over this period, instead of increasing by about $2 billion Since there was an actual rise of $3.3 billion in spending by State and local governments, an adequate level of public outlays would have been maintained if the reduction in Federal spending had been held to $1.3 billion. Instead, the slash in Federal spending was about $12 billion.

The severe slashes in Federal spending had a far greater impact than the bare figures reveal; because every dollar of Federal spending induces 2 to 3 dollars of private spending. Comparing the fourth quarter of 1954 with the first quarter of 1953, a reduction of $12 billion in the annual rate of Federal outlays was accompanied by the development of a $30 billion deficit in total annual output.

If maximum employment and production had been maintained, the higher level of Federal spending requisite to this end would have been consistent with a more nearly balanced budget, especially since in the absence of recession smaller tax reductions would have been necessary.

The Council of Economic Advisers, unfortunately, has presented no analysis of the needed levels of public outlays, consistent with maximum employment and production without inflation. This is one of their serious derelictions under the mandate of the Employment Act. They have not set the Federal budget in the perspective of the national economy.

PRIVATE INVESTMENT OUTLAYS

In the fourth quarter of 1954, total private domestic investment was running at an annual rate about $6.8 billion below the maximum economy level. Of this, however, about $4.5 billion was represented by inventory liquidation instead of accumulation. Only about $2.3 billion represented a deficiency in new construcion and producers' durable equipment.

The deficit in fundamental private investment was not a byproduct of inadequate funds or incentives. If the level of consumer expenditures and outlays, and of public outlays, had been kept high enough, the level of business investment in construction, plant and equipment would have been sufficiently higher than it actually turned out to be.

The changes in the inventory picture have been largely responsive to, rather than the causes of, more fundamental economic maladjustments. The Council of Economic Advisers has, I believe, been seriously in error in terming the recession an inventory recession. Profound forces—productivity, income flow, agagricultural decline, etc.—have been at work, and these advisers do not squarely face, nor do the advisers appraise the significance of these profound forces for the immediate or long-range future.

SAVINGS

The pinch put upon consumers in 1953 and 1954 forced an excessively rapid drawing down of saving, as many consumers were forced to spend a larger part of reduced incomes. The rate of personal saving out of personal income was 7.8 percent in 1952, 8 percent in 1953, and 8.6 percent in the fourth quarter of 1953. It dropped to 7.7 percent in 1954, and to 7.2 percent in the fourth quarter of 1954. Regardless of the desirable level of saving in the long run, this drastic and precipitate reduction worked hardship upon millions of families, as could be clearly demonstrated by looking at the figures on the distribution of savings among American families.

Question 2. On the basis of economic developments since 1952, how would you classify calendar year 1954 in respect to the four phases of the busines cycle identified in the earlier volumes of the National Bureau of Economic Research—as expansion, recession, contraction, and revival?

In the context of the current economic situation, I do not find these four categories particularly meaningful. They seem to me to be based upon a type of economic analysis, as applied to the current American economy, which is now inadequate. This type of analysis, I believe, does not sufficiently measure changes in the economy against the need for growth; it tends to measure changes too much with reference to fixed previous levels, and therefore tends to produce many misleading conclusions.

For example, the gross national product hardly changed at all in the first three quarters of 1954; and in the fourth quarter it was about 1 percent higher than the average for the year as a whole and somewhat under 2 percent higher than in the third quarter. By measurement against previous fixed levels, one would say that the economy moved sideways—neither expanding, receding, nor contracting—for the first three quarters of the year, and then revived or expanded substantially in the fourth quarter. But this seems to me a highly misleading emphasis.

It is closer to reality to say that the economy in the first three quarters of 1954 fell further and further behind "par for the course," which gets higher with the advance in productivity and the growth in the labor force. Consequently, we were much worse off in the third quarter of the year than in the first quarter. This conclusion is not vitiated because, in the short run, concealed unemployment and unfavorable shifts in the use of the labor force may mask some of these highly adverse developments. The best proof of this principle is that there was more than twice as much unemployment in 1954 as in 1953, and this could never be explained simply by looking at the gross national product which declined only from $364.9 billion in 1953 to $357.1 billion in 1954.

Similarly, it is superficial to measure the upturn in output in the fourth quarter simply by comparing it with the third quarter. It must also be compared with the level that would represent maximum output in the fourth quarter, which was higher than the level that would represent maximum output in the third quarter. An "upturn," if not sufficiently sizable, may be entirely consistent with a deteriorating situation insofar as the upturn does not keep up with the growth factor, or at least begin to remedy the accrued deficiencies of previous lack of growth. Some of the already cited figures on unemployment, for example, show little basic improvement.

Furthermore, the economic situation must be evaluated in terms of a wider variety of indices than those commonly used to measure whether the economy is expanding or contracting. For example, the materials in the President's Economic Report, prepared by the Council of Economic Advisers, would convey to the casual reader the impression of a distinct revival or expansion in the fourth quarter. But nowhere do these materials make any claim that the unemployment situation has been substantially changed, when allowance is made for seasonal factors and for the composition of employment. In fact, the advisers systematically avoid real analysis of unemployment, its causes or cures.

My own view is that 1954 could not be characterized as anything other than a year in which we fell dismally short of maximum employment and maximum production—which I deem in accord with the Employment Act to be imperatively valid goals for the American economy. And because the end of the year, allowing for the growth factor, found us further from these goals than the start of the year, I am less optimistic for 1955 as a whole than I was for 1954 as a whole from the viewpoint of levels of unemployment.

Whether 1954 should or should not be called a year of recession or contraction, it certainly was a year in which we lost ground by the tests which I believe to be most valid. At the end of the year, our total output was further below maximum output than at the start of the year. At the end of the year, there was more hard-core unemployment than at the start of the year, the allocation of the labor force was more disturbing, and the corrective distance that we needed to go to restore either maximum employment or maximum production was greater.

Question 3. What purpose, in terms of carrying out the objectives of the Employment Act, is served by defining the needed levels of employment, production, and purchasing power, and for how far ahead should they be defined?

The purpose of the Employment Act is to promote maximum employment, production, and purchasing power, while considering certain other important objectives as well.

If maximum employment means optimum employment, different people may define it in different ways. One person may think that we should have 4 million unemployed, and another person might think we should have 1½ million unemployed. Vastly different consequences of policy and program would result from these two different positions.

But if the needed level of employment is not defined at all, there is no basis for testing whether an asserted current economic condition or outlook is assuring or not because there are no standards against which to measure it. The Council of Economic Advisers does not define maximum employment. They do not even tell us whether they regard the current level of unemployment as far too high, far too low, or just about right. Thus, when they say 1955 looks good, we cannot tell whether they feel that it would be good if unemployment were to be reduced by 2 million, or whether they feel that it would be good even if unemployment were to grow by 2 million.

In my opinion, this is a rejection not only of the philosophy but also of the legal mandate of the Employment Act. It seems to me to be an avoidance of responsibility because national economic policies and programs are designed to achieve objectives, and no adequately concrete objective is stated by the advisers.

Maximum production means a sufficient level of output and demand to be consistent with maximum employment. If maximum employment is not defined, maximum production cannot be defined either. And without defining maximum production, we cannot determine whether the current situation or the outlook for the months and year ahead is good or bad or indifferent. If we have maximum production now, a 4-percent growth in the economy during 1955 would be fairly good; but if we are 20 or 30 billion dollars short of maximum production now, we need a much bigger growth to restore it.

The Council of Economic Advisers, in my opinion, seems to avoid the mandate of the Employment Act that needed levels of production be defined. From reading their materials, one can gather that they feel that the economy ought to grow in 1955, and that it will grow some. But this is far too vague to provide a sound basis for either a formulation or a critique of policies or programs. How much must we grow to absorb productivity? A growing labor force? Those now unemployed?

Only the rash would attempt precise answers to these questions. But no definition whatsoever of the needs reflects no analysis adequate to set forth problems or devise solutions.

Maximum purchasing power means, in the final analysis, a flow and dispersion of income among various sectors of the economy which will promote equilibrium at maximum levels of employment and production. The Council of Economic Advisers undertakes no general analysis of this problem—if they did, how could they possibly have ignored the whole problem of a declining agriculture in a report which purports to deal systematically and comprehensively with the current problems of the American economy? But this is not surprising: If the problems of maximum employment and production are avoided, there is no base upon which to analyze purchasing power needs. What trends in farm income are desirable? What supplements to consumer income, especially for low-income families, are within the range of sound policies and programs?

The Employment Act is, in the final analysis, a vehicle for the prudent and sensible development of consistent national economic policies and programs. But the ultimate purpose of such policies and programs, manifestly, is to promote the utilization of our labor force and other resources in ways which avoid excess waste of manpower and excess waste of opportunity for enjoying maximum output. It would seem obvious beyond the need for argumentation that no systematic formulation or evaluation of such policies and programs can have any sound point of departure, unless that point be a definition of what quantities of employment and production connote maximum employment and production, and what allocations of purchasing power are consistent with maximum employment and production.

The importance of defining these needed levels, as explicitly required by the Employment Act, may quickly be grasped by a reading of the Economic Report. The economic advisers have prepared for the President a thoroughly competent collection of historical data on recent economic trends. But a reading of the report, because it does not define needed levels, reveals no discussion of crucial issues such as these:

How are trends in productivity shaping the size of the task of maintaining maximum employment and production? How are changes in the composition of national income shaping the problem of maintaining maximum purchasing power? Are we progressing or not progressing, measured not against the levels of 6 months or a year ago, but measured against the changing levels required for a maximum economy? What are the implications if the current deficits in output and demand increase, and these deficits may increase even if the economy grows but does not grow enough.

The economic advisers make a few forecasts, surrounded by many hedges. But the Employment Act did not set up a forecasting agency. It set up a national economic policy coordinating body, with forecasting to be used mainly as one tool for the formulation of policy. To be sure, there are a number of random policies and prgrams set forth in the Economic Report. But they do not stem from the economic analysis, because the analysis does not define needs.

Under the circumstances, although I believe that the meaning of the Employment Act is unmistakably clear, I feel that the joint committee might consider advising the advisers to carry forward the responsibilities which the act imposes upon them.

I believe that the Employment Act requires that needed level of employment, production, and purchasing power be defined at least for the full year in which the January Economic Report of the President is submitted. They should now be defined for at least 1955. For certain long-range programs, and as a further guide to our problems of economic adjustment, it is desirable to project some needed levels for several years ahead, say to 1960. But such projections are of little value unless they are used to shed light upon immediate problems, needs, policies, and programs. If a happy portrayal of what we might accomplish by 1960 is used as a substitute for a clear definition of what we should begin doing now, the happy portrayal becomes a mere distraction, and to that extent is injurious.

Question 4. What are the implications of recent trends and present indications for employment, unemployment, hours of work, productivity, total production, private investment, levels of consumption, Government demand for goods and services, and savings for the coming year?

I do not believe that the rate of economic upturn in gross national product and in the industrial production index during the fourth quarter of 1954 can be maintained throughout 1955. Nor do other observers. This upturn was predicated largely upon a rapid fourth quarter expansion of automobile production, with impact upon steel and other industries. On page 24 of the Economic Report, the tentative forecasts made by the economic advisers with respect to investment, consumption, and Government spending, even if achieved in actuality, do not add up to anything like sustained expansion of these indexes at the fourth quarter 1954 rate.

An assumption that, with luck, the economy in 1955 as a whole might have a total output 3 percent above the 1954 level would seem to me a fairly optimistic assumption—and certainly no more pessimistic than what one can derive from reading the Economic Report. I believe that we might, under existing policies and programs, register a 3 percent higher level of total output, at least in the first half of 1955, than in 1954 as a whole.

But those who take comfort in what would result from this rate of expansion, have, like the economic advisers, made no estimates whatsoever of the amount of expansion required to absorb excess unemployment, absorb new entries into the labor force, absorb those who have been kept out of the labor force by recessionary conditions, absorb the growth in productivity which is certain under current technological trends if the economy advances; and, in addition to all this, restore a product mix in the use of the labor force more healthful and less wasteful than that which now exists.

If the level of total output in 1955 should be 3 percent above 1954, that would not be nearly enough expansion to meet these problems. An expansion in these proportions would result in an increase in hard-core unemployment. An expansion of only 3 percent would mean that the level of true unemployment for 1955 as a whole might average around 6½ million, contrasted with slightly above 4 million in 1954. The level of full-time Census Bureau unemployment might be considerably lower than 6½ million, due to forced reductions of hours of work to share unemployment, temporary layoffs, etc. This level of unemployment would be complicated by further pressing of the labor force into relatively less productive areas where more workers cannot be efficiently used under general economic conditions far short of maximum employment and production.

The budgetary intentions of the Federal Government, as now announced, combined with the basic weaknesses in the consumer income structure, the continuing deterioration of agriculture's position, and the high improbability that the downward trend of fundamental business investment will be reversed under these combinations of circumstances, would seem to offer little prospect that the economy as a whole will average sufficient growth in 1955 to prevent the gradual accumulation of hard-core unemployment.

All this can be changed by appropriate policies and programs. But these kinds of programs and policies seem to me to require a much more basic economic analysis and a much firmed adherence to the need—defining requirements of the Employment Act—than the advisers under the act have thus far displayed.

To restore maximum employment and production by the end of 1955, the level of total output for 1955 as a whole needs to be in the neighborhood of $378 billion, or about 6 percent above the $357 billion level for 1954 as a whole. Total output would need to reach an annual rate of about $390 billion in the fourth quarter of 1955, or more than 8 percent above the $361 billion level in the fourth quarter of 1954.

Unemployed manpower and other idle resources are a progressive threat to our economy if their realities are ignored. But unemployed manpower and other unusued resources are an enormous potential asset, because they give us the power, if brought back into use, to enlarge our economic strength, and thus without excessive strain to place a large enough offering upon the altar of freedom. The fact that we could now produce at an annual rate $30 billion higher than we are now producing, and can raise this much further in the year ahead, makes it unconscionable in the face of the rising Communist threat to let any of our fields lie bare. This is the challenge of the Employment Act; and it is as important or more important now than ever before to rise to the challenge and not to evade it.

The CHAIRMAN. The meeting tomorrow will be in the same room at 10 o'clock. We take up the problems of regional and industrial unemployment.

There will be an executive meeting at 9: 30 in room 324.

(Whereupon, at 4: 10 p. m., the committee adjourned until Thursday, January 27, 1955, at 9:30 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

THURSDAY, JANUARY 27, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10:30 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman; Senator Sparkman; Senator Watkins; and Representatives Bolling, Kelley, and Talle.

The CHAIRMAN. Gentlemen, we are very glad, indeed, to welcome you here, and appreciate your taking this time to be with us.

The subject we are going to consider this morning, as you know, is the problem of regional and industrial unemployment. We invited the Secretary of Labor to come, or to send a representative. We are very pleased that Mr. Goodwin, who is the Director of the Bureau of Security of the Department of Labor, is here.

Has the Department of Commerce sent a representative?

Mr. ENSLEY. Yes; Mr. Roterus.

The CHAIRMAN. The procedure which we are going to use is to ask each person rather briefly to discuss the questions which we have submitted. We suggest that you take not more than 5 or 5 to 7 minutes, although representatives of the Departments will be permitted a longer period of time in which to speak.

I think that no questions concerning policy should be submitted to the representatives of the Departments, namely, Mr. Goodwin and Mr. Roterus. They are not policymaking officials, and, therefore, should not be questioned about policy. Nor should they be questioned about conversations which they may have had with other members of the executive department, or any agreements or disagreements which they may have with the executive policy.

We do this in order to preserve the sanctity of the executive department which has not always been carefully followed before certain committees, but which we are anxious to protect.

With that statement, Mr. Goodwin, would you lead off on this question. I am going to ask all of you to discuss question 1 first, before we turn to the second question:

What are the facts respecting employment, unemployment, layoff, part-time work, and living conditions in depressed regions and industries? And in this connection if there is any information on the number receiving food relief I think that would be appropriate.

Mr. Goodwin.

OPENING STATEMENT OF ROBERT C. GOODWIN, DIRECTOR, BUREAU OF EMPLOYMENT SECURITY, UNITED STATES DEPARTMENT OF LABOR

Mr. GOODWIN. Mr. Chairman, I have a brief statement which I would like to make at this time.

I welcome this opportunity to appear again before your committee. I wish to discuss with you our experience with regional and industrial unemployment, some of the conditions which give rise to local unemployment, and programs which are designed to deal with these problems. I would also like to submit, in a few days, a somewhat more detailed statement relating to regional and industrial unemployment over the past year.

A year ago in January claims activities were rising substantially more than seasonally, and instead of declining in February, as it usually does, insured unemployment continued to rise through March and April to 2,181,000. Thereafter, the average weekly volume declined steadily to less than 1.5 million in November.

The rise in insured unemployment was accompanied by a rise in the number of claimants exhausting unemployment benefits. The number of exhaustions rose from 94,000 in January to 171,000 in August, and then tapered off to 152,000 in December. The total number of exhaustions for the year was 1,762,000. As may be expected, the largest volumes of exhaustions generally occurred in those States which experienced the heaviest levels of insured unemployment.

The economy began to improve this past fall, and the seasonal increase in insured unemployment, which usually begins in November, did not develop this year until December when the volume moved up to 1.7 million. Furthermore, the rise this year was somewhat smaller than usual.

During 1954, $2 billion in benefits was paid to about 6.6 million individuals under State unemployment-insurance programs, as compared with $962 million paid to 4.2 million individuals in 1953.

It is too early to tell yet what January will show, but insured unemployment rose as usual in the first week to 1,857,000. Normally insured unemployment begins to turn down toward the end of January and early February.

The volume of insured unemployment varied widely among different regions, States, and areas over the past year. The largest volumes of insured unemployment were experienced in the middle Atlantic and east north central regions which account for about half of the covered workers of the Nation, and which have a heavy concentration of durable goods manufacturing. In these regions which include New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin, cutbacks in such industries as steel, autos, military hardware, heavy industrial machinery, machine tools, railroad equipment, and farm machinery contributed significantly to insured unemployment levels. Curtailments in apparel manufacturing also caused some unemployment in New York, New Jersey, and Pennsylvania.

The highest rate of insured unemployment, as distinct from the numbers of workers involved, were experienced in West Virginia, Kentucky, Tennessee, Mississippi, New Hampshire, Oregon, Pennsylvania, Maine, and Rhode Island.

PROBLEM OF LOCALIZED UNEMPLOYMENT, EXTENT AND CAUSES

While the State figures on insured unemployment provide a valuable indicator of the relative impact of unemployment among different sections of the country, they do not, of course, tell the whole story about the problem of localized unemployment. The Bureau of Employment Security classifies 149 major local areas according to their relative degree of unemployment.

Our January 1955 classification shows that 105 areas which account for close to 80 percent of the 32.5 million nonfarm wage and salaried workers surveyed had only moderate unemployment. Some 44 other major areas had substantial unemployment and were classified in group IV in January. Of these, 35 had between 6 and 12 percent of the work force unemployed; the other 9 had unemployment in excess of 12 percent. About one-third of the Nation's total unemployment is centered in areas classified in group IV.

At this point, I wish to emphasize that not all of these areas are confronted with long-term unemployment problems. A very large share of the more than 1 million unemployed workers in the group IV areas are concentrated in areas with short-run unemployment problems, stemming from temporary dislocations in specific industries. No single cause can fully explain serious unemployment in some areas while the Nation as a whole is generally prosperous.

Several contributory factors, however, can be isolated. Among these are:

1. Short-run cutbacks in consumer demand for certain products. The Detroit and Pittsburgh areas early in 1954 illustrate the effects of such cutbacks in the auto and steel industries.

2. Long-term loss of an industry's competitive market position. Employment in some areas has been declining over long periods of time because of the inroads of competing products upon the market position of basic local industries. This has frequently been accompanied by geographic shifts of the industries effected. Many textile areas in New England have experienced this problem. Many Pennsylvania anthracite coal mining areas, such as Scranton, Wilkes-Barre-Hazleton, and Pottsville have suffered employment losses due to competition from other fuels.

3. Exhaustion or depletion of natural resources: Coal-mining areas, where the most accessible veins have been exhausted or depleted, have been hardest hit. To a lesser extent areas dominated by such industries as lead, zinc, and silver mining, and lumber have also developed labor surpluses as a result of the depletion of natural resources.

4. Technological changes: Changes in methods of production or materials used for certain items have resulted in substantial labor surpluses in some areas. For example, the change-over from cotton cord to nylon cord in rubber tires has created heavy unemployment in the Cedartown-Rockmart area of Georgia. Similarly, the change to diesel engines has contributed to labor surpluses in the important railroad and locomotive repair center of Altoona, Pa.

5. Lack of an adequate industrial base: In some areas locally available employment opportunities are not sufficient to support a growing population and labor force on a year-round basis. Among these are the seasonal resort areas of Atlantic City, N. J., Asheville, N. C., and Ronceverte-White Sulphur Springs, W. Va.; the tobacco processing

centers of Durham and Winston-Salem, N. C., and the Great Lakes shipping ports of Duluth, Minn., and Superior, Wis.

6. Shifts in Government activities: Some areas are or have been in the labor-surplus category because of changes in emphasis of our defense program. Cutbacks in ordnance requirements over the past 2 years, for example, have contributed significantly to the development of surplus conditions in many small areas.

PROGRAMS TO ALLEVIATE UNEMPLOYMENT

To over 40 million workers the first line of defense against unemployment is unemployment insurance. It is automatic in the sense that it goes into effect without requiring special State or Federal action. It directly supports the purchasing power of those seeking work and it is of known amount and duration so that recipients and the communities in which they live can plan their own actions with a full knowledge of the facts.

In addition to the system of State unemployment insurance laws which operate in all States, the District of Columbia, Hawaii, and Alaska, there is Federal legislation providing unemployment insurance for railroad workers, Korean veterans, and civilian employees of the Federal Government.

As recommended by the President, State unemployment insurance programs should be improved by broadening coverage and by increasing the amount and duration of benefits. The Secretary of Labor has communicated with the State governors urging that action be taken to revise State laws so that they may more adequately carry out the basic objectives of a sound unemployment insurance system. I want to emphasize that unemployment insurance is a first line of defense, and is one of the built-in economic stabilizers. Unemployment insurance in itself does not spark a resumption of economic activity but it provides time for other programs to get under way.

The nature of the unemployment problem and the kind of action required to deal with the problem differ from one locality to another. For this reason the primary responsibility for dealing with localized unemployment problems rests with the local community whose resources and facilities must be coordinated to overcome the conditions which give rise to the unemployment. State governments share with local governments the responsibility for cooperating with the local community groups to develop action programs which will bring about economic diversification and stimulate employment opportunities. The role of the Federal Government is to cooperate with State and local governments in these efforts. It brings to bear its technical resources in helping to determine the character of the problems and it helps to develop courses of action to deal with the problem. In addition to its general national economic policies and programs it modifies its own operations and activities to provide assistance to local areas experiencing serious unemployment.

Federal programs to alleviate unemployment in labor surplus areas include three broad fields of activity: Technical assistance to the States and the communities primarily through the Departments of Commerce and Labor; certain special provisions in procurement policies benefiting bidders from areas of substantial labor surplus; and assistance through accelerated tax amortization to benefit new or expanded plants necessary to strengthen the mobilization base located in areas of labor surplus.

In addition, programs that are not directly linked to area unemployment may be of some assistance to areas of substantial labor surplus. These include the program for urban renewal under the Housing Act of 1954; Federal assistance for school, road, and hospital construction; the construction or expansion of Federal installations such as Atomic Energy Commission plants and Defense Department installations, and the programs of the Small Business Administration. Unemployment is also a consideration in adjusting many other broad Federal programs such as foreign-trade policy and the development of river basins and harbors, and flood control.

The program of the Department of Labor with regard to local area unemployment includes both the determination and publication of the facts and technical assistance through the State employment security agencies to the communities themselves in organizing their own community resources. Forty-two State unemployment insurance laws specifically provide for programs to alleviate and prevent unemployment. The community employment development program is now one of the important programs in the employment security system. In a typical situation a representative from the Department of Labor is sent to assist State technical staffs and the local office manager in a thorough review of the facts concerning a locality's labor market, the basic causes of the unemployment, and the employment outlook as far forward as key employers in the area can estimate their labor requirements. The local office manager, with the assistance of the Department's representative, stimulates local civic leaders, key employers, and major union leaders to cooperate in working out an overall program for the community. This program lays heavy stress on developing further the assets of the community and correcting weaknesses. It points generally to the types of industries that are necessary not only to provide additional employment but to balance the local economy. Primary stress in all of this work is laid upon local responsibility and local initiative.

The Department of Commerce, through its area development division, works closely with us in providing assistance to communities of substantial unemployment. The Department of Commerce representative, Mr. Roterus, will, I am sure, elaborate on the activities of his Department.

Federal procurement policies to assist areas of substantial labor surplus have now been extended to include offshore procurement. These policies include Defense Manpower Policy No. 4, as amended in November 1953, and Executive Order 10582, which modifies the application of the "Buy American Act." Under DMP-4, a procurement agency may set aside a portion of a procurement for the specific purpose of offering it to firms in labor-surplus areas at an acceptable price determined through free competitive bidding. While this program has not resulted in the redirection of a large volume of contracts to such areas, the wide dissemination of the list of labor-surplus areas has resulted in manufacturers in these areas receiving more attention. The total volume of contracts secured by them has been significant. From January 1 to September 30, 1954, a total of over $900 million in Defense Department contracts was placed in surplus-labor areas.

On December 17, 1954, the President issued Executive Order 10582 to expand offshore procurement. However, the order permits the rejection of a foreign bid in any situation where the domestic low bidder would produce most of the materials in areas of substantial labor surplus, providing such action is determined to be in the national interest. This policy is still too new to measure its results.

A more basic program is the granting of additional accelerated tax amortization to firms that locate in areas of substantial labor surplus. The program is more basic since it creates a permanent business activity. This policy was initiated in November 1953 by the Office of Defense Mobilization and came after a great volume of applications had already been processed, so that relatively few industries remained eligible for accelerated amortization. Nevertheless, through December 1954, some 31 facilities involving a total capital investment of $204 million have been certified for areas of substantial labor surplus. These facilities, when completed, are expected to provide jobs directly for nearly 9,000 workers. As we all know, such employment will create secondary jobs in trade, service, and other supporting activities.

RECENT PROGRAM DEVELOPMENTS

Some months ago the Council of Economic Advisers set up a task force to examine and evaluate programs designed to assist areas of substantial labor surplus. The President's Economic Report recognized that the procurement and tax-amortization policies have been of rather limited assistance, but recommended their continuation. Further, the report strongly urged the strengthening of the technical assistance programs, especially those conducted by the Departments of Commerce and Labor.

The Department of Labor is reviewing past experience in this field and what can be done to assist areas experiencing substantial unemployment. It is obvious, however, that the initiative and responsibility of the local community and State governments are of basic importance in resolving localized unemployment problems.

The CHAIRMAN. Thank you very much.

(Mr. Goodwin's statement, and a supplemental statement subsequently submitted appear at pp. 236, 242.)

The CHAIRMAN. Mr. Roterus.

OPENING STATEMENT OF VICTOR ROTERUS, CHIEF, AREA DEVELOPMENT DIVISION, OFFICE OF TECHNICAL SERVICES, UNITED STATES DEPARTMENT OF COMMERCE

Mr. ROTERUS. Mr. Chairman, members of the committee, members of the panel, I have a rather brief statement, but I have cut it further to stay within the 10 minutes allotted me.

The CHAIRMAN. Thank you.

Mr. ROTERUS. Areas of spot unemployment are principally of two types—the temporal type which appear and vanish with the fluctuations of the national economy and those of a chronic type which may persist even when the national economy is at high levels. The latter areas particularly present special problems and needs. Since Mr. Goodwin, of the Department of Labor, has discussed the extent of these areas and the reasons why they are faced with long-term unemployment problems, I should like to confine myself, first, to several observations about the problems and needs of these areas, and second, to how our particular program attempts to assist these communities in meeting their problems and needs.

NEEDS OF SURPLUS LABOR AREAS

Areas of long-term unemployment have these characteristics, among others:

(1) They need either a complete revitalization of their existing industries, or where these industries face a shrinking future, new activities—a new economic base—are needed to keep pace with national progress and to provide increasing job opportunities.

(2) Many of these areas, exclusively schooled in the development of one type of resource or industry, are not prepared to move incisively into new product fields or to serve new and changing markets.

(3) The know-how with which to take the necessary steps in developing a revitalized local economy based on local resources and advantages is often lacking.

(4) The knowledge and ability to make use of existing State and Federal aids in buttressing local area development efforts are likewise lacking.

(5) Despite the most arduous local efforts at a solution—which usually is determined to be the establishment of new lines of industry—these efforts sometimes die on the vine because effective contact has not been made with the executives of private industry whose decisions as to new and branch plant locations are a vital key to expanding job opportunities.

AREA DEVELOPMENT PROGRAM OF THE DEPARTMENT OF COMMERCE

Acting on suggestions of the President's Advisory Board on Economic Growth and Stability, the program of the Area Development Division of the United States Department of Commerce was expanded last spring to assist labor surplus areas in their efforts to deal with their own problems. The Department gave the Division the assignment of serving as a focal point and clearinghouse in the Federal Government for area groups and delegations seeking assistance to relieve local area unemployment. As a result, the Division has attempted to meet the demands of local delegations and congressional requests with prompt and orderly handling and, when indicated, appropriate units of the Federal Government have been called on and have cooperated on the problems on which they were capable of making a contribution. In addition, the Division began fashioning a program to assist State and local groups in working toward new employment opportunities in the areas of labor surplus.

The elements of this program can be briefly summarized as follows:

1. Several employment development kits and aids were prepared. A canvass was made of local and State programs, and the actions of many communities were summarized in a simple Community and Area Development Checklist, which I have here (exhibit A).

(The exhibits referred to in Mr. Roterus' testimony are on file with the committee.)

Mr. ROTERUS. This checklist is a brief compendium of the types of actions that various aggressive communities had taken to cope with problems of industrial development, retail and service trade expansion, tourist and recreation development, local government aids, and so forth. The checklist also enumerated actions that had been effectively taken by the various States.

Another self-help tool that the Division has provided to meet the know-how needs of many local areas for establishing new industry based on local resources is a Community Industrial Development Kit (exhibit B). This kit covers a range of topics including (*a*) the survey of what prospective industry wants to know about your community; (*b*) promotion stage—how to find the industrial prospects; and (*c*) advice on how other communities have gone about this job.

The Division found that many communities had been successful in establishing new industries through the device of the planned industrial park which in essence is similar to a high-class residential subdivision. To make these experiences available to all communities determined to expand and diversify their economic base, the Division just recently issued a how-to-do-it publication entitled "Organized Industrial Districts; a Tool for Community Development."

That is this document here (exhibit C).

I might add that in the Northern States this device has not been used as much as in developing the West and Southwest.

The second part of the program we are developing goes to the heart of the matter of establishing new industry to take the place of old or declining industries in areas of surplus labor. Once a community has organized for this effort their prime need is to come into direct contact with firms planning expansions. In this connection we have tried various devices to assist communities in need. Several times a month, for example, leading executives from the various types of private industry are called to industry conferences held by the Department of Commerce. Time is allotted on the agenda of these conferences to discuss the problem of surplus-labor areas. the stake of private industry in their solution, and the conference is asked to give earnest consideration to the advantages of these areas in their planning for future plant locations.

Right now there is a meeting of machine-tool executives in the Department of Commerce, and this story is being brought to their attention.

Another effort in the direction of encouraging diversification of the local economies was the new products, new methods, and patents exhibit held in Detroit last October in which State and local governments, labor unions, and private industry cooperated with the Department. The Department of Defense, which has spent billions of dollars in research, put on public view new products, processes, and materials which have commercial development possibilities, and which they are eager to get into civilian production for quick defense conversion when the need arises. We are now engaged with the Department of Defense in looking into possibilities for extending this exhibit to other sections of the country, preferably on a regional basis.

Another effort to enlist private industry into the program for assisting labor surplus areas was in cooperation with the Society of Industrial Realtors. A task force appointed by this society visited Lawrence, Mass., as a test case, and made a report which has general application to the problems of all labor surplus areas. Using the methods outlined in this report members of the task force are actively negotiating with several manufacturing firms with respect to possible locations in that area.

I might add that this type of effort does not have overnight results, and it takes persistent work. For example, Cumberland, Md., from whose representative we are going to hear today, is a case in point. Some time ago the Commerce and Labor Departments, in cooperation with State agencies, conducted an industrial development survey there. This survey and report provided the city's first inventory of available industrial sites. The report also outlined a detailed program for local action with complete responsibility for industrial development work lodged in one agent. The Area Development Division later called to the attention of the industrial development department of the railroad going through Cumberland and to industry executives the available governmental incentives for plant locations in labor surplus areas. A few months ago these various and associated efforts—Federal, State, local, and private—bore fruit in the fact that a large glass company began construction of a $33 million plant which will employ upward of 800 people. With this stride forward and with the aggressive local efforts now active in the Cumberland area, I venture to say that we have not yet seen the end of new development in Cumberland.

Another important activity of the Division which has been limited by the available personnel has been the on-the-spot assistance to State and local groups in combating problems of local unemployment. Division representatives, on request of local delegations and Members of the Congress, have made field visitations to communities in Indiana, Kentucky, Oklahoma, Pennsylvania, Virginia, West Virginia, and a number of communities in New England. These visitations are the perfect time to inform the local development groups how to make full use of aids and programs of the Department of Commerce and other agencies which can be helpful on specific local problems. We have found that most communities are appreciative not only of our technical assistance but apparently get a morale boost in their own efforts through personal contact and assistance.

These visitations are always conducted in cooperation with State planning and development agencies with whom the Division maintains a close working relation through informal bulletins, an annual conference in Washington, and other means. Followups in Washington with other agencies able to provide particular types of assistance and the continuing contact with local and State groups entailed by the field visitations are illustrated by our reports on recommendations made to the President by the Northeast Pennsylvania Industrial Development Commission (exhibit D), and drought relief and area development recommendations, eastern Oklahoma (exhibit E). In these visitations we have received the full cooperation of representatives of the Small Business Administration, the Department of Labor, the Department of the Interior, the Housing and Home Finance Agency, the Department of Defense, and others.

The Economic Report of the President for 1955 recommends further strengthening of the area-development program of the Department of Commerce. If additional funds are made available during the next fiscal year the Division will step up its various activities.

In particular, we shall increase our on-the-spot assistance to labor-surplus areas by stationing area-development specialists in the field. These specialists would give personal and continuing consultation to labor-surplus-area groups in followup of requests for such help made to the Congress and executive branch. They will also keep us informed of what successful devices are being used by various labor-surplus communities in attacking their problems, and this information will be made the subject of a periodical bulletin which will be made available to all local labor-surplus areas.

Further, out of our experience in the field we expect to make suggestions as to what the Federal Government might do further in assisting these spot areas of unemployment to get back in step with national growth.

(The exhibits referred to in Mr. Roterus' testimony are on file with the committee. His prepared statement appears at p. 260.)

The CHAIRMAN. Thank you very much.

In view of the fact that the first two witnesses have not confined themselves, and perhaps it is quite proper that they should not, to the first question, but dealt with the second, third, and fourth questions, I think that the other members of the panel should be free to discuss the subject as a whole.

Mr. Thomas, from Pennsylvania.

STATEMENT OF LESTER THOMAS, INTERNATIONAL REPRESENTATIVE OF THE UNITED MINE WORKERS

Mr. THOMAS. My statement before this committee today will be confined solely to the coal-producing areas of the State of Pennsylvania and the serious problem in unemployment that now exists in these areas.

Anthracite region:

Prospective labor market conditions in anthracite labor market area of Pennsylvania as of November 1954

Definition of classification:
IV–A—6–11.9 percent of labor force unemployed.
IV–B—12 percent or more of labor force unemployed.

POTTSVILLE (SCHUYLKILL COUNTY) AREA

Current area classification—IV–B—Very substantial labor surplus:	
Civilian labor force	82,750
Unemployed	16,350
Employed	66,400
Percent unemployed	19.8

SCRANTON AREA

Current area classification—IV–B—Very substantial labor surplus:	
Civilian labor force	105,050
Unemployed	15,600
Employed	89,450
Percent unemployed	14.9

SUNBURY-SHAMOKIN-MOUNT CARMEL AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	68,770
Unemployed	10,500
Employed	58,270
Percent unemployed	15.3

WILKES-BARRE-HAZLETON AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	147,650
Unemployed	22,900
Employed	124,450
Percent unemployed	15.5

CLEARFIELD-DU BOIS AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	35,900
Unemployed	5,100
Employed	30,800
Percent unemployed	14.2

INDIANA AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	21,150
Unemployed	2,800
Employed	18,350
Percent unemployed	13.2

JOHNSTOWN AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	102,300
Unemployed	19,100
Employed	83,200
Percent unemployed	18.7

KITTANNING-FORD CITY AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	23,400
Unemployed	3,350
Employed	20,050
Percent unemployed	14.3

UNIONTOWN-CONNELLSVILLE AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	53,400
Unemployed	13,100
Employed	40,300
Percent unemployed	24.5

PITTSBURGH AREA

Current area classification—IV–B—Very substantial labor surplus:

Civilian labor force	924,300
Unemployed	87,000
Employed	833,200
Percent unemployed	9.4

Labor force, employment, and unemployment in the anthracite region, by labor market area—Bimonthly, November 1953–November 1954

Labor market area	November 1953	1954 January	March	May	July	September	November
Scranton (Lackawanna County):							
Total civilian labor force	105,650	105,050	105,150	105,000	105,900	105,050	105,200
Employment	94,700	92,350	92,200	89,050	87,950	89,450	89,850

[1] Office opened June 1954.

In the period November 1953–November 1954, unemployment in the Scranton, Wilkes-Barre-Hazleton, and Pottsville areas combined increased by 18,000. Prior to November 1953, the unemployment problem in these combined areas was very acute. This rise in unemployment in the past year can be attributed directly to the declining employment in the anthracite mines and its adverse effect on railroad and other employment within the area.

In the 3 areas employment in mining decreased by 14,000. Added to this were declines in transportation and other trades, which brought the total drop attributable to mining to approximately 18,000 in a 1-year period.

As recently as January 10 of this year mining employment loss, approximating 1,700, occurred in the Shamokin-Mount Carmel area, which had been already hard hit by unemployment, totaling in the neighborhood of 10,500.

According to the Anthracite Institute, 1954 commercial production of anthracite coal dropped 12.6 percent below the output in 1953 and 36.6 percent below the output of 1952. The decline in production was attributed to the continued competition of domestic and imported fuel oils and natural gas, together with above normal temperatures during the first half of 1954.

Data respecting average man-days worked in the anthracite coal-mining industry during 1954 are not yet available from the Pennsylvania department of mines. However, according to information provided by local employment-office reports, staggered or short workweeks marked the industry through most of the year. The reports show that reduced work schedules were adopted by such large operators as the Glen Alden Coal Co., Lehigh Navigation Coal Co., Lehigh Valley Coal Co., Hudson Coal Co., and the Philadelphia & Reading Coal & Iron Co.

The seriousness of the unemployment problem in the anthracite region can best be described by giving the number unemployed in the various areas of that region:

Pottsville area, unemployed as of November 1954, 16,350; percent unemployed of entire labor force, 19.8 percent.

Scranton area, 15,600 unemployed; 15.9 percent.

Shamokin-Mount Carmel area, 10,500 unemployed; 15.3 percent.

Wilkes-Barre-Hazleton area, 22,900 unemployed; 15.5 percent.

In further describing the seriousness of this situation, I want to point out the amount of moneys that have been paid to unemployed persons in this area. During the year 1954 there was a total of 2,093,007 compensable claims paid in the anthracite area, totaling $49,274,000.

[1] Office opened March 1954.

[2] Office opened June 1954.

In the period November 1953–November 1954, unemployment in the 3 largest bituminous coal-producing areas, Pittsburgh, Johnstown, and Uniontown-Connellsville, increased by approximately 64,000.

A drop in demand for both primary and fabricating metals is the major reason for the unemployment rise. Decreased production in the metal industry reduced the demand for bituminous coal and for firebrick for the coke ovens. Lowered requirements in all of these fields in turn adversely affected railroad transportation and wholesale and retail trade. Primary metals employment in these 3 areas decreased by approximately 29,000; fabricating metal and machinery by 13,000; bituminous mining by 12,000; transportation by 7,750; stone, clay, and firebrick by 2,150; and trade by 8,700.

Bituminous coal production in 1954 fell substantially below the output in 1953. United States Bureau of Mines reports indicate that 1954 production was down 14.3 percent in the industry as a whole. Principal factors responsible for the decline were substantial reduction in the industrial consumption of coal, particularly by the steel industry; increased use of diesel locomotive power by the railroads; and some reduction in the domestic use of coal, attributable to the milder weather that prevailed in 1954 and the increasing competition of oil and gas as fuel.

During the year 1954 there was a total of 1,941,829 compensable claims paid in the bituminous area, totaling $45,867,000. The amounts paid in both the anthracite and bituminous regions amount to over 38 percent of the total compensation paid in Pennsylvania.

Adding to the seriousness of this question is the fact that the number of unemployment compensation benefit exhaustions is increasing steadily, and has resulted in an annual total of persons exhausting their unemployment compensation amounting to 35,440.

As a result of these exhaustions, the Department of Public Assistance is increasing its caseload to the extent that the Governor of Pennsylvania has this week introduced in the General Assembly of Pennsylvania a deficiency appropriation amounting to over $16 million to provide for the carrying on of public assistance until the end of the present biennium, which occurs on May 31, 1955. The total appropriation of the Department of Public Assistance amounts to over $200 million in a biennium. This despite the fact that the standard of grants by public assistance to the various recipients in no way compares with the amounts granted in other industrial States.

The human side of the picture is equally bad. We see families being broken up, with sons and daughters and husbands unable to find work in the region commuting to nearby States such as New Jersey, Delaware, and Connecticut in order to earn a livelihood for the people remaining at the homestead. We see fathers of families unable to meet the family budget, depending for support on wives and daughters who work in mills and factories in the region. This is not natural, nor do they want this, but too often it is the only way family expenses can be met. What this does to the family relationship between the father and the rest of the family can be easily imagined.

Why do these people stay in the region, you may ask. They are bound by the natural ties that come from living in an area where your ancestors have resided for generations and your parents lie buried.

They have homes which represent lifetime savings and cannot be sold at anything near their real value. These sentimental and financial ties are real and have great meaning to the folk in my region. They are good citizens, and you may refer to the official records of our military establishments, and you will find that the enlistment and draft rates in the region were among the highest in the country.

My organization, the United Mine Workers of America, has tried to take care of the old and the disabled, without having them a burden on the community, through its welfare funds. This program has been in peril of breaking down in the anthracite region because of low production. Originally geared to pay $100 per month to a retired miner, reduced revenue has required cutting this modest sum in half, and even so the income picture is not bright and the fund is not self-sustaining.

Our organization has worked with the owners and coal operators, with the Anthracite Institute, with the Coal Governors' Committee, with community groups, with Congressmen, local officials, with every person or organization that has shown the slightest sympathy or understanding of the plight of the anthracite industry. Our objective has not been to obtain a subsidy, or to ask for Government financial aid of any kind. We want to develop the uses of anthracite, to find wider markets, domestic and foreign, to encourage greater use of our product, and to revitalize the industry through this kind of positive action.

We also feel and sincerely believe that one of the greatest assets this country has is its fuel resources underground. In time of war, oil and gas will immediately be rationed. They will not fill the needs of a wartime economy.

But will the anthracite industry be able to help out, as it did during World War II if it sinks to ever lower levels of production, mines are abandoned to water seepage and gas, and its workers leave for other industries?

You cannot get a mine in working order in a week or a month after the water and gas have had control of it. You cannot put inexperienced people in the mines. The result will be that when the need is greatest the anthracite industry may be unable to bring out of the ground the coal which will be vital to a wartime economy.

On this basis alone the anthracite operators, owners, and the United Mine Workers of America, and every enlightened engineer are in agreement that there should be a national fuel policy which would undertake to conserve and protect for future use the underground coal of our country, and you cannot do this without seeing to it that the industry which operates in this field remains alive and able to undertake the task when needed.

Much that has been said with regard to the anthracite region applies to the bituminous area, except that it applies to a much wider and larger area involving many more people in southwestern and central Pennsylvania. The bituminous industry has been facing increasing competition from many fields, and millions and millions of tons of mined coal are aboveground, reflecting the decreasing demand for this product.

The human side of the situation is not much better than that which I described for the anthracite. One major improvement is the welfare and retirement fund. Because of the national scope of the bituminous industry, the welfare and retirement fund is financially more secure, and stipulated payments of $100 per month have been made regularly, but even with the bituminous welfare and retirement fund, there have been certain cutbacks made in regard to the assistance to disabled mineworkers and hospitalization benefits given to the members of miners' families in prior years, due to financial depletion.

In a number of bituminous areas the situation is one of deeper distress than in the anthracite, because the unemployment is newer and industrial plants have not been built to the same extent as in northeastern Pennsylvania. Therefore, opportunities for younger and single members of the family are less. This is reflected in the unemployment ratio for such an area as Uniontown-Connellsville where, according to the official figures of the Bureau of Employment Security, the unemployment rate is 25 percent of the labor force, a proportion which is not reached anywhere else in Pennsylvania, and which must be compared with the State average of 8.6 percent.

Through Pennsylvania natural gas and oil, lightly taxed, and residual oil imported from foreign countries, are demolishing and destroying the soundness of a basic industry of this country. They are piping in gas and bringing oil right into the coal region, into the heart of the land where coal is mined. If this is not halted and continues, the work force capable of bringing out of the earth our great resource of coal will not be available for an emergency when it comes

The bituminous industry, as the anthracite industry, working with the United Mine Workers of America, does not ask for Government subsidy or financial aid. They only ask that their competitors bear a fair share of taxes so that the coal industry may be restored to proper competitive position. They ask that the importing of residual oil be halted or diminished or heavily taxed, so that this unfair, cheap fuel, brought from a low-wage-paying country, be stopped from destroying an industry which supports hundreds of thousands of American citizens and families.

The records will show that there is a close relationship between the rise of the importation of residual oil and the decrease in consumption of bituminous coal. If there is any one thing which can be pointed to as endangering the well-being, and even the continuance of the coal industry, it is certainly the residual oil problem.

I have not attempted to present a thoroughly documented economic picture of the coal industry in Pennsylvania. I am not an economist nor a statistician. The figures and statements which I have presented, however, are true and accurate. More important is the fact that for almost 20 years I have lived with these problems and have presented them to the legislatures of Pennsylvania in an effort to obtain the assistance of the Commonwealth. But with the increasing complexity of our economy, I think we can all agree that this problem, like so many others, is a national problem which must be considered by the Congress and the national administration. More than anything else it is a human problem involving hundreds of thousands of miners and their families, who are turning to the Congress of the United States for honorable assistance in the making of their livelihoods.

The CHAIRMAN. Thank you very much.

Mr. Fishman.

OPENING STATEMENT OF LEO FISHMAN, PROFESSOR OF ECONOMICS, UNIVERSITY OF WEST VIRGINIA

Mr. FISHMAN. West Virginia and sections of six other States in the Appalachian coalfields are suffering acute economic and social distress. Since I am more intimately acquainted with conditions in West Virginia than elsewhere, my remarks will be confined to the situation existing in that State.

Employment opportunities in West Virginia have been declining since 1948 when nonagricultural employment reached a peak of 543,900. In 1954 employment in nonagricultural industries was only 473,400. Between 1953 and 1954, when nonagricultural employment for the United States as a whole declined by 3 percent, nonagricultural employment in West Virigina declined by 7 percent. During 1954 employment in the bituminous coal industry of West Virginia was only 76,400, roughtly equivalent to what it was during the worst years of the depression.

The drop in employment between 1953 and 1954 in leading West Virginia industries was as follows: Bituminous coal, 16,900; transportation, 3,700; stone, clay, and glass, 1,900; chemical, 1,200; and lumber, wood products, and furniture, 600. Cash receipts from farm marketings in West Viriginia were $6.4 million lower for the first 10 months of 1954 than they were for the first 10 months of 1953. Even in 1953, the most recent year for which such figures are available, the average income per farm from farm sources was lower in West Virginia than in any other State in the Nation.

Unemployment has been a problem throughout the State for some years. Within the past few years this problem has grown steadily worse. In 1954, of the 16 labor market areas in West Virginia 13 were classified as areas of very substantial labor surplus, IV–B, and 3 as areas of substantial labor surplus, IV–A. The median rate of unemployment for all these areas was 13 percent of the labor force. In Beckley, W. Va., an important city in the southern coalfields, the unemployment rate was well over 20 percent.

Twenty-two counties out of the 55 in the State are not included in any labor market area. While precise figures are not available for these rural counties, there is ample evidence to indicate that they too are suffering because of inadequate employment opportunities.

With respect to underemployment, the picture is not quite as clear cut. In the bituminous coal industry, as a result of substantial reductions in the working force and other adjustments, underemployment is not as prevalent now as it was a few years ago. In the glassware industry and on many farms, however, underemployment of labor continues to present a serious problem.

The seriousness of West Virginia's unemployment problem is emphasized by the fact that from April 5, 1950, to July 1, 1954, while population of the United States increased by an estimated 6.3 percent, the population of West Viriginia declined by an estimated 2.9 percent. Only two other States, Arkansas and New Hampshire experienced a population decline in this period, and in neither of these States was the decline as high as 1 percent.

The population decline, 59,000, resulted largely from an outward migration for jobs, and did alleviate the unemployment problem in the State to some extent. With the contraction of employment opportunities elsewhere, however, migration has ceased to be an important alleviating factor. During the fiscal year ending June 1954, the State employment service sent only 868 workers to jobs in other States as compared with 14,120 sent to jobs in other States during the previous fiscal year.

Indeed, there is evidence that a number of those who left the State and found jobs elsewhere, later returned to West Virginia when they lost their jobs. The number of workers who lost their jobs in other States and who filed claims for unemployment insurance in West Virginia increased from 8,364 during the fiscal year ending June 1953, to 21,499 during the last fiscal year.

An unfortunate dilemma exists for the State. As the seriousness of the situation increases, the financial ability of the State to cope with the resulting social problems and to provide for essential public services declines. State revenues have fallen off at an alarming rate. The receipts of the general revenue fund during the last 6 months of 1954 were $3 million less than receipts during the last 6 months of 1953. Since a provision of the West Virginia Constitution prohibits any increase in the bonded indebtedness of the State as a result of deficits in the general fund, prospective deficits must be avoided by reductions in planned expenditures.

All State spending units have, therefore, been requested to reduce their expenditures for the fiscal year 1955 by 5 percent of their appropriated funds. Most State services, including education are affected by this order. Financial grants of the department of public assistance to the aged, the blind, dependent children, and the unemployables, which were already inadequate, have been reduced to 70 percent of a minimum subsistence budget. It is not possible for those who are dependent on these grants to maintain a decent standard of life, and actual deterioration of their physical condition is likely to result.

No financial assistance is available for the 34,360 persons who exhausted their unemployment compensation benefits during 1954 without having found a job, or for those who exhausted their unemployment benefits in previous years and still have not found jobs. Public assistance for these persons is limited to the provisions of the surplus food distribution program. A diet composed largely of available surplus food is not likely to be well balanced. The dietary deficiencies are particularly likely to be serious in the case of infants and small children. Moreover, surplus food is available in only 30 of the 55 counties of West Virginia, since in the other 25 counties there are no distribution facilities for this program. Social workers report that the physical growth of many children is being stunted and their personalities warped. In some instances death is being hastened because of the inadequacies of the public assistance program.

The CHAIRMAN. Mr. Fishman, do you have any estimate as to the total number of persons in West Virginia who are receiving surplus foods?

Mr. FISHMAN. Yes. In May 1954, 136,500 people in 30 countries were receiving food. In 25 counties no surplus food was available for the unemployed.

The CHAIRMAN. That is May of 1954?

Mr. FISHMAN. May of 1954.

The CHAIRMAN. That is the last month for which you have a record?

Mr. FISHMAN. Yes. Conditions have not improved since then.

The CHAIRMAN. I have heard reports that the figure now is larger than that.

Mr. FISHMAN. Quite likely. I inquired of the person in charge of the food-distribution program in Charleston last week and these are the most recent figures he had available for my inquiry.

The CHAIRMAN. We made inquiry and found that there are no readily available national figures on this subject. The figures are scattered among the various States.

Thank you, Mr. Fishman.

Mr. FISHMAN. The fact should be stressed that West Virginia alone cannot cope with its basic economic problems which are structural in character and the result of long-term forces. West Virginia is located in the heart of the Appalachian coalfields. Its cities are relatively small in size and their industries are few in number. Basically, West Virginia's problems stem from the unhealthy condition of the bituminous coal industry. In January 1949, 1 out of every 4 wage and salary jobs was in the cool industry.

The problems of the bituminous coal industry are well known and need not be elaborated on here. Suffice it to say that the displacement of bituminous coal by petroleum and natural gas, and the accelerated mechanization of mining operations since the war are primarly responsible for the declining rate of production and the even greater rate of decline of employment in that industry.

The welfare of the railroad and lumber industries in the State are directly dependent upon the level of operations in the mines. Local trade, public utilities and service industries also mirror the ups and downs of the bituminous coal industry. In certain areas, the situation has been aggravated by the fact that the glassware and pottery industries, which are concentrated in a relatively small number of cities, are suffering from the effects of foreign competition. Recently, imports of glassware from Germany and Japan have increased in value and threaten to cause further reduction in employment this year.

Of all the leading West Virginia industries, only the chemical industry appears to have a bright future, particularly in the Ohio Valley. The decline in employment in that industry last year was probably the result of purely temporary factors.

West Virginia farms are for the most part too small to provide the farm family with a satisfactory income, particularly since lack of sufficient capital and the nature of West Virginia's topography hinder the widespread use of laborsaving devices. Many farm families, therefore, are necessarily dependent on some off-farm employment. During 1954 the problems of these families were intensified since declining opportunities for off-farm employment were accompanied by substantial declines in prices for the produce of their farms, such as beef, chickens, broilers, eggs, and apples, none of which benefit from a support program.

It should be noted that West Virginia has been aware of the need for positive action to attract new industries to the State. The West Virginia Industrial and Publicity Commission, for example, during the current fiscal year is spending approximately $100,000 largely for this purpose. Business taxes and property taxes are relatively low and there are no labor or other laws which businessmen would consider restrictive. Nevertheless, new firms are not coming to West Virginia in sufficiently large numbers to alleviate the problem of unemployment.

None of the recommendations offered in the Economic Report come to grips with the problems existing in West Virginia. The analysis contained in the Economic Report and the recommendations for public policy are based on the assumption that long-term expansionary forces will continue to sustain aggregate income in the United States, and that the essential economic problem is to prevent temporary deflationary influences of a cyclical character and other short-term restrictive forces from gaining the ascendancy.

Since the situation in West Virginia is not the result of purely temporary forces, the recommendations for public policy in the Economic Report are not likely to alleviate that situation. The proposal to extend unemployment insurance coverage from 24 to 26 weeks would be very temporary assistance, assuming that adequate funds for this purpose would be available in West Virginia. The unemployment compensation reserve fund balance at the end of December 1954 was $62,312,486 or 30 percent below the balance at the end of December 1953.

Last year the unemployment fund declined by 30 percent because of the large volume of payments made from it.

The proposal to expand the area development program of the Department of Commerce appears to be a purely formal recommendation. To date the program has in no way contributed to the relief of distress in West Virginia, and it is not likely to do so unless the size of the staff administering the program as well as its administrative powers and funds are greatly enlarged.

Military procurement and construction contracts received by West Virginia have been inadequate to alleviate the economic problems of the State. From July 1950 to March 1954, according to the West Virginia Department of Employment Security, West Virginia firms received contracts amounting to $191,738,000, a mere 0.2 percent of the total value of the contracts awarded during that period.

The CHAIRMAN. A mere two-tenths of 1 percent, not 2 percent.

Mr. FISHMAN. That is right.

Effective measures by the Federal Government to alleviate conditions in West Virginia should include the following:

I. Measures to stimulate the recovery of depressed industries and areas:

1. An increase in the volume of military procurement and construction contracts.

2. Encouragement of private firms, by more effective means than have hitherto been employed, to reopen idle plants formerly utilized for defense production. A rubber plant formerly operated by Goodyear Rubber Co., for example, is now idle in Nitro, and a plant formerly operated by the United States Steel Corp. for naval ordnance, lies idle in South Charleston.

3. Assisting the bituminous coal industry in developing new markets and new uses for coal, and in finding methods to reduce costs, particularly transportation costs. In many areas half the price of

bituminous coal goes to the railroads in payment for the cost of haulage. It should be recognized, however, that no program to aid the bituminous coal industry is likely to improve the employment situation materially.

4. A public works program. West Virginia cities and counties are without funds to provide themselves with sewer disposal plants, adequate waterworks, school buildings and facilities, streets and street lighting, parks and playgrounds.

II. Measures to facilitate continued healthy economic development.

1. A more vigorous Federal program to attract small business to West Virginia.

2. More positive policies for plant dispersal. For strategic reasons, more defense and essential civilian plants should be located in West Virginia. The State is sufficiently far from the primary population and industrial centers to be safe from a military point of view, and sufficiently close to those centers to offer locations which are attractive from an economic point of view.

3. A retraining program for unemployed miners, and if necessary, a resettlement program as well. A successful industrial development program should provide employment opportunities for these men.

III. Measures to relieve existing distress.

1. A greater measure of financial and technical assistance to the State's public assistance program.

2. Assistance in the distribution of surplus foods in areas of need where distribution facilities are at present either inadequate or unavailable.

(Mr. Fishman's prepared statement appears at p. 263.)

The CHAIRMAN. Thank you very much, Mr. Fishman.

Now, we have had two discussions of the coal-mining situation. We also have with us this morning Congressman Gray, of the 25th Illinois District, which is the southernmost district of Illinois, whose major industry is coal. He has kindly agreed to come here and discuss the situation in his district and make some statements about the urgency of the situation.

Congressman Gray.

OPENING STATEMENT OF HON. KENNETH J. GRAY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Representative GRAY. Thank you, Mr. Chairman, members of this committee. I will say it is a distinct pleasure to have the opportunity of coming and talking to you this morning about something close and dear to my heart, and that is the critical unemployment situation.

I had a prepared statement, but to conserve time I would like to talk to you just for a few minutes to tell you about some of the conditions as they exist today in the 25th Congressional District in southern Illinois.

Now, we are comprised of 15 counties. We are predominantly coal mines. We have a little bit of agriculture. We are experiencing not only a recession, but a full-fledged depression in southern Illinois. We have 30,000 able-bodied men and women out of work. We have 30,000 receiving surplus Government food. In just this morning's paper, I find an unemployed carpenter, 45 years old, ended his life by drinking carbolic acid. Now, that is the condition in southern Illinois. I am not here to try to paint a dismal picture, but to talk facts. The people sent me to Congress to stand up and speak out in behalf of their wants and their needs, and I think that in America, the land of plenty, that every man and woman should be entitled to earn a decent living for their family. Now, I want this economic report—I am going to leave the prepared statement I have, and I would certainly appreciate your looking that over.

I am going to introduce in this Congress a public-works bill. I believe it is time that these unemployed people were put back to work. We have the foreign importation of residual oil and other things that is hurting the coal markets, and I hope that this committee can report back some findings that would help correct this situation. I have studied with great interest the Economic Report of the President of the United States, but I find no place in this report where they make mention of such districts as the 25th Congressional District in southern Illinois, which I represent.

Now, folks, it is terrible. My hometown of West Frankfort, Ill., had a population of 15,000 in 1940. The population today is 8,000. We have lost almost 50 percent of our population over prewar, so I believe it is time that something was done for these critical unemployed areas.

I believe that all that glitters is not gold, as you will see in some of these reports that are put out. I say get out and look as some of these areas, such as southern Illinons, and you will see that the people are really suffering. The report this week, in 5 counties in my district there were 20,175 people receiving surplus food. That is only in 5 counties, out of the 15 in my district. It would be upward of 30,000 to 35,000.

I might say in passing we have over 300,000, approximately, in the State of Illinois unemployed, but it is worse down in southern Illinois, where we have the coalfields. I will not take up any more of your time, Mr. Chairman. I appreciate coming over here. I do want to say that I think it is time that something was done.

Last year the President was asked if he did not believe it was time for a public-works program, and he said he did not believe it was time for a slambang public-works program. Well, I say it is time at least for a little pitty-patty public-works program, because these people need to have means of employment.

I thank you.

The CHAIRMAN. Thank you very much.

(The prepared statement of Representative Gray appears at p. 265.)

Senator SPARKMAN. Mr. Chairman, may I add just a word. First I want to thank Congresman Gray for giving us that statement. As he knows, we have a good bit of coal in Alabama, and several of the counties in my State are affected in the same way.

In fact, some 5 months ago I had a report from 1 county that has a population of 43,000, and 24,000 were on emergency rations in that county. I am certain that as the winter has progressed, that number has gone up.

In fact, about a month ago, the director of public welfare for Alabama told me that over 300,000 in the State were on emergency rations. That is 10 percent or better of the population of the State.

Not all of these people are coal people, I want to make it clear, because the impact on the farmer during this fall and winter has been particularly heavy, and the rolls have grown as they have gone on relief.

Representative KELLEY. Mr. Chairman.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Chairman, the same situation is true in Pennsylvania. It is not all coal, of course, as has been pointed out. The anthracite and bituminous areas have contributed to the unemployment but we have many other areas of unemployment—steel, aluminum, and glass, but the latest figure I have is over 900,000 families in the State of Pennsylvania receiving surplus food. That is 10 percent.

Senator SPARKMAN. You mean people, not families.

Representative KELLEY. Yes, over 900,000 people in the State of Pennsylvania receiving surplus food.

Senator SPARKMAN. What is the net ratio to your population?

Representative KELLEY. Well, the population is approximately 10 million. In my own district, which is 1 county, which is an industrial district and also a great deal of agriculture, but there are 38,000 persons obtaining relief surplus food, in that 1 county alone. The problem of unemployment, as I mentioned yesterday, is a severe one in many areas of the United States, and something should have been done about it before this.

I posed the question yesterday that on account of these depressed areas of the United States—and there are many of them—a public-works program should have been in effect long ago, but the answer was that it took too long to do it. Back of that answer was the thought, perhaps, that we are on the way to full employment again, so by the time we had a public-works program operating, we would have no need for it. That is what I dispute, because these depressed areas are not going to recover so soon, as was pointed out yesterday. Some of these economists expected unemployment to be worse in 1955 than in 1954, and certainly worse than 1953. I will ask the panel members Do you not think we should have a national fuel policy, especially for the protection of our fuel industries?

One reason that occurs to me: Coal is basic industry. We can't operate in peace or in war without it. We could not function. There is a limitation to gas. There is a limitation to oil, too, but there are untold billions of tons of coal available in this country. It is very rich, but they are being wasted in such times as these. When you close down a mine and it is down for a while, especially if it is one that has some problem of natural disturbances—you know what I am talking about, Mr. Thomas—you don't go back and open that mine again because it would be too expensive.

The cost of doing that would be prohibitive in many, many cases. Many millions of tons of coal, very good high-grade coal, I know from personal experience, have been lost over the past years as a result of depressions, no fuel policy.

The Federal Government, because it is such a very basic industry, should certainly nurture it and provide that it will be conserved.

What do you think about that?

Mr. THOMAS. I think you are perfectly right, Congressman. There is no question in my mind that, as you say, the reserves of gas and oil in this Nation are limited. It is very difficult to get figures on your oil reserves insofar as this Nation is concerned. Whether that is kept a secret by the oil companies for tax purposes or not, I don't know, but over a 5- or 10-year period, it is hard to get any estimates as to what your oil reserves are in this Nation.

We all know that the coal industry is very valuable, particularly in cases of emergency in this Nation, and if a national fuel policy was established that would possibly maintain the bituminous industry at a 500 million mark, this Nation would then be prepared, or the coal industry would then be prepared to meet any emergency that this Nation would never come face to face with, but dropping below that production mark, I think we are periling ourselves when we do that and periling the Nation as a whole.

Representative KELLEY. Well, that thought occurs to me, too, or the recollection, that much of the very high-grade metallurgical coals that we knew in the past have been exhausted. Not only that, but they were wasted, because in times of depression or low business operation those very high-grade coals have been sold for low-grade use; coking coal has been sold in times past for locomotive fuel, for generating steam, and powerplants—low-grade use.

Certainly some means of conserving those fuels should have been in effect. Those fuels are very necessary for the steel industry, as you know, and now today the steel industry must search around to find coals in which they can beneficiate or clean or prepare for coking purposes, which is very costly, and in many cases they are not satisfactory, either. That is just another example.

Now we are blaming the residual oil for some of our difficulty. There is no question about that. Some of us are attempting to have the Committee on Ways and Means accept a plan to restrict the flow of residual oil from South America from being dumped on our eastern shores and displacing coal. The figures I had, I think, were 32 million tons displaced, 24,000 men out of jobs as a result of residual oil problems. Maybe we can succeed, maybe we cannot, I do not know, but certainly something should be done about it.

Many of us have introduced legislation to that effect and I was one of them. But that is one of the reasons why the coal industry has found itself in a low production period. Mechanization has caused a great deal of it. Nobody can dispute that we do not want to interfere with that, but certainly there are other problems that the Government should take action on in regard to conserving the coal, the good grades of coal that still exist in this country, and to conserve the mining properties that have been in operation. We might need them some day. For instance, suppose we got into an emergency and we needed coal suddenly. We might not have the men to man the mines, just the same as the watch industry. We were fearful that the technicians engaged in the watchmaking industry would be lost and that is one reason why we placed a restriction upon the importation of Swiss watches. The same thing applies to coal. Mining coal is a specialized activity.

We are not going to get them back in the mines again if they are once established in some other work, and they move away from the mining areas. I have made a long speech here about that, but that is because I have been very close to this coal problem for so many years that I hate to say how long.

You might learn how old I am. But at least I have been very close to it all of my life, and I think I know something of its problems. I know that it is a serious matter. The reason that it has not been given more attention by this administration and past administrations is because the average person, the layman, is not aware of the seriousness of the situation in the industry, what it means to the Nation, in time of peace and in time of war.

Mr. THOMAS. Mr. Chairman, I would like to make this statement: In summarizing the work of this committee, I think Mr. Kennedy, vice president of the Mine Workers, is going to appear, and in regard to the national fuel policy, and that I think he would have a very capable explanation of our position and the policy of the United Mine Workers on that.

The CHAIRMAN. Are there any other comments?

Representative TALLE. Mr. Chairman, perhaps I should make my comment later on. What I am saying, Mr. Kelley, is not rebuttal to anything you have said, but you mentioned that public works take a long time, and that was attested to yesterday by one of the panel members, Dr. Gainsbrugh. He was right about that. The Chinese say a journey of a thousand miles begins with but a single step.

Well, I have worked for 15 years trying to get some significant things done on the Mississippi River. There are a lot of flood-control problems there and I feel that I have gone through 999 steps during those 15 years. There is one step left now, and that is to get some money, and I beg of my colleagues here that they assist me this year to get some money to carry out some of those projects and maybe that will help to alleviate some of the job problems we have.

I am not speaking in rebuttal, Mr. Kelley.

Representative KELLEY. No; I understand. I agree with you that it would take some time to get a public-works program in action.

Representative TALLE. There are so many hurdles to jump.

Representative KELLEY. Yes, certainly; I realize that, but I say that we still need it even when we do get it.

Representative TALLE. Oh, yes; I am for such a program.

The CHAIRMAN. Of course, I would like to remark that in 1945–46, very large sums of money were appropriated by Congress to draw plans for public works.

Representative KELLEY. That is right.

The CHAIRMAN. We have never heard what happened to those plans. They are presumably gathering dust somewhere, but presumably there is a back shelf of public works with the engineering plans which were accurate as of 8 years ago, which apparently have never been dusted off or considered.

Senator SPARKMAN. It would take about 4 or 5 years from the time the planning money was set up to get them on the shelf, and then, as Representative Talle knows, it would take about that much longer to get money out of the Appropriations Committee.

The CHAIRMAN. Mr. Barkin.

I think we are moving away from coal to textiles.

OPENING STATEMENT OF SOLOMON BARKIN, DIRECTOR OF RESEARCH, TEXTILE WORKERS UNION OF AMERICA, CONGRESS OF INDUSTRIAL ORGANIZATIONS

Mr. BARKIN. Mr. Chairman, I gather that my formal presentation will be in the record, and I shall not read it.

I should like only to summarize within the 5 minutes, picking up some highlights on this problem.

First of all, let me say that I express complete dissent to the report by the two representatives of the Departments of Commerce and Labor. Both of them have attempted, as does the Economic Report of the President, to create the illusion that this is a local problem and can be solved by local business groups. I appear here to say that it cannot be solved by local people; it is a problem of the National Government. It is a coverup, I think, to create the agencies which now exist in the Departments of Commerce and Labor, and think they will be of any help. They have not been of any help.

The Department of Labor for many years has had feeble results. The Department of Commerce division which Mr. Roterus represents has done practically nothing with respect to the Lawrence situation. Mr. Roterus came out himself after a visit of this group of realtors, and said they were going to give us help. The first statement he gave to the press was that the textile business is finished for Lawrence, Mass. That is not the kind of help we want.

He brought a group of realtors up there before the election of 1954 and they heard stories similar to the one he is trying to pass off now, that he is going to bring employment into Lawrence. Well, nothing has happened.

We do not need headlines by Secretary Weeks, or anybody else who comes up there. We need jobs in those textile areas, and they have not come.

Let me just summarize the major parts of our statement. First of all, strangely and unlike the coal industry, we have not gotten any assistance from the industry itself, the employers of the industry, in trying to highlight the distress and problems of our industry. Massachusetts had a commission in 1949. I appeared before them and indicated what our problems were. The result was a report, and nothing else. The report itself was not a fair representation of the needs and problems of the industry.

My own union enlisted the Joint Committee on the Economic Report back in 1948–49; they stimulated the organization through the National Planning Association of a committee in the South in order to diversify the industry there. We then, through the efforts of the National Planning Association, secured the establishment of a committee of New England. Nothing is happening. The people of New England, the industrial and financial interests of New England, are not organizing to help that region, because apparently their self-interest does not dictate it.

The same thing happened with the report of the Economists Committee of New England frankly which was stimulated by our own efforts through the old Council of Economic Advisers through Mr. Keyserling. That report is on the shelf.

Now we have this current Council of Economic Advisers telling us that they are studying the problem again, but that is as far as it has been going. They have not even begun to initiate full-scale reports, have not brought us in to see what can be done in order to assure a full-scale effort.

This is not a local problem, let me assure you. These problems—we have gotten this fancy word "structural." Structural problems are not local, they are national, and cannot be solved by local efforts of a local individual group.

Let me just say with respect to the Council of Economic Advisers report, we take strong exception to the spirit and contents of the remarks and views, as they relate to the problem which we have here. Fortunately we have gotten some recognition within it. The report says that some industries and localities have suffered from serious unemployment. We are grateful for the recognition. It has not been there before.

But now we are assured, however, that the recovery was largest in the series of industries like my own, in another sentence.

Let me tell you, gentlemen, unfortunately that is not true. There has been so little recovery in the textile industry in terms of employment that it does not matter.

The reasons primarily, as my statement indicates, are twofold: First and most important of all, our man-hour productivity is rising at a tremendous rate, even Government figures indicate, even statistically you can establish that it is over 5 percent per annum since 1948. Now, the report makes no suggestion for aiding the revival and reinvigoration of the industry. It urges the Department of Commerce's alternate program be strengthened, but we are encouraged against expecting much help since these programs can only make a limited contribution toward relieving spot unemployment.

Their major recommendation is to turn it back to the local citizens whom we know. Those of us who have dealt with it, whether it is New England, Middle Atlantic States, and the South, with which I am intimately acquainted, cannot handle these problems.

In your State, Senator Sparkman, the coal and the textile people cannot solve their problems. Their problems are nationwide, and they need nationwide guidance to help them through.

This same report goes on and says it prescribes the encouragement of enterprise and innovation, but the entire report is built on the concept of high employment and not full employment. If you will read this report rather carefully, it says as follows: it declares that although the economy in whole was prosperous, some communities suffered from sizable unemployment. Its major reliance is to be placed upon policies that promise high and stable employment, but not full employment, and that distinction between those of us who believe in full employment as over against the philosophy of the current administration of high employment, is the difference between unemployment in our regions, Congressmen and Senators, and my region, and the figures that concern this administration. We want jobs for all, and they are not ready to give it to us. They are not ready to work for policies which will assure it, and that is why we are very appreciative of this opportunity to speak to you.

It prescribes the encouragement of enterprise and innovation, but not in sufficient volume to overcome the distress of local communities, and the decline of shrinking employments. It is an unfounded presumption that full employment will threaten the integrity of the money in which contracts are expressed and payments made. It has stopped in its tracks an adequate policy. It has desisted from aiding the communities and industries in need as it is fearful of imparting an upthrust to economic activity.

These are mellifluous words that run through this report, but they never seek full-employment conditions. That is what they are evading. It is a worse document than the one we had a year ago because it tries to reassure people when we do not have full employment.

Let me just say, because I do not want to go into it in detail, because it is in my document: President Eisenhower said in 1952, when he came to talk to the people of Lawrence, "We are going to take care of you." The next thing we heard was the Secretary of Labor saying: "Look, we cannot take care of you; take care of yourself." And that is where it has been since.

Later on, Secretary Weeks sent up these realtors who told us, "Boys, the textile industry is finished. We will try to get you something else." But nothing has happened in that area.

We need real help. When we found this to be the condition, the president of our union, Mr. Emil Reave, wrote to the President of the United States. We got the regular runaround, of course. First, it went from him to Mr. Hauge, and Mr. Hauge said "Give us a plan." We gave him a plan. So he shifted it on to Mr. Weeks. Mr. Weeks then sent us a letter of December 7 of last year and said "We will be glad to see you." Well, we have not heard from him again. He told us about some textile industry committee in the Department of Commerce. To the best of our knowledge, there is not any such committee there.

We are, therefore, urging you members of this committee, we have been pleading with every governmental and public body in most States of this Union, and the Congress of the United States, give us a chance to explore the problem. We cannot solve these problems, and, what is more, unfortunately very few of the industrialists in our industry are interested.

I have this sentence which expresses it:

> The stronger elements in the industry have sometimes bemoaned prevailing conditions, but they have looked forward to the pruning out or the profitable absorption—that is a fancy way of calling these mergers which are going on—of the marginal units as a means for rehabilitating their own positions. They have hoped with the shrinkage in capacity or the limitation of competitors, their own operations would improve. They have not undertaken real studies into the fundamentals of their industries to help rehabilitate the entire structure.

In this report we indicate—in my statement we indicate that we have lost between 250,000 and 275,000 jobs since the beginning of 1951. The loss has taken place in the North, South, East, and West, every part of the country. It is not a northern problem, and it is not a southern problem. It is true the northern mills have shrunken and closed up more frequently. If you look on page 6 of my statement you will see the number of mills that have been closed. In the New England area, 236 mills with 92,000 people. In the Middle Atlantic States, 287 mills with 51,000 people. In the South, 117 mills, with 25,000. The southern closings are just on the brink, and if my knowledge of the industry is correct I expect 50 to 75 cotton yarn mills to close during the next year or two.

The problem of our industry is serious, and it needs help. Our communities, both North and South, are in the employment surplus area, and we have got to find some kind of help in order to reintegrate, rehabilitate, and restimulate the industry. In our statement, on page 8, we tell you what are the causes of the present condition in the industry: Loss of domestic outlets, loss of export markets, change in type of garments, changing pattern of consumer expenditures, tardiness in meeting new consumer trends, interfiber competition, general business contracts, the failure to develop new markets, and, let me stress that here is an industry that needs reinvigoration of managerial talent, North, South, East, and West; they have not developed a significant new market during the last 20 or 50 years within this industry, and we have got to find some in order to rehabilitate it, but, particularly, members of the committee, on No. 9, the tax laws, whether it be the capital gains tax or the carryback provisions, have encouraged millowners to abandon plants rather than put their money back into this industry.

We urge you through your report and through your membership in other committees to have a full-scale investigation of this problem. It is a serious problem because the mergers of our country now are being followed up by plant closings.

In our industry, and in other industries, of course we would like to avoid having any problem of further aggravation through imports. The mergers have concentrated our industry. We used to be the classical competitive industry. We are not that any more. You take 40 financial interests in our industry, and they cover well over 75 percent of the productive capacity in this industry, and that is a new thing, Senator Sparkman, as you know. We have become just like the other industries, an industry of giants, and where there is an industry of giants they squeeze out the small guy, but in doing so they have not yet expanded the markets and employment for the industry.

We want a minimum wage because a great many of these companies are forcing lower wages and driving out mills paying decent wages. Local tax subsidies are being established in new areas, and thereby drawing mills away from Southern and Northern States where they now exist.

We would like to suggest to you a number of different courses of action which are noted on page 11.

Fundamentally, we would like to have your joint committee give us a good, full-scale investigation. We have asked for it for years. Nobody seems to worry about the textile industry but ourselves, and we would be much pleased if one were arranged; we have only given you the barest outline of this problem. There are a great many people, employers, distributors, consumers of textiles, who would like to get help, but there is not a personality in an industry of twelve to fourteen billion dollars worth of sales—there is not a personality who is interested in leading a full-scale investigation so that we can rehabilitate it.

We urge specific programs of action, immediate and long term. We need new research. Strangely enough in America there is a big industry of this size where there is no real fundamental research being conducted, and the one institution which was established for fundamental research at the University of Virginia is not permitted to engage in it because there is no one ready to finance textile research.

The CHAIRMAN. What about the local textile research?

Mr. BARKIN. They do not do textile research. There is one man, Professor Schwartz, at MIT, who does a little basic textile research, but we do not have any institutes engaged in basic textile research, and, strangely enough, the English have us all beat in this particular area. We have a few agencies that do applied research for individual manufacturing.

We would like to urge $1.25 an hour minimum, a higher minimum.

Gentlemen, if this were the proper occasion—I have a discussion here—I think the President's Economic Report is frankly untutored on this subject. It represents just misinformation and inadequate guidance. The President of the United States in his Economic Report makes the completely unjustified statement that anything over 90 cents will create unemployment. We know it will not because the fact of the matter is that every previous increase in the minimum wage has been greater than he has proposed.

The rest of our statement is self-evident, and says what we would urge upon you, gentlemen, and we hope that you give us a real chance of presenting the problems of this industry to you.

(The prepared statement of Mr. Barkin and other material from the Textile Workers Union of America appear at p. 266.)

The CHAIRMAN. Mr. Harris.

OPENING STATEMENT OF SEYMOUR HARRIS, PROFESSOR OF ECONOMICS, HARVARD UNIVERSITY, AND CHAIRMAN OF THE NEW ENGLAND GOVERNORS COMMITTEE ON THE TEXTILE INDUSTRY

Mr. HARRIS. Mr. Chairman, I am glad that the distinguished Senator from Alabama is here because I am going to say some things about the South though not particularly about Alabama, I might say.

I have a high regard for the Senator from Alabama, and I hope he does not take too hard some of the things I say about the South in relation to New England.

I want to say at the outset, Senator Douglas, and I will certainly take less than 10 minutes, that I do not associate myself with Mr. Barkin as to what he said about the Department of Commerce and the Department of Labor. I think they are doing an excellent job. The only problem is they are not given adequate resources to do a better job.

I have had two debates with the Under Secretary of Labor, who is responsible for the work on unemployment, and though I am a Democrat I want to say he is doing a very good job.

I shall add, however, that Mr. Barkin knows a great deal about these problems, and his statements should be given careful consideration.

I have a statement which I will not read; I just want to point out the highlights.

Despite the general prosperity of the country in the years since 1940, there have been many serious sore spots. Even $350 billion of military outlays and $250 billion of Federal deficits have been inadequate to solve the problems of the New England textile towns and regions, the Middle Atlantic coal towns, several of the Northwest agricultural States (three actually lost population over 20 recent years). It is of some interest that from 1929 to 1953, New England's share of national income payments dropped by 20 percent, New York State's by 29 percent, and the Southeast's share rose by 34 percent. Relative to New England, the Southeast gained almost 70 percent in a period of 24 years.

This is a remarkable achievement for which the South deserves credit.

I also want to point out there have been gains in the West; the Central States have done well and maintained their position. But the Central States are vulnerable in case of a decrease in military expenditures because 66 percent of their employment is in highly unstable durable goods industries, and there is here a curious inconsistency between isolationistic and economic interests.

The CHAIRMAN. Is this about the Middle West?

Mr. HARRIS. Yes.

Now, large outlays by the Government have to some extent obscured these problems. As you all know, there is a regional struggle for dollars. Every region tries to get the maximum supply of dollars. New England, for example, has to have dollars to pay for its food and raw material, and has to sell goods to pay for these items. If through farm policy the prices of a region's imports of food and raw materials rise, if through tariff policy it faces increased competition for its manufactured goods, if newer industrial regions capture its markets, then it must either capture new industries or suffer a loss of cash, and with the loss of cash, lower prices, lower wages, or if stickiness prevails in the labor market, unemployment.

There is a supplementary paper to be put in the record in which I show how limited are the employments that can replace lost industries. Thus we can explain the transformation of New England from a high- to a low-wage region. In manufacturing, New England's wages are lower than anywhere but the South, and in 18 industries for which figures were available, New England's wages were higher than the national average only in 3 industries.

In my opinion, one of the most important economic problems of the Nation is this serious competition among States for industry with a tendency of competing States to cut services and keep taxes down in order to keep or attract industry. This is evident, for example, in the newer industrial regions aggressively seeking a place in manufacturing by putting minimum taxes on industry as a means of attracting industry and even providing subsidies; by keeping down social security benefits; by fighting trade unions aggressively, and thus keeping wages down—the Taft-Hartley Act tended to freeze relative wages of North and South at a point where the South had a great advantage—using financing through tax-exempt securities as a means of enticing industries from the North.

According to published reports, southern Congressmen succeeded in removing a provision in the 1954 Finance Act which would have stopped this unfair practice of building plants for northern management by the issue of tax-exempt seurities.

Of particular interest is the effect of the social security program on interstate competition. For example, in each of the last 2 years, 1952 and 1953, the 2 major textile States in New England levied taxes of 2.7 percent of payrolls on employers to finance unemployment compensation; but the 3 major southern textile States had average rates of 1.32 and 1.29 percent in these years. This does not include the State of Alabama.

In the years 1946 to 1950, the ratio of benefits to taxable wages was 2.7 percent in Massachusetts and Rhode Island; 0.9 percent, in the Carolinas and Georgia. The average weekly benefits for the 5 most important manufacturing States in the North in 1953 was $25.82; in the 5 major States in the South, $19.60, or an excess of 31 percent for the North. The unemployment compensation program, though it was justified in part as a program which would not result in competition among States to reduce taxes and benefits, has as a result of experience rating become just that. Benefit schedules tend to deteriorate to the lowest common denominator.

Now, the Federal Government—of course, did you say——

The CHAIRMAN. No, I was wagging my finger to indicate I agree.

Mr. HARRIS. It is scarcely necessary to add that the Federal Government has played a large part in this movement of industry from North to South. Generally, cash has been taken from the North and transferred to the South. These transfers are especially costly to the Northeast because they are accompaniel by large transfers of cash via investments of corporations operating on a national level from North to South. Both capital and management go. Labor stays. In 1 year New England seemed to lose about $1 billion, or 7 percent, of its income as the Federal Treasury took out more in taxes than it spent in New England.

These transfers, of course, reduce the competitive position of the North and this is a point which I hope both Senator Douglas and the distinguished Senator from Alabama will consider seriously.

Also relevant is the political strength of southern Congressmen, who though they are theoretically strong in support of free enterprise, nevertheless are willing, even eager, to obtain financial help from the Federal Government for their constituents. Northern Congressmen will have to organize and fight as effectively as southern Congressmen if they want to stop the continued losses of their industries.

The CHAIRMAN. Well, I would say amen to that. They outsmart us every time.

Mr. HARRIS. It is not surprising, then, that New England has been losing its textile industry at a rapid rate. These losses have been going on for a long time; but in the 3¾ years ending September 1954, the drop of employment was 38 percent. At that rate the industry, the most important in New England accounting until very recently for about 10 percent of employment directly and 20 percent indirectly, would be gone in 8 to 9 years.

Now, I may say, Senator Sparkman, as Mr. Barkin said, that this is serious even in the South, and at the rate of loss of employment in the South the industry would be gone in the South in 15 to 20 years.

It is no wonder, then, that in January, July, and September 1952, unemployment in Lawrence, Mass., averaged 19, 25, and 21 percent, respectively; and in the same months in 1953, 18, 18, and 17 percent—in the midst of the greatest prosperity. There were substantial amounts of unemployment in other textile towns, also, no less than 30,000 unemployed at the end of 1954 in four textile towns of medium size. From peak employment in 1949 to 1951, to October 1954, Boston lost 9,400, or two-thirds of its textile jobs; Fall River, 10,000, or two-thirds; New Bedford, 5,900, or one-third; Lowell and Lawrence, 10,600, or one-third; Providence, 33,100, or 60 percent.

A great many people in New England say that the new industries are coming in fast enough to take up the slack. This is not true. For example, from 1919 to 1947 New England gained only 4 percent of the new jobs in the 10 fastest-growing manufacturing industries, a proportion much below the region's share of factory jobs. In the same period, the region had lost 200,000 jobs in textiles and shoes. In the prosperous years of 1947 to 1953, New England added 290,000 jobs; but one-third in manufacturing. The record was better than from 1919 to 1947, in part because the region had been alerted and showed much initiative; but the major factor was Government spending. What is more, the heavy gains in service employments partly reflected the pressure for jobs from those unemployed in declining industries.

So I emphasize that the new industries are not coming in fast enough. Losses of New England and the North stem in part from real advantages of the South, and I might say the South is becoming a great industrial area, and it should become a great industrial area. These losses result from southern access to raw materials and markets, in plentiful supplies of labor eager and willing to work, in cheap power, in aggressive leadership and management, community, and government—it almost seems as though the Civil War is being fought all over again—in the advantage of a new industrial region in being able to adapt its investments to current, instead of past, spending patterns. But in part the gains may be associated with the depression of national standards—for example, social security—and large favors from the Federal Government.

The northern regions must fight as vigorously as the South; must be as modern in research, in management, in worker interest; must seek their fair share of Federal outlays; must expect the leadership of a well-organized political coalition on the southern model; must fight for adequate standards of social security, through Federal standards must fight for higher minimum wages, a fair share of tax subsidies. For example, the accelerated amortization program, of Government contracts, and so forth.

And I would not agree with Mr. Barkin that management is nearly as bad in New England as he makes it out to be. As chairman of the Governors Committee we consulted with 60 management representatives, and the top management of this industry is as fine as we have anywhere in the country. In the prewar days they made some bad decisions, but those who survived had to be awfully good.

And in the allocation of tariff cuts, the Government should consider the net effect of all Federal policies on a region. Can cuts in textiles be justified in view of the total effect of Federal policies and the present state of the textile industry?

The CHAIRMAN. I may say that for 140 years representatives of New England have been appearing before the Congress of the United States saying that unless they had high tariffs that their industry would go to pot.

Mr. HARRIS. You don't want it. I will send you a copy of it.

The problems of jobs for the unemployed in textiles are serious, untenable statements in the Randall report, notwithstanding.

Finally, unhealthy interstate competition will not be treated until the Federal Government assumes a greater responsibility for standards of tax collections, as was intended under unemployment insurance.

Now, I do not go nearly as far as Mr. Barkin does on the Council's report. I merely say on the whole I am disappointed. The Council scarcely touches upon the problem of distressed areas. In earlier years the Council showed much more interest in these problems. With more time I hope the Council will make amends.

First, it should be noted that unemployment has been greater than may be gleaned by the report. Add 3.75 million of unemployed at peak; 1 million partially unemployed—half time for those registered thus; 250,000 temporarily idle; and 500,000 for general cut in hours—this total is cut one-half to allow for duplication with above—the total is then 5.5 million.

Incidentally, the Council says the peak was higher in February 1950 than in March 1954. But note that the rise was much greater in 1954 over 1953 than in 1949–50 over 1948.

And let us not forget the tremendous amount of military expenditures in that period.

Second, the Council refers to the Government's contributions in assisting localities through Government contracts. This has been of little importance. The administration backed down when several Congressmen raised a fuss on this issue, and even then distress areas were to be allowed only to meet bids of others. Accelerated amortization was a gift to the prosperous, not the depressed, regions. It helped bring the depressed industries down.

Third, the Council suggests improved unemployment compensation benefits. But so did the President on several occasions in the past. This is just talk. Until the President and Congress take a hand and insist on Federal standards and remove fear of interstate competition, the program will remain inadequate; and the pressure will grow for guaranteed wages.

Note the state of unemployment compensation:

1. In the 16 years, 1938 to 1953, there were 57 million man-years of unemployment, and but $12 billion of unemployed benefits were disbursed, or about $210 per man-year of unemployment. Even in 1949 benefits equaled one-quarter of wage losses.

2. Duration of benefits was 19 weeks before exhaustion.

3. Taxes collected in 1953 were 1.40 percent instead of 3 percent, with each State, through the unsupportable experience rating, fighting to get rates and benefits down.

4. One-fifth of workers are still uncovered.

5. Half the unemployed workers had their benefits exhausted in 1954. Whereas 96 percent of total wages were covered in 1939, only 72 percent were covered in 1953.

6. The percentage of benefits to wages was 41 percent in 1938 to 1940, and 32.5 percent in 1951 to 1953. In relation to total wages, inclusive of supplement, even less is had.

7. Ceiling benefits were equal to 67 percent of wages in December 1939, and 41 percent in December 1953.

8. No program for Federal reinsurance has been proposed to meet the problems of States with a heavy incidence of unemployment. So far the Federal Government seems to have absconded with $500 million to $1 billion of unemployment taxes, and now has agreed to give back as loans $200 million to be collected in the future.

9. And what about sickness insurance, even more necessary than unemployment compensation?

Finally, in the discussion of international economics, nothing is said concerning the effects of further tariff cuts on the declining industries, or how to help them.

The CHAIRMAN. Thank you very much.

Senator SPARKMAN. Mr. Chairman, I wish time permitted for me to interrogate Dr. Harris, but I do want to ask him one question: Here about 4 years ago we had a panel discussion and one economist from New England—and I have thought all along that it was you, Dr. Harris—said that you did not believe that the Government ought to be called upon to support an uneconomic industry, and that it might be a good time for New England to get rid of its cotton textiles.

Mr. HARRIS. Senator Sparkman, that was not the present witness. It was probably Mr. Neal, vice president of the Boston Reserve Bank. This has always been the Boston Reserve Bank line.

Senator SPARKMAN. I was under the impression it was an economist from one of the colleges.

Mr. HARRIS. It may have been. It may have been Slichter, possibly. I would be glad to answer that, Mr. Chairman, if you like. I don't for 1 minute say that the textile industry is necessarily going to survive in New England. At the present time it is clear that it may not. And, of course, the South is making a bid for the woolen industry and that is more serious than cotton because we have maintained our wool position the last 25 years.

Senator SPARKMAN. We are stepping up wool production.

Mr. HARRIS. I know you are. All I would say is—and I am sure Mr. Barkin will agree with me—it looks bad for textiles in New England, and when you have a weak industry, the Government must not give it another shove downward. Let it lose ground slowly so we can make the adjustment. It makes much difference if it goes in 5 years or in 25 years, and that is all I am asking for. Adjustments are made easier in a long period.

Senator SPARKMAN. I would like to make this comment. About a year ago there was a textile manufacturer from Connecticut talking with me one day, it was a casual conversation, but in the course of conversation he told me he was going to build a new plant at a certain town in Alabama. He named the town to me. He was not going to move his plant from Connecticut. I said: "Why did you decide, when you were ready to expand your plant, to put it down here in Alabama and in this particular town?"

He told me why he wanted to put it in that particular town, but his answer was: "I want to get down here where the cotton is."

And I said: "How much does it cost you extra per pound to ship your cotton from the South to New England over what it would cost you down here?" And he said: "Well, offhand I would say 2 cents a pound."

Now, I don't know how big a factor that is, but it sounds pretty important.

Mr. HARRIS. I got into a disagreement with Mr. Barkin when I was chairman of the Governors Committee, because I said the real factor was wage differences and productivity, and this is what really counts, your vast supplies of labor.

Senator SPARKMAN. I agree that the labor supply has a great deal to do with it, but my own feeling is that the greatest single factor in the removal of cotton textiles from New England to the South has been the change from the freight rate structure over the past several years.

Mr. HARRIS. That counts.

Senator SPARKMAN. As long as we had the official territory and the penalty against the South and the West, we simply did not have much chance of establishing industries to process our raw materials, and I believe that has been the greatest single factor and certainly should not be omitted.

Mr. HARRIS. It is a factor of some importance. We mention it in our report, but I will tell you what is one of your greatest factors. You are on the make as an industrial region and you are doing a tremendous job. The whole community. You have not been established for generations in this field. This makes a difference, and it is important with respect to your labor costs. You will find on the average it is the labor costs that make the greatest differences. This is partly a matter of management, too.

Senator SPARKMAN. I hope you include those figures in your report because I have heard that statement so often, and yet to me it seems rather unrealistic. (See p. 303.)

Representative KELLEY. Is there a differential of wage rates between the North and the South?

Mr. HARRIS. Oh, yes. Mr. Barkin will probably tell you 30 percent. But I will say it is between 10 and 20.

Representative KELLEY. What is the matter with the bargaining position in the South?

Mr. BARKIN. Gentlemen, this gets into many controversies, but I would like to just state this one conviction of mine, which I would like to be the fact. Fundamentally the wage problems in the cotton textile-rayon industry at the present time I would say, the wage differences are rather minimal. That is not the fundamental problem. There are chiseling companies in the South who tend to undermine conditions, but the progressive companies do not pay a wage substantially different.

Now, Professor Harris is correct in saying that the surviving companies are very competent, but unfortunately the decline has come from the companies which have not survived and the fact that he points to the age of the textile managements of many of the textile companies in New England and the North, their inability to adapt themselves to the new market trends, their unwillingness because of various factors, age, third or fourth generation, general discouragement from the Federal Reserve Bank in Boston, and the State Street financial interests to rehabilitate their company; this is a real conspiracy.

Representative KELLEY. Pardon me. Mr. Harris made the statement that there was a difference in wages. That is what I was concerned with, is there a differential. You say no, it is a small one. Then what is it?

Mr. HARRIS. Mr. Barkin is wrong on this, Mr. Congressman.

Representative KELLEY. Are the mills in New England more obsolete?

Mr. HARRIS. Mr. Barkin is trying to apologize for the fact the CIO has not done a very effective job in unionizing the South.

Senator SPARKMAN. I wish you would check the average textile wage in the South, Dr. Harris, and compare it with New England. I do not think there is as wide a differential as you indicated. Of course, our industrial growth is new, but I call your attention to the fact that there was a cotton mill at my hometown, established there, as I recall, about 1830; so at least we have been in the textile business a good, long time.

Mr. HARRIS. I know that. Well, Senator, one reason for the difference is the fringe benefit which accounts for one-third of the difference between North and South.

Senator SPARKMAN. You may be right on that.

Mr. HARRIS. I will send you some material on that, both our report and some recent material.

Senator SPARKMAN. I can't help but make one further suggestion. You talk about cheaper power in the South. I have often felt if New England developed its rivers and power facilities, it could have cheap power.

Mr. HARRIS. Mr. Barkin and I have been trying to convince the New England community on that. There are 186 Federal power developments in this country, and none in New England.

Representative KELLEY. You have a higher power rate than any place in the country, don't you?

Mr. HARRIS. Yes. That does not make much difference in textiles, but it means we do not get anything like the aluminum industry to take the place of textiles.

Senator SPARKMAN. Did you see the article on the front page of the Wall Street Journal yesterday—I am sorry I did not keep it. It told quite a story on how the empty textile mills are filling up with new industries.

Mr. HARRIS. That is nonsense. They fill up with parasitic industries which pay less than textiles. We have had it surveyed. Questions are asked of textile workers: How do you like your new job? Most of them do not like it. Lower wages, much less pleasant work, and so on.

When there are all of these unemployed textile workers in a town, some parasitic industry tries to exploit them. In Lawrence in the past years we have averaged between 18 and 25 percent unemployed.

The CHAIRMAN. We have discussed coal and textiles. Now we come to automobiles.

Representative KELLEY. We have not finished coal. We could never finish that.

(The prepared and supplemental statements of Seymour E. Harris appear at pp. 292, 295, and 303.)

The CHAIRMAN. Mr. Fraser.

OPENING STATEMENT OF DOUGLAS FRASER, ASSISTANT TO THE PRESIDENT, UNITED AUTO WORKERS, CONGRESS OF INDUSTRIAL ORGANIZATIONS

Mr. FRASER. Mr. Chairman, members of the committee, my name is Douglas Fraser, I am an administrative assistant to Mr. Walter Reuther, president of the United Automobile Workers, CIO. May I add that before moving into my present position I worked for 14 years in auto plants in Detroit, holding various official posts in my local union from steward and committeeman to president of the local. I have had opportunities, therefore, of seeing what unemployment means, both through personal experience and many years of helping to deal with the problems of individual workers, as well as concerning myself with the broader problems of national scope with which I have to be familiar in my present position.

Mr. FRASER. I am filing with the Secretary a more lengthy submission which presents in fuller detail the matter which I wish to lay before the committee. The statement which I am about to make is simply a summary of that submission.

Earl in 1953 it became apparent to our union, not only that the country was facing the threat of a recession, but that the automobile corporations in particular, by engaging in a mad production race in the early part of the year, were making it inevitable that there would be heavy cutbacks in the later months. This not only would mean serious unemployment for auto workers, but because of the importance of the auto industry as a purchaser of the products of other industries, a cutback in auto production would be a serious blow to an economy which was already in shaky condition.

The threat of unemployment in Detroit was aggravated by the production-scheduling and labor-recruitment policies of the auto corporations. They had scheduled for production in the first half of the year 60 percent of the volume they projected for the year as a whole. In order to achieve their schedules they were recruiting thousands of workers from other areas in spite of the fact that there could not possibly be more than a few months work for them and their temporary employment would later intensify unemployment for the workers already in the industry.

Mr. Reuther, as president of the union, wrote the corporation presidents urging them to put an end to this kind of folly. He got no satisfactory reply from any of them.

The blow soon hit. Between April and November 1953, employment of production workers in the auto industry nationally fell by 130,000. By September 1954, it had fallen still another 220,000. Out of every 100 jobs available at the peak of production, 43 had disappeared.

In Detroit we faced a mounting tide of unemployment. From 15,000 in April 1953 unemployment increased to 78,000 in September and 107,000 in January 1954. It was at this point that Defense Secretary Wilson assured us: "Come spring and everything is going to be all right in Detroit."

Detroit waited for spring and the robins. But instead of improving, unemployment jumped to 140,000, then to 150,000, and, finally, in September 1954 to 195,000. Both the bird dogs and the kennel dogs got pretty hungry.

Every aspect of the city's life was affected by the lack of jobs. The passenger loads of the Detroit Street Railway, which had previously been declining at the rate of about 5 percent per year now slumped at a rate of more than 14 percent per year. In the first 4 months of 1954, Detroit department store sales fell 8 percent below the same months of 1953, compared with a drop of 3 percent in the Nation as a whole.

Welfare loads began to climb. The number of persons coming for aid to the Detroit Public Welfare Department, as measured by the number of "screening interviews," went up more than 4 times, from 224 per week in April 1953 to 909 per week in February 1954. In the whole of 1954, over 46,000 were forced to seek help in this way, compared with less than 17,000 in 1953. The Detroit County Welfare Department had to employ additional workers, and the Detroit Welfare Department actually had to put on a nightshift to take care of the flood of applications for help. A Detroit welfare commissioner placed the blame squarely on the auto industry's recruitment program in 1953, and said he had warned them at the time that "if Detroit industry didn't stop recruiting workers in every hamlet, village, and crossroad in the country, it would get us into trouble."

Detroit newspapers, specifically the News and the Free Press, which echo faithfully the views of auto industry top management, proposed that the problem be met by refusing public assistance to anyone who had not established 3 years' residence in the State, "thus inducing more of the newcomers to go home." This proposal, it was said, "would erect a more substantial barrier for Michigan taxpayers against those who drift from State to State in search of work." The taxpayers who would benefit most from such an inhuman measure would be the auto corporations which had been responsible for the recruitment of these workers into the State.

What it amounts to is that an unemployed Detroiter who asks for assistance is called a "kennel dog" and told that he should go and look for work in other communities. But if a worker from one of those other communities is sought out by the auto corporations and persuaded to come to Detroit for a job and is then laid off, he is labeled a "drifter," undeserving of public aid.

One of the factors contributing to the heavy demand for public assistance was the complete inadequacy of unemployment compensation, both in amount of benefit and in its duration. During 1954 some 70,000 workers in the Detroit area exhausted their unemployment compensation benefits.

Some of the unemployed were driven to burglary. In February 1954 the head of the hold-up bureau in the police department told the press that burglaries were up 56 percent over the previous year, that most of the increase was the work of "novice criminals and juveniles" resulting from unemployment, and that the police department was "swamped" by it.

This year the auto companies are engaged in another production race still more reckless than that of 1953. If present production is maintained, by the end of June the number of cars produced will total

72 percent of the most optimistic figure estimated by any industry spokesman as the goal for the entire year.

The CHAIRMAN. Mr. Fraser, you are producing at the rate of about 165,000 cars a week there?

Mr. FRASER. Yes; it amounts to annually about 8½ million cars projected over the year, that was as of the week of January 22.

The CHAIRMAN. Is it possible for the industry to maintain that rate of production over the year?

Mr. FRASER. No; the most optimistic estimate of production for 1955 was by the president of General Motors, and he thinks we can reach 5,800,000 in 1955. The other estimates of industry spokesmen have been somewhat lower, substantially lower. So it is easy to see if we are producing at the rate of 8,500,000 currently, and the best we can expect is 5,800,000, we are going to be in serious trouble in the months ahead.

The CHAIRMAN. I have made a hasty computation, and my figures may be wrong, but if in the first 26 weeks of the year you continue to produce at this rate, you produce roughly 4,300,000 cars, and if the figure of 5.8 is correct, that would leave only 1.5 million cars for the last 6 months, or about 35 percent of the rate of production for the first part of the year.

Mr. FRASER. We come up with a figure in terms of percentage going at this rate, we will have 72 percent of the year's production in the first 6 months based upon the most optimistic figure for 1955.

The CHAIRMAN. In June?

Senator SPARKMAN. June 30 or June 1?

Mr. FRASER. That would be the end of June, June 30.

The CHAIRMAN. In other words, in 50 percent of the time you would have done 72 percent of the work, leaving 28 percent for the remainder?

Mr. FRASER. The remaining 6 months.

The CHAIRMAN. Those figures roughly check with mine. You would have a little over a third the rate for the last half year that you have for the first half year. In other words, you expect the decline in the beginning of summer?

Mr. FRASER. Yes.

The unemployment that is inevitable later this year as a result of such scheduling will be aggravated by the enormous increase in productivity brought about by automation and other technological developments that were introduced on a large scale with the changeover to the current models. Even in December 1954—and incidentally, these are the latest figures—when car production totaled approximately 642,000, Detroit had 85,000 unemployed.

While the guaranteed employment plan which our union intends to negotiate this year will put a curb on the kind of irresponsible production scheduling which is again taking place, and will prevent a repetition of the reckless recruitment policies of the past, it is apparent that restoration of full employment in the auto industry, as in other industries, depends upon national policies designed to establish a broad case of expanded purchasing power. Only by such means can we enable millions of American families to achieve adequate living standards, and in so doing to provide a great new market for the products of American industry.

Attached to the submission which I am filing with you is a booklet in which are outlined in some detail the specific measures which we urge.

(The material referred to is on file with the committee.)

Mr. FRASER. In broad outline, they fall into three groups. First, are direct measures to increase purchasing power through such steps as increased income-tax exemption, improved social security and unemployment compensation, increased aid to farmers, and a substantially higher minimum wage. Second, are programs to provide employment while at the same time catching up with the backlog of needed housing, schools, hospitals, highways, and other community facilities. Third, is a substantial increase in aid to underdeveloped countries with a view to assisting them to increase the strength of their own economies, thus strengthening their resistance to communism.

I have two additional immediate recommendations to make. One is that recognition be given to the economic absurdity of continuing the excise tax on automobiles at a time when every means should be used to stimulate their purchase.

The second, which should have the highest possible priority on the legislative list, is a Federal law equivalent to the Forand-Kennedy bill of last year establishing Federal minimum standards for State unemployment compensation laws, especially as regards amount and duration of benefits. Only Federal action can bring about the nationwide improvement in these laws which is essential if we are to meet our moral obligation to make possible even a minimum standard of decent living for those who are unemployed through no fault of their own.

The CHAIRMAN. Thank you very much, Mr. Fraser.

Representative KELLEY. Mr. Chairman, it seems to me that Mr. Fraser makes a strong argument there for the closed shop.

Mr. FRASER. I am sorry, Congressman.

Representative KELLEY. I said, rather facetiously, that what you said about unemployment is a strong argument for the closed shop.

Mr. FRASER. The tragedy is that the recruitment teams from the auto companies go into the South and they give everybody the impression that it is permanent employment. Everybody knows it is only going to be 3 or 4 months. It is unfair to the people they recruit and unfair to the people in the vicinity of the industry.

Senator SPARKMAN. I understood Mr. Wilson to say that when cold weather came those people would go back south anyway.

Mr. FRASER. I could quote Secretary Wilson at length regarding this problem, but that was one of his suggestions.

(Mr. Fraser's prepared statement appears at p. 303.)

The CHAIRMAN. In Illinois we are proud to have the center of the farm-machinery industry of the country, and the biggest center is the so-called Quad Cities of Rock Island, Moline, and East Moline, Ill., and Davenport, Iowa. We are very happy to have the able State's attorney from that area, Mr. Moran, to speak on that industry.

STATEMENT OF BERNARD J. MORAN, STATE'S ATTORNEY, ROCK ISLAND, ILL.

Mr. MORAN. Members of the committee, I am a lawyer and not an economist. I would like to confine my statements to the conditions in the Quad City area to tell you what I know about the economic situation in the community and what the conditions are and the nature of our community which has been classified as having a substantial labor surplus.

Rock Island County contains three of the Quad Cities, Rock Island, Moline, and East Moline, Ill., which, with Davenport, Iowa, comprise an industrial metropolitan area of 246,000 persons. It is the farm-machinery capital of the world and the home of four major farm-machinery manufacturers, Deere & Co., International Harvester Co., J. I. Case Co., and the Minneapolis-Moline Co.

The Quad Cities have a considerable industrial diversification with many other factories whose names and products are well known, producing boots and shoes, sewing machines, bread slicers, electrical appliances, oil burners, men's clothing, paperboard containers (the Container Corp.), batteries, automotive parts, cold-air registers, sash doors, veneer-wood toys, and automotive safety service equipment. There are many large factories.

Corollary to the large plants are independent suppliers in the form of machine shops, tool-and-die shops, sheet-metal shops, foundries, and others who provide full or partial capacity to the needs of the large factories. Highly skilled labor produces quality tools, dies, castings, heat-treating, metal-treating, sheet-metal, and steel fabricating.

The United States Rock Island Arsenal is located offshore in the Mississippi on Arsenal Island, which forms a link in the traffic lanes of the Government bridge between the cities of Rock Island and Davenport. Production shops, arms-development laboratories, and the country's largest ordnance depot occupy a great deal of the 3 square miles of land on this island. The arsenal presently employs 6,000 people.

The new Alcoa $85 million aluminum rolling mill, which has a huge capacity for production of aluminum sheets and plates, is also located in the Quad Cities. Now Alcoa usually maintains an employment force of 2,000 people.

Rock Island County is the home of the Rock Island Lines and has one of the finest classification yards in the country. It is also served by the Milwaukee and Burlington Railroads. Transportation by air, highway, or over the Mississippi River system, which renders an important service and saving to industry in this area, is excellent. River shipping last year exceeded 6 million tons.

This picture of industrial diversification does not yet modify the fact that our prosperity depends upon prosperity in the farm-machinery industry. Seeking ultimate causes, the prosperity of this area is dependent upon the prosperity of the farmer here and abroad.

Farm prices and the confidence of the farmer in his future are the barometers to which the area is most sensitive, partly because some of our largest farm-machinery plants operate tight to demand, and when sales are off men are almost immediately unemployed.

I might also state that the scale of wages is not such that an unemployed person can long maintain himself during a layoff.

In the Quad Cities, when the farm-machinery industry suffers substantial layoffs, there is an immediate reaction in the shops of the independent supplier, foundries, machineshops, tool and die shops, and sheet-metal shops, as well as in all other businesses relating to goods and services.

Until 2 years ago employment in the Quad City area and in the farm-machinery industry was considered normal, subject to seasonal fluctuations and labor disputes. The community was prosperous. However, the sales of new farm machinery declined in 1953 and again during 1954 as farmers restricted their purchases in the face of the third consecutive year of declining farm prices and income.

The farm-machinery industry employs 14,400 of the area's total labor force of 109,500 persons, but other local business and industry is so sensitive to layoffs in the farm-machinery industry that by last year an estimated 10,000 persons were unemployed, and the area was classified as having a substantial labor surplus.

Since that time, and due principally to gains in the farm-machinery industry, employment conditions have improved. The Illinois State Unemployment Service estimates that there are now 6,300 persons unemployed in the Quad Cities, but this figure does not include an unknown number who are not eligible for benefits, those who have not asked for benefits, or those persons who have exhausted benefits. Employment is also somewhat eased by the fact that many workers with low seniority have migrated. The area was reclassified last week by the Department of Labor as having a moderate labor surplus.

There are still an estimated 2,500 persons who have not been recalled by the farm-machinery industry, and while both labor and management are optimistic about the long-range future of the farm-machinery industry, both agree that the prospects for 1955 are as expressed in an address by Bruce Lowry, chairman of the executive committee of the Farm Equipment Institute and vice president of Deere & Co., when he said "I think farm-machinery business next year has a good chance of being about the same as 1954," which was not good.

The CHAIRMAN. Now, that was his optimistic estimate?

Mr. MORAN. That was his best optimistic estimate, and that is the conclusion to which he came. I might say that the conclusion that it is not good is an inference you have to draw from unemployment in the industry.

During 1954, the J. I. Case Co. operated at a loss of $549,252, after giving effect to the tax credit applicable under the carryback provisions of the Revenue Act of 1954. Sales by this company during the fiscal year of 1954 were 17.15 percent less than in 1953, which was also not a good year, and manufacturing operations were approximately 30 percent below the previous year. J. I. Case Co. attributes its unfavorable operating results to the low volume of sales which it connects directly with the fact that farm income in the United States and Canada showed a decline during the year due to lower prices on many farm products.

Prices received by farmers during 1954 averaged more than 3 percent less than prices received for farm products during 1953, whereas, the prices paid by farmers in 1954 averaged approximately 2 percent higher than during 1953, due to higher family living costs.

Total production and marketing this year will probably decline somewhat primarily as the result of more stringent Government controls on production. It is estimated that there will be a further decline in cash receipts from farm marketings based on the outlook for stable or slightly lower farm prices on a somewhat smaller volume of marketings. This decline as estimated will be between 3 and 5 percent.

Lower crop receipts will be responsible for most of the fall in the total receipts. Lower cash receipts will undoubtedly result in lower net income because production expenses will not be reduced as rapidly as the gross farm income. The weather, of course, will also be partly a factor, but the immediate future for the farmer is certainly not much brighter than it was in 1953 and in 1954. Even when buying new farm machinery to replace wornout early postwar models, the farmer's prospect is for an increase rather than a decrease, due to the increased price of steel and the related component parts and of other basic materials and labor.

The solution to this Quad City unemployment problem is partly local and partly national. When the farmer receives adequate prices for his product, or, more basically, when he becomes confident of his economic future, and confident that there will be no further farm-price declines, he will start purchasing needed new farm machinery. This will create employment in the farm-machinery industry, and normal prosperity in the Quad City area.

The locality can help itself with the assistance of the Federal and State Governments by striving for a further diversification of industry. The area is too sensitive to conditions in the farm-equipment industry and its economy will be healthier when employment is diffused with other major industries.

Illinois is 1 of 4 States that does not have an industrial development commission, but sound governmental policy should dictate assistance to the area in enabling it to attain a more stable economy.

We have not, as yet, felt the benefits of the Government's program for tax benefits, or for contract allocation.

The following of the recommendations would be helpful:

1. Consider revising unemployment insurance benefits so that (*a*) the great majority of covered workers are eligible for payments that at least equal half their regular earnings, and (*b*) the term of unemployment insurance benefits is 26 weeks for every person who qualifies for any benefit and who remains unemployed that long (No. 12 of appendix A).

2. Expand the area development program of the Department of Commerce, which is designed to help depressed communities (No. 13 of appendix A).

3. Strengthen the Federal-State Employment Service (No. 9 of appendix A).

4. Continue the program for helping business concerns of small size to obtain access to adequate financing, to a fair share of Government procurement contracts, and to competent counsel; and extend the program's lending authority (No. 27 of appendix A).

I might say that steps have already been taken. The folks in the community are studying the organized industrial district booklet put out by the United States Department of Commerce. The effort was made several weeks ago to bring in an electronics division of the Western Electric Co., with the idea of further diversifying and diffusing employment.

In regard to one question on the sheet, I might say that we have not, as yet, felt the benefits of the Government's program for tax benefits or for contract allocation.

The CHAIRMAN. Do you wish to make any recommendations?

Mr. MORAN. I think that those are probably self-explanatory, Senator. They are in line with the President's recommendations. We feel, of course, that a great majority of the workers to the half or the 26 weeks, that would obviously present a big burden being thrown on the goods and services industries, which are smaller.

The CHAIRMAN. We have this problem: Under the rating system, which virtually all of the States have adopted, an improvement in benefits means higher costs on the part of individual employers, and we are back again to the old difficulty of interstate competition, with one State being afraid to raise its standards lest it put its employers at a competitive disadvantage compared to others. That is the reason why some of us believe we should have national minimums, and it should not be thrown to States, as is recommended by the Council of Economic Advisers and by the President.

Mr. Talle.

Representative TALLE. No questions, Mr. Chairman.

The CHAIRMAN. Mr. McDowell, we come to the Central Atlantic States.

OPENING STATEMENT OF ARTHUR G. McDOWELL, DIRECTOR OF CIVIC, EDUCATION, AND GOVERNMENTAL AFFAIRS, UPHOLSTERERS INTERNATIONAL UNION OF NORTH AMERICA, AMERICAN FEDERATION OF LABOR

Mr. McDOWELL. The Economic Report of the President now before the joint committee, on page 56 cites three special causes for persistence of structural or "spot cases of sizable unemployment in some places."

Those classes of causes are given as follows:

1. Lasting drop in demand for their wares.
2. An exodus of industry to new localities.
3. A vanishing supply of some material basic to the local economy.

The only recommended Federal Government initiative to meet these situations, which "may remain even when the Nation's economy practically reaches full employment," are also three in number, but obviously not as equal in weight of impact on the problem as in number.

The report's recommendations are:

1. Strengthening the area-development program of the Department of Commerce.

That is the only Department mentioned, I believe, although reference was made in previous testimony to the Labor Department which I did not find in the report.

2. Continuing for the time being the policy of special tax-amortization benefits for new defense facilities located in surplus-labor areas.
3. Placing of Government contracts as far as possible in these areas.

This is light artillery, indeed, for attacking as large and as deeply entrenched a problem as is faced by coal communities of Pennsylvania and West Virginia, or the traditional textile areas of New England and Middle Atlantic States. It also carefully avoids any attack on what the left hand of other governmental policies—local, State, and National—is doing to actually accentuate the problem. Nor is any body of principles consulted as to what may be the guiding lines or limitations of public policy which may be wisely and legitimately affected by legislation and administrative actions within the letter and spirit of that legislation.

Agonizing as has been the consequences to my native State of the lasting drop in the demand for our special anthracite coal and our sharing in the drooping fortunes of bituminous type, I would not have the gall to propose to a committee of the National Legislature measures to fetter the development of competing power and fuel resources or the indefinite subsidization of a traditional product of declining competitive efficiency. Nevertheless, a policy of conservation of what will for generations continue to be a basic national resource and, even more basic, the human resources of established communities with their homes, schools, churches, and business life is a concern of the Nation and of all sound economic policy. The report is amazingly brief and even silent on this problem.

I might say that the omission of any figures as indicative of the number of those in receipt of the disposal of surplus foods is quite an indication of the failure of the report to think of the economic problem in warm human terms and realities.

The continuance in Federal tax policy of the extraordinarily generous depletion allowance extended to the prosperous and flourishing petroleum industry is a case in point calling in question the equity and soundness of national policy in dealing with unequally situated natural-resource industries.

The exodus of industry to new localities, so far as it is a natural searching out of more favorable location in terms of raw materials, abundant or trained labor supply, a consumer-deficiency area such as was the west coast for a long time in my own industry, and so forth, is one thing, and not to be interfered with, at the very least, by Government policy.

When, however, as in recent years, this migration of established industry is stimulated by local and State government policies that smack of industrial cannibalism, i. e., new industrial development of old stable agricultural communities at the expense of rupture of older industrial communities and on the basis of subversion of declared national public policies such as the encouragement of collective bargaining, the denial of classification of labor as a commodity, and so forth, it is something else again. When such exodus with all the new problems it creates is actually subsidized by Federal tax policy, such as the extension of the tax-exempt privilege of local municipal-purpose bonds to industrial-purpose bonds to subsidize the practice of Mississippi villages of seduction of northern city factories by offers of virtually free factories, it is time that the Federal Government's right hand should apprise itself of what its left hand is doing.

It was once the conviction of every village in the midwest that it was entitled to a railroad in defiance of all economists and engineers, and the fact that it is farther by rail than by any of Daniel Boone's paths from St. Louis to Kansas City is testimony to the power of that conviction.

Many a county and town bankrupted itself in the railroad era, as probably will many municipalities in the modern Mississippi Bubble empire of municipal industrial purpose bond issues, but there is no reason for Federal taxation and labor policies to be accessories to the crime. The nonsense of a Federal labor law that proclaims its aim as the furthering of collective bargaining, and then carries a clause to encourage and abet the States still preponderantly agricultural, to enact laws to drastically weaken if not throttle in their cradle all collective-bargaining agencies, is obvious.

It is futile to preach sermons to the States apropros the desirability of sustaining the national level of consumer income by adopting uniform high standards of unemployment compensation laws, when there is no even proposed use of the Federal power which alone brought those laws into nationwide enactment by the respective State legislatures in the few years of the late 1930's.

Competition between sections, as well as between industries and services, and particular enterprises, is a great and healthful force, worth the unequal development of particular localities, but there is no health in new legislation or old which encourages competition between State legislatures in creation of low-wage areas, special and peculiar labor systems based on artificially and unequally weakened collective bargaining, cheap undeveloped unemployment and workmen's compensation and factory laws, et cetera. The correction of bad legislation of the past may be as or more pertinent to the problem in hand than new measures.

The CHAIRMAN. Mr. McDowell, would you stop there a moment. You seem to be saying that the so-called right-to-work laws which forbid the union shop, as well as the closed shop and which, therefore, go beyond the Taft-Hartley Act, are inducements for the migration of labor.

Mr. McDOWELL. They have a great bearing on it.

The CHAIRMAN. Do I understand you correctly to say that national labor laws on these points should have priority over State law?

Mr. McDOWELL. Precisely, and it should be equitable legislation and not legislation encouraging action in only one direction, and that negative.

May I inject in here an experience of a Philadelphia hosiery enterprise, giving the factors which lead to migration of an industry. This plant was established for a generation in this area, a new and modern plant, relatively speaking, liquidated its plant at a considerable profit on a real-estate proposition. It arranged for transfer to a Mississippi plant which was supplied to it under this bond subsidy arrangement, virtually free. The local union took a poll of its members and then submitted an offer to meet the wage rates which would be accepted by the labor in Mississippi. The company which could have continued operating where it had been profitable said very cynically "Could you give us a free plant? We get a virtually free plant from Mississippi, and, second, we won't have the interference. We have a labor law that will block your progress in organization."

The CHAIRMAN. Is it correct that these local bond issues to finance the provision of private plants are, therefore, tax exempt?

Mr. McDOWELL. They are tax exempt in two respects. They are tax exempt in the fact that the income from them is federally tax exempt. They are also tax exempt in that the lease or rental fee, if it amounts to a substantial amount for a large investment, goes to a municipality and, of course, is tax free, because the municipality's income is not subject to taxation.

Now, the third cause of regional and industrial unemployment given in the report, as vanishing supply of some material basic to the local economy, is in category of, first, in influence of broad economic developments seldom caused by legislation or its absence, and not easily subject to legislative attack. Nevertheless, while the exhaustion of the Minnesota iron range cannot be legislated against, the research and aid in developing the possibilities of secondary ores should be as legitimate a field of governmental action as subsidization of new river channels for floating in ores from new foreign fields. While the southern movement of wood furniture from Michigan was logical as lumber supply was exhausted, an earlier conservation and replanting policy of the Federal Government would have been a good investment for the whole country, including the South, some sections of which are now repeating Michigan history.

Plants under contract with our union in North Carolina now are proposing to move to other States, particularly Mississippi, because of exhaustion of lumber supply.

It is regrettable and disturbing that the report which would have the Department of Commerce agency strengthened did not correlate the measures with which the Labor Department is concerned, such as increase of rate and coverage of national minimum wage, effective use of Walsh-Healey Public Contracts Act, raising and making uniform of State unemployment compensation, and workmen's compensation act, labor relations legislation, and so forth. These measures, which, taken together and constantly improved, tend to equalize competitive conditions between sections, have great bearing on problems we are considering today.

And, may I say, Mr. Chairman, that the basic question seems to be in such matters as this taxation encouragement in the matter of bonds, is a matter of justice. One of our trade union officers traveling over the supposedly hunger-ridden section of Asia, said he never heard one man complain of hunger. He heard many complaints of injustices, and in this case this injustice is buttressed by the Federal taxation policies, and that is as dangerous as anything in terms of economic impact.

I would say, in conclusion, that a section of the people of our country who, due to circumstances beyond their control, face a crucial burden of need for reorganization of their economic life or have their obvious economic opportunity for advance blocked by natural or social economic obstacles, such as once obstructed the development of our Tennessee Valley, which obstacles can, however, be removed by means easily available to National Government, such sections have a legitimate special call on a national legislature. The interdependence of national and even international prosperity in modern times is a commonplace.

The report is disturbing in its easy dismissal of the menace to the general prosperity of the spreading and almost cancerous nature of these areas where unemployment becomes a continuous proposition. Those of us who are familiar and have lived, as I have, in the coal mining area, saw what occurred in the period before the great depression of 1929 forward. We saw the beginning of that depression spread from textile and coal centers.

I might say as you see the sweep of the heavy burden of unemployment figures in a belt of States in the chart presented there on yonder easel that in our industry, in the furniture industry, in the last year we had a rate of unemployment of 13 percent, which ran in excess of twice the national rate even of unemployment in manufacturing.

When you see the distribution of it, then you see how these communities are tied together, because at a national rate of 13 percent unemployment in the furniture industry last year, in Pennsylvania it was 23 percent, in Maryland it was 18 percent, and so on down the line. In such cases we either prosper or decline together.

(Mr. McDowell's prepared statement appears at p. 314.)

The CHAIRMAN. Are there questions?

Mr. Parsons.

STATEMENT OF VAN PARSONS, GENERAL CHAIRMAN OF THE BROTHERHOOD OF RAILROAD TRAINMEN, WESTERN MARYLAND RAILROAD

Mr. PARSONS. Mr. Chairman, members of the committee, and members of the panel; my name is Van Parsons. I am the general chairman of the Brotherhood of Railroad Trainmen on the Western Maryland Railway, with residence and office in Cumberland, Md. I shall confine myself to that area.

Having lived in the city of Cumberland for the past 20 years, and having worked for the Western Maryland for all of that time, it has been possible for me to observe the drastic change which has occurred in railroad employment within the last 5 years.

Looking at the field of railroad employment on a national basis, we find that in July 1953, railroad employment was 1,239,443. According to the latest report of the Interstate Commerce Commission, December 1954, railroad employment has declined to 1,027,267, a falling off of 212,176 in 18 months.

A decline is evident in my own area. The railroad industry in this city accounts for the employment of approximately 5,000 of the total labor force, which is 40,000 when employment is at a high level—immediate postwar period. At present there are 6,500 persons unemployed in the Cumberland area. This represents an unemployment of 14.4 percent. In contrast with this figure of overall unemployment, the unemployment of 1,500 railroad workers represents a rate of 30 percent in that industry, which is double the rate for the area. This figure includes both employees engaged in transportation and those employed in the shop crafts, such as machinists, boilermakers, car repairmen, et cetra.

The Federal Government has classified Cumberland as a distress area since the spring of 1949. It is designated as an IV–B area, which indicates there is no immediate prospect for the reemployment of those on the unemployment rolls in that area. It has carried the distress area label longer than any other area in Maryland, and perhaps any other area in the country, according to the Department of Labor.

There are three factors which account almost entirely for this condition. One is the decline in manufacturing employment at a synthetic yarn plant; second, is the decline in transportation employment in railroad shops; and third, the decline in bituminous coal-mining employment. All of the above economic activities are the type which import dollars into a community, and the declines have produced a noticeable result in service and trade activities.

According to a survey just released by the Railroad Retirement Board in cooperation with the Department of Labor, it is reported that five-sixths of those unemployed in the railroad industry in Cumberland are unable to obtain other employment in the same city.

I am unable to account for the Department's statement that one-sixth of the unemployed railroad workers have found other employment in Cumberland. I work with and am in constant contact with these people and know from my own experience that it has been impossible for them to find any kind of employment.

I call your attention specifically to the decline in the textile industry in that area. At peak employment there was a total labor force of 10,000 in my area. Of this number only 2,700 are working there today. Hundreds of these people who have lived all of their lives in Cumberland and own their own homes have been forced to go to other areas to seek employment.

It is futile to hope that unemployed railroad workers could find any kind of other employment in an area as depressed as this one, where unemployment extends to several major industries.

As I rode to Washington on the train yesterday, I talked with an official of the board of education of Allegheny County, Md. He acquainted me with the unemployment situation in the city of Frostburg, which is only 11 miles from my home, and is included in the Cumberland labor area. Frostburg has a population of 5,000 people. He told me that for a janitor's vacancy the board of education received 192 applications within a few days. Another example, at the Hercules powder plant, located just outside of Cumberland, which employs 700 full-time workers, there are on file 5,500 applications for employment. I included this in my statement to show the committee how drastic the situation is there.

In the transportation field the decline in railroad employment has resulted from many factors. Among these are the competition from the trucking industry, particularly in short-haul and less-than-carload shipments, the modernization program, including the dieselization of railroads, and other technological improvements, such as automatic control devices, and the decline in the use of coal as a fuel, it being substituted by imported residual fuel oil.

The solution to this problem is not a simple one. As I see it, several remedies could be tried to correct the tight situation in the Cumberland area. There could be an increase in the payment of unemployment-insurance benefits, both as to the amount of the payment, and the duration of the payments. Public works and Federal construction could be increased in the Cumberland area.

In line with what the Congressman said, we read daily about the crying need for more schools. School construction could provide a shot in the arm for the building trades, and its stimulation would reflect itself in associated industries.

For many years the Brotherhood of Railroad Trainmen has plugged for the elimination of grade crossings. In the Cumberland area are many such highway hazards, the elimination of which through Federal work projects would not only increase employment, but eliminate a constant threat to rail-highway accidents.

The Government can also provide a measure of relief by reducing the Federal income tax burden on wage earners in the lower tax brackets. Increasing personal exemptions and exemptions for dependents will provide more purchasing power than any other single remedy available. Distressed areas should be given priority in the allocation of Government contracts. It may be necessary to award the contracts on a noncompetitive basis, but we think it is a necessity in view of the urgency for stimulating employment among the area's large number of unemployed.

As far as increasing business in the railroad industry in this area, not too much emphasis can be laid on the fact that this decline in the transportation industry is directly related to the drop in the production and hauling of coal. The Western Maryland Railway is chiefly a coal-hauling railroad. In recent years the heavy increase in the importation of residual fuel oil for use in the eastern section of the country has contributed to the decline in the use of coal as a fuel.

If the President of the United States under the authority granted him in the Trade Agreements Act would see fit to limit the importation of residual oil, it would be possible to restore the depressed coal industry to greater production.

I am grateful for the opportunity to appear on this panel to acquaint you with the unemployment situation in the Cumberland area, and hope this committee will be able to make some recommendations that will relieve the hardships being experienced in the Cumberland area.

I have some figures here I would like to quote for the committee.

The continued increase in the number of barrels of imported residual oil reflects itself directly in the decrease in railroad employment in the eastern section of the country. Current figures on residual oil imports for 1954, up to and including the week of December 24, indicate there have been imported 128,327,160 barrels. This figure equals 30,557,500 tons of coal, using the ratio of 4.167 barrels of residual oil as being equivalent to 1 ton of bituminous coal.

To take the matter further, this loss of over 30 million tons of coal by rail results in the loss of 509,291 carloads of coal, based on the loading of 60 tons of coal to a carload. The Association of American Railroads states a coal haul averages about 300 miles per car from the mine to the consumer on the Atlantic seaboard. Using 80 cars per train for an average, the 509,291 carloads would equal about 6,366 trains. Since railroad operating employees are paid on a 100-mile basis, and the average mine haul is 300 miles, the actual loss would justly be 3 times the 6,366 trains, or 19,098 trains or train crews.

But this still is not the complete picture. We have spoken so far only of carloads of coal lost. The other side of this movement is the hauling of empty cars to mines for the transportation of coal to consumers. To obtain the whole effect, and to determine the total number of trains and crews displaced by this operation, the number of 19,098 trains must be doubled, since there would be a like movement of empty cars to the mines before there could be the same movement of loaded cars out of the mines. By this process we see that a total of 38,196 trains are affected.

There are not less than 5 employees on each train crew; after multiplying this by the number of trains affected, we discover this equals 190,980 man-days lost.

The above figures cover railroad employment in the eastern section of the country, which is the area affected by the importation of residual oil—the coal fields of Pennsylvania, West Virginia, western Virginia, eastern Tennessee, eastern Kentucky, and western Maryland, embracing the three coal districts; namely, the Eastern, Allegheny, and Pocahontas.

Sources: National Coal Association, Washington, D. C.; Association of American Railroads, Washington, D. C.

That concludes my statement.

The CHAIRMAN. Thank you very much, Mr. Parsons.

I am going to ask Mr. Goodwin at this time if he would submit for the record the latest figures dealing with two subjects:

First, the list of plants getting tax amortization because of labor surplus in their area and, second, a list of the defense contracts and the amounts which have been set aside for distressed areas in the United States.

Mr. HARRIS. Senator, may I make a footnote there?

The CHAIRMAN. Yes.

Mr. HARRIS. It would be very helpful if we would also have the total amount involved for the whole country as well as the populations of these distressed areas. That will give us some ideas whether they are really doing anything for these distressed areas. Is that possible?

The CHAIRMAN. Third, let us ask Mr. Goodwin if he would get the population of these distressed areas, and, fourth—I think we know the total tax amortization, which, as I remember it, is around $30 billion at the present time; then we could get a total, if it is not classified, on the total defense contracts for the country as a whole.

(The following information was subsequently received for the record:)

List of accelerated tax amortization certificates where additional allowances were authorized for facilities located in areas of substantial labor surplus, through December 1954

Name of company	Location of facilities	Number of additional employees	Product	Amount	Normal	Certified

[1] Data cover the period Jan. 1 through Sept. 30, 1954, except that those areas and industries which have been designated as labor surplus areas subsequent to Jan. 1, 1954, include only contracts awarded after the date of designation. Contracts awarded prior to Jan. 1, 1954, are summarized in a preceding issue of this report, published on Mar. 1, 1954.

[2] Prior to Jan. 1, 1954, the date of Office of Defense Mobilization approval. Beginning with Jan. 1, 1954, this is the date the Department of Labor designated the area as group IV (area of substantial labor surplus).

[3] New contracts (all debit actions, omitting any credit actions) for the period of time each area was a designated labor surplus area since Jan. 1, 1954.

[4] Department of Navy includes contracts of $10,000 and over.

[5] Contracts awarded to the textile industry are excluded from the data on contracts awarded in the geographic labor surplus areas.

NOTE.—Grand total, Defense Department procurement, January-September 1954, $10.3 billion.

The CHAIRMAN. Thank you very much, gentlemen. I think we have brought out a series of facts which need to be considered. There is always a tendency for people in Washington to see things with rosy-colored glasses. I think this has furnished a very healthy corrective. I want to thank you for taking the time and trouble to come here.

(The prepared statements of the panel are as follows:)

STATEMENT OF ROBERT C. GOODWIN, DIRECTOR, BUREAU OF EMPLOYMENT SECURITY, UNITED STATES DEPARTMENT OF LABOR, TO THE JOINT COMMITTEE ON THE ECONOMIC REPORT, JANUARY 27, 1955

I welcome this opportunity to appear again before your committee. I wish to discuss with you our experience with regional and industrial unemployment, some of the conditions which give rise to local unemployment, and programs which are designed to deal with these problems. I would also like to submit, in a few days, a somewhat more detailed statement relating to regional and industrial unemployment over the past year.

A year ago in January claims activities were rising substantially more than seasonally, and instead of declining in February as it usually does, insured unemployment continued to rise through March and April to 2,181,000. Thereafter, the average weekly volume declined steadily to less than 1.5 million in November.

The rise in insured unemployment was accompanied by a rise in the number of claimants exhausting unemployment benefits. The number of exhaustions rose from 94,000 in January to 171,000 in August and then tapered off to 152,000 in December. The total number of exhaustions for the year was 1,762,000. As may be expected, the largest volumes of exhaustions generally occured in those States which experienced the heaviest levels of insured unemployment.

The economy began to improve this past fall, and the seasonal increase in insured unemployment, which usually begins in November, did not develop this year until December when the volume moved up to 1.7 million. Furthermore, the rise this year was somewhat smaller than usual.

During 1954, $2 billion in benefits was paid to about 6.6 million individuals under State unemployment-insurance programs, as compared with $962 million paid to 4.2 million individuals in 1953.

It is too early to tell yet what January will show but insured unemployment rose as usual in the first week to 1,857,000. Normally insured unemployment begins to turn down toward the end of January and early February.

The volume of insured unemployment varied widely among different regions, States, and areas over the past year. The largest volumes of insured unemployment were experienced in the middle Atlantic and east north central regions which account for about half of the covered workers of the Nation and which have a heavy concentration of durable goods manufacturing. In these regions which include New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin, cutbacks in such industries as steel, autos, military hardware, heavy industrial machinery, machine tools, railroad equipment, and farm machinery contributed significantly to insured unemployment levels. Curtailments in apparel manufacturing also caused some unemployment in New York, New Jersey, and Pennsylvania.

The highest rates of insured unemployment, as distinct from the numbers of workers involved, were experienced in West Virginia, Kentucky, Tennessee, Mississippi, New Hampshire, Oregon, Pennsylvania, Maine, and Rhode Island.

THE PROBLEM OF LOCALIZED UNEMPLOYMENT: EXTENT AND CAUSE

While the State figures on insured unemployment provide a valuable indicator of the relative impact of unemployment among different sections of the country, they do not, of course, tell the whole story about the problem of localized unemployment. The Bureau of Employment Security, classifies 149 major local areas to their relative degree of unemployment.

Our January 1955 classification shows that 105 areas which account for close to 80 percent of the 32.5 million nonfarm wage and salaried workers surveyed had only moderate unemployment. Some 44 other major areas had substantial unemployment and were classified in group IV in January. Of these, 35 had between 6 and 12 percent of the work force unemployed; the other 9 had unemployment in excess of 12 percent. About one-third of the Nation's total unemployment is centered in areas classified in group IV.

At this point, I wish to emphasize that not all of these areas are confronted with long-term unemployment problems. A very large share of the more than 1 million unemployed workers in the group IV areas are concentrated in areas with short-run unemployment problems, stemming from temporary dislocations in specific industries. No single cause can fully explain serious unemployment in some areas while the Nation as a whole is generally prosperous. Several contributory factors, however, can be isolated. Among these are:

1. *Short-run cutbacks in consumer demand for certain products.*—The Detroit and Pittsburgh areas early in 1954 illustrate the effects of such cutbacks in the auto and steel industries.

2. *Long-term loss of an industry's competitive market position.*—Employment in some areas has been declining over long periods of time because of the inroads of competing products upon the market position of basic local industries. This has frequently been accompanied by geographic shifts of the industries affected. Many textile areas in New England have experienced this problem. Many Pennsylvania anthracite coal-mining areas such as Scranton, Wilkes-Barre-Hazleton, and Pottsville have suffered employment losses due to competition from other fuels.

3. *Exhaustion or depletion of natural resources.*—Coal-mining areas, where the most accessible veins have been exhausted or depleted, have been hardest hit. To a lesser extent areas dominated by such industries as lead, zinc, and silver mining, and lumber have also developed labor surpluses as a result of the depletion of natural resources.

4. *Technological changes.*—Changes in methods of production or materials used for certain items have resulted in substantial labor surpluses in some areas. For example, the changeover from cotton cord to nylon cord in rubber tires has created heavy unemployment in the Cedartown-Rockmart area of Georgia. Similarly, the change to diesel engines has contributed to labor surpluses in the important railroad and locomotive repair center of Altoona, Pa.

5. *Lack of an adequate industrial base.*—In some areas locally available employment opportunities are not sufficient to support a growing population and labor force on a year-round basis. Among these are the seasonal resort areas of Atlantic City, N. J., Asheville, N. C., or Ronceverte-White Sulphur Springs, W. Va.; the tobacco processing centers of Durham and Winston-Salem, N. C.; and the Great Lakes shipping ports of Duluth, Minn., and Superior, Wis.

6. *Shifts in Government activities.*—Some areas are or have been in the labor surplus category because of changes in emphasis of our defense program. Cutbacks in ordnance requirements over the past 2 years for example, have contributed significantly to the development of surplus conditions in many small areas.

PROGRAMS TO ALLEVIATE UNEMPLOYMENT

To over 40 million workers the first line of defense against unemployment is unemployment insurance. It is "automatic" in the sense that it goes into effect without requiring special State or Federal action. It directly supports the purchasing power of those seeking work and it is of known amount and duration so that recipients and the communities in which they live can plan their own actions with a full knowledge of the facts.

In addition to the system of State unemployment insurance laws which operate in all States, the District of Columbia, Hawaii, and Alaska, there is Federal legislation providing unemployment insurance for railroad workers, Korean veterans, and civilian employees of the Federal Government.

As recommended by the President, State unemployment-insurance programs should be improved by broadening coverage and by increasing the amount and duration of benefits. The Secretary of Labor has communicated with the State governors urging that action be taken to revise State laws so that they may more adequately carry out the basic objectives of a sound unemployment-insurance system. I want to emphasize that unemployment insurance is "a first line of defense" and is one of the built-in economic stabilizers. Unemployment insurance in itself does not spark a resumption of economic activity but it provides time for other programs to get underway.

The nature of the unemployment problem and the kind of action required to deal with the problem differ from one locality to another. For this reason, the primary responsibility for dealing with localized unemployment problems rests with the local community whose resources and facilities must be coordinated to overcome the conditions which give rise to the unemployment. State governments share with local governments the responsibility for cooperating with the local community groups to develop action programs which will bring about economic diversification and stimulate employment opportunities. The role of the Federal Government is to cooperate with State and local governments in these efforts. It brings to bear its technical resources in helping to determine the character of the problem and it helps to develop courses of action to deal with the problem. In addition to its general national economic policies and programs, it modifies its own operations and activities to provide assistance to local areas experiencing serious unemployment.

Federal programs to alleviate unemployment in labor-surplus areas include three broad fields of activity: technical assistance to the States and the communities primarily through the Departments of Commerce and Labor; certain special provisions in procurement policies benefiting bidders from areas of substantial labor surplus; and assistance through accelerated tax amortization to benefit new or expanded plants necessary to strengthen the mobilization base located in areas of labor surplus.

In addition, programs that are not directly linked to area unemployment may be of some assistance to areas of substantial labor surplus. These include the program for urban renewal under the Housing Act of 1954; Federal assistance for school, road, and hospital construction; the construction or expansion of Federal installations such as Atomic Energy Commission plants and Defense Department installations, and the programs of the Small Business Administration. Unemployment is also a consideration in adjusting many other broad Federal programs such as foreign-trade policy and the development of river basins and harbors, and flood control.

The program of the Department of Labor with regard to local area unemployment includes both the determination and publication of the facts and technical assistance through the State employment security agencies to the communities themselves in organizing their own community resources. Forty-two State unemployment insurance laws specifically provide for programs to alleviate and prevent unemployment. The community employment development program is now one of the important programs in the employment security system. In a typical situation a representative from the Department of Labor is sent to assist State technical staffs and the local office manager in a thorough review of the facts concerning a locality's labor market, the basic causes of the unemployment, and the employment outlook as far forward as key employers in the area can estimate their labor requirements. The local office manager, with the assistance of the Department's representative, stimulates local civic leaders, key employers, and major union leaders to cooperate in working out an overall program for the community. This program lays heavy stress on developing further the assets of the community and correcting weaknesses. It points generally to the types of industries that are necessary not only to provide additional employment but to balance the local economy. Primary stress in all of this work is laid upon local responsibility and local initiative.

The Department of Commerce, through its Area Development Division, works closely with us in providing assistance to communities of substantial unemployment. The Department of Commerce representative will, I am sure, elaborate on the activities of his Department.

Federal procurement policies to assist areas of substantial labor surplus have now been extended to include offshore procurement. These policies include Defense Manpower Policy No. 4, as amended in November 1953, and Executive Order 10582, which modifies the application of the Buy American Act. Under DMP-4, a procurement agency may set aside a portion of a procurement for the specific purpose of offering it to firms in labor surplus areas at an acceptable price determined through free competitive bidding. While this program has not resulted in the redirection of a large volume of contracts to such areas, the wide dissemination of the list of labor surplus areas has resulted in manufacturers in these areas receiving more attention. The total volume of contracts secured by them has been significant. From January 1, 1954, to September 30, 1954, a total of over $900 million in Defense Department contracts was placed in surplus-labor areas.

On December 17, 1954, the President issued Executive Order 10582 to expand offshore procurement. However, the order permits the rejection of a foreign bid in any situation where the domestic low bidder would produce most of the materials in areas of substantial labor surplus, providing such action is determined to be in the national interest. This policy is still too new to measure its results.

A more basic program is the granting of additional accelerated tax amortization to firms that locate in areas of substantial labor surplus. The program is more basic since it creates a permanent business activity. This policy was initiated in November 1953 by the Office of Defense Mobilization and came after a great volume of applications had already been processed, so that relatively few industries remained eligible for accelerated amortization. Nevertheless, through December 1954 some 31 facilities involving a total capital investment of $204 million have been certified for areas of substantial labor surplus. These facilities, when completed, are expected to provide jobs directly for nearly 9,000 workers. As we all know, such employment will create secondary jobs in trade, service, and other supporting activities.

RECENT PROGRAM DEVELOPMENTS

Some months ago the Council of Economic Advisers set up a task force to examine and evaluate programs designed to assist areas of substantial labor surplus. The President's Economic Report recognized that the procurement and tax amortization policies have been of rather limited assistance, but recommended their continuation. Further, the report strongly urged the strengthening of the technical assistance programs, especially those conducted by the Departments of Commerce and Labor.

The Department of Labor is reviewing past experience in this field and what can be done to assist areas experiencing substantial unemployment. It is obvious, however, that the initiative and responsibility of the local community and State governments are of basic importance in resolving localized unemployment problems.

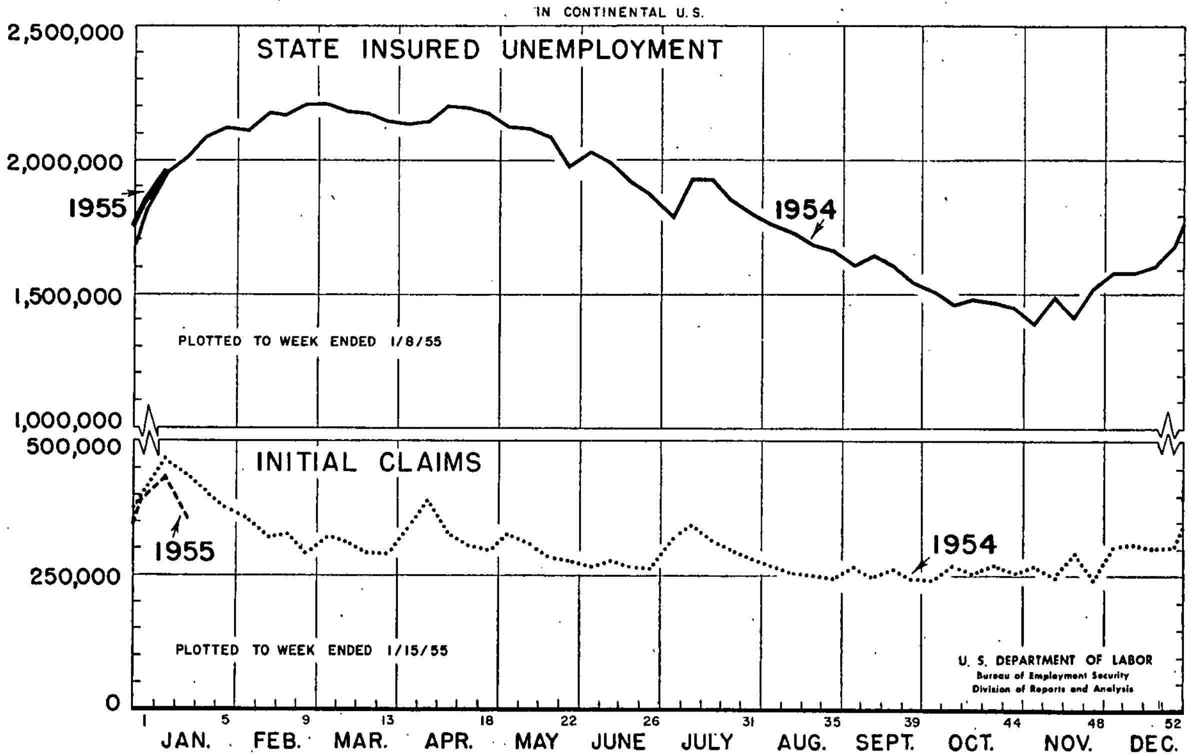
STATE INSURED UNEMPLOYMENT AND INITIAL CLAIMS BY WEEKS 1954 - 1955



SUPPLEMENTAL STATEMENT SUBMITTED BY ROBERT C. GOODWIN, DIRECTOR, BUREAU OF EMPLOYMENT SECURITY, UNITED STATES DEPARTMENT OF LABOR, TO THE JOINT COMMITTEE ON THE ECONOMIC REPORT

REGIONAL AND INDUSTRIAL UNEMPLOYMENT IN 1954

In 1954 the economy moved to a more normal peacetime pattern. The transition involved major adjustments in broad sectors of the economy, particularly during the earlier part of the year. This statement will summarize some of these adjustments on a national basis as they were revealed by unemployment insurance activity, and will indicate the different regional, State, and area experience during the year. Selected statistical data and charts are appended.

The year 1954 began with claims activities rising substantially more than seasonally. Normally both new and insured unemployment rise at the beginning of the year as a result of the postholiday contraction in trade and services, and the further curtailment in outdoor work. In 1954, however, the rise was accelerated by a mounting volume of nonseasonal layoffs resulting from overall adjustments in inventory-demand relationships.

Initial claims, which indicate new unemployment among covered workers, rose from an average of 346,500 per week in December 1953 to 416,500 in January 1954, a postwar high for the month.

Insured unemployment (representing completed weeks of unemployment), which normally begins to decline toward the end of January and early February, in 1954 edged up through March and April to 2,181,000—the highest April average in the postwar period. During these months, the unemployment among covered workers was mainly concentrated in durable-goods manufactures such as autos, military hardware, steel, heavy industrial machinery, machine tools, railroad equipment, and farm machinery. Soft-goods industries such as apparel, textiles, and shoes also contributed to the claims load, although to a lesser extent.

Initial claims began to decline seasonally in February, reaching a low of 265,000 in November and averaging 303,500 per week for the year, as compared to a weekly average of 218,300 in 1953. Insured unemployment, by late spring, began to indicate that the economic decline was leveling out. Normal seasonal influences were beginning to dominate the Nation's labor markets to a greater extent than earlier in the year and the employment situation in general was showing evidences of more stability. Insured unemployment began a steady decline after April as record levels of construction activity, gains in other outdoor work, and some improvements in soft goods and a number of durable-goods industries eased the job situation. Generally, the employment situation evidenced marked stability during the summer months of 1954, while the fall brought unmistakable evidences of some recovery.

Insured unemployment continued downward in the fall months, reflecting improvements in trade and manufacturing and the continuing high level of building activity. A number of industries which had been experiencing market uncertainties showed evidences of increased strength—including steel, machinery, furniture, apparel, and textiles. However, claims arising from the automobile industry indicated sizable layoffs as a result of the earlier, and longer than usual, model changeover period. By the latter part of October and November, automobile manufacturers had recalled thousands of workers from insured unemployment status, and automobile plants were fast resuming full production. The significant rise in automobile output stimulated many related industries. As a result, in sured unemployment, which normally rises in November, this year registered a slight decline, averaging 1,463,000 for the month. As a result of normal seasonal influences, the weekly volume rose in December to 1,463,000, and the rise continued in the early weeks of January.

On a seasonally adjusted basis, insured unemployment continued to decline in October, November, and December, although the unadjusted figures indicated no change between October and November and a sharp rise of 200,000 in December (see appendix 1).

For 1954 as a whole, insured unemployment averaged 1,857,000, as against 988,000 in the preceding year. However, while the 1954 level was nearly twice that of 1953, it was about 100,000 under the weekly average in 1949, the previous year of heavy insured unemployment volumes.

CLAIMANTS EXHAUSTING BENEFIT RIGHTS

The increased volume of insured unemployment in 1954 was accompanied by a rise in the number of claimants exhausting their benefit rights. The number of exhaustions rose rapidly in the early part of the year reaching 156,000 in April, and then showed a more gradual rise to 171,000 in August. Thereafter the volume of exhaustions tapered off to 141,000 in November and then showed a moderate seasonal increase to 152,000 in December. The total number of exhaustions for the year was 1,762,000, compared with less than 759,000 in 1953. The largest volumes of exhaustions were generally experienced among the States having the heaviest levels of insured unemployment. In 1954, there were 200,000 exhaustions in Pennsylvania and more than 100,000 each in New York and Michigan. Other States with more than 75,000 exhaustees during the year were Illinois, Indiana, Ohio, New Jersey, Massachusetts, and California. (See appendix 2.)

Employment security records contain no evidence of how long claimants who exhaust their benefit rights remain unemployed, since such persons are not required to appear regularly at local offices once they have used up their benefits. Thus without special comprehensive surveys it cannot be definitely determined how many of those who have exhausted their benefits are still unemployed at a given time, that is, not working and still seeking work.

PARTIAL UNEMPLOYMENT

Approximately 7 percent of the insured unemployed workers in 1954 claimed benefits for partial unemployment, as compared to nearly 9 percent in 1953. The decline in the relative number of claimants who were partially employed reflected, in part, a change between 1953 and 1954 in the economic outlook. During a large part of 1953 layoffs were frequently of very short duration resulting from temporary impediments in the production process. Consequently, employers tended to maintain their work force on a part-time or a partial week basis. As production and employment declined in the early part of 1954, however, layoffs both increased in number and in duration and the proportion of partial unemployment to total unemployment among insured workers declined.

WOMEN AMONG THE INSURED UNEMPLOYED

There was a smaller proportion of women among the insured unemployed in 1954 than there was in 1953. Women comprised about 36 percent of the insured unemployed in 1954, as compared to 41 percent in the previous year. The proportion of women was lower because the major employment declines in 1954 occurred in durable goods manufacturing where the bulk of the work force is male. Moreover, many light industries which normally employ large numbers of women fared relatively well during the year. There was considerable variation among the States in the proportion of women among the insured unemployed. The heaviest ratios were in the New England States, New Jersey, the Carolinas, Georgia, and Florida, where such industries as textiles, apparel, leather products, and tobacco processing, which normally employ a high proportion of women, are important.

REGIONAL AND STATE DEVELOPMENTS DURING 1954

The largest volumes of insured unemployment during much of the year prevailed mainly in the Middle Atlantic and East North Central regions which account for about half of the covered workers of the Nation and have a heavy concentration of durable goods manufacturing. (See appendix 3.) In these regions, which include New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin, cutbacks in a variety of heavy industries such as steel, autos, industrial machinery, machine tools, railroad equipment, and farm machinery contributed significantly to insured unemployment levels, particularly during the earlier part of the year. A considerable part of Pennsylvania's unemployment was attributable to weaknesses in coal mining, while curtailments in apparel manufacturing contributed to the loads in New York and New Jersey as well as in Pennsylvania.

New York had the highest volume of insured unemployment in the Nation during 1954, with a weekly average of 239,000. The weekly volume of insured unemployment in this State reached a peak of 279,000 in June, with the apparel, machinery, fabricated metals, leather, and carpet industries contributing substantially to this load. The summer and fall months witnessed an improvement, with the weekly volume of insured unemployment falling to 184,500 in September and October. Toward the end of the year insured unemployment moved upward as a result of normal seasonal influences. Despite the high volume, the rate of insured unemployment for New York State for the year as a whole was about the same as that for the Nation—5.3 percent.

Pennsylvania had the second highest volume of insured unemployment during the year—a weekly volume of 220,000. The peak was reached in April and May as a result of curtailments in primary metals, construction, anthracite mining, fabricated metals, electrical machinery, and apparel. The weekly average of insured unemployment in the State thereafter dropped steadily until December and then showed a small seasonal rise. The 7-percent rate of insured unemployment in Pennsylvania was well above the national average.

Illinois and Michigan had nearly equally heavy volumes of insured unemployment in 1954, with average weekly levels of 129,000 and 113,000 respectively. Illinois experienced its peak volume in May when curtailments in coal mining, apparel, leather, fabricated metals, machinery, and electrical equipment contributed sizably to the load. Thereafter, as improvements occurred in most of the State's important industries, the volume of insured unemployment declined steadily until December. As was the case in most other States, the volume of insured unemployment rose in December but the increase was of moderate proportion and mainly attributable to the usual seasonal forces. Michigan experienced two peaks in the weekly volume of insured unemployment. The first peak was reached in March, when layoffs in fabricated metals, machinery and some layoffs in the automobile industry raised unemployment loads. Unemployment then declined through June; thereafter, a rise occurred which continued through September when the average weekly volume reached a high for the year of 159,100. The high volumes in this period were primarily due to curtailments in the auto industry which was experiencing an earlier-than-usual and longer-than-usual model changeover period. In each of the last 3 months of the year insured unemployment in Michigan dropped substantially reflecting the resumption of full production of 1955 models in automobile manufacturing and the favorable effect this had on related industries. By December the volume of insured unemployment in Michigan was less than one-half what it had been in September. The Michigan rate of insured unemployment for the year as a whole was 6.2 percent while the rate in Illinois was the same as the national average at 5.2 percent.

The only other States in the east north central and middle Atlantic regions with insured unemployment levels of substantially more than 50,000 per week were Ohio, with 97,000, and New Jersey, with 83,000. Ohio reached its peak unemployment insurance load during the year in March, primarily because of employment reductions in the rubber and tire industries, and some curtailments in autos and in primary metals, fabricated metals, nonelectrical machinery, and ordnance. The annual rate of insured unemployment for the State was 3.9 percent, well below the national average. In New Jersey the peak volume of insured unemployment was reached in May and was largely attributable to cutbacks in apparel, autos, ordnance, and electrical machinery. For the year as a whole, New Jersey's rate of insured unemployment was 5.7 percent—only slightly above the national average.

California and Massachusetts also experienced substantial volumes of insured unemployment during the year (averaging 136,000 and 68,000, respectively) although both States had unemploymene rates that were well below the national average.

The highest annual rates of insured unemployment, as distinct from the numbers of workers involved, were experienced in West Virginia, Kentucky, Rhode Island, Tennessee, Mississippi, New Hampshire, Oregon, Maine, and Pennsylvania. The rates in these States ranged from approximately 7 percent in Maine, Oregon, and Pennsylvania to a high of 10.9 percent in West Virginia and 10.3 percent in Kentucky. On a broad regional basis, the east south central region and the middle Atlantic region had the highest rates of insured unemployment during the year. On the other hand, the rates of insured unemployment for the west north central, west south central, and mountain regions were substantially below the national average of 5.2 percent.

Depressed conditions in coal mining contributed to the high rates in Pennsylvania, Kentucky, and West Virginia. The latter two States were also affected by the return of displaced workers from nearby industrial States. Tennessee's rate reflected layoffs in such industries as chemicals, textiles, apparel, ordnance, and tobacco. Mississippi was affected by declines in nonmanufacturing industries and in apparel. In Rhode Island unemployment in textiles, costume jewelry, and in machinery were mainly responsible for the high rate of unemployment while Maine and New Hampshire felt the effects of cutbacks in textiles and leather goods. Oregon's heavy rate resulted primarily from rises in unemployment in the logging and lumber industry.

In the first week of January 1955 when both the level and rate of insured unemployment normally approaches a peak, there were 10 States with insured unemployment rates of 8 percent or more (see appendix 4). These States included Oregon, Washington, Kentucky, West Virginia, Tennessee, and Mississippi, whose insured unemployment rates had remained consistently high during much of 1954. Three additional States—Maine, Rhode Island, and Pennsylvania—which had also experienced consistently high rates of insured unemployment during 1954, reported unemployment rates of approximately 7 percent in early 1955.

AREA DEVELOPMENTS IN 1954

The employment and unemployment developments of the past year reflected changes in the employment situation in practically all of the country's leading production and employment centers. Area unemployment levels, which had been rising slowly throughout the autumn of 1953, increased sharply as the year 1954 got underway. In the 2 months preceding January 1954, more than nine-tenths of the 149 major labor markets covered by the BES regular area classification program reported increases in their jobless rolls. Reflecting these changes, the Bureau's January 1954 area classification indicated that only about one-third of the 149 major areas continued to have a tight, or balanced, labor supply (groups I or II classifications) during that month, with the remaining two-thirds reporting some labor surplus—groups III and IV (see appendix 6). The number of areas in group I and II had been nearly equal to those in groups III and IV during most of 1953.

Unemployment continued to climb in most areas during the winter and early spring months of 1954 as employment declines, previously limited to a few selected lines, such as autos and farm machinery, spread to a wide range of industries. Major centers of production for steel and steel products, ordnance materials, nonferrous metals, shipbuilding, electronics and electrical equipment, tires and tubes, and textiles all reported measurable job decreases. These employment declines and unemployment increases resulted in large-scale shifts in area classifications in the early months of 1954. Labor supply classifications of 45 of the 149 major areas were changed between January and March—by far the largest number of changes for any single classification period since the present system was inaugurated in July 1951. All of the shifts were to categories reflecting a loosening labor supply. Between March and May, another 21 areas were transferred to categories reflecting higher unemployment.

By mid-May, when the trend toward looser labor supply was arrested, only 16 major areas remained in the balanced category, as compared with 49 at the beginning of the year; none continued to be classified as a group I area of overall labor shortage. Although there was only a minor increase in the number of moderate surplus group III areas between January and May (from 79 to 82), the number of areas with a relatively substantial surplus increased markedly during the period, from 20 to 51. Such key centers as Detroit, Philadelphia, Pittsburgh, St. Louis, and Buffalo were among those placed in group IV at that time.

In mid-May also, the group IV category was split into two separate groupings (IV–A and IV–B) in order to isolate areas with the most serious unemployment problems. The group IV–B category was used to designate areas with very substantial labor surpluses—where unemployment (apart from seasonal and temporary factors) affects about 12 percent or more of the area's work force. Seven major areas were placed in group IV–B in May.

The year-long downtrend in area employment totals began to level off between May and July. Three-fifths of the 149 major labor markets reported employment gains over this 2-month period. While seasonal pickups in construction—a bulwark to the economy of most areas during all of the past year—and other outdoor activities provided the primary impetus for the rise, manufacturing employment also increased in almost half of the areas. Unemployment continued to trend upward in many areas, however, where the usual influx of students and graduates into the labor force, as schools closed for the summer, more than offset the rise in employment. On balance, these diverse trends had little net effect on the overall labor supply situation in most job centers. Only five areas changed classification between May and July, in contrast to the sweeping classification changes reported earlier in the year.

Employment conditions in most of the Nation's key employment centers remained relatively stable during the midsummer. Unemployment edged downward between July and September, except in a few areas mainly producing automobiles, nonelectrical machinery, steel, and coal. The area unemployment decreases, while widespread, generally continued to be on a small scale during this period, however. As in the preceding 2 months, few localities reported sufficient change in their unemployment level to significantly affect their overall labor supply-demand situation. As a result, classifications of only 6 major areas were revised between July and September; 4 of these changes were to categories indicating a smaller volume of unemployment and tighter labor supply. This period marked the first since May 1953 that the number of areas which shifted to more favorable ratings outnumbered those reflecting a higher level of unemployment.

The late autumn months (mid-September to mid-November) were characterized by a continued slow improvement in employment conditions in most of the 149 leading production centers. While seasonal factors again represented a predominant influence, many areas reported better-than-seasonal downtrends in unemployment since early fall. Large-scale call backs by auto plants as production on the 1955 model cars got under way contributed significantly to these declines. Employment increases in steel, metal products, and electrical machinery were also noted in some areas, with gains stemming, in part, from the pickup in demand for auto components. Manufacturing employment, measuring on an overall basis, reached its high point of the year in mid-November. Initial hirings of extra workers by trade and service establishments getting ready to handle peak-volume Christmas traffic were, of course, also a factor in the year-end employment gains.

These improvements were reflected in a shift to more favorable classification ratings for 3 major areas between September and November, while only 1 area was reclassified to a category indicating a higher level of unemployment. The November area classifications marked the first time since early spring that fewer than 50 major employment centers were listed in labor supply groupings denoting a relatively substantial or very substantial labor surplus (groups IV–A and IV–B). Coal, steel, auto, and textile producing centers continued to account for a large share of the areas still classified group IV in November.

As the year 1954 drew to a close, Christmas hiring in trade and service, and the recall of automotive manufacturing workers, increased end-of-1954 employment totals to the high point for the year in many areas. Some rise in unemployment was reported in early January 1955, however, reflecting usual winter-season curtailments in construction and other outdoor activities. Despite these seasonal curtailments, the trend toward an overall improvement in area job market conditions continued. Employment increases in auto plants again played a major role in this improvement, with gains in primary steel products and machinery also noted in some centers. In a number of instances, however, increases in production were accompanied by increases in hours of work, rather than in employment. A few areas reported that new defense contracts were contributing to recent additions in employment.

In mid-January 1955, the employment outlook for manufacturing industries—particularly in the durable goods sector—appeared to be the most favorable in recent months. Employer hiring plans, as reported to local public employment offices near the turn of the year, pointed to continued job gains to early spring in motor-vehicle manufacturing, aircraft, primary iron and steel production, and farm machinery. Employment increases were also expected in furniture and "service-industry and household machinery"—a group which covers such major household appliances as refrigerators, washing machines, air conditioners, sewing machines, and vacuum cleaners. Apparel and shoe producers were also scheduling some additional hires over the next few months.

Six major areas (including Detroit) were reassigned in January to classification categories denoting a smaller volume of unemployment and tighter labor supply. Improved conditions in several other areas did not result in classification changes because employment gains in basic industries were obscured by seasonal increases in unemployment. For the first time in the past 3 years the number of areas moving to more favorable ratings between November and January outnumbered those moving to categories reflecting a higher level of unemployment. (See appendix 7.)

THE PROBLEM OF LOCALIZED UNEMPLOYMENT: EXTENT AND CAUSES

The January 1955 classification shows that 105 areas—which account for close to 80 percent of the 32.5 million nonfarm wage and salaried workers in the 149 major areas regularly surveyed—had only moderate unemployment as the new year opened. Some 44 other major areas had substantial unemployment and were classified in group IV in January. Of these, 35 had between 6 and 12 percent of the work force unemployed; the other 9 had unemployment in excess of 12 percent.

As indicated previously, the number of major areas with substantial labor surplus has receded to some extent over the past 6 months. At the high point in July 1954; some 53 major areas were listed in group IV as compared with 44 today. Among the important industrial centers dropped from the substantial unemployment category during this period were such areas as Detroit; the Davenport-Rock Island-Moline area in Iowa and Illinois; Kenosha, Wis.; and San Antonio, Tex. There has been some increase in the number of smaller areas in group IV during this period. This increase does not necessarily reflect current economic trends or recent changes in local economic conditions, however, since the number of smaller group IV areas depends to some degree on the extent to which the Department of Labor is requested to undertake special surveys.

As has been true during most of the past several years, areas dominated by the coal mining and textile industries were heavily represented on the group IV list in January. Employment in these two industries has been declining since 1948. Several auto- and steel-producing centers—despite the recent overall improvement in these activities—also continued to be characterized by substantial labor surpluses. Almost two-thirds of the 144 major and smaller areas now in the group IV category are located in the following nine States: Pennsylvania, West Virginia, Michigan, Kentucky, Indiana, Massachusetts, New York, Ohio, and Alabama.

Not all of the group IV areas are confronted with long-term unemployment problems however. A very large share of the more than 1 million unemployed workers in the group IV areas are concentrated in areas with short-run unemployment problems, stemming from temporary dislocations in specific industries. No single cause can fully explain serious unemployment in some areas while the Nation as a whole is generally prosperous. Several contributory factors, however, can be isolated. Among these are: Short-run cutbacks in consumer demand for certain products; long-term loss of an industry's competitive market position due to the inroads of competing products; exhaustion or depletion of natural resources; technological changes; lack of an adequate industrial base to support a growing population on a year-round basis; and shifts in Government activities such as may occur because of changing emphasis in the defense program.

How some of these factors have contributed to local labor surpluses is illustrated in the following brief description of the unemployment problems in some representative group IV areas.

Altoona, Pa.

Generally this area has been a one-industry chronic unemployment area whose economy has depended upon railroad equipment production and maintenance. In recent years, partly because of dieselization, local employment in this industry has declined sharply.

Atlantic City, N. J.

The chronic labor surplus in this resort-trade area is only temporarily absorbed at the midsummer seasonal peak. The area is characterized by a serious lack of industrialization and diversification. The small, local manufacturing industry is dominated by apparel.

Cumberland, Md.

This area has had a chronic surplus even during periods of peak mobilization, since there has been little or no industrial expansion to keep pace with population growth. The area's four major establishments (rayon, paper, rubber tires, and railroad shops) are controlled by firms located outside the area. The local rayon, paper, and tire plants are marginal operations. The competitive market for textiles has necessitated modernization of equipment in the rayon plant, cutting job totals about in half. Publicity on labor disputes in previous years has discouraged new industries.

Duluth-Superior, Minn.-Wis.

Lack of off-season jobs for workers engaged in the area's dominant activity—lake shipping of iron ore—and lack of diversification of industry are responsible for heavy unemployment in this area. The gradual depletion of the high-quality Mesabi ore resources has affected the area, although taconite and other new developments will make more ore shipments possible in the future. On the other hand, the St. Lawrence seaway and the increased utilization of Labrador and South American ores may have adverse effects on the future of Duluth.

Gloversville, N. Y.

Gloversville, N. Y. has experienced declining employment for a number of years due to the problems of the local glove industry. A decline in sales of fine leather gloves and competition of foreign glovemakers and manufacturers in the Middle West tended to depress the economy of this virtually one-industry area.

Lawrence, Mass.

The Lawrence area has had the relatively most severe labor surplus in the Nation, with unemployment representing more than 20 percent of labor force during most of 1954. The longstanding labor surplus, dating from World War II, has been caused by general decline in wool textiles, the area's major industrial activity. Several important local textile plants have shut down completely or moved out of the area in the past few years. Despite its recent sharp decline, textiles still remain largest single source of factory employment.

Muskegon, Mich.

The labor-surplus problem in this area is not chronic. However, the Muskegon area is characterized by sharp economic fluctuations, usually of the boom-and-bust variety. The area had an extreme shortage of labor during most of World War II but had a large surplus during 1949–50 recession. Labor supply had been relatively well-balanced during most of period since the outbreak of hostilities in Korea, but cutbacks in both civilian and defense orders—affecting three major industries (refrigerators, foundries and auto equipment)—pushed the area into group IV at end of 1953. More recently, the area improved from group IV–B—very substantial labor-surplus classification to IV–A—substantial surplus rating, however.

Portland, Oreg.

The unemployment problem in this area is not chronic. During World War II especially, the area had severe labor shortages because of shipbulding. In the postwar period, like most of Pacific Northwest, the Portland areas has had a large population increase and has not expanded job opportunities at equal pace. Slackening demand for plywood, lumber, other wood products and declines in food processing were chiefly responsible for the sharp drop in employment which resulted in a group IV classification for the area. Currently, shipbuilding is only of minor importance in area's economy.

Providence, R. I.

The sharp slump in textile employment in recent years is largely responsible for the persistence of heavy unemployment in the Providence area. Costume jewelry has succeeded textiles as the area's major factory activity, but this industry is characterized by sharp seasonal peaks and valleys.

San Juan, Puerto Rico

Government, trade, and service are the largest sources of employment in the San Juan area, with manufacturing representing only about 12 percent of total nonfarm jobs as compared with an average of 33 percent for the continental United States. The local manufacturing industry is largely centered in apparel, food processing, stone-clay-glass, and furniture. This limited industrialization has contributed to a severe lack of job opportunities. At the same time, the area's rapid population growth has induced workers to migrate to the mainland, when possible. Despite some factory employment pickup in the past year, the area's unemployment total has remained high.

Scranton, Pa.

The longstanding chronic labor surplus in the Scranton area (primarily males) reflects the increasing mechanization of coal mines and the declining importance of anthracite coal to the national economy. An energetic local community development program has succeeded in attracting many new industries to the area.

Despite the construction of 50 new plants, and the expansion of 65 others since World War II, providing thousands of new jobs, and despite extensive outmigration to other industrial centers, unemployment in the Scranton area has been above 12 percent during all of the past year. Many of the new industries which have located in the area are textile and apparel plants which employ women primarily. As a result, unemployment among male workers has remained at a very high level.

Tacoma, Wash.

The Tacoma area has had large population growth in last decade, but expanding job opportunities have failed to keep pace with the population increase. The area's major industrial activities—logging, lumbering, plywood—are highly seasonal and the area normally develops a substantial labor surplus during the winter months. Because of the diminishing local supply of saw and peeler logs, this labor surplus has been more severe during recent years.

Appendix I

Average weekly volume for State insured unemployment, unadjusted and adjusted for seasonal variations, 1954 and 1953

[In thousands]

Month	1954		1953	
	Unadjusted	Seasonally adjusted	Unadjusted	Seasonally adjusted
January	2,034	1,696	1,156	964
February	2,170	1,829	1,084	914
March	2,175	1,925	1,014	898
April	2,180	1,975	961	870
May	2,070	1,950	889	837
June	1,924	1,888	833	817
July	1,862	1,825	861	844
August	1,692	1,825	816	880
September	1,580	1,993	779	983
October	1,466	1,939	840	1,111
November	1,463	1,765	1,115	1,345
December	1,666	1,708	1,509	1,546

Classifications of labor-market areas according to relative adequacy of labor supply—149 major areas, bimonthly, January 1954–January 1955

Classification groups	Number of areas						
	January 1954	March 1954	May 1954	July 1954	September 1954	November 1954	January 1955
Group I	1	0	0	0	0	0	0
Group II	49	20	16	16	17	16	15
Group III	79	95	82	80	81	85	90
Group IV	20	34	51	53	51	48	44
Group IV-A			44	45	42	39	35
Group IV-B			7	8	9	9	9
Total	149	149	149	149	149	149	149

Distribution of employment in major areas by classification groups—149 major areas, bimonthly, January 1954–January 1955

Classification groups	Percent of nonagricultural wage and salaried employment						
	January 1954	March 1954	May 1954	July 1954	September 1954	November 1954	January 1955
Group I	0.6						
Group II	30.6	15.2	7.2	7.3	8.1	7.9	7.3
Group III	64.8	72.1	66.7	66.1	65.5	66.8	71.7
Group IV	4.0	12.7	26.1	26.6	26.4	25.3	21.0
Group IV-A			24.3	24.0	24.1	22.9	19.5
Group IV-B			1.8	2.0	2.3	2.4	1.5
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Explanation of Classification Codes

Group I—Areas of labor shortage: Areas in which local labor shortages which will impede "essential activities" exist or are expected to occur in the near future.

Group II—Areas of balanced labor supply: Areas in which current and prospective local labor demand and supply are approximately in balance.

Group III—Areas of moderate labor surplus: Areas in which current and prospective local labor supply moderately exceeds labor requirements.

Group IV—Areas of substantial labor surplus: Areas in which current and prospective local labor supply substantially exceeds labor requirements.

Group IV-A—Areas of substantial labor surplus.

Group IV-B—Areas of very substantial labor surplus.

Appendix 7

[Advance release of Bimonthly Summary of Labor Market Developments in Major Areas]

Area Classification Summary, January 1955

United States Department of Labor, Bureau of Employment Security, Division of Reports and Analysis

The new year opened on a note of optimism in most of the Nation's leading production and employment centers. Brisk Christmas hiring in trade and service plus the large-scale recall of automotive manufacturing workers boosted end-of-1954 employment totals to the high point for the year in many areas. Some rise in unemployment was reported in early January, reflecting usual winter season curtailments in construction and other outdoor activities. The employment outlook for manufacturing industries—particularly in the durable goods sector—appears to be the most favorable in recent months. Employer hiring plans, as reported to local public employment offices near the turn of the year, point to continued job gains to early spring in motor vehicle manufacturing, aircraft, primary iron and steel production and farm machinery. Employment increases were also expected in furniture and service-industry and household machinery—a group which covers such major household appliances as refrigerators, washing machines, air conditioners, sewing machines, and vacuum cleaners. Apparel and shoe producers also scheduled some additional hires over the next few months. These are the principal findings resulting from the latest survey of area manpower conditions in 149 major labor markets conducted by the Bureau of Employment Security in cooperation with affiliated State employment security agencies.

The survey also indicated that, despite the recent seasonal curtailments in employment, the trend toward an overall improvement in area job market conditions has been maintained. It was even accelerating slightly as the year 1955 got under way. Employment increases in auto plants as production on the 1955 model run moved into high gear again played a major role in this improvement, with gains in primary steel products and machinery also noted in some centers. In a number of instances, increases in production were accompanied by changes in hours of work, rather than employment, however. A few areas also reported that new defense contracts were contributing to recent additions in employment.

Revisions in the Bureau of Employment Security January listing of area classifications according to relative adequacy of labor supply are based on the improved labor market situation and favorable employment outlook indicated in the area manpower survey. Six major areas—among them the key industrial center of Detroit—have been reassigned to classification categories denoting a smaller volume of unemployment and tighter labor supply. Improved conditions in several other areas did not result in classification changes because the effects of employment gains in basic industries were obscured by temporary increases in unemployment stemming from seasonal influences. Only three areas were transferred to classification groupings indicating a loosening in labor supply since the mid-November area classification. For the first time in the past 3 years the number of areas moving to more favorable ratings between November and January outnumbered those moving to categories reflecting a higher level of unemployment.

A summary of January classifications for the 149 major areas, along with comparable figures for November and January 1954, is shown in the table below. The number of smaller areas classified because of the existence of substantial unemployment during each period is also indicated.

Classification	January 1955	November 1954	January 1954	Description of classification
Major areas	149	149	149	
Group:				
I	0	0	1	Areas of labor shortage.
II	15	16	49	Areas of balanced labor supply.
III	90	85	79	Areas of moderate labor surplus.
IV	44	48	20	
IV-A	35	39		Areas of substantial labor surplus.
IV-B	9	9		Areas of very substantial labor surplus.
Smaller areas:				
Group:				
IV	100	97	31	
IV-A	55	56		Areas of substantial labor surplus.
IV-B	45	41		Areas of very substantial labor surplus.

The turn-of-the-year area classifications highlight the spectacular rise of automotive production and employment as compared with the reduced levels of most of the past year. With model changeover schedules of most leading auto producers already completed by mid-November, production on the 1955 model cars began to build up very rapidly in the closing weeks of last year. December auto production—according to industry reports—reached an annual output rate of more than 7½ million vehicles; preliminary data indicate that this high rate of production is being continued into January. These production gains resulted in very sizable unemployment decreases in a number of key auto centers. In the Detroit area itself—which accounts for about two-fifths of all auto industry employment—joblessness has been more than cut in half since early fall. Other important auto centers reporting moderate-to-sizable unemployment declines during recent weeks were Flint and Lansing, Mich., Fort Wayne and

South Bend, Ind., Toledo, Ohio, and Kenosha, Wis. Not all of these declines resulted in changes in area classification, however.

Classification of the following major areas was revised between November and January:

IV–A to III: Davenport-Rock Island-Moline, Iowa-Ill., Detroit, Mich., Joliet, Ill., Kenosha, Wis.

II to III: Dayton, Ohio.

IV–B to IV–A: Muskegon, Mich., Providence, R. I.

IV–A to IV–B; Mayaguez, P. R., Terre Haute, Ind.

In addition to these changes, four smaller areas—Harrisburg, Ill., Connersville, Ind., Auburn, N. Y., and Cambridge, Ohio—were added to the list of smaller group IV areas between November and January. One area—Ann Arbor-Ypsilanti, Mich.—was deleted because it was no longer experiencing substantial unemployment. The number of smaller group IV areas included on the list does not necessarily reflect current economic trends or recent changes in local economic conditions, since this number depends, to some degree, on the extent to which the Department of Labor is requested to undertake special surveys. Three of the new group IV areas (Harrisburg, Ill., Auburn, N. Y., and Cambridge, Ohio), were classified in the IV–B, very substantial surplus category. The Burlington, Vt., area, listed as a smaller group IV–A area in November, was also classified in the IV–B category in January.

MOST AREAS ANTICIPATE JOB GAINS TO EARLY SPRING

Area employer hiring plans to mid-March as reported to local public employment offices, indicate slight job gains to early spring in about two-thirds of the areas covered by the survey. Factory industries are expected to account for the major share of the rise. In many areas, however, scheduled manufacturing increases may be offset, in part, by the usual wintertime curtailments in seasonal nonmanufacturing activities.

Durable goods producers—hardest hit by the employment cutbacks of a year ago—are expected to lead the manufacturing advance, although scheduled gains in these industries also are not likely to be large. If employer hiring plans materialize, the auto industry will continue to account for a significant part of the overall uptrend. Planned employment increases to mid-March are not scheduled to match the rapid expansion registered during the past few months, however. The anticipated continued high level of auto production is also reflected in increased employer requirements in several major iron and steel producing centers, particularly in the Chicago area. Smaller steel gains were also scheduled in Pittsburgh, Youngstown and Canton, Ohio, and in Johnstown, Pa.

The important aircraft industry—now ranking as one of the Nation's largest employers of factory workers—was among those planning a modest payroll expansion to mid-March. On the basis of the information supplied by employers, the largest increases appear to be in prospect for the key Los Angeles area, and in Baltimore, Cincinnati, St. Louis, Seattle, and Tulsa, Okla. Among other durable goods industries, Detroit and Grand Rapids, Mich., Columbus, Ohio and York, Pa., list prospective expansions in the service-industry and household machinery group, while the Davenport-Rock Island-Moline area in Iowa and Illinois is expected to lead the gains in farm machinery. Reports from key production centers for electrical machinery and shipbuilding indicate that employment in these industries may edge down slightly during the winter but should be leveling off by mid-March. In the nondurable goods sector, slight employment gains are anticipated by apparel and shoe producers, while textiles and petroleum refining are expected to hold steady.

A brief summary of the factors prompting classification changes for each of the areas shifting to new categories between November and January follows:

CHANGED FROM GROUP IV–A TO GROUP III

Detroit, Mich.: Unemployment down by more than 50 percent since autumn as high level auto production spurs sharp employment pickup. Factory job totals reach highest level since July 1953. Auto plants, other factory industries schedule additional gains during first quarter.

Davenport-Rock Island-Moline, Iowa-Illinois: Recent gains in farm machinery, food processing, service cut area unemployment. Locally important ordnance holds steady. Pickup in dominant farm machinery plants scheduled to continue through early spring.

Joliet, Ill.: Important nonelectrical machinery paces recent employment increases; transportation, Government hires also contribute. Scheduled employment uptrend to early spring due to be led by primary metals and machinery.

Kenosha, Wis.: Sharp employment pickup, concentrated in important auto industry, augmented by slight gains in most other factory activities. Improved area situations expected to continue with further hiring in autos.

CHANGED FROM GROUP II TO GROUP III

Dayton, Ohio: Lack-of-order layoffs in home appliances, smaller cutbacks in electrical machinery, transportation equipment bring factory payroll dip. Construction, Government also down seaasonally. Some losses to mid-March expected in rubber products, electrical machinery, machine tools, and construction.

CHANGED FROM GROUP IV–A TO GROUP IV–B

Mayaguez, P. R.: Area joblessness rises as migrants return from continental United States and apparel cutbacks due to lack of orders. Further declines in apparel scheduled; beginning of sugarcane cutting and grinding season not expected to reduce unemployment significantly by March.

Terre Haute, Ind.: Recent food processing, chemical, other scattered manufacturing, construction declines reduce employment, boost area's already substantial number of unemployed. Fabricated metal, seasonal construction, trade losses likely to cut employment further through early spring.

CHANGED FROM GROUP IV–B TO GROUP IV–A

Muskegon, Mich.: Eighteen-month downtrend in employment halted as new defense orders, demand for auto components spur sizable factory job rise. Out-migration, other labor force withdrawals also help reduce unemployment. Continued uptrend in durables in prospect to March, led by primary metals, auto parts, lumber.

Providence, R. I.: Unemployment decline continues. Rubber products, textiles, electrical machinery lead recent factory gains. Important textiles schedules uptrend through early spring; nonelectrical machinery, apparel, instruments also plan increases.

SMALLER GROUP IV AREAS

Added to Group IV–A List

Connersville, Ind.: Sharp declines in durable-goods manufacturing—centered in important nonelectrical machinery industry—primarily responsible for current substantial labor surplus. Losses in auto parts and fabricated metals also contribute to jobless increase.

Added to Group IV–B List

Harrisburg, Ill. (classified IV–B in December): Over-the-year reductions in mining of fluorspar and bituminous coal, plus retrenchments in trade, boost unemployment to very substantial proportions.

Auburn, N. Y.: Durable goods payrolls drop one-third in past year. Loss heaviest in ordnance, but cutbacks in other lines (diesel engines, tank parts, air conditioners) contribute. Past year also marked by shutdown of plants producing farm machinery, shoes and wood and metal products.

Burlington, Vt. (reclassified from group IV–A): Shutdown of important textile firm, further defense-item cutbacks, retrenchment in trade boost area joblessness to very substantial labor surplus level. Additional reduction in manufacturing and service anticipated.

Cambridge, Ohio.: Joblessness up nearly one-third since year ago as several local plants leave area. Sizable recent cutbacks in electrical machinery also add to jobless total.

Removed from Group IV–A

Ann Arbor-Ypsilanti, Mich.: Sharp gains in key auto industry, accompanying increases in metals and metal products and machinery result in sizable factory uptrend. Callback of local auto workers to jobs in nearby Detroit area also contribute to recent unemployment declines.

Classification of labor market areas according to relative adequacy of labor supply, January 1955

REGION I

Group II: Hartford, Conn., New Haven, Conn.

Group III: Bridgeport, Conn., New Britain, Conn., Stamford-Norwalk, Conn., Waterbury, Conn., Portland, Maine, Boston, Mass., Brockton, Mass., Springfield-Holyoke, Mass., Worcester, Mass., Manchester, N. H.

Group IV—IV-A: Bristol, Conn.,[1] Biddeford, Maine,[1] Fall River, Mass., Fitchburg, Mass.,[1] Lowell, Mass., Milford, Mass.,[1] New Bedford, Mass., North Adams, Mass.,[1] Providence, R. I., Springfield, Va.[1] IV-B: Lawrence, Mass., South bridge-Webster, Mass.,[1] Burlington, Vt.[1]

REGION II

Group II: Rochester, N. Y.

Group III: Newark, N. J. Perth Amboy, N. J., Trenton, N. J., Binghamton, N. Y., New York, N. Y., Syracuse, N. Y.

Group IV—IV-A: Atlantic City, N. J., Paterson, N. J., Albany-Schenectady-Troy, N. Y., Buffalo, N. Y., Hudson, N. Y.,[1] Oswego-Fulton, N. Y.,[1] Utica-Rome, N. Y., San Juan, P. R. IV—B: Amsterdam, N. Y.,[1] Auburn, N. Y.,[1] Gloversville, N. Y.,[1] Mayaguez, Ponce, P. R.

REGION III

Group II: Richmond, Va.

Group III. Wilmington, Del., Washington, D. C., Baltimore, Md., Charlotte, N. C., Greensboro-High Point, N. C., Allentown-Bethlehem, Pa., Harrisburg, Pa., Lancaster, Pa., York, Pa., Hampton-Newport News-Warwick, Va., Norfolk-Portsmouth, Va., Roanoke, Va.

Group IV—IV-A: Asheville, N. C., Durham, N. C., Kinston, N. C.[1], Waynesville, N. C.[1], Winson-Salem, N. C., Berwick-Bloomsburg, Pa.[1], Erie, Pa., New Castle, Pa.[1], Oil City-Franklin-Titusville, Pa.[1], Philadelphia, Pa., Pittsburgh, Pa., Reading, Pa., Williamsport, Pa.[1], Radford-Pulaski, Va.[1], Clarksburg, W. Va.[1], Huntington,W. Va.-Ashland, Ky., Parkersburg, W. Va.[1], Wheeling, W. Va.-Steubenville, Ohio, IV-B; Cumberland, Md.[1], Altoona, Pa., Butler, Pa.[1], Clearfield-DuBois, Pa.[1], Indiana, Pa.[1], Johnstown, Pa., Kittanning-Ford City, Pa.[1], Lock Haven, Pa.[1], Pottsville, Pa.[1], Scranton, Pa., Sunbury-Shamokin-Mt. Carmel, Pa.[1], Uniontown-Connellsville, Pa.[1], Wilkes-Barre-Hazelton, Pa., Big Stone Gap-Appalachia, Va.[1], Covington-Clifton Forge, Va.[1], Richlands-Bluefield, Va.[1], Beckley, W. Va.[1], Bluefield, W. Va.[1], Charleston, W. Va., Fairmont, W. Va.[1], Logan, W. Va.[1], Morgantown, W. Va.[1], Point Pleasant, W. Va.[1], Ronceverte-White Sulphur Springs, W. Va.[1], Welch, W. Va.[1]

REGION IV

Group II: Jacksonville, Fla., Atlanta, Ga.

Group III: Birmingham, Ala., Mobile, Ala., Miami, Fla., Tampa-St. Petersburg, Fla., Columbus, Ga., Macon, Ga., Savannah, Ga., Jackson, Miss., Aiken, S. C.-Augusta, Ga., Charleston, S. C., Greenville, S. C., Memphis, Tenn., Nashville, Tenn.

Group IV—IV-A: Alexander City, Ala.[1], Anniston, Ala.[1], Decatur, Ala.[1], Florence-Sheffield, Ala.[1], Gadsden, Ala.[1], Talladega, Ala.[1], Cedartown-Rockmart, Ga.[1], Cordele, Ga.[1], Walterboro, S. C.[1], Bristol-Johnson City-Kingsport, Tenn.-Va.[1], Chattanooga, Tenn. Knoxville, Tenn. IV-B: Jasper, Ala.[1], LaFollette-Jellico-Tazewell, Tenn.[1], Newport, Tenn.[1].

REGION V

Group II: Flint, Mich., Columbus, Ohio.

Group III: Louisville, Ky., Detroit, Mich., Grand Rapids, Mich., Kalamazoo, Mich., Lansing, Mich., Saginaw, Mich., Akron, Ohio, Cincinnati, Ohio, Cleveland, Ohio, Dayton, Ohio, Hamilton-Middletown, Ohio, Lorain-Elyria, Ohio, Youngstown, Ohio.

Group IV—IV-A: Frankfort, Ky.,[1] Owensboro, Ky.,[1] Adrian, Mich.,[1] Battle Creek, Mich., Bay City, Mich.,[1] Benton Harbor, Mich.,[1] Ionia-Belding-Greenville, Mich.,[1] Jackson, Mich.,[1] Monroe, Mich.,[1] Muskegon, Mich., Owosso, Mich.,[1] Port Huron, Mich.,[1] Canton, Ohio, Findlay-Tiffin-Fostoria, Ohio,[1] Mansfield, Ohio,[1] Newark, Ohio,[1] Sandusky-Fremont, Ohio,[1] Springfield, Ohio,[1] Toledo, Ohio. IV-B: Corbin, Ky.,[1] Hazard, Ky.,[1] Henderson, Ky.,[1] Madisonville, Ky.,[1] Middlesboro-Harlan, Ky.,[1] Morehead-Grayson, Ky.,[1] Paintsville-Prestonsburg, Ky.,[1] Pikeville, Ky.-Williamson, W. Va.,[1] Iron Mountain, Mich.,[1] Cambridge, Ohio.[1]

REGION VI

Group II: Madison, Wis.

Group III: Aurora, Ill., Chicago, Ill., Davenport, Iowa-Rock Island-Moline, Ill., Joliet, Ill., Peoria, Ill., Rockford, Ill., Indianapolis, Ind., Minneapolis-St. Paul, Minn., Kenosha, Wis., Milwaukee, Wis.

Group IV—IV–A: Connersville, Ind.,[1] Evansville, Ind., Fort Wayne, Ind., Muncie, Ind.,[1] South Bend, Ind., Duluth, Minn.-Superior, Wis., Beaver Dam, Wis.,[1] La Crosse, Wis.,[1] Racine, Wis. IV–B: Harrisburg, Ill.,[1] Herrin-Murphysboro-West Frankfort, Ill.,[1] Litchfield, Ill.,[1] Mount Vernon, Ill.,[1] Michigan City-La Porte, Ind.,[1] Terre Haute, Ind., Vincennes, Ind.[1]

REGION VII

Group II: Cedar Rapids, Iowa, Des Moines, Iowa, Wichita, Kans.

Group III: Kansas City, Mo., Omaha, Nebr.

Group IV—IV–A: Burlington, Iowa,[1] Ottumwa, Iowa,[1] Joplin, Mo.,[1] St. Joseph, Mo.,[1] St. Louis, Mo., Springfield, Mo.[1] IV–B: Pittsburg, Kans.[1]

REGION VIII

Group II: Tulsa, Okla., Dallas, Tex.

Group III: Little Rock-North Little Rock, Ark., Baton Rouge, La., New Orleans, La., Shreveport, La., Oklahoma City, Okla., Austin, Tex., Beaumont-Port Arthur, Tex., Corpus Christi, Tex., El Paso, Tex., Fort Worth, Tex., Houston, Tex., San Antonio, Tex.

Group IV—IV–A: Fort Smith, Ark.[1], McAlester, Okla.[1], Muskogee, Okla.[1], Texarkana, Tex.-Ark.[1]

REGION IX

Group II: Denver, Colo.

Group III: Salt Lake City, Utah.

Group IV—IV–A: Albuquerque, N. Mex.

REGION X

Group III: Phoenix, Ariz., Fresno, Calif., Los Angeles, Calif., Sacramento, Calif., San Bernardino-Riverside, Calif., San Diego, Calif., San Francisco-Oakland, Calif., San Jose, Calif., Stockton, Calif.

Group IV—IV–A: Honolulu, T. H.

REGION XI

Group III: Seattle, Wash., Spokane, Wash.

Group IV—IV–A: Portland, Oreg., Tacoma, Wash.

GEOGRAPHICAL BOUNDARIES OF NEW SMALLER GROUP IV AREAS

(Not Previously Listed in "Directory of Important Labor Market Areas")

Name of Area: Auburn, N. Y., Cambridge, Ohio.

Area definition: All of Cayuga County, N. Y.; all of Guernsey and Noble Counties, Ohio.

EXPLANATION OF AREA CLASSIFICATIONS

Area classification according to relative adequacy of labor supply are intended to provide a quick, convenient tool to measure comparative differences in the availability of labor (and general economic well-being) of the Nation's major production and employment centers. These condensed, summary indicators of area labor market conditions have been widely used by Government agencies and private organizations in the introduction, administration, and evaluation of manpower programs and policies since the area classification program was initiated during World War II.

A brief description of area classification codes is shown below:

Group I—Areas of labor shortage: Areas in which local labor shortages which will impede "essential activities" exist or are expected to occur in the near future.

[1] Smaller areas covered because of substantial labor surpluses. These areas are not part of the regular major area reporting program of the Bureau of Employment Security and its affiliated State employment security agencies.

Group II—Areas of balanced labor supply: Areas in which current and prospective local labor demand and supply are approximately in balance.

Group III—Areas of moderate labor surplus: Areas in which current and prospective local labor supply moderately exceeds labor requirements.

Group IV—Areas of substantial labor surplus: Areas in which current and prospective local labor supply substantially exceeds labor requirements.

IV–A—Areas of substantial labor surplus.

IV–B—Areas of very substantial labor surplus.

A total of 149 major labor market areas throughout the Nation are classified every 2 months. A labor market area consists of a central city or cities and the surrounding territorv within reasonable commuting distance. A major labor market area has at least one central city with an April 1950 population of 50,000 or more. In most cases the entire labor market area has a population of 100,000 or more. A labor market area takes its name from the central city or cities. Usually there are many other communities within the boundaries of a labor market area. Definitions of all classified areas (both major and smaller) are listed in the "directory of Important Labor Market Areas.

The area classifications are assigned according to uniformly applied criteria. They are based on labor market reports, both narrative and statistical, submitted to the Bureau of Employment Security by affiliated State employment security agencies, and prepared in accordance with nationally established uniform reporting procedures. The reports are prepared locally, drawing upon labor market data available in the local public employment offices, including information on current employment and unemployment levels and employer hiring plans. Area reports are submitted to the Bureau of Employment Security between the 15th and the 25th of the even-numbered months. Following the receipt of these reports, a careful analysis is made of the employment, unemployment, and outlook in the area, and preliminary classifications are assigned. These preliminary classifications are cleared with the State employment security agencies through the regional offices of the Bureau of Employment Security. In this clearance, the most recent significant changes in local labor market conditions are reported to the Bureau. The final classifications assigned thus take into account the latest employment and unemployment developments in each area. The classifications are released approximately 1 week after clearance with the State agencies.

The extent of unemployment in a particular area is one of the major factors in determining the area classifications assigned to each locality. Other criteria used include: the employment outlook as reflected by local employer estimates of manpower requirements, the relationship between labor supply and demand, and the seasonal pattern of employment and unemployment fluctuations.

ADMINISTRATIVE REGIONS OF THE BUREAU OF EMPLOYMENT SECURITY

Region I: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont.

Region II: New Jersey, New York, Puerto Rico.

Region III: Delaware, District of Columbia, Maryland, North Carolina, Pennsylvania, Virginia, West Virginia.

Region IV: Alabama, Florida, Georgia, Mississippi, South Carolina, Tennessee.

Region V: Kentucky, Michigan, Ohio.

Region VI: Illinois, Indiana, Minnesota, Wisconsin.

Region VII: Iowa, Kansas, Missouri, Nebraska, North Dakota, South Dakota.

Region VIII: Arkansas, Louisiana, Oklahoma, Texas.

Region IX: Colorado, Montana, New Mexico, Utah, Wyoming.

Region X: Arizona, California, Nevada, Hawaii.

Region XI: Idaho, Oregon, Washington, Alaska.

STATEMENT OF VICTOR ROTERUS, CHIEF, AREA DEVELOPMENT DIVISION, OFFICE OF TECHNICAL SERVICES, UNITED STATES DEPARTMENT OF COMMERCE, BEFORE THE JOINT COMMITTEE ON THE ECONOMIC REPORT, RE PROBLEMS OF REGIONAL AND INDUSTRIAL UNEMPLOYMENT

Areas of spot unemployment are principally of two types—the temporal type which appear and vanish with the fluctuations of the national economy and those of a chronic type which may persist even when the national economy is at high levels. The latter areas particularly present special problems and needs. Since

Mr. Goodwin, of the Department of Labor, is discussing the extent of these areas and the reasons why they are faced with long-term unemployment problems, I should like to confine myself, first, to several observations about the problems and needs of these areas, and, second, to how our particular program attempts to assist these communities in meeting their problems and needs.

NEEDS OF SURPLUS LABOR AREAS

Areas of long-term unemployment have these characteristics among others:

(1) They need either a complete revitalization of their existing industries, or where these industries face a shrinking future, new activities, a new economic base, are needed to keep pace with national progress and to provide increasing job opportunities.

(2) Many of these areas, exclusively schooled in the development of one type of resource or industry, are not prepared to move incisively into new product fields or to serve new and changing markets.

(3) The know-how with which to take the necessary steps in developing a revitalized local economy based on local resources and advantages is often lacking.

(4) The knowledge and ability to make use of existing State and Federal aids in buttressing local area development efforts are likewise lacking.

(5) Despite the most arduous local efforts at a solution—which usually is determined to be the establishment of new lines of industry—these efforts sometimes die on the vine because effective contact has not been made with the executives of private industry whose decisions as to new and branch plant locations are a vital key to expanding job opportunities.

AREA DEVELOPMENT PROGRAM OF THE DEPARTMENT OF COMMERCE

Acting on suggestions of the President's Advisory Board on Economic Growth and Stability, the program of the Area Development Division of the United States Department of Commerce was expanded last spring to assist labor surplus areas in their efforts to deal with their own problems. The Department gave the Division the assignment of serving as a focal point and clearinghouse in the Federal Government for area groups and delegations seeking assistance to relieve local area unemployment. As a result, the Division has attempted to meet the demands of local delegations and congressional requests with prompt and orderly handling and, when indicated, appropriate units of the Federal Government have been called on and have cooperated on the problems on which they were capable of making a contribution. In addition, the Division began fashioning a program to assist State and local groups in working toward new employment opportunities in the areas of labor surplus.

The elements of this program can be briefly summarized as follows:

1. Several employment development kits and aids were prepared. A canvass was made of local and State programs, and the actions of many communities were summarized in a simple community and area development checklist. This checklist is a brief compendium of the types of actions that various aggressive communities had taken to cope with problems of industrial development, retail and service trade expansion, tourist and recreation development, local government aids, and so forth. The checklist also enumerated actions that had been effectively taken by the various States.

Another self-help tool that the Division has provided to meet the know-how needs of many local areas for establishing new industry based on local resources is a community industrial development kit. This kit covers a range of topics including (*a*) the survey of what prospective industry wants to know about your community, (*b*) promotion stage—how to find the prospects, and (*c*) how other communities have gone about it.

The Division found that many communities had been successful in establishing new industries through the device of the planned industrial park which in essence is similar to a high-class residential subdivision. To make these experiences available to all communities determined to expand and diversify their economic base, the Division just recently issued a how-to-do-it publication entitled "Organized Industrial Districts: A Tool for Community Development."

2. Another vital part of the program we are developing goes to the heart of the matter of establishing new industry to take the place of old or declining industries in areas of surplus labor. Once a community has organized for this effort, their prime need is to come into direct contact with firms planning expansions. In this connection, we have tried various devices to assist com-

munities in need. Several times a month, for example, leading executives from the various types of private industry are called to industry conferences held by the Department of Commerce. Time is allotted on the agenda of these conferences to discuss the problem of surplus labor areas, the stake of private industry in their solution, and the conference is asked to give earnest consideration to the advantages of these areas in planning future plant locations.

Another effort in the direction of encouraging diversification of the local economies was the new products, new methods, and patents exhibit held in Detroit last October in which State and local governments, labor unions and private industry cooperated with the Department. The Department of Defense, which has spent billions of dollars in research, put on public view new products, processes, and materials which have commercial development possibilities, and which they are eager to get into civilian production for quick defense conversion when the need arises. We are now engaged with the Department of Defense in looking into possibilities for extending this exhibit to other sections of the country.

Another effort to enlist private industry into the program for assisting labor surplus areas was in cooperation with the Society of Industrial Realtors. A task force appointed by this society visited Lawrence, Mass., as a test case and made a report which has general application to the problems of all labor surplus areas. Using the methods outlined in this report, members of the task force are actively negotiating with several manufacturing firms with respect to possible locations in that area.

3. Another important activity of the Division which has been limited by the available personnel has been the on-the-spot assistance to State and local groups in combating problems of local unemployment. Division representatives, on request of local delegations and Members of the Congress, have made field visitations to communities in Indiana, Kentucky, Oklahoma, Pennsylvania, Virginia, West Virginia, and a number of communities in New England. These visitations are the perfect time to inform the local development groups how to make full use of aids and programs of the Department of Commerce and other agencies which can be helpful on specific local problems. We have found that most communities are appreciative not only of our technical assistance but apparently get a morale boost in their own efforts through personal contact and assistance.

These visitations are always conducted in cooperation with State planning and development agencies with whom the Division maintains a close working relation through informal bulletins, an annual conference in Washington, and other means. Followups in Washington with other agencies able to provide particular types of assistance and the continuing contact with local and State groups entailed by the field visitations are illustrated by our reports on recommendations made to the President by the Northeast Pennsylvania Industrial Development Commission, eastern Kentucky survey, and drought relief and area development recommendations, eastern Oklahoma. In these visitations we have received the full cooperation of representatives of the Small Business Administration, the Department of Labor, the Department of the Interior, the Housing and Home Finance Agency, the Department of Defense, and others.

FUTURE PLANS

The Economic Report of the President for 1955 recommends further strengthening of the area development program of the Department of Commerce. If additional funds are made available during the next fiscal year, the Division will step up its activities.

In particular, we shall increase our on-the-spot assistance to labor surplus areas by stationing area development specialists in the field. These specialists would give personal and continuing consultation to labor surplus area groups in follow up of requests for such help made to the Congress and executive branch. They will also keep us informed of what successful devices are being used by various labor surplus communities in attacking their problems, and this information will be made the subject of a periodical bulletin which will be made available to other local areas.

Further, out of our experience in the field we expect to make suggestions as to what the Federal Government might do further in assisting these spot areas of unemployment to get back in step with national growth.

STATEMENT BY LEO FISHMAN, PROFESSOR OF ECONOMICS AND FINANCE, WEST VIRGINIA UNIVERSITY

West Virginia and sections of six other States in the Appalachian coalfields are suffering acute economic and social distress. Since I am more intimately acquainted with conditions in West Virginia than elsewhere, my remarks will be confined to the situation existing in that State.

Employment opportunities in West Virginia have been declining since 1948 when nonagricultural employment reached a peak of 543,900. In 1954 employment in nonagricultural industries was only 473,000. Between 1953 and 1954, when nonagricultural employment for the United States as a whole declined by 3 percent, nonagricultural employment in West Virginia declined by 7 percent. During 1954 employment in the bituminous coal industry of West Virginia was only 76,400, roughly equivalent to what it was during the worst years of the depression.

The drop in employment between 1953 and 1954 in leading West Virginia industries was as follows: Bituminous coal, 16,900; transportation, 3,700; stone, clay, and glass, 1,900; chemical, 1,200; and lumber, wood products, and furniture, 600. Cash receipts from farm marketings in West Virginia were $6.4 million lower for the first 10 months of 1954 than they were for the first 10 months of 1953. Even in 1953, the most recent year for which such figures are available, the average income per farm from farm sources was lower in West Virginia than in any other State in the Nation.

Unemployment has been a problem throughout the State for some years. Within the past few years this problem has grown steadily worse. In 1954, of the 16 labor-market areas in West Virginia 13 were classified as areas of very substantial labor surplus (IV–B) and 3 as areas of substantial labor surplus (IV–A). The median rate of unemployment for all these areas was 13 percent of the labor force. In Beckley, W. Va., an important city in the southern coalfields, the unemployment rate was well over 20 percent.

Twenty-two counties out of the 55 in the State are not included in any labor-market area. While precise figures are not available for these rural counties, there is ample evidence to indicate that they too are suffering because of inadequate employment opportunities.

With respect to underemployment, the picture is not quite as clear cut. In the bituminous coal industry, as a result of substantial reductions in the working force and other adjustments, underemployment is not as prevalent now as it was a few years ago. In the glassware industry and on many farms, however, underemployment of labor continues to present a serious problem.

The seriousness of West Virginia's unemployment problem is emphasized by the fact that from April 5, 1950, to July 1, 1954, while population of the United States increased by an estimated 6.3 percent, the population of West Virginia declined by an estimated 2.9 percent. Only two other States, Arkansas and New Hampshire experienced a population decline in this period, and in neither of these States was the decline as high as 1 percent.

The population decline (59,000) resulted largely from an outward migration for jobs, and did alleviate the unemployment problem in the State to some extent. With the contraction of employment opportunities elsewhere, however, migration has ceased to be an important alleviating factor. During the fiscal year ending June 1954 the State employment service sent only 868 workers to jobs in other States as compared with 14,120 sent to jobs in other States during the previous fiscal year.

Indeed, there is evidence that a number of those who left the State and found jobs elsewhere, later returned to West Virginia when they lost their jobs. The number of workers who lost their jobs in other States and who filed claims for unemployment insurance in West Virginia increased from 8,364 during the fiscal year ending June 1953 to 21,499 during the last fiscal year.

An unfortunate dilemma exists for the State. As the seriousness of the situation increases, the financial ability of the State to cope with the resulting social problems and to provide for essential public services declines. State revenues have fallen off at an alarming rate. The receipts of the general revenue fund during the last 6 months of 1954 were $3 million less than receipts during the last 6 months of 1953. Since a provision of the West Virginia constitution prohibits any increase in the bonded indebtedness of the State as a result of deficits in the general fund, prospective deficits must be avoided by reductions in planned expenditures.

58422—55——18

All State spending units have, therefore, been requested to reduce their expenditures for the fiscal year 1955 by 5 percent of their appropriated funds. Most State services, including education are affected by this order. Financial grants of the department of public assistance to the aged, the blind, dependent children, and the unemployables, which were already inadequate, have been reduced to 70 percent of a minimum subsistence budget. It is not possible for those who are dependent on these grants to maintain a decent standard of life, and actual deterioration of their physical condition is likely to result.

No financial assistance is available for the 34,360 persons who exhausted their unemployment compensation benefits during 1954 without having found a job, or for those who exhausted their unemployment benefits in previous years and still have not found jobs. Public assistance for these persons is limited to the provisions of the surplus food distribution program. A diet composed largely of available surplus food is not likely to be well balanced. The dietary deficiencies are particularly likely to be serious in the case of infants and small children. Moreover, surpus food is available in only 30 of the 55 counties of West Virginia, since in the other 25 counties there are no distribution facilities for this program. Social workers report that the physical growth of many children is being stunted and their personalities warped. In some instances death is being hastened because of the inadequacies of the public-assistance program.

The fact should be stressed that West Virginia alone cannot cope with its basic economic problems which are structural in character and the result of long-term forces. West Virginia is located in the heart of the Appalachian coalfields. Its cities are relatively small in size and their industries are few in number. Basically, West Virginia's problems stem from the unhealthy condition of the bituminous coal industry. In January 1949 1 out of every 4 wage and salary jobs was in the coal industry.

The problems of the bituminous coal industry are well known and need not be elaborated on here. Suffice it to say that the displacement of bituminous coal by petroleum and natural gas, and the accelerated mechanization of mining operations since the war are primarily responsible for the declining rate of production and the even greater rate of decline of employment in that industry.

The welfare of the railroad and lumber industries in the State are directly dependent upon the level of operations in the mines. Local trade, public utilities, and service industries also mirror the ups and downs of the bituminous coal industry. In certain areas, the situation has been aggravated by the fact that the glsslware and pottery industries, which are concentrated in a relatively small number of cities, are suffering from the effects of foreign competition. Recently imports of glassware from Germany and Japan have increased in volume and threaten to cause further reductions in employment this year. Of all the leading West Virginia industries, only the chemical industry appears to have a bright future, particularly in the Ohio Valley. The decline in employment in that industry last year was probably the result of purely temporary factors.

West Virginia farms are for the most part too small to provide the farm family with a satisfactory income, particularly since lack of sufficient capital and the nature of West Virginia's topography hinder the widespread use of labor-saving devices. Many farm families, therefore, are necessarily dependent on some off-farm employment. During 1954 the problems of these families were intensified since declining opportunities for off-farm employment were accompanied by substantial declines in prices for the produce of their farms, such as beef, chickens, broilers, eggs, and apples, none of which benefit from a support program.

It should be noted that West Virginia has been aware of the need for positive action to attract new industries to the State. The West Virginia Industrial and Publicity Commission, for example, during the current fiscal year is spending approximately $100,000 largely for this purpose. Business taxes and property taxes are relatively low and there are no labor or other laws which businessmen would consider restrictive. Nevertheless, new firms are not coming to West Virginia in sufficiently large numbers to alleviate the problem of unemployment.

None of the recommendations offered in the Economic Report come to grips with the problems existing in West Virginia. The analysis contained in the Economic Report and the recommendations for public policy are based on the assumption that long-term expansionary forces will continue to sustain aggregate income in the United States, and that the essential economic problem is to prevent temporary deflationary influences of a cyclical character and other short term restrictive forces from gaining the ascendancy.

Since the situation in West Virginia is not the result of purely temporary forces, the recommendations for public policy in the Economic Report are not likely to alleviate that situation. The proposal to extend unemployment insurance coverage from 24 to 26 weeks would be of very temporary assistance, assuming that adequate funds for this purpose would be available in West Virginia. The proposal to expand the area development program of the Department of Commerce appears to be a purely formal recommendation. To date the program has in no way contributed to the relief of distress in West Virginia, and it is not likely to do so unless the size of the staff administering the program, as well as its administrative powers and funds, are greatly enlarged.

Military procurement and construction contracts received by West Virginia have been inadequate to alleviate the economic problems of the State. From July 1950 to March 1954, according to the West Virginia Department of Employment Security, West Virginia firms received contracts amounting to $191,738, a mere 0.2 percent of the total value of the contracts awarded during that period.

Effective measures by the Federal Government to alleviate conditions in West Virginia should include the following:

I. MEASURES TO STIMULATE THE RECOVERY OF DEPRESSED INDUSTRIES AND AREAS

1. An increase in the volume of military procurement and construction contracts.
2. Encouragement of private firms, by more effective means than have hitherto been employed, to reopen idle plants formerly utilized for defense production. (A rubber plant formerly operated by Goodyear Rubber Co., for example, is now idle in Nitro, and a plant formerly operated by the United States Steel Corp. for Naval Ordnance, lies idle in South Charleston.)
3. Assisting the bituminous coal industry in developing new markets and new uses for coal, and in finding methods to reduce costs, particularly transportation costs. In many areas half the price of bituminous coal goes to the railroads in payment for the cost of haulage. (It should be recognize, however, that no program to aid the bituminous coal industry is likely to improve the employment situation materially.)
4. A public works program. West Virginia cities and counties are without funds to provide themselves with sewer disposal plants, adequate waterworks, school buildings and facilities, streets and street lighting, parks and playgrounds.

II. MEASURES TO FACILITATE CONTINUED HEALTHY ECONOMIC DEVELOPMENT

1. A more vigorous Federal program to attract small business to West Virginia.
2. More positive policies for plant dispersal. For strategic reasons, more defense and essential civilian plants should be located in West Virginia. The State is sufficiently far from the primary population and industrial centers to be safe from a military point of view, and sufficiently close to those centers to offer locations which are attractive from an economic point of view.
3. A retraining program for unemployed miners, and if necessary, a resettlement program as well. A successful industrial development program should provide employment opportunities for these men.

III. MEASURES TO RELIEVE EXISTING DISTRESS

1. A greater measure of financial and technical assistance to the State's public-assistance program.
2. Assistance in the distribution of surplus foods in areas of need where distribution facilities are at present either inadequate or unavailable.

STATEMENT OF KENNETH J. GRAY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Mr. Chairman, I am here on behalf of the people of southern Illinois, an area suffering the ravages of a complete economic depression almost without comparison in this Nation. The economy of the United States as a whole may be sound; but that is not true of southern Illinois. The people of our great country may be enjoying, by and large, what the present administration calls "a growing prosperity"; but that is not true of the people of southern Illinois. What is true of southern Illinois is that it suffers near-total economic disaster, a tragedy and a suffering comparable only to the very dark days of the early 1930's.

Mr. Chairman, yesterday morning I read in the papers of my district of a jobless man committing suicide; and every morning of families fleeing the area; of want and despair. Try to imagine, Mr. Chairman, that in our land of plenty, there are in southern Illinois over 30,000 people who are forced to get food from the Illinois Public Aid Commission, or else literally starve. Try to picture over 30,000 heads of families without work, without much hope, without a future. I will, separately, supply you with statistics, which are heart wringing. The facts are available, but they cannot impart the feeling of misery these people are going through. And the real tragedy, the most terrible fact of them all, is that this situation is not even remaining stable; each day it gets worse. Day after day there are more shutdowns; day after day the roster of the unemployed, the hungry, and the hopeless gets longer; day after day the suffering increases. The first news greeting me this morning, for example, was the shutdown of another mine, another 200 heads of families to line up for food and the dole.

Mr. Chairman, I do not have the power to fully paint for you the sad details of this dreadful picture; no one can. But I can speak out and ask, is it not time to do more than merely lend a sympathetic ear to the problems of our own people? Is it not time to balance the human budget before balancing the monetary budget? Mr. Chairman, the people of southern Illinois have a right to be heard; they have a right to work; they have a right to live with their families in their own homes. It is my honor and privilege to represent them. In their name, I plead for equity, and for them voice the hope of desperation that justice will be done. I intend to introduce a public works program bill and I hope it will receive every consideration. I hope this committee will seek out the true facts of conditions and make recommendations for immediate assistance.

Thank you.

STATEMENT OF SOLOMON BARKIN, TEXTILE WORKERS UNION OF AMERICA, RESEARCH DEPARTMENT, NEW YORK, N. Y., BEFORE THE JOINT COMMITTEE ON THE ECONOMIC REPORT ON THE TEXTILE INDUSTRY AS A DEPRESSED INDUSTRY

The President's Economic Report speaks of some industries and localities suffering from serious unemployment. The textile industry has been in a depressed state since 1951 and has not yet recovered. Textile communities throughout the country have been hard hit and many have not been rehabilitated through the development of alternative employment. Tens of thousands of textile workers dependent upon unemployment benefits have exhausted their claims and therefore have had to fall back upon their families for maintenance. Many older textile workers have been turned away from the employment offices by other employers and have found themselves "too old to work and too young to retire."

APPEALS TO PRIVATE INITIATIVE

The past and current depressed conditions in the textile industry have been brought to the attention of the Federal authorities for a number of years. The Texile Workers Union of America, CIO, has been most alert to these developments and has been calling for remedial action by State, regional, and National governmental bodies. We first appeared before the Massachusetts Special Commission on the Textile Industry on October 31, 1949 urging at that time that "the problems which beset us now arise from the deficiencies of individual manufacturers who are showing lack of enterprise and who are refusing to build up through adequate modernization of equipment, management and merchandising, research facilities, product development and sales organization, the type of enterprise required in this day and age in the textile industry * * *. The competent New England manufacturers who are following current lines of progressive development will flourish. Those who are unfortunate enough not to have fully fathomed the fundamental changes within the industry and reorganized their properties to meet these trends will not survive * * *. They will sacrifice the thousands of workers who are now employed and who have investments of their lives and skills in serving in these mills * * *. The main problem * * * is to find a means of stimulating enterprise among manufacturers and improving their skills in meeting the developments of the day."

Unfortunately, little was done by the commission to rally the employers and help stimulate the industry's progressiveness in the areas and places where it was most laggard, particularly in the northern areas.

As an active member of the National Planning Association the present witness promoted the organization of the Committee of the South of that body, which prepared a report on means of stimulating the growth of that region. Our conviction has been that the development of a diversified field of industrial activity in that region was essential to the advance of the textile industry and the improvement of the lot of the textile worker and his family. Much progress, we are glad to report has been made in this direction.

Finding the regional organization unwilling to initiate the research necessary for the solution of the economic problems of the New England textile industry and the region as a whole, the present witness as representative of the Textile Workers Union of America, CIO appealed to the Council of Economic Advisers urging it to assume the responsibility for the promotion of work for regional rehabilitation. The result was the appointment by the Council of Economic Advisers of a Committee on the New England Economy in the spring of 1950, and the submission of a report on June 28, 1951, entitled "The New England Economy."

We also hoped that there would be a local effort and therefore urged that the National Planning Association develop a Committee of New England which, at the request of the Joint Committee on the Economic Report of the United States, prepared a report, published in 1954, entitled "The Economic State of New England."

In the meantime, the conference of New England governors, at the urging of many interests, and particularly the Textile Workers Union of America, CIO, appointed a special Committee on the New England Textile Industry of which Mr. Seymour E. Harris was chairman, which rendered a report on April 1, 1953.

The one common result of these many efforts has been the failure of any responsible body to follow up the recommendations or proposals with a specific program for action. The highly individualistic nature of the industrialists in the textile industry, and for that matter, the financial and industrial leaders of New England, has frustrated industrywide efforts.

The stronger elements in the industry have sometimes bemoaned prevailing conditions, but they have looked forward to the pruning out or profitable absorption of the marginal units as the means for rehabilitating their own positions. They have hoped that with the shrinkage in capacity or elimination of competitors their own operations would improve. They have not undertaken real studies into the fundamentals of their industries to help rehabilitate the entire structure. This short-run approach has netted the promoters tremendous profits collected largely from tax concessions.

The raw-cotton interests, with the aid of Federal funds and the United States Department of Agriculture, have promoted their products, as have the synthetic-yarn producers. Only recently the Carded Yarn Association acknowledged that its sector faced an industrywide problem of shrinking markets and uses. But no wider public confessions of difficulties have been heard.

Industrial interests have resisted concerted efforts at the study and promotion of textiles, textile products and uses. A few subdivisions have tried limited advertising campaigns. But there has been no extensive undertaking for the broadening of markets and the opening of new ones.

APPEALS TO THE PRESENT ADMINISTRATION

The current administration promised much but has done little to relieve distress in the textile industry. The President's Economic Report acknowledges that "some industries and localities suffered from serious unemployment" but we are reassured that "the recovery was largest in the * * * textile industries." There are no suggestions in the report of means for aiding the revival and reinvigoration of the industry and its expansion. The only recommendation is for assistance to "depressed communities to develop workable solutions of their problems." The Department of Commerce's area development program is to be strengthened. But we are cautioned against expecting much help since "these programs can make only a limited contribution to relieving 'spot' unemployment." Moreover, the adjustment is to be left to "the local citizens themselves." Major reliance is to be placed upon policies that "promise a high and stable level of employment in the Nation at large."

But it is quite obvious, as the Economic Report declares in the preceding paragraph, that "although the economy as a whole was prosperous, some communities suffered from sizable unemployment." Certainly the philosophy underlying the President's Economic Report, which sets its goal at high rather than full employment, offers us no confidence that these industrial and geographical difficulties will be relieved. A government which does not seek to assure a job opportunity for all will only provide verbal solace to the victims of industrial change, unenterprising industrial managers and unfair competition built upon wage cutting and substandard labor conditions.

It prescribes the encouragement of "enterprise and innovation" but not in a volume sufficient to overcome the distress of local communities and the decline of shrinking employments. Its unfounded presumption that full employment will threaten the "integrity of the money in which contracts are expressed and payments made" has stopped it in its tracks. It has desisted from aiding the communities and industries in need as it is fearful of action which will impart "an immediate upward thrust to economic activity." Economic policies inspired by this philosophy are not likely to generate a full employment economy essential to the solution of the problems of the economic "sorespots" in our country.

The history of the treatment of the textile problem by this administration reflects these current attitudes. Candidate Eisenhower came to Lawrence, Mass., and other New England textile communities and promised help in speeches to the people. After the election local unions appealed for assistance. Nothing was done. The first Secretary of Labor in the present administration then spoke to the citizens of that community and told them to look to their own resources for help because nothing else would be forthcoming. Nothing else happened until the issuance of a Government order for 6 million yards of worsted uniform cloth, representing less than 1 percent of the industry's capacity. This was offered as a substantial contribution. Actually, only a portion of the order went to the distressed areas. Moreover, it came too late for many closed mills and abandoned workers.

A woven and worsted industry conference held by the Secretary of Commerce was closed to the Textile Workers Union of America despite several requests for representation. The same division of the Department of Commerce which is to be in charge of area development was then sent up before the election of 1954 to visit Lawrence, Mass. with a troop of realtors. The only solace resulting from this visit was that Mr. Victor Roterus publicly declared that "the textile business is finished" in Lawrence. Obviously nothing resulted from this visit though vague suggestions were offered by the visiting group that some negotiations were being carried on by new companies.

Having been estopped from effective consultation with the lower echelons of the present administration, Mr. Emil Rieve, president of the Textile Workers Union of America, on September 23, 1954, wrote to President Eisenhower after the public announcement of a plan to spend $150 million to buy coal for shipment overseas, to ask him to "take a similar approach to textiles." He noted that "the world's people are as much in need of cloth as of coal; the materials to clothe the ragged would be more than welcome in the far corners of the earth." He urged that the President act on his statement that "never will we desert any section or people who need help that only the Federal Government can provide."

Mr. Gabriel Hauge answered on behalf of the President that "he will be glad to have any such proposal as you wish to present carefully considered by cognizant officials of the executive branch" (letter of September 30). A program was transmitted in a letter of October 27, a copy of which is attached. The receipt of this proposal was acknowledged by Secretary of Commerce Weeks on December 7 in which he indicated that he would be happy to "arrange for you and your associates * * * to meet with our people." We accepted this invitation but no arrangements have been made by the so-called Department of Commerce Textile Industry Committee or anybody else within the United States Department of Commerce to meet with us. We are still waiting for such an offer.

We are therefore eager that the Joint Committee on the Economic Report address itself fully to the problems and maladies of this industry so that a fully constructive program be developed to reinvigorate and provide it with the wherewithal to reestablish its legitimate position within the American economy.

We urge upon the joint committee that there is too great an inclination to concern ourselves with the global figures and overlook the individual deficiencies in our economy. This failure to analyze the weaknesses and the shrinking areas can be as fatal now as it was in the twenties. We know that the troubles of the textile and coal industries during those years proved to be harbingers of the oncoming disaster. The shortages in buying power and the heartless competition at the expense of the worker which demoralized the industry and the wage structure of these industries during the latter part of the twenties were precursors of the disaster that befell us in 1929. Had we then addressed ourselves as we are urging you to focus now upon the problems of the distressed areas and industries and the problems of economic rehabilitation and recovery in them, we might well have avoided the depths of the depression of the early thirties.

The need for such a far-reaching investigation has been recognized not only by textile labor organizations and the Congress for Industrial Organizations, which called for such an investigation at its last convention (a copy of the resolution is attached), but also by an independent newspaper such as the New York Times, which, in an editorial on June 7, 1954, declared as follows:

"The textile unions have sought to cooperate in increasing the efficiency of the industry and the productivity of its workers. But the industry has been losing ground in the face of competition from imported fabrics, synthetics and nonunion producers in the South.

"It is clear that no general upturn in the economy will automatically restore the prosperity of the mines or the textile mills. The sooner the administration gets together with management and labor in these industries to seek answers to their basic problems, the sooner remedial programs can get underway."

DISTRESSED CONDITIONS IN THE TEXTILE INDUSTRY

Employment has declined significantly from the more active days within the industry. In 1948, there were 1,280,000 production workers. This number dropped to 1,200,000 in 1950. In both 1952 and 1953 the total was about 1,100,000. The low point in 1954 was in July with 953,000 workers. Recovery since July has been minor: in December the total was 998,000 compared to 980,000 in June and August 1954. There has not therefore been any such recovery as the President's Economic Report suggests. The net drop from 1948 has been 282,000 and from 1951, 177,000 persons.

What has happened, however, which is most welcome, has been an increase in the hours of work. In December 1954, the average weekly hours for the first time during the year exceeded 40 hours per week. They had dropped to 37.1 hours per week during April.

The shrinkage in employment has taken place in all regions of the country. Attached is a comparison of the employment of both wage and salaried workers in each State between February 1951 and October 1954. A total shrinkage of 283,000 jobs occurred in the 45 months (table I). (Employment of salaried and wage earners increased by some 7,800 from October to December.) One hundred and seventeen thousand jobs were lost to the industry during this period in New England, 85,000 in the Middle-Atlantic States and 52,000 in the South. The largest reductions in employment were suffered in Massachusetts (58,200) and Pennsylvania (36,800). North Carolina saw a shrinkage in employment of 20,000. No single textile State could report an increase in employment between February 1951 and October 1954.

As textile mills are generally located in nonmetropolitan areas, frequently comprising one-industry or one-mill communities, alternative employments in the locality are lacking. The slump in textile employment therefore depresses entire communities and leaves workers and their families stranded. The significance of this concentration is borne out by the fact that 5 of the 8 major areas in the continental United States which are designated "areas of very substantial labor surplus" by the Bureau of Employment Security, are textile areas. In addition, four smaller textile areas are classified in this category (having 12 percent or more of the labor force unemployed). There are also 20 textile areas (including 7 major communities) in the "substantial labor surplus" classification, i. e., with more than 6 but less than 12 percent of the labor force unemployed. (See table II.) These communities have not prepared for this situation with new industrial developments. The people have a lifetime investment of skills in tle textile industry.

The concentration of textile manufacturing in the States along the Atlantic seaboard makes these areas peculiarly dependent upon the industry. The proportion of total manufacturing employment accounted for by the textile industry is in excess of 50 percent in North and South Carolina and more than 25 percent in Rhode Island and Georgia. In addition, substantial proportions of the factory employment in New Hampshire, Maine, Massachusetts, Vermont, Connecticut, Pennsylvania, New Jersey, Virginia, Alabama, and Tennesee are provided by the textile industry.

The inability of these communities to get out of this chronic state is attested by the fact that they have remained distressed for long periods of time. We have kept records of such communities as those in Massachusetts and find that Lowell had an unemployment rate of 6.16 percent in February 1951 and in September

1954, 10.2 percent; Lawrence had an unemployment rate of 10.8 percent in February 1951 and its September 1954 rate is 23.5 percent. In New Bedford the rate has risen from 2.9 percent to 12.0 percent; and in Fall River from 3.6 percent to 12.3 percent.

What this actually means is suggested by the fact that 5,200 people were unemployed in Lowell; with only 3,613 being paid unemployment benefits; 12,100 were unemployed in Lawrence with only 6,070 receiving unemployment benefits; New Bedford with 8,350 unemployed had only 6,152 receiving benefits; Fall River with 7,200 unemployed had 6,189 unemployment insurance beneficiaries.

Nor do these figures fully illustrate the problem since many older persons, and particularly older women, have been canceled out of the labor market because their age prevents them from finding jobs and they are no longer considered eligible for employment in the vast pools of unemployed living in these areas.

The effects of such hidden unemployment is most depressing since they shift the burden of support to the relatives and families and thereby weigh heavily upon them with unfortunate consequences on their standard of living and the children's opportunities.

The shrinkage in employment has been produced by two major factors. First has been the mill closings and the other is the impressive rise in man-hour productivity within the industry. The mill closings, of course, have practically completely shut out new employment opportunities for the affected person. A survey of textile mill closings reveals that during the period from 1946 through 1954, 640 eastern plants were closed employing 168,000 persons in the major textile divisions (exclusive of very small plants). The distribution was as follows:

Textile mill liquidations in Eastern States, 1946–54 [1]

	Total		New England		Middle Atlantic		South	
	Plants	Employees	Plants	Employees	Plants	Employees	Plants	Employees
1946–49	233	49,095	87	24,775	89	11,600	57	12,720
1950–52	200	50,715	72	30,745	115	16,845	13	3,125
1953–54	207	68,135	77	36,315	83	22,800	47	9,020
Total	640	167,945	236	91,835	287	51,245	117	24,865

[1] Includes spinning, weaving, knitting, dyeing, finishing, and carpet plants.

Many of these plants are located in isolated communities where no other opportunities exist. This is reflected in the fact that for the year ending June 30, 1954, almost 100,000 New England workers, unable to find jobs during the period covered by unemployment compensation, exhausted their insurance benefits.

It is also apparent that a large proportion of those found in the unemployment survey as having been unemployed in excess of 26 weeks, who in December 1954 numbered 376,000 persons, included many textile workers.

The difficulties which older textile workers encounter in securing new employment has been told in many places. We have made a survey of the liquidation of the Oakes Mill in Bloomfield, N. J., and the liquidation of the Esmond Mill in Esmond, R. I. The staff of the Committee of New England of the National Planning Association made studies of the postliquidation experience of employees of two New Hampshire woolen and worsted mills. Professors Myers and Schultz of the Massachusetts Institute of Technology made a study of the closing of the mills in Nashua, N. H. A further study is to appear by Prof. William H. Miernyk of Northeastern University. They all tell the story that older persons have difficulties in getting jobs; younger persons may find jobs; textile workers seek jobs within the textile industry since they find other employers reluctant to hire them; most of those who get jobs in other industries have to take severe wage reductions. Most of the textile workers are relatively immobile. Professor Miernyk concludes that "workers displaced by the liquidation of textile mills in New England are not being absorbed in large numbers by the industries which are expanding in this area * * * The highly aggregate comparisons of recent employment trends in New England conceal the fact that industrial growth and decline do not always coincide in the same areas." He further adds that "a number of writers have implied, while others have explicitly stated, that displaced textile workers are being absorbed by growth industries, notably electronics. Our findings do not bear out these statements * * * Instead of employing displaced textile workers in large numbers it appears that the growth industries are employing new entrants into the labor force." His final conclusion is that "there is no reason to expect a larger proportion of displaced workers to be absorbed by other industries in the future than has been true in the past."

RISING PRODUCTIVITY

The second major cause of the reduction in employment in this industry is increased man-hour productivity. One major factor in this rise has been the use of new equipment. Since World War II, the industry's expenditure for modernization and expansion has amounted to over $4 billion. The bulk of these expenditures was for the purchase of new equipment rather than new buildings. More innovations are impending.

But these expenditures are only part of the cause for higher output. The textile industry has learned the techniques of other American industries and has assiduously applied them during the past several years. There are new processes, procedures and management techniques. In addition there are new fibers, which have challenged the older ones. These changes can be found in each division of the industry. The combined effect of these changes has been a rise in man-hour productivity in excess of 5 percent per annum particularly since 1948, when the effects of the earlier investments became apparent.

The nature of the problem is illustrated by the fact that employment during the month of November 1954 in the textile industry was 993,000 persons which was 20 percent below the average employment level of 1947–49. According to the Federal Reserve Board, textile mill production for the month was actually 103 percent of the base period of 1947–49. Twenty percent less workers in November 1954 were producing 3 percent more product than in the base period of 1947–49. This rough measure indicates an increase in productivity of 29 percent in the period.

CAUSES FOR THE PRESENT CONDITION

There have been many causes for the present state of affairs in the industry. These hearings cannot provide the forum for an adequate discussion of these problems. We shall therefore limit our presentation to an enumeration of these problems.

1. Loss of domestic outlets

The industry has lost many major outlets for textiles. These are reflected by the loss of textiles for wrapping, packing and bagging to paper and plastics. Window shades have been replaced by blinds. Tablecloths, aprons and curtains have lost out to plastics. The losses have been particularly large in industrial and household uses.

2. Loss of export markets

The industry has lost major export markets. From a level in excess of 1.5 billion yards in 1947, the volume of cotton fabric exports has dropped below 600 million yards, with every likelihood that even this level will not be maintained.

3. Changes in types of garments

There has been a drop in the per capita consumption of textiles due to the diminished use of such garments as overcoats. Casual attitudes and habits have reduced consumption and turnover, particularly as clothing lasts longer. Many significant changes in clothing patterns such as the substitution of blouses and skirts for suits and dresses for women and the acceptance of slacks and sport shirts instead of suits among men have sharply affected total output.

4. Changing pattern of consumer expenditures

The inadequacy of income, the appeal of other expenditures, particularly consumer goods, the heavy burden of mortgage debt, have all contributed to a reduced expenditure on apparel. Despite the seeming diversity of apparel items and the high turnover of style, they have not significantly affected per capita fiber consumption. Increased population has not raised total consumption.

These conditions are reflected in the fact that the ratio of apparel expenditures to total consumer expenditures amounted to 6.9 percent in 1954 as compared with 7.7 percent in 1951, 8.5 percent in 1949, 9.5 percent in 1945 and 8.7 percent in 1939.

Per capita consumption of textile fibers has apparently not risen over the prewar levels. From 27.3 pounds in the period from 1925–29, per capita consumption increased to 28.1 pounds in 1935–39. Actually in 1937 and 1939 it reached 31 pounds. In the year 1954, the consumption level was 32 pounds per capita.

5. *Tardiness in meeting new consumer trends*

Apparel has been designed for urban living despite the large number of people now living in suburban areas. People want washable items. Rayon and woolen fabrics which have been tardy in meeting this demand lost markets which were not entirely filled by other fibers.

6. *Interfiber competition has discouraged buying*

The excessive claims of the fiber manufacturers have done much to repel the American consumer. Many apparel manufacturers and fabric producers put fabrics on the markets without proper testing for specific end uses. Their shortcomings finally led to their withdrawal and the bad experience brought a revulsion among many consumers who have been wary about buying unproven items.

The substitutions have provided bonanzas for the innovators but later failures followed as the items did not stand up under actual wear. In the meantime demoralization has ensued and the older industries such as woolens and rayons have suffered. New substitutions are rendering obsolete even new innovations. In tire cord, rayon displaced cotton. Now nylon is battling it out with rayon. Already we hear of a nonfabric tire.

7. *General business contraction*

The industry has also suffered from the contraction in overall business which reduced income and therefore cut more sharply into apparel expenditures, which have become a residual claim on expenditures. The drop in manufacturing activity eliminated much demand for industrial textiles.

8. *The industry has not developed any significant new markets*

The textile industry has intensified the competition for established markets. As traditional end uses have been eliminated, the remaining producers have more feverishly developed the remaining markets. Few have ventured to open up new demands through research and intensive surveys of possible outlets.

A much discussed new potential market is that for conveyors which was developed by the rubber manufacturers.

There is little organized research for new markets in the industry.

9. *Many textile owners have abandoned their mills*

The textile industry has suffered from unprogressive managements.

In the first place many mills have been owned by the same interests for several generations. They had survived the depression and were capitalized at very low values.

(*a*) Some of these older interests sold out to other textile interests, textile users or financial speculators, during or immediately after the war, who were primarily interested in avoiding the excess-profits tax. They paid high prices, which gave the original owners large capital gains. The purchasers financed the transaction with the cash accumulated in the old business and then could continue business with a high capitalization and therefore pay little or no excess-profit taxes.

(*b*) Others sold out to established textile interests, particularly since the carryover provisions of the corporate income-tax law have become more attractive. They thereby profited through a merger and acquired the stock of the successor corporation which was generally a nontaxable transaction. The successor corporation has been able to use the carryover provision as a means of escaping future taxes. In some instances these tax savings have amounted to 20 and 30 millions of dollars. These mergers, based on the capitalization of the loss position of the merged companies, have been widespread within the textile industry and are matters for real public investigation.

In the second place, a number of interests have been unwilling to invest to modernize their operations. No mill can survive unless it has the latest type of equipment and those owners who have been unwilling to keep abreast of the times have often abandoned their mills in preference to modernizing them. This procedure was attractive particularly at times and places where the real estate was of substantial value and when a market existed for the used equipment.

In the third place, the decline in the market for certain products has limited the capacity required in them. Older managements have in those cases been unwilling to move into new product areas and start afresh in the competitive struggle.

We urge a thorough investigation into the effect of our tax structure upon the process of plant abandonment and mergers and purchases. Our tax system has inordinately encouraged these movements. And the textile industry has been one of the most important areas for the utilization of the tax laws for personal aggrandizement accompanied by widespread plant abandonment.

10. Imports have seriously affected some divisions of the industry

While the textile industry as a whole has not been particularly affected by imports, the woolen and worsted division has been seriously injured from time to time as the volume of imports has risen in the face of a shrinking market. These imports have then tended to aggravate and demoralize an already difficult situation. The industry must look with alarm at any increase of imports of serious proportions since they would aggravate what is now a seriously disturbed condition. It is an industry which must be maintained.

The hard and soft fiber cordage and twine division has also felt the impact of rising imports and is in need of protection as an essential industry. The threat of a major increase in cotton textile imports from Japan as a result of impending tariff negotiations is a real one. Any action which would compound the difficulties of this depressed industry must be avoided.

11. Prices have been set by the highly efficient mills

In this highly competitive market, prices have been driven to very low levels. Mill margins have also been very low. With the industry now highly concentrated in a relatively few hands, the major mill and selling organizations have set their prices at levels which reflect the southern wage scales and their high efficiencies. As a consequence the less efficient mills and those paying more than the southern wage scales on products predominantly produced in the South have had severe pressure on their income levels.

12. The high rate of mergers and mill purchases has concentrated the industry

The mill mergers and purchases have continued in large numbers since they began during the last war. The movement from 1944 through 1948 has been revived during the last few years so that we are now in a new period of consolidation. This has been stimulated by the tax laws; the decline of the woolen and worsted industry; the drive for diversification; and the practice of integration which has brought production, selling, and factoring within the same interest grouping.

13. The absence of a realistic wage floor has maintained an inordinate pressure on union scales

The intense competition and the high rate of unemployment have enabled employers to resist union demands for wage increases and resulted in the deterioration of existing wage standards. Employers in the northern cotton-rayon and woolen and worsted industry have taken the union to arbitration and forced wage reductions upon the workers. Northern manufacturers continue to pressure for southern wage standards though they are quite willing to maintain higher standards if wage levels were equalized throughout the country.

In the South, the low-wage mills have continued to undermine the wage structure. Some of the southwestern mills have even threatened the wage levels in the Southeastern States. The internal southern competition has brought wage reductions in a number of nonunion shops.

The injunctions which have nullified the Secretary of Labor's orders for $1 prevailing minimum wage in cotton-rayon and $1.20 in the woolen and worsted industries under the Walsh-Healey Public Contracts Act have accelerated the demoralization within the industry.

14. Local tax and finance subsidies create unfair advantages leading to unnecessary migration

Another stimulant to disorganization and unfair competition has been the local inducements offered by communities in the form of tax exemptions, profitable lease arrangements and local financing of plants and equipment. These have encouraged companies to abandon existing locations and move to new properties with little cost and investment. The result has been an unhealthy competitive situation which has called forth protests both from labor and management in the North and in the South.

PROPOSED COURSES OF ACTION

To help deal with the problems raised by the large scale distress and the decline in the textile industry many approaches and programs have to be considered. Some are designed to stimulate the industry; others to aid the victims of change and unenterprising management; others to prevent greater demoralization; and still others to prevent unfair competition within the industry.

The following are recommendations which have been offered at various times and which are herewith submitted for full consideration by the Joint Committee:

1. We urge a full investigation of the problems of the textile industry and a consideration of the problems of the textile industry and a consideration of each of the proposals listed below. No governmental agency in the present administration has been willing to undertake this responsibility.

2. As an immediate program to help the industry, we propose the following:

(*a*) Distribution of textiles to needy nations overseas.

(*b*) Distribution of clothing to the needy in our own country on the same principles as are applied to surplus food.

(*c*) Reestablishment of textile stockpiles for our Armed Forces to stimulate immediate employment.

(*d*) Contracts should be granted to mills in distressed manpower areas. The present provision is unsatisfactory. The allocations have been minimal and have provided little or no relief to the distressed areas.

3. As a long-term effort toward stimulating the growth and expansion of the textile industry, we urge a research program such as has been conducted for the raw cotton industry. It should be designed primarily to study present and potential markets, consumer preferences and needs, and industrial requirements to open up new applications for textiles. In the case of the woolen and worsted industry there is a need for a wool fabric "library" to stimulate new design and aggressive merchandising.

4. Unfair competition at the expense of workers has been widespread. In order to recover the wage cuts which have been imposed upon the industry and to prevent further wage cuts and unfair use of workers, and to establish fair competition the following are essential:

(*a*) A national minimum wage of $1.25 per hour. We believe that the President's proposal of 90 cents will be inadequate. It will have little or no effect in the textile industry where the Secretary of Labor has already found that the prevailing minimum wage is $1 for the major division (cotton-rayon and miscellaneous textiles) and $1.20 for the woolen and worsted industry.

We believe that the President's Annual Economic Report takes an indefensible position in its attack against a higher than 90-cent minimum wage. It is completely contradicted by the factual report issued a few days ago by the Department of Labor on the effects of the 75-cent minimum wage of 1950. All evidence on the experience with minimum-wage legislation during the past 20 years belie the President's bears about a higher than 90 cents an hour statutory wage.

The statements in the President's Annual Economic Report that a "higher minimum (than 90 cents) might well cause lower production and substantial unemployment in several industries and * * * bring generally higher prices in its wake" is a reiteration of a stock argument used through the years by the opponents of any legislation setting fair minimum wages. The facts are that each increase in the basic minimum rate in the past has been accompanied by increases in production and greater employment. Price increases, where they have occurred at all, have been so minor as to be insignificant.

Actually the 1950 increase from 40 to 75 cents—as demonstrated by the current Department of Labor study—was more substantial than the rise now recommended by the President. In 1950 we had an 88-percent increase on the 40-cent-an-hour rate which directly affected over 6 percent of covered employees. A 90-cent minimum would be a 20-percent boost on the 75-cent rate and would directly affect less than 5 percent of eligible workers.

The above report finds that the 1950 increase to 75 cents resulted in "only minor effects other than pay increases * * * (and) minor effects on such variables as employment, plant shutdowns, prices, technological change, hiring, and overtime."

The President's message completely misses the point when he states that "minimum wages do not deal with the fundamental causes of low income and poverty." The fact is that the weak bargaining power of unorganized workers in certain industries and areas is a fundamental cause of their not receiving decent wages. The minimum wage law partly corrects this imbalance in bargaining power which is the principal cause of substandard wages. The purpose and actual result of minimum-wage legislation is to enable workers who have little or no bargaining power to achieve a progression in wages not too far behind the levels enjoyed by other American workers.

The adoption of a realistic minimum wage in 1955 will have no greater consequences than those experienced in 1950. A statutory wage of $1.25 is justified by the rise in living costs and the sharp increases in man-hour productivity during the past 4 years. A minimum rate of $1.25 per hour is required to enable large numbers of underprivileged employees to achieve living standards not too much below what could be properly described as a decent American standard.

(*b*) We urge the repeal of the Fulbright amendment to the Walsh-Healey Act which has frustrated any revision of the prevailing minimum wage.

(*c*) We urge a further protection for the self-organization efforts of workers in unorganized mills of giant industrial corporations to protect them from the vengeance and unequal economic powers of these huge economic units.

(*d*) We urge a full-scale study of the 35-hour week for this industry at 40 hours' pay during the current period of distress.

5. Regional and local development are essential: The present administration has recommended the expansion of its area development program. Until now it has been a stepchild with little support. It has largely been engaged in making occasional political forays into distressed areas. It has sometimes captured a local news headline, but it has few resources and means for implementing a program. We welcome the expansion of this program but it must be more than a Department of Commerce undertaking. It must have the concentrated support of the full administration and the command over the facilities of many different agencies. Moreover, in all but the distinctly local problems, development is dependent upon extensive regional and area research and planning. Agencies for such purposes do not now exist.

More study and thought must be provided for the stimulation of small enterprise.

6. Mergers and abuses of tax system: Congress has a distinct responsibility to study the abuses of the tax system with particular reference to circumstances surrounding the present merger movements in the textile industry. Some phases which we believe require searching inquiry are the following:

(*a*) The disallowance for tax purposes of the deduction of rent from taxable income by industrial companies which lease plants built from the proceeds of municipal bond issues. The ultimate aim should be the elimination of State and local tax exemption and other subsidies to private enterprise which artifically stimulate migration of plants.

(*b*) The elimination of the use of the capital gains tax provisions in our Federal income-tax laws for the purpose of liquidating businesses or acquiring businesses for the purpose of their later abandonment.

(*c*) The elimination of the use of the carryover provisions by corporations which utilize them for the acquisition of corporations looking to the later abandonment of properties and operations.

(*d*) As an alternative the imposition of a special tax on the gains resulting from such use of the capital gains tax or the carryover provisions for the specific purpose of using such proceeds for local development, worker adjustment programs and local public works.

7. Exemption of textile products from further tariff reductions: In view of the demoralization of the textile industry and the undue burden already imposed upon the textile workers and because the increasing productivity within the industry will reduce costs even more sharply than they have to date, with the consequence that foreign producers will not be able to maintain a permanent foothold in our markets, we urge that rates of duty on textile items in the tariff schedules not be further reduced in the negotiations with Japan or any subsequent or concurrent negotiations with foreign countries.

8. Assistance to workers victimized by the shrinkage of textiles and the wholesale abandonment of plants: We endorse the recommendation in the President's Economic Report for policies "to ease the movement of people to new areas or new occupations." Similarly we concur that people should be provided for minimum needs in their old age or in the event of misfortune." Unfortunately, the definition of minimum needs presented in the Economic Report is grossly inadequate.

We therefore propose the following:

(*a*) Liberalization of the unemployment insurance provisions so that they provide two-thirds of the average weekly earnings to unemployed persons. For workers displaced by abandoned plants we urge a longer period of qualification for unemployment benefits, such as 2 years.

(*b*) In case of abandoned plants we urge consideration of the application of the principles already applied in the railroad industry under the Transportation Act of 1940, which provides that whenever facilities are coordinated or consolidated (and later defined as including abandoned), employees are to receive displacement and dismissal allowances, reimbursement for movement expenses and wage losses if required to move to new residences and reimbursement for losses incurred in sale of home or cancellation of leases if required to move.

(*c*) There is need of establishing preferential hiring rights for new jobs established by the same corporation or industry for a period of 2 years subsequent to plant liquidation.

(*d*) Eligibility for early retirement, at age 60, is necessary for persons displaced as a result of the abandonment of plants.

(*e*) Federal assistance is necessary for retraining of workers displaced as a result of plant abandonment.

OCTOBER 27, 1954.

Mr. GABRIEL HAUGE,
Administrative Assistant to the President,
The White House, Washington, D. C.

DEAR MR. HAUGE: Your letter of September 30 indicates that President Eisenhower would be glad to consider any plan we might submit for relieving unemployment and general depression in the textile industry. We hope you were entirely in earnest, for the problem is so grave, so complex and has persisted so long that the need for a remedy outweighs political considerations.

I will attempt in this letter to enumerate the specific steps we believe should be taken by the Federal Government. I will not attempt to discuss their implementation in detail; this can better be done through conferences with the appropriate Government officials if the President decides to take action.

Let me begin by outlining very briefly the scope of the problem:

Since 1950 the textile industry has suffered a sharp and continuous shrinkage. Some 270 yarn and weaving mills have been liquidated, the largest number of them in the woolen and worsted division. Employment of production workers has fallen by 275,000 since the first quarter of 1951. Less than a million are still employed, and many of these are on short time. Many factors have contributed to this shrinkage, including a major shift in consumer buying habits and a remarkable procession of technological improvements that have increased man-hour productivity by an average of 5 percent a year.

In any other basic industry this degree of dislocation and distress would long since have attracted national concern. But the textile industry is the most widely dispersed, both in ownership and in physical plant, of all the basic industries in our country. Instead of a few large, spectacular failures, as would result under similar circumstances in the steel or auto industries, we have undergone a multiplication of small, local disasters, none especially newsworthy in itself but having a devastating impact in sum.

The problem is further complicated by the fact that the typical textile mill is in a small community, where it is the largest or perhaps the only source of employment. Also, the typical textile worker is older than the average in other industries. These factors greatly hinder the absorption of displaced textile workers elsewhere.

We believe the national interest requires prompt and constructive action by the Federal Government with both immediate and long-range objectives. To meet the immediate need we propose the following:

1. Action by the President, under the Mutual Security Act, to add textiles to the commodities distributed to needy nations overseas. As you know, coal and agricultural products are already included in this program. Obviously such a plan must be carried out with discretion, to avoid damaging the textile industries of other countries where they exist. But just as obviously, a large proportion of the world's people are inadequately clothed. Textile contributions from us could help to build the international good-will we sorely need.

2. Distribution of clothing to the needy in our own country, on the same principles followed with surplus food. No American should lack warm and serviceable clothing while textile mills stand idle.

3. Reestablishment of textile stockpiles for our Armed Forces. This is especially needed in view of the rapid disappearance of woolen and worsted mills, whose productive capacity, then far greater than now, was strained to the utmost during World War II.

4. A program of supplementary Federal unemployment benefits to extend the duration of payments to those in distressed areas who have exhausted their State insurance. This is a desperate need in the "one-industry towns" hit so hard by textile mill closings.

The long-range objective, of course, must be the restoration and maintenance of healthy economic conditions in the textile industry. Spokesmen for the Federal administration of which you are a part have said repeatedly that Government's best role is to guide and stimulate American enterprise, not to take over its functions. We believe our proposal is consistent with this position.

What we suggest is a textile research program, a greatly-broadened equivalent of the work which has been successfully carried on for some years for the benefit of the cotton industry alone. Such a program should study consumer trends and investigate possible new uses and new markets for textiles. A great many specific projects could be undertaken under this program; we would be glad to outline a number of them at the appropriate time.

Government leadership is needed in this undertaking because the wide dispersal of the industry has prevented it from carrying out broad, basic research of its own. Perhaps if the Government takes the initiative the industry itself will ultimately develop sufficient sense of industrywide responsibility to correct this shortcoming.

Certainly the need is there; not only among textile workers and hard-hit textile communities, but in the Nation as a whole, for let us remember that in its own, undramatic way the textile industry is as vital to the defense and to the well-being of our country as the blast furnace, the auto plants and the mines.

Very truly yours,

EMIL RIEVE, *General President.*

Textile Industry Problems

(Resolution Adopted at 16th Convention of the Congress of Industrial Organizations, Los Angeles, Calif., December 6–10, 1954)

The textile industry preceded the rest of the American economy in the descent to mass unemployment and suffering. Today some 300,000 textile workers are idle, more than 50,000 as a result of permanent mill closings during the last 2 years. Several hundred thousand are working part time. Employment is less than in 1932. Thousands have exhausted unemployment compensation benefits and have been forced onto local relief rolls. The depression in the industry has caused widespread hardship in textile communities throughout the country.

The plight of the industry is due to the failure of managements to fulfill their responsibilities to their customers and workers. Fabric and apparel design has not kept pace with the changing living habits of American consumers. Instead of fashioning materials to whet the appetites of the new suburbanites, the mills have continued to produce fabrics designed for more formal urban living. There is a dearth of fabric and apparel designs suitable for this era of the long, casual weekend, backyard sports, TV-viewing and the home workshop. Expenditures on advertising and sales promotion have been woefully inadequate. Research is needed on the potentialities of textiles for new industrial applications as well as for expansion of old uses.

Consumer per capita expenditures on apparel have not increased in proportion to the rise in total consumer spending because the textile industry has not moved to maintain its position in the consumer market. Employers have resigned themselves to shrinking the industry's capacity without consideration for their public responsibilities. Some have carried their irresponsibility to the point of capitalizing on tax loopholes and local government subsidies to reap financial gain by closing their plants. The welfare of the workers and the community has been ignored in the ruthless drive of a few men to profit from the low tax rate applicable to gains from the sale of capital assets. Others have exploited the industry-hungry towns which used their tax-exempt authority to float municipal bonds to pay for new plants and equipment.

Many companies were forced out of business because of their failure to reinvest the excessive profit earned during previous boom periods. Others were unable to complete in a "buyers' market" because they lacked enterprising management. Their inability to keep pace with new methods, style changes, and merchandising developments made their demise inevitable.

In contrast, there are many companies whose efficiency and superior merchandising have continued to yield profitable financial returns. Corporations with strong financial backing have grown through the acquisition of additional plants. These mergers and acquisitions have resulted in an unprecedented concentration of control in the industry. Some 50 textile giants control half of the industry's basic capacity.

Rapid improvements in textile technology have added to the workers' problems by reducing the amount of labor required per unit of production. Management has taken advantage of these developments to extend work assignments inordinately and has refused to share the gains from increasing productivity. Man-hour productivity has risen at the annual rate of 4.5 percent since 1946 with a total cumulative rise of 36 percent. Combined with a declining total production to an annual rate of 12.7 billion yards from a rate of 14.76 billion yards at the end of 1950, these developments have permanently eliminated thousands of textile jobs.

Imports of textiles, including woolens and worsteds, cordage and twine, fine cottons, silk scarves and others, have increased markedly and have accentuated the problems of the industry. In the woolen and worsted branch the impact of imports has been most severe because of the shrinking American market and the concentration of foreign exporters of lightweight fabrics for this country.

The Federal Government has abdicated its responsibilities in the textile field. The defense manpower policy which authorized allocation of some Government orders to areas of high unemployment has been scuttled. The protection promised by the Walsh-Healey Public Contracts Act to employers with decent wage scales in bidding for Government contracts has been wiped out by the Fulbright amendment which authorizes court action to prevent minimum wage regulations from being put into effect. Increases in the minimum wage for work on public contracts, from $0.87 to $1 in cotton-rayon and from $1.05 to $1.20 in woolen and worsted, have been blocked by such litigation. The Government has refused to implement a provision of the tariff agreement which authorizes higher rates to protect the woolen and worsted industry from growing imports. On the other hand, the Government maintains a duty on raw wool which adds to the cost of wool products without protecting the wool farmer.

It also supports an artificially high price for cotton which results in the accumulation of a huge cotton surplus and prevents the consumer from enjoying the benefits of lower cotton costs: Now, therefore, be it

Resolved, 1. We call upon the Federal Government to take affirmative action to stem the tide of depression in the textile industry:

(*a*) An agency should be set up by Congress to represent the textile industry, labor, and the public for the purpose of enforcing a basic 35-hour workweek in the industry at 40 hours' pay. The agency should be empowered in periods of distress to limit machine operations to two shifts per day.

(*b*) A program of stockpiling needed military fabrics should be created now so that production orders can be released immediately.

(*c*) American textiles should be used in the same fashion as surplus food and coal for the relief of needy nations overseas. In similar fashion, textiles should be distributed to needy Americans as surplus food is now distributed.

(*d*) Contracts should be negotiated with mills in distressed manpower areas to reemploy the unemployed.

(*e*) A systematic investigation should be undertaken of ways to broaden the use of wool fibers as well as cotton. The Department of Agriculture should provide leadership in establishing a wool fabric "library" to stimulate new design and aggressive merchandising.

(*f*) Industrial expansion programs must be revised to locate new plants in areas where surplus manpower is available.

2. We support the proposal of the House Ways and Means Committee to disallow, for tax purposes, the deduction of rent from taxable income by industrial companies which lease plants built from the proceeds of municipal bond issues. This action would be a suitable first step in eliminating State and local tax exemptions and other subsidies to private enterprise.

3. All profits and capital gains resulting from the liquidation of mills should be taxed at a special rate of 25 percent and the proceeds used to finance local development programs, to aid workers to adjust themselves and to set up public works and the development of local resources and facilities.

4. We call upon the Senate Committee on Labor and Education to look into the use of capital gains taxes, local subsidies and corporate mergers as stimuli to the liquidation of business enterprises.

5. The Federal Government should provide a research organization for studying methods of broadening the markets for textile fabrics.

[From This Week magazine, New York Herald Tribune, November 9, 1952]

THE CASUAL ERA

THE TEXTILE WORKERS' RESEARCH CHIEF SAYS THAT SUBURBAN LIFE AND EARLY MARRIAGES ARE RUINING THE HIGH-STYLE DRESS BUSINESS

By Clive Howard

The modern American woman, according to Solomon Barkin, is a terrible problem.

Solomon Barkin is a big, loose-limbed, earnest man who is research chief for the CIO Textile Workers Union. It is his job to keep a constant eye on the state of the clothing business, which means more or fewer jobs for the textile workers—and what he sees nowadays often gives him cause for pause.

We sat having dinner in a Fifth Avenue hotel. He looked around him and right then and there spied something that nobody in the clothing business could be very happy about.

"Take a quick look at the women here," he said. "I count 12 of them. Five are wearing suits. Three of them are wearing a skirt and blouse. One has a skirt and sweater. That leaves just three who are wearing a dress—that good old-fashioned sartorial institution."

He shook his shaggy head. "Take your own poll right here—and then tell me if you'd like to be in the dressmaking business. Or count the hats. I see quite a few blondes and brunettes and 1 redhead, but I only see 4 hats. How would you like to be in the millinery business?"

Obviously our own Roper poll that night in the dining room did not seem very favorable. But why?

"It's the postwar trend," Barkin said. "It used to be that a woman would never think of eating at a place like this in anything except a dress. She would have felt naked without a hat."

Perhaps modern women have lost their pride in personal appearance?

"No, sir," said Barkin. "Cosmetic sales haven't fallen; if anything they're going up. I haven't heard of any mass bankruptcies among beauty shops, and the home permanent industry is just about the biggest success story of the decade. It's just that women nowadays don't feel they have to have a lot of clothes on their backs to be in the swim. That may be mixing metaphors a little, but that's the way it is.

"Take the suburban housewife. In the morning she puts on a skirt. Over it she throws a smock—that's a big item in clothing sales nowadays, the smock—and she's ready for her housework. Or if she hasn't too much work to do and thinks somebody might drop in, she wears a brunch coat over the skirt. That's a kind of three-quarter length housecoat. Looks pretty good, especially when it has gold designs on it."

BIG DAYS IN THE TWENTIES

"In the afternoon she's got a little fancy shopping to tend to, or a bridge party or something. So what does she do? She takes off the smock and puts on a blouse or a sweater. Or one of her husband's old shirts—even that's considered perfectly respectable for most purposes nowadays.

"Then she combs her hair and does a careful job with the lipstick and vanity case. She feels dressed up just by putting a new face on. That's all that today's customs require."

From what I remembered offhand about my own wife and her friends, Barkin's analysis made a lot of sense. But what did the war have to do with it?

"Now you get into sociology," he said. "That's my hobby, you know; I write books on sociology when I have the time. You sure you want me to get wound up on it?"

I gave him the green light.

"Well, the dressmaking industry really got started during the twenties. Before that everything was mostly done by local dressmakers and seamstresses. Then came the factory-made dress. It was cheaper, lasted longer and gave you your choice of just about anything you wanted at any price you wanted to pay.

"Those were the days for the dress industry. You could take a $200 Paris gown and make a pretty exact copy to sell for $100. You could make another copy to sell for $50. And so on all the way down the line to $6.98.

"Women liked dresses in those days and snapped them up. It was an era of city living. The suburbs didn't amount to much as yet. There weren't too many automobiles or too many commuters. Life was much more formal than nowadays. If you had a car, you used it to visit friends or just go out for a Sunday drive—and you dressed up to do it. The movies were the biggest form of entertainment—and that meant dressing up again."

CAME THE WAR

Barkin looked around the restaurant and his eye fell upon a couple in the corner. They were young, extremely young. The girl was wearing a skirt and sweater, no hat.

"Watch her left hand when you can catch a glimpse of it," he said, "I'll bet she's wearing a wedding ring."

I watched; the hand came into view—and she was.

"That's another thing," said Barkin. "People weren't marrying so young in those days. Women stayed single longer and in a sense were competing for the attention of men. That meant dressing up. I call it display competition—and all fashion is really display.

"The dress industry grew even during the depression. People didn't have enough money to get married. A lot of them couldn't afford houses or automobiles or electric iceboxes or any of the other big expensive things. What did they buy? They bought clothes. Clothing was cheap; you could afford it even if you couldn't afford anything else."

"And then," I reminded him, "came the war."

"Right," Barkin said. "and now you've got to put a couple of things together. In the first place, the marriage rate went sky high. So did the birthrate. Marriages and babies have been the biggest boom of the last 10 years. And where do all these new married couples live? In the suburbs. There, in a nutshell, is what's happened to the clothing industry."

I had to admit that I didn't quite get it.

"Just think for a minute about that suburban housewife," Barkin went on. "She's got a house to take care of, with no help. She's got a couple of children. What's she going to wear while she's with the kids in the back yard? A Paris creation?

"Not on your life. She's a skirt and blouse woman. Or maybe even slacks and blouse, except that many women don't look good in slacks.

"And what does she do for entertainment? She and her husband watch television and you don't have to dress up for that. Or they drop in on some neighbors who dress just as casually as they do. Or they go to a drive-in. Still no dressing up.

"This is the most informal and casual era in the history of American clothes. Even the wealthiest people are dressing casually; it's the first time they've copied a style from the lower income groups, rather than vice versa. Come back to my office and I'll show you the figures."

Barkin's office, down on University Place, always comes as a shock to his visitors. The desks and tables are littered with papers—books, booklets, pamphlets, memos. On his own desk that night the stack was 6 inches high, and there was hardly enough bare space to hold a pencil or postage stamp.

"Don't let the office throw you," he said. "This represents my own personal filing system. Only way I can find what I need when I need it."

He thumbed through 3 feet of papers piled on a table and, sure enough, came up with the figures he wanted.

"Take a look at this. The average family used to spend 10 percent of its income for clothing. Now watch how the line on the graph goes down. Today it's only 7 percent—and believe me, it's still dropping. Everybody's got more money. Everybody's got more kids. You'd think that the line would be going up, but it's just the opposite.

"Of course, the men are responsible, too. During the war they got used to wearing casual clothes in the Army—the Eisenhower jacket, for example, or the Army windbreaker. They found out you could keep warm and still be comfortable.

"When the soldier got back he probably bought one dress-up suit, but then he started looking for something cheaper and more casual. He started buying sports jackets and slacks. He began wearing sports shirts instead of white shirts. Another blow at formality. Now do you get the picture?"

It began to add up. The shift to the suburbs. The concentration on home and children. Television and the drive-in.

THE STYLISH TEENS

"Exactly," said Barkin. "And don't forget that houses are expensive. So are furnishings. Nowadays families are putting their money into their homes, instead of on their backs. In the matter of keeping up with the Joneses, the main thing is the house. And of course the car you need to live in the suburbs.

"The average young married man spends 5 days a week working for the boss. Then he goes home and puts in 2 days of what I call working for the mortgage. He mows the lawn, puts in a garden, does some painting, takes down the screens and puts up the storm windows. His wife works right with him. And who needs fancy clothes?"

I was beginning to feel a little sorry for Barkin's workmen in the textile industry, not to mention the businessmen who hire them, and I said so. Barkin grinned.

"Don't worry; we'll lick the problem yet," he advised me. "The real trouble is that the industry just hasn't caught up with the trends; it didn't realize what was happening. One of these days the industry will start making clothes designed for our times—and you'll see that there's some life in it yet.

"Besides, who can say how long a trend will last? You know who the most fashion-conscious women in America are today? You may not believe it, but they're the teen-agers. The bobby-sox era is dying. The teen-agers are taking to quilted dresses and crinolined party dresses with layers of petticoats underneath. They're more high-style conscious today than their mothers—and who knows what will happen when they get a little older?"

[Journal of Commerce, New York, Thursday, July 22, 1954]

WOOL MILLS, CIO SAY MODERNIZATION OFFERS SOLE SOLUTION TO INDUSTRY ILLS

(By Charles F. Davis)

Wool-cloth mill management's failure to modernize manufacturing methods, styling, and merchandising is more directly the cause of the industry's present depressed state than the wage demands of organized labor, according to an executive of the Textile Workers Union of America, CIO.

While few cloth producers will go along with the premise that wages are a secondary problem, many of them will admit that the industry has been remiss in the development of new products, textural effects, and in other respects has been hidebound.

If there is anything incongruous in this near-agreement on the part of organized labor and management, it is no less so than the fact that one of the most important divisions of the United States textile industry may well be disappearing, at least in its present concept.

Solomon Barkin, TWUA's director of research, pointed out to the Journal of Commerce in an interview that the woolen and worsted industry has in the past decade shrunken drastically and will shrink even more unless management takes corrective action.

MANY MILLS LIQUIDATED

In 1947, he pointed out, the industry employed about 167,000 workers and now the figure is between 58,000 and 60,000. Since the end of World War II about 50 mills have been liquidated, he added.

The worsted end of the business has been the hardest hit and is the most culpable, Mr. Barkin stated.

Although Government fabric needs during the Korean war provided worsted producers with a reprieve, their products even then were losing ground to cottons, particularly in regards to lightweight cloth and more recently it has been even more overshadowed by various types of synthetics.

This business was forfeited by management almost without a struggle, according to Mr. Barkin.

In contrast to the worsted division, woolen fabrics have more than held their own due a growing demand for casual wear which, for the industry, manifested itself in calls for new textures in sport coatings, and a willingness on the part of woolen-cloth producers to develop new designs.

Woolen-cloth producers were quick to grasp the signifiance of the casual-wear trend and the new emphasis on sport coats, among other things, having been made acutely aware of the call here for cloth to be thus used by British exploitation of the market, Mr. Barkin pointed out.

More serious, in Mr. Barkin's view, than the tendency for the wool-cloth industry to move South where labor is mostly unorganized is the possibility that in doing so wool-cloth production will come into the hands of interests who are essentially cotton or synthetic fiber fabric producers. This will tend to further reduce emphasis on wool as a self-sufficient, adaptable, and desirable apparel component, he believes.

To the extent that from January 1951 through June 1953, about 140,000 American system spindles have been installed by the industry, this is already coming about, he said. The American system is an adoption of cotton-spinning techniques and is of southern origin and development.

Recently announced and pending mergers of old-line New England wool-cloth mills with cotton and synthetic fiber interests is the latest and even more ominous sign that wool may be relegated into a secondary position, he added.

While admitting that the TWUA's most immediate concern is and has been the continuation of equitable wage scales and working conditions, Mr. Barkin said that it has long been appreciated by the union that these cannot be maintained unless the industry is healthy.

Questioned as to whether or not the union's willingness to take a wage cut this year—which in most instances came to about 9½ cents per hour—was not an admission that it's wage demands in the previous 2 or 3 years were unreasonable, Mr. Barkin strongly denied it.

"Last year the arbitrators turned down a reduction sought by management stating that the mills must face and solve its own problems of marketing deficiencies, sales, and administration," Mr. Barkin said.

"By 1954, the arbitrators found that management had not solved the problems but in the interest of the industry's survival the reduction was essential. Fundamentally, however, the problem of finding new markets and buyers are still the key issue which must still be solved by management," he added.

Referring to an 11-point program the union recently formulated and forwarded to Secretary of Commerce Sinclair Weeks, Mr. Barkin said that it stressed Government contracts and relief work in order to give management more time to solve these problems.

Mr. Barkin said that the program also included Government assistance in research comparable to that which has proven so successful in the cotton industry and to otherwise provide Government facilities by which management can expand the market for wool cloth.

Depression in Textiles: A Warning to America

(Chapter 3 of Executive Council Report, Eighth Biennial Convention, Textile Workers Union of America, CIO, May 3–7, 1954)

Although the American economy as a whole operated in high gear through the first three-quarters of the last 2 years, the textile industry did not. The Nation's output broke all records as tremendous plant improvement and expansion programs were completed; more people were employed than ever before, and consumer income reached new peaks. Yet the textile industry was unable to sustain the level of activity it had reached in the first quarter of 1951, when it was producing at an annual rate of 14.8 billion yards of cotton, synthetic and wool woven fabrics.

Textile production declined in the second quarter of 1952 to 78 percent of the first quarter's volume. Man-hours of work shrunk almost as much though employment dropped only 12 percent, since about half the adjustment came through reduction in hours. There was a pickup at the end of 1952 which touched its height in the first half of 1953, when production reached 90 percent of the first quarter of 1951. The rise in man-hours was only slightly less and employment was at about 93 percent of the 1951 level. But the recovery faltered and production declined through the last half of 1953 to 80 percent of the 1951 first quarter. By the end of 1953 employment had dropped more than total man-hours; employment was about 4 percent below the second quarter of 1952 but man-hours were about equal. The overall contraction in production, accompanied by many mill closings, has therefore begun to reflect itself sharply in complete liquidation of textile-mill jobs.

Thus the textile industry was operating at a low level at a time when output in other major industries was slowed only by material shortages or other production bottlenecks. In addition, the textile industry had failed to share equally in the growth of consumer demand stemming from the high level of economic prosperity. From 1939 through 1953 our physical national product doubled and the consumer actually enjoyed 70 percent more in services and goods, but the increase in textile yardage was only about 30 percent.

While the total number of workers actually employed in the nation rose from 45.8 million in 1939 to 62 million in 1953—an increase of 35 percent—the number actually employed in the textile industry dropped by 3 percent, with workers averaging less than 40 hours a week.

As in the 1920's the textile industry was sick while the rest of the economy flourished. Government, management and the public, unfortunately, remained oblivious to the fact that this was a harbinger of more far-reaching economic difficulties.

Production of broad-woven fabrics

[In millions of linear yards]

	Cotton	Syntehtic and silk	Wool	Totals	
				Quarterly	Annual rate
Capacity [1]	2,850	710	130	3,690	14,760
1952:					
1st quarter	2,395	557	86	3,038	12,152
2d quarter	2,275	518	81	2,874	11,496
3d quarter	2,314	569	88	2,971	11,884
4th quarter	2,539	623	96	3,258	13,032
1953:					
1st quarter	2,612	624	85	3,321	13,284
2d quarter	2,616	622	93	3,331	13,324
3d quarter	2,414	577	84	3,075	12,330
4th quarter [2]	2,400	530	80	3,010	12,040

[1] Per quarter—based on production in 4th quarter of 1950 and 1st quarter of 1951.
[2] Estimated.

One reason why the textile industry did not participate fully in the general prosperity was its failure to design and promote new products suiting the Nation's changes in living habits and patterns. These have been transformed by the vast growth of suburban housing developments, with their emphasis on do-it-yourself activities, and the increased leisure time available to the mass of people in a period of full employment.

In 1953 Americans had about $138 billion in discretionary spending power (income left after their basic needs are satisfied) compared to $26.5 billion in 1940. Construction of more than 7 million new one- and two-family houses since the war converted millions of apartment dwellers to suburban homeowners puttering around the house. Gardening took on the aspects of a major industry as consumers in 1952 spent some $836 million for flowers, seeds, and potted plants.

FOLKS DON'T DRESS UP TO STAY AT HOME

The do-it-yourself movement mushroomed into a multimillion dollar business supplying paint, tools, flooring, wallpaper, wood, outboard motors, etc., to suburbanites; outdoor furniture and cooking equipment also enjoyed tremendous expansion as the people spilled out of their houses into patios, lawns, and backyards. These new interests arose from the need of homeowners to supply such services themselves rather than depend upon landlords or builders.

Equally significant has been the widespread popularity of television, bringing the family back into the home and making it the focal point for leisure-time activities. In short, household life in America is now predominantly casual, both in attitudes and attire.

At the same time, outside-world tastes also shifted. Dressy affairs have given way to sports like hunting, fishing, and boating, and to drive-in movies. Travel expenditures alone exceeded $9 billion last year, with motels soaring to a billion dollar a year level. These leisure-time activities are of the type that accentuate casual apparel—a hybrid of sports and work clothes. In 1947 dress shirts made up 3 out of 4 men's shirts sold; in 1953 sport shirts outsold dress shirts 2 to 1. Another major change in men's clothing was the growth of separate dress and sport trousers, from 38 million pairs in 1948 to 46 million in 1952 and over 50 million in 1953. In women's fashion, the trend toward informality is evidenced by the shift from dresses and suits to skirts, blouses, and sweaters. Thus while dress and suit cuttings in the first half of 1953 went down 6 and 11 percent, respectively, skirt output rose by 16 percent.

The net effect of suburban living, long weekends, backyard sports and home workshops has been to lessen interest in attire and encourage the use of clothing which not only consists of fewer items but lasts longer. As a result, civilian per capita consumption of textiles (in terms of fibers) is only 36 pounds in the postwar years in comparison with 29 pounds before the war—a rise of 24 percent when compared with the 50 percent rise in real per capita disposable income.

The heavy burden of consumer debt has also had a restrictive effect on textile consumption. Mortgages make first claim on the income of the more than 7 million families who have bought their own homes since the war. Between the end of 1945 and 1953, the amount of mortgage debt outstanding on 1- to 4-family houses rose from $18½ billion to $65 billion.

Other types of consumer debt have also dampened current expenditures. Consumer credit outstanding has soared in the last few years as more and more people have used this means to purchase automobiles, furniture, television sets, and household appliances. Total consumer credit rose from $5.7 billion at the end of 1945 to $28.9 billion at the end of 1953; automobiles alone account for $11 billion of this total.

Thus there is a total consumer-homeowner debt of nearly $95 billion, which takes a big bite out of consumers' current income. This reduces consumer expenditures for items which can be postponed, with apparel one of the chief victims. The proportion of the consumer's dollar spent on apparel has declined steadily since the war.

Apparel expenditures as a percent of total consumer expenditures

1946	10.4	1949	8.8	1952	7.8
1947	9.6	1950	8.0	1953	7.3
1948	9.5	1951	8.0		

For the last 4 years the proportion spent on apparel has been below the prewar level (8.6 percent in 1939).

A concerted drive by the textile and apparel industries is needed to recapture consumer interest. Designers have barely tapped the potentialities for greater sales to the newly leisure-conscious suburbanites. Research has been sadly neglected. Expenditures for advertising and sales promotion have been pitifully small compared to the outlays by producers of durable goods. Textile manufacturers must start an industrywide program, in cooperation with apparel manufacturers, to revive the appeal of clothing and whet the appetite of consumers for new things to wear.

While there has been considerable expansion in the use of textile products in the home, it has hardly been enough to keep abreast of the vast new needs. The opportunities for industrial application have remained almost untouched.

The last 3 years have witnessed a series of aggressive advertising campaigns to promote new textile fibers like orlon, dacron, acrilan, and dynel. However, great irresponsibility has marked the launching of these new products as "miracle fibers." Consumers found the claims for these synthetics to be exaggerated. Moreover, many spinning mills lacked proper equipment or know-how to process the new fibers, and often resorted to shortcuts which resulted in inferior yarn and fabric.

The widespread disillusionment of consumers hurt the market for these new fibers. Also creating confusion was the multitude of different blends of natural and synthetic fibers, generally marketed without reporting the proportion of each fiber or the special advantages offered. Nevertheless, the bulking quality which enables the new fibers to be used as a wool substitute or for blends, plus their superior crease resistance and launderability, makes them a formidable threat to the older fibers.

Spinners and weavers of wool, rayon and acetate have all suffered from the inroads of the new fibers. Although there is no assurance that they will hold their present position, they have seriously upset the industry, especially the older branches, and discouraged consumer buying. Cotton, on the other hand, has recovered part of the market it had previously lost to rayon and acetate.

Percentage distribution of fiber consumption

	1946	1950	1952
Manmade fibers:			
Rayon and acetate	13.5	19.8	18.9
Other	.9	2.1	4.0
Cotton	74.1	68.5	69.6
Wool	11.4	9.5	7.4
Silk	.1	.1	.1
Total	100.0	100.0	100.0

These shifts in the distribution of consumption among the various textile fibers reflect the following developments:

1. Improved styling and finishes on cotton fabrics for women's wear stimulated their use in dresses, blouses, skirts, and woven fabric underwear and nightwear, as indicated by the following figures on percentage of cotton to total garments cut:

	1949	1953 [1]
Dresses (unit priced)	20	29
Blouses	26	49
Skirts	25	37
Underwear and nightwear	[2] 40	55

[1] Estimate based on data for 1st half.
[2] 1950.

2. The superior launderability of cottons enabled them to recapture the bulk of the men's woven fabric sport shirt market:

Percentage of cotton sport shirts

1950	49
1951	42
1952	49
1953 [1]	55

[1] Estimates based on data for first 10 months.

3. Lower cost, improved finishes, and superior styling made it possible for rayon and the newer synthetics to take over part of wool's markets in men's summer suitings, separate trousers, and women's suitings:

Percent of garments made of man-made fibers

	Men's summer suits	Trousers	Women's suits
1949	46	40	34
1950	50	49	42
1951	61	63	60
1952	69	61	61
1953 [1]	70	61	55

[1] Estimate.

In addition to the displacement of natural fibers by synthetics, the textile industry has suffered from the substitution of nontextiles in various household and industrial uses. Plastic film has made major inroads in the upholstery fabric market and in automobile seat covering and door paneling. When added to the earlier displacement in window and shower curtains and tablecloths, these developments assume major importance.

Failure of the woolen and worsted branch of the industry to protect its competitive position stands in marked contrast to the success of the cotton interests in improving their styling, finishing and merchandising. With Government aid in studying the properties of cotton and its potential uses, growers and manufacturers cooperated in developing new processes and staging an effective promotion campaign. Research is needed in the wool field to improve its qualities with respect to shrinkage and mothproofing. Fabric design has lagged behind the times as domestic mills generally gave up the initiative to foreign producers. While many woolens have been styled to meet the shift in consumer preference toward casual wear, worsteds have not yet been adequately adapted to this trend. Many mills are also unable to compete because of obsolete plant and equipment. The woolen and worsted industry will have to bestir itself to meet the growing challenge of the newer synthetics. Creative answers must be forthcoming to the problems posed by product design, technology, merchandising and sales promotion.

MORE RESEARCH IS REQUIRED

The same problems confront the rayon and acetate branch of the industry. The dressy appearance of many filament yarn fabrics bars them from a major place in the current vogue. New fabric designs will be needed; better finishes are required; standards of launderability must be improved and enforced. The industry has made a start on a sales promotion program but this will have to be supplemented by attractive styling and fabric qualities to meet our new suburban civilization.

Certain broad areas of use for textiles have hardly been explored. For example, laminated glass fibers are currently being used in experimental production of automobile bodies. If successful this development will open up a vast new field for the use of fibers in labinates. Research is needed on the potentialities of textiles for various new industrial applications as well as the possibilities of expanding old uses.

The rate of mill liquidations increased substantially in the last 2 years, leaving a train of ghost towns and some 50,000 jobless workers. Management deficiencies which had been glossed over in the textile booms that followed World War II and the Korean war were glaringly exposed by intensified competition. Companies whose stockholders enjoyed a bonanza in dividends from highly profitable operations in 1946–48 and 1950–51 found that their failure to plow back sufficient funds to modernize plant and equipment left them at a serious disadvantage in 1952–53. The necessity of cutting costs posed financial problems for which they had not prepared themselves and many mills were forced out of business.

REASONS WHY MILLS LIQUIDATE

Other companies gave up the ghost because they lacked the enterprising management necessary for survival in a highly competitive era. Mills whose original owners had been alert and aggressive enough to build up the business lost their momentum as ownership passed into the hands of the family's second and third generations. Absence of research work left many firms unable to improve their products or bring out new fabrics in keeping with changing demands. The importance of styling and merchandising grew as competition increased and those who had nothing special to offer or lacked the ability to promote sales were doomed to failure. Also inevitable was the closing of plants where labor relations had deteriorated as a result of inflexible management attitudes.

A number of mills were liquidated as a result of deliberate schemes by management to achieve maximum financial gains. The welfare of the workers who had devoted the major portion of their lives to these mills was ignored in the ruthless drive of a few men to profit from loopholes in our tax laws, under which capital gains (such as a gain from the sale of a plant) are taxed at only 26 percent compared to a maximum rate of 92 percent on ordinary income. No consideration was given to the fate of communities whose entire economic life depended upon the operation of these mills. Instead, every opportunity was seized to exploit communities in other parts of the country through acquisition of new plants and equipment paid for by industry-hungry towns which used their tax-exempt authority to float municipal bonds.

The American economy is headed for a general decline unless consumer spending is increased. The total output of our economy rose to a new peak of $367 billion in 1953, a boost of 5 percent over the previous year. This rise was shared by all three types of domestic activity—consumer expenditures, business investment and Government purchases. However, this year the latter two are moving down. Business has been reducing inventories and plans to spend less on new plants and equipment. The Federal Government has announced a $5 billion reduction in its budget. Consequently an increase in consumer buying will be needed to fill the gap thus created. There is little evidence that this will be achieved. The weakness of consumer demand for apparel in 1953 was a forerunner of the declining strength being exhibited by total consumer demand in 1954.

While the industry as a whole reported fairly modest financial returns in 1952 and 1953 (earning 4½ percent on sales before taxes in 1952 and 5½ percent in 1953), many firms were able to score notable successes. Returns well over 5 percent on sales were recorded by Bates Manufacturing Co. (7.6 percent), Berkshire Fine Spinning Associates, Inc. (9.5 percent), Beaunit Mills, Inc. (6.2 percent), Consolidated Textile Co. (9.4 percent), Erwin Mills, Inc. (5.8 percent), Pepperell Manufacturing Co. (9.5 percent), Standard-Coosa-Thatcher Co.

(14.1 percent), Sagamore Manufacturing Co. (6.6 percent), S. Stroock & Co., Inc. (20.2 percent) and Woodside Mills (10.0 percent). Financial reports have not yet been made public by many other companies whose efficiency and superior merchandising in this competitive period have yielded handsome returns. The performance of these profitable firms can be used as a yardstick to gage the management deficiencies of companies which failed to measure up.

BIGGEST COMPANIES GET BIGGER

Corporations with strong financial backing found many opportunities during the last 2 years to augment their position in the market by acquiring control of additional plans. Among major acquisitions were those by J. P. Stevens & Co. (Utica & Mohawk Cotton Mills), Burlington Mills Corp. (Peerless Woolen Mills, Inc.), United Merchants & Manufacturers, Inc. (A. D. Juilliard & Co., Inc.), Textron, Inc. (F. Burkhart Manufacturing Co.), Abney Mills (Erwin Mills); Pepperell Manufacturing Co. (Dunson Mills), Berkshire Fine Spinning Associates, Inc. (Lincoln Bleachery & Dye Works). In addition, a number of companies were merged to form new industrial giants; these include Flagg-Utica Corp. (J. T. Flagg Knitting Co. and Utica Knitting Co.), and the consolidation of U. S. Finishing Co. and Aspinook Co.

Number of production workers in United States textile manufacturing industries, 1940–53

Industry	December 1940	December 1945	December 1947	December 1949 [1]	December 1951 [1]	December 1953
Total [2]	1,308,000	1,230,000	1,431,600	1,323,000	1,277,000	1,165,000
Yarn and broad woven fabric [3]	769,800	721,200	786,700	697,400	671,300	589,100
Cotton, silk, and synthetic	587,000	559,400	611,300	549,600	555,800	503,700
Woolen and worsted	182,800	161,800	175,400	147,800	115,500	85,400

Source: U. S. Bureau of Labor Statistics.

These mergers and acquisitions continued the postwar trend toward concentration of control in the hands of larger and larger textile giants. The 50 largest interests in the spinning, weaving, and finishing branches of the industry now employ almost 400,000 workers, or about half the total labor force in these branches.

TECHNOLOGY STILL MOVES AHEAD FAST

In contrast with the inert managements referred to in our earlier discussion of liquidations, these aggressive companies have placed heavy stress on modernization. The pressure for cost reduction in the last 2 years resulted in the expenditure of over $500 million for plant improvement and expansion. The bulk of the postwar expansion program had been completed by 1951 so subsequent capital expenditures were concentrated in improvement of existing facilities. Altogether, the industry has spent more than $3½ billion on new plant and machinery since the war. By the end of 1953 more than half the gross value of the industry's capital assets was made up of postwar installations.

Along with improved technology the textile industry has transformed its methods of operating along the lines of the most modern American industries. Centralized controls have been instituted over scheduling and production, and systematic checks imposed on quality. Plant layouts have been revamped to provide a straight-line flow of production. Materials handling has thereby been reduced to a minimum and, where actually necessary, mechanical means have been substituted for labor. Technically trained supervisors and time study engineers have combined to tighten labor standards. Manhour output has been substantially increased. With the decline in activity at the end of 1953, many companies pared their overhead and work force. Demands for higher machine assignments for workers were more numerous than ever.

With the woolen and worsted industry operating at depressed levels, the problem of imports assumed serious proportions. Imports of wool top were particularly onerous because of the marked rise in the quantity of Uruguayan tops brought into the United States as a direct result of Uruguay's foreign exchange manipulation. Uruguayan producers were given a higher exchange rate on top exports than on raw wool—a Government subsidy which enabled them to boost their exports to the United States from 6 million pounds in 1951 to 16 million pounds in 1952. Altogether, 23 million pounds of wool tops were imported in 1952 compared to 10 million in 1951 and 4 million in 1950.

TWUA cooperated with the wool trade in urging the United States Customs Bureau to impose a countervailing duty on Uruguayan wool top imports. After considerable delay, the Bureau levied an 18 percent countervailing duty effective last June. As a result, top imports declined to about 6 million pounds in 1953.

Imports of woolen and worsted fabrics increased to a point where they captured a substantial portion of the American market. While domestic production declined steadily from 786 million square yards in 1946 to 470 million in 1953, imports rose from 4 million to 25 million square yards.

Imports as a percent of domestic production

[In millions of square yards]

	Imports	Production	Percent
1946	4	786	0.5
1950	19	586	3.2
1951	19	509	3.7
1952	24	501	4.8
1953 [1]	25	470	5.3

[1] Partly estimated.

The impact of imports was especially heavy because of the concentration of foreign producers on lightweight fabrics. In 1953 more than half the total imports were in cloths of 8 ounces a square yard or less. Imports of the lightest types (6 ounces a square yard or less) constituted 12 percent of domestic output in 1953.

To protect the industry from further destruction, TWUA in 1953 requested the United States Tariff Commission to implement a provision of the general agreement on tariffs and trade which authorized raising tariff rates on woolen and worsted fabrics when imports exceed the "trigger point" of 5 percent of production. This request was rejected on a technicality. Early in 1954 the union again urged the Commission to raise the tariff rate from 25 percent to 45 percent as soon as imports in any weight category reach 5 percent.

While woolen and worsted imports have been rising, exports of cotton goods (the only textile item which the United States exports in substantial quantities) have been dropping sharply. Shipments of cotton fabrics declined from 802 million square yards in 1951 to 762 million in 1952 and 630 million in 1953, a drop of 21 percent in 2 years. Foreign markets for cotton goods have been contracting as domestic textile industries have been built up in the underdeveloped areas of the world. Japan and India have expanded their capacity to a point where their exports exceed those of the United States. Great Britain's industry is also geared to supply a larger portion of the world cotton goods market. The United States, therefore, faces a shrinking foreign market.

The economic problems faced by the textile industry call for vigorous action by the Federal Government to aid in making the necessary adjustments. In the 1952 Presidential election campaign, General Eisenhower made specific promises to aid distressed areas and to effectuate other policies leading toward a recovery in textiles. However, campaign pledges which would have aided hundreds of thousands of textile workers were quickly forgotten after the Republican administration took office.

LAWRENCE EXPOSES IKE'S DOUBLETALK

In Lawrence, Mass., where more than 20 percent of the labor force of 53,000 was unemployed as a result of woolen-mill closings, the President had promised preference for distressed areas in obtaining Government contracts. The Truman administration's policy of setting aside parts of contracts to be let in distressed areas had not been sufficient because of the requirement that the lowest bid be matched. At the end of 1953 President Eisenhower announced he favored strengthening the set-aside program to assist distressed areas, but withdrew his support before any alleviation could be worked out. He explained that it was not his intention to offer special assistance to any area, but rather to improve conditions throughout the Nation; the only result was continued unemployment in Lawrence and other hard-hit cities.

Meanwhile, total unemployment rose from 1.2 million in October 1953 to over 2.4 million at the beginning of 1954, not counting the people who had dropped out of the labor market and young workers who could not find jobs.

One of the final actions of the Truman administration had been an order by the late Secretary of Labor Maurice J. Tobin setting $1.20 as the minimum wage for the woolen and worsted industry under the Walsh-Healey Public Contrast act. This would have protected unionized mills from cutthroat competition on Government contrasts. However, the order was nullified by Martin P. Durkin, Eisenhower's first appointee as Secretary of Labor, who insisted on holding additional hearings. Only at the end of January 1954 did the new Secretary of Labor, James P. Mitchell, reissue the order. The delay frustrated the purpose of the Walsh-Healey Act. Further delay is expected from employer court action challenging the order.

FEDERAL POLICIES SHRINK MARKETS

Tobin's earlier order of a $1 minimum wage in cotton-rayon has been in court since February 1953. Here again the Labor Department has been most dilatory in pressing the matter.

The slowness with which the Republican administration moved on all other economic problems confronting textiles has aggravated the industry's difficulties. While they objected to the Brannan plan for farm price flexibility proposed by the Democrats, the Republicans had no substitute to offer which would stimulate demand for agricultural products through lower prices. Instead, 90 percent of parity was supported by the Government for basic crops, including cotton, and huge surpluses piled up in Government warehouses. Cotton prices have been maintained between 32½ and 33 cents a pound in spite of a sharp decline in demand. The bulk of the current bumper crop of 16 million bales is going into Government storage under the loan program. A more realistic Government policy is needed to permit marketing of cotton at lower prices while sustaining farmers' income.

Another Government policy which increases the cost of textiles without affording genuine protection to the farmers is the duty on raw wool imports. The loss of two-thirds of the apparel wool market to foreign wools is sufficient evidence that the import duty does not protect the farmer. It merely adds to the cost of the wool product. Direct payments to the farmer instead of a duty on imports would benefit the farmer without penalizing the woolen and worsted industry.

State and local governments also played their part in intensifying the problems of the textile industry. Several Southern States have authorized municipalities to issue bonds to finance new plants for lease to private interests. Such bonds enjoy the tax-exempt status of municipal issues and therefore afford the private users of the new plant a competitive advantage over companies which must get financial backing in the corporate bond market. Moreover, companies which lease such plants do not have to make the initial capital investment normally required to build and equip new factories. Many of these communities have also offered tax abatement as a further inducement. These various incentives proved attractive to textile interests; their devotion to private enterprise was not strong enough to deter them from accepting public subsidies. The beneficiaries include not only northerners; southern millowners have also been induced to move to new locations. A bill to eliminate the unfair competition arising from such subsidies has been bottled up in Congress.

MANY MANAGEMENTS FAVOR THE SQUEEZE

TWUA has proposed many positive steps designed to maintain the textile industry in a prosperous condition, but management has refused to join in supporting these measures. The successful firms, in fact, have hoped for the elimination of the marginal mills. Civic and business leaders in distressed areas have looked to other industries to replace textile plants. The Eisenhower administration is disinclined to seek a solution for specific problems; with callous disregard for the woes of workers and communities, it has retreated behind the smug self-assurance that this is the price to be paid for our political and economic freedom. TWUA has literally been the sole defender of the victims of economic disaster; even affected employers have not asserted themselves, preferring to liquidate in silence.

* * * * * * *

The textile industry faces a period of continuing challenge. The problems of the past are likely to be heightened as the American economy goes through what has been described as a "readjustment" but which may well become a real slump. Total demand for textile products cannot rise substantially as long as unemployment grows. Competition will therefore become more intense and merchandising activities more crucial.

The gray goods market has declined in importance in the cotton and synthetic fields. Progressive managements do not rely on undifferentiated products to support their operations. Fabrics need to be distinctively designed and identified for purposes of advertising and sales promotion. Brand names known by consumers as well as the trade assure a market for particular products even when general demand is low; labels are the assurance of quality. The development of new products and new finishes, colors, and textures creates new uses which can open up vast new markets.

These are the avenues for growth in our changing economy. To maintain its stability, the textile industry more than ever needs careful insulation from foreign low-wage competition, and realistic Federal minimum wage laws are required to maintain wage levels within the industry.

The Problems of Older Economic Regions in a Dynamic World

By Seymour E. Harris, Professor of Economics, Harvard University

Credentials: I have served on several expert committees on the New England economy, inclusive of the Report of the Committee on the New England Economy (a report to the President, 1951). I have been chairman of the New England Governor's Committee on the Textile Industry, have represented the New England Governors at public hearings, and am the author of the Economics of New England and numerous other books.

SUMMARY AND GENERAL COMMENTS

Trends in the economy

Despite the general prosperity of the country in the years since 1940, there have been many serious sore spots. Even $350 billion of military outlays and $250 billion of Federal deficits have been inadequate to solve the problems of the New England textile towns and regions, the Middle Atlantic coal towns, several of the Northwest agricultural States (3 actually lost population over 20 recent years). It is of some interest that from 1929 to 1953, New England's share of national income payments dropped by 20 percent, New York State's by 29 percent, and the Southeast's share rose by 34 percent. Relative to New England, the Southeast gained almost 70 percent in a period of 24 years. Nor did all "old" States lose relatively: cf. Connecticut, Maryland, New Jersey, Michigan, and Ohio, on the one hand, with Massachusetts, Rhode Island, New York, Pennsylvania, on the other.

The large relative gains have been in the South and Far West (8.47 to 12.10 percent for the latter) and the large losses in New England and the Middle East (a decline of 33.7 to 27.06 for the latter). The Central States and Northwest roughly maintained their relative position of 1929.

But the Central States (Michigan, Illinois, etc.) are vulnerable in this respect. Manufacturing recently accounted for 37.6 percent of their wages and salaries (30 percent for the Nation) and 66.5 percent of the employment in manufacturing was in the highly unstable durable goods industries (substantially tied to military outlays). There is here a curious inconsistency between political views (isolationism) and economic interests.

Trends obscured by Government outlays

It is scarcely necessary to add that these relative losses and gains underline important adjustment problems. Large outlays by Government have to some extent obscured the problems. Some of the additional public spending spills over to the depressed regions. But it is also clear that an unjustifiable increase of deficit spending would be required to solve these problems through general fiscal measures.

The regional struggle for dollars

Too little attention has been paid to regional problems. Most of our trade is interregional, not international. Each region has a dollar bill to pay for services and commodities purchased from the outside. If through farm policy the prices of a region's imports of food and raw materials rise; if through tariff policy, it faces increased competition for its manufactured goods; if newer industrial regions capture its markets—then it must either capture new industries or suffer a loss of cash, reduced prices, and reduced wages; or if stickiness prevails, unemployment. In this paper I show how limited are the employments that may replace lost industries.

New England a low-wage region

Thus, to some extent we can explain the transformation of New England from a high- to a low-wage region. In manufacturing New England's wages are lower than anywhere but the South, and in white-collar work her wages are even below those of the South. Of 18 industries for which figures were available, New England's wages were higher than the national average only in 3 industries: textiles, chemicals and allied products, and stone, clay, and glass products. In 1950, average manufacturing hourly wages in the United States were $1.46, as compared with $1.38 in New England. Had New England been able to find adequate alternative employments in the last generation, she would not have suffered from the unfavorable balance of payments, relative loss of cash, and pressure on costs—a pressure that is also felt in unemployment as national trade unions interpose obstacles to wage cutting.

The dangerous competition for industries

In recent years there has developed a dangerous competition among States for industry, with the tendency of competing States to cut services and keep taxes down in order to keep or attract industry. This is evident, for example, in the newer industrial regions aggressively seeking a place in manufacturing by putting minimum taxes on industry as a means of attracting industry and even providing subsidies; by keeping down social-security benefits; by fighting trade unions aggressively and thus keeping wages down (the Taft-Hartley Act tended to freeze relative wages of North and South at a point where the South had a great advantage); using financing through tax-exempt securities as a means of enacting industries from the North. (According to published reports southern Congressman succeeded in removing a provision in the 1954 Finance Act which would have stopped this unfair practice of building plants for northern management by the issue of tax-exempt securities.)

Of particular interest is the effects of the social-security program on interstate competition. For example, in each of the last 2 years (1952 and 1953), the two major textile States in New England levied taxes of 2.7 percent of payrolls on employers to finance unemployment compensation; but the 3 major southern textile States had average rates of 1.32 and 1.29 percent in these years. In the years 1946 to 1950, the ratio of benefits to taxable wages was 2.7 percent in Massachusetts and Rhode Island; 0.9 percent, in the Carolinas and Georgia. The average weekly benefits for the 5 most important manufacturing States in the North in 1953 was $25.82; in the 5 major States in the South, $19.60, or an excess of 31 percent for the North. The unemployment compensation program, though it was justified in part as a program which would not result in competition among States to reduce taxes and benefits, has as a result of experience rating become just that. Benefit schedules tend to deteriorate to the lowest common denominator.

Federal Government and interregional competition

It is scarcely necessary to add that the Federal Government has played a large part in this movement of industry from North to South. Generally cash has been taken from the North and transferred to the South. These transfers are especially costly to the Northeast because they are accompanied by large transfers of cash via investments of corporations operating on a national level from North to South. Both capital and management go. Labor stays. In 1 year New England seemed to lose about $1 billion or 7 percent of its income as the Federal Treasury took out more in taxes than it spent in New England. The Government used part of this cash to reduce power costs in the South, expand research facilities, etc., and thus to weaken New England's position. Freight rates are lower in the South, in part because of Government policy.

Political strength of the South

Also relevant is the political strength of southern Congressmen, who though they are theoretically strongly in support of free enterprise nevertheless are willing, even eager, to obtain financial help from the Federal Government for their constituents. Northern Congressmen will have to organize and fight as effectively as southern Congressmen if they want to stop the continued losses of their industries.

It is not surprising then that New England has been losing its textile industry at a rapid rate. These losses have been going on for a long time; but in the 3¾ years ending September 1954, the drop of employment was 48 percent. At that rate the industry, the most important in New England accounting until very recently for about 10 percent of employment directly and 20 percent indirectly, would be gone in 8 to 9 years.

It is no wonder, then, that in January, July, and September 1952, unemployment in Lawrence, Mass., averaged 19, 25, and 21 percent, respectively; and in the same months in 1953, 18, 18, and 17 percent (in the midst of the greatest prosperity). There were substantial amounts of unemployment in other textile towns also—no less than 30,000 unemployed at the end of 1954 in 4 textile towns of medium size. From peak employment in 1949–51 to October 1954, Boston lost 9,400, or two-thirds of its textile jobs; Fall River, 10,000, or two-thirds; New Bedford, 5,900, or one-third; Lowell and Lawrence, 10,600, or one-third; Providence, 33,100, or 60 percent.

The influx of new industries

What is more, the new jobs or new industries do not always make up for these losses. Between two census years (1919 to 1947), New England gained only 4 percent of the new jobs in the 10 fastest growing manufacturing industries, a proportion much below the region's share of factory jobs. In the same period the region had lost 200,000 jobs in textiles and shoes. In the prosperous years of 1947 to 1953, New England added 290,000 jobs; but only one-third was in manufacturing. The record was better than from 1919 to 1947, in part because the region had been alerted and showed much initiative; but the major factor was Government spending. What is more, the heavy gains in service employments partly reflected the pressure for jobs from those unemployed in declining industries.

New industries in textiles and shoe towns less desirable

Despite these gains, the problems of the textile and until very recently the shoe towns continue to trouble the region. The incoming industries were less desirable generally than those that had left. The new jobs were not adequate to employing new workers as well as the displaced workers.

Advantages of the South

Losses of New England and the North stem in part from real advantages of the South—in access to raw materials and markets, in plentiful supplies of labor eager and willing to work, in cheap power, in aggressive leadership of management, community, and Government (it almost seems as though the Civil War is being fought all over again), in the advantage of a new industrial region in being able to adapt its investments to current, instead of past, spending patterns. But in part the gains may be associated with the depression of national standards (e. g., social security), and large favors from the Federal Government.

The task for the North

The northern regions must fight as vigorously as the South; must be as modern in research, in management, in worker interest; must seek their fair share of Federal outlays; must expect the leadership of a well-organized political coalition on the Southern model; must fight for adequate standards of social security (through Federal standards); must fight for higher minimum wages, a fair share of tax subsidies (e. g., the accelerated amortization program), of Government contracts, etc.

And in the allocation of tariff cuts, the Government should consider the net effect of all Federal policies on a region. Can cuts in textiles be justified in view of the total effect of Federal policies and the present state of the textile industry? The problems of jobs for the unemployed in textiles are serious, untenable statements in the Randall report notwithstanding.

Finally, unhealthy interstate competition will not be treated until the Federal Government assumes a greater responsibility for standards and tax collection as was intended under unemployment insurance.

Treatment of unemployment by the President's Council

On the whole, I am disappointed. The Council scarcely touches upon the problem of distressed areas. In earlier years the Council showed much more interest in these problems. With more time I hope the Council will make amends.

First, it should be noted that unemployment has been greater than may be gleaned by the report. Add 3.75 million of unemployed at peak; 1 million partially unemployed (half time for those registered thus); 250,000 temporarily idle; and 500,000 for general cut in hours (this total is cut one-half to allow for duplication with above)—the total is then 5.5 million. Incidentally, the Council says the peak was higher in February 1950 than in March 1954 (p. 88). But note that the rise was much greater in 1954 over 1953 than in 1949–50 over 1948.

Second, the Council refers to the Government's contributions (p. 20) in assisting localities through Government contracts. This has been of no importance. The administration backed down when several Congressmen raised a fuss on this issue, and even then distress areas were to be allowed only to meet bids of others. Accelerated amortization was a gift to the prosperous, not the depressed, regions. It helped bring the depressed industries down. (See New England Textile Report, pp. 282–283: "With more than 50 percent of textile employment, the South received 90 percent of the tax amortization expenditures. * * * New England with 25 percent of employment received 1 percent.")

Third, the Council suggests improved unemployment compensation benefits (pp. 91–92). But so did the President on several occasions in the past. This is just talk. Until the President and Congress take a hand and insist on Federal standards and remove fear of interstate competition, the program will remain inadequate; and the pressure will grow for guaranteed wages.

Note the state of unemployment compensation:

1. In the 16 years, 1938–53, there were 57 million man-years of unemployment and but $12 billion of unemployed benefits were disbursed, or about $210 per man-year of unemployment. Even in 1949 benefits equaled one-quarter of wage losses.
2. Duration of benefits was 19 weeks before exhaustion.
3. Taxes collected in 1953 were 1.40 percent instead of 3 percent, with each State through the unsupportable experience rating fighting to get rates and benefits down.
4. One-fifth of workers are still uncovered.
5. Half the unemployed workers had their benefits exhausted in 1954. (Whereas 96 percent of total wages were covered in 1939, only 72 percent were covered in 1953.)
6. The percentage of benefits to wages was 41 percent in 1938–40 and 32.5 percent in 1951–53. (In relation to total wages, inclusive of supplement, even less is had.)
7. Ceiling benefits were equal to 67 percent of wages in December 1939 and 41 percent in December 1953.
8. No program for Federal reinsurance has been proposed to meet the problems of States with a heavy incidence of unemployment. So far the Federal Government seems to have "absconded" with $500 million to $1 billion of unemployment taxes and now has agreed to give back as loans $200 million to be collected in the future.
9. And what about sickness insurance, even more necessary than unemployment compensation?

Finally, in the discussion of international economics, nothing is said concerning the effects of further tariff cuts on the declining industries or how to help them.

Supplementary Statement by Seymour E. Harris

1. THE BALANCE OF PAYMENTS OF REGIONS AND WAGE RATES

In many ways regional relations are more important than international relations, and especially for large countries. Trade among regions is much larger in the United States than between this country and other countries. For example, in

1 year exports of the United States were 5 percent of national income; but exports from New England (regional and international) were about 25 percent. Of course, the smaller the region (e. g., a State), the greater becomes the importance of regional trade.

Regional trade raises some problems common to international trade and some that are not. A region, of course, has the problem of the balance of payments. New England, for example, only produces 3 percent of its income from agriculture (10 percent for the Nation), and hence has to import its major foods and raw materials, paying for them primarily through exports of manufactures and secondarily through exports of services. The region also pays for its agricultural and mining products through receipts on income from past investments abroad or in other regions. A great manufacturing region tends to export most of its manufacturing product—obviously if it accounts for 6 percent of the national consumption, it will export, say 94 percent of the textiles. Though if its total manufacture of textiles is 25 percent of the Nation's it will export some textiles and import others—still its net exports would be several times its consumption.

A region, like a nation, is concerned with the problem of paying its bills. If the prices of its imports rise vis-a-vis those of its exports, the balancing of accounts may cause difficulties. For example, both because of natural forces and also the intervention of government (raising agricultural prices and through tariff policy depressing relatively prices of industrial production), the terms of trade of industrial regions have tended to deteriorate relative to agricultural regions in the years since 1933–55. Hence the balance of payments of the industrial regions becomes precarious; and especially for older industrial regions if, as a result of increased competition of newer industrial regions, the competitive position of older industrial regions tends to deteriorate.

A region may well experience even greater difficulties than a nation. A large part of labor in manufacturing is organized on a national basis, and, therefore, tends to set a national wage level—for example, this is true of the steel industry and automobiles. Hence, should the Middle West lose ground in iron and steel to the South, it cannot easily recoup its loss by cutting wages. Even when trade unions are of unequal strength in different regions or do not set wages on a national basis, adjustments may be greatly impeded. For example, according to 1 estimate, the percentage of workers organized in 11 Southern States was 25 percent of the national level in apparel and 43 percent in textiles.[1] Hence, wage rates are likely to be lower in the South in these industries. Here is a peculiar situation. Wages generally are higher in the North than in the South. Hence it is very difficult for trade-union leaders in the North to accept cuts in wages in industries suffering losses in the North; for the wage level is set to some extent by the high-wage industries. If the unions do not agree to wage levels (and labor costs) commensurate with those in the South, however, unemployment in these industries rises.

Here we may all agree that the adjustment to unfavorable balance of payments, whether the occasion is a deterioration in the terms of trade or loss of competitive position, is beset with difficulties. Nevertheless, there is evidence of adjustments. For example, whereas textile wages were about 50 percent higher in New England than in the South early in the century, 50 years later they were but 10 to 20 percent higher. These adjustments result from the pressure of unemployment in the regions losing cash as their competitive position suffers; and even the rigidities introduced by institutional factors yield to some extent. Another bit of evidence of the consumption of adjustments is to be found in net income payments. Thus, from 1929 to 1948, per capita income payments of New England rose by 79 percent, of the 7 most industrialized States outside of New England by 99 percent, and of the 5 most important industrialized States in the South by 197 percent.[2]

2. RELEVANCE OF GOVERNMENT POLICY

Rigidities in wage rates, related to some extent to the policies of labor unions operating nationally, do indeed interfere with adjustments. But the problem of regions suffering competitive losses may also be aggravated by Government policies. Thus the Federal Government, through its agricultural policies, raises prices of raw materials and foods for the industrial regions; provides power

[1] F. T. DeVyver, Labor Factors in Industrial Development of the South, Southern Economic Journal, October 1951, p. 194.

[2] The New England Economy: A Report to the President by the Committee on the New England Economy, July 1951, p. 31.

and tax subsidies for the newly industrialized regions; and introduces social-security programs which put a greater burden on old than on new industrial regions. For all of these reasons, the competitive position of the South as against the North improves. Ultimately, of course, the pressure of demand for labor and other factors should increase costs and retard the movement to the South. But the large reservoir of labor on the farms being squeezed out by technological gains greatly slows up the upward pressure on costs. Compare the New England situation where immigration as a source of labor is no longer available, and where there is virtually no reservoir on the farm.

Not alone Federal Government, but also State and local government influence the competitive power of regions. In the competition for employment, each government tries to keep taxes down and social services to a minimum. In the fierce competition to hold or attract industries, State and local government avoid new taxes, economize on school, health, relief programs. Where incomes are lower and services less advanced, industry tends to move. The South in particular tends to keep their costs down. Not only does the South keep their costs down, but they provide tax systems that hit consumers rather than business; and they use taxes disproportionately to subsidize industries which they seek to import.

Obviously with costs much lower in the South and with relatively free flow of management and capital, the South tends to gain at the expense of the North. Variations in the cost of living in the country seem to be about one-third as high as in wage rates. In fact, when budgets applicable to each region are studied, it is found that the annual cost in a recent year for a family budget for 10 southern cities was but 1½ percent less than for 3 New England cities. But the differences are larger when consideration is given to the fact that a new industrial area tends to establish itself in the smaller cities disproportionately—where costs are low. Thus in a recent year 30 percent of the Nation's population was in North Atlantic States and 28 percent in southern States; but the former accounted for 34 percent of the 199 largest cities and the latter only 19; and similarly for other categories of large cities.[3]

The reader will find statistical material on regional variations in costs, inclusive of payroll taxes, all taxes, hydroelectric power, on relative supplies of labor, etc., in the Report on the New England Textile Industry.[4]

Governmental activities then tend to influence the location of industry; and in the United States at least to favor the new industrial regions. In international relations, no government would allow a foreign nation to capture its markets at a rate (say) that the South has captured some of the Northern markets. Governments would interpose obstacles to trade. But in the United States not only has the Federal Government (and other governments) not intervened but they have tended to accelerate the movement. There is one notable exception, however. By setting minimum wages (both on a general level and on an industry basis), the Federal Government has tended to deprive the South to some extent of one of its most important competitive assets—plentiful supply of labor and low wages. But both because of the level at which minimum wages were set and the administrative weakness, the effects of minimum wages were not large.

3. SOUTH-NORTH COMPETITION: REAL AND OTHER ADVANTAGES

South-North competition raises difficult problems. Without a question, the South has important advantages and is bound to develop into a great industrial region. Proximity to rich raw materials and markets, a dedication on the part of labor, management, and the community to attract industry, the large supplies of labor—these are among the great advantages. With these great advantages, capital and management move easily into the South. The only question that can be raised is a noneconomic one. Should a region, with these great advantages, also be encouraged to depress standards of living, of government services, etc., below a level deemed desirable by the Nation? In other words, on top of the great advantages of markets, and of resources, should the South also through governmental measures be allowed to obtain additional advantages at the expense of northern rivals—e. g., through an excess of Federal spending over

[3] See Handbook of Labor Statistics. 1950, pp. 121–122 and BLS Serial No. 2, 1949. Calculated from the City Worker's Family and Budget, 1948, p. 22.

[4] By the committee appointed by the Conference of New England Governors, 1952. Also see S. E. Harris, Economics of New England, 1952, and The New England Economy: A Report to the President by the Committee on the New England Economy, 1951.

receipts[The question may even be raised whether northern wages should be depressed relatively in response to wages set by the large supplies of labor in the South, not held in check by strong trade unionism? The real issue comes down to the rate at which the South should be allowed to gain, not whether she gains or not.

4. PROBLEMS OF ADJUSTMENT

According to the theory of international trade, a county (or region) that loses ground in some industries then moves on to other industries. This will involve, of course, changes in occupations of workers and often of movement to other locations, investments in other industries, etc. All kinds of difficulties arise. Workers often do not want to write off skills acquired in an industry, and there is great reluctance for management and investors to move into regions or localities which have suffered from economic dislocations. When there is much unemployment, the movement into new industries faces additional obstacles—as British experience in the interwar period showed. When economic conditions are improving and especially when overfull employment prevails, the adjustments are made more easily—as United States and British experience in the forties show. Though even in this period, part of the success stemmed from special measures taken by Government and also enterprise to implement the free-market forces. Even in the prosperous forties and fifties there have been many coal and textile towns which have continued to experience large and long-continued spells of unemployment.

That the problem of adjustment can be serious is suggested by the fact that the outlets for the unemployed (say in textiles, shoes, or apparel in the Northeast and in coal in Pennsylvania and West Virginia) are distinctly limited, though in a growing economy some of the slack may be taken up. This follows because most employments are necessarily restricted to given localities; and hence a region suffering from unemployment cannot easily capture employment from other regions.

Elsewhere I have discussed this problem more fully. Here I present several paragraphs from this study. The major conclusion to be drawn is that losses can be recouped only out of a limited area of economic activity.[5]

"The major competition faced by American industry is interregional, not international. For example, exports out of the country are but 4 to 5 percent of the gross national product. Obviously, most sales are at home. In fact, a large part of all sales are within the region or even city of production. This is perhaps even more true of services than of movable goods. A large part of our services are almost exclusively free of interregional competition—medical, local, and State government, public utilities, domestic service, local transport, public education, etc. Here competition outside the city or region is distinctly limited. This point is of importance because it underlines the limited area within which adjustments in response to losses in interregional competive position must be made.

"It is well to remember that manufacturing income in 1952 accounted for but 31 percent of all income. The major adjustments in the competitive position of a region have to be concentrated to a considerable extent on this part of the economy. Hence, large losses in interregional competition, say in textiles and shoes, if they are to be made good in substitute exports, must largely be made good in improvements in manufacturing 'export' industries. Agriculture, forestry, fisheries, and mining account for but 9 percent of the national income. Here competition is relevant but the limits of adaptability are determined largely by the resources available.

"An estimate of approximately 40 items included in service employments and accounting for 60 percent of all income suggests that only about 10 percent of all income and corresponding employments included here are largely subject to interregional competition. Thus for retail trade, public utilities, transportation, telephone services, most services (education, religion, cinema, private households), local and State government, and a large part of Federal Government, the location of activities for the most part is determined by the present distribution of population and income. Only as population and income are redistributed will the services be redistributed. They are determinates, not determinants. Substantial parts of wholesale trade and of insurance are examples

[5] S. E. Harris, Interregional Competition: With Particular Reference to North-South Competition, Proceedings of the American Economic Association, 1954, pp. 370–372.

of services subject to interregional competition. (See Survey of Current Business, July 1953, p. 16.)

* * * * * * *

"An indication of the areas of competition is given by the distribution of various types of incomes by regions. * * * We compare for each region the percentage of incomes earned by different employments relative to the region's share of the Nation's income. Thus in the seven regions of the country, for 1952, the average percentage of trade and service income to the region's total income payments varied only from 24.1 to 28.0 percent (the United States average was 25.6). In construction, the range was from 3.4 percent (New England) to 5.0 percent (Southeast). Here the differences are explained largely by the slow advance of New England and the rapid industrial growth of the South—not by the South selling construction services to other regions. Where the percentage of income accruing to particular employments does not vary much from region to region, it may be assumed that competition is distinctly limited. In some instances, where percentage of employment varies generally, e. g., transportation, the explanation may well be that differences reflect geography rather than interregional competition. Heavy concentration of population explains a low proportion of employment in transportation in New England and Central Stataes, and large distances explain high relative employment in transportation in the South, Northwest, and Far West. Differences in the proportion of service income may also reflect variations in spending patterns in part: the right Northeast spends more on services than the poor South.

"For agriculture, government, and manufacturing, the minimum and maximum figures (taken from the Survey of Current Business, August 1953, p. 9) were as shown in the following table.

	National average	Minimum		Maximum	
		Area	Percent	Area	Percent
Agriculture (income)	6.7	Middle East	1.5	Northeast	20.3
Government (income payments)	15.9	Central	12.5	Southeast	20.3
Manufacturing (payrolls)	24.5	Northwest	10.6	New England	32.9

"If a manufacturing region loses heavily in exports, its losses must be recouped largely in manufactures, with some help from services. Yet even in manufactures there are segments where adjustments are not easily made. For example, in 1951, the distribution of manufacturing employment was as follows:

"1. Seven industries with location predominantly determined by access to raw materials (and to some extent to proximity to markets) accounted for 35 percent of the value added in 1951.

"2. The location of 7 industries accounting for 46 percent of the value added was determined to a substantial degree by the need of being near the raw materials.

"3. The other 5 industries (textiles, apparel and related, printing and publishing, leather and leather products, instruments and related products) accounting for 19 percent of value added were industries which might be located largely independently of the proximity to the sources of the raw materials.

"The last group would especially be subject to pressures for any adjustments that have to be made."

Ricardo's theory of international trade was based on the assumption that labor and capital do not move across national frontiers; and that there are no impediments to movements within a country. On both assumptions Ricardo was wrong. In the 19th and early 20th centuries, both capital and labor moved across national frontiers in large amounts and numbers. Relatively speaking these movements have become a trickle since 1914. Across State or regional boundaries, movements are not as unrestricted as Ricardo assumed. Indeed, there are no immigration laws to contend with; exchange control or discrimination against foreigners. Yet it is interesting that in 1948, for example, per capita income in Mississippi was $758 as compared with $1,891 in New York State, $1,817 in Illinois, and $1,651 in California, or 40, 42, and 45 percent of the per capita incomes in these States.

5. REGIONAL DIFFERENCES OF INCOME

Despite the great gains of the South, there are still substantial differences of income between South and North. In a recent year the per capita income in Mississippi was 40–45 percent of that in several Northern States. Why is this not corrected by movements of population from South to North and capital and management from North to South? (In part the differences are fictitious.)

How can one explain such large variations of per capita income within a country? To some extent these may be explained by statistical incomparability. Mississippi has more children relative to total population; more agricultural workers (low income); more Negroes (low income); lower cost of living and hence smaller real differences. But genuine differences still remain. Yet, why do not the agricultural workers and particularly the Negroes move to higher income occupations and States? Indeed, there is movement from farm to city, from South to North, from North to West, and not from South to West. For example, from 1929 to 1948, whereas the population of New England, the Middle Eastern States, and the Pacific Northwest rose 1.1, 1.2, and 4.3 times as much as the national income, in the Southeast and West North Central, the percentages were 0.5 and 0.6.[6] And as has been noted earlier, the per capita incomes rose much more in the South than in the North. That the rise has been disappointing in the Far West (108 and 77 percent in the Pacific Northwest and Pacific Southwest, respectively, as compared with 107 percent in the country and 179 percent in the Southeast), is to be explained by the large influx of people into that region.

But why have differences not associated with equalizing factors (e. g., number of children) not been eliminated. Ignorance; lack of resources required for movement; noneconomic factors (e. g., a preference for living in Mississippi to living in California)—these are among the explanations. The sluggishness of movement relates especially to labor, and to some extent to management. But capital moves with great ease across regional frontiers. Under modern corporate enterprise with more than 90 percent of capital of corporations obtained without appeals to the market, the corporation allocates its capital on the basis of returns to be expected. A northern steel or textile firm compares costs of producing and selling North and South, East and West, and on the basis of estimated returns the corporation then invests. With large supplies of labor available, rich resources, and proximity to rich markets, the steel company will divert some of its capital to the South. With capital so mobile and labor considerably less mobile, labor in the regions experiencing competitive losses suffer the more because it loses so easily its complementary agent, capital.

6. REPLACEMENTS FOR DECLINING INDUSTRIES

Obviously a region that has a disproportionate investment in industries that are losing ground must find outlets elsewhere; and for the reasons given is likely to lose ground. Here, for example, is the trend of various industries:

Percentage of employment

	1899	1939	1951
Textiles, apparels, and shoes	28.5	20.7	19.4
Chemicals, petroleum, and rubber	4.6	6.6	7.5
Primary metals		8.6	8.6
Metals, machinery, instruments, etc. (5 major industries)		24.0	33.1

Source: U. S. Census of Manufactures, 1947, II, various pages; and 1951 Annual Survey of Manufactures, Advance Report, Series MAS 5/24, Mar. 11, 1953, p. 7.

Again, here is a comparison of employments in 3 rather soft and rather weak manufacturing industries (textiles, apparels, and leather and products of leather) with 8 relatively strong industries (chemicals and allied, rubber products, primary metal industries, fabricated metal, machinery—both electrical and other, transportation equipment, instruments and related). The 1947 census gave the following percentages of employment in the 3 weak to the 8 strong industries: South Atlantic, 204; East South Central, 89; New England, 83; Middle Atlantic, 62; West North Central, 40; West South Central, 32; Pacific, 19; Mountain, 12; and East North Central, 10. It would be expected that Northern States with

[6] U. S. Department of Commerce, Economic Development Atlas, 1950.

high wages and a substantial percentage of employment in the three weak industries would experience difficulties; and southern States would also not grow so rapidly as other regions given their industry-mix, though an important offset would be their low costs.

7. EMPLOYMENT TRENDS, 1929 TO 1949

An examination of employment trends over 20 years (1929 to 1949) shows that despite New England's problems her gains in manufacturing have been small. For the whole country the relative proportion of manufacturing employment had risen by 1.84 percent; for New England, only 0.31 percent; for the Central States, 4.03 percent; Southeast, 3.77 percent; Middle East, 2.77 percent. Nor do gains in noncommodity producing industries (tertiary) necessarily accrue to the high-income regions. The South has a larger percentage than New England; and the high-income Central States have but 46.22 percent of employment in these industries as compared with 61.25 percent in the Far West and 56.60 percent in the Middle East. Among these industries, Government, trade, and miscellaneous especially gained, and transportation, finance, industry and real estate have especially lost ground relatively. When there are gains made by regions suffering losses, they are likely to be made in the growing employments, though not necessarily.[7]

8. CONCLUSIONS ON INTERVENTION BY GOVERNMENT

In summary, factor movements tend to bring about an equalization of income among regions. The equalization may be quickened by Government aid for the regions gaining ground. (Though it should be noted that Government operations may also prevent or slow up losses for low-income regions as for example in the attempts in the thirties to keep incomes in agricultural regions from declining precipitously.) For the regions losing ground, the intervention of the Government on behalf of low-income (newly industrialized) regions may aggravate the problems of adjustment. Without the usual obstacles to trade or movement of capital and labor prevailing in the relations among countries, the losses of some regions and gains of others may be at an uncomfortable rate. The outlets for capital and labor displaced in the losing regions are limited, though the seriousness of the situation may be concealed by large Government outlays and resultant high levels of employment. Under these conditions, mobility improves. Factor movements are large, even when no serious obstacles to trade prevail, whereas among countries with factor movements greatly restricted and hence the gains of trade correspondingly increased, trade restrictions are on an unusual scale.

9. EXPLANATION OF TRENDS IN NEW ENGLAND

For many reasons, New England grows less rapidly than other regions. Among the more important explanations are its early industrialization, its great dependence on textiles and shoes, the two slowest growing of all census industries in the last 50 years, its location in the northeast corner of the Nation and therefore its inability to attract industries which require bulky raw materials and produce products expensive to transport, and finally certain institutional factors and notably those related to politics, Federal policy, etc.

Here are some figures which show the trends in New England:

(*a*) Percentage rise of nonagricultural employment, 1939–53: United States, 63.3; New England, 37.4 (lowest of all 10 regions).

(*b*) Percentage change in nonagricultural employment, 1939–53:

	United States	Northeast	West-North Central	South Atlantic	Pacific
Construction	124	79	102	119	210
Manufacturing	71	35	98	54	140
Government	68	39	32	94	139
Trade	60	32	51	89	75
Service	59	49	48	65	84
Finance	49	51	61	104	79
Transportation and public utilities	46	26	52	53	70
Mining	1.4	−79	29	−1.7	−11

[7] These figures are all based on Regional Trends in the United States, 1953.

Again, New England's gains are less than those of all other regions with few exceptions, other than in finance. But it is especially in the last 10 years that New England's relative losses have been large. Her nonagricultural employment rose only by 4.9 percent as compared with 20.7 percent for the country.[8]

10. TRENDS IN NEW ENGLAND TEXTILES

In textiles the trends are more serious as they are, though not to an equal degree, in leather and shoes. In 1919, New England accounted for 440,000 textile jobs; in 1947, 283,000. There was little change from 1947 to 1951 (net) but by 1954 the total seems to have fallen by about 100,000 additional. Hence the net decline since 1919 is considerably more than 200,000 jobs, or more than one-half of the textile jobs available in 1919. Earlier in the century New England had accounted for about 80 percent of the cotton spindles; her proportion of spindle activity now seems to be less than 10 percent. Total United States employment in textiles seems to have been relatively stable from 1919 to 1951. Again, in the last few years, New England has experienced serious losses in woolens, an industry in which she maintained her relative position almost unchanged from 1919 to 1947. Even in recent years, textile employment accounted for about 10 percent of the employment in New England, and, of course, in terms of the secondary effects of losses of a textile job perhaps 20 percent of all jobs are involved.[9]

Since 1951, the textile industry has suffered substantial losses in the country, though especially in New England. Note in this same period all industrial production rose by about 10 percent and real gross national product by about 12 percent. The table below reveals a significant downward trend from 1951 to 1954. In fact, total textile jobs declined by 268,000, or 20 percent; in New England by 107,000, or 38 percent; and in the South by 41,000, or 7 percent. Generally New England's relative losses are several times those of the South, but in fine goods New England's output fell by 31.5 percent in 3¼ years, while the South gained 10.6 percent.

Percentage change in textile activity, 1951 to 1954, United States, New England, and South

	Change, September 1954 from January 1951			Change, September 1954 from September 1953		
	United States	Northeast	South	United States	Northeast	South
Cotton consumption (per working day in bales)	−22.2	−48.9	−19.0	−7.6	−21.6	−6.5
Spindle activity in cotton fibers (average hours per working day)	−16.1	−47.3	−10.0	−8.0	−25.7	−5.1
Spindle activity in synthetic fibers (average hours per working day)	−5.7	−9.1	−5.9	+13.4	−16.7	+17.5
Production, fine goods (millions of linear yards)	[1] −11.2	[1] −31.5	[1] +10.6	[2] −4.3	[2] −13.3	[2] +2.7
Production, synthetic broad woven fabrics (millions of linear yards)	[1] −25.4	[1] −41.4	-------	[2] −16.4	[2] −10.8	-------
Employment (in 1,000's):						
(a) Cotton and synthetic textile mills (broad woven fibers)	-------	−48.2	[3] −7.7	-------	−26.7	[3] −4.6
(b) Textile mill products	−19.9	−38.2	−7.2	−9.7	−20.3	−3.6

11. TEXTILE LABOR REMAINS UNEMPLOYED

In the most careful study yet made of the mobility of textile workers, Dr. Miernyk, in tracing the subsequent history of employees of 6 mills that shut down in 6 textile towns in New England, found that 45 percent were presently employed, 43 percent were unemployed, and 12 percent had abandoned the labor market. He also found that about one-third of those who obtained jobs moved on to other

[8] All figures are from the BLS Monthly Review, July 1954, pp. 740–743.
[9] Figures from Report of the New England Textile Industry by Committee Appointed by the Conference of New England Governors, 1952, p. 96, and U. S. Census, Facts of Industry.

textile jobs, suggesting that in view of the declining employment in the textile industry they merely squeezed other textile workers out. The employees of closed mills generally found their new job less satisfying than their textile employment, and suffered a deterioration of skills used and a reduction in pay.[10]

Additional Information Submitted by Seymour E. Harris

WAGE AND FRINGE DIFFERENTIAL, NEW ENGLAND AND THE SOUTH

Cotton and Synthetic Textile Mills, January 1954: Total differential, 25.7 cents per hours; wage differential, 16.4 cents; fringe differential, 9.3 cents.

Wage differential

	Average straight time hourly earnings
New England	$1.338
South	1.174
Differential	.164

NOTE.—New England earnings based on report by the U. S. Bureau of Labor Statistics entitled, "Wage Structure, Cotton and Synthetic Textiles, March 1952," and adjusted by wage changes since March 1952.

Southern earnings as reported by BLS in March 1952. No change has taken place in the level of southern wages as noted in a BLS report issued in February 1954 entitled, "Cotton and Synthetic Textiles, Wage Trends, 1950–53." Further substantiation of the fact that no change has taken place is found in comparing average gross hourly earnings as reported monthly by the BLS.

Fringe differential

[Cents]

	New England	South	Differential
Vacation pay	4.86	2.91	1.95
Paid holidays	3.69	.09	3.60
Holiday premium	.21	0	.21
Third shift premium	1.10	.83	.27
Group insurance	3.57	1.00	2.57
Retirement separation pay	.67	0	.67
Total	14.10	4.83	9.27

NOTE.—New England costs taken from a survey of expenditures by mills for these items. Prevalence of these fringes substantiated by BLS Wage Survey of March 1952.

Southern costs computed on basis of prevalence of these practices as shown by BLS Survey (1952) and average straight time hourly earnings in the South.

Statement by Douglas Fraser, Administrative Assistant to the President, UAW–CIO

PROBLEMS OF REGIONAL AND INDUSTRIAL UNEMPLOYMENT

My name is Douglas Fraser. I am an administrative assistant to Mr. Walter Reuther, president of the United Automobile Workers, CIO. May I add that before moving into my present position I worked for 14 years in auto plants in Detroit, holding various official posts in my local union from steward and committeeman to president of the local. I have had opportunities, therefore, of seeing what unemployment means, both through personal experience and many years of helping to deal with the problems of individual workers, as well as concerning myself with the broader problems of national scope with which I have to be familiar in my present position.

You have asked me to discuss problems of regional and industrial unemployment. I should like to tell you something of what widespread unemployment in the automobile industry has meant for the Detroit metropolitan area, which is to a very large extent dependent on that industry. It is, I am afraid, typical of what has happened to many cities in the past two years.

---

[10] W. H. Miernyk, Inter-Industry Labor Mobility: The Case of the Displaced Textile Worker, Boston, Mass., especially ch. II (mimeographed and preliminary).

The wave of layoffs and short workweeks that hit the automobile industry in the second half of 1953 and continued to afflict us through 1954 did not catch us by surprise. As early as March 1953 President Reuther warned in a report to the 14th Constitutional Convention of the UAW-CIO that: "The national economy is now headed for a long-postponed showdown with basic economic realities." He pointed out that full production and full employment could be maintained only if there were a substantial increase in consumer purchasing power to match the increasing productivity of industry and take up the slack resulting from declining expenditures for defense and business investment.

It soon became apparent, moreover, that the jobs and pay checks of workers in the auto industry were threatened not only by the possibility of a general economic decline, but by the reckless, irresponsible production scheduling and labor recruiting policies of the automobile industry itself. On May 11, 1953, Mr. Reuther wrote to the presidents of 14 major automotive corporations with whom our union had agreements, protesting these policies. He said in part:

"The UAW–CIO is deeply disturbed by the prospects that there may be substantial layoffs and widespread hardship in the automobile, truck, and parts industries during the second half of 1953. This threat of widespread layoffs results from the fact that management is planning to produce a disproportionately high percentage of their annual projected 1953 production schedules during the first 6 months of this year."

* * * * * * *

"Efforts on the part of industry to produce in excess of 60 percent of their annual production during the first 6 months is both economically unsound and morally wrong. If management persists in these efforts, it must assume the full responsibility for the unemployment and the hardships that thousands of workers and their families will experience.

"The UAW–CIO feels that management's policy of crowding an abnormally high percentage of the total annual production in the first 6 months of the year is irresponsible and antisocial and will result not only in disrupting the lives and security of individual workers and their families, but it will seriously affect many communities by placing upon them costly burdens resulting from the economic dislocation and unemployment.

"The UAW–CIO has on various occasions questioned the desirability of the hiring policy of many of the companies in the automobile industry who have carried on extensive recruiting programs in the deep South and other nonindustrial areas of our country in an effort to attract workers into the automotive centers in numbers far beyond the reasonable possibilities of maintaining such workers in steady and continuous employment. Such a policy of recruiting workers from other sections of the country is unfair to such workers, it is unfair to the regular workers in your plants, and it is unfair to the communities."

* * * * * * *

"Workers being recruited in the South and in other nonindustrial areas are being asked to uproot themselves from their home communities for a few months of work in the auto plants followed by unemployment of unpredictable duration in strange surroundings. They are being brought into areas where housing facilities are already overtaxed. When their jobs end many will become public charges to be provided for by the citizens of the automotive production centers, who will thus be forced to pay the price for the unrealistic and unsound scheduling of the auto corporations. Recruitment of these inmigrants will intensify later unemployment for those workers who are normally attached to the auto industry.

"The prospect of substantial layoffs is a matter of grave concern to our union and its members. We urge most strongly that you take all steps possible to level out production by your company over the remainder of the year to avoid the consequences that will inevitably flow from present production scheduling.

"I can assure you that the UAW–CIO will be glad to cooperate in any way we can with your company and with the industry as a whole to prevent unemployment and the resulting personal and community hardships later in the year. We will sincerely appreciate and will give the most careful consideration to any suggestions you may have to meet the situation outlined above."

The replies received to this letter indicated that the managements of the automobile corporations either suffered from delusions as to the market prospects of their respective corporations or were totally unconcerned as to the consequences their irresponsible scheduling would have on their workers and the communities in which they live.

Subsequent events proved that Mr. Reuther's warning had been timely and amply justified. Although some companies were able to enlarge their shares of an inadequate market at the expense of others, the industry as a whole failed to maintain the production pace recklessly established in the first part of 1953. In the latter half of the year, and continuing into 1954, automobile employment fell drastically. Employment of production workers in the industry nationally, which had reached a peak of 816,000 in April 1953, had fallen by November 1953 to 686,000. It recovered only slightly in December with the introduction of the new models, then continued its downward plunge to the low point of 466,000 in September 1954, a decline of 43 percent from the peak.

Although the workers brought in from outside, being recent recruits to company payrolls, were among the first to bear the brunt of layoffs, they were not alone affected. The crowding of production into the first half of 1953 meant that in the second half there was insufficient work for the regular employees. Many thousands were laid off and thousands more had their paychecks drastically cut by short workweeks.

The effects in Detroit were most serious. Unemployment in the Detroit metropolitan area increased from 15,000 in April 1953 to 78,000 in September. By January 1954 it had risen still further to 107,000. With great difficulty we succeeded in persuading the Department of Labor in February to classify Detroit a distressed labor area so that it could have a priority rating for defense contracts.

Defense Secretary Wilson, however, indicated that he didn't "know particularly of any such contracts which might be channeled into the city." He had previously expressed the opinion that "Detroit is well able to look after itself." He told the press: "Come spring, and everything is going to be all right in Detroit."

Detroit waited for spring to bring back the robins and the workers' jobs. The robins came, but not the jobs, and both the bird dogs and the kennel dogs got pretty hungry. From 107,000 in January the number of unemployed jumped to 140,000 in February. For a few months it hovered slightly below that figure, then jumped again to 150,000 in July, to 153,000 in August, and, finally, to 195,000 in September. In 19 months unemployment had multiplied itself by 13 times. Even that figure is probably an understatement, because it fails to include the many thousands of older workers, housewives, and others who, finding jobs impossible to get, had given up the search and were thus counted out of the labor market.

The rising tide of unemployment affected every aspect of the community's life. Passenger travel on the Detroit Street Railway, for example, slumped badly. From the beginning of 1952 through the first half of 1953 it had been declining at a rate of about 5 percent per year. From the middle of 1953 through the end of 1954 the decline was speeded up to more than 14 percent per year. In the first half of 1953 the DSR carried an average of 21,750,000 passengers per month. By the last half of 1954 the monthly average had fallen to 17,380,000, a decline of 20 percent.

Retail trade was similarly affected. While department-store sales slumped across the Nation, the decline in Detroit was two or three times as severe. Before the change to this year's models brought a temporary pickup, in the period from January 1 to October 30, 1954, department-store sales in Detroit had fallen 5 percent below the same period of 1953, compared with a 2-percent decline for the same period nationwide. Even this comparison disguises the full extent of the drop, since the latter part of 1953 was already a period of recession in Detroit. Thus, for the period January 1 to May 1, 1954, which compares with the good months of 1953, department-store sales in Detroit were 8 percent below the previous year, as compared with a nationwide decline of only 3 percent.

The same factors which reduced department-store buying, of course, affected the trade of small merchants. The corner grocer, the restaurant owner, the filling-station operator, all felt the pinch when auto assembly lines ground to a halt and tens of thousands of workers found themselves without jobs and without paychecks, or with incomes drastically reduced by short workweeks.

Among those in most direct contact with the distress and misery suffered by unemployed workers were the city's welfare agencies. One method of measuring the impact of unemployment upon those who have had little in resources with which to meet it, or whose resources have been eventually exhausted, is the number of "screening interviews" of relief applicants given by the Department of Public Welfare of the City of Detroit. These figures are substantially larger than those for the number of relief applications issued, since they include those who had to be advised at the screening interview that they were not eligible for assistance. The number of screening interviews does indicate the number of people who were driven by necessity to ask for public assistance, whether or not that assistance was forthcoming.

Although the number of screening interviews began to climb slowly as soon as automobile employment passed its peak in April 1953, the increase was not marked until the fall and winter, when the cumulative effects of increasing layoffs and exhaustion of other resources by workers and their families, including exhaustion of unemployment compensation benefits, began to be felt. From 224 interviews per week in April 1953 the number crept up to 252 per week in July. In August the weekly average jumped to 329, in September to 379, and by December the July figure was more than doubled, with 521 screening interviews per week. In January 1954 the number was 762, in February it was 909, and it fluctuated about this latter figure until August 1954, when it jumped again to 1,025.

For the whole of 1954 the number of such interviews totaled 46,177, compared with 16,761 in 1953.

All the above figures, of course, are for the city of Detroit. They do not include the additional thousands of persons in need in the metropolitan area whose applications were made to agencies in communities outside the city.

Some of the attached photostats of press reports published in January and February of 1954 may give a more graphic picture of the community problems arising out of widespread unemployment. Under the heading "County Relief Cases Offer Added Burden," dated January 19, 1954, we read that the Wayne County Social Welfare Department needed additional clerical help to deal with growing relief rolls. On February 6, 1954, the city welfare department reports "Welfare Relief Pleas Doubled" in comparison with the previous year; and by February 17, 1954: "Welfare Department Adds Night Shift." The report under this heading reads:

"The Detroit Welfare Commission yesterday approved a night shift at its central intake office, 6750 West Fort, beginning next Monday.

"Welfare Superintendent Daniel Ryan said his present staff was unable to keep up with the tremendous increase in welfare applicants."

The welfare agencies well knew what was a large part of the cause of their increased burdens. The Detroit Free Press on February 3, 1954, reporting an interview with Welfare Commissioner Irving Small, stated:

"Small placed blame for the Detroit area's estimated 107,000 unemployed squarely on industry. He said he warned a year ago that industry's national program of worker recruitment would cost Detroit millions of dollars."

The Free Press quoted Mr. Small as saying:

"I hate to say I told you so, but as long as a year ago I said that if Detroit industry didn't stop recruiting workers in every hamlet, village, and crossroad in the country it would get us into trouble. Now it looks like it's going to happen."

Manifestations of irresponsible disregard for the welfare of workers who had been lured into Detroit by these recruiting practices did not cease when the workers were dumped on the streets. Detroit newspapers which have gained a reputation for being faithful echoes of the opinions held by top management in the large auto corporations proposed that the problem of swelling relief rolls be dealt with by new restrictiotns that would deny public assistance to anyone who had not established 3 years of residence in the State. Attached are reproductions of two editorials, both dated February 4, 1954, from the Detroit Free Press and the Detroit News, putting forward this callous and inhuman proposition.

The Free Press editorial, entitled "New Detroiters Ineligible for Dole," minced no words. It called directly for "a bill changing the legal settlement period to 3 years," giving as a reason that:

"It would erect a more substantial barrier for Michigan taxpayers against those who drift from State to State in search of work."

If an unemployed Detroit worker asks for assistance he is called a "kennel dog" and told that he should go and look for work in other communities. But if a worker from one of those other communities is sought out by the auto corporations and persuaded to come to Detroit for a job and is then laid off, he is labeled a "drifter," undeserving of public aid.

The News was less specific in its recommendation, but equally casual in its disregard of the human needs that lie behind unemployment statistics. It said:

"What has happened in the past 12 months, including the recruitment 'excesses,' will continue to happen for as long as the industry remains as vitally and competitively enterprising as it fortunately has been until now. * * *

"The process concededly is and has been rough on the taxpayers. And, of these, let us remember, the auto companies themselves are among the biggest. But there really is no practicable cure for it, barring the palliative of tightening the residence requirements for welfare and thus inducing more of the newcomers to go home. Aside from that, the option is open to any serious objector to sell out and remove to some locality where life is more placid and less exciting than we find it, here in dynamic Detroit."

The auto corporations had made all the profit there was to be made out of the labor of the recruited workers, and then had turned them out as casually as one would toss away an old shoe. When this process was found to be "rough on the taxpayers," who had to support the laid-off workers, the News could suggest no better palliative than denying the workers even public assistance so that the corporations as taxpayers could be excused from having to pay even a small portion of the social cost of their own irresponsibility.

An important cause of the increased burden of the welfare department was the insufficient duration of unemployment compensation benefits. This did not present a serious problem in the early months of the recession, but as the length of layoffs was extended the number of workers whose unemployment compensation benefits became exhausted mounted rapidly. Even in April 1953 there were an average of 172 exhaustions per week in the Detroit area. It remained at about this figure until September, but in October the number jumped to 283 per week, in November to 466, and in December to 750. In February 1954 it passed the 1,000 mark, and by April had reached 1,937. It declined in July and August with the implementation of amendments to the State law extending duration but in August jumped again to 2,419. From there with the gradual introduction of new models, the number again declined, but the preliminary figure for December 1954 was still over 950 per week.

All told, the number of workers exhausting their benefits each week averaged 1,370 in 1954, compared with 255 per week in 1953.

It should be emphasized that these figures tend in part to be cumulative—that is, the workers who exhaust their benefits in 1 week are for the most part still without benefits the next week when they are joined by those who have exhausted their benefits in that second week, and so on, less, of course, any who find employment or whose benefits are resumed as the result of the beginning of a new benefit year. At the very least, an average rate of exhaustions of 1,370 per week during 1954 means that somewhere near 70,000 workers in the Detroit area were unemployed and without unemployment compensation benefits for some period in the course of the year.

Despite the extension of duration of unemployment compensation benefits to 26 weeks by amendments to the State law made last year, it is quite likely that the number of workers exhausting their benefits this year will be as high as last year or higher. Contrary to the recommendations made by President Eisenhower, the State legislators refused to provide uniform duration for all eligible workers and insisted on continuing the practice of relating the individual worker's duration of each year to the length of his employment during the preceding year. This means that workers who suffered extensive unemployment in 1954 will be able to draw fewer benefit checks when laid off in 1955.

Welfare agencies were not the only institutions in the community to feel the effect of growing unemployment. A press report of February 23, 1954, a reproduction of which is attached, was headed "Blame Theft Rise on Job Pinch—Burglaries Up 56 Percent This Year." The news story, based on an interview with Detective Inspector Carl Falk, of the holdup bureau, said:

" 'Burglaries are the work of novice criminals and juveniles in many cases,' Falk said.

"He said most of the increase in burglaries can be attributed to juveniles whose allowances have been cut because of unemployment or to men who are jobless.

" 'The increase has swamped the undermanned police department,' Falk said."

The members of the committee may recall reading an article in the Washington Star of January 17, 1954, headed "Second Best Year for Motor City Will Still Mean Unemployment Distress," and carrying a graphic photograph of crowded workers lining up for unemployment compensation benefits. As the writer pointed out, in spite of the fact that Detroit had just completed its second biggest auto production year in history (and financially, its best year) there were then 107,000 workers unemployed—a figure that was soon to increase substantially. He referred to the heavy unemployment that might be expected later in the year simply because the industry was scheduling 60 percent of its anticipated production for the first half of the year and leaving only 40 percent for the second half, and showed also how with this sort of production scheduling any unexpected dip in sales could result in still more drastic cutbacks in the latter part of the year.

Those warnings are of particular importance again today because the auto industry is again showing every sign of engaging in the same kind of reckless production race as it engaged in during the first half of 1953. The most optimistic forecast from an industry source that we have been able to find is an estimate by the president of General Motors of 5.8 million passenger cars in 1955. Yet in the 1 week ending last Saturday, January 22, the industry produced 163,416 cars, representing an annual rate of 8.5 million. At this rate it would require less than 36 weeks of production to reach the year's goal of 5.8 million. If the production pace is maintained only for 6 months it will mean production for the first half of the year of more than 4.2 million cars, or 72 percent of the year's total, leaving only 1.6 million for the second half. Production would be cut back from 163,000 per week to less than 62,000.

The business press has indicated that one motive behind current abnormal production scheduling is the desire of the corporations to build up inventories of finished cars in order to strengthen their hand in forthcoming negotiations with our union. If this is a factor, it is further testimony to the total irresponsibility of the automobile corporations. In order to achieve an advantage in bargining, they are ready to plunge whole communities into local depressions. Regardless of the reason, continuation of production at current rates in the face of the industry's estimate of the total size of its market can only mean that scores of thousands, perhaps hundreds of thousands, of auto workers will face a long stretch of unemployment in the later months of this year while excessive inventories are worked off. Every businessman, every professional in the auto-production centers who is dependent on workers' paychecks will suffer along with the auto workers and their families.

No matter which corporation wins the auto production race, auto workers are bound to lose. Last year it was Chrysler and the independents that lost, and many thousands of Chrysler, Hudson, and other workers were on the streets for weeks, or only working a few days a month. If, in 1955, Chrysler and the independents regain the ground they lost, it will merely mean cutbacks at Ford and General Motors, with resulting unemployment for their workers.

As long as the corporations devote their energies to a fight for larger shares of an inadequate market, instead of pressing for national policies to reestablish an expanding economy in which all companies can grow and prosper, we shall have to anticipate this kind of trouble.

Even under the best of conditions, Detroit faces the threat of serious permanent unemployment unless we reestablish an expanding economy in which the auto industry can grow. The use of automation and other technological improvements has already progressed so far in the direction of increasing productivity that output of 642,000 cars was achieved in December 1954 without providing jobs for some 85,000 Detroit workers who were still unemployed. Only a rapidly increasing market, based on expanded purchasing power, can make up the gap and match the increases in productivity that are still to come so that auto workers again can be assured of regular jobs.

I have outlined the unemployment situation with which we have been faced in the Detroit area, the many problems it has created for workers and their families, and for the community as a whole, and the reason for our fears that at least equally serious difficulties lie ahead of us in 1955. What suggestions do we have to make as to solutions to that problem?

A partial solution will be found by the auto workers themselves in negotiation of a guaranteed employment plan, more commonly known as the guaranteed annual wage. The guaranteed employment plan, by causing layoffs to be reflected in costs directly on the employer's books, will go a long way toward eliminating layoffs that now result from irresponsible production scheduling or from other causes within the direct control of the employer. Managements will find it more profitable to schedule production with a view to minimizing layoffs than to engage in reckless production races that in the long run can only hurt everyone concerned. When layoffs do take place, the maintenance of the purchasing power of laid-off workers will not only protect them and their families against the insecurity and loss of living standards that come with unemployment today, but in an automobile city like Detroit will be of substantial help in preventing the slump in local business that now results when large-scale unemployment strikes.

We in the UAW–CIO, however, have never suggested that the guaranteed employment plan would be an economic cure-all. It has an important contribution to make toward achievement and maintenance of full employment, and not the least important of the effects we hope for from it is that when it has been negotiated we may expect to see some management representatives down here in Washington and at the State capitals pressing you and your colleagues to adopt a good deal of legislation designed to maintain full employment which they have in the past, for the most part, opposed.

In order to achieve full employment and maintain it we must have national policies geared to that purpose. I am filing with this submission copies of a pamphlet issued by the UAW–CIO in which we have outlined in some detail what we think those policies should be. I shall summarize our proposals only briefly here.

We see the root cause of our present economic difficulties in a lack of sufficient purchasing power in the hands of the great majority of American families. We know, from surveys of the Federal Reserve Board and other sources, that they have unmet needs sufficient to absorb vast quantities of the products of industry. All that is required is to make the purchasing power available to them. Additional means of making the best possible use of our actual and potential production are to be found in connection with unmet community needs for more and better homes, health and educational facilities, transportation facilities, etc., and the even greater needs of the hundreds of millions who live on the bare edge of subsistence in other lands.

Our proposals, therefore, fall into three main categories:

First, we suggest direct measures to increase the amount of purchasing power available to these families through such steps as increasing the personal income tax exemption, improved social security and unemployment compensation, increased rather than decreased assistance to small farmers, and a substantial increase in the minimum wage.

Second, we suggest initiation at the Federal level, as well as assistance to action by the States where appropriate, in large-scale programs of housing, expansion and modernization of schools and hospitals, highway construction and improvement, and projects for the conservation and development of our natural resources.

Third, we propose that by a substantial increase in technical and material aid to underdeveloped countries, particularly with a view to assisting them to increase the strength of their own economies, we would not only open up vast new markets for the products of American industry, but would do far more than can be achieved in any other way to strengthen them as allies and bulwarks against the spread either of Communist armies or Communist ideologies.

In conclusion, I should like to make a special plea for two specific measures, one because it is of direct concern to the automobile industry and its workers, and the other because it relates to the most immediate problem facing unemployed workers, that of maintaining themselves and their families until work is available.

Among the factors that limit sales of certain consumers goods are the Federal excise taxes. The present tax on automobiles is 10 percent. Any excise tax is undesirable as a source of revenue because it is a tax on consumption. It tends to restrict consumption and sale of goods and thus to lessen the number of jobs available in the production of those goods. In fact the excise tax traditionally has been regarded as a kind of sumptuary tax, a special tax levied on luxuries or on goods whose consumption it is desired to discourage, in order to persuade us to spend our money on more essential things. As such, the imposition of an excise tax on automobiles is an absurdity in the light of present-day conditions. The automobile today is a necessity. It is a necessity to millions of Americans who would be unable to go about their daily business without it, and it is a necessity to our communities which no longer have public transportation facilities sufficient to replace it. Yet a penalty of 10 percent is placed on every person who purchases a car in order to discourage him from doing so. Elimination of the tax on the understanding that it would be accompanied by a 10 percent reduction in car prices would be of assistance to every automobile buyer and to the thousands of unemployed auto workers in this country. We would, of course, favor similar action with respect to other excises of the same general character as the excise tax on autos.

The second measure which requires the highest possible priority on the legislative agenda is a Federal law equivalent to the Forand-Kennedy bill of last year which would establish Federal minimum standards for State unemployment-compensation laws, particularly with regard to the amount of benefit provided and the duration of that benefit.

The State unemployment-compensation laws came into being originally as a result of action by the Federal Congress. The Federal Government has a continuing responsibility to see to it that they accomplish the purpose for which they were enacted.

We ask for more than lip service to the principle of improvement in unemployment compensation laws; we ask for action. A year ago, the President recommended improvements in the State laws asking particularly that benefit levels be raised so as to assure to the great majority of workers benefits equal to at least half their regular earnings. The members of the President's own party in the State legislatures either ignored his recommendations entirely or twisted them into something less and totally inadequate.

We are struck by the marked contrast between the silence of the administration in the face of inaction on unemployment compensation and the vigor with which it moved to secure the enactment of its tax program. When members of his own party in the State legislatures ignored or rejected the President's unemployment compensation recommendations—which would have benefited millions of low-income families—the President failed to raise a finger; but when passage of his relief-for-the-rich tax program was challenged by members of the opposition party, the President himself took to the national airwaves to secure its enactment.

When it became obvious that those States whose legislatures met last year would refuse to enact the President's unemployment compensation recommendations, neither the President nor the majority of Republicans in either House of Congress saw fit to throw their support behind the Forand-Kennedy bill which would have established minimum standards in line with the President's recommendations.

The President has renewed his recommendations to the States this year. We of the UAW–CIO are again appealing to the State legislatures to make the improvements in their laws called for by the President. We would welcome his vigorous personal support which, if it is to be effective, must be directed particularly toward influencing State legislators of his own party.

But we recognize realistically that reactionary majorities in many State legislatures will resist enactment of the President's recommendations, and that their refusal to improve their laws will be used as an excuse for inaction in other States on the ground that employers within such States would be placed at a competitive disadvantage. I have already referred to the large number of workers in Detroit who were forced to ask for public assistance because they had exhausted their unemployment-compensation benefits. It would be interesting to know how many others were forced to ask for help because the benefits they received were insufficient to maintain their families. Unfortunately I do not have those figures, but I do know that the present scale of benefits is insufficient to maintain any adequate standard of living, and many States pay less than Michigan.

It is highly desirable, on grounds of equity to employers and workers alike, that adequate minimum standards be set by this Congress, to apply in every State in the Nation. I urge your support for this measure as one of extreme urgency at this moment.

[From the Detroit News]

WILSON SAYS CITY NEEDS NO JOB AID—FERGUSON URGES UNITED STATES TO MAKE USE OF STANDBY PLANTS

Detroit today won a top priority rating for defense contracts, but the chances of getting them vanished when Secretary of Defense Wilson, amid protestations from Senator Ferguson, said no contracts are available.

Wilson's statement came from Washington as Governor Williams announced the opening of a Detroit office to help manufacturers seeking defense work.

"I do not know particularly of any such contracts which might be channeled into the city," Wilson said.

This followed a Washington conference between Wilson and Ferguson in which the Senator said he told Wilson that the Defense Department should make an immediate decision regarding idle standby defense plants.

Earlier, Wilson had said he was not worried about Detroit.
"I would say Detroit is well able to look after itself," he commented.
"I would not worry about Detroit.
"A great many people do not properly understand the automobile business.
"The business is never good in winter.
"Come spring and everything is going to be all right in Detroit."

RECALLS "OLD DAYS"

Wilson recalled that he had been in Detroit (as president of General Motors Corp.) for a long time and said he remembered the "old days" when there was unemployment.

"I used to worry about it every January and February," he said.

"People do not understand that when auto production and sales get a little out of balance, there is always an adjustment. It has always been that way."

Governor Williams ordered the opening of the Detroit office to aid manufacturers when he was informed the area had been given the priority rating.

OUR JOBS IN THEIR HAIR

Action of Secretary of Labor Mitchell in designating Detroit as an area of critical unemployment brought dissent from Secretary of Defense Wilson. The former G. M. president said in part: "I would not worry about Detroit. Come spring and everything is going to be all right there." Mitchell's action made Detroit the first major United States city in the critical classification.

ECONOMISTS DOUBT 1954 WILL BE BLEAK

WASHINGTON, February 9.—Several economists told Congress today that the United States public has a lot of money and is ready and willing to spend it.

That fact, they said, should change the business dip into a rise around the middle of the year—although the economy probably will not hit the peaks of 1953.

The economists gave their views to the congressional economic committee at a discussion of the 1954 consumption outlook.

FORD ECONOMIST HEARD

George P. Hitchings, Ford Motor Co. economist, said it appears "the worst of the decline in general business activity has already taken place." He said consumer spending in 1954 probably will be "5 to 10 percent below the abnormally high rate of 1953, but at least as high as 1952."

[Detroit Times, February 6, 1954]

BLAME THEFT RISE ON JOB PINCH

COUNTY RELIEF ROLLS OFFER ADDED BURDEN

Walter J. Dunne, director of the Wayne County Social Welfare Department, today said growing relief rolls may force him to ask for additional clerical help.

Dunne said the number of families requiring supplemental assistance has been edging upward since the Korean truce. Supplemental aid is given families where the breadwinner's wages are not enough to cover living costs.

There are now 995 cases on the rolls, an increase of 246 since August.

WELFARE RELIEF PLEAS DOUBLED

Applications pending with the city welfare relief are more than double the requests at the same time last year, it was announced today by the department of public welfare.

The welfare department said it has 1,162 applications before it today, while the figure stood at 437 in 1953.

However, the total number of welfare cases this year has dropped appreciably below the 1953 total, from 3,568 to 2,406.

CASES RISE, WELFARE PLANS NIGHT HOURS

Because of a flood of applications, the welfare department's central intake office at 6750 West Fort will be open at night beginning next week.

Superintendent Daniel J. Ryan requested permission from the welfare commission to keep the office open because of what he called a stampede of relief applicants.

The office will not be open to new applications. It will serve only persons returning to central intake with completed applications, Ryan said.

WELFARE DEPARTMENT ADDS NIGHT SHIFT

The Detroit Welfare Commission yesterday approved a night shift at its central intake office, 6750 West Fort, beginning next Monday.

Welfare Superintendent Daniel Ryan said his present staff was unable to keep up with the tremendous increase in welfare applicants.

Thirty-two more workers will be hired and six transferred from other departments to handle exclusively on the night shift the important second interviews.

Ryan said original applications for welfare will be accepted only by the regular day shift.

He declared the welfare department now has a caseload of 2,468 and a backlog of 1,324 applications. This compares with 3,500 cases last year at this time and 415 applicants.

For the last 2 weeks applications have averaged 260 a day with 50 percent of them persons who have exhausted their Michigan employment security benefits.

Ryan said new applications will be accepted only from persons who have exhausted these MESC benefits, their bank accounts and savings bonds.

The night shift will operate from 3 : 20 to 11 : 20 p. m.

[From Detroit Free Press]

BURGLARIES UP 56 PERCENT THIS YEAR—EXPERT GIVES RULES TO AVOID ROBBERIES

By Joe Dowdall, Free Press staff writer)

Burglaries have increased 56.5 percent over last year, much of it traceable to the fact that 221,000 persons in the Greater Detroit area are unemployed, police say.

Thirty-one burglaries were reported Monday morning alone, bringing the total for this year to date to 1,801, compared to 1,150 for the same period last year.

In each of the 31 burglaries, the householder violated antiburglar rules, according to Detective Inspector Carl Falk, head of the holdup bureau. He gave this advice for householders to help them protect their property:

1. If you receive mysterious phone calls and there is no answer on the other end of the line, it may be a burglar trying to find whether you're home.

2. Leave at least one light on when you go out at night, preferably where it cannot be seen directly from outside windows, so that it appears someone is home.

3. Leave by the front door, locking the door and side doors and both storm doors. Lock the front door and leave the front screen or storm door open instead.

Burglars are sneak thieves who hate direct contact with their victims and dread the added risk of cutting through or jimmying two doors. At the front door, there is more chance of their being seen.

4. Close the garage door so they cannot tell whether your car is there.

Burglaries are the work of novice criminals and juveniles in many cases, Falk said.

He said most of the increase in burglaries can be attributed to juveniles whose allowances have been cut because of unemployment or to men who are jobless.

The increase has swamped the undermanned police department, Falk said.

Falk had a last warning for householders who plan to leave their homes for any extended period: Cancel milk and paper deliveries. Ask the neighbors to take the mail and leave the house and garage locked.

JOBLESS START RUSH ON WELFARE—WORKER RECRUITING BLAMED FOR SITUATION

(By Dale Nouse, Free Press staff writer)

Detroit unemployment is about to catch up with the welfare department.

Welfare Superintendent Daniel J. Ryan warned the welfare commission Tuesday that the city's jobless are flooding relief offices.

His alarm, reflecting increased applications and emergency relief orders, drew from Commissioner Irving Small an "I told you so" rejoinder.

Small placed blame for the Detroit area's estimated 107,000 unemployed squarely on industry. He said he warned a year ago that industry's national program of worker recruitment would cost Detroit millions of dollars.

Ryan pointed out that the welfare department's caseload of 2,393 is the lowest it has been in 27 years.

"But, from all indications, we've reached the low point," he explained. "The load is about to begin climbing."

Pending applications, generally considered an accurate barometer of the city's economy, now number 1,138, more than 4 times the average of recent years.

Ryan also said about 200 persons a day, more than double the normal number, are applying for assistance. Only about 30 to 35 percent of the relief seekers will be accepted, he added.

Most of the 1,138 pending applications, which represent destitute families who are living on emergency grocery orders issued by the department, will become regular relief cases unless the city's job picture improves suddenly, Ryan said.

In a 10-day survey made at central intake, where all relief applicants are screened, more than half of those who applied were out of work and had exhausted their savings, he said.

Many of the others were wives and mothers whose husbands had deserted them, Ryan explained.

The department, he continued, has shifted 8 experienced welfare workers to the central intake office at 6750 West Fort and has hired 12 additional workers to handle the increased load.

Ryan said unemployment-compensation benefits, which run for 20 weeks, act as a "cushion" for the welfare department.

"But when the compensation ends and the savings are exhausted, we catch it," he said. "We are at that point now."

Small, who calculated that the volume of applications could boost the caseload as much as 1,600 a month, said:

"I hate to say I told you so, but as long as a year ago I said that if Detroit industry didn't stop recruiting workers in every hamlet, village, and crossroad in the country, it would get us into trouble. Now it looks like it's going to happen."

[The Detroit News—Editorial page—Thursday, February 4, 1954]

FEVER AND CHILLS—EMPLOYMENT IN DETROIT

Once again the complaint is heard that local relief rolls are being swelled by the past excesses of the auto industry in worker recruitment.

A member of the welfare commission modestly recalls that he warned of this last year when the industry was combing the country for people willing to come to Detroit and help make cars. The warning went unheeded. The people came, and now, with savings and unemployment insurance exhausted, are finding their way to the welfare offices where their support becomes a burden on the taxpayer.

The auto industry last year was engaged in making more cars than in any previous year, save one. The value of its product was the highest on record and to create this value it needed and hired more people than it ever had hired before. Amid the accompanying acclaim and abounding prosperity, a suggestion that the industry restrict its payrolls was assured of falling on deaf ears. Certainly any single company to which a request might have been addressed would have rejected it as doubtless a dirty trick inspired by its competitors.

Alternate periods of feverish activity and of lull are as old as auto manufacture. What has happened in the past twelve months, including the recruitment excesses, will continue to happen for as long as the industry remains as vitally and competitively enterprising as it fortunately has been until now. It is thanks to such excesses that Detroit has more than the 286,000 population it boasted in

1900. Some of those recruited always go home; others have remained to make this a bigger and on the whole a better and more prosperous metropolis.

The process concededly is and has been rough on the taxpayers. And of these, let us remember, the auto companies themselves are among the biggest. But there really is no practical cure for it, barring the palliative of tightening the residence requirements for welfare and thus inducing more of the newcomers to go home. Aside from that, the option is open to any serious objector to sell out and remove to some locality where life is more placid and less exciting than we find it, here in dynamic Detroit.

[Detroit Free Press, February 4, 1954]

RELIEF OFFICIAL REMINDED NEW DETROITERS INELIGIBLE FOR DOLE

Welfare officials are anticipating an increase in relief rolls as a result of unemployment in Detroit.

Already, applications for public assistance and the granting of emergency relief orders for food are beginning to climb.

This occasioned some boasting on the part of Welfare Commissioner Irving Small.

He was quoted as saying: "I hate to say I told you so, but as long as a year ago I said that if Detroit industry didn't stop recruiting workers in every hamlet, village, and crossroad in the country it would get us into trouble."

Just to keep the record straight, the people of Detroit should know that there is no factual basis for Small's remarks.

The facts are that no person who came to Detroit within the past year is eligible for public assistance here.

Legal settlement laws state that a person must reside in a community a full year and be entirely self-supporting during that period before he is eligible for welfare aid.

If, during the first year, he is forced to seek help from friends or charity organizations, or obtains free medical care, his settlement is said to be broken. He must start all over again to gain legal settlement.

Persons who apply at the Detroit Welfare Department for aid and who are found not to be legally settled here are referred to the Wayne County Welfare Department.

The county agency arranges to send the persno back to the place where he is legally settled . He may refuse to go but, in that case, he is entirely responsible for the support of himself and family and cannot receive any aid from public-assistance agencies.

Legal settlement laws are basic to the public-assistance programs in all States.

The fact that Small apparently overlooked them in his boastful "I told you so" remarks again illustrates his unfamiliarity with his job.

Nevertheless, Michigan's legal settlement laws do need a change from the 1-year residence requirement to 3 years.

This has been urged by Detroit welfare officials and other public-assistance leaders throughout the State.

It would erect a more substantial barrier for Michigan taxpayers against those who drift from State to State in search of work.

By requiring 3 years residence in the State before a person becomes eligible for public assistance, Michigan taxpayers would be more sure that the person being helped intends to live in this State and to resume all the responsibilities of a self-supporting citizen when able to do so.

It is hoped that a bill changing the legal settlement period to 3 years will be introduced and passed at this session of the legislature.

STATEMENT OF ARTHUR G. McDOWELL, DIRECTOR OF CIVIC, EDUCATION, AND GOVERNMENTAL AFFAIRS OF UPHOLSTERS' INTERNATIONAL UNION OF NORTH AMERICA, AMERICAN FEDERATION OF LABOR, AND CHAIRMAN OF SUBCOMMITTEE ON MIGRATION AND SUBSIDIZATION OF INDUSTRY OF A. F. OF L. NATIONAL LEGISLATIVE COMMITTEE

The Economic Report of the President now before the joint committee, on page 56, cites three special causes for persistence of structural or spot cases of sizable unemployment in some places.

Those classes of causes are given as follows:

1. Lasting drop in demand for their wares.
2. An exodus of industry to new localities.
3. A vanishing supply of some material basic to the local economy.

The only recommended Federal Government initiative to meet these situations, which may remain even when the Nation's economy practically reaches full employment, are also three in number but obviously not as equal in weight of impact on the problem as in number.

The report's recommendations are:

1. Strengthening the area development program of the Department of Commerce.
2. Continuing for the time being the policy of special tax amortization benefits for new defense facilities located in surplus labor areas.
3. Placing of Government contracts as far as possible in these areas.

This is light artillery, indeed, for attacking as large and as deeply entrenched a problem as is faced by coal communities of Pennsylvania and West Virginia or the traditional textile areas of New England and Middle Atlantic States. It also carefully avoids any attack on what the left hand of other governmental policies—local, State, and national—is doing to actually accentuate the problem. Nor is anybody of principles consulted as to what may be the guiding lines or limitations of public policy which may be wisely and legitimately effected by legislation and administrative actions within the letter and spirit of that legislation.

Agonizing as has been the consequences to my native State of the lasting drop in the demand for our special anthracite coal and our sharing in the drooping fortunes of bituminous type, I would not have the gall to propose to a committee of the National Legislature measures to fetter the development of competing power and fuel resources, or the indefinite subsidization of a traditional product of declining competitive efficiency. Nevertheless a policy of conservation of what will for generations continue to be a basic national resource and even more basic the human resources of established communities with their homes, schools, churches, and business life is a concern of the Nation and of all sound economic policy. The report is amazingly brief and even silent on this problem. The continuance in Federal tax policy of the extraordinarily generous depletion allowance extended to the prosperous and flourishing petroleum industry is a case in point calling in question the equity and soundness of national policy in dealing with unequally situated natural resource industries.

The exodus of industry to new localities so far as it is a natural searching out of more favorable location in terms of raw materials, abundant or trained labor supply, consumer deficiency area such as was west coast for a long time in my own industry, etc., is one thing and not to interfere with at very least, by Government policy. When, however, as in recent years, it is stimulated by local and State government policies that smack of industrial cannibalism, i. e., new industrial development of old stable agricultural communities at expense of rupture of older industrial communities and on basis of subversion of declared national public policies such as the encouragement of collective bargaining, the denial of classification of labor as a commodity, etc., it is something else again. When such exodus with all the new problems it creates is actually subsidized by Federal tax policy such as the extension of tax exempt privilege of local municipal purpose bonds to subsidize the practice of Mississippi villages of seduction of northern city factories by offers of virtually free factories, it is time that the Federal Government's right hand should apprise itself of what its left hand is doing. It was once the conviction of every village in the Midwest that it was entitled to a railroad in defiance of all economists and engineers and the fact that it is farther by rail than by any of Daniel Boone's paths from St. Louis to Kansas City, is testimony to the power of that conviction. Many a county and town bankrupted itself in the railroad era as probably will many municipalities in the modern Mississippi bubble empire of municipal industrial purpose bond issues, but there is no reason for Federal taxation and labor policies to be accessories to the crime. The nonsense of a Federal labor law that proclaims its aim as the furthering of collective bargaining and then carries a clause to encourage and abet the States still preponderantly agricultural, to enact laws to drastically weaken all collective-bargaining agencies, is obvious. It is futile to preach sermons to the States apropos the desirability of sustaining the national level of consumer income by adopting uniform high standards of unemployment-compensation laws, when there is no use of the Federal power which alone brought those laws into nationwide enactment by the respective State legislatures. Competition between sections, as well as industries and services and particular enterprises, is a great and healthful force, worth the unequal development of particular localities but there is no health in new legislation or old which encourages competition between State legislatures in creation of low-wage areas, special and peculiar labor systems based on artificially and unequally weakened collective bargaining, cheap undeveloped unemployment and workmen's compensation and factory laws, etc. The correction of bad legislation of past, may be as or more pertinent to problem in hand, than new measures.

The third cause of regional and industrial unemployment given in the report as vanishing supply of some material basic to the local economy is in category of first, in influence of broad economic developments, seldom caused by legislation or its absence and not easily subject to legislative attack. Nevertheless, while the exhaustion of the Minnesota iron range cannot be legislated against, the research and aid in developing the possibilities of secondary ores should be as legitimate a field of governmental action as subsidization of new river channels for floating in ores from new foreign fields. While the southern movement of wood furniture from Michigan was logical as lumber supply was exhausted, an earlier conservation and replanting policy of Federal Government would have been a good investment for the whole country including the South, some sections of which are now repeating Michigan history.

It is regrettable and disturbing that the report which would have the Department of Commerce agency strengthened did not correlate the measures with which the Labor Department is concerned such as increase of rate and coverage of national minimum wage, effective use of Walsh-Healey Public Contracts Act, raising and making uniform of State unemployment compensation, and Workmen's Compensation Act, labor relations legislation, etc. These measures which taken together and constantly improved tend to equalize competitive conditions between sections, have great bearing on problem we are considering today.

Certain principles probably would get general assent, with a sharp divergence in the specific only where interest or special local problem is bringing extraordinary pressure to distort judgment.

First, most of us today concur with idea that activity of Government should direct itself to create conditions favorable to general prosperity and continuous development. Government should not prescribe the content of that prosperity or the expanding standard of living that is aimed at. Consumer choice and private initiative should determine development save in an overriding consideration such as national defense.

Government policy should, with some defense exception, not be utilized for economic favor of one section at expense of another or in a discriminatory fashion which it should be noted is not less discriminatory for being achieved by applying same arbitrary rule or permission to very unequal sections.

At same time a special sectional practice which does not meet general national approval as a public policy is not entitled to subsidization or special legal sheltering of its weaknesses. For a remote example, chattel slavery which tied up its capital in its labor supply and fettered its own agricultural as well as commercial and industrial development by attachment to a backward labor institution did not have a sound basis for asking for Federal public works which other sections provided themselves with by other means.

Finally, however, a section of the country or our people in modern times who, due to circumstances beyond their control, face a crushing burden of need for reorganization of their economic life or have their obvious economic opportunity for advance blocked by natural or social economic obstacles such as once obstructed the development of our Tennessee Valley, which obstacles can be removed by means easily available to National Government, such sections have a legitimate special call on a National Legislature. The interdependence of national and even international prosperity in modern times is commonplace.

(Whereupon, at 1:20 p. m., the committee adjourned until Friday, January 28, 1955, at 10 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

FRIDAY, JANUARY 28, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Senator Sparkman, Vice Chairman Patman, and Representatives Bolling, Mills, Kelley, Wolcott, Talle, and Curtis.

The CHAIRMAN. Our session this morning is on fiscal policies. We invited the Secretary of the Treasury, Mr. Humphrey, and the Director of the Budget, Mr. Hughes, to come or to send a representative. I have received letters from them declining the invitation to appear. The reason ascribed is that they cannot participate in a panel which could include persons not directly connected with the congressional committee itself.

Representative CURTIS. Mr. Chairman, is it your intention to put their letters in the record?

The CHAIRMAN. If you wish to have the letters put in the record——

Vice Chairman PATMAN. Let us evaluate that just a moment, Mr. Chairman. Does that mean he is declining the invitation because people other than Members of Congress could interrogate him?

The CHAIRMAN. Well, the reason stated is—I will read first from Secretary Humphrey's letter:

> However, I feel that we cannot accept your invitation to participate in a panel discussion which would include persons not directly connected with the committee itself.

And the identical sentence is used by Mr. Hughes.

Vice Chairman PATMAN. Well, we can correct that. In fact, I think there is something to what they say, and we can correct that.

The CHAIRMAN. I would like to point out that last year, in hearings in the panels which we held, each department, with the exception of the Treasury, I think, did send a representative to the roundtables. The Department of Commerce sent Mr. Meehan, the Department of Labor sent Mrs. Wickens. Mr. Manville, of the Census, which is under Commerce; Mr. Wells, Agricultural Marketing Service, under Agriculture; Mr. Vernon, Department of State; Mr. Riefler, assistant to the Chairman, Federal Reserve Board, testified. So that last year, with the exception of the Treasury, I think the departments sent representatives to the roundtables.

Vice Chairman PATMAN. Now, this involves a policy I think we might settle sometime, Senator. I think we should concede their point. I think their point is well taken from their viewpoint, and I think we should state that they will only be questioned by Members of Congress.

I would not want a substitute. If they cannot come, I would just excuse them.

The CHAIRMAN. Of course, I said, if they sent a substitute, subordinates would not be questioned on policy.

Vice Chairman PATMAN. Well, I would not have a substitute. There is no use taking their time on that. But I think that you should urge them to accept the invitation with the understanding that only Members of Congress, members of his committee, will question them.

The CHAIRMAN. I wonder if this is not a matter that we can take up in executive session?

Vice Chairman PATMAN. Is it your wish that these letters be made a part of the record?

Representative CURTIS. I think they should, rather than just an interpretation of what they say, and, Mr. Chairman, might I say this: That was one reason I was anxious for us to get that point ironed out ahead of time, and, as I stated before, I had thought that Senator Watkins and you had reached an agreement.

In my discussion with you informally yesterday it became obvious that there was not agreement on that point as to whether or not the panel itself should interrogate these witnesses. It is a serious problem. I do not know for certain what is right on it, but I do believe the committee should reach some conclusions.

The CHAIRMAN. Without objection, these letters will be made a part of the record at this point.

(The letters from the Secretary of the Treasury and the Director of the Bureau of the Budget are as follows:)

THE SECRETARY OF THE TREASURY,
Washington, January 26, 1955.

Hon. PAUL H. DOUGLAS,
Chairman, Joint Committee on the Economic Report,
Washington, D. C.

DEAR SENATOR DOUGLAS: The original of a letter, dated Wednesday, January 19, never did reach the Treasury, but I do have a copy of the letter which arrived early this week.

Representatives of the Treasury, including myself, are, of course, available to testify before congressional committees upon matters within our jurisdiction whenever the committees concerned desire. However, I feel that we cannot accept your invitation to participate in a panel discussion which would include persons not directly connected with the committee itself. We will always attempt to accommodate ourselves to your convenience and supply all the information which we can possibly provide.

Best personal regards.

Sincerely,

G. M. HUMPHREY.

EXECUTIVE OFFICE OF THE PRESIDENT,
BUREAU OF THE BUDGET,
Washington, D. C., January 26, 1955.

Hon. PAUL H. DOUGLAS,
Chairman, Joint Committee on the Economic Report,
United States Senate, Washington, D. C.

MY DEAR MR CHAIRMAN: Thank you for your letter of January 18, 1955, in which you invite me or a representative of the Bureau of the Budget to participate in a panel discussion on fiscal policy on Friday, January 28, 1955. I regret that I must decline your invitation.

Whenever any congressional committee desires a representative of the Bureau of the Budget, including myself, to testify about any matter on which we can properly supply information I shall be happy to arrange for such appearance before the committee for that purpose. However, I feel that we cannot accept your invitation to participate in a panel discussion which includes persons not connected with the committee itself.

As in the past, the Bureau of the Budget will gladly supply the joint committee and its staff with all the information we can provide.

Sincerely yours,

ROWLAND HUGHES, *Director.*

The CHAIRMAN. The subject this morning is Fiscal Policy. We have addressed a series of questions to members of the panel.

In the main, we look forward to a discussion of what our fiscal policy in 1955 should be.

The first question is whether we should balance the budget, whether we should allow expenses to exceed income. If so, why, and the consequences.

I assume we are speaking of the year 1955–56, that is the one on which we are determining policy. (See correspondence, p. 1146 for budget estimates, fiscal year 1955.)

I would suggest that we go to subsequent questions later.

Mr. Buehler.

OPENING STATEMENT OF ALFRED G. BUEHLER, PROFESSOR OF PUBLIC FINANCE, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA

Mr. BUEHLER. Mr. Chairman, gentlemen, members of the committee, I would like to make the assumption at the outset, that we have, in general, weathered the readjustment, or recession, of 1954 and that we are now apparently on the road to recovery. The appropriate fiscal policy for the fiscal year 1956, as I see it, would be one calling for balancing the cash payments and cash receipts. In this manner, the impact of the budget upon the economy would be approximately neutral.

The CHAIRMAN. You advocate balancing the cash budget?

Mr. BUEHLER. That is right.

The CHAIRMAN. When that idea was advanced in the 1930's it met with great objection from some of the people who are now suggesting it.

Senator SPARKMAN. Mr. Chairman, may I amend that, and say also during the forties.

The CHAIRMAN. I am interested in seeing the revival of interest in this idea that it is the cash budget and not the administrative budget that is important. A few days ago we were talking about the cash budget, and not the administrative budget.

Do you have any idea why there has been this change of sentiment, that the cash budget, which was something that was abhorred, is now something that is set up as the test of fiscal solvency?

Mr. BUEHLER. Actually, of course, both budgets are important—both the so-called administrative budget and the cash payment and receipts budget.

I think, Senator, that during and after the war the cash payments and receipts analysis came into some vogue, because of the interest of economists in inflation, and it was felt that the immediate impact of the budget on the economy could better be measured by referring to the cash receipts from the public and the cash going out to the public.

The CHAIRMAN. Is it not true that from the years 1946–51, if you take the cash basis, that the total budgets were more than balanced, and the total cash collections and total receipts by the Government appreciably exceeded expenditures by the Government? Isn't that true?

Mr. BUEHLER. Yes, Senator, if you mean the fiscal years ending in 1947 through 1949. In the fiscal year ending in 1950 there was a cash deficit.

The CHAIRMAN. So if that is the test applied for a deficit, there were no deficits during that period?

Mr. BUEHLER. Well, of course, actually, as we know, the administrative budget is also important.

The CHAIRMAN. Oh, certainly.

Mr. BUEHLER. It gives us a clue as to what is coming—for example, to accrued obligations. For the long-range point of view, we need the administrative budget.

The CHAIRMAN. The administrative budget is the most important part of the cash budget, but it is not the entire story because of social-security payments.

Mr. BUEHLER. That is right.

The CHAIRMAN. So what you say is that for the year 1955–56 the cash budget, in your judgment, should be balanced because you believe it will be recovered?

Mr. BUEHLER. Yes.

The CHAIRMAN. Do you think the budget submitted by the administration on a cash basis will be balanced?

Mr. BUEHLER. Well, I have not had an opportunity to study thoroughly the budget as reported; I believe it has a cash surplus of $600 million.

The CHAIRMAN. The deficit, as predicted, is $4½ billion. For 1955–56 it estimates a deficit of $2.4 billion, and social-security payments you estimate as in excess of $3 billion, so there is a surplus.

(Mr. Buehler's prepared statement appears at p. 387.)

The CHAIRMAN. Mr. Elder.

STATEMENT OF ARTHUR ELDER, TAX CONSULTANT, AMERICAN FEDERATION OF LABOR

Mr. ELDER Mr. Chairman, and members of the committee, I will confine myself to 1 or 2 points that are of particular interest to the American Federation of Labor for 2 reasons:

First, I believe there are questions that have been outlined here by Senator Douglas that are of more particular immediate, and perhaps even long-term interest, to our members and others, and also because I feel that there are people who will speak here this morning who are more competent to discuss some of these other points than I am.

At the outset, I would like to say that the $2.4 billion deficit for fiscal 1956 we know is predicated on the ability of the Department of Defense to cut requested authorization for $35.75 billion in spending to $34 billion. Should these savings not materialize the deficit may be as high as $4.15 billion. Neither figure takes into account the additional obligations the Federal Government may assume in connection with the continuance of existing programs or possible initiation of new programs that may be financed outside of the conventional budget.

I assume we will discuss that later on.

In addition to the anticipated deficit for 1956, a deficit of $4.5 billion is expected for the current fiscal year. These deficits raise serious questions as to the wisdom of Congress in having made tax reductions of the nature and in the amount authorized last year.

Because the economy has made only a limited recovery from the 1954 recession in our belief a moderate Federal deficit at this time is not alarming. However, to the extent any portion of the $7.4 billion in tax reductions made last year were premature or ill advised, they contributed to bringing about unnecessary deficits.

Another somewhat disturbing aspect of present fiscal policy is the increasing emphasis that is being placed on State and local governmental assumption of financial responsibility for the support of existing or contemplated services. State and local governments which have become increasingly dependent on regressive forms of taxation have increased their indebtedness by 85 percent during the past 5 years—$20.9 billion in 1949 to $39.9 billion in 1954.

The variations in taxpaying ability among the States are obvious—per capita income, $834 in Mississippi, $939 in Arkansas, $2,304 in Delaware, and $2,194 in Connecticut. There is an equally widespread in the proportion of income being paid by States in local and State taxes, less than 6 percent in Ohio, more than 11 percent in North Dakota. Federal fiscal policies, in our opinion, should be directed at minimizing the excessive drain on resources in those States where taxes are excessively high in proportion to income, yet are inadequate to provide necessary local and State services.

The CHAIRMAN. Thank you very much, Mr. Elder.

Since the remainder of your paper deals with these other questions, I think perhaps we will stop there.

Vice Chairman PATMAN. Mr. Chairman, may I present a personal statement about something which I think is timely because of the announcement in the paper yesterday.

The offer of the 40-year 3-percent bonds should be withdrawn by the Treasury.

This offer is intended to set the future borrowing rate at one-half percent higher than the rate at which the last financing was financed. This will result in a needless cost of billions upon billions of dollars in extra interest charges. The 40-year 3-percent bond interest represents the culmination of a second attempt to establish a long-term interest rate that cannot be sustained by the basic conditions underlying the American economy.

The long-term trend in interest rates is closer to the 2½-percent rate than it is to the 4-percent rate of the 1920's that Secretary Humphrey and Mr. Burgess are trying to restore.

This second effort threatens to undermine the economic stability of the country in precisely the same fashion that the first abortive effort did in 1953.

This bond issue will force up the cost of all public and private borrowing. It will further depress the farm parity ratio as the farmers' interest costs rise in the face of a continuing drop in farm prices.

This issue represents a deliberate effort to permanently freeze the one-half percent increase in interest rates arbitrarily imposed on veterans' home mortgages by the Secretary of the Treasury in May 1953, 4 days before the Federal Reserve moved to loosen the credit supply.

In the 2 years since the hard-money crusade began the interest share of personal income has risen 11 percent. The wage and salary share is lower today that it was in 1952 and 1953. The farm and business proprietor shares are at their postwar lows.

It is time to call a halt to the campaign for the enrichment of the lenders.

Thank you, Mr. Chairman.

Representative CURTIS. Mr. Chairman, just a minute.

Mr. Patman, was that your statement?

Vice Chairman PATMAN. My personal statement, yes.

Representative CURTIS. Mr. Chairman, I would just like to suggest at this point that this committee is supposed to be, as I understand it, a study group, and I hope that we won't have political remarks read by any of the members, myself included, in conducting our studies. I do not think that is the purpose, and I think it interferes with the orderly procedure of the committee, and I would suggest that the remarks be withdrawn from the record of this committee.

The CHAIRMAN. Do you so move?

Representative CURTIS. No, I am suggesting, first.

Vice Chairman PATMAN. I want to be heard on that, Mr. Chairman.

I think I am about the least political—I should not say that—but I try to be as nonpartisan as possible. Certainly I have worked in a bipartisan climate and atmosphere, and tried to create one.

Representative CURTIS. Will the gentleman yield for clarification?

Vice Chairman PATMAN. Yes.

Representative CURTIS. My point was not as far as the statement itself was concerned. On the floor of the House, or somewhere else, I think it is highly proper, and I was not going to the merits of it. I was simply raising the propriety of that kind of statement being injected into the record of this committee which is attempting to make studies.

Vice Chairman PATMAN. Well, we never would get anything done if you wanted to say that you should not say anything——

Representative CURTIS. If this were in the nature of a question, sir, directed to the panel it would have propriety, but I could see how this would get completely out of bounds if I were to take on that public statement of yours to challenge its accuracy.

Vice Chairman PATMAN. I wish you would. If it is not accurate, I hope you challenge it.

Representative CURTIS. I would, sir, on the floor of the House, where I think is the proper place, but I do believe that it interferes with what our committee is trying to do.

Vice Chairman PATMAN. I will look forward with pleasure to your doing that.

Representative CURTIS. Well, I do not think it will further the efforts of this committee, as I see this.

Vice Chairman PATMAN. I could have embodied this in a question.

Representative CURTIS. Had you done so I think it would have been in much better form.

Vice Chairman PATMAN. Well, I disagree with the gentleman, and I know something about the practices of this committee in the past.

Representative CURTIS. Without any rules, that is what I have already found out, that everything has been found apparently without any rules or procedure or anything.

Vice Chairman PATMAN. We have never had any trouble.

Representative CURTIS. As long as I am a member of this committee I am going to do my best to see that it does follow orderly procedure, and to see that there is some semblance of order.

The CHAIRMAN. Mr. Galbraith.

Representative CURTIS. Mr. Chairman, I made a suggestion that that be withdrawn from the record.

Now, Mr. Patman does not want to do that.

Vice Chairman PATMAN. Well, let us see if the panel disagrees with the statement.

Representative CURTIS. Well, if you want to proceed in that fashion, if you are going to ask the question, that is one thing, but if it is just a statement for the newspapers, that is another.

Vice Chairman PATMAN. I would like to ask the panel if the panel disagrees with that statement.

The CHAIRMAN. Does anybody want to volunteer?

Mr. GALBRAITH. Mr. Chairman, I agree essentially with Mr. Patman's statement. I think the effort to extend the period of the bonds, and the increased interest rate that is involved are unwise.

Mr. LUTZ. Mr. Chairman, I would disagree with the statement.

Mr. VICKREY. I propose to disagree with the statement. I will disagree in my turn.

The CHAIRMAN. Does anybody else wish to volunteer any information?

Senator SPARKMAN. I wonder, Mr. Chairman, since we are submitting this to the panel, if I could ask this question: Do the members of the panel now, regardless of what your attitude may have been back when the 3¼ percent issue was put out, do you now believe it was a mistake to put out that issue?

Mr. GALBRAITH. Mr. Chairman, I think I was misunderstood. I said I essentially agree with Mr. Patman's statement.

Senator SPARKMAN. I understood that. Then I was asking about the 3¼ percent issue that was put out. I am asking with the advantage of hindsight—I am not asking what your viewpoint was at that time, but now looking back, do you think an error was made in the issuance of those bonds?

Mr. LUTZ. May I ask, Senator, are you referring now merely to the 3¼ percent rate?

Senator SPARKMAN. The bond issue put out at the 3¼ percent rate which precipitated that whole thing.

Mr. LUTZ. Is your question directed to the 3¼ percent rate, or the length of maturity of the bond?

Senator SPARKMAN. I would combine. I say the bond issue as it was put out.

Mr. LUTZ. Well, it seems to me——

Senator SPARKMAN. Of course, I think the rate would be primarily the thing, but the term naturally would be a factor.

Mr. LUTZ. The rate would be a function of the term of the bond.

Senator SPARKMAN. Yes, I realize that.

Mr. LUTZ. As I recall the trend of yield on long-term issues, at that time they had no issue quite as long as the proposed 3¼ maturity.

Senator SPARKMAN. Nor a rate that high.

Mr. LUTZ. The rate was moving up to and actually attained about $3\frac{1}{4}$ in the months before the bonds were put out. If the only guide that the Treasury has is the present attitude of the market, then it seems to me if they have proposed a long-term issue they could hardly have made any other decision with respect to the interest rate offered on that particular issue.

Senator SPARKMAN. Now, you speak of the trend, and it is true that the trend was up, but wasn't that influenced very largely by the feeling that was freely advertised all over the country to the effect that the Government was going to increase interest rates?

Mr. LUTZ. I could not answer that.

Senator SPARKMAN. And is it not true that the yield itself never exceeded 3 percent until this issue was put out? The interest rate did not actually climb to $3\frac{1}{4}$ but was probably around 3 percent, even with that emphasis.

Mr. LUTZ. It is my recollection that in April it was 3.16 and in May it rose to 3.24 or 3.25.

I am speaking now from memory.

Senator SPARKMAN. Of course, this was announced, as I recall, about the first of April.

Mr. LUTZ. I cannot say.

Senator SPARKMAN. I believe it was. It was issued May 1.

I am reminded by a staff member it was proposed in March.

Representative CURTIS. Would the gentleman yield?

Senator SPARKMAN. And the $3\frac{1}{4}$ rate was not reached until in April; is that right?

Mr. LUTZ. Yes, it was just under 3 percent back in March and April.

Senator SPARKMAN. On a similar panel we discussed this last year. I remember Dr. Nourse stating his position, that he felt it was too much too fast. I believe that is what he said.

Representative CURTIS. Will the gentleman yield a minute for a question of procedure?

Mr. Chairman, I would like to point out that we have a series of questions that were prepared for this panel. I think that is what we should be on, and I understand that Monday we take up this question on monetary matters, and that was really the reason, Mr. Patman, that I raised the question of bringing in these extraneous things at that time.

I am interested in your question, too, but I would like to suggest that we proceed in order on the questions prepared for the panel.

Senator SPARKMAN. Mr. Chairman, let me say that I fully agree with Congressman Curtis in that statement. However, I thought we were discussing fiscal matters now. I thought that was this question before us.

Representative CURTIS. I think it says monetary policies.

Senator SPARKMAN. If you will notice, it says our fiscal policy for 1955. That is the question we are on now.

Representative CURTIS. Yes, sir; but if the Senator will read the questions that have been prepared to ask the panel you will see that we have some specific things to go over, and I think it includes other matters.

The CHAIRMAN. These questions are suggestions. They are not definite rules of the committee.

Senator SPARKMAN. Well, I am perfectly willing for it to go over, but I do think it is a subject that ought to be discussed, because I may say that I think that 3¼ issue probably gave us more real troubles during the last 2 years than any other single thing in fiscal affairs of the Government.

Mr. Bolling.

Representative BOLLING. Mr. Chairman, speaking of the matter of procedure, it is not my understanding that the panel or the committee are limited to the discussion of only four questions or whatever the questions are. We are discussing a general area.

The CHAIRMAN. That is right. These questions were thrown out for the purpose of aid.

Mr. Galbraith, do you want to discuss question I now?

Representative KELLEY. Mr. Chairman.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Let me get this clear. Is there objection raised to a statement coming from a Member of Congress in regard to the subject matter? Can the Members of Congress not express an opinion? Is that the objection?

If that is true, then I suggest we might fold up our papers and go home.

Representative CURTIS. No, sir; I would be very glad to speak to that. My objection was to the timeliness of whether or not it was within the purpose of this committee to bring in matters at that time. I was suggesting if that was a statement, the proper place for it was the floor of the House; if it was a question propounded to this panel, I was suggesting that this panel had been set up with a view toward discussing certain questions, and then we have the questions that would fit along the line that the Congressman was speaking. Naturally, any Congressman can say what he pleases, but I am very much concerned that this committee keep its eye on what appears, to me at any rate, to be its object, which is to study the economic report and break it down, as has been broken down in these panel discussions, and take it up as we have been doing in an orderly manner.

Representative KELLEY. I had the impression that what Mr. Sparkman said was related to the subject matter today.

Representative CURTIS. That, of course, is a question of opinion and I was suggesting that the way to determine it would be to look at the suggested questions to this panel and then look at the suggested questions for Monday.

Senator SPARKMAN. I am very glad to waive my questions until Monday.

The CHAIRMAN. You are not moving to strike from the record?

Representative CURTIS. No, sir; not as long as he asked it in the form of a formal question to this panel; no, sir.

The CHAIRMAN. Mr. Galbraith.

OPENING STATEMENT OF JOHN K. GALBRAITH, PROFESSOR OF ECONOMICS, HARVARD UNIVERSITY

Mr. GALBRAITH. Mr. Chairman, question 1 asked briefly about our fiscal policy for this coming year. This requires an assumption as to what the economy will be like during the coming year, and without going into detail on matters the committee has always covered, let me express my own view very quickly.

There is much that is admirable in the report of the council this year. I think it has shown considerable grace and ease in getting away from the cliches of a balanced budget and the unspeakable evils of deficit financing. Indeed the administration as a whole has shown a remarkable flexibility of mind in the speed with which it has moved away from these slogans.

I am reminded, Mr. Chairman, that the late Lord Keynes said in 1935, in a letter to George Bernard Shaw, that he was engaged in witing a book which he thought, in 10 years, would revolutionize thinking on economics. That was in 1935, 20 years back. I think, however, if he had been pressed he might have allowed himself an extra 10 years to capture a Republican administration.

I hope, Mr. Curtis, you understand that I am being purely scientific in this. There is no partisanship involved.

Representative CURTIS. The panel can say anything they want.

Mr. GALBRAITH. Much of this year's report, as I say, is admirable. It does, it seems to me, reach two conclusions that are worth examining. It concludes that the economic policy of the Government has been conducted during the last 2 years with impeccable wisdom and insight, and that no mistake of any sort has been made. I do not know that that is so important for our consideration here. I do think we should ask ourselves sometime who it is that is fooled by this kind of ritualistic claim. I do not think either Democrats or Republicans should suppose that on economic matters they are really quite that wise. We should allow ourselves a little more room for error. However, what is much more serious, the report concludes that everything in this coming year will be perfect, that we shall have full employment, no inflation, and that there will be no tendency for the kind of high-level stagnation of this past year to continue. This should worry us, because I think if the committee were looking for bad news it could find some.

We have a business administration which prides itself on being hardheaded. My secretary wrote "hardhearted", but I want it clearly understood that the word was "hardheaded", and it seems to me that the essence of the realism of a hardheaded administration is to look things in the face. It should emphasize the bad news rather than the good and always be prepared for the worst. We can properly wonder whether that has been done in this report.

I, myself, would place much more emphasis than the report does on the fact that private investment is still declining and that the farm picture is still not good, and that we might be in something like an inventory cycle in housing, and that part of the upswing in the past year was undoubtedly the result of the special situation in the automobile industry. Now if these things are important, Mr. Chairman, it seems to me that our fiscal policy should reflect them. Our fiscal policy should reflect the bad news rather than the good news. On this assumption I should like to make 2 or 3 suggestions on that policy.

My first suggestion would be that we don't pare expenditures for purely fiscal reasons. We should pare them as required for reasons of efficiency. We should not spend money unnecessarily. But on purely fiscal grounds, we should not be kept from making up the very important backlog of work that needs to be done in this country.

There are things, as we all know, of great urgency that need to be done. These include roads, education, health—I am rather sorry that I mentioned roads first because they are not the most urgent—housing, area redevelopment program, resource development, and so forth. Then on purely fiscal grounds——

Senator SPARKMAN. May I interrupt there? I did not get your purpose for saying you were sorry that you mentioned roads first.

Mr. GALBRAITH. Well, I must say, Senator Sparkman, that some things here disturb me and I will mention them in response to a later question. I hope the Congress will look very carefully at the new road program and at the proposal to tie it to its own source of financing. This device would give roads a preference over other needed services of the Federal Government. Important as roads are there is danger that they will somehow achieve a magic priority over other things of equal or greater importance. That is the only reason that I said that.

Senator SPARKMAN. Now I will just throw out this thought, since I probably shall not be here when you take the other question. The Senate meets at 11 and I want to go over.

I hope that when the roads program is discussed, some thought will be given to what I think is a real weakness in the proposed roads program, particularly for the smaller States or those States that will have a relatively small mileage on the interstate system.

My State, for instance, will not be as well off under the new program as it is now, and it cannot even match the funds that the Federal Government provides now, so how is the new program going to be helpful to a State like mine?

Representative TALLE. Mr. Chairman.

The CHAIRMAN. Mr. Talle.

Representative TALLE. Perhaps Dr. Galbraith will be good enough to include in that list of important things the item of flood control.

The CHAIRMAN. On the upper Mississippi.

Representative TALLE. Thank you for helping me.

Representative CURTIS. Well, St. Louis.

Mr. GALBRAITH. Mr. Chairman, I am not advocating a frantic spending program. It does seem to me that the useful things this year should not be cut on purely fiscal grounds.

On the tax side, I would urge that the Congress keep an open mind for the time being. If things are as good as the administration expects—if the rule works out that has been so much practiced in the past year, namely, that the future will be not what we make it, but what we say it will be—then I would be against any tax cut. I would support the President in continuing the corporate rate, high though it is, and in continuing the excises. If it should develop, come April or May, or even as late as June that we still have substantial unemployment, three or four millions unemployed, then I would urge a tax cut. However, I would not urge a cut in the corporation rate or even in excises.

The stock market has been very strong and I think it would be unstabilizing to cut corporate rates at this time. This is something that should be done later at a more propitious time. It is evident that an increase in corporate earnings is not urgent at the moment. A tax cut this spring would be for the purpose of stimulating expenditures or adding to purchasing power in the economy. This means that the cut should be in the personal income tax, and I myself would urge that it be accomplished by lifting the exemptions.

I hesitate to make these suggestions in the presence of people who are much more expert than I am. I hope that Congressman Mills, for example, understands that these are not the suggestions of a profound tax expert.

Mr. Chairman, my other comments have to do with the specific questions that were asked, and I assume that you want to come back to those later.

The CHAIRMAN. That is right.

(Mr. Galbraith's prepared statement appears at p. 389.)

The CHAIRMAN. Mr. Groves.

OPENING STATEMENT OF HAROLD M. GROVES, PROFESSOR OF ECONOMICS, UNIVERSITY OF WISCONSIN

Mr. GROVES. Senator Douglas, members of the committee, I will confine my remarks to about three specific points. In general, I agree quite well with the statement that was just made, with one exception, that I shall come to.

I have outlined here some six alternative possibilities (and there are more) with regard to the matter of budget balance. I have selected the last of these for endorsement. This may be described as calling for a somewhat higher level of expenditures, and of taxes. The tax adjustment would not take the form of higher rates, but of tightening the tax structure, particularly at points commonly called loopholes.

Secondly, with regard to tax reduction in general, I am somewhat skeptical of the recession-curing quality and character of tax reduction. Of and by itself, I have no doubt that it is effective, but the trouble with tax reduction is that it carries with it a constant urge to also cut expenditures.

I suppose there is engraved in the subconscious of all of us a notion that an unbalanced budget is sinful, even though we may talk to the contrary. If we cut taxes, we have the urge to cut expenditures. The orthodox position with which I am not going to quarrel is that a balanced reduction of taxes and expenditures is not counterrecessionary or counterdeflationary, but quite the contrary.

However, my position with regard to increasing public expenditures, is not so much based on economics, as upon the interest in the public services—in other words, it is based upon the proposition that the public needs at the present time are, on the whole, somewhat greater than private needs, and that consequently certain expenditure increases for things like education, foreign aid, and so forth, are warranted.

I do not think we should have a deflationary budget, and consequently I am recommending a balanced strengthening of both the tax side of the equation and the expenditure side.

I might make one further general remark, and that is that I am always skeptical about increasing income-tax exemptions, because with as high-powered a revenue system as we have, it is necessary to reach a very large number of people, and have a broad base, and if we do not do it by taxes that are rational and direct and progressive, we are almost sure to do it by taxes, looking at it from the standpoint of the long run, that are distinctly inferior in quality. A long-run trend toward prewar exemption levels would hardly make for an improved tax system.

(Mr. Groves' prepared statement appears at p. 393.)

The CHAIRMAN. Mr. Heller.

OPENING STATEMENT OF WALTER W. HELLER, PROFESSOR OF ECONOMICS, UNIVERSITY OF MINNESOTA

Mr. HELLER. Mr. Chairman, I would like to start out by taking just a little exception to Mr. Galbraith's comments that Keynesian on economics has been embraced by the present administration, if that is in effect what he is saying. Although the administration has incurred continual deficits, they have done so with evident distaste. This distaste is certainly not as strong in the Council of Economic Advisers, whose excellent and beautifully written statement acknowledges the need for deficits at times, as it is in the Treasury Department, where the distaste seems to be both strong and persistent. It seems to grow out of a failure to distinguish between what one might call constructive deficits and destructive deficits. Constructive deficits are those to which the economy's response is higher production, higher employment, and higher real national income. Destructive deficits are those to which the response is inflation and distortion of the economy.

Turning to the 1955 fiscal-policy question, I feel that we are now in a period in which deficits are constructive. As others have pointed out to the committee, our rate of production is runing some $20 billion short of our potential, maybe more. Therefore, Federal deficits are more likely to evoke a higher production response than a higher price response.

Now, if we do not increase our deficits (or our tax-financed expenditures, if that be the route preferred) in order to meet our pressing defense and economic development needs, both at home and abroad, I think our economy can afford the risk of further tax reduction.

The suggestion has been made to the committee that a reversible tax reduction be undertaken. In other words, tax reductions in the corporation and excise taxes and personal exemption increases should be put into reversible form, that is, made temporary and subject to recall. Rather than wait and see, as Mr. Galbraith proposes, I should prefer this route with the possibility of reversing action, if this is found to be necessary.

In proposing tax reductions now, I am relying in part on the tremendous capacity to absorb inflationary pressure that the United States economy has demonstrated. Remember that the terrific inflationary pressures after Korea led to only about 9 months of inflation and that we have had essentially 4 years of price stability since early 1951. Remember that we have had that price stability in spite of, or possibly because of, a tax level of about 33 percent of national income, which incidentally seems to give the final and conclusive lie to Mr. Colin Clark's 25-percent tax limit idea. These facts lend strong support to the proposition that, if there is unemployment to be overcome, we can and should take a greater risk of inflation than we had thought advisable in earlier times.

(Mr. Heller's prepared statement appears at p. 395.)

The CHAIRMAN. Mr. Lutz.

OPENING STATEMENT OF HARLEY L. LUTZ, NATIONAL ASSOCIATION OF MANUFACTURERS, NEW YORK, N. Y.

Mr. LUTZ. Mr. Chairman, I interpreted your questions with the same freedom that you described them, that they are not firm directives, but merely suggestions. I have a statement on the economic report which is rather brief, in the course of which I shall probably answer a good many of your questions.

The CHAIRMAN. I think that is fine. If it is possible for you to treat primarily of question 1, that is fine, because I checked Mr. Elder, but he was in his statement possibly going on to subsequent points, but we believe in latitude.

Proceed, please, Mr. Lutz.

Mr. LUTZ. I think I shall get to that, Mr. Chairman.

In the time at my disposal I shall discuss briefly the economic and political philosophy of government which is revealed in the economic report at different points and in various ways. My interpretation is that this report undertakes, rather unsuccessfully, to steer a course between a free, private economy and a planned economy. It is natural, no doubt, that a report prepared by and for the Government should place the major emphasis on what the Government has done.

In my view, however, the reasons for concern go deeper than recognition that a Government agency is naturally inclined to extoll and support its employer. The fact that the Council of Economic Advisors is a Government agency, gives its views and its proposals a weight of authority that no nongovernmental organization could carry in expressing the same ideas.

The tone of the report is set, on page 2, by an enumeration of basic tenets which are said to underlie the administration's economic actions and its future program. Four of the six propositions advanced there deal with what the Federal Government is doing or intends to do, and only two relate to the private economy as a matter of major concern. Another example of the emphasis on the superior role of government is in this sentence from page 48:

> Budget policies can help to promote the objective of maximum production by wisely allocating resources first, between private and public uses; second, among various governmental programs.

This is a disturbing statement because, in my view, it points directly toward the planned, and eventually the socialized, economy. It says, in so many words, that maximum production can be promoted by permitting the budgeting authority, in its superior wisdom, to determine the allocation of total resources between private and public uses.

From this it follows that if the budget authority should decide to increase the public share of total resources, the private share would be correspondingly diminished. Concretely applied, this means that if in its superior wisdom the Government should increase its budget in order to apply more of it to the production of particular goods such as steel, rubber, aluminum, electric power, or other things, there would be less private resources and a smaller total of private production than would otherwise be the case. It is impossible to avoid the implication that total production can be increased by getting the Government into business through absorption via the budget of a larger share of total resources.

Economic production is the peculiar domain of private capital and effort. Government encroachment into that domain is not conducive to a larger total, particularly in a society which is as well equipped as is our own with private managerial competence and all else that contributes to productive efficiency.

Long ago Adam Smith observed that the functions of sovereign and trader could not be merged without detriment to the performance of one function or the other. The business of government is to govern and our society will advance most rapidly if the public functions and services are kept within that sphere, and if the portion of total resources drawn into public use is held to the minimum required for the efficient performance of the necessary public services.

This conception of the nature and function of the budget rejects the doctrine that the chief purpose of the budget, and of the spending and taxing power, is to pump money into or out of the economy as determined by the aims and intentions of a superplanning agency. Adam Smith said that when a ruler attempted to superintend the industry of private people and to direct it toward the employments most suitable to the interest of the society, he was undertaking a duty in the attempting to perform which he must always be exposed to innumerable delusions, and for the proper performance of which no human wisdom or knowledge could ever be sufficient.

I would direct your particular attention to the gap between certain expressions of our national objectives, and aspirations, on one hand, and the omissions from the report of adequate recognition of the actions required if these lofty and worthy ends are to be attained.

On page 4 are these statements:

> Our economic future depends on the full use of the great treasure house of intelligence, skill energy, and confidence of the American people.

And again, from the same page:

> * * * unless there are satisfactory jobs for those who seek useful employment, and unless human labor is devoted increasingly to the production of goods and services that improve the quality of life, our gains in productivity may be dissipated.

One more, on page 6:

> Public policy must also protect incentives and encourage a spirit of enterprise and innovation among people. The man or woman who, in the hope of personal betterment, works harder, designs a new product, creates a new method, invests is a new business, moves to a better job, or suggests a new idea to his employer must believe that the rewards of initiative and efforts are worth while. Through all of its policies the Government must encourage enterprising action by business managers, investors, and workers, in an environment that is kept basically free and competitive.

These are splendid statements of our personal and national objectives and aspirations. They are entitled to command, and I believe that they do command, universal approval and support. With a platform such as these passages provide, anyone who continued to read through the report would expect to find an equally forthright and constructive program whereby the objectives set out there are to be attained.

In this respect, however, the report is disappointing. It fails to recognize adequately the great importance of private capital formation as one of the most essential conditions for the provision of satisfactory jobs, for the increased production of goods and services that improve the quality of life, and for the desired advance of the level of well-being.

There are references to the things that Government is doing to aid small business, to curb monopoly, to expand so-called public assets, and to extend social-security benefits. These and the other actions described, which constitute a combination of policing and paternalistic measures, may have beneficial effects. They cannot possibly serve, however, as adequate substitutes for the growth of the Nation's stock of the private capital which increases our productive potential.

This lack of emphasis on, or adequate recognition of, the importance of steady growth of our capital is the more surprising in view of the rate at which the labor force is growing and of the capital investment which is required, on the average to provide a productive, well-paid job for each new worker. It is equally amazing to find that, although there is a clear grasp of the bearing of heavy taxes on incentive and the provision of job opportunities, there is so little concern about the defects of the Federal tax structure. On page 49 it is said:

> It should nevertheless be recognized that present taxes are still a heavy burden. Lower taxes would tend to encourage work, promote more efficient business practices, and create more jobs through new investments.

This is an excellent description of an important line of action that must be taken if we are to have that glorious economic future which, on page 4, we are told may be ours. But on the subject of tax relief, the report offers stones instead of bread. It is said that there can be no tax reductions this year, not even those that were agreed upon a year ago. Maybe there can be something, next year, if expenditures are reduced.

As for next year, the report says, on page 49:

> Congress might then consider enacting a general, though modest, reduction in taxes and, at the same time, continue the program which was begun last year of reducing barriers to the free flow of funds into risk-taking and job-creating investments.

In my judgment, here is another weakness of the Economic Repart, namely, the failure to carry through from the perfectly clear perception of the bad effects of heavy taxes to a firm and definite position on the necessity of prompt, corrective action. The removal of other barriers to the free flow of funds into risk-taking and job-creating investments is a desirable step, but it will be relatively futile unless there is also removed the very obstructive barrier of the high taxes on incomes, and the gross discriminations of the steeply progressive rates of tax on individual incomes.

There are two sources of tax reduction. The traditional measure of such reduction has been the amount by which the public spending has been, or can be, reduced. The Economic Report places the principal prospect for tax cuts on this traditional basis.

Another sources of tax reduction which hitherto has been generally disregarded is economic growth. This factor has been recognized in the President's recent messages. The National Association of Manufacturers has published within the past week a new tax program which proposes to utilize the growth factor as a source of tax reduction. This is, of necessity, a long-range program, the projections of which are based on the historic growth trend without regard to the annual variations or temporary reversals of that trend. As a first step, a series of tax-rate reductions in the rates of corporation and individual tax is projected over a 5-year period.

My time does not permit lengthy exposition of the plan, but copies can be made available to members of the committee, or for inclusion in the record, if desired.

Mr. Chairman, may I request that the report be included in the record.

(The report referred to is on file with the committee.)

The Chairman. Thank you very much.

Mr. Lutz. The two points at which the tax-rate reductions would be made under this plan are the corporation tax rate and the progressive element of the individual rate scale.

The Chairman. Mr. Lutz, I do not want to interfere with your presentation, but since you now seem to be coming into topics covered under question 2, I wonder if you would defer comments on that.

Mr. Lutz. Certainly.

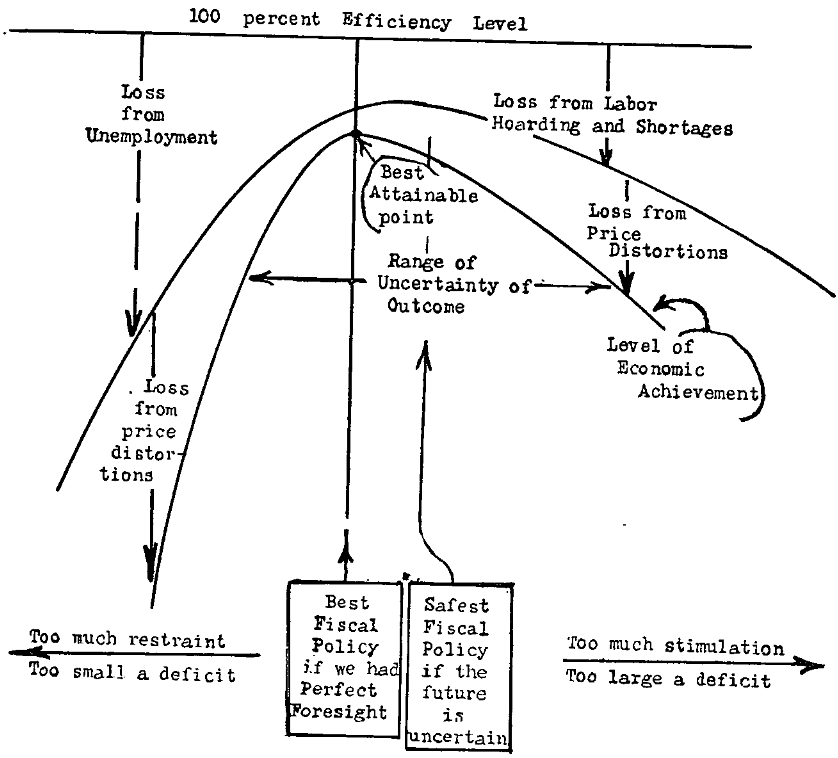
(Mr. Lutz's prepared statement appears at p. 400.)

The Chairman. Mr. Vickrey.

OPENING STATEMENT OF WILLIAM S. VICKREY, PROFESSOR OF ECONOMICS, COLUMBIA UNIVERSITY

Mr. Vickrey. I would first like to say that I concur very heartily with Walter Heller and Harold Groves, and perhaps would want to go just a little further than Mr. Heller in urging very strongly that in view of the inevitable range of uncertainty as to just what the ideal fiscal policy will be we ought to err on the side, first of all, of more stimulating action than less.

This is just a general proposition, not one that is merely applicable to this particular juncture, because, in general, the ill effects of overstimulation, are very much less serious in many ways than the effects of understimulation, and perhaps I can show what I mean by drawing a simple diagram over here on the board.



We can perhaps measure a baseline here which might be called the ideal fiscal policy, just the right amount of stimulus to achieve the best possible adjustment in our resources, and perhaps we can take the top line here to represent the economy running at a hundred percent of efficiency. Then if we err on one side or the other we will get two kinds of losses; by and large, one will be the loss resulting from ineffective use of our labor force, and we can think over here on the downward side too little stimulus will result in fairly severe loss due to unemployment.

Too much stimulus on the labor side results in a little loss, not nearly so severe, resulting from inability to find people for particular jobs at the strategic moment; that kind of thing.

But in addition to the distortions due to inadequate use of labor and other resources, we have another kind of loss due to possible price dislocations that would occur if, on the one hand, we have an inflationary situation, or, on the other hand, we have a deflationary situation. Those probably, I would judge, just from my own feelings about it, would be much less serious, and we can put the losses due to price dislocations and something like that there [indicating].

If we add these two things together we get a picture more or less like this [indicating].

Thus over on this side, we have the losses due to unemployment; over on this side we have the losses due to inflation.

My point is merely that we do not really know—I certainly cannot, and I do not think there are any gentlemen here who would be prepared to, guarantee that they could hit this best possible type of fiscal policy right on the nose. But if we have a range of error, and we happen to fall short a good deal, it is very much worse to fall short on this side than on the other, and I think that we should aim somewhere in here, that is to have more stimulation to the economy rather than less, and as Mr. Heller has just said, our recent experience seems to indicate that there is really in fact very little danger to be feared from a mild overstimulation of the economy. I do not think there is any danger that in the next 18 months or so almost any measure that is likely to get through Congress is likely to overstimulate the economy so seriously that we need to be afraid of the consequences.

Moreover, there is another point that is often overlooked, and that is that too often in fixing these overall goals of fiscal policy we talk as though there was no monetary policy to be used, and very often in discussing monetary policy we talk as though monetary policy was to be considered in isolation and apart from fiscal policy.

In a way I am a little bit sorry that you have decided to hold hearings separately on these 2 matters on 2 different days, because I think that they really should be considered jointly and together, and one of the reasons, moreover, why I would like to see a higher deficit rather than a smaller one is if we overshoot the mark and overstimulate the economy, the Federal Reserve System has the power to put on the brakes. But if we undershoot the mark, there is often very little that the Federal Reserve System can do to correct that mistake. We can correct the mistakes on the upward side; we cannot correct them on the downward side without congressional action.

Then over a longer period I think we have a definite policy decision to make which often is not made deliberately. It should be clearly realized that in the long run, at least, we can achieve full employment either with a cheap-money policy and a relatively small deficit, or equally well with a tight-money policy and a larger deficit.

Now, while these two policies may lead to approximately the same level of employment, and the same degree of utilization of our resources, the detailed effects on the economy will differ. One policy will lead to a different distribution of income as between rents, profits, and dividends, as against wages. It will lead also to a different level of the current standard of living; in general, a higher deficit would mean that we were using more of our resources to enhance the current standards of living, and less of our resources to stimulate private capital formulation. This is something that I think we ought to discuss and decide deliberately, and we cannot make a decision in this general field unless we bring the two policies together.

If we always have a fixed fiscal policy, and we are trying to find a monetary policy, then we have to fit our monetary policy to our existing fiscal policy in light of current economic conditions, whereas they ought to be considered together.

I often picture the economy as a steam engine. That is an analogy in which you use fiscal policy to get up steam, and then monetary policy to throttle the steam. You certainly want to have enough steam in the boiler so you are in no danger of stalling the engine. When you don't have very much steam in the boiler the Federal Reserve Board may be rather afraid, as I think it has been very legitimately on occasion, to apply the brakes for fear the whole thing will generally shut down.

Well, Mr. Chairman, I think that about concludes what I have to say on the first question.

(Mr. Vickrey's prepared statement appears at p. 402.)

The CHAIRMAN. Thank you.

Mr. Kelley.

Representative KELLEY. I would like to direct a question to Mr. Lutz.

He said that more emphasis should be placed upon the operation of the free-enterprise system as compared to Government policy, and he criticized the report to that effect.

I wonder what he would say, however, if the Government did not emphasize the part that the Government should play in our economy, how could the Congress carry out the mandate set forth in Public Law 304 of the 79th Congress in the declaration of policy there, that the Government should use all of its powers consistent with its needs and obligations to promote maximum employment, maximum production, and maximum purchasing power?

We have a mandate there. We have got to do something about these things.

Mr. LUTZ. I suppose you are referring to the Full Employment Act in that citation?

Representative KELLEY. That is right.

Mr. LUTZ. Well, as I recall that mandate, it says that the Congress shall use all practicable means, consistent with its other obligations, to provide the conditions under which full employment will be provided.

Now, if I could pursue my answer just a minute——

Representative KELLEY. It says "maximum employment," also "maximum production" and "maximum purchasing power," those three things.

Mr. LUTZ. That is right, and I am very glad that you linked those things together because it brings to my mind something Mr. Vickrey was just saying, that seems to be the general consensus of the panel, aside from myself: "Sure, we want everybody to have a job that can work and ought to be working." We want to have him have as good a job as possible, and earn just as much money as possible.

Now, you are going to have a million new workers every year for the next 10 years. How can you provide 10 million new jobs without providing the capital which will provide jobs in which they will earn the income they are entitled to expect, and maintain the standard of living that they ought to enjoy in this country?

I say that one of the things that has been neglected in the Economic Report, and I think neglected by implication in the way in which our tax system operates, is that we are not getting the stage set for the increase of the private capital formation by which these jobs can be provided, and you can legislate, Mr. Kelley, all you please, but unless you have got those economic facts in the picture I do not think your legislation will achieve its purpose.

Representative KELLEY. Well, you will have to admit, I think, that the Government has a function in these matters.

Mr. LUTZ. Oh, I am not saying at all that there is no place for the Government in our society, that there are not many things that the Government can very wisely and properly do. I do question, however, the advantage of assuming that the Government shall undertake not even a major role, but a substantial role, in this business of supplanting the private economy in order to provide jobs and income and to increase production. That is my central point of criticism of the report. It does not seem to recognize the importance of our tremendous treasure house of skill, energy, and initiative of the American people. We are not giving that a fair shake in doing its part, as long as we have the ball-and-chain kind of tax system.

The report admits that lower taxes will create more jobs, will create more investment, and will provide more opportunity.

Representative KELLEY. Where the lower taxes are given is another point of disagreement.

Mr. LUTZ. The place to apply those reductions is where the restrictions are the most severe against achieving these objectives.

Representative KELLEY. Will you not admit that lower taxes on income would stimulate purchasing power and also production?

Mr. LUTZ. I think that you would get a slight effect if you were going to raise exemptions, but I think that you cannot get the kind of dynamic effect on the economy through raising exemptions and reducing the taxable income base and reducing the number of people who are paying taxes in the same degree that you would get if you reduced the high and discriminatory and excessive rates on corporations and individual income, because that is where you have got to rely mainly for the increased investment funds by which the new generation of workers are going to be provided with jobs.

Representative KELLEY. Let me ask this final question: Why would corporations and individuals invest their money in business or an enterprise if they are not assured of a market for their goods? That means purchasing by the public, the wage earner.

Of course then you go back to the old question of which comes first.

Mr. LUTZ. Have you got the answer to which one comes first there?

I would say there are many areas in which markets are assured. There are many new areas and of those no one today has any conception of what they are or can be in which there is a very substantial element of risk involved, and we have got to encourage the spirit of risk taking, the spirit of new enterprise, the willingness to gamble, if I may use that word in the proper sense, on the development of a new product or such an improvement of an old product that it becomes, in effect, a new product, and the finding of new opportunities for the use of capital in the employment of labor: I will simply stand on my fundamental thesis that we must have that kind of advantage and stimulus and improvement in our fiscal and economic structure if we are going to do anything at all for the 10 million new workers that are going to be on the scene within 10 years.

The CHAIRMAN. Mr. Galbraith.

Mr. GALBRAITH. I wonder, Mr. Chairman, if I would be out of order if I asked my respected former Princeton colleague a question?

I have been concerning myself for the past year or so with matters of history, a book on the 1929 crash and on the happenings of the early 1930's. I would like to ask Professor Lutz, if I might, what in his judgment went wrong then? That was a time when taxes, as a result of Mr. Mellon's tax reductions, were almost infinitesimal by present standards. In late 1929 the Treasury cut the taxes on a man with $10,000 income by half. That meant his tax went down from around $120 to around $60 a year. This was also a time when I think by Professor Lutz' standards the Government was keeping its hands out of the economy admirably. Yet I think he would agree with me that this was perhaps not, economically speaking, the brightest period in the history of the Republic.

Mr. LUTZ. Mr. Chairman, if I were to attempt to answer Mr. Galbraith's question I would have to write a book on the twenties to parallel the book that he is writing on the thirties, because it involves all of the things that went wrong, and I am not referring now merely to Mr. Mellon's reductions of the tax rates, and Mr. Coolidge's balancing of the budget, and paying off of the debt, and so on, but there were a great many other things, as he knows, as well as the chairman, I am sure, does, and the other members of the committee, that would require, as I say, another book, equal in size to that one that Mr. Galbraith is writing about the 1930's.

Representative BOLLING. I would gather, then, Professor Lutz, that you do not feel the manipulation of the tax rate is a panacea in itself?

Mr. LUTZ. No, I do not think that anything that governments attempt to do in directing or controlling or running the economy is a panacea. In fact, I think too many people look on it as the final answer to all of our problems, and I am inclined to agree with one thing that Mr. Vickrey said, and unfortunately we are not covering that in our discussion today, and that is that we are overlooking the tremendous powers of the money and credit management invested in the Federal Reserve Board to correct a great many of these things that we attempted to do by spending money and taxing away money through the budget itself.

We need certainly to have full recognition of the things that can be done through the control, regulation, the increase of money supply, or, if necessary, the reduction of the available credit through actions that the Federal Reserve Act gives the Federal Reserve Board the power to undertake, instead of trying to do many of those things, or too many of them through the manipulation of the budget.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. Yes, Mr. Chairman.

I would like to pose some elementary questions just for my own information to see whether any of the panel disagree, really.

First of all, this is an elementary statement, but I want to be sure that economists generally agree that unbalancing or having an unbalanced budget is inflationary? Is it my understanding that there is no disagreement among economists on that, that it is an inflationary impetus?

Mr. LUTZ. May I ask a question for clarification?

Representative CURTIS. Yes, sir.

Mr. LUTZ. Well, if the budget is unbalanced the question of whether the financing of that deficit is going to be inflationary or not would depend upon the manner in which the Government gets the money to cover its deficit.

Representative CURTIS. I do not think I am being as fundamental as I wished.

Regardless of how Government does it, it might, by using the terms that were used by Mr. Vickrey, a motor and a brake, you might be able to "brake" that inflationary impetus, but my sole question is, Is deficit financing actually an inflationary factor? Is there agreement on that?

Mr. HELLER. Well, it may just be a matter of terminology. But perhaps we should put in the word "expansionary" along with "inflationary," if you mean by inflation, as many people do, that it causes a rise in the price level.

It does not necessarily do so if there are unemployed resources so that the response is a rise in production rather than a rise in prices. Consequently, I would simply amend it by saying that economists generally agree that a deficit is either expansionary or inflationary.

Representative CURTIS. Or to apply Mr. Vickrey's metaphor, it is part of the engine that would produce steam, and possibly there are other devices that might apply the brakes.

Now, the next question would be this: The amount of inflationary effect, and I am solely confining myself again, using this metaphor, to the amount of steam, depends on the amount of deficit in a particular year, but it also does it not, depend on the amount of your debt as it exists at that time, the Federal debt, or do you think it makes a difference?

In other words, let us illustrate this way: If you impose an additional $5 billion of Federal debt, when the debt level were only, say, $20 billion, would that $5 billion have the same amount of steam if you imposed $5 billion when we have a debt of $270 billion?

Now, I am eliminating for the sake of that question the ratio of the public debt to GNP, or something of that nature.

In other words, does the amount of the Federal debt affect the amount of inflationary effect an additional deficit has or is it just a constant amount in the opinion of the panel and the economist generally?

Mr. VICKREY. Well, if I could hazard an opinion, I would say that there might be some difference but it would be minor.

Representative CURTIS. You think it would tend to be pretty constant, for every billion you added it would not make too much difference what your previous debt was?

Mr. VICKREY. No; it would make a difference, of course, what the relation was to the gross national product.

Representative CURTIS. I am eliminating that.

Mr. VICKREY. At the same level of gross national product I think you would get approximately the same amount of stimulating effect.

Representative CURTIS. Do you know, sir, whether there is any general agreement among economists on that? Has there been any attempt to measure inflationary power, how much steam?

Mr. VICKREY. This, as far as I know, has not been examined in the literature, this specific question.

Mr. LUTZ. Mr. Chairman, may I comment on that question?

The CHAIRMAN. Surely.

Mr. LUTZ. I think, Mr. Curtis, it would make a very considerable difference, in this way: Let us suppose that with our present level of gross national product we had a national debt of only $50 billion, and the Government proposed to float, as you say, another $5 billion, I think the chances are that they could very easily dispose of that much additional debt among private investors who would be glad to add to their portfolios in that particular respect, and there would be no particular occasion to go into the banks for it.

Now, this comes back to the distinction that I tried to make in regard to your first question, whcih is that essentially the inflationary effect of public borrowing is conditioned pretty largely on whether the borrowing is done from the private economic community outside of the banks, or whether the borrowing is done through the banks. If it is money taken from private investors who have already received income and are waiting for a chance to use it, it is merely a transfer of funds; it does not create any additional purchasing power in the whole economy. It is only when they go into the banks that you create additional purchasing power.

Now, with a debt of 275 or 280 billion dollars, I hazard the guess that perhaps you have approached close enough to the saturation point of what private nonbank investors want to carry in that field, so your only alternative or principal alternative if you wanted to get another $5 billion, would be to get it out of the banks, and that means a direct addition to the purchasing power, and obviously inflationary effect.

The CHAIRMAN. Is it monetary purchasing power?

Mr. LUTZ. Yes.

Representative CURTIS. I want to thank you for that observation because, in my own feeble way, that is about the conclusion I had reached, when you got to a point where actually the Federal Government is creating credit in order to finance these things it is almost a geometrical proportion when you reach there, for every billion you add you are probably going to have that much additional steam as opposed to these levels where you suggest it could be absorbed in private enterprise.

Mr. HELLER. Mr. Chairman, may I just make an observation there that pertains to Mr. Patman's earlier statement? Apparently there is a feeling that we can draw money from long-term investment sources today or the Treasury would not be proposing a 40-year bond issue. In other words, that is more likely to compete with the type of, shall we say, noninflationary sources of funds of which Mr. Lutz is speaking, than would the short-term borrowing.

Representative CURTIS. I think that is a fair observation. Rather than get into actually the techniques, I was interested in the basic powers that exist, or the basic trends that these things create.

Mr. HELLER. All I was getting at was that this could take place apparently, at $275 billion of debt as well as at 50 or 25 billion dollars.

Representative CURTIS. Would it actually, though? If it were at lower levels you would find investors looking for places to put their money, whereas at a higher level you pretty well have saturated your market, and you have to figure out devices to encourage them, and you actually become, then, much more in competition with private investment.

The CHAIRMAN. Before the discussion has finished might I add a matter of fact to the discussion of this issue—on the question of personal savings.

On page 24 of Economic Indicators, the current issue, we have added some pencil figures for the last quarter. You find in 1939 total personal savings were estimated at $2.9 billion, or only 4.1 percent of disposable income. Whereas in the year 1954 the total for the year is estimated at $19.6 billions, or virtually $20 billion, or 7.7 percent of personal income. So that over the last 15 years what has happened has been that not only has the total volume of personal savings increased enormously by nearly 7 times, but it has almost doubled, relatively, to personal income. I would like to have those facts thrown out into the discussion as to whether people really think there is a drying up of personal savings.

Mr. Groves.

Mr. GROVES. I would think the marketability of bonds to individuals depend on two factors. One is the availability of money, and the other is confidence. As to the availability of money, Senator Douglas just covered that point. As to confidence, I would think the question in the mind of an investor in Government bonds would be more a matter of whether we face inflation than whether our debt market is so saturated with bonds that the Government at some future time might default on its obligations.

The CHAIRMAN. Anything further, Mr. Curtis?

Representative CURTIS. My next observation, and again it is thrown out for comment, as I analyze this thing, inflation actually could be interpreted to be another form of taxation as far as the Federal Government is concerned.

I wondered if that generality is acceptable to the panel, and whether it would be acceptable to economists generally?

Mr. LUTZ. Isn't it more accurate to say that it is a practice which has many of the worst effects of the wrong kind of taxation in that it penalizes the people with fixed incomes and limited opportunity for equalizing income against the force of the inflation?

Representative CURTIS. I certainly would say that if it is a tax, and I personally have come to the conclusion that it is a method of taxing, it is the rottenest there is. It is the worst form of taxation. But the question I am posing is whether there is any disagreement that inflation actually is a form of taxation, and whether economists generally recognize that, or whether there is a dispute on that subject.

Mr. GALBRAITH. May I say a word on that, Mr. Curtis?

Representative CURTIS. Yes.

Mr. GALBRAITH. I think there is a fundamental distinction to be made, and that is the distinction between an economy where there is a great deal of slack, a great deal of unemployment and idle factory capacity, and so forth, and an economy that is working at full capacity.

The principal effect of a deficit in the first instance will be horizontal, that is, of people going back to work, of factory capacity being used more fully. It will be only to a small extent expressed in increasing prices. In this sense Mr. Vickrey was disposed to refer to the expansionary effect rather than the inflationary effect. Of course, if prices are not going up and people are not paying more for the goods, there is no tax effect.

Representative CURTIS. I think that is a fair observation.

Mr. GALBRAITH. When, by contrast, an economy that is working all out, the tendency will be for prices to rise, and the observation that you make, I think, is a very acute one. Then inflation is the equivalent of taxation.

Representative CURTIS. Under those circumstances of expansion, as far as people on fixed income is concerned, pensions, retirement, where there is no chance of their increasing their income unless we were able to rectify through the brakes on our monetary policy, that it would, as far as those people are concerned, be a tax.

Mr. GALBRAITH. Well, not if prices are rising. Take the extreme case of the thirties. At any time, then, when new orders came in, factories did not raise their prices. They increased their output.

Representative CURTIS. I agree.

Now, then, the next observation I have is one of concern on reading the Economic Report, and also the many, many discussions that we have had in the Ways and Means Committee. There seems to be a great tendency to look upon just increasing a tax rate as thereby increasing the tax take, and I think every one here in discussing taxes, and the reduction thereof, is just assuming that reducing taxes will reduce the take, or that increasing the rate will increase the take.

Isn't it generally agreed among the members of this panel, and economists, that you can have tax rates at a point where you get diminishing returns, where in actually raising your rates you get less in take rather than more? Is there any disagreement on that fundamental observation?

Mr. ELDER. Mr. Chairman, it is my understanding that that was the theory under which tax cuts were made in the twenties, one of the theories, at any rate, and I do not think in terms of the results that that was borne out necessarily.

Representative CURTIS. In other words, you do not think that a tax rate, any rate, I do not care what it is on, can reach the point where actually the take is diminished, and I would suggest to you, sir, if you do not believe that, let us take tariffs, where exactly that device has been used, to increase the rates for entirely different purposes from tax take, and, of course, the net result has been that we do not collect anything from our high tariffs. I think my question now is broadened again.

Isn't that true of any tax rate? I do not care what you are taxing; you could tax it at such a high rate that your take would be less.

Mr. BUEHLER. May I say something on that?

Representative CURTIS. Surely.

Mr. BUEHLER. As tax rates go up the point will eventually be reached where a tax will have some effect on the behavior of the individual.

Consider, for example, the effects of a tax rate of a hundred percent. We would imagine a man saying "Why should I work; why should I invest?"

Representative CURTIS. Well, it is 87 percent for some.

Mr. BUEHLER. The tax rate is one thing. There is also another effect of high tax rates: The taxpayers may seek ways to avoid a tax legally, or evade it illegally, and thus reduce revenue. There is a third observation that I think ought to be made, which is that it is frequently very difficult to measure the effects of taxes to prove precisely that a tax does this or that, probably because so many factors are involved, and the motivation of the individual is not simply economic.

You spoke, Mr. Curtis, of the effects of the tariff. We have a somewhat similar problem in State taxation: The question in Pennsylvania, where we have relatively high corporation taxes, is whether these taxes have any effect on the movement of industry into the State, or out of the State. We have been trying to collect data for years over there, and occasionally one turns up an illustration where the effects can be measured.

We know, however, as taxes increase and get heavier and heavier they are bound to have some effect on initiative, investment, employment, and business.

I would say that as taxes become heavier and heavier they do have an effect on economic activity and revenue. We do not know exactly where the "bite" comes. I have had another thought: Consider, for example, the situation of the young men and women going out to work in the world from our colleges and universities and compare their reactions to taxes with those of their fathers and grandfathers. A boy or girl now stepping out into life goes out into a world with what the older people would think of as relatively high taxes. A young person accepts the environment of high taxes. He starts out that way. An older person who grew up when there was no income tax, or very little income tax, however, looks at it differently.

What I am saying is it is that our reactions to taxes depend partly on what we are accustomed to paying. New taxes, for example, bite harder and have more effect than old taxes to which we are accustomed.

Mr. ELDER. Mr. Chairman, I wonder if you are not entering topic No. 2 now?

Mr. Curtis, you referred to the fact that you had a high rate of 87 percent and I believe that Dr. Lutz emphasized that.

Now, question No. 2, at least to me, raises the question as to whether or not we actually do have rates.

Yes; the personal income-tax schedule does go up into the higher areas, 87 percent, and approaches 90 percent. But if you are looking at the overall picture you have to look at it realistically, and if you do that you have to recognize that you must look at the effective tax rate.

Now, if you look at the effective tax rate in terms of the statistics of income, I think you will find the figures for 1951, for example, that if you get up even into the very highest bracket, if you take the half-dozen people who have incomes of about $5 million, you will find that the effective rate on those taxpayers is considerably less than 60 percent.

Now, a tax schedule which leaves an income with $5 million or upward with a net income of $2 million does not seem to me to be excessively high. Indeed, it raises the question directly as to whether or not some of these items that are mentioned in topic No. 2 should not be discussed with a view to determining to what extent these various legalized tax-escape areas have operated to weaken the income-tax structure. It seems to me that is very important.

Representative CURTIS. Mr. Chairman, I think the panel has gotten way ahead of me because I am still on question No. 1 and I was just asking some very basic questions. Of course, the discussion that the panel has engaged in follows logically from this, but my question was solely confined to whether or not there was agreement that tax rates could be so high, not referring to any particular tax, and one came in to illustrate the point that tax rates could become so high that the tax take was less in reference to this question of allowing expenses to exceed income because when we talk about income we are talking about taxes.

Now, I gather from the discussion that there is not any real basic disagreement among economists—and that is true—that any tax rate could become so high that it would actually produce less tax take.

Now, if there is disagreement on just that fundamental question, that is all I am confining myself to.

Mr. BUEHLER. Could I add another comment to this effect: One should distinguish, and I do not know if Dr. Elder had this in mind—I am sure he is familiar with it—between what might be called the marginal rate in a progressive income tax and the average rate. The taxpayer is more affected, as I see it, by the rate on the marginal, or additional, income than he is by the average rate, and I am sure Dr. Elder had that in mind. A progressive tax imposes increasing rates on increases in income.

Mr. VICKREY. I would perhaps like to ask another question, and that is a tax rate may in theory become so high that the immediate yield of that particular rate goes down. I myself doubt whether we have any of those outside of your tariff, for example, but there is also the possibility that reducing the tax on transportation, let us say, might produce enough stimulus to the economy as a whole so that over a period of years, perhaps not immediately, but over a period of years, the result might be that the income tax yield might go up, as a result of cutting down on the transportation tax.

Representative CURTIS. I agree with that observation. The question of whether or not we have any other like I illustrated on tariffs is the immediate question that we get into, and we do get into these details, but I think you would agree that on anything you could have a rate so high that you would have diminished returns.

I would like to make one other observation and then ask one final question, if I may:

You used the metaphor of arsenic, as far as tax rates are concerned. I prefer the metaphor of a rudder on a ship, that when the ship is not going very fast, you have a pretty hard time controlling it, but if it has pretty good way on, just a little deflection of the rudder will have a tremendous effect. I think that is true of tax rates. When they are going pretty strong, you can have a tremendous effect by changing the wording slightly in the tax.

My final statement is this, and I hope everyone agrees with it: Your tax take comes essentially from tax rate times tax base. Now, tax base, in my opinion, is private-capital investment because it is the only place we can get our taxes, and therefore isn't it important to know the ratio of private-capital investment to public-capital investment in going into this field, and I would refer to the figures I have picked out, the Tax Foundation figures. I know they have, incidentally, the same chart exactly, without any additions for the year 1952, the facts and figures on Government finance in 1954 and 1955, on page 32, in their chart 16, Estimated Annual Wealth.

Take the 1929 figure, public wealth, 44.1; private wealth, 383, and that is a 9-to-1 ratio, in 1948, the last figure, it is public wealth, 71.6, and private wealth, 390.2, or just a little better than a 5-to-1 ratio.

Now in the Economic Report there is some attention paid to that, and in considering this question of expenses and income I think that the tax formula has to be considered because we could increase our tax base by continuing to move Government out of these many fields that they have gone into and we could actually reduce the tax rate and have the same tax take.

Now is there anything wrong with that logic that any of the gentlemen of the panel see? You may not agree that we should do that. I am not posing that, but whether the mathematics are accurate.

I judge by the silence that there is no disagrement.

The CHAIRMAN. Mr. Mills.

Representative MILLS. Mr. Chairman, is it the concensus of the panel that it would be unwise for the administration and the Congress to attain a balanced budget in any fiscal year involving any segment of the calendar year 1955 by reducing expenditures to do so or by raising taxes to do so?

Mr. LUTZ. Are you referring to fiscal year 1955–56, the one that the new budget covered?

Representative MILLS. It would have to be that, because there is nothing much Congress can do about the expiring budget.

Mr. LUTZ. I think you can balance the budget in 1956 and I think you ought to.

Representative MILLS. It is your opinion that it should be done. I am trying to bring out what has been said in just a few words. I understood that most of the members of the panel thought it would be unwise to do that. Is Professor Lutz the only one who thinks it would be wise to balance the budget by either reducing expenditures or raising taxes in the fiscal year 1956?

Mr. GALBRAITH. I think, Mr. Mills, it should be pointed out that, under conditions of less than full employment, a hike in taxes or a reduction in expenditures might have the effect of lowering the tax yield and increasing the deficit. This is one of the perverse features of modern life, with which we must reckon.

Representative MILLS. Those of you who do not feel that the budget should be balanced, what are the dangers, if any, to our economy, from continued deficit financing for the coming fiscal year?

Mr. LUTZ. Would you state that question again?

Representative MILLS. As I understood it, all of the members of the panel except you, Professor Lutz, felt it might be unwise to balance the budget in fiscal 1956. I am asking those members of the panel now if there are any dangers in a continuation of an unbalanced budget for fiscal year 1956 which they desire to call to the attention of this committee.

Mr. HELLER. May I speak to that point?

The CHAIRMAN. Mr. Heller.

Mr. HELLER. I think essentially what we are saying is this: Yes, there are some dangers that the deficit might have inflationary consequences if there is a tremendous resurgence in the private economy that we do not now foresee. But these dangers or "costs" of the deficit are potentially so much smaller than the potential gains from running the deficit, that we prefer the deficit to a balanced budget or surplus situation.

Representative MILLS. Now what size deficits should the Congress permit, or what size deficits should the Congress not permit in the fiscal year coming?

Mr. GALBRAITH. Could I add just a word to Mr. Heller's comment on that? I have discussed that at some length in the statement I have submitted. I think there is one thing that needs to be done in addition to minimize the danger. I said earlier that I would like to see the decision on tax cuts and hence the decision on a larger deficit deferred for as long as possible.

In addition, should the economy become strong later in the year, should there be pressure on prices and wages, should there be, in short, signs of serious or incipient inflation, then there must be a willingness to reverse direction. This places a heavy responsibility on the Executive. It must be willing to defer new capital commitments and postpone expenditures wherever it can. It will call for a strong Federal Reserve policy to the extent that this is effective and it could conceivably call for a special session of Congress to replace taxes that were cut. Such a change in direction does not involve a confession of error. We do not know what is going to happen later in the year. The administration does not know. We should be most tolerant of an administration which keeps an open mind on these matters and does reverse direction.

The thing I want to emphasize is this: The willingness to reverse direction is our source of safety in this policy. This is not a completely safe policy. Very little is safe in this world. The policy can be made safe if we are willing to change direction when it is clearly called for.

Mr. ELDER. I would go along with that, and I would go beyond that to this extent: I would say that if Congress approved additional expenditures in those areas, that it would be businesslike to consider an upward tax revision, as Dr. Galbraith suggests, to take care of those programs, and I have the feeling that they would not be too difficult to sell if they are approached on the basis of the need.

Now the dilemma, as far as these services are concerned, seems to be this: That the Federal Government up to this point has not assumed responsibility. On the other hand, the States and local governments clearly are not assuming the responsibility, and taking into account their present tax setups, it is not likely that in the immediate future they will assume responsibility much beyond what we are currently assuming.

That being the case, it seems to me we should realistic and recognize that the Federal Government, with its greater taxing power, with its greater credit resources, should not only step in for the sake of providing these needed services, but also for the sake of seeing that they are provided in a businesslike way.

Representative MILLS. Well, it is the thought of the panel that if additional services are provided by Congress, that additional revenues should be requested by the Congress of the people to compensate for those services during the coming fiscal year?

Mr. ELDER. I would say that that is a matter for Congress to determine.

Representative MILLS. We are seeking your advice on it.

Mr. ELDER. There are many factors. My feeling would be if these programs are initiated in terms of an emergency, that it might not be necessary at this particular time to consider upward adjustments in the tax rates.

On the other hand, if they are long-term programs, it would seem to me that financing should be approached on a long-term basis.

Mr. BUEHLER. Mr. Chairman, I am one of those who think that conditions are sufficiently promising, although I agree that the future is unknown to every man, to predicate action in the fiscal year 1956 on a Federal budget which would be approximately neutral.

In the budget as proposed, and of course it can be modified and probably will be subsequently, there is, I believe, a surplus of cash receipts over cash payments of approximately $600 million. I do not know how, personally, to discount the Formosa action, whether that may lead to stepped-up defense spending or not, but it does involve possibilities of inflationary spending. It seems to me that we, as a Nation, are more likely to resist recession and to respond to the challenge of a depression than we are to respond to the promise of mild inflation. We do not seem to be too much concerned about continued inflation. It is easier to reduce taxes than it is to increase them, and once we take them off, or raise the exemptions of the personal income tax, there is the difficulty of getting them back. But I do think that our fiscal policy should be flexible and that it should be related to our guess as to what the economic outlook will be.

Now another related point is that of the responsibilities of the States and the local governments. We have been working over in Pennsylvania, as they have in other States, on studies of intergovernmental relations. The work of the Federal Commission on Intergovernmental Relations has been supplemented by the studies of quite a few State commissions.

We are not a wealthy State as compared with, say, New York or California, Connecticut, Maryland, and some of the other States, but Pennsylvania ranks about 13th in per capita income payments. As one appraises our financial and economic resources, he learns that we can support education and build our schools if we want to. I am not saying, of course, that our taxes are distributed in the same way over the population as the Federal taxes are, with their heavy emphasis upon the progressive personal income tax.

I think there is this important consideration to be kept in mind: The more inclined the Federal Government is to step in and support public education and other services, the less inclined the State and local governments are to assume responsibilities. If the governor of any State, the major of any city, can look to Washington for increased Federal aid, it makes his local tax problem an easier one, and the citizens are inclined to feel that the money coming out of Washington somehow or other is money for which they do not have to pay taxes.

Mr. Elder. Mr. Chairman, if I may, Dr. Buehler's comment with regard to Pennsylvania—I am perfectly willing to accept his knowledge with respect to the experience in Pennsylvania, particularly with reference to his conclusion that the citizens of Pennsylvania are able to perhaps support schools more liberally than they are. I think we have to recognize that in Pennsylvania, as Dr. Buehler said, you have a State with above-average income, which is paying about less than 6 percent of income in local and State taxes. You have a good many of the poorer States with much below average income that are taxing their people 11 and 12 percent of their income, and are still unable to maintain services even approaching the type of services that you have in Pennsylvania. I would agree with Dr. Buehler that in approaching this whole question of Federal aid, it should not be on the basis of handout. It should be on the basis of maximum assurance that our States and our local government are really trying to do a job to provide services, and formulas can be devised that will ensure that that be done.

The CHAIRMAN. You are getting away from the first topic.

Representative MILLS. I think Mr. Lutz had some comment on that.

Mr. LUTZ. Very briefly, I think it would be proper for me to make one observation. I have already indicated the impression I gather from the views of the members of the panel, that all of them believe that the Government should keep on doing a little more to support the people. Now I am probably old fashioned. I have subscribed to the view of that great President of your own party a generation ago who said the people should support the Government and not be supported by it.

Now, let's make it concrete and get the way clear. With the kind of tax rate reduction which I am advocating here, you have, I think, a greater prospect and assurance of the economic growth that you all want than you will if you keep on needling the economy by Government deficits with or without direct inflationary tendencies. In other words, let's set a halt to this idea that it is the function and the duty and the capacity of the Government to support the people all of the time and give the people a chance to support themselves, and the Government, too.

Representative MILLS. Incidentally, we have not come to that halt yet.

Mr. LUTZ. We have not reached that turning point yet.

The CHAIRMAN. Mr. Heller.

Mr. HELLER. Just one rather important footnote to any discussions of how much of a deficit we need and whether we need a deficit: We ought to be certain that we recognize that the economic content and significance of Federal budget figures change and is changing from year to year. That is to say, a cash deficit of a given size next year might have a different economic significance than a cash deficit of the same size this year. To illustrate this, let me refer explicitly to the Mills plan for speedup of corporate income-tax collections. That has been adding about $2 billion a year, as I understand it, to Federal receipts, without a corresponding reduction of private income. It has been a speedup of collection of liabilities that had already accrued.

Now that extra collection won't occur next year, since the Mills plan cycle will be completed this spring. The result is this: If, say, we had a balanced cash budget this year and a balanced cash budget again next year, the economic impact of the two budgets might not be the same at all. Assuming no other changes, the balanced cash budget in the coming year would be more deflationary than the balanced cash budget this year. No longer having the extra collections of accrued taxes under the Mills plan, next year's budget would have to draw in funds that represent an actual withdrawal from the private income stream. This is, of course, no criticism at all of the Mills plan (which was designed to put corporations on a somewhat more comparable basis with individuals as to income-tax collection), but is merely an illustration of the care we must exercise in using budget data for economic analysis and policy.

Now this is only one of several changes currently taking place in in the economic meaning of budget figures. We are presumably going to come to that in question 6 later on, but we need to take it into account here so we don't just say $2 billion of deficit next year would mean the same thing as $2 billion of deficit this year. It might mean something quite different economically.

Representative MILLS. On that point, Mr. Chairman, you will recall that the administration last year, in connection with H. R. 8300, requested Congress to move forward corporate payments into the fall of the preceding year or the year in which the profits were earned in order to overcome the deficit of, I think, $200 million that will occur in the year.

Mr. BUEHLER. May I add a note on that, if it is germane: The things that are done in Washington are sometimes copied by the States. Referring again to Pennsylvania, we have had a speedup in State corporate tax payments, and have therefore been interested in the effects of the acceleration of corporation taxes. It would seem that during the period of acceleration of corporate income tax payments, the ratio of taxes to corporate earnings increased. It is like a wave coming in on the ocean shore, when the water rises and then subsides. During the period of acceleration there is a heavier tax payment, a larger collection of revenue. Then the wave subsides, you are back at the previous tax rate. With this new speedup in Federal corporation income tax payments that is to come into effect in the autumn of this year, corporation taxes are increased over a 5-year period.

Representative MILLS. Well, that would be permanent in that corporations would estimate earnings for the calendar year.

Mr. LUTZ. That keeps it in the same fiscal year instead of moving it from one to another.

Representative MILLS. Yes. The fiscal effect of the suggestion to force corporations to pay their taxes in March and June, rather than give them 4 quarters to pay, was to require corporations during the 5 transition fiscal years to pay on the basis of 110 percent of liability, whereas in the calendar year they would still continue to pay on the basis of 100 percent and it did give the Treasury 10 percent more corporate revenue during those 5 transition years.

Mr. BUEHLER. Yes; that was the point in which I was interested.

Mr. LUTZ. Mr. Chairman, I think one point ought to be brought out here. That $2.4 billion deficit is, to a certain extent, illusory, because at least $1.7 billion of it is interest on the trust accounts and accrued discount on the savings bonds which does not represent tax payment to the public.

The administrative budget carries an interest charge of about $6.3 billion, and only about 4.6 or 4.7 billion dollars of that interest is cash payment to the public. The rest is added to the principal of the public debt in the trust accounts and in the accounting for discount bonds, so that in talking about the effect of a deficit or whether we need one or not, we ought to recognize that about three-quarters of the estimated deficit is an illusion, as far as any economic effect is concerned.

The CHAIRMAN. But there is also the $1¾ billion which it is said the Secretary of Defense is to make from the assigned expenditures without any specific allocation, and if he is not able to make those economies, the deficit on the figures presented by the Secretary of the Treasury would be slightly over $4.1 billion.

Representative MILLS. That is all, Mr. Chairman.

(Whereupon, at 12:20 p. m., a recess was taken to 2 p. m.)

AFTERNOON SESSION

The joint committee met at 2 p. m., the Honorable Wright Patman (vice chairman) presiding.

Present: Representatives Patman, Mills, Kelley, and Talle.

Vice Chairman PATMAN. May we come to order.

Senator Douglas will not be here this afternoon. He is attending the session of the Senate, which is a very important one, as you all know.

We will continue where we left off this morning. This morning all of the members of the committee had propounded questions, except Mr. Talle, Mr. Wolcott, and myself.

Since they are not here, I will ask a few questions before starting out on these other questions that are posed by the Council. Mr. Ensley suggests that after we get through with the questioning on the first one, that we give each member of the panel, say, 5 minutes to explain his views on anything that is related to or closely related to the matters under investigation and study by this committee, which will be satisfactory.

First I would like to ask Professor Lutz a few questions, if you please, Professor.

Mr. LUTZ. Certainly.

Vive Chairman PATMAN. This morning you said something about if we had a national debt of, say $50 billion and a gross national product of, say $370 billion; is it not a fact, Professor, that the only reason we have the high gross national product is because we have the high national debt; and that it would have been impossible to have had a $370 billion gross national product with a $50 billion national debt considering the circumstances during the period that the debt was increased to its present amount?

Mr. LUTZ. Well, I think, Mr. Patman, that to a certain degree the expansion in dollar terms of our gross national product is a result of the inflation that has taken place through the increase of the debt from the roughly $50 billion in 1939 or 1940 to the $275 billions or $280 billions that we have at the present time.

Vice Chairman PATMAN. Well, in view of the emergency that we were going through, wasn't it absolutely necessary for the Government to do that, because in order to have been successful in the war and in order to take care of our domestic economy, we had to have the money, and there is no other way to get money under our fine capitalistic system except creating debts; is there?

Mr. LUTZ. Well, you raise a very interesting, although at the present time quite academic question, as to how we could have paid for World War II. I happen to have been among the few back in 1940 and 1941 who believed that it was possible to finance or very substantially finance——

Vice Chairman PATMAN. I was on your side. That was my contention.

Mr. LUTZ. Finance that war by an increase of revenues. Now if we had been able to do that, first the cost of the war would have been very much less, and, secondly, we would not have had this very large burden of debt which we now have to carry, and so in that sense the growth of our economy in current dollar terms is undoubtedly in part a product of the increase in productivity and in part an increase in the number of dollars available in which we attempt to measure that.

Vice Chairman PATMAN. Suppose I pinpoint that real question that I think is involved here, and that is the creation of money. Now, you mentioned this morning that if the bonds are sold to the commercial banks, they create the money with which to buy those bonds. I agree with you 100 percent, and for that reason I am in favor of not permitting the commercial banks to buy bonds.

I do not mean I would cut it off suddenly, but I would adopt a policy which would eventually result in commercial banks not being able to buy those bonds at all. If there is any excess left after savings of the people, life-insurance companies, and the like have been tapped, and if it is necessary to still sell bonds, I would let the Federal Reserve banks take them, rather than the commercial banks. I think it would be in the interest of the country that that be done, for the reason that the creation of money is the same either way.

In the first instance the Government would save some money as the interest would flow back into the Treasury, and in the other you have the total interest burden that the taxpayers would have to pay.

But the main question I want to ask you, Professor Lutz, is this: Under our system you agree that that is the only way we have money, by the creation of debt; is that right?

Mr. LUTZ. We get some of our money by direct Treasury action, such as the purchase of silver and the issue of silver certificates.

Vice Chairman PATMAN. Well, that is the minor part. I am talking about the billions. Now if everybody paid their debts, it would be that way, we would not have any money except the silver and the silver certificates and the Civil War greenbacks, and not very much money.

If everybody had to pay their debts, what would we do for money?

Mr. LUTZ. To whom would they pay these debts?

Vice Chairman PATMAN. To whom they owed them.

Mr. LUTZ. Then the other fellow would have the money.

Vice Chairman PATMAN. But originally the money is created and it gets back to destroying the creation.

Mr. LUTZ. I am not sure it destroys money to pay debts. An individual who owes money, and if he has a bank account, he would give his creditor a check on his account in order to settle that debt; now the debtor's bank account goes down by the thousand dollars he paid, but the creditor's bank account goes up by the thousand dollars. You have not destroyed any money in that process.

Vice Chairman PATMAN. Suppose you borrow a thousand dollars from the bank and then you go in and pay that. First you create the $1,000, at least the bank did on its books and next you extinguish it.

Mr. LUTZ. That is true. The process of borrowing from the bank creates that, and the taking up of the note extinguishes that much of the bank-deposit credit.

Vice Chairman PATMAN. You mentioned the balanced budget this morning. I am in favor of that, and I would be willing for Congress to stay in session until we do balance it. But if we cannot reduce expenditures enough, I am in favor of making it up with taxes.

Are you in favor of that?

Mr. LUTZ. I think that would depend on what kind of taxes you are going to use.

I think we might consider it this way: The maintenance of a balanced budget means that the Government is not obliged to increase its debt. Now as I pointed out this morning, three-quarters of the $2.4 billion deficit we have now is illusory.

Vice Chairman PATMAN. That is a small point.

Mr. LUTZ. That is three-quarters of the present deficit.

Vice Chairman PATMAN. Well, there is another verse to that, Professor Lutz. Overall, involving tens of billions of dollars, would you be in favor of where Congress could not reduce expenses, would you be in favor of them levying taxes such as they are willing to levy in order to balance that budget?

Mr. LUTZ. As a general rule, as a general procedure, yes, I am in favor of a balanced budget.

Vice Chairman PATMAN. And you would be in favor of taxes to do it?

Mr. LUTZ. I would be in favor of some kind of taxes for that purpose much more than I would some other kind of taxes.

Vice Chairman PATMAN. Even though you would not favor the particular kind of taxes, you would favor any kind of taxes to an unbalanced budget?

Mr. LUTZ. If the budget is seriously unbalanced, yes.

Vice Chairman PATMAN. How much would you consider serious?

Mr. LUTZ. Let me answer it negatively. I would say, disregarding the three-quarters of the present deficit that is illusory and merely a paper bookkeeping matter, that the other $600 million is not serious unbalance. I do not know how far I would want to go before I would say you were in danger. It depends on how the Government is going to borrow the money necessary to keep it balanced. If it is possible to raise the necessary funds by nonbank borrowing, it has a neutral effect, really, on the economy.

If you have to go into the banks for a large amount, then I think it is very serious.

Vice Chairman PATMAN. Now this morning you mentioned more than once that the Federal Reserve Board could affect the supply of money and credit, as I understood you. In actual practice, the Open Market Committee is the only body that affects money and credit, isn't it?

Mr. LUTZ. Well, the Open Market Committee, and possibly changes in the reserve requirements of member banks.

Vice Chairman PATMAN. Well, of course, there are the reserve requirements, but I don't think they have interfered with the reserve requirements much in recent years. They have not used that as the method. They have used the Open Market Committee as the method. Of course, the rediscount rate could be used for psychological reasons, but since the banks are not borrowing, it has no practical effect. It is sort of an understanding between all of the people in the business that that means harder money if they raise it, and easier money if they lower it; isn't that right?

Mr. LUTZ. The rediscount process does not come into play until the banks are close enough to their reserve margins so that they have to transmit some of their earning assets to the central bank in order to build up their reserve position.

Vice Chairman PATMAN. That is right, and my criticism of the Open Market Committee is that it is composed of 4 members of the board when there are 7 members of the board; there are 6 now, and 5 representatives of the private banks, and the private banks have charge of the Open Market Committee now.

It is all done in the Federal Reserve bank in New York, as you know, and it is under the jurisdiction and direction of the Federal Reserve bank there. In other words, the private bankers are operating it, and when they buy a bond, say, of a billion dollars, they in effect go to the Bureau of Engraving and Printing and get a billion dollars of Federal Reserve notes to pay for that bond; is that not right?

Mr. LUTZ. That might be one of the ways they pay for it.

Vice Chairman PATMAN. Of course, in practice they give credit. It is all bookkeeping. But it is a charge on that money printed by the Bureau of Printing and Engraving. They have got to use something to buy the bond. The only thing they can use is created money. That money is created at the Bureau of Printing and Engraving.

Mr. LUTZ. As far as it consists of Federal Reserve notes, that is so.

Vice Chairman PATMAN. Well, that is what they use. That is all they can use.

Mr. LUTZ. You know more about that than I do, but my impression was instead of issuing to a member bank or to an individual any large mass of Federal Reserve notes they would probably give him a deposit credit.

Vice Chairman PATMAN. Yes, but if they wanted the money they would use the notes.

Just like when you borrow a thousand dollars from a bank, if you want the money they give you the money right now, although they did not create it right then like your deposit there. Just like if the bank calls for the actual currency it gets Federal Reserve notes.

Mr. LUTZ. I was not aware that the Federal Reserve banks issued notes except to member banks on their requisition, because the member banks feel that the people of the community want more folding money, and the notes are not entered into the Reserve bank's balance sheet until they are set up as a liability because of having been distributed to the member banks.

Vice Chairman PATMAN. Well they issue them, Professor Lutz, to buy Government bonds. Now, they do not always issue them, as you say. They just give the person from whom the bond was purchased, or the corporation is given credit, but if they want the money they get Federal Reserve notes for them. That is the only way they have to pay. That is the only money that the Open Market Committee has. They just create that much money whenever they buy a bond. And they create $25 billion worth of it to buy $25 billion worth of bonds. So, in effect, when you say Federal Reserve Board, you mean the Open Market Committee having the influence.

Mr. LUTZ. As the operating agent of the Board in this particular connection, the Open Market Committee.

Vice Chairman PATMAN. Mr. Vickrey, I believe you mentioned this morning that we need probably more stimulation in purchasing power; is that right?

Mr. VICKREY. Yes.

Vice Chairman PATMAN. Well, that we can run the risk of some inflation better than we can run the risk of some deflation?

Mr. VICKREY. Yes.

Vice Chairman PATMAN. That is the point you made?

Mr. VICKREY. That is part of it; yes.

Vice Chairman PATMAN. And I agree with you on that, but, therefore, why should you not agree with the statement I made in opposition to these new 3-percent bonds? You know that is just siphoning off more purchasing power from people who will use it to buy goods and services, and diverting it and turning it into the hands of people who will not use it for that purpose at all. They will just wait for another investment.

Mr. VICKREY. Well, I think I would probably agree with you at this immediate juncture, that perhaps this is not the time to attempt to lengthen Federal debt, although I would disagree as to the amount of effect that has.

In effect, the Government budget runs a certain deficit, and has to borrow the corresponding funds one way or another. It is going to get those funds out of the money market, assuming that the Federal Reserve takes no action to increase the amount of money in circulation, and it can get that money either by the way of long-term borrowing or by short-term borrowing.

Vice Chairman PATMAN. And you think that we should stay by the 2½-percent rate on 20 years, for instance?

Mr. VICKREY. In the short run, yes; for a longer pull, no.

By this I mean that this is not the time to attempt to raise interest rates. The immediate present is not the time.

Vice Chairman PATMAN. Yes, sir; I agree with you.

Mr. VICKREY. But I do believe that we should run such a deficit, that it would be necessary in order to keep the economy under control to close the throttle a little bit. That is after we get to a stage of full employment, and we begin to be threatened with a price rise. Then we ought to be in a position where the Federal Reserve could take action to raise interest rates, to go out into the money market and sell Government securities, take money out of circulation.

That action on the part of the Federal Reserve, or the Open Market Committee, can be taken much more rapidly than any action that Congress can take as a rule.

Vice Chairman PATMAN. Certainly. They are taking action every minute, I guess.

Mr. VICKREY. So the point I wanted to make was that unless there is steam under the boiler, unless there is a tendency for inflation to take place when interest rates are kept low, then there would not be any room for them to take action if the interest rates are already low and they wanted to do something about heading off a recurring recession, then you can open up the throttle——

Vice Chairman PATMAN. Now, do you think the Treasury might have had in mind the proposed road bond program where they expect to have 3 percent long-term bonds, and this is sort of a pattern for it? Do you think that might have been considered in issuing this 40-year 3-percent bond?

Mr. VICKREY. I do not really know.

Vice Chairman PATMAN. I notice the Treasury today for the first time has admitted something that the Treasury has never admitted before, about these 3¼ percent bonds. They say the conditions are different now. This is from the Washington Star which also says, "Conceding the 3¼ percent bonds did have some deflationary effect on markets, they insisted that other factors such as Federal Reserve Board policy also affected the market." It is the first time the Treasury has ever admitted, ever conceded, that those 3¼-percent bonds had a deflationary effect. The paper notes, too, that Treasury officials said 3 percent still indicates cheap money in comparison to other countries where 3½ percent financing has been common.

Is it your understanding that the only major power that has been charging as much as 3 percent, you might say the wholesale rate for money, was England, and England only raised the rate yesterday to 3½ percent?

Mr. VICKREY. Well, I am not quite sure that I understand.

Vice Chairman PATMAN. I say, isn't it a fact that the only major power in the world that has been charging as much as 3 percent for money, that is what we term the wholesale rate for money, is England, but it was only yesterday that England raised the rate to 3½ percent? Is that your understanding?

Mr. VICKREY. Well, when you say "England," is this an action taken in the way in which bonds are offered, or is this an action taken by the banking system in an attempt to control the situation?

Vice Chairman PATMAN. The Bank of England, as I understand it, raised the rate to 3½ percent.

Mr. VICKREY. Well, that would correspond more nearly to the open market selling bonds at a point where the rate goes up to 3½.

Vice Chairman PATMAN. But this article refers to other countries charging 3½, but I do not know of any other major country charging 3½ except England, and that was just last year.

Mr. VICKREY. I am not familiar with that.

Representative TALLE. In that same article, it is also stated that typically the bank rate of the Bank of England has relatively little effect on the commercial rates, and that the commercial rates in England would likely remain as before, or at least would not be affected by this action of the bank to a significant degree.

Vice Chairman PATMAN. Do you believe that is possible, Dr. Talle?

Representative TALLE. Yes, I think they did it for a specific purpose. They wanted to attract money from foreign countries into their country.

Vice Chairman PATMAN. Do you believe they can hold down their domestic rate and do that?

Representative TALLE. Well, I think the domestic rates will be determined by the supply of and the demand for loanable funds.

Vice Chairman PATMAN. Perhaps they can, but I have my fingers crossed on that one.

Dr. Galbraith, I wanted to ask you a question about this proposed road program. I wanted to ask you later on, I had just as well ask it now:

On these toll roads you pay about a cent a mile. If you use the average amount of gasoline that the average vehicle uses, about 13¼ miles to the gallon, that would mean at least 17 or 18 cents extra for every gallon of gasoline, would it not?

Now, have you evaluated this proposed road program to the extent that you can tell us what you thing about the proposals to encourage toll roads in the program?

Mr. GALBRAITH. Mr. Chairman, there are really two questions here. There is the question of the principle of the toll road.

Vice Chairman PATMAN. That is right.

Mr. GALBRAITH. There is also the matter of financing. That I understand is still undergoing revision in the executive branch.

On the matter of toll roads, I pretend to no very profound judgment. I have an uneasy feeling that the old idea of free roads may have been the right one, and that we are getting a rather messy situation of different levels of tolls and tollgates, and the time might come when we would have another free road movement.

We have been through that cycle once before. The old turnpikes, as you know, were toll roads. One of the great reform movements of the last century brought us free roads again.

But let me leave that aside. I do feel very strongly about the proposals that are being made in connection with the financing of this new program. I hope Congress will look at these very carefully.

I am not normally on the side of Senator Byrd, but I think he is right on this particular issue. There is a process of elaborate and, if I may say so, expensive self-delusion in this notion that special bonds should be issued for the road program, and that they should have earmarked revenue. The purpose is partly to keep the road program from bumping into the debt limit. The simple answer to that, if the roads are essential, is to increase the debt limit. The other purpose of this financing is simply to keep the debt out of sight. The administration of late has been busy inventing devices to this end.

I have said in my statement here that a good housekeeper does not like to sweep the dust under the rug, but she would a lot rather have the dust under the rug than on the dinner table. That apparently is the way the administration feels about the debt. It does not worry nearly so much about it if it can somehow keep it out of sight.

Well, the CCC loans are being gotten out into the banks.

Vice Chairman PATMAN. The RFC was broken out that way.

Mr. GALBRAITH. We are using insurance, contingent liabilities, and now we come to this thing. We are grown up; we can carry our debt like men. Perhaps, if you won't take me seriously, I might say we have a big debt worthy of a big country.

Vice Chairman PATMAN. Well, we could not have a gross national product as big as we have without it.

Mr. GALBRAITH. As I say, I am not serious on this. I am serious when I say that this self-delusion is childish, and moreover it is going to be expensive. We are going to pay more interest in order to borrow by special arrangement for the road programs.

Vice Chairman PATMAN. Well, we are doing it now through Commodity Credit. That is an example.

Mr. GALBRAITH. Now, the test of these things should be the old-fashioned test of how we get the most for the least—how we keep down the cost as much as possible for the service that we are getting. As a taxpayer I feel unwilling to pay these extra costs for this process of self-delusion. I think there is nothing whatever to be said for the proposals that are presently being discussed in connection with the road program, and I hope the administration will revise those proposals before it submits them to the Congress, and if it does not revise them, then I hope the Congress will reject them. I hope I am sufficiently definite on that.

Vice Chairman PATMAN. Yes, as definite as you can be, I think, under the circumstances.

I agree with you that if we are going to have debts they should be in the national debt and not try to hide them. It will cost us more that way, as you suggest, and on the road program I think if we put a small gasoline tax, 2 cents a gallon, on all of the gasoline used, if we use this report as the basis for the amount used, it is probably about as much money as we could spend, and we would pay it as we went along.

I have a statement here about this debt. I asked Secretary Humphrey to furnish me a statement of financial obligations guaranteed by the United States Government which are outside of the statutory debt limit, and I have the statement here, and, without objection, I will place it in the record. The amount of indirect and direct Government obligations will surprise you.

They aggregate in all about $294 billion. That is added to the $281 billion national debt.

I will put it in the record.

Of course, it includes obligations on bank deposits, Canal Zone bonds, United States postal savings, Federal Reserve notes—Federal Reserve notes are not carried in the debt limit, although they are a direct obligation of the United States Government; every note says so. Insurance in force; Federal deposit insurance, Veterans' Administration; the guaranties of private obligations, public housing, all those, and the commitments for future loans like Farmers' Home Administration, public housing, and all of the rest of them. They aggregate about $294 billion.

(The material is as follows:)

TREASURY DEPARTMENT,
FISCAL SERVICE,
Washington, January 21, 1955.

Hon. WRIGHT PATMAN,
House of Representatives, House Office Building,
Washington, D. C.

MY DEAR MR. PATMAN: In further reply to your letter of January 12, 1955, there is enclosed herewith a statement of financial obligations and guaranties of the United States Government which are outside of the statutory debt limit.

As you know, the type of guaranteed obligations included within the debt limit are those described by the House Committee on Ways and Means, as published in House Report 246 of the 79th Congress, 1st session, while those contained in the attached statement are authorized by numerous acts of Congress covering guaranteed loans, insurance, and other programs administered by various Government corporations and agencies.

Very truly yours,

E. F. BARTELT,
Fiscal Assistant Secretary.

LONG-RANGE COMMITMENTS AND CONTINGENCIES OF THE UNITED STATES GOVERNMENT AS OF NOVEMBER 30, 1954

The attached statements and schedules cover all major financial commitments of the United States Government, except the public debt outstanding subject to limitation and those involving recurring costs for which funds are regularly appropriated by the Congress and are not yet obligated, such as aid to States for welfare programs and participation in employee-retirement systems. It includes guaranteed and insured loans and mortgages and other pledges of the full faith and credit of the United States.

Caution should be exercised in any attempt to combine the amounts in these statements with the outstanding public debt in order to avoid double counting and misleading results, as explained in the following examples:

1. Deposits in the United States Postal Savings System on November 30, 1954, amounted to $2,154,089,600. Behind these deposits, however, were cash in depositary banks amounting to $30,600,398, public-debt securities having a face value of $2,140,318,080, cash in possession of the System, and other net assets. Deposits of the Canal Zone Postal Savings System on November 30, 1954, amounted to $6,475,135. These deposits were offset by public-debt securities with a face value of $7,100,000, and other net assets. The faith of the United States is pledged to the payment of the deposits made in the Postal Savings Systems and the accrued interest thereon.

2. The face value of life-insurance policies issued to veterans and in force on November 30, 1954, approximated $42,784,212,443. This does not represent the Government's potential liability under these programs. Some policies will be permitted to lapse. On those which are continued in force, the future premiums, interest, and invested reserves amounting to $6,472,104,000, should cover the normal mortality risk. The reserves are invested in Government securities, reflected in the public-debt total. The Government will continue, however, to bear the cost of deaths attributable to war service.

3. Under the Servicemen's Readjustment Act of 1944, as amended, loan guaranties up to 50 percent on each loan for the acquisition of farms and businesses, provided guaranties do not exceed $2,000 if for personal property, and $4,000 if for real property; and 60 percent for the acquisition of homes, provided guaranties do not exceed $7,500, are made to veterans. Such loan guaranties totaled approximately $9,618,000,000 as of June 30, 1954. These loans for the acquisition of home, farm, and business property are secured by the underlying assets and are being liquidated through installment payments.

SCHEDULE 1

United States direct obligations—bonds and securities which are outside the statutory debt limit as of December 31, 1954

Panama Canal loan of 1961	$49, 800, 000
Postal Savings bonds	34, 936, 860
Matured debt on which interest has ceased:	
Old debt matured—issued prior to April 1, 1917 (excluding Postal Savings bonds)	1, 376, 510
2½ percent Postal Savings bonds	1, 694, 300
First Liberty bonds	1, 323, 500
Treasury savings certificates	88, 100
Debt bearing no interest:	
United States notes (less gold reserve)	190, 641, 585
Deposits for retirement of national bank and Federal Reserve Bank notes	242, 264, 592
Other debt bearing no interest	5, 731, 733
Total	527, 857, 180

NOTE.—In accordance with sec. 21 of the Second Liberty Bond Act as amended by the act approved April 3, 1945, obligations guaranteed as to principal and interest by the United States are included within the statutory public debt limitation. As of December 31, 1954, such outstanding guaranteed obligations amounted to $33,942,186.

SCHEDULE 2

Unliquidated obligations as of June 30, 1954

Total as reported by Government agencies, exclusive of Post Office Department, against appropriations and contract authorizations:	
Department of the Army	$9,009,591,578
Department of the Air Force	16,019,068,931
Department of the Navy	11,252,998,941
Secretary of Defense	5,185,478,686
Other agencies	7,965,765,834
Total unliquidated obligations	[1] 49,432,903,970

[1] The amount of unliquidated obligations contained in this figure is a mixture of actual liabilities plus uncompleted contracts, purchase orders, etc., for materials or services as of June 30, 1954. Some of the uncompleted contracts may not be completed for 1 or more years and as of June 30, 1954, represent commitments for future deliveries of materials or services. The agencies have not been able to furnish the actual liability portion of the unliquidated obligations. The above figure includes unliquidated obligations of appropriated funds of Government corporations; does not include any of the liabilities or unliquidated obligations of Government corporations arising from the activities of their own or borrowed funds.

SCHEDULE 3

Securities and other liabilities of Federal agencies not guaranteed by the U. S. Government as of Dec. 31, 1954

Banks for cooperatives:	
Notes payable to commercial banks	$36,000,000
Collateral trust debentures	120,000,000
Commodity Credit Corporation: Certificates of interest (Nov. 30)	1,308,339,335
Federal home loan banks: Federal home loan bank obligations	272,000,000
Federal intermediate credit banks:	
Debentures	635,060,000
Notes payable to commercial banks	5,250,000
Total	[1] 2,376,649,335

[1] Excludes obligations due other Federal agencies.

NOTE.—Does not include privately owned Federal land bank bonds of $1,029,750,900 and notes payable of $15,195,040 as of December 31, 1954.

On January 11, 1955, the U. S. Treasury, on behalf of the Federal National Mortgage Association offered for cash subscription $500 million of notes of the Association.

SCHEDULE 4

Conditional obligations as of Nov. 30, 1954

A. Obligations issued on credit of the United States:	
Funds due depositors:	
Canal Zone Postal Savings System	[1] $6,475,135
United States Postal Savings System	[2] 2,154,089,600
Federal Reserve notes (face amount)	26,435,896,598
Total obligations issued on credit of the United States	28,596,461,333
B. Insurance in force:	
Export-Import Bank of Washington	227,878
Federal Crop Insurance Corporation	[3] 353,470,000
Federal Deposit Insurance Corporation	[4] 106,214,999,000
Federal Savings and Loan Insurance Corporation	[4] 22,602,000,000
Veterans' Administration:	
National service life insurance:	
Regular	39,004,359,087
Other	2,006,621,000
United States Government life insurance	1,773,232,356
Total insurance in force	171,954,909,321
C. Guaranties of private obligations, etc.:	
Commodity Credit Corporation	855,679,318
Export-Import Bank of Washington	107,285,460
Farmers' Home Administration	66,715,486
Federal Housing Administration:	
Property improvement loans	[5] 233,994,207
Mortgage loans	16,811,222,410
Foreign Operations Administration	[6] 37,822,800
Maritime Administration	658,333
Public Housing Administration	2,583,125,465
Secretary of the Treasury:	
Reconstruction Finance Corporation (in liquidation)	10,631,228
Defense Production Act of 1950, as amended	2,052,000
Federal Civil Defense Act of 1950, sec. 409	2,115,000
Small Business Administration	7,798,765
Defense Production Act of 1950, as amended	395,388,224
Veterans' Administration	[4] 9,618,000,000
Total guaranties of private obligations, etc	30,732,488,696

[1] Excludes accrued interest.
[2] Excludes accrued interest, and represents an estimated amount.
[3] Represents estimated insurance coverage for the 1954 crop year.
[4] Figure is as of June 30, 1954, the latest available.
[5] Represents the Administration's portion of insurance liability. Estimated outstanding balance of insurance in force is $1,420,451,674. Insurance on loans shall not exceed 10 percent of the total of such loans.
[6] Figure is as of Sept. 30, 1954, the latest available.

SCHEDULE 5

Other commitments as of Nov. 30, 1954

A. Commitments to make future loans:	
Commodity Credit Corporation	$646,060
Disaster loans revolving fund	2,361,825
Export-Import Bank of Washington:	
Regular activities	539,521,405
Defense Production Act of 1950, as amended	25,502,308
Farmers Home Administration	7,762,634
Housing and Home Finance Administrator:	
Liquidating programs	1,004,300
Loans for educational institutions	42,226,200
Urban renewal fund	84,122,240
Public Housing Administration	86,175,706
Rural Electrification Administration:	
Electric program	425,736,295
Telephone program	126,001,269
Secretary of the Treasury:	
Reconstruction Finance Corporation (in liquidation)	[1] 17,147,145
Defense Production Act of 1950, as amended	[1] 86,802,310
Federal Civil Defense Act of 1950, sec. 409	3,122,340
Small Business Administration	9,943,984
Total commitments to make future loans	1,458,076,021
B. Commitments to insure mortgage loans: Federal Housing Administration	3,145,481,351
C. Commitments to purchase mortgages insured by Federal Housing Administration or guaranteed by the Veterans' Administration: Federal National Mortgage Association	546,740,627
D. Unpaid subscriptions to capital stock of the International Bank for Reconstruction and Development (Dec. 31, 1954)	2,540,000,000

[1] Includes loans sold subject to repurchase agreement.

Mr. GALBRAITH. Could I make one further comment, Mr. Chairman, in that connection:

I have in my statement here a suggestion to this committee that it ask the Bureau of the Budget for just precisely this information. I hope the record will show that there was not any collusion between us, that it is evident that good minds run along the same channel.

Vice Chairman PATMAN. I think the latter is so.

Mr. GALBRAITH. I also addressed a comment to Mr. Talle. I have been, I am afraid, a bit severe on the administration in connection with this road program, so far as it has emerged.

Let me suggest to you, sir, that my comments reflect the stoutest traditions of the Republican Party. In the 1930's under the New Deal two proposals were made by the administration to the Congress to adjust the concept of the budget. One of them was the notion that we should shift over to the cash budget. The Republican minority at that time rejected that idea, mistakenly in my judgment, but it rejected it nonetheless.

Also in the 1930's Mr. Roosevelt proposed a budget; he proposed breaking the budget into current and capital accounts. This also ran into strenuous objection of the Republican minority. On this I think the Republican minority was right. I think the capital budget does conceal more than it reveals, and I think we owe a debt to the Congressmen and Senators of that time who talked the administration out of the proposal.

What I am saying is that the tradition of the Republican Party has been very austere on these matters, and I trust that it will continue to be austere and resist these efforts to keep the debt out of the budget—these efforts to deal surreptitiously with the debt. I hope it will continue in its old tradition of keeping the debt out where we can see it and facing up to it.

Representative TALLE. If I may answer that?

Vice Chairman PATMAN. Mr. Talle, it is your time to interrogate the panel, anyway. If you will just take over.

Representative TALLE. Thank you. I do not want to cut in on your time.

Vice Chairman PATMAN. No, sir; I have finished.

Representative TALLE. Just two comments, Dr. Galbraith: One, I do not believe in concealing debt.

The English for a long time have had the practice of concealing assets. That is much better, safer practice. Second, whatever reference you make to the finest traditions of the Republican Party has my approval, and I am willing to sing hosannas to those fine traditions.

Now, if I may refer in passing to what Mr. Patman said, not in the form of rebuttal except to state the discount rate of any central bank is certainly a variable thing. At the present time I understand the discount rate is 5½ percent in Denmark, 2¾ percent in Sweden, 4½ percent in Mexico, 10 percent in Greece and Ecuador; and if it is 4 in England there is obviously a wide variance in these countries. Some rates are lower, some higher, but those are matters that are often done for government reasons, and I understand the British want to attract money to London. They are interested in getting more dollars for one thing.

I am intrigued by question No. 6 among the President's recommendations. After that I have one other item I should like to deal with, but No. 6 was touched upon by Dr. Galbraith, and I should like to pursue it first.

It says: "Increase the present statutory debt limit to permit greater flexibility in the management of Federal finances."

As we know, the increase made by the last Congress was temporary. Perhaps that is a question that will not need very much discussion. I am sure that you gentlemen who are scholars in the field have made up your minds as to what should be done with reference to that, and I would appreciate knowing what you in your scholarly judgment think should be done.

May I start with you, Dr. Buehler?

Mr. BUEHLER. Surely. What question is that?

Representative TALLE. No. 6. Increase the present statutory debt limit to permit greater flexibility in the management of Federal finance. That is a recommendation made by the President in his Economic Report on pages 49 and 50.

Mr. BUEHLER. Pardon me. Then your question is whether permission should be given to increase——

Representative TALLE. Yes. Should it be done or not?

Mr. BUEHLER. Well, I believe in being realistic in a situation. If you put the teakettle on the stove the pressure is there, the lid is going to be blown off, and if the budget is being financed in such a way that the debt limit is necessary for the financing; yes.

I am answering my own question, in a way. Of course, that may be related to the question of whether the budget ought to be cut, and we should avoid borrowing by reducing expenditures. I am not sure that that is the question that you had in mind.

Representative TALLE. Yes; what you have said is relevant.

Mr. BUEHLER. Well, there are items in every budget, I know we have them in budgets at the local and State, as well as at the Federal, level, which are wasteful. Good management would eliminate such expenditures, and the Nation's resources could be utilized to better advantage.

Then there is the question as to the function or responsibility. Of course, the big money is spent because we undertake national-defense programs. It is not a question of whether we should spend for national defense, but what sort of a program we should have, and how far we should go in developing that program; or put it the other way, what is the essential minimium for defense and other expenditures?

Representative TALLE. The Secretary of the Treasury, Mr. Humphrey, has said repeatedly that he needs flexibility in the interest of good management.

Dr. Elder.

Mr. ELDER. Well, actually in the light of what I have heard here, irrespective of what my opinions might have been upon coming here, it seems to me that the budgetary limit does not mean very much. As I understand it, the chairman of the committee pointed out that the Government is obligated to many billions over and above the obligations that have been incurred under the conventional budget.

Representative TALLE. That is, in the form of contingent liabilities?

Mr. ELDER. That is right. Which obviously must be met, and those obligations must be paid.

Representative TALLE. The Government must pay its bills.

Mr. ELDER. That is right.

Representative TALLE. Dr. Galbraith.

Mr. GALBRAITH. I agree with Mr. Elder. I think the Federal debt limit is something of an anachronism and should either be lifted or abandoned entirely. In the last analysis, the volume of the Federal debt is settled by the taxes that are raised by the authority of Congress, and the money spent under the authority of Congress. It is not set by the Federal debt limit. If we are honest with ourselves I think we will conclude that in the last 20 years the Federal debt limit has been used only for one purpose: It has been used by the minority party to bedevil the majority party, and for no other useful purpose. We have had a lot of fun at it. We have enjoyed it. But I think that probably the time has come when we should give up our pleasure and get rid of the thing.

Representative TALLE. Thank you. Dr. Groves.

Mr. GROVES. I agree that the debt limit does not serve a very useful purpose at the present time. I do not go along with the view that the size of the debt is of no importance at all. It seems to me that it is of some importance, if for no other reason than that debt management is more severe as the debt gets larger. But I am inclined to think that this consideration is not major. The fact is that the growth in wealth and income is one of the dimensions of the debt, and really is more important than the size of the debt itself.

I certainly agree with the remarks that have been made to the effect that there should not be a surreptitious increase in the debt. In any case where borrowing creates a burden on future Federal tax revenues, the data should be included in the debt statistics. The new highway program does create such a burden.

Representative TALLE. Thank you.

Dr. Heller?

Mr. HELLER. By and large I would concur with what has already ben said. It may be worth adding that some of this mischief of taking some debt items out of the public debt and some expenditure items out of the budget in the past couple of years has simply been a response to the squeeze put on the administration by the debt limit. For example, the expansion of off-the-budget financing of CCC support loans by $1.2 billion in the past fiscal year was largely a case of necessity being the mother of invention.

The financing of those by the regular type of debt would have pushed our Federal debt through the limit. So, apart from the other objections that have been mentioned to the debt limit, it leads to mischief in financial reporting and financing.

Representative TALLE. Thank you.

Dr. Lutz.

Mr. LUTZ. Mr. Chairman, Mr. Talle, I find myself in the minority once more.

I think there is virtue in a debt limit. True, we have never tested it because whenever we get into any trouble in trying to spend more than we are willing to provide we raise the debt limit, but I think there is genuine virtue in saying we are not going to go beyond this point.

Now, I will tell you why we go beyond that point, and why we are up against it now in connection with the proposed road program, and if that gets through then there are a half-dozen others right around the corner that are going to be brought forward by one or maybe both parties in Congress in order to expedite certain current benefits.

The reason we have to go outside of the debt limit, or outside of the budget, is that we want to spend more, right now, in a hurry, than we are willing to pay for right now in one way or another, and I would say that if we have to engage in a great national highway program, or a great national school construction or hospital or housing or any other program, that the limit to the annual expenditure on any of those programs should be the amount that you can get inside of a balanced budget.

We do not have to build the highway program in 10 years; we can take 20 years for it, and here is another reason why I do not think we should pile up a mountain of debt: It is not as if once we built a new set of roads, or rebuilt the old set, we would have the job done from now on. By the time we get around the circle with our 40,000 miles of highway you are going to have to start rebuilding the first batch of them, and if we borrowed for the first batch and have not done anything about the debt we are going to have to borrow again when we start rebuilding them.

The end of that road I do not need to describe to you. You know what it is.

So I say that on any of these programs, assuming that they are sufficiently important to have the Federal Government participate in them in any substantial degree, that it should be done only at a rate and on a scale that can be financed currently.

Now, I think that the chairman referred to the embarrassment that the Treasury finds itself laboring under on account of the present debt limit. We proposed as a policy of the National Association of Manufacturers a year or so ago, a margin of six or eight billion dollars that would give them enough leeway within that limit, and this does not refer to concealing indebtedness, Mr. Patman. What we proposed was that the tax anticipation certificates issued and maturing within a given fiscal year should not be included in the debt limit, and for this reason: A tax anticipation certificate is nothing but a receipt for prepaid taxes and, therefore, since it will be retired in the other part of the Government's fiscal year out of the tax cash payments by the individual or company that has acquired those certificates, it does not mean a permanent addition to the public debt.

Of course they should never be refunded. They should never be carried over to the next fiscal year.

The only thing we are worried about, and the reason we want a debt limit, is to avoid this continual addition to the public debt, and a tax certificate is not of that nature, when they are treated as they should be, which is a tax paid 3, 6, or 9 months in advance of when the law says that tax is due.

So I think we take an awfully long, deep step into the unknown if we start talking about getting rid of the public-debt limit, or any kind of finagling by which you can set up a lot of direct obligations of the Government outside of a limit that is intended to be a limit.

So to these contingent liabilities, Mr. Patman, if you view them realistically, we know that the Government is, in all likelihood, in the position where it will never have to meet anything like $294 billion of obligations. The thing the Government will have to do is be in a position to liquidate such obligations for housing, or insurance, or any of the things as may enter into contingent liabilities. In most cases the Government may not have to put up taxpayers' money in order to cover any shortage there.

Therefore, I think we ought to view those so-called contingent liabilities in a little different way than we would the hundred percent complete direct obligations of the Federal Government, because there is nobody else that is going to do anything about those, as there is in the case of mortgages, and the bank deposits, and the Federal Reserve notes, and so on.

Vice Chairman PATMAN. Well, the Federal Reserve notes are not carried in the national debt, and they are direct obligations.

Mr. LUTZ. I know. But I understood you to refer to these as part of the contingent obligations.

Vice Chairman PATMAN. They are listed by Secretary Humphrey, but they are direct obligations like any of the national debt.

Mr. LUTZ. Yes. But so are the greenbacks.

Vice Chairman PATMAN. That is the greenbacks.

Mr. LUTZ. I mean the old United States note.

Vice Chairman PATMAN. Yes; they are.

Mr. LUTZ. Well, the silver certificates are, too, as a matter of fact.

Vice Chairman PATMAN. Certainly they are.

Representative TALLE. Thank you.

Shall we hear from Dr. Vickrey?

Mr. VICKREY. Briefly, I also feel there is no virtue in the statutory debt limit, or for that matter in placing the debt in different categories, separating tax-anticipation certificates, Federal Reserve notes, greenbacks, or what have you. They are, I think, all in the same category as far as their economic effects are concerned, and that is the important thing.

Representative TALLE. I surely appreciate this response to my question.

Mr. BUEHLER. Might I supplement my brief remarks?

Representative TALLE. Surely.

Mr. BUEHLER. I think there is some usefulness to this debt limit. You know, the American Government is rather peculiar in having hearings and discussions on taxes, on the budget, and on monetary policy. I do not know too much about the foreign practice, but I think we are one of the few countries that has open hearings.

Now, as to this question of the debt limit. It provides an opportunity periodically to review and discuss the problems of the budget. It has the advantage of requiring a reappraisal of the changing financial situation and bring the issue out in the open. This is not the issue of the debt limit, basically, but the question of whether we should undertake the road program and other projects, and if we are going to undertake them, how we are going to finance the programs involved.

Representative TALLE. If the Chairman will permit me, I should like to turn to capital formation for small business.

Vice Chairman PATMAN. Go right ahead, sir.

Representative TALLE. In years past, at least years ago, a corporation could engage in some economic activity and a large part of its gross profits could be plowed back into the business, and so the business grew by being successful. The excess-profits tax bore very heavily on business, and particularly small business. Much business in Iowa is small. Most business generally is small, and I am reminded frequently that the excess-profits tax bore heavily on small business. It was dropped a year ago.

Even so, under the very high corporation tax there is not enough left after the tax is paid so that it would make much difference whether the remainder is plowed back in the business or not. At least the take by the Government is so large that small business comes to Congress for help, and in lieu of the RFC we set up a Small Business Administration to meet their needs. In other words, small business comes to Government to borrow from a fund it has, in effect, been forced to pay tax money into.

Under the former plan, the corporation could make its own decision, but under the loan plan whoever administers the Small Business Administration has something to say about whether there shall be expansion or not by granting or denying the loan. The corporation itself cannot make the complete decision.

Now as I have said, a part of the money that is borrowed, if indeed the loan is approved—it seems to me it is much easier to get a 2 or 3 million dollar loan for somebody than to get a loan of $10,000—was paid as a tax by the borrower. If growth is stopped, the growth that would have occurred without the high tax does it not appear that that is a rather damaging tax, both as to healthy business expansion and the creation of jobs that goes with expansion?

Vice Chairman PATMAN. It was repealed nearly a year ago, Mr. Talle.

Representative TALLE. Yes, it was dropped a year ago, January 1, 1954. But the corporation rate is still very high and bears heavily on small business, I would say.

Vice Chairman PATMAN. I want to make the record plain that, although I am in favor of a balanced budget, there are certain conditions under which I would be in favor of deficit financing, if unemployment becomes a problem and it was necessary to have deficit financing to solve the unemployment problems and to carry out the mandates of the Maximum Employment Act. We have seven members of the panel here and we would like to hear from you, gentlemen.

You are all acquainted with these other questions. We have covered 1, I believe, and there are 7—6 more, and if you gentlemen will just elaborate on the answers to these questions, your own views, around 5 minutes each, it would be appreciated very much.

Let's see, we will start down here with Mr. Vickery, and go up this way.

Mr. VICKREY. Well, under changes in tax structure, back in 1938, I think it was, Henry Simons made some rather caustic reference to the business of digging deep into high incomes with a sieve. Since then we have dug more deeply but the sieve has gotten bigger and better and different sizes and shapes of holes in it. Just generally speaking, I think we do need to think about the whole tax structure and how to make it make a little bit more sense.

The tax treatment of corporations badly needs overhauling. The recently enacted dividend credit does serve to moderate very slightly the differentials between corporations and other forms of organizations, but as a means of doing anything substantial toward dealing with this problem, it seems to me this is a dead end, because to equalize the burden, the credit would have to be several times higher than the level that it is proposed to reach in the presently enacted legislation. It is easy to see that this can never take us very far toward an equalization of the burden as between incorporated forms and unincorporated forms of business. This needs some form of recognition of the difference between corporations that accumulate earnings and corporations that do not. I have a rather extended proposal in this direction which I think it is not appropriate to elaborate here.

Again, the President's Economic Report speaks of the free flow of funds into investments, implying that this must wait until tax reductions become feasible. In the capital gains tax we have a chance to encourage the free flow of capital by raising tax rates and exempting. A taxpayer puts his money in a venture. His interest in the venture has increased greatly in value, and under the present law if he turns his funds into a new venture, he will first have to pay a 25 percent capital gains tax. That is not the worst of it. The fact is that if he holds on to that interest in one way or another until he dies, he can escape taxation entirely. Whereas, if we require some final accounting by the taxpayer at the time of his death, and payment then of a capital gains tax on the gains thus revealed, the deterrent to his shifting his investment from this now mature and well-ripened investment into some new investment would be merely the fact that he would have to pay the tax now, rather than later on, and that would not be such a serious deterrent to the free flow of funds.

Another step in the same direction might be taken with respect to the tax-exempt bonds. A great deal of the funds of high income taxpayers are now locked up in tax-exempt bonds which really belongs in equity investments of various kinds. And I would suggest that we might remedy this situation without unduly disturbing the market for such securities by converting the exemption into a tax credit, the tax credit being at such a rate as to maintain, approximately, the market value of such bonds, and this would operate in such a way as to encourage high income taxpayers to get out of these investments and turn these over to lower income taxpayers and release funds in this way for equity investment.

On the excise taxes——

Vice Chairman PATMAN. I did not get your point there, how you would get the wealthy people in the high-income brackets to stop buying tax-exempt bonds?

Mr. VICKREY. Well, now, you see, a person in the top brackets gets an exemption from a 60- or 70-percent tax by buying tax-exempt bonds.

Vice Chairman PATMAN. You see, the basic question there is whether or not you can disturb those tax-exempt bonds, isn't it?

Mr. VICKREY. There may be a constitutional question there.

Vice Chairman PATMAN. There is, a serious one.

Mr. VICKREY. And that is a question I would not want to address myself particularly to.

Vice Chairman PATMAN. Well, that is the one that stops the whole deal, I think.

Mr. VICKREY. But the one that is more likely to stop it in practice is the practical argument that if you disturb this exemption you will be making it more difficult for the localities to borrow and you will be upsetting capital values and all that.

Vice Chairman PATMAN. Thank you very much, and we will get back to you again when we go through the panel.

Professor Lutz, please.

Mr. LUTZ. Mr. Chairman, I will concentrate my remarks in this limited period to question No. 2, which really includes 7 or 8 questions in itself. What changes, if any, should be made in the tax structure with regard to preferential treatment of dividends? We in the National Association of Manufacturers have gone along with that proposal, but, frankly, I think we must recognize that the seriousness of that question is due almost entirely to the present high rates of individual income tax, and if we can get those rates down to a reasonable level, then the principle of the issue is not resolved, but the seriousness of the practical application of it greatly diminishes.

Depletion allowances, yes, we approve those, and we do so without venturing into the specific detail of a particular percentage rate of depletion for any industry, but the principle of allowing depletion, certainly in the more hazardous and speculative type of industry, where you never know what is under the ground until you dig a hole, is eminently sound.

Capital gains; we think that the rate of tax on capital gains could very reasonably be reduced. I think even the present rate of tax has probably prevented a considerable amount of shifting into more venturesome enterprises that might have been allowed to go on if you had not had that much of a deterrent.

On family partnerships we have no position and I have no opinion, because it is a peculiar aspect of the tax situation that we have not had occasion to go into.

Questions E and F, as to whether to raise the exempt limit or change the rates of income tax up and down, I would answer very definitely that the first move should be to reduce the income-tax rates. You would use up more tax-reduction tickets in a very small increase in the exemption than you can afford to use up in that way when you consider the relative seriousness of releasing the brakes on invention and enterprise and initiative, thrift, and aggressiveness in promoting the economic growth of the country on which we all depend for our future.

With respect to excise taxes, I again would probably be in a minority here because I believe there is a very definite place in the Federal revenue structure for a broadly based system of Federal excise taxes, and in our tax program which has been submitted for the record, you will find our views on that set out in some detail.

As to the matter of estate taxes, again my personal view is, and that is the view of the association that I am representing here, that the whole field of estate and gift taxes should be relinquished once more to the States where it was begun and developed and where it could be a substantial source of revenue, whereas in the Federal revenue picture it is about 1 percent.

Vice Chairman PATMAN. On that point, Professor Lutz, wouldn't you have this situation prevail, that each State would be competing with the other States on having low rates or no rates? I remember one State advertised all over this country at one time: Come to this State and you will have no estate or inheritance taxes, and no income taxes. They have it written into their constitution.

Mr. LUTZ. I remember, Mr. Patman, when this matter came up after World War I, the National Tax Association, in which I was rather active at that time, had taken the position on numerous occasions that the whole estate-tax field should go back to the States. The reason it was not done and the source of the 80-percent credit in the act of 1926 was the opposition of New York, Pennsylvania, and 1 or 2 of the States of the eastern seaboard, who raised precisely that point.

Now we have heard a good deal in the course of today about the financial difficulties of some of the—well, I do not like to use the word "poorer States"—but those with less well developed economic resources than other States, and I cannot quite believe in the present condition of State and local finance that there would be any State that would go as far as to offer complete exemption from death taxes unless they felt that they could attract enough wealth in there so that by income taxes or some other method they could pick up as much or more as they would out of the death taxes.

I do rely on the competition of the States to avoid the kind of excessive rates on estates at death that we now have in the Federal law. More than that, however, I think it is of very great significance in the whole State fiscal picture to have this additional revenue or this additional revenue source, and I do not think it makes any difference to the Federal Government at all, as far as the Federal budget is concerned.

Vice Chairman PATMAN. Thank you very much, Professor Lutz.

Mr. Heller.

Mr. HELLER. Mr. Chairman, I would like to comment very briefly on 2 or 3 things. First, with respect to the sixth of the committee's questions regarding the comprehensiveness of the budget, I would just like to note that the budgetary developments on highways and so forth are still in their opening stages, as far as the different methods of financing and accounting are concerned. As we move further into them, I think it is important to do three things: First, to maintain fidelity in showing the costs and the debt of Government; second, to promote accuracy in the economic interpretation of Government deficits and surpluses; and third, to make sure that if we decide to adopt capital budgeting in this country, we make our decision a conscious one rather than something done piecemeal on the appeal of particular programs like the highway program, the TVA, and the other things that have been proposed for separate financing.

Secondly, I would like to comment on the tax structural question, No. 2. Perhaps to conserve time I might read a few sentences from my statement:

> One is disappointed to find in the administration's documents no expression of concern and no proposal for action to counteract the growing erosion of the income-tax base. This point Mr. Vickery mentioned about dipping deeper and deeper with a sieve has reached alarming proportions.
>
> It was not unexpected that a great flood of liberalizations in the tax structure to stimulate business incentives and provide tax reliefs to individuals was vigorously pushed through last year. But having attended to these myriad adjustments (with only very minor loophole-closing efforts), the Treasury might have been expected to turn its attention to such gaping holes as the tax exemption of State and local bond interest, excessive percentage depletion, the failure to recognize capital gains at death, and various income-splitting devices such as family partnerships. Some of these gaps, surely, must offend the Treasury's sense of fairness and even-handedness in the application of the income tax.
>
> At the same time, the Treasury would find much sympathy for its undoubted view that top-bracket rates of 70, 80, and 90 percent are unrealistically and damagingly high. Even under a policy permitting of no revenue loss, a combined program of cutting back the top rates and offsetting the modest revenue loss by restoration of the base would have been very much in order.

And I would hope that steps along that line would be taken.

Third, may I comment briefly on the level of taxation. Underlying some of the discussion here today has been a rather persistent suggestion that the country can afford more defense, more technical assistance and foreign aid, more school programs, more highway programs, and so on. One asks oneself why, in the last analysis, those programs are not endorsed and recommended by the administration. Judging by the Treasury's pronouncements and the President's statements in his budget message relating to the damaging effects of taxation, I think the answer traces back directly to the fear of the damaging economic effects of high taxes.

Now what evidence exists to support this fear that high taxes will have such serious disincentive effects and will so weaken the sinews of our economy that we ought to tailor our defense and development programs to these presumed dangers of taxation?

No conclusive evidence exists, so no firm answer can be given. But it is worthwhile to point out that the most extensive study that has ever been undertaken of this subject, namely, the Merrill Foundation project at the Harvard School of Business Administration under the general direction of Prof. Dan Throop Smith concluded more or less as follows——

Mr. GALBRAITH. If I may interrupt, is that by any chance the Professor Smith who now has some association with the Treasury?

Mr. HELLER. Yes, thank you for this clarifying question. He is Assistant to the Secretary of the Treasury in connection with tax matters. The basic conclusion of the project as to taxes and investment incentives could be characterized essentially as follows:

If the underlying market strength for the products of industry exists, even the comparatively severe tax rates of recent years do not seriously inhibit investment and productive incentives. Or rather than take the chance of paraphrasing incorrectly, let me quote directly the conclusion presented by the associate director of the project, Prof. Keith Butters:

> If a general statement has to be made in flat, unqualified terms, the striking fact is that, by and large, the tax structure seems to have had only a relatively limited and specialized impact both on the basic incentives which motivate the private economy and on the structure of the economy. The effects of the tax structure on the aggregate levels of employment and real income realized over the last 10 to 15 years have been even more limited, as is obvious from the record levels achieved in both employment and income during this period.

But this is a question that is open to a great deal of difference of opinion and difficulty of measurement. Therefore, I respectfully suggest that the Joint Economic Committee create a subcommittee (drawing especially on its members who are also members of the two taxing committees) to make a thorough study of the economic effects of the tax structure. Such a study should, if possible, cover both the economic effects of the disparities in tax structure about which the panel has spoken and the economic effects of the overall level of taxation. If this were undertaken soon, it could make a very valuable contribution to tax legislation, especially next year.

Vice Chairman PATMAN. Thank you very kindly.

Mr. Groves.

Mr. GROVES. Mr. Chairman, I went along with the proposition which was suggested by Dr. Galbraith that we should not have hidden debt, and I also take the position, by and large, that it is as bad to have hidden subsidies in the tax system. If we must have subsidies, it is better usually to have them open rather than hidden. If it be true that the discovery and exploitation of our natural resources requires a subsidy (which I doubt) it would be better to grant it directly than hiding it in the tax system. I take it the depletion feature which allows a taxpayer to deduct the value of his assets several times over could quite reasonably be interpreted as a hidden subsidy in the tax system.

Nothing has been said about the dividend proposition which was mentioned in the questions and I will say a few words about that. I was one of those who took the position that there is a valid consideration of equity involved in the so-called double-taxation argument, but I am not in favor of the dividend-received credit that was enacted by the last Congress. I think it should be recalled, for two reasons: One economic and the other a matter of equity.

As to the economic one, I would say that the response of private investment to the tax incentives which were given in the last Congress, particularly in new capital of business enterprise, has not been of the magnitude to absorb large increases in the incomes of large taxpayers. Considering this and the present level of the stock market, I conclude that the repeal of the excess-profits tax and the changes in the rules with regard to depreciation (which I support) are all the business tax relief which is economically warranted under present circumstances.

As to the equity matter, I think that structurally the dividend-received credit stepped off on the wrong foot. On the assumption that only right rules of taxation are likely to show any stability for the future, I predict that this innovation will prove to be a bone of contention for a long time. Objections to the dividends-received credit in terms of equity are, first, that it violates the fundamental rule that the measure of a personal tax should include all of an individual's personal income. If a corporate tax is to be considered a tax collected at the source for the individual, then that corporate tax, as in the case of wages and salaries, should itself be part of the tax base.

It is a complicated point, but I think it goes to one of the fundamental differences between the dividend-received credit and the dividen-paid credit.

The second point is related to the first. The degree of doubling in the corporate and personal tax, decreases as the bracket increases, and thus is not recognized by a dividend-received credit. The final point is that in the case of certain corporations, notably public utilities, where the tax is more or less automatically shifted on to the consumer, there isn't any doubling.

However, I do not think there is any solution for this problem as long as American business takes the position that a differential tax, differential as between undistributed and distributed profits, is unacceptable.

I might say just a word about the excises. I think some of them are pretty bad, particularly the excise on communications and transportation, and that they should be retained in the tax system only with an uneasy conscience. But probably their repeal can wait until a time more favorable from the standpoint of the public needs of the country and the economic situation.

I would hope that some attention might be given to the estate tax at long last. That it is very much in need of attention most impartial critics will concede. But the last answer to the problem would be to turn it back to the States. The States and subdivisions of the country are vulnerable to a very persistent problem of tax competition. They are constantly under pressure of taxpayers threatening to move and in some cases of taxpayers actually moving because of the tax rates.

Incidentally this is the most valid ground for the expansion of Federal aid. The Federal tax system imposes a blanket levy over the whole country, but the States always have to go out on a limb whenever they increase tax burdens.

Vice Chairman PATMAN. Thank you.

Mr. Galbraith.

Mr. GALBRAITH. Mr. Chairman, the previous witnesses, Mr. Groves, Mr. Vickrey, and Mr. Heller, covered a number of points that I would have covered. In the interest of conserving the committee's time, I will just pass those by. I will also say that these men speak with more authority on tax matters than I do so that the committee will not have missed anything by my omitting them.

I am going to confine myself to just two brief points. I mentioned before the question of taking the debt outside of the budget and of the cost of doing so. This practice is not confined to the debt. The private leases negotiated by the post-office system are the same sort of thing. I also suspect that a careful examination would show that they are costing the Federal Treasury more money than the old-fashioned system of borrowing it and building post offices. Many other such devices are being invented for ostensibly shifting responsibilities away from the Government.

I view with some concern this whole development. It is based on the assumption that it is worth spending the taxpayers' money in order to do things in a particular way.

The old-fashioned test was efficiency. The Government did those things for itself which it would do most efficiently. It left to private enterprise the things that private enterprise would do at the lowest cost. Just as there is no case to be made, in my judgment, for the socialist view that the Government should enlarge its activities willy-nilly, so I do not think there is any case for shoving things out to private concerns if the result is higher cost.

We have had a number of manifestations of that in recent times. We have talked about several of them today—private leases of the post office, the shoving out of the Federal debt. We have all heard the name of Dixon-Yates.. I hope that we will get back quickly to the old rule of doing things at the lowest cost, regardless of questions of ideology.

The other point I want to make concerns the proposal to reduce taxes by 14 percentage points on overseas investments. It is a recommendation of the Randall Commission. I would hope that the Ways and Means Committee would look very carefully at that proposal. It is assumed that this will stimulate investment abroad. It was so assumed in the Randall Commission's report and it is so assumed in the report of the Council of Economic Advisers. That assumption, I think, is unexamined. I do not think it is more than an assumption. And in my own judgment it is an implausible assumption.

My own guess is that capital responds to profits. When profits are high, it will go abroad. When profits are inadequate, it won't. I also suspect that one of the reasons we have not been a great exporter of capital on private acount has been that domestic investment has, generally speaking, been more profitable than foreign investment, and a good thing, too. The private investor will send his money to Abyssinia if he can get more on it with the same security than he can get in Texas or Arkansas or Iowa or Missouri.

Representative KELLEY. And Pennsylvania.

Mr. GALBRAITH. Of course. But if he can get more in those areas, that is where the money will go, and this is the decisive question, not the matter of taxes.

Now the Randall proposals, if they are properly hedged in, if they are not made retroactive, which I assume they would not be, would not cost the Treasury much, but I think it would be a great mistake if it raised false hopes that this would stimulate the export of capital.

Vice Chairman PATMAN. If money is invested in England, can an investor draw that money back without difficulty?

Mr. GALBRAITH. As far as exchange control is concerned?

Vice Chairman PATMAN. Yes. I thought they had some restriction on capital coming out of England.

Mr. GALBRAITH. Well, you would have to get a Treasury license. However, if it were new investment—if it were postwar investment—my impression is you probably could get a license. I am not an expert on that.

Representative MILLS. Mr. Patman, I will make this observation: I do not know about England, but I do know that there are sufficient profits being brought back to the United States in the year 1954, for example, from investments abroad that the 14-point differential in tax for that year would have resulted in a loss in revenue to the Treasury of $147 million, according to the Treasury estimate, so profits are coming from some foreign sources, at least.

Mr. GALBRAITH. That would be if it were granted to past investment.

Representative MILLS. Existing investment; that was the way the proposal was last year and as it passed the House.

Mr. GALBRAITH. It would have applied to past investment.

Representative MILLS. Yes.

Mr. LUTZ. Mr. Chairman, the only way you can get profits earned in a foreign country back into this country is to be able to use the pounds or francs or kroner in that foreign country to buy a dollar draft on New York, let us say, and if there are no dollar balances available in that country, I do not see how anybody over there—the Treasury or any private bank—could sell you a dollar draft, unless they first borrow the money over here which they use to sell you that draft.

Vice Chairman PATMAN. I was referring to Dr. Talle's statement that the rate was raised in England to attract outside capital—foreign capital. I assume that they would expect to get a large part of that capital from the United States, and I was just wondering if they would not have difficulty getting it back once it was over there.

Representative TALLE. It was stated in the article I read that probably one reason for that rate was to attract money from us. Dollars were involved, but as to the second point, I cannot say. I will say, though, that when other matters have been cleared up, I would like an expression from the panel on the item that was just referred to, with respect to the second provision of the President on the 14 points.

Vice Chairman PATMAN. Yes; we will get to that.

Thank you, Mr. Galbraith.

Mr. Elder.

Mr. ELDER. Mr. Chairman, with regard to most of these points relating to areas in which the Treasury is losing revenue, I would agree with Mr. Vickrey, Dr. Heller, Dr. Groves, and Dr. Galbraith—particularly under the categories labeled A—that is, having to do with preferential treatment of dividends; B, depletion allowances for extractive industries; C, the taxation of capital gains; D, family partnerships; and H, the estate and gift taxes.

Then I would add to them, as 1 or 2 other members of the panel have, the tax-exempt State and local bonds, and then the split-income provisions which have been applied in several areas.

Reference has been made earlier to the need for balancing the budget. I do not think that there is any question but that if preferential treatment under these various categories had not been extended by Congresses during the last 10 or 12 years, that the Treasury, at present rates—that is, at the present corporate tax rates and the present personal tax rates—would be receiving from 3½ to 5 billion dollars more revenue than is now likely to be forthcoming. That very fact in itself would, it seems to me, in effect, eliminate the need for some of this discussion we have had with regard to balancing the budget.

We had a deficit last year. I believe we anticipate a deficit this year of approximately $4 billion and something in the nature of 2 to 4 billion dollars next year.

Now this raises a number of other questions, too. I agree with Dr. Heller that assuming there were equality of treatment, as far as these various areas were concerned, that it would be feasible to think in terms of lowering the top bracket rate in the personal income-tax structure, lowering it conceivably to 60 percent.

I think from the standpoint of income that the Treasury would be much better off with a top rate of 60 percent, if at the same time we could look forward to eliminating the favored tax treatment in these several categories I referred to. But I would like to comment on 1 or 2 items that have not been dealt with adequately, at least from my point of view.

There is a reference to the raising of the exemption limit. Dr. Groves referred earlier to his belief that raising the exemption limit would be a very costly business. I think we all recognize that, but it is my understanding, and I think it is generally the understanding of people who are very much in favor of the income-tax principle that exemptions were established in the first place with some relation to maintaining a reasonable minimum standard of living. That does not seem to be the case in 1954 with an exemption of $600. Certainly for an adult taxpayer $600 is inadequate.

I think I should say, further, that I recognize each increase of $100 costs $2½ billion in revenue loss, and reference has been made to the possible inflationary effect of an increase of $100 or $200. If there is a real desire to do something in the way of raising the exemption to help the people that really need help, it can be done in such a way as to mitigate the inflationary effect and even to lessen the possible loss of revenue.

If, for example, instead of raising the exemption $100, the tax relief were given in the form of a $20 tax credit in lieu of each $100 raise in the exemption, that would certainly relieve your low-income-group taxpayers and at the same time would lessen the possible loss of revenue.

That would be one way of taking care of that. There obviously are other suggestions that might be just as practical.

On the matter of changing the rate of income taxation either up or down, I referred earlier to my belief that if you had an upper limit of 60 percent that was generally applicable, it might be more practical than the top rates that you have now. On the other hand, at the lower rate it seems obvious that a 20-percent beginning rate on the first $2,000 of taxable income is too high. It might have been justified at one time, but we should be looking forward to the time when we should be considering a beginning rate, perhaps by establishing a $1,000 bracket and assume that we can start with a beginning rate of 10 percent or possibly 15 percent.

In any case, a 20-percent beginning rate on first-bracket income works a very definite hardship on your low-income taxpayers and I have a feeling in this connection that we are too prone to think solely in terms of the Federal taxpayer. If we look at the picture as a whole, if we take into account State and local taxes, I think we have to recognize that the State and local tax systems are becoming increasingly regressive and are being borne in a disproportionate manner by the people in the income groups below $5,000. In that connection I was very much interested, Mr. Talle, in your reference to the fact that a high corporate income-tax rate is really burdensome for small corporations.

That may be true, and I recognize a very serious problem. By the same token I think we also recognize that in those areas where the large corporations dominate, and those areas are quite extensive, the corporation tax might be regarded as more and more of a consumer tax—a tax on the consumer rather than actually a tax on the corporations that pass the money over to the Treasury. I think it is pretty generally accepted that as the corporation tax continues, a larger and larger proportion of it, is incorporated into the price structure and that is particularly true in those areas of business which are controlled by large corporations.

That is about all, Mr. Chairman, that I care to say.

Vice Chairman PATMAN. Thank you, sir.

Mr. Buehler.

Mr. BUEHLER. Mr. Chairman, I would like to comment on 2 or 3 points, if I may, one following up on Dr. Elder's remarks, and also relating my remarks to what Professor Groves said about the taxation of dividends.

This so-called double taxation of dividends is related to the question of the incidence of the corporation tax. Is the tax shifted or isn't it?

The orthodox opinion had been for many years, I think, that the tax was not shifted. There seems to be a growing opinion among economists and business people that there is shifting of the tax but there is no agreement on how much is shifted. Of course, if the tax is entirely shifted, there is no double taxation, in the economic sense, and the tax acts like a sales tax. It has no exemption for food, clothing, or anything else, and, therefore, if one is opposed to sales taxes he should argue for the removal or moderation of the corporate-income tax.

If it is assumed that corporate-income tax is not shifted, then you are in a different position because in an economic sense there is double taxation, there is an inequity there which falls on the stockholders, or at least on the common-stock holders, and it is not wiped out entirely by the capitalization of the tax discrimination. Prices of stocks in the market are affected by many things, and certainly are not closely correlated, with the differences in taxing dividends and other income.

So I have felt that there has been inequity in the treatment of dividends. Instead of a matter of preferential treatment, it seems to me to be a problem of correcting an inequity.

I cannot think of any good reasons, as my mind goes back over history, why dividends were considered pure profits and this so-called double taxation arose. We allow interest to bondholders, rentals on leased property, and payments of wages and salaries, as expenses, but we allow nothing as an interest return on the capital of the shareholders in computing corporate net income. We got deeper and deeper into the tangle of double taxation as the corporate and personal income-tax rates increased, and when we wanted to do something about it, we found that large amounts of revenue were involved.

There is much to be said for the British system. The last time I checked there was a corporate rate of 47½ percent, which was about midway in their personal-income-tax rate, and apparently the British consider that there is no shifting of the tax on corporation income, or they look at it as a method of withholding an income tax from the individual. So dividends are considered to be already subjected to a tax, and the persons receiving dividends report the tax paid by the corporation along with cash dividends, and an adjustment is made in relation to gross dividends and total income.

Now, speaking of the question of corporation income tax shifting, we might argue for practical purpose that the goal would be, let us say, that we would work out a system whereby about half of the tax would be assumed to stay with the stockholders. Or we might take the initial rate of the personal-income tax and work out a credit at that rate to be allowed to shareholders. A series of steps, so the market is not disturbed too much, might be taken to relieve gradually the double taxation of dividends. I realize that this dividend problem is part of the overall tax question, and must be related to it.

Another point has not been mentioned in the discussion, but it occurred to me, as I looked over the economic report and considered some of the provisions in the Revenue Act of 1954. The revenue bill came out with a provision permitting partnerships to be taxed corporations.

Mr. Patman has always been interested in small business, and we have talked over the years about that. When the Revenue Act of 1954 came through it did the opposite of what many of us were interested in doing. I inquired at the Treasury and they told me yesterday that the revenue considerations were apparently important. It would cost about $50 million to permit corporations to be taxed as partnerships, but if we were to make taxation neutral so that a small business could organize either as a partnership, a proprietorship, or a corporation, according to the advantages of that business form, then we would arrange it as best we could so that there would not be any tax penalty for either being a corporation or not. Small corporations would then have the option, now denied to them, to be taxed as partnerships.

I think that is a question that might be looked into in relation to the problems of small business and economy.

Another point: There has been quite a bit of publicity given in the last several months to the authority method of financing public school improvements. In the report of the President's Council there was a reference to the authority method, and a suggestion, as I got it, that this might be studied. That is of great interest to us in Pennsylvania, and perhaps to persons in some of the other States. We have had hundreds of local school authority applications coming to the State public school building authority for assistance in constructing school buildings. The State authority was organized to enter into the construction of school buildings and lease them to the school districts. Out of the rentals the State is repaid its share of the cost. About half of the total cost is put up by the State.

The public school authority has some advantages. It may be the quickest and easiest way of financing new school buildings. Borrowing by the State is subject to the constitutional limitation that only $1 million can be borrowed without a referendum. Local governments also encounter constitutional debt limits. It may very well be that our old debt limits ought to be changed. This particular method of financing school construction has, however, provided us with uncoordinated public school building construction. Interest rates are also higher on revenue bonds than they would be on full-faith and credit bonds. I do not think we have evidence in Pennsylvania to show that authority financing has been an orderly method to meet cyclical economic problems or long-range problems of economic growth. It would seem to be desirable to look into the question of authority financing, study it further, see just what the economic effects are, and determine what reforms are desirable.

Thank you.

Vice Chairman PATMAN. Thank you sir.

Mr. Heller, do you want to make an additional statement?

Mr. HELLER. Just a very brief statement underscoring what Professor Groves and others have said about the dividend credit.

I want to go beyond my personal opinion to the conclusions reached by Dr. Daniel Holland on the basis of an exhaustive study of dividend taxation that he has conducted for the National Bureau of Economic Research.

Here, I would be inclined to entertain another question from Mr. Galbraith. We know, of course, who has been the research director of that organization.

Mr. GALBRAITH. I am not sure that it is fully on the record. Maybe you should make clear who it is.

Mr. HELLER. The Chairman of the Council of Economic Advisers, Mr. Arthur Burns, is the former director of Research of the National Bureau. I do not mean to say that he subscribes to these conclusions, but the study comes from the excellent organization he directed.

Now, Dr. Holland has applied the findings of his study to the dividend credit enacted last year, and here I want to quote just three sentences presenting his conclusions:

> The tax credit by providing a constant amount of relief at all income levels operates in such a way that a greater degree of relief is obtained, the higher the stockholders' income level.

Representative TALLE. May I ask you, Dr. Heller, if you are familiar with Professor Alvin Hansen's paper on that subject?

Mr. HELLER. Yes, thank you; I am.

> In summary, our major conclusion—

Holland continues—

> is that the relief provisions of the Internal Revenue Code of 1954 are inappropriate measures for the hardship they seek to alleviate. They are not geared directly to the basic features of this "hardship," namely, that it becomes increasingly less severe the higher the marginal personal income tax rates to which stockholders would be subject.

Vice Chairman PATMAN. Thank you.

I think the hour is about 4 o'clock, now, almost 4. I wonder if we could not poll the panel on certain issues without having them express them unless they desired to do so, but we would like to have expressions from them briefly, if they would like to express themselves on some points.

Representative KELLEY. I would like to direct a question to Dr. Buehler, in regard to the Pennsylvania manner of financing the school systems.

Mr. BUEHLER. The school buildings?

Representative KELLEY. I suppose that was brought about by the fact that Pennsylvania says it is in trouble, financially, and also in many areas of Pennsylvania the local people are in difficulty in financing school construction. I know there is one municipality in my district, East Vandergrift, where the taxation rate for schools is 45 mills, which is exceedingly high, and it is in difficulty. It does not know what to do to help itself. It cannot appeal to the State. The State says it cannot do it. So I think this matter of setting up an authority is to get around that difficulty.

Mr. BUEHLER. Well, I do not think that is entirely the issue, Mr. Kelley, although it is an important part of it. The State help is, however, geared to the resources of the community. The school board can set up an authority, or the citizens can. Then the State will contribute through the State authority.

I think the State subsidy averages out about half of the school construction costs. The State contribution is supposedly related to the needs of the district. Applications for aid are acted upon in the order they are received, however, and this does not give priority to the communities with the most urgent needs.

Representative KELLEY. You mean they have to match the funds?

Mr. BUEHLER. Yes, there is a matching principle, but the wealthy school district must pay a greater share of the cost than the poor ones.

Mr. LUTZ. Before you proceed with the poll, may I have permission to refer to one point in Mr. Elder's comments, namely, the idea that the corporation taxes are passed on to the consumers.

I have here a couple of paragraphs and a brief tabulation, which, if you permit, I will hand to the reporter for inclusion in the record.

Vice Chairman PATMAN. Certainly, we would like to have it.

(The material referred to is as follows:)

EXPLANATION OF NATIONAL ASSOCIATION OF MANUFACTURERS POLICY ON 5-PERCENTAGE-POINT REDUCTION IN THE NORMAL CORPORATE TAX

The association's policy, as revised in October 1954, is that "the 5-percentage-point reduction in the normal corporate rate now scheduled for March 31, 1955, should be effectuated without further postponement."

The Taxation Committee has reviewed this policy in light of the administration's recommendation that the 52-percent rate be continued for another year.

Its conclusion is that the policy should stand, as further extensions of the 52-percent rate would compound the tax discrimination against American industry and have an adverse effect on economic growth.

Tax discrimination comes both from the steepness of the 52-percent rate, and the fact that there already has been one postponement of the 5-percentage-point reduction originally set, in the Revenue Act of 1951, for April 1, 1954. Prior to March 1954, the association's policy had called for termination without any postponement. Policy was revised to accommodate some continuation of the 52-percent corporate rate, but it was specifically provided that the 5-percentage-point reduction "should not be postponed for more than 1 year."

This action was taken to strengthen industry's support of the Revenue Act of 1954, although a large if not the major part of the relief provided was of no direct benefit to industry. A major influence was the dividend credit included in the revenue legislation which, however, was later scaled down from 10 percent to 4 percent.

It will be recalled that the initial postponement of the 5-percentage-point reduction followed a 6-month postponement of the termination of the excess-profits tax; a tax which came to be almost universally recognized as unsound in principle and inequitable in application.

The postponements of corporate tax terminations are in sharp contrast to attitude and action in regard to the individual tax reductions scheduled for

December 31, 1953. There was no thought of postponing these reductions; rather there was considerable sentiment for moving up the effective date. These reductions provided only scaled down relief in the higher tax brackets.

Tax discrimination against American enterprise is further compounded by the speedup in corporate taxpayments. The original speedup, the so-called Mills plan, will be completed with payments of 100 percent of corporate tax liability in March and June of this year. The 1954 legislation provides for a further speedup, namely, the prepayment of corporate taxes in September and December. The law provides for a 10-percent prepayment in 1955, rising to 50 percent in 1959. The result of the two speedups is to move up nearly a year the payment of one-half of corporate tax liability. During the 5-year transition, the effect on corporate finances of the new speedup will be roughly equivalent to a 10-percent increase in the corporate rate. Unlike the situation when the individual income tax was put on a pay-as-you-go basis, there is no forgiveness of corporate tax to smooth the transition.

The request for further postponement of the 5-percentage-point reduction poses a vital issue for the American people. If the national standard of living is to continue to advance in the face of population increases estimated at 20 million a decade, and good jobs are to be provided for new workers who will number up to a million a year, an increased volume of capital formation will be required in the years ahead. Capital formation has a double effect in regard to employment. First, the process itself provides jobs. Second, the plant, equipment, and other facilities produced both improve the productivity of existing jobs and provide jobs where none existed before.

The most critical element of capital formation is venture or equity capital, the two principal sources of which are retained earnings of business and savings in the middle and higher income group. It is the pressing need for an increased flow of venture capital which has led the association to develop its new plan for orderly reduction of the high and discriminatory rates of both individual and corporate tax over a 5-year period. The 5-percentage-point corporate reduction is a first step in this plan.

There is no room for complacency over continuation of the 52-percent corporate rate on the notion that the burden is largely passed on to consumers. The record since 1948 indicates quite the contrary. The years since 1948 have been one of substantial growth in every respect—except for net corporate profits which have remained virtually unchanged.

During the 7 years in question, net profits have varied over a range of only $1 billion—from a high of $18.2 billion to a low of $17.2 billion. During the same period, the volume of corporate sales has risen from less than $400 billion to over $500 billion. The statistical record, as published by the United States Department of Commerce except for the 1954 estimates, is as follows:

Year	Profits [1] (after tax)	Corporate sales
	Billions	*Billions*
1948	$18.1	$388.7
1949	17.7	370.1
1950	17.2	431.9
1951	17.4	488.4
1952	18.2	498.7
1953	17.3	523.5
1954 [1]	[2] 17.7	[3] 510.0

[1] Profits are shown excluding inventory profits. However, inclusion of this element would leave the point of the tabulation unchanged—profits would still show no growth from 1948 to 1954.
[2] Estimate by Council of Economic Advisers.
[3] Advance estimates by NAM, based on published figures for first 9 months of year.

In 1948, the top corporate rate was 38 percent, it has been 52 percent since 1951 (leaving out the excess-profits tax, 1950–53). This amounts to a 30-percent increase in the corporate tax and accounts in large measure for the stagnation of net profits in recent years.

In the face of this record, it is clear that the association would fail in its leadership responsibilities if it acceded to further continuation of the 52-percent rate. The 5-percentage-point reduction will do little if any more than offset the impact on corporate finances of the speedup in corporate taxpayments to begin in September. This offset should be provided by allowing the reduction which was promised in 1951 and which already has been once postponed.

Mr. LUTZ. It shows from 1938 to 1954 corporate profits after taxes and after adjustments for the so-called inventory against losses, have varied only $1 billion during the whole period, and yet corporate sales have gone up from less than $400 billion to $500 billion, and the corporate tax rate has gone up from 38 to 52 percent, and yet the corporate profit level has remained practically constant.

Vice Chairman PATMAN. Yes, sir.

Now, without objection, and I am sure there is no objection, the members of the panel may extend their remarks to elaborate on what they have said, or even answer what others have said. You will be furnished a transcript of your testimony, and you may change your remarks as you desire, or add to them.

I would like to ask the panel how many of you believe that estate, gift, and inheritance taxes should be left up to the States, and the Federal Government laws on the subject repealed?

How many of you believe that?

Mr. LUTZ. I believe that.

Mr. BUEHLER. I do think, Mr. Chairman, that the credit against the Federal tax, as Professor Groves and other economists have stressed, that there ought to be a more liberal sharing of that.

Vice Chairman PATMAN. That is a different question. It is related all right, but it is different.

Is there just one in favor of that?

How many would be opposed to it?

(There was a show of hands.)

Vice Chairman PATMAN. There are six opposed to it.

Now, there is a question about limiting Federal taxes to 25 percent, that no tax shall exceed 25 percent against individuals and corporations.

How many of you would favor that provision, that constitutional amendment, that would limit taxes to 25 percent?

Mr. LUTZ. I should like to say that I am in favor of the principle. I do not think that the formula you suggest there is acceptable or adequate, but I certainly would believe in the principle of a constitutional limitation on the rates of income taxation, both individual and corporate, and it can be done, I am convinced, without impairing the ability of the Federal Government to support itself.

Vice Chairman PATMAN. Do you mean to 25 percent?

Mr. LUTZ. No, no, I am not talking about that.

Vice Chairman PATMAN. You think there should be a limit?

Mr. LUTZ. I think there should be a limit.

Vice Chairman PATMAN. Well, of course, that is a little bit different.

So there is no one here who agrees with the 25-percent limitation.

Now, on accelerated depreciation, how many believe that the present law as administered now should be continued on accelerated depreciation?

Mr. LUTZ. You mean under certificates of necessity?

Vice Chairman PATMAN. Under the Revenue Act of 1954, to make it more understandable.

Mr. LUTZ. I would go along with that. I think in general the decisions of business management as to how you are going to handle that part of your accounting should be left to business.

Vice Chairman PATMAN. Are you in favor of the changes made in the Revenue Act of 1954 concerning depreciation?

How many of you favor that?

(There was a show of hands.)

Vice Chairman PATMAN. Five.

Mr. HELLER. Can I put a footnote on that? That is a tough one.

Vice Chairman PATMAN. I will ask how many oppose, and then you can put your footnotes.

Well, put your footnotes in.

Mr. VICKREY. I would be much happier about it if there were more complete taxation of capital gains.

Vice Chairman PATMAN. You mean more than 25 percent?

Mr. VICKREY. Yes.

Vice Chairman PATMAN. What would you advocate?

Mr. VICKREY. Eventually I would like to see them treated as ordinary income.

Vice Chairman PATMAN. In other words, have a program that would ultimately cause them to be classified as ordinary income?

Mr. VICKREY. Right.

Vice Chairman PATMAN. Any other footnotes on this?

Mr. HELLER. I favor it in principle, but have some misgivings because of the revenue loss. The staff of the Joint Committee on Internal Revenue Taxation has estimated the net revenue loss over the next 18 years or so at roughly $20 billion. In the 1954–55 economic situation, we might better have made a tax reduction of that magnitude in a way which would stimulate purchasing power.

Mr. GALBRAITH. I think I agree with Dr. Heller, but with this difference. He favors it with that qualification. I would oppose it for that reason.

Mr. ELDER. Mr. Chairman, I feel it is poorly timed. It is on the books, now, and I suppose it will stay there, but our experience with the special provision for writing off wartime facilities has shown that there is a way to get facilities when it is necessary to get them, and I have a feeling that the 1954 provision was poorly timed. If it was needed, it was decidedly premature, and I do not believe that it is going to at least immediately within the next few years accomplish what its proponents tell us they hope it will accomplish.

Vice Chairman PATMAN. Did you want to add a footnote to this?

Mr. GROVES. I have just a minor reservation on the subject; I am skeptical about its effect with regard to new assets and old assets. It is something that I have not explored with any great study, but the fact that advantages are confined to new assets, and I suppose it was impossible from the revenue standpoint to make them general, may introduce an inequity in competition.

Mr. BUEHLER. Mr. Chairman, I wanted to add a note. I am uncertain about the effects of this. I do thing, though, it is a step forward in the sense we have been talking about, but I think the question will have to be studied. This is not the final solution, in my opinion.

Vice Chairman PATMAN. Any others?

All right. Now, would you like to poll the panel on a question?

Representative MILLS. Let me ask one thing: We have had discussion of this dividend credit. I wonder if you would present a question——

Vice Chairman PATMAN. You present it.

Representative MILLS. All right.

What is the position of the panel with respect to the present divident credit provision? Would you leave it or would you repeal it? Those who would repeal it, raise your hands.

(There was a show of five hands.)

Mr. VICKREY. I am not happy about it. I do not know that I would want to repeal it as it stands without putting something in its place.

Representative MILLS. Those who would not want to see it repealed?

Mr. LUTZ. Mr. Mills, I am not free to vote on your question because I think it is a matter of association policy to support that, but I am sure that even in the association, and for myself personally, there are many who are unhappy about the way in which it was approached. We feel that it is another one of those gadgets by which you try to get out from under the impact of particularly high rates.

Representative MILLS. Let me ask the question this way: I wonder how the panel feels on this question:

Do you think that it is the proper approach to the so-called elimination of double taxation of dividends?

Those who thing it is, I would like to see your hands.

Mr. BUEHLER. Could I say something? It is not the dream approach, that is certain, but it is one of those questions that has been debated and controversial. We were in the mood to do something, and we have done something. I would like to see what the results are, and stick with it for the time being. It is far from a perfect approach to the problem. So I will answer with that qualification.

Representative MILLS. It may be again considered. That is the reason I asked the question.

Vice Chairman PATMAN. All of the rest are against it; is that right?

Representative MILLS. I understand that the panel does not feel that it is the ideal solution for the elimination of the double taxation of dividends. I do not want to put myself, Mr. Chairman, in the position of saying that I thoroughly believe there is such a thing as double taxation of dividends. I am not thoroughly convinced on that point.

Representative TALLE. Mr. Chairman.

Vice Chairman PATMAN. Mr. Talle.

Representative TALLE. Before the session closes I would like to say for myself, at least, I appreciate very much that you gentlemen of the panel have come here to educate me. I appreciate it very much, just as I am grateful for this association with my esteemed colleagues in a calm discussion of important matters.

Now, I should like to ask a "quickie" before you go; What is the effect of the capital-gains tax on the stock market?

Vice Chairman PATMAN. Suppose we have brief comments on down. Would any of you like to comment on it?

Representative MILLS. Mr. Talle, may I ask that you divide that into two parts, first of all the tax rate itself, and the holding period? There are two elements there that I think would undoubtedly affect the situation, if I may make that amendment to your question.

Representative TALLE. That is quite all right with me.

I would be glad to have answers, accordingly.

Vice Chairman PATMAN. Mr. Heller?

Mr. HELLER. I want to make just one or two comments on the rate itself. I am not going to deal with the holding period, if I may sidestep that one.

A few weeks ago, the Washington Post had an editorial saying that one of the ways to stop the stockmarket boom was to repeal the capital gains tax, and I should like to speak out against that. It is quite true that certain transactions are now inhibited by the capital gains tax. People are perhaps reluctant to switch from one stock to another when it means realizing a capital gain and having the Internal Revenue Service snip out a piece of their capital in the process. In this respect the repeal of the capital gains tax would mean more churning around and activity in the stock market. But I cannot see how it would reduce any speculative or upward pressure in that market because its net effect would be to leave a larger amount of funds in the stock market. Proceeds of a sale of stock involving a gain would be available for reinvestment undiminished by any tax. It therefore appears that repeal of the capital-gains tax would not diminish the stock market boom but would actually intensify it.

Mr. GALBRAITH. Could I add just one word to that?

It seems to me there are two issues here, Mr. Talle. One is the effect of the capital-gains tax on the funds available for the stock market. The other is the effect of it on participation.

It seems to me that the effect of the capital-gains tax is probably to cut down somewhat the participation in the market and to cut down the number of transactions.

Now, since the essence of the speculative market is a large volume of participation, and also a large volume of trading, we have a depressing effect from the capital-gains tax there.

The other thing that the capital-gains tax has done in a period like this past year has been, of course, to force people to hold a considerable volume of liquid assets against their tax liability. Just how big that is one doesn't know, but it is substantial, and this, of course, has a further depressant effect. I would certainly agree with Professor Heller that on the prima facie evidence, the capital-gains tax does provide a restraint on security speculation.

I must say, however, that I would not like to be interpreted as agreeing entirely with my friend, Mr. Vickery, that we should go on from this level of capital gains to tax capital gains like income. I would be a little uneasy about that for the time being.

Vice Chairman PATMAN. Anyone else who would like to comment on that?

Any other questions?

Mr. GROVES. Mr. Chairman, I might add just a word.

Vice Chairman PATMAN. Certainly, Mr. Groves.

Mr. GROVES. Mr. Chairman, I mentioned this in connection with the relief that was given to large taxpayers in the last session. Either 1 or 2 things must happen when such relief occurs, on the assumption that the national income remains the same. One is that there be more private investment, and the other is that more money becomes available for existing private paper assets. And insofar as there is no more private investment, that money becomes available to inflate the stock market, and I think that is an important factor at the present time.

An easier capital-gains tax, along with tax relief for business income and the large taxpayer make more money available to inflate the stock market.

Vice Chairman PATMAN. Does anyone else have a comment?

Mr. ELDER. With regard to the capital-gains rate, I can see the objection to bringing it up to parity all at once to the present income-tax rate. There are a number of other approaches, averaging over the holding period, for one. Certainly another matter to be considered is the application of the capital-gains tax even at the present rate of debt prior to the application of the estate tax.

Vice Chairman PATMAN. Mr. Groves brought out a point that I am very much interested in. I have a feeling that with so much more money being diverted to the paying of higher interest rates this has placed into the hands of people additional funds to go into the market and bid up stocks. I think that has been a contributing factor.

What do you think about that, Mr. Groves?

Mr. GROVES. I am not quite sure that I follow you, Mr. Chairman, but I do think it is important that if you get an increase in the income in the higher brackets, and you do not get an increase in private investment, that the money becomes available for speculation in paper.

There are two kinds of investments. One is in wheels, the other is in paper. If available funds do not go into wheels, they go into paper. When that money becomes available, and isn't used, the only place for it to go is into paper.

Vice Chairman PATMAN. And this hundred-dollar dividend top exemption, wouldn't that have the tendency to encourage the use of that money for further speculation?

Mr. GROVES. You mean the hundred dollars on the individual incomes?

Vice Chairman PATMAN. I am talking about the dividends from stocks.

Mr. GROVES. Yes; I would.

Vice Chairman PATMAN. I think you will notice in this report that more and more money has been required for the use of interest payments, and that money normally flows into the hands of people, does it not, Dr. Groves, who would not use it for purchasing the ordinary things of life, but would have it and would normally use it for further speculation and for further investment?

Mr. GROVES. That is true to some extent, but, of course, it is also true that interest is much more a poor man's income than dividends, and you would find that relief in terms of dividends and business income would have a greater tendency to go into the stock market than draining off money by interest, though I think both would have an effect.

Vice Chairman PATMAN. Any other statements?

Representative MILLS. Mr. Chairman, I just had one question. It is one of the basic questions that has been asked, and I do not believe we have touched on it very much. I believe we could cover it in just a few seconds, or minutes: The question of what effect the Revenue Act of 1954 may have had upon reversing the downturn in business activity. I might state that I had not thought that it could have any material effect in that respect because it really did not become operative by the time business seemed to have leveled off or turned back uphill.

Now, I wondered if it really did have any effect, in the opinion of any of the members of the panel?

Vice Chairman PATMAN. You mean in restoring the country from a recession——

Representative MILLS. The downturn in business activity is reversed now, we are told. Did the Revenue Act of 1954 play any part in the reversal of that trend?

Mr. BUEHLER. I would say there were two things there: One would be more funds available for investment, and the other could be the psychological factor which the Economic Report emphasizes. I would suppose the effects are not measured.

Representative MILLS. I would see where your second might have some effect, but I wondered how much importance you could attach to the first, because I do not know whether additional money became available.

Mr. BUEHLER. Well, the excise taxes——

Representative MILLS. No; I am talking about the rewrite of the general code, not the excise taxes.

Mr. LUTZ. Well, I would think the effect on the individual investors to increase incentive was greater than any direct effect under the new provisions of the code.

Representative MILLS. The increased depreciation allowance would have had an effect if it resulted in expansion of business facilities. I do not know whether or not that has occurred.

Mr. GALBRAITH. There is an interesting point there, Congressman Mills. The thing that kept the downturn from going too far last year was a very strong position of consumer spending. Consumer spending and consumer spending for construction—residential housing—held up. The things which one would presume to have been affected by the Revenue Act of 1954 for a psychological point of view—business investment, and, of course, in the early part of the year the inventory situation—were the weak parts of the economy.

Vice Chairman PATMAN. Mr. Heller.

Mr. HELLER. Mr. Chairman, may I just say that if the joint committee does undertake a study of the economic effects of taxation, we should certainly like to turn this question back on you. I am sure that the country would be very much interested in any conclusions the committee might draw on the basis of a little bit longer run operation of the new code.

Vice Chairman PATMAN. Your suggestion will be brough to the attention of Chairman Douglas, and I am sure he will bring it to the attention of the committee, and I am sure he will give it serious consideration. I think it is a good suggestion, myself.

Representative MILLS. I just want to say this, Mr. Chairman: In my opinion it is a subject matter for consideration by some committee of the Congress. I think it should be considered.

The suggestion is very valuable.

Vice Chairman PATMAN. Mr. Kelley, any questions?

Representative KELLEY. I have no questions, Mr. Chairman.

Vice Chairman PATMAN. Dr. Talle, any more?

Representative TALLE. Just a remark, that what we may now consider psychic income, that cannot be measured, may perhaps be measurable after the proposed tax study is completed.

Vice Chairman PATMAN. Monday the committee will meet at the Banking and Currency Committee in the New House Office Building. The committee is indebted to the members of the panel for spending so much time with us and being so helpful. We appreciate it.

Mr. GROVES. May I say for the panel that we very much appreciate being invited.

Vice Chairman PATMAN. Thank you, sir. The committee will recess until Monday morning.

(The prepared statements of the panel are as follows:)

STATEMENT OF ALFRED G. BUEHLER, PROFESSOR OF PUBLIC FINANCE, UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA

The American economy has, in general, succeeded in weathering the readjustments of 1954 and is now apparently on the road to recovery. Currently, the uneasy situation in Formosa adds to the uncertainties of the future and suggests possibilities of increased defense spending, with its inflationary tendencies. Until the situation becomes more definitely clarified, the policy of balancing Federal cash payments to the public with cash receipts from the public is a logical one.

Within reasonable limits, our fiscal policies should be flexible and adapted to changing economic situations. While our objectives of stability and growth may conflict somewhat with each other, we can, within limits, attain both. Americans generally seem to want a dynamic and growing economy, at some cost of stability. We also appear to be more worried about recession and depression than we are about inflation.

In considering public finance and the problems of the economy, it is well to keep in mind that public finance, both in theory and practice, involves ethics and political science, as well as economics. The individual is inclined to favor those measures which improve his economic status and to oppose those which are costly to him, whether they are good for the economy or not. Those who hold public office are accountable to the people and naturally want to please their constituents. Social goals may conflict with the desire for economic stability, and inflationary programs of public construction may, for example, be advanced in spite of their economic effects.

A further difficulty arises from the fact that the effects of Government spending, taxing, and borrowing policies and operations upon the economy are not altogether clear. There may be uncertainty and debate not only over the economic outlook but also over the appropriate measures to be taken in coping with the problems of economic stability and growth. In our system of government, we depend upon a multitude of counsels upon public discussion and debate, and the formulation of measures through our particular legislative and administrative processes, cumbersome as they may be.

The impact of modern governmental activities and their financing—Federal, State, and local—upon the economy is tremendous. Government finances should, therefore, to the fullest extent possible, be consistent with our economic and social objectives.

Fiscal policy is not without limitations, however. Tax measures, for example, must usually be concerned with classes of taxpayers rather than particular individuals. A highly selective fiscal policy would call for actions adapted to individual situations.

The Federal tax revisions which became effective in 1954, or will subsequently become effective as a result of 1954 legislation, were no doubt the outcome of various considerations. Like other major tax changes, they engendered much debate.

Among the measures reducing taxes were the repeal of the excess-profits tax, the reduction in the personal income tax, the lowering of the excises, and revisions in the Internal Revenue Code for the benefit of individuals as income recipients, consumers, investors, owners of farms and businesses, and otherwise engaged in economic activity.

Some important tax increases were also approved. Old-age insurance contributions were advanced in rate from 1.5 to 2 percent in 1954. Starting next fall, corporations with net incomes over $100,000 are required to accelerate their income-tax payments in order to place them more nearly on a current basis. The effect of the acceleration is to increase substantially the ratio of tax payments to corporate income during the transition period required to convert tax payments over to the new basis. A steadier flow of corporation income-tax collections will result and Government borrowing operations will be reduced in the latter part of each year. Both the taxpayers and the economy are thus affected by the acceleration program.

The removal of the excess-profits tax reduced the taxes of the corporations to which it applied. More funds were available for reinvestment and the payment of dividends. Certain stimulating tendencies were thus at work. On the other hand, the use of an excess-profits tax along with the corporate net income tax to impose high-tax rates upon the corporations affected, has some tendency to ease the resistance of management to higher expenses. That is, an excess-profits tax may have some inflationary as well as anti-inflationary effects, although its effects, on balance, would appear to be restrictive and its removal expansionist.

The excess-profits tax involves so many complications and inequalities that its use, short of outright war, should, if possible, be avoided. Equivalent revenues could be raised otherwise from corporations, if necessary, with less difficulty. Its chief value in a period of inflation is psychological and political as a part of an overall program of curbing inflation.

The individual income tax and excise reductions of 1954 placed more money in the hands of individuals, directly and indirectly, and thus had stimulating effects upon consumer spending and saving. While excises are commonly thought of as taxes on spending, they may restrict saving rather than spending, especially among the middle and upper income groups.

The effects of excises on retailing are more apparent than those on manufacturing. When a tax is imposed at the retail level, the consumer can see it as an addition to price; when it is reduced or withdrawn, the consumer can ordinarily anticipate a price reduction. From this viewpoint, excises at the retail level have advantages over taxes at the manufacturing level in influencing consumer behavior.

The alleviation of the taxation of dividend income received by investors may be defended on grounds of equity and also as a stimulus to investment. Interest, property rentals, wages, salaries, and other expenses of corporations are deductible in determining taxable net income, but nothing is allowed for a return to the stockholders on their investment. The earnings of corporations going out in dividends are taxed again in the hands of individuals after the earnings have been taxed to corporations. No other type of income is subject to such double taxation. It is both inequitable and something of a discouragement to equity investments.

Some argue that the discrimination against dividend income has been allowed for in the capital markets by a tax capitalization process. To some extent this may happen, but stock prices are determined by many factors and the capitalization process is certainly an imperfect one. Alleviating the double taxation of dividends does not give dividends "preferential treatment." Instead, its purpose is that of alleviating an existing discrimination against dividend income, a discrimination which seems to have no rational economic foundation.

A difficult problem is that of balancing the taxation of investment and consumer expenditures. An expanding economy requires expanding investment and consumption. Neither can be penalized without injury to the whole economy.

Taxes, in general, have restrictive effects upon those who pay them and feel their influence. The taxpayers may forget that taxes are imposed to pay for the costs of Government services, and that Government spending restores the money taken in taxes to the income stream. Both consumers and investors may therefore resist the payment of taxes.

As the budget is reduced and taxes can be lowered, taxes should be lightened upon both consumption and investment, upon both individuals and business. They should be lightened upon the lower, middle, and upper incomes so that the restrictive effects of taxation upon consumer spending and productive investment will be minimized.

No doubt any formula for tax reduction will be an occasion for debate and differences of opinion. The tax reduction program, when it becomes feasible, should be formulated in relation to the objectives of a reasonably stable and growing economy and a fairly distributed national income.

It is not possible here to discuss all of the important policy questions involved in the 1956 budget program. If the inflationary pressures should prevail, it will be desirable to reduce Federal expenditures to the extent possible, maintain a surplus of revenues over expenditures, and reduce the debt.

In closing, there is one aspect of the Economic Report which I would like to mention. It illustrates some of the problems involved in fiscal policy. It is the suggestion that when State and local governments encounter outmoded debt limits in contemplating the construction of public school buildings and other capital improvements, they may find the authority device a desirable alternative to conventional methods of finance.

We have been experimenting in Pennsylvania with both State and local authorities in financing public schools and other improvements. They provide a ready loophole by which our archaic constitutional debt limits may be circumvented and are undoubtedly a means by which increased public construction can be financed.

It is not yet clear that authority financing is generally an orderly method of financing needed public improvements in our State. Its use is limited ultimately by the good judgment of those responsible for authority financing, the tax and credit resources of the State and the local communities involved, and the willingness of investors to buy authority bonds. Immediately, public improvements may be undertaken regardless of their cyclical effects.

STATEMENT BY JOHN KENNETH GALBRAITH PROFESSOR OF ECONOMICS, HARVARD UNIVERSITY

I should like, first, to comment on the economic outlook for 1955 and the tax and expenditure policy which seems appropriate in light of that prospect. Then I will address myself briefly to some of the questions on which the committee has requested specific answers.

This year's report of the Council of Economic Advisers, which the committee has before it, is a lucid and workmanlike review of the state of the economy. It is a credit to the distinguished economists who authored it. The administration, in turn, is to be congratulated on the talent it commands.

I am also impressed, as anyone must be, by the grace and ease with which the administration has dispensed with its slogans and abandoned its clichés about the absolute virtues of hard money, the absolute necessity of a balanced budget, and the unspeakable evils of deficit financing. It has now concluded, it seems clear, that these things are not good or bad in themselves. Rather they must be viewed in their context. There are times when a balanced budget is sound policy. There are times when it is not. (At the moment the administration obviously favors a modest deficit.) Once those who toyed with such ideas were regarded as dangerously avant garde if not a trifle reckless. Now they are pedestrian and commonplace and lost in the multitude—a common fate of the youthful liberal.

In 1935, in a letter to George Bernard Shaw, the late Lord Keynes said: "I believe myself to be writing a book on economic theory which will largely revolutionize—not I suppose at once but in the next 10 years—the way the world thinks about economic problems." That, to be sure, was 20 years ago. Still, had Keynes been pressed, he might have allowed himself a little more time to capture a Republican administration.

II

Although there is much that is good in this year's report, it would be a mistake to accept too uncritically its estimate of the future or its recommendations. The Council, as everyone is aware, takes an exceptionally rosy view of both the past and the future. Economic policy in the past 2 years, it concludes, has been guided by undeviating wisdom and perfect insight. Even the Treasur 's adventure with high interest rates in early 1953—an adventure which was quickly abandoned and which, if those who take monetary policy seriously are to be trusted, must have had some bearing on the recession that followed—now emerges as an act of remarkable prescience. This may not be so.

Perhaps it was a mistake. And perhaps it is also a mistake—one, I hasten to say, that antedates the present administration—to assume, in writing these reports, that the Government, where economic decisions are concerned, must always bat exactly 1,000—or shoot par on every round. In economics, whether Republicans or Democrats, we are not that good. It would be interesting to know who is fooled by this ritualistic claim of total wisdom.

The present report also continues and enlarges on an equally unfortunate attitude toward the future. It assumes, whatever the evidence or lack of it, that the future will be completely wonderful and that everything will work out precisely to perfection. These annual reports could, in time, degenerate into repetitive exercises in fatuous optimism. The present one is not wholly reassuring in this regard.

This is disconcerting for another reason. We have, at the moment, an administration which prides itself on taking a hardhearted, businesslike view of its problems. The essence of such realism, we have anciently been told, is a rejection of any tendency to self-delusion and a willingness to face facts and be prepared for the worst. This should mean, where economics is concerned, a willingness to search out any lurking or latent threat of recession or stagnation or inflation. These should then be brought sternly to the attention of the Congress. By being so forewarned we would have a better chance of being forearmed with a policy.

It is discouraging that the present practice is almost the precise opposite. We are told in the report that recovery is certain to continue. The possibility of a setback is not mentioned. There is no hint that we might continue with a kind of high-level stagnation. We are told we can count on full prosperity, full employment, and there is apparently no serious concern about inflation. Things may work out this way. But would it not be wiser, more reassuring, and also more businesslike to assume something a little less than the best?

I am sure that the Council is sincere in its optimism. Yet, had it been looking for an excuse to take a less rosy view, there is evidence that it could have cited. Private investment in capital plant and equipment is cyclically one of the most important of all indicators. It is falling and will continue to fall in the near future. The recent upswing in business activity in general may have an unhealthy dependence on the automobile industry and even on the struggle for leadership in that business. The Council sets great store by the housing industry, and it has certainly behaved well so far. But just as we had an inventory cycle elsewhere in the economy, we could have one here as the backlog is made up and supply outruns demand. Export demand for farm products continues weak. (It is not completely easy to sell our surplus for free.) As a result, net farm income is expected to decline still more this year.

Finally, we noticed during the thirties and we saw again during the forties that once the economy was well launched on a course of behavior it tended to persist in that behavior. The great depression lasted a long while. So did the postwar expansion. Both, in their durability, confounded the experts. This is at least a warning that the present stagnation may not liquidate itself automatically and at once.

I am not predicting continued stagnation. I would like to avoid making any prediction, for it is an insecure, uncertain, and vastly underpaid profession. I do question the wisdom of the Council's total optimism as a practical working assumption. It would be better and safer, and also more conservative, to assume that the coming year will be like the past year; not bad but not good enough. It would be sufficient were the administration guided by its own fears. During the past year high administration officials have talked hopefully about full employment, but no one can doubt that unemployment was what dominated their secret thoughts. This uneasiness lay behind the numerous predictions of an imminent upturn. In our time there is a widespread belief that the future is not what you make it but what you say it will be.

III

If the possibility of continued stagnation—or a new setback—is kept open, the general outlook on economic policy must be revised. There should be no curtailment of needed expenditures on strictly fiscal grounds. On the contrary—and always assuming that national security is being properly taken care of—this would be a favorable time to go ahead with needed public works and improvements. Obviously there should be no frantic expansion: we should be ready to accept curtailment if overemployment and inflation should appear. But we have a great backlog to make up on health and education facilities, in urban redevelopment and low cost housing, in roads, in recreational facilities—the national parks, for example, urgently need an infusion of new money—and in resource development. A modest expansion in all of these areas would now make good sense.

I would support the administration in its request that the corporation tax due to expire on April 1 be extended. This is because it is the wrong tax to reduce at this time. The corporate tax is now as high as it should be and perhaps higher; it would be a good rule of thumb if we were to think of 50 percent as a firm ceiling for this tax. However, if we reduce taxes this spring it will be to encourage economic expansion. In light of the recent behavior of the stock market, there is no evidence that the economy needs the stimulus of a further increase in corporate earnings. On the contrary, this might add unwisely to speculative inflation in securities prices.

The most efficient (and at the moment the safer) way to encourage expansion, if it is needed, is through encouraging consumer spending. The best way of achieving this is to cut the personal income tax, and the best kind of cut is an increase in exemptions. If the economy is still weak this spring and summer I would urge such a reduction to replace and supplement the corporate tax reduction. (The case of the excises is less clear. On balance, I would continue these and cut the personal tax instead.) If the economy is strong—as the Administration expects—then there should be no tax reduction of any kind. A substantial surplus on cash account would seem probable were this to happen, and it should be welcomed and used for debt reduction.

In summary, then, I would assume some unemployment and some need for general expansion until this hypothesis is disproved by events. As a first consequence we should start in on the large accumulated backlog of needed Federal expenditures. Because we have just had a substantial tax reduction and because the civil functions of the Federal Government—education, health, housing, roads, recreation, resources—have been starved in relation to need for some years, I would make the first move on the expenditure side. If by next May or June there is still marked slack in the economy—say three or four million unemployed—there should, in addition, be a tax cut. It should be designed for maximum effect on consumer spending. This means an increase in exemptions. Should signs of inflation develop during the course of the year, there should be no tax cuts of any sort and the Executive should promptly retrench on spending. Such willingness to change direction is essential. It should not imply a confession of error. It is essential if we are to have an approach to full employment and, at the same time, avoid inflation and loss of value by the dollar.

The policy I suggest means budgeting for a larger deficit than at present—slightly larger if only needed spending is increased, and substantially larger if unemployment persists and exemptions are raised. However, we should be clear as to the ultimate effect of this policy. The real enemy of a balanced budget in the United States—as we are learning this year as so often before—is insufficient production. The measures here proposed are for the purpose of bringing the economy back to full production. The larger earnings and the larger revenues which result will—if past experience is a guide—bring us closer to balance than a policy that allows of continuing stagnation.

IV

Let me turn now to 2 or 3 specific questions on which the committee has asked for suggestions. (I pass over some of these because I am not sufficiently informed. Thus I have never been sure that I fully understand the doctrine of percentage depletion, although what I have heard of it sounds very nice. It would seem to me important that it be promptly applied to professors. There is no group where depletion of what is called intellectual capital proceeds so immutably and leaves a more hideous void. Surely, we should be permitted to deduct from our taxes each April an allowance for this annual deterioration. I am told that Powers models have an analogous case.)

The committee is probably wise in raising a question over the way debt transactions are being taken out of the budget. With a little ingenuity, direct liabilities of the Federal Government can be translated into indirect, insured, or contingent liabilities; although they remain liabilities nonetheless. The long-term lease on a new post office, designed to cover the interest and amortization costs of the private landlord, is just as much a liability of the Government as the debt which, in old-fashioned times, was incurred to construct such facilities. The same principle applies to the underwriting of CCC loans, other loan guaranties, and, of course, to the special obligations which are being discussed (as this is written) in connection with the new highway plan.

The common purpose of these arrangements is to keep the debt out of sight. This avoids collision with the debt limit. Also, it is evident that the anxieties of both the public and the administration over the size of the debt are substantially mitigated by keeping it invisible. A good housekeeper doesn't like dust under the rug. But she infinitely prefers it to dust on the dinner table.

The disadvantages of crypto- as distinct from forthright debt are several. We are grown up. Presumably we can shoulder our debt like men. The cost of these subterfuges may be substantial. It would be most surprising indeed if the Post Office were not paying more for its leases than it would in interest on money borrowed by the Government. There are similar added costs with the other devices.

Most serious, there is a tendency which is already evident to favor Government activities for which the debt can be kept out of the budget. There is a grave danger that highways, under the new plan, will get a special priority over health, education, or other outlays simply because it has its own financing plan attached to it. As proposed at this writing, the highway plan has the additionally objectionable feature of earmarking revenues. This unnecessarily complicates the whole Federal housekeeping in the interest only of unduly elaborate self-delusion. If we must fool ourselves, we should do it in a simple, uncomplicated way.

This committee might profitably ask the Bureau of the Budget for a comprehensive survey of the present structure of direct, indirect, contingent, and guaranteed liabilities and their cost. The Congress might also look more critically on the present and future use of these devices. In the past, Congress has been rather austere on these matters. It has been reluctant—too reluctant in my view—to accept the concept of a cash budget. In the thirties, an effort by President Roosevelt to promote a capital budget—with borrowing confined to capital outlays—met a hostile reception. Such double budgeting was attacked as a device to show balance where there wasn't and to conceal a deficit where there was one. Although I was less certain at the time, I now believe the Congress was right. The capital budget confused at least as much as it clarified. Congressmen should look with at least equal suspicion on the practice of moving the debt outside the budget.

V

This effort to get the debt out of Government hands is part of a larger tendency in the administration which would seem to justify some reflection. A business administration, we should expect, would be singularly immune to ideology. Romance would not play a part in decisions where the consequence is costly to the taxpayer. Instead, cold-blooded efficiency—getting the most for the least—would be the sole or at least the overriding consideration.

In fact, ideology appears to play a disturbingly large role in current decisions. This is true even when it is costly. The turning over the CCC loans to banks and Federal buildings to private landlords seems to be in pursuit of the conviction that private enterprise is preferable whatever the price. Ideology takes absolute precedence over efficiency. There are other manifestations. State, local, or private resource development is held to be preferable even though the public cost is higher or the benefit is less. There is, one hears, the case of Dixon-Yates. According to an old and valuable rule, the Government should never do what private enterprise can do better and for less. Socialists have been given very bad marks for letting ideology override welfare and insisting willy-nilly on Government enterprise. But Government should also do—and without concealment or embarrassment—the things it can do best and most cheaply. The old-fashioned rule on these matters has been to let efficiency be our guide. It is a good rule.

VI

I should like to say a final word on a very different matter—on the recommendation of the Randall Commission that taxes on foreign-earned corporate income be reduced to encourage investment abroad.

We should be on the lookout for anything which will encourage capital exports. Nonetheless, I trust that the Congress will examine this measure carefully, if only to avoid acting in pursuit of false hopes.

The Randall Commission has assumed that taxation is a barrier to American investment abroad. If so, the easing of taxes will encourage such investment. However, no proof seems to have been advanced on this point. The critical role of taxes has merely been assumed. There is a strong probability that taxes have very little to do with the matter. In the case of oil, copper, nickel, bauxite, and the like, American capital has gone abroad because the profits were very promising. In other cases it hasn't gone abroad because more money was to be made with less risk in Texas or California than in Ethiopia or Ecuador. Profits are the central motivation which in our economy should hardly surprise us. Taxes are of secondary or tertiary significance.

We should bear in mind, incidentally, that our situation on capital export is very different from that of 19th century England. Then capital was exported from England because the domestic rate of return was relatively low. Foreign countries compete in our capital markets against an excellent domestic rate of return. The domestic return will probably still be more attractive whatever the tax situation.

Not much damage would be done by enacting the Randall proposal. It presumably would not apply to past investment—to do so would be to give some existing concerns an unjustified bonanza—and the extractive industries might conceivably be excluded as a category. But no one should suppose that the measure will have much effect on overseas investment, and the Randall report may perhaps be criticized for raising false expectations in this regard.

Statement of Harold M. Groves, Professor of Economics, University of Wisconsin

Most of the time we academicians have you Senators and Congressmen at a disadvantage. You have to make the decisions and we can criticize to our hearts' content without even forming, much less announcing, any decision of our own. Today the situation is reversed; you have us over the barrel.

The major theme of this session is fiscal policy and the heart of fiscal policy is the balance (or unbalance) of budgetary revenues and receipts. As I see it, we are now offered at least six alternative programs or packages. These may be summarized in tabular form as follows:

Package	Budget	Expenditures	Taxes
A	Balanced	Reduced	As recommended.
B	do	Much reduced	Somewhat reduced.
C	Unbalanced	As recommended	As recommended.
D	Much unbalanced	do	Reduced.
E	Unbalanced	do	Reduced at some points; raised at others.
F	do	Increased	Increased (though not necessarily by higher rates).

It will be noted that package C is the President's program. Packages E and F which call for some increases in some taxes need not involve an increase in tax rates. Of course there are other ways of strengthening the tax system.

At the risk of appearing to be an irresponsible spendthrift, I support the last of these alternatives, package F. This involved a budgetary deficit of the magnitude recommended by the President; it also involved a conservative increase in public expenditures, no further cuts in taxes, and the strengthening of the tax system by what is popularly termed "plugging loopholes."

As for the urge to balance the budget, I concede the desirability of keeping this objective always dangled before us. Such procedure reminds us that it is easier to spend money than to raise it. But we still have too much unemployment of men and resources to adopt a deflationary budget now. Our cash budget as projected is already overbalanced.

As for economy, of course I am for it in the sense that there is waste in government that calls for elimination. But in an overall sense I am for increased expenditure because in general I think our public needs (military, foreign aid, domestic school facilities) are greater right now than our private needs.

As for the public debt, it is an important problem, but a modest annual increase in debt not greater than that anticipated in national economic growth, is surely not our worst anticipated headache.

As for tax reduction, it might be supported as a recession measure. Its weakness here lies in the fact that along with the urge for a further reduction in taxes will go another for the further reduction of public expenditures. A balanced reduction of taxes and expenditures is not counterdeflationary—quite the contrary.

Some of our taxes are not good enough to warrant easy retention. Particularly vulnerable to criticism, I think, are the excises on communication and transportation. By no stretch can these taxes be called luxury levies and their incidence is probably about as capricious and regressive as that of a general sales tax. But their elimination can wait for a time (hopefully) when the pressure of public needs has slackened.

As for an increase in personal income-tax exemptions, it is always tempting and popular. But it would constitute a step very hard to reverse and I doubt that a trend toward prewar tax exemptions would make for the improvement of our long-run tax system. Experience shows that a high-powered revenue system must be broadly based; if we don't use the income tax for this objective, we will use taxes regressive and less rational in distribution.

Major attention, I am convinced, should be given to closing the so-called loopholes in our existing tax system; this is partly to raise more revenue and partly to revive the canon of equity in taxation. Three general remarks on this subject seem in order:

The first is that the revision of the revenue act last year, whatever may have been its score in other respects, gave only lip service to the principle of equity. None of the major devices for minimizing taxes were removed; in some cases they were considerably extended.

The second is that the impression is widely shared that the Congress deliberately throws a high rate schedule to the public as a demagogic bone and then as deliberately allows escapes from taxes that makes these rates specious.

The third is that, generally speaking, it is better to subsidize directly than through the tax system. If the discovery and exploitation of natural resources is so risky a business and so clothed with public interest that it needs a subsidy, which I doubt, it would be sounder to grant one openly.

Time does not afford opportunity to present details, but, very briefly, support can be given to either the elimination or drastic downward revision of percentage depletion; the taxation of capital gains presently eliminated from the tax base by death transfer; the inclusion of the receipts of minor children in the income of the parents; a separate and higher schedule of rates for married taxpayers; and the amalgation or integration of the estate and gift taxes.

The list is only a partial one, but it indicates some of the areas needing attention that last year's revision did not revise.

Of all of these areas the one that cries loudest is percentage depletion. A system that permits the taxpayer to recover his capital over and over again would be unbelievable if it were not a fact to behold. It is generally regarded as a symbol of what organized pressure can do to legislative bodies and it undermines respect for the entire tax system.

A word may be added about the controversial so-called preferential treatment of dividends. I accept the view that there is an inequity in the double taxation of profits but I think the so-called dividend received credit, recently enacted, stepped off on the wrong foot. It is so vulnerable to objection in terms of equity that it better be recalled. A change is not likely to rest easily in prospects of a stable future unless it is done right in the first place.

The credit as enacted violated a fundamental principle of income taxation namely that all of the income of the personal taxpayer should be used in measuring the base of the personal tax. If the corporate tax is to be regarded as a personal levy collected at the source then the tax itself should be included in the individual's tax base. This is the rule that we now follow in the case of wages and salaries. Moreover the dividend received credit disregards the fact that the double-tax factor decreases as income gets larger. It also disregards the fact that corporate taxes, particularly those of public utilities, are sometimes shifted forward to consumers.

There is no solution of the problem as long as American business refuses to accept the proper one—a differential rate on undistributed as compared with distributed profits. Moreover, considering the present state of the stockmarket and the level and prospective level of business investment, I am inclined to the view that the repeal of the excess-profits tax and the concessions to depreciation, both of which can be supported, are as much relief for the business taxpayer as the present economic situation and the status of fiscal needs will permit.

OBSERVATIONS ON FEDERAL TAX AND FISCAL POLICY IN 1955 BY WALTER W. HELLER, UNIVERSITY OF MINNESOTA

(Notes for panel discussion on fiscal policy before the Congressional Joint Committee on the Economic Report, January 28, 1955, Washington, D. C., submitted in accordance with the invitation of the chairman, Senator Paul A. Douglas.)

In undertaking a critical appraisal of the Eisenhower administration's fiscal policy, one is somewhat disarmed by the excellence of its budgetary and economic documents. The United States Budget for the fiscal year 1955 represents another forward step in the steady improvement of this document since World War II. The new Economic Report of the President is a model of superb writing and persuasive reasoning. The fault one finds, therefore, is not so much in the specific fiscal policies that are spelled out in the President's documents. One's misgivings and differences fall mainly under the heading of what is left out of, or merely implied in, these documents as they relate to the Government's fiscal program.

In the limited time and space available to me, I wish to examine three major shortcomings in Federal budgetary and tax policy today: first, the combined fear or high taxes and unduly unbalanced budgets which appears to be depriving us of the full measure of military security and civilian well-being which is within our grasp; second, the failure to acknowledge and explain that Federal surplus and deficit figures have a different economic meaning today than they did 2 or 3 years ago as a result of changes in methods of financing certain activities and changes in the timing of certain expenditures and tax collections; third, the lack of any attempt to stem or reverse the tide of tax concessions which, in combination with excessive top-bracket rates, have seriously distorted our income tax structure.

1. THE FEARS OF HIGH TAXES AND UNBALANCED BUDGETS

In the face of a large gap between actual and potential-employment and output, the administration's 1955 fiscal program is suffused with a certain timidity—some might wish to call it "restraint" or "conservatism." Although encouraging signs indicate that gross national product for 1955 may reach or even exceed a bit of the 1953 level of $365 billion, this falls short by some $20 billion of what the economy is capable of producing at reasonably full employment. At the same time, well-informed experts inside and outside of Government present strong evidence of pressing but unfulfilled needs for more civilian and military defense, more aid to Asia, more schools, more conservatism and resource development. Why, then, do we find no bold programs to draw on our underutilized capacity to fill these needs?

(a) *Tax fears*

Much of the answer appears to lie in the fear of high taxes as such, coupled with an unwillingness to incur deficits exceeding some limit of political tolerance and presumed economic danger. In the light of frequent administration references to the damaging impact of high taxes on our economy, one finds it difficult to escape the conclusion that America's capacity for defense, foreign aid, school construction, and so on is being closely linked with a narrow definition of taxable capacity. Are the fears of tax damage well founded? Are taxes so detrimental that they should be calling the tune on the Government's military and civilian programs?

This fear of the economic consequences of high taxes generally takes two forms. The first is the fear that taxes will seriously damage incentives, retard investment, and thereby limit our economic potential and performance. In the words of the recent budget message, "The present tax take of nearly one-fourth of our national income is a serious obstacle to the long-term dynamic growth of the economy which is so necessary for the future." The second form is best illustrated by the now famous thesis developed by Colin Clark (and reiterated by him in uncompromising terms in 1954 in Welfare and Taxation) that taxes exceeding roughly 25 percent of the national income inevitably bring inflation in their wake.

As far as the disincentive effects of taxation are concerned, no conclusive evidence exists. However, we are fortunate in now having the results of the most extensive research ever undertaken on this subject. I refer to the Merrill Foundation project that has been going forward at the Harvard Graduate School of Business Administration during the past 10 years or so under the direction of Prof. Dan Throop Smith (who since early 1953 has been on leave as Assistant to the Secretary of the Treasury in connection with tax matters). As reported a year or so ago to the American Economic Association, the study's basic finding may be characterized as follows: If the underlying market strength for the products of industry exists, even the comparatively severe tax rates of recent years do not seriously inhibit investment and production incentives. To put it in the words of Prof. J. Keith Butters, associate director of the project:

"If a general statement has to be made in flat, unqualified terms, the striking fact is that, by and large, the tax structure seems to have had only a relatively limited and specialized impact both on the basic incentives which motivate the private economy and on the structure of the economy. The effects of the tax structure on the aggregate levels of employment and real income realized over the last 10 to 15 years have been even more limited, as is obvious from the record levels achieved in both employment and income during this period.

"Just as there is little evidence that individuals in the aggregate have gone on an investment strike or have significantly reduced the intensity of their effort and activity because of taxes, so there is little evidence that taxes have curtailed corporate and business investments to undesirably low levels in postwar years."

What of the Colin Clark proposition that inflation takes over when taxes exceed 25 percent of national income? Whatever validity it might have in economies of less resiliency and capacity than ours, the performance of our own economy in the past 4 years has pretty well discredited Clark's thesis as it might apply to the United States. (Joseph A. Pechman and Thomas Mayer had already demolished—in the Review of Economics and Statistics, August 1952—the statistical underpinnings Clark had brought forward from the experience of other countries to establish his thesis.) In spite of the great inflationary jolt given the economy by the Korean war, prices stabilized after only 9 months of inflation. Since then, side by side with a combined Federal-State-local tax burden hovering around 33 percent of national income, we have enjoyed essential price stability for almost 4 years.

Our economy has demonstrated an astounding capacity to roll with an inflationary punch. Combined with our increasing concensus and skill in the handling of anti-inflationary monetary and tax policies, this great capacity of our economy to deliver higher production rather than higher prices in response to injections of purchasing power provides a primary guidepost for fiscal policy today and in the future. When actual production seriously lags behind potential production, as it does today, the fear of inflation need not choke off reasonable additions to military and civilian outlays, even if they are not fully matched by tax increases. Alternatively, if we hold the line on Government spending, we need not shrink from the legally scheduled reductions of excises and corporation taxes and the politically scheduled increases in personal exemptions. The idea that these tax cuts should be made on an explicit subject-to-reversal basis has much to commend it. It would reassure those who fear inflation and strengthen the hand of policymakers in the unlikely event that inflation does develop. It would do little, of course, to abate the fears of those who abhor deficits as such.

(*b*) *Deficit fears*

The present administration has a record of continual deficits to date. Yet one gains the impression that it regards these with strong distaste, especially now that taxes have been reduced. (I speak here more of Treasury pronouncements and point of view than of the Council of Economic Advisers' apparent position.) This distaste is part and parcel of the traditional view which automatically associated surpluses with virtue and deficits with sin. Traditional reverence for the balanced budget is well founded in personal and business finance and in State and local government budgeting: Failure to live by the balanced-budget rule (with exceptions, of course, for nonrecurring capital investments) may lead to insolvency and bankruptcy. Not so, in the case of the Federal Government. It is armed with central banking and monetary powers and charged with the duty of maintaining maximum employment and economic stability. Its responsibility for a balanced economy—one in which resources are fully employed and productivity is growing without inflation—must often prevail over its desire for a balanced budget.

Instead of associating surpluses with good and deficits with evil through thick and thin, a much more useful distinction in Federal finance is between constructive deficits and destructive deficits. (A parallel distinction can be applied to surpluses.)

Constructive deficits are those to which the economy's response is higher real consumption and investment, higher employment, and higher real national income. In other words, these are deficits which more than pay for themselves. They can be incurred by lowering taxes and increasing Government transfer payments to enable private enterprise and consumers to guide resources back into productive employment. Or they can be incurred by increasing Government outlays for public works and other projects or services. Such constructive deficits may be called for under three general sets of circumstances: (1) To counter a downturn of the business cycle; (2) to combat a persistent reluctance of the private economy to absorb new manpower and other productive resources as rapidly as they become available; (3) to overcome a failure of the private economy to generate enough liquid funds to finance continuing growth and expansion of the economy.

Destructive deficits are those to which the economic response is inflation and distortion of the economy rather than a real increase in output and employment. Such deficits lead to deadweight increases in the national debt which can claim no counterpart in the form of increased employment or productivity.

At the present time resources stand ready and waiting to be absorbed in productive employment. Federal deficits in this setting are constructive. To increase them by reducing taxes would not go beyond the bounds of prudent finance, especially if the reductions are explicitly made reversible.

(c) *Conclusion*

If the foregoing paragraphs seem to suggest a position favoring, on one hand, higher taxes, and on the other lower taxes, the answer is, they are intended to. But this is the case where the right hand does know what the left is doing. If, on one hand, the fear of disincentive effects and possible inflationary consequences of high taxes is curbing needed defense and development expenditures, then I should like to speak for higher taxes. The available evidence on incentives and inflationary aspects of taxation provides no warrant for cutting back military and civilian programs of government to avoid the damaging economic effects of taxation.

If, to get back to "the other hand," decisions are made not to expand defense and development programs and thereby put currently unused resources to work on Governments undertakings, then I should like to speak for lower taxes to put these resources to work in private undertakings. Tax reduction can help us realize our full potential which requires putting $20 billion of unused resources to work. It seems unnecessary to run the risk of letting the economy lose $20 billion of potential production for lack of adequate markets.

2. CHANGING CONTENT OF BUDGET FIGURES

Apart from intelligent attitudes toward Federal deficits, sound fiscal policy requires accurate economic measurement of deficits (and surpluses). In this connection, one should commend the Council of Economic Advisers for its unequivocal adoption of the cash-consolidated budget as the basis for measuring the Government's fiscal impact on the economy. But in the same breath, one should warn against making the cash budget a sacred economic cow. For its content and economic comparability change from year to year. This is particularly true currently. Government policymakers owe it both to themselves and to us to identify, explain, and take account of changes in financing and timing which alter the content of the budget as an economic yardstick of Government activity.

Let me cite a few recent cases of shifts in methods of financing or timing which changed the relationship between the size of the Government's cash deficit and the size of the Government's additions to or subtractions from private income flows. A prime example is the price-support program of the Commodity Credit Corporation. By extending to wheat and corn the financing methods that had been previously restricted to cotton price supports, the Commodity Credit Corporation in fiscal 1954 took an additional $1.2 billion of price-support operations off of the Federal budget and out of the Federal debt. This was done by pooling the price-support loans and selling certificates of interest to the banking system. The Government acted as a sort of broker, but bore the interest charges on the certificates sold to the banking system. The Federal budget and the public debt were relieved of the $1.2 billion throughout the 1954 fiscal period. Much of this came back onto the budget this fiscal year, when the support loans matured, but a large counterbalancing amount was again taken off by the renewed sale of certificates of interest.

Another new operation, conducted under the Lease-Purchase Act of 1954, has a similar but much smaller effect on the net budget figures as contrasted with prior practice. Under prior practice, Government post offices, courthouses, and other buildings were constructed and paid for as current expenditures, presumably to be financed by taxation under the general goal of a balanced budget. After a long drought in construction of new public buildings, the new program provides that under proper safeguards, contracts may be let for private financing and construction of these buildings. They are then leased back to the Government and eventually taken over at the end of the lease. According to the Wall Street Journal, the Federal Government will be able to construct upward of $250 million of public buildings within a 3-year span, with only about $50 million showing up in the budget during that same span of time. While the particular figures may be wide of the mark, the relationship is representative. The impact on the economy is considerably greater than is reflected in current Federal expenditures. Under prior budgetary practices, the deficit in this example would have been $200 million greater or the surplus $200 million smaller over the time span involved.

Many other fields may be cited in which changes of financing are taking place that ought to be interpreted for us in terms of their impact on the economic meaning of Federal budget figures. I refer, for example, to the sale of certificates of interest to the banks as part of the process of liquidating RFC loans; to the new methods of financing FNMA operations (which appear to change public debt and administrative budget figures, but not the net cash surplus or deficit); to the proposed change in financing certain TVA operations; and to some of the proposed methods of financing General Clay's $50 billion highway program. Analogous in their impact are shifts of certain activities more or less entirely off the budget (with repurchase of services in some cases) as exemplified by the proposed Dixon-Yates contract and the substitution of private for public construction of dams.

It is worth noting that the foregoing developments in some cases represent and in other cases foreshadow a piecemeal movement toward capital budgeting. The splitting off of capital investments and lending activities combined with substitution of loan financing for tax financing of initial outlays is the essence of capital budgeting. To the extent that this takes place, Federal deficits shrink and surpluses grow. Yet the programs continue or even expand. Economic policymakers should adjust their readings of cash surpluses and deficits accordingly.

Not all of the changes in the economic significance of budget figures involve changes in the coverage or comprehensiveness of the budget. To the extent that they do, consolidation of extrabudgetary with budgetary figures will serve most of the economists' needs. But consolidation would be no solution, for example, in the case of a change in timing of tax collections as under the Mills plan. This plan for speeding up corporate tax collections is completing its 5-year cycle this year. The speedup has added $1 to $2 billion a year to both conventional and cash receipts figures (but not those of the Department of Commerce income and product account). The deficit has been reduced by this amount. But since the plan involved merely speedier payment of liabilities already accrued, the change in budget figures is not accompanied by a parallel change in the flow of private income. As a consequence, a deficit or surplus in fiscal 1956 will have a different economic meaning than a like deficit or surplus would have in fiscal 1955.

I do not mean to suggest that we were ever able to use cash surplus and deficit figures as a comprehensive and unchanging picture of Government's impact on the economy. Government activity was strongly inflationary in the period just after Korea even though the budget showed a cash surplus. Also, the economic lines between actual lending activities on one hand (which are recorded in the budget) and guaranties and insurance (which are not) are thin and difficult to draw. So the economic reading of Federal budget figures always has to be undertaken with caution and understanding.

But it is high time that warning signals be hoisted for policymakers, economists, and citizens generally that the content of Federal budgetary figures is changing. It is time to note, if this be the case, that a cash surplus of $1 billion by today's budgetary practices and definition might have been a $1 billion deficit by yesterday's. It does not seem unreasonable to ask the Government's budgetary and economic agencies to follow this general rule: that whenever there is a significant change in the treatment of a Federal program in the budget without a corresponding change in the extent to which that program affects private income flows, those who use budgetary data in economic analysis and policymaking should be given full, clear-cut notice.

3. STRUCTURAL DEFECTS OF THE INCOME TAX

Moving from questions relating to the level of taxes and deficits and their interpretation, to questions of the structure of taxation, one is disappointed to find in the administration's documents no expression of concern and no proposal for action to counteract the growing erosion of the income tax base. It was not unexpected that a great flood of liberalizations in the tax structure to stimulate business incentives and provide tax reliefs to individuals was vigorously pushed through last year. But having attended to these myriad adjusments (with only very minor loophole—closing efforts), the Treasury might have been expected to turn its attention to such gaping holes as the tax exemption of State and local bond interest, excessive percentage depletion, the failure to recognize capital gains at death, and various income-splitting devices. Some of these gaps, surely, must offend the Treasury's sense of fairness and even-handedness in the application of the income tax. At the same time, the Treasury would find much sympathy for its undoubted view that top-bracket rates of 70, 80, and 90 percent are unrealistically and damagingly high. Even under a policy permitting of no revenue loss, a combined program of cutting back the top rates and offsetting the modest revenue loss by restoration of the base would have been very much in order.

That the need for such action has become urgent, even critical, was underscored again at the meetings last month of the American Economic Association. As one speaker (Prof. Paul Strayer, of Princeton) put it: "Let us remember that a truly effective income tax with more modest pretensions is worth more than one riddled and weakened for political reasons. It seems to me that the choice now before us is between the salvage of the income tax and the return to a greater dependence upon indirect taxation. * * * No tax law can be perfect. It is clear, however, that few can be as bad as the current income tax law and still command the respect of any intelligent citizen or economist."

Ironically, in the opinion of many, one of the features that cries loudest for correction is the dividend credit provision enacted just last year. By providing no relief at all for dividend recipients falling below the income tax exemptions and by providing greater relief, proportionately, the higher the taxpayer's income, the new dividend credit represented "wrong-way relief." In this connection, let me quote from a report on the National Bureau of Economic Research study of dividend taxation by Daniel M. Holland: "In summary, our major conclusion is that the relief provisions of the Internal Revenue Code of 1954 are inappropriate measures for the hardship they seek to alleviate. They are not geared directly to the basic feature of this hardship, viz, that it becomes increasingly less severe the higher the marginal personal income tax rates to which stockholders would be subject."

Although a program for restoring the even-handedness of the income tax is critically needed, one cannot be very optimistic about the prospects of achieving it as long as the current attitude toward preferential tax treatment prevails. There appears to be a strong preference for methods of granting subsidies which do not apear in the budget as expenditures but rather take the form of guaranties, insurance, and above all, tax reduction. The proposal for tax benefits to foreign investors is part and parcel of this movement. In terms of serving national economic and political objectives, it is probably one of the least objectionable tax concessions. If it were acompanied by the elmination of some of the indefensible concessions that now exist, one would have a good deal more optimism about the fate of our Federal income tax.

STATEMENT ON THE ECONOMIC REPORT OF THE PRESIDENT BY HARLEY L. LUTZ, PROFESSOR EMERITUS OF PUBLIC FINANCE, PRINCETON UNIVERSITY, AND TAX CONSULTANT, NATIONAL ASSOCIATION OF MANUFACTURERS

In the time at my disposal I shall discuss briefly the economic and political philosophy of government which is revealed in the Economic Report at different points and in various ways. My interpretation is that this report undertakes, rather unsuccessfully, to steer a course between a free, private economy, and a planned economy. It is natural, no doubt, that a report prepared by and for the Government should place the major emphasis on what the Government has done. In my view, however, the reasons for concern go deeper than recognition that a Government agency is naturally inclined to extoll and support its employer. The fact that the Council of Economic Advisers is a Government agency gives its views and its proposals a weight of authority that no nongovernmental organization could carry in expressing the same ideas.

The tone of the report is set, on page 2, by an enumeration of basic tenets which are said to underlie the administration's economic actions and its future program. Four of the six propositions advanced there deal with what the Federal Government is doing or intends to do, and only 2 relate to the private economy as a matter of major concern. Another example of the emphasis on the superior role of government is in this sentence from page 48:

"Budget policies can help to promote the objective of maximum production by wisely allocating resources first, between private and public uses, second, among various governmental programs."

This is a disturbing statement because, in my view, it points directly toward the planned, and eventually the socialized, economy. It says, in so many words, that maximum production can be promoted by permitting the budgeting authority, in its superior wisdom, to determine the allocation of total resources between private and public uses. From this it follows that if the budget authority should decide to increase the public share of total resources, the private share would be correspondingly diminished. Concretely applied, this means that if in its superior wisdom the Government should increase its budget in order to apply more of it to the production of particular goods such as steel, rubber, aluminum, electric power, or other things, there would be less private resources and a smaller total of private production than would otherwise be the case. It is impossible to avoid the implication that total production can be increased by getting the Government into business through absorption via the budget of a larger share of total resources.

Economic production is the peculiar domain of private capital and effort. Government encroachment into that domain is not conducive to a larger total, particularly in a society which is as well equipped as is our own with private managerial competence and all else that contributes to productive efficiency. Long ago Adam Smith observed that the functions of sovereign and trader could not be merged without detriment to the performance of one function or the other. The business of government is to govern and our society will advance most rapidly if the public functions and services are kept within that sphere, and if the portion of total resources drawn into public use is held to the minimum required for the efficient performance of the necessary public services.

This conception of the nature and function of the budget rejects the doctrine that the chief purpose of the budget, and of the spending and taxing power, is to pump money into or out of the economy as determined by the aims and intentions of a superplanning agency. Adam Smith said that when a ruler attempted to superintend the industry of private people and to direct it toward the employments most suitable to the interest of the society, he was undertaking a duty in attempting to perform which he must always be exposed to innumerable delusions, and for the proper performance of which no human wisdom or knowledge could ever be sufficient.

I would direct your particular attention to the gap between certain expressions of our national objectives and aspirations, on one hand, and the omissions from the report of adequate recognition of the actions required if these lofty and worthy ends are to be attained.

On page 4 are these statements:

"Our economic future depends on the full use of the great treasure house of intelligence, skill, energy, and confidence of the American people."

And again, from the same page:

"* * * unless there are satisfactory jobs for those who seek useful employment, and unless human labor is devoted increasingly to the production of goods and services that improve the quality of life, our gains in productivity may be dissipated."

One more, on page 6:

"Public policy must also protect incentives and encourage a spirit of enterprise and innovation among people. The man or woman who, in the hope of personal betterment, works harder, designs a new product, creates a new method, invests in a new business, moves to a better job, or suggests a new idea to his employer must believe that the rewards of initiative and effort are worth while. Through all of its policies the Government must encourage enterprising action by business managers, investors, and workers, in an environment that is kept basically free and competitive."

These are splendid statements of our personal and national objectives and aspirations. They are entitled to command, and I believe that they do command, universal approval and support. With a platform such as these passages provide, anyone who continued to read through the report would expect to find an equally forthright and constructive program whereby the objectives set out there are to be attained.

In this respect, however, the report is disappointing. It fails to recognize adequately the great importance of private capital formation as one of the most essential conditions for the provision of satisfactory jobs, for the increased production of goods and services that improve the quality of life, and for the desired advance of the level of well-being. There are references to the things that Government is doing to aid small business, to curb monopoly, to expand so-called public assets, and to extend social-security benefits. These and the other actions described, which constitute a combination of policing and paternalistic measures, may have beneficial effects. They cannot possibly serve, however, as adequate substitutes for the growth of the Nation's stock of the private capital which increases our productive potential.

This lack of emphasis on, or adequate recognition of, the importance of steady growth of our capital is the more surprising in view of the rate at which the labor force is growing, and of the capital investment which is required, on the average, to provide a productive, well-paid job for each new worker. It is equally amazing to find that, although there is a clear grasp of the bearing of heavy taxes on incentive and the provision of job opportunities, there is so little concern about the defects of the Federal tax structure. On page 49 it is said:

"It should nevertheless be recognized that present taxes are still a heavy burden. Lower taxes would tend to encourage work, promote more efficient business practices, and create more jobs through new investments."

This is an excellent description of an important line of action that must be taken if we are to have that glorious economic future which, on page 4, we are told may be ours. But on the subject of tax relief, the report offers stones instead of bread. It is said that there can be no tax reductions this year, not even those that were agreed upon a year ago. Maybe there can be something, next year, if expenditures are reduced. As for next year the report says, page 49:

"Congress might then consider enacting a general, though modest, reduction in taxes and, at the same time, continue the program which was begun last year of reducing barriers to the free flow of funds into risk-taking and job-creating investments."

In my judgment, here is another weakness of the Economic Report; namely, the failure to carry through from the perfectly clear perception of the bad effects of heavy taxes to a firm and definite position on the necessity of prompt, corrective action. The removal of other barriers to the free flow of funds into risk-taking and job-creating investments is a desirable step but it will be relatively futile unless there is also removed the very obstructive barrier of the high taxes on incomes, and the gross discriminations of the steeply progressive rates of tax on individual incomes.

There are two sources of tax reduction. The traditional measure of such reduction has been the amount by which the public spending has been, or can be, reduced. The Economic Report places the principal prospect for tax cuts on this traditional basis.

Another source of tax reduction which hitherto has been generally disregarded is economic growth. This factor has been recognized in the President's recent messages. The National Association of Manufacturers has published within the past week a new tax program which proposes to utilize the growth factor as a source of tax reduction. This is, of necessity, a long-range program, the projections of which are based on the historic growth trend without regard to the annual variations or temporary reversals of that trend. As a first step, a series of tax rate reductions in the rates of corporation and individual tax is projected over a 5-year period. My time does not permit lengthy exposition of the plan, but copies can be made available to members of the committee, or for inclusion in the record, if desired.

The two points at which the tax rate reductions would be made, under this plan, are the corporation tax rate and the progressive element of the individual rate scale. By a series of annual reductions over 5 years the top rate in each case could be brought down to 35 percent. On the assumption that there would be, on the average over this period, a continuation of economic growth at the historic rate of 3 percent, there would be provided as much revenue through the period as is now obtained from the present high rates.[1] As an illustration, if the Federal revenue requirement over the next 5 years were not to exceed, say $60 billion a year, this level of revenue could be maintained because of the expansion of the taxable corporate and individual income bases, even with the proposed annual-rate reductions. The possibility of a serious military crisis canot be ruled out in any period, much less the present, but this ever-present possibility provides no reason to forego constructive planning for national growth and prosperity. If and when the Nation should again be faced with a great military crisis, it will be better prepared to meet the situation if investment and production have been maximized in the meantime.

The reason for concentrating the reductions that are realizable from the growth factor on the high rates of income tax is that these rates are the most penalizing on incentive, effort, enterprise, and capital formation. The case for action here fits perfectly with the excellent statements which I have already read from the report concerning the release of our creative energies, the provision of enough satisfactory jobs, the importance of letting every industrious, ambitious, creative person realize that the rewards for his efforts will yield personal betterment. The reduction of penalizing, discriminatory taxes is the one effective and convincing way of demonstrating that we really mean what is said on this matter.

The plan does not deal expressly with the first bracket rate of the individual tax, but it is emphasized that during and after the execution of the plan, every opportunity of further tax reduction arising from budget cuts or a more rapid rate of economic growth than is assumed in the plan, should be applied to a reduction of the first bracket rate.

If it be said that inasmuch as the plan assumes continued growth, why should the available tickets for tax reduction be used in this particular way. My answer is that there is no assurance that the growth will continue, and especially is this so if we do not work and plan for it. The report says, correctly, that there is no way of lifting more than a corner of the veil that separates the present from the future, and that we shall achieve the grand economic future awaiting us only by wise management of our national household. The best assurance we can give that economic growth will continue is to remove the barriers and impediments most likely to prevent it. Chief among these barriers is the ball and chain of high and discriminatory tax rates.

Statement of William Vickrey

Gentlemen, I would like if I may to address my remarks primarily to the first two paragraphs of the suggested agenda for today.

Err, if at all, on the inflationary side

First, as to the appropriate overall fiscal policy for 1955, there are others coming before you who have made a more diligent study of the recent annals than I, and I would not want to presume to recommend a specific level for the deficit or surplus to be aimed at. But I would want to urge very strongly that in view of the inevitable range of uncertainty as to just what the ideal fiscal policy would be, we should err, if at all, on the side of too much stimulus, too large a deficit, rather than too little. This is because in my judgment the damage done by too much stimulation to the economy is much slighter, and is more easily dealt with, than the loss incurred if the stimulus is too mild.

---

[1] In chart 1, on p. 3 of the report, there is a hypothetical projection of gross national product from about $360 billion in 1955 to $500 billion in 1965. This is a growth rate of 3.3 percent a year, compounded. Our assumption of 3 percent thus appears reasonable, or even slightly on the conservative side.

Unemployment worse than inflation

The losses from an over- or under-stimulation of the economy are felt chiefly in two areas: employment and prices. In the price area, losses occur both when prices rise unduly and when they fall unduly; these losses are in the shape of wrong production decisions made because of distortions in the price structure and inability to forecast prices correctly, and in the shape of inequities that arise when legitimate expectations are upset: debts becoming more burdensome as prices fall, savings losing their value as prices rise. In the employment area, there is on the inflationary side often a loss from inability to find labor for strategic jobs, and from hoarding of labor in partial idleness to avoid such a contingency, but this is relatively slight compared with the very substantial and measurable loss of output that occurs when large numbers are unemployed; the inequities and disappointments that arise out of unemployment also are much more serious than those which occur from mere changes in the price level. I think that there are many who will agree with me in judging that the evils and losses accompanying unemployment are far more serious than those accompanying any degree of inflation that there is the remotest likelihood of our getting into in the near future. Accordingly, I would suggest that it is well worth while running even a quite appreciable risk of a mild inflation, rather than risk causing the present level of unemployment to continue for a week longer than is absolutely necessary. The accompanying chart will perhaps make this point a bit clearer.

(The chart referred to appears at p. 334.)

Small deficit and easy money versus large deficit and tight money

Another point I would emphasize in fixing overall goals is that fiscal policy and monetary policy should be considered jointly. Too often each type of policy is discussed as though the other were impotent or nonexistent. It should be clearly realized that in the long run, at least, a full-employment economy with stable prices can be achieved either with a cheap money policy and a relatively small deficit (or perhaps even a surplus), or equally well with a tight money policy and a larger deficit. Of course, while these two alternative policy combinations may lead to the same level of employment and prices, the detailed effects on the economy will differ, but the choice should be made deliberately on the basis of these differences and not as a result of political and administrative accidents. Thus a tight-money and large-deficit policy is likely to lead to a higher current standard of living at the expense of a lower level of private capital formation; to a larger share of the national income being distributed in the form of interest, dividends, profits, and rents, and a smaller share in the form of wages; what is often overlooked is that such a policy provides a greater leeway for the use of monetary policy in checking an incipient deflation or recession. For example, if we had come to the summer of 1953 with the same level of employment, incomes, and prices, but with a larger annual deficit and higher interest rates, there would have been more room for the Federal Reserve System to maneuver, and it is even possible that a reduction of interest rates from around say 6 percent to the rates actually reached at the beginning of 1954 might have turned the tide, whereas with actual rates ranging from 2 percent to slightly over 3 percent in the summer of 1953, by the time it became apparent that substantial stimulative action would be needed, the utmost that the Federal Reserve System could do proved insufficient, as the available range of action then allowed permitted only a reduction in interest rates of 1.8 percent for Treasury bills, and much less than this for the more widely significant rates.

Too much deficit can be corrected by FRS; too little cannot be

There is a great deal to be said in favor of firing up the boilers of the economy with a substantial budget deficit and then throttling this steam with high interest rates: throttling by the Federal Reserve System can be adjusted from week to week as developments warrant, while changes in fiscal policy take considerably longer to put into effect. If more than enough steam is produced by more deficit financing under the boiler than is absolutely necessary, this can always be throttled down by tight money policy on the part of the Federal Reserve System. On the other hand if there is too little deficit financing, or too large a surplus, the economic machinery may stall even with the throttle wide open. An error in the direction of too large a deficit can readily be corrected, at least insofar as the tendency to inflation is concerned, by monetary policy producing higher interest rates; there is no equally ready corrective for an error in the direction of too low a deficit or too large a surplus.

Present dividend credit method is a dead end

As to changes in the tax structure, the tax treatment of corporations badly needs overhauling. The recently enacted dividend credit does serve to moderate very slightly the differentials between taxes on enterprise organized as corporations and other forms of organization. But as a means of doing anything really substantial toward dealing with this problem it is essentially a dead end. In its present form the dividend credit is not really large enough to reduce the discrimination very much, and if increased to a level where it would produce even a very rough equalization on the average, it would at the same time produce intolerable inequities. Preferred stockholders would receive what is essentially a windfall. Dividend recipients in the upper income brackets would be relatively undertaxed, while those in the lower income brackets would still be overtaxed, in the case of corporations distributing their income, while nothing effective could be done by this method to mitigate the discriminations arising with respect to corporations accumulating earnings.

Ending double tax on corporation income

Any serious attempt to achieve a major abatement of the discriminations now involved in the taxation of corporations must take some account of the differences between corporations that distribute most of their earnings and those that do not. About the most satisfactory simple way of doing this that I can think of would be to impose an annual tax of say 2 percent upon the accumulated undistributed profits of corporations, as an interest charge on the tax not paid by individuals. The way would then be open to treating the present corporation tax at least in part as a tax withheld at source; if this is done by means of a tax credit such as the present one, then either the dividend must be "grossed up" to obtain the individual's net income before the tax was withheld, or the amount of the tax credit added in to his net taxable income.

Capital gains at death of taxpayer

The President's Economic Report speaks on page v and again on page 49 of lowering tax barriers to the free flow of funds into risk-taking and job-creating investments, in a context implying that this must wait until rate reductions become feasible. But in the field of capital gains there is at least one place where this objective can be promoted with a gain rather than a loss of revenue. Under present law, taxpayers are often "frozen in" to their existing investments by consideration of the fact that if they hold on to these investments until their death there will be no capital gains tax to be paid on whatever appreciation in value there may have been, either by themselves or by their heirs. A provision requiring a tax at capital gains rates to be paid on the excess of the value of these assets as appraised for estate-tax purposes over their tax basis would go far toward eliminating this barrier to the free switching of investments, and would in addition produce a small amount of revenue which would permit the lowering of tax barriers in other areas. There is no reason either in equity or in public policy for thus retaining a tax discrimination in favor of those who refrain from turning over their assets until their death. Such an enactment would make it possible for those who had invested in profitable growth ventures to switch, when these ventures have reached maturity, to new risk ventures, without thereby losing a valuable tax exemption, since the exemption would no longer exist.

Tax credit for Government bond interest

Another step in this same direction would be the conversion of the exemption of interest on State and local bonds into a tax credit at a rate calculated to be just sufficient to preserve the market value of these bonds. Conceivably, an appropriate credit would be 30 percent of the interest received, to be applied as a reduction against the tax. For top-bracket taxpayers the net yield after taxes obtainable from such bonds would no longer be quite so far out of line with after-tax yields on other securities, and some of the funds thus released would presumably become available for risk investment, while the Government bonds would pass into the hands of low-bracket taxpayers to whom the credit would be more valuable than the exemption was previously. The demand for the bonds from such investors would, if the rate of the credit is properly determined, be just sufficient to maintain the value of the bonds on the market. Since the market values would be maintained there would be no ground for objection from government bodies, since new issues could still be floated at comparable yields, and institutional owners would be protected from capital loss.

Drop transport and communication excises

Concerning excises, I would suggest chiefly the elimination at the earliest possible moment of the taxes on transportation and communication. These are decreasing cost industries, and taxes on such industries have a double burden: not only must the users of these services pay the tax, but as the tax causes a reduction in use, average costs per unit of service rise because of the lower level of utilization of the facilities, and these higher average costs must be borne either in the form of higher charges or lower profits. Each dollar of revenue obtained from such taxes as these may well cost taxpayers $1.20 or more when all of the repercussions have been worked out. In theory, at least, a good case can be made for subsidizing such industries; while one may not want to go so far as to provide an outright subsidy, at least there is no excuse for singling them out for special and extra tax burdens.

Percentage depletion unsound.

I cannot pass over the subject of depletion allowances without expressing my conviction that they have no place in an individual income tax. Recovery of actual investment, yes; but anything above this is income to the person receiving it. Nor is there any public policy to be served: rather the reverse; the percentage depletion allowances encourage excessive development of domestic mineral properties rather than foreign, encourage early exhaustion of oud own resources and increase our ultimate dependence on foreign sources, and increase the dollar shortage abroad by curtailing imports of minerals.

Estate taxes are badly in need of strengthening and simplification. Several lines of approach are possible, but no real progress can be made without fundamental overhaul.

On the experience of 1954, I cannot pretend to have any expert opinion; my judgment would be that the main contribution made by tax changes to the arrest of the economic decline would be from the reduction in individual income taxes; the major effect of the other changes probably was felt only considerably after the bottom had been reached. In my judgment the built-in stability of any set of rate schedules is inherently incapable of doing more than mitigating swings after they have arisen, and so I would not wish to depend on such built-in stabilizers as a protection against inflation in the long run. On the other hand I see no immediate danger of conditions arising during the next year to 18 months that would call for increased rates for fiscal policy purposes. Nor over a longer run does it seem likely that deficits of the order proposed for 1956 would give rise to inflation; indeed I would feel that much larger deficits may be needed to provide the pressure needed for the satisfactory operation of monetary controls.

If I were asked to suggest a specific fiscal prorgam, I would propose the immediate and permanent elimination of the transportation and communications excises, to take effect as soon as feasible; not only would this have a desirable stimulative effect, but since these taxes are a part of costs, there would be a tendency for such a repeal to keep prices down and thus inhibit any possible inflationary influence that a stimulative fiscal action might have at this time.

In addition, I would like to see an immediate temporary tentative cut in personal income taxes, such as to involve a reduction in the withholding rates of say 20 percent, beginning March 1, or as soon thereafter as would be feasible. Then toward the end of the present session of Congress, say in June, Congress should take another look at the then trend of the economy and establish the withholding rates for the remainder of the year and set the final rates for the income of the year 1955 in such a way as to agree with the overall level of withholding that thus results for the entire year. I would make the cut entirely in the rates rather than the exemptions, in the expectation that it would be easier to put the rates back up later in the year if that should prove to be indicated than would be the case if cuts were made in the personal exemptions.

In deciding on the final level of rates for the year, I would like to see this done on the assumption that the aim is a budget situation which in and of itself would produce a mild degree of inflation in the absence of any action by the Federal Reserve Board, with the presumption and legislative direction, if necessary, that that body act to control any inflationary pressures that do develop by adequate increases in reserve requirements, increases in rediscount rates, and by adequate sales of securities on the open market so as to tighten the money market and drive interest rates up to levels where undue expansionary activity would be throttled off. The Federal Reserve System may still operate to facilitate the orderly absorption of large issues of Government securities, but it should be relieved of any responsibility for the keeping of interest of rates on Government securities at any particular level. If restrictive action appears to it to be necessary to avoid undue inflation, such policies should be pursued regardless of their effects in raising the rates of interest payable on Government issues.

If this is done, Congress can then adjourn with the feeling that the economy is under some degree of control, and is not merely drifting, as at present, with the throttle almost wide open, but with not enough steam in the boiler to produce full employment.

(Whereupon, at 4:25 p. m., the committee adjourned until Monday, January 31, 1955, at 10 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

MONDAY, JANUARY 31, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas (chairman) presiding.

Present: Senator Douglas (chairman), Senator Sparkman, Representative Patman (vice chairman), and Representatives Bolling, Mills, Kelley, Wolcott, Talle, and Curtis.

The CHAIRMAN. As you know, we meet this morning to discuss monetary policies, with particular reference to the Economic Report of the Council of Economic Advisers. We appreciate you gentlemen taking the time to discuss this with us. We are very grateful.

We have invited a representative of the Secretary of the Treasury or the Secretary to attend, but the Secretary has declined on the same grounds that he gave on Friday.

We are very glad that the Federal Reserve Board has designated Mr. Riefler, who is Assistant to the Chairman, as a representative. We are happy to have him here.

I think perhaps it would be a good idea if we took each of the subjects in turn and went through the panel and then the members of the committee could ask questions of the members of the panel and perhaps there could be some discussion within the panel itself.

Vice Chairman PATMAN. Mr. Chairman, before you ask a question, since you have someone representing the Chairman of the Board of Governors, do you expect to have the Chairman later on?

The CHAIRMAN. We invited either the Chairman or someone designated by the Chairman. I understand that Mr. Riefler appears here in response to our invitation.

Vice Chairman PATMAN. Well, I think you ought to have the Chairman here. If you do not have him this time, you ought to have him another time. My feeling is the same way about the Treasury. I do not see how we can go into the study unless we have the policymaker here. I do not think we should have anyone less than the policymaker.

Now, I am not saying that we should not hear Mr. Riefler; we will do the best we can, but I am hoping it is not a precedent—that it is not an established policy to accept substitutes.

The CHAIRMAN. This does not constitute a binding precedent and the question of later appearance, I think, can be discussed inside the committee.

Vice Chairman PATMAN. Just one thing, did you invite the Chairman, Mr. Martin?

The CHAIRMAN. Yes.

58422—55——27

Vice Chairman PATMAN. And Mr. Martin sent his representative down?

The CHAIRMAN. Well, it is perfectly true that he could designate someone as his representative.

Vice Chairman PATMAN. You stated that.

The CHAIRMAN. Yes.

Vice Chairman PATMAN. Well, that would be a good reason.

The CHAIRMAN. The first question I should like to address to the panel is this: What should be our monetary policy in 1955 with respect to the quantity of money and credit? Should we have (*a*) a fixed quantity of bank credit, (*b*) a decrease in the quantity, (*c*) an increase in the quantity comparable to the increase in physical production, or (*d*) an even more rapid increase in quantity?

I shall ask Mr. Riefler to begin the discussion.

OPENING STATEMENT OF WINFIELD W. RIEFLER, ASSISTANT TO THE CHAIRMAN, BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM

Mr. RIEFLER. The monetary and credit policies pursued by the Federal Reserve System in 1955 will continue to be guided by the philosophy emboided in the Employment Act, that is, the nurture and cultivation of sustained economic growth and stability at high levels of resource use.

In more concrete terms, this means that credit and monetary policy will be directed toward furnishing the reserves needed by the commercial banks to perform efficiently their function of financing the economy at a high level of resource utilization without contributing either to inflation or deflation, and without encouraging developments that will make for instability. So far as the cost and availability of credit are concerned, it means that the System will try to promote a pattern of finance that will find a market for the economy's savings in constructive activities. So far as the quantity of credit is concerned, it will work for a rate of growth in the active money supply appropriate to the growth in the resources available to the economy.

It would not be wise to establish a fixed or mechanical formula to govern the relationship between growth in the money supply and growth in the economy. Both businesses and individuals hold cash balances for a variety of reasons which may change from time to time. The result will be registered both as a change in the velocity of circulation and a change in the appropriate relation between growth in the money supply and growth in real output.

The CHAIRMAN. Mr. Riefler, I hope you will forgive me if I make this comment: The very guarded nature of your comment reminded me of the statement that language is a device designed to conceal thought.

Now, in response to the particular question here, do I understand you to say that you believe that the total supply of money should be expended with production taken into account, taking in mind the philosophy of maintaining a constant price level, neither an increase in prices nor a decrease in prices?

Mr. RIEFLER. I thought I said that.

The CHAIRMAN. Do you think you have a very good measure of the velocity of circulation?

Mr. RIEFLER. Not too good, and you have to take into account all of the lags and leads which there may be in the situation.

The CHAIRMAN. Do you regard the figures which we have on page 30 of Economic Indicators, namely, demand deposits adjusted, as a correct measure of the total supply of money?

Mr. RIEFLER. We are using demand deposits plus currency in circulation as the statistical measure of the active money supply. I think that is as close as you can get to it statistically. Of course money is what people use for money. The statistical measure is never a complete expression of the concept.

The CHAIRMAN. I have often wondered if currency in circulation was not misleading. A great deal of it has been lost, a great deal of it is in safety deposit boxes, and so on.

Mr. RIEFLER. I think that, after the bank closings in 1933 and during the period of controls and black-market operations, currency in circulation seemed to increase faster than was indicated by the economic situation, and I also think that during the period of currency instability abroad, quite a bit of our currency got over there with the troops, and tended to remain.

My impression is that the trend is the other way now, that that kind of locked-up currency is being released.

The CHAIRMAN. That is my impression, too.

Mr. RIEFLER. So far as changes in the active money supply are concerned, that trend would tend to conceal or understate the increase at the present time. But the amounts are relatively small and I do not think they would be worth particular attention. That is my impression.

The CHAIRMAN. That is all.

Mr. Talle.

Representative TALLE. No questions.

Vice Chairman PATMAN. Mr. Riefler, I listened with interest to your statement which is on page 3 of your written statement, as I understand it. You state that you hope to help the economy by furnishing the needed reserves to the banks. Is that a fair statement?

Mr. RIEFLER. Yes.

Vice Chairman PATMAN. In other words, if the banks need more money you will change the reserve requirements so they can issue more money on their reserves?

Mr. RIEFLER. Well, we might. The reserves are furnished to the bank in three ways—well, two ways. When we change reserve requirements we are not furnishing reserves to the banks. We are changing the amount of reserves they are required to hold. But when we furnish reserves actively, it is either by buying securities or by lending to the banks through the rediscount window.

Vice Chairman PATMAN. I notice last year you state the total loans of all commercial investments increased about $11 billion, of which about $4 billion was in active money supply. How was that brought about?

Mr. RIEFLER. The bulk of the increase in loans and investments in the commercial banks was reflected by a growth in their deposits. Of the deposit growth part was time deposits, and part was demand deposits. That $4 billion is the increase in demand deposits plus currency in circulation.

Vice Chairman PATMAN. Do you mean most of that was obtained by people borrowing at commercial banks? In other words, they increased their deposits by making loans?

Mr. RIEFLER. Yes; people borrow from commercial banks and get deposits and then pay them out. The people that receive the payments put them back in the banks. Some of them put them back in the form of time deposits. That activity is reflected in the growth of time deposits. Part of them put them back in the form of demand deposits, and that is reflected in the growth in the active money supply.

Vice Chairman PATMAN. Now, on this one question, I assume that your answer would be that if we keep our economy growing and our national product increasing, it will be necessary in a proportionate manner to expand the money supply; is that right?

Mr. RIEFLER. Yes, not necessarily by a formula, though. You look for growth in the money supply with growth in the economy. It is very important.

Vice Chairman PATMAN. There is no fixed rule to govern it, though.

The CHAIRMAN. Mr. Kelley?

Representative KELLEY. No questions.

The CHAIRMAN. I regret that I seem to have violated my own rule by questioning Mr. Riefler before the other members had a chance to question.

(Mr. Riefler's prepared statement and supplemental information appear at pp. 489, 491.)

The CHAIRMAN. I shall now call on Mr. Hansen.

OPENING STATEMENT OF ALVIN HANSEN, LITTAUER PROFESSOR OF POLITICAL ECONOMY, HARVARD UNIVERSITY

Mr. HANSEN. Mr. Chairman, with respect to the question you asked, I have a very, very brief statement which I would be glad to read with respect to the matter of the quantity of money and what should be our policy during the next year. I will make this first general statement.

I suggest that for a rich industrial country the correct quantity of money is not any precise fixed amount. It may be anything within a rather wide range. A rich, highly developed country desires and is capable of holding a very large amount of liquid assets in relation to its income. A poor, undeveloped country is not. In a rich country there is no close relation between the quantity of money and aggregate spending. In a poor country there is. That is why the quantity theory of money applies quite well to poor countries. The quantity theory has very little relevance for rich advanced countries.

If the level of economic activity is low, we should actively promote high liquidity and a policy of easy credit. If activity is running very high, the monetary authorities should lean moderately against the inflationary pressures. Monetary policy should make a modest contribution toward the containment of inflation, but primary reliance should be placed upon fiscal policy and selective controls.

The monetary authorities should, I believe, follow no rigid formula with respect to the quantity of money. A rich advanced society does not hold money merely for transactions purposes, and therefore the old velocity concept is more or less meaningless. A rich society cannot function well without large liquid assets, ready to take advantage of changing investment opportunities and prepared to meet unforeseen contingencies. Such a society cannot prosper without a highly elastic monetary system.

I might add that it seems to me with respect to the coming year I see no reason why we should move toward monetary restraint. As I see it, we are currently some 25 billion below our output potential, and I estimate this not on an overfull employment basis, but on a basis that is lower than in the high peak quarters. Even in these high peak quarters, as a matter of fact, we had no inflation.

So I see no reason why we should move even as has been suggested, from "active ease" to "just ease." I would suggest a continued utmost ease in the monetary field in the year ahead.

The CHAIRMAN. Thank you.

(Mr. Hansen's prepared statement appears at p. 491.)

The CHAIRMAN. Mr. Reierson.

OPENING STATEMENT OF ROY L. REIERSON, VICE PRESIDENT AND ECONOMIST, BANKERS TRUST CO., NEW YORK, N. Y.

Mr. REIERSON. Mr. Chairman, I find myself in substantial agreement with the general objectives as stated by Mr. Riefler, and partial but not complete agreement with the point of view presented by Professor Hansen.

As a general objective, I would support the thesis that we should provide a money supply sufficient to keep pace with the requirements of an expanding economy, that is, promote a gradual increase in the money supply in line with increase in the output and in the monetary needs of an expanding economy. By implication, this means that I am in general agreement with benchmark (c), listed in the question.

I would suggest, however, that the application of this general concept to a particular situation is a very complex and difficult problem, and certainly would agree with both previous speakers that we cannot use an arithmetic formula in trying to apply the principle. The principle provides some very rough benchmarks, but probably no more than that.

I take it that we are interested in avoiding twin evils. We certainly wish to avoid, in a period of economic slack, an inadequate money supply. We wish to avoid policies of credit restraint that would accentuate credit contraction and deflation in a period of business weakness, and which would by their nature be restrictive and restraining upon the money supply. Likewise, I take it that we wish to avoid the other evil of an excessive growth in the money supply, that is, an increase at a rate far above the increase in the volume of output in the economy. In the past, this has frequently brought inflationary pressures and increases in prices.

The most dramatic example of an oversupply of money is, of course, provided by war financing when military operations are financed through the banking system and contribute to inflationary pressure during and after the war.

I suggest, Mr. Chairman, that a rapid increase in the money supply under conditions other than war could have similar but perhaps less drastic results, especially if the situation should arise where large amounts of credit were being used for purposes that did not increase the flow of goods entering the market. I am not suggesting that we are in that position at the present time.

The application of this general principle to any particular situation is obviously complicated by a variety of factors. One of them may be long-term changes in the monetary habits of the population. It appears that the active money supply relative to gross national product is currently a little higher than it was in the period of prosperity in the twenties. However, these changes in monetary habits are probably fairly gradual and can be largely ignored in the short run.

However, we also have cyclical fluctuations in the relationship between money and economic activity. In a period of business decline, particularly if the decline is of significant proportions, we frequently have a slower rate of turnover of the money supply as measured by these inadequate indexes, and, consequently, perhaps need a somewhat higher money supply relative to gross national product.

The reverse probably is true in periods of prosperity when a faster turnover of the money supply may reduce the need for as large an increase in the volume.

What I am suggesting, Mr. Chairman, is that the application of this very rough and general principle should be made in light of the cyclical situation in the economy, that in a period of business decline, credit policies should be used that would create an environment in which the money supply could increase faster than the average rate of growth. In a period of initial business recovery, I would think that the money supply should remain adequate and credit conditions not be restricted. But as business expands, if the cyclical patterns with which we are accustomed tend to prevail in the future, then the thought occurs to me that we shall approach a time when a less liberal credit policy and a slower rate of increase in the money supply would be perfectly appropriate.

Specifically, I think that the increase in money supply in 1954 was resonably in line with this long-term growth benchmark. I think that the present business situation warrants continued application of the general benchmark; an increase in annual terms of perhaps 3 to 4 percent would seem reasonable. But I suggest that we should maintain flexibility in our thinking, adapt our thinking to the cyclical changes in business activity and restrain the rate of growth of the money supply as we approach full employment.

In the application of this general principle, another complication is that of seasonal fluctuations. The seasonal fluctuations in demand deposits are of substantial importance, and the seasonal fluctuations in money in circulation are likewise large enough so that they cannot be ignored. This complicates the use and interpretation of the data on the money supply.

The CHAIRMAN. Thank you very much.

(Mr. Reierson's prepared statement and supplemental information appear at pp. 486–488.)

The CHAIRMAN. Mr. Stein.

OPENING STATEMENT OF HERBERT STEIN, ASSOCIATE RESEARCH DIRECTOR OF THE COMMITTEE FOR ECONOMIC DEVELOPMENT

Mr. STEIN. Mr. Chairman, I would like to state first for the record that I appear here today to present my own views and not to represent the Committee for Economic Development, with which I am associated.

I do not believe that the question of the appropriate rate of increase in the money supply can be answered for a period as long as 1 year ahead without an ability to forecast economic conditions that I do not believe anyone has.

One's opinion of appropriate monetary policy at any one time depends, or should depend, upon one's appraisal of the economic situation as it exists and as it is foreseen for a short period ahead.

It is one of the great advantages of monetary policy that the forward look need not be very long, since the policy can be changed in time if developments in the more distant future call for a change.

In general, I agree with the diagnosis of the economic situation contained in the Economic Report. This diagnosis is that we are experiencing a recovery, which is not yet complete, and that continued rapid movement to full recovery is possible, even "promised," but not assured.

In my opinion, this diagnosis calls for a prescription of continued active monetary ease. This means that banks should be so well supplied with reserves that they will be actively seeking opportunities to extend credit and will be increasing their investments in Government securities.

I do not see anything in the President's Economic Report that is necessarily inconsistent with this prescription. However, I believe that the report could have been clearer on this point.

Possibly before the end of this year we shall need an anti-inflationary monetary policy. But this possibility does not means that we do not need, or cannot have, an active stimulating monetary policy now. The meaning of flexibility in monetary policy is that we can have a stimulating policy now and a restrictive policy 6 months from now.

(Mr. Stein's prepared statement and supplemental information appear at pp. 494, 495.)

The CHAIRMAN. Mr. Whittlesey.

OPENING STATEMENT OF CHARLES R. WHITTLESEY, PROFESSOR OF FINANCE AND ECONOMICS, UNIVERSITY OF PENNSYLVANIA, AND ECONOMIST, THE PENN MUTUAL LIFE INSURANCE CO.

Mr. WHITTLESEY. May I say that in the letter I received from the chairman there was this statement: "We shall ask each member to summarize his views on the assigned topic in an opening statement of 5 to 7 minutes."

I am going to have to break into my subject and I am not sure that my thoughts will be revealed as well as they would have been otherwise, but they certainly will not be concealed if I can avoid it. Addressing myself to the questions you have put before us, I have combined may answer with that to the second question presented to the panel. When that comes up, I shall have to pass.

The first two questions seem to call for some simple and categorical rule of thumb which is to remain valid throughout 1955. But monetary policies are contingent at all times upon the conditions that prevail in the country. It will be the task of the monetary authorities to choose from among the alternatives mentioned here, and others not named, the policies which are appropriate to conditions as they unfold.

It is entirely conceivable that within the coming year conditions will alter to such an extent that quite opposite measures will be called for at different periods. To suggest, as these two questions seem to do, that particular policies can be laid down this far in advance, is largely to deny the necessity of having a central monetary authority.

The effect of changes that have taken place in the economy has been to increase the importance of those instruments of policy which relate primarily to the use of money as contrasted with those which relate primarily to its quantity. It follows that I consider the present exclusive concentration on the general instruments of credit control, notwithstanding a nostalgic hankering for them, not merely misplaced but anachronistic. For the same reason I feel that other selective controls such as regulations W and X should be made available to the Federal Reserve on a standby basis. I am convinced that the Korean inflation would have been far more moderate if the Board had had these instruments at their immediate command and had employed them promptly and vigorously.

That unfortunate and unnecessary experience was the price paid for our pathological fear of bureaucracy, a fear which keeps us from giving our monetary authorities the power they require to do their job adequately, lest they abuse that power. This is in spite of the self-evident fact that any limitation on the power of the monetary authorities to do harm, as in restricting the use of particular instruments of credit control, is likewise a limitation on their power, under other circumstances, to do good. It is in spite of the further fact that the history of Federal Reserve operations shows that the Board has often suffered from an excess of caution but seldom if ever from an excess of adventurousness in the exercise of its powers.

In speaking of supplementing the present arsenal of stabilization measures I have gone somewhat beyond a discussion of monetary policies for 1955. At least I hope and expect that this year will present no crisis that will expose the inadequacies of present monetary powers. But I have no confidence that we shall escape such a crisis before the decade is out. And I firmly believe that the time to prepare for crisis is before crisis descends.

To summarize certain things I had said elsewhere, I would go much further than the Economic Report goes in urging that a full complement of powers be available for more serious tests that surely lie ahead.

The CHAIRMAN. Thank you very much.

(Mr. Whittlesey's prepared statement and supplemental information appear at pp. 496–498.)

The CHAIRMAN. Mr. Wood.

OPENING STATEMENT OF ELMER WOOD, PROFESSOR OF ECONOMICS, UNIVERSITY OF MISSOURI

Mr. WOOD. Mr. Chairman, I would agree with Mr. Stein's statement that there is no reason to discontinue a policy of active ease. The ultimate tests of monetary policy that seem useful resolve into facts about prices and about employment. As long as employment is no higher than it is at the present, and as long as prices are not rising significantly, it seems desirable to follow a policy of monetary ease—about such as we had in the latter part of last year.

If we should have still further recession, monetary expansion should be stepped up. If prices should start rising significantly during 1955, while there is still considerable unemployment, we should compromise. Everything considered, we should be willing to see some rise of prices if unemployment remains as great as it is now. On the other hand, we should not be willing to purchase full employment—with the percentage of unemployment, say, at the early 1953 level—at the expense of inflation at the rate, say, of 5 percent a year for very many years. These figures are illustrative and are not intended to suggest a formula. I do not think we can operate on a formula.

As I consider that last statement again, it seems that it might be thought slightly equivocal. I do not mean to be indefinite about the matter. There should be no question about monetary expansion when we are having recession and falling prices—and it should be of the required order of magnitude. And we should even change our arrangements for issuing money if that seems necessary in order to have the expansion needed. Also, when prices are rising and there is overemployment, or what is commonly referred to as that, we should restrict to the required extent.

Because of upward pressures on prices from the supply side we are probably faced with creeping inflation over the long run. The monetary authorities cannot be expected to hold back these upward pressures simply by monetary restriction. The innocent would suffer more than those responsible.

In other words, if the monetary authorities are going to discipline the economy, and punish with unemployment, an upward pressure, say, in industrial prices——

The CHAIRMAN. Do you mean from monopolies?

Mr. WOOD. Yes, sir.

The CHAIRMAN. From the labor movement, and so on?

Mr. WOOD. Administered prices. And suppose then the monetary authorities say "We will show you. We will cut off your water to a certain extent and stop any further increase and bring those prices down." They are punishing innocent people who were not responsible for that administered price rise. I do not think we want to say unconditionally that we would give that kind of disciplining to avoid such a rise of prices. If the problem cannot be dealt with adequately by policing the power groups, the monetary authorities will compromise in favor of some inflation. The public will demand that they behave that way; maybe not immediately, but sooner or later they will.

We come now to a different aspect of the question as stated. The question seems to imply that the amount of money is the appropriate measure of monetary ease or pressure at any given moment. Actually the amount of money reflects mainly the demand for balances arising out of the given cost-price structure and level of economic activity. Of course, there are some other elements in the demand for cash, but those are the two main ones; and since they do not respond immediately to the administrative procedures available to the authorities, but only slowly and cumulatively, the amount of balances shows a similar lack of responsiveness.

Thus the amount of balances is a historical result of cumulative forces and not a measure of monetary tendencies at a given moment. What the authorities need is an instant pointer reading of the change in the monetary ease or pressure which they are exerting with the controls in their hands. This pointer reading is the prices of various types of debts.

Nor is the amount of money a very useful test of longer-run policy. The longer-run tests are prices and the volume of employment. Finally, let us note, a change in the quantity of money is not an instrument of procedure. No board decides administratively what it shall be.

Money is socially costless, and if every treasurer and every individual consumer should change his target of the amount of balance he wants to hold, let them all have what they want. That does no harm. Let us have no preconceived idea that money ought to increase at such-and-such percent a year. Let us suppose the public become worried and want to shift from debt assets that are not money into money. There is no reason why the monetary authorities should exact harder terms as a condition to permitting the public to have those balances.

The reason why I do not approach the matter from the standpoint of the velocity of circulation is that I believe the public can ordinarily have all the balances they want at any given time, and without any serious change in the sacrifice necessary to obtain them. A change in the demand for balances is associated with, causes, a change in their amount, and not with a change primarily in the rate of turnover of some given amount determined by the authorities or by the banking system independently of the public. And it ought to be that way. If, however, there is inflation, the terms on which the public adjust their balances should be hardened. This may have little effect on the amount of balances they choose to hold, but it will have a cumulative effect on the volume of commitments and prices—which is presumably the final objective.

I think the question involved is one of criteria. You cannot use your monetary procedures and watch the pointer reading of prices and employment change instantly. They register effects slowly and cumulatively. But you can get an instant reading of whether you are applying additional pressure by looking at the prices of debts. If the Treasury bill rate goes up to 3 percent, we know there is more pressure applied regardless of the volume of reserves and of deposits.

(Mr. Wood's prepared statement and supplemental information appear at pp. 498–500.)

The CHAIRMAN. Thank you. I would like to ask one or two technical questions and then I will ask Congressman Patman to lead off. First, what is the amount of excess reserve, so-called, now in the Federal Reserve System?

Mr. WOOD. I have not looked lately, Mr. Chairman, but my guess would be that it is of the order of six or seven hundred millions.

The CHAIRMAN. Is that correct?

Mr. RIEFLER. Yes, it would be a little larger.

The CHAIRMAN. And what do you use as a multiplier now as to the potential expansion, five and a half?

Mr. RIEFLER. The technical one would be something like that.

The CHAIRMAN. So, roughly, the banks would have a lending capacity of something over $3 billions?

Mr. RIEFLER. Well, more than that, because the discount rate is only 1½ percent. That is quite a promotive rate. Member banks can borrow at that rate. They get reserves through borrowing, the discount rate, that is a fairly promotive rate, 1½ percent.

The CHAIRMAN. But they are not resorting to rediscount. They could expand credit something over $3 billions with the present reserves.

Mr. RIEFLER. Of course, they do not rediscount and borrow to lend and expand credit, but what happens is they have excess reserves or they have liquid assets easily converted into reserves, as far as an individual bank is concerned, and it goes out to put its money to work, to lend.

The CHAIRMAN. I am not speaking of the potential reserve but the present reserve.

Mr. RIEFLER. The actual present reserve would be something like that.

The CHAIRMAN. Something over $3 billion. Would you say this is appreciably larger than usual, or this is a normal figure?

Mr. RIEFLER. I do not know whether it is normal. It is within the range. It has been larger, it has been smaller.

The CHAIRMAN. Isn't it true normally in a recession that the excess reserves rise?

Mr. RIEFLER. Yes.

Mr. WOOD. I do not know that I should make quite the inference there that you and Mr. Riefler are making. Those excess reserves are, to a large extent, irrelevant. They are held by small banks that do not want to sharpen their pencils too much, and prefer a convenience margin in their deposits at the Federal Reserve to adding a little more to their balances with correspondents or to their Treasury bills, etc. The real expansion potential is indicated by the terms on which balances can be maintained, and what is likely to happen to those terms as economic expansion proceeds.

The members of the economy can convert debts into money at their option, and it ought to be without a stepping up of the pressure on them, as long as prices do not register a move upward.

The CHAIRMAN. In other words, I infer you are somewhat allergic to an increase in the interest rate on Government securities?

Mr. WOOD. Yes; I see no reason for doing it at the present time.

The CHAIRMAN. One other technical question I would like to ask, Mr. Reierson. I think you made a very interesting and fruitful suggestion in altering the rate of growth of your money supply to take into account cyclical changes in the velocity of circulation. I wondered if you had any estimate as to how much of an adjustment that would be in the period of sharp revival and intense activity. On the other hand, how much of an adjustment would be required to speed up the quantity in a period of rather sharp recession?

Mr. REIERSON. Mr. Chairman, I would hesitate to express any views for the record in specific quantitative terms. I think credit policy has to be determined in the light of a lot more considerations than have been mentioned before this panel. In interpreting and appraising data on the money supply, I think consideration has to be given to the changes on the asset side of bank balance sheets that show what factors are contributing to the change in the money supply. All these make it very difficult to come out with and apply arbitrary, categorically quantitative measures.

At the risk of being misinterpreted and misunderstood, I might suggest that in a period of depression, if we take a normal rate of growth in money supply of somewhere between 3 and 4 percent, that perhaps

4 to 5 percent might not be worrisome. In a period of intense boom, I would hope that the rate of increase would be substantially less than the average rate of growth.

The CHAIRMAN. You seem to be suggesting about 1 percent.

Mr. REIERSON. One or two percent, perhaps, as a rough criterion.

The CHAIRMAN. Thank you very much.

Vice Chairman PATMAN. Professor Hansen, I noticed you stated that you do not believe any restraint is necessary at this time?

Mr. HANSEN. Yes, sir.

Vice Chairman PATMAN. Do you believe that phrase that has been used by the Federal Reserve, "active ease" is generally understood throughout the country as to what it actually means?

Mr. HANSEN. Well, I should imagine it is pretty generally understood. We have had a condition of active ease for a year or more, and I would imagine people thinking about these problems understand what is meant by that phrase, active ease. I would say a continuation of active ease means a continuation of the easy availability of credit on easy terms that we instituted shortly after May and June in 1953.

Vice Chairman PATMAN. You mean commencing May 11, 1953, when they went into the market and bought some securities?

Mr. HANSEN. I mean when the Federal Reserve, in May and June of 1953, entered into large market operations, and in June and July I think they lowered the reserve requirements.

Vice Chairman PATMAN. Senator Sparkman called my attention to the fact that it was May 6. I think that is the time they had their meeting when they agreed they would do it, but they did not actually go into the market until May 11. Incidentally, May 6 was just 2 or 3 days after the rates on veterans' loans and FHA loans had been raised.

What is strange to me is that there was not some coordination there so that the monetary authorities would let the people who were contemplating raising the mortgage rates know that it would be unnecessary to raise those rates. In just 3 or 4 days they were going to change their policy and take an about-face and the raising of the rates would be unnecessary.

Do you understand that, Professor Hansen?

Mr. HANSEN. I would agree with you.

Vice Chairman PATMAN. And those rates have not been eased, actively or otherwise. Now, Professor Hansen, I notice that the President's report said the income shares of both farm and business proprietors were at postwar lows in 1954. That is on page 83 of the report.

Do you see anything in the present actions of the monetary authorities that will be helpful in restoring to a normal condition or a prosperous condition these two groups, the farm and the small business groups that were at alltime postwar lows in 1954?

Mr. HANSEN. Yes, but I think the monetary authorities could not alone bring about that desirable result. The monetary authorities could, however, continue easy credit and easy availability of credit, and that along, with other measures, fiscal measures, could, I think, accomplish a great deal, in another 12 months, in raising the incomes of the groups you have referred to.

Vice Chairman PATMAN. Doesn't it occur to you, though, that they are picking out for special help the people who do not need it so much?

Now I refer to the fact that I have a statement here of Guaranty Trust, showing profits increased 23 percent last year. The Chase

National's profits increased 34 percent last year. Now all of these actions of monetary authorities in raising interest rates and permitting more speculation in the Government-bond market will help out the very people who have been prospering the most, won't it, Professor Hansen?

Mr. HANSEN. Well, I am not quite sure that that is so. It is true the moneylenders would profit from higher interest rates but business corporations in general would not, because it would tend to restrain expansion that might otherwise take place, and I think business corporations profit from expansion, and not from a rise in the rate of interest. They are not moneylenders.

Vice Chairman PATMAN. Isn't it a fact that it squeezes the little businessman who will not only suffer because of the rise in interest, but also because the policies have not presented industrial raw material prices from being increased? I refer to steel, copper, and aluminum. The small, unintegrated company will be squeezed there because that company is not in a position to take care of itself.

Don't you agree with that?

Mr. HANSEN. Yes; all industrial enterprises would be squeezed to some extent by a restrictive monetary policy.

Vice Chairman PATMAN. And don't you think a policy of definite restraint and restriction is going on right now?

Mr. HANSEN. I see signs of it and I should be opposed to it.

Vice Chairman PATMAN. Don't you see signs that the money-lenders are shooting for a 4 percent wholesale rate in money, I means a Government rate?

Mr. HANSEN. I do not know what rate they are shooting at, but they are moving in that direction at a time when they should not do so, in my judgment.

Vice Chairman PATMAN. In 1953, when there was some complaint about the increase in the interest rate to 3½ percent, Secretary Humphrey said he compared it with the 1920's. He said it was still much lower than in the 1920's, indicating to me that perhaps he was using that as his guide, that he was shooting for that 4 percent rate in the 1920's, and then the other day, when something was said about this 3 percent rate being high, the Treasury noted it is still low in comparison to rates charged in other countries, and every time you mention a high rate they seem to think it ought to be higher.

So I cannot figure it out any other way except that they are shooting for 4 percent money like they did in the 1920's. Now the farmer is the other small-business man that is involved in this thing. I do not think it is intentional propaganda. I share the chairman's views on the Wall Street Journal. I think it is a wonderful publication. I do not always accept 100 percent what they say, but it is certainly thought-provoking, and it is a fine publication, but sometimes they do not always tell the whole story.

I see here this morning's Wall Street Journal, January 31, it says that prices farmers got for their wares rebounded 2 percent in the month ended January 15. The upturn carried the Government index of agricultural prices to 144 percent, 5 points above the month earlier, when the index hit a new low.

Benson expects agricultural prices to climb and approach the year-ago figures. That would indicate to the people who read it that the farmers are doing mighty well, that they have had this jump, 2½ percent in prices. But the Wall Street Journal overlooked the fact that there was a report gotten out just a few days ago, in which it said. I am quoting the Government figures, "the level of prices paid by farmers for goods and services used in family living and in farm production increased nearly 1½ percent during the month ended January 15, offsetting the increase in farm price levels."

Don't you think the Wall Street Journal could use that figure, too? If they are pointing out that the farmer is doing so well one month, they should also point out that the cost of what they buy has increased 1½ percent during the same period.

I will not ask you to answer that particular one, but on this shooting for 4 percent money, we asked Mr. Humphrey about that before this committee once, and about how that would affect the market when he got ready to make these announcements, and he gave as an illustration that it had no more effect on the market than a farmer's wife going in and selling a dozen eggs on the open market.

You do not agree with that, do you?

Mr. HANSEN. I read that statement and was quite interested in it.

Vice Chairman PATMAN. You do not agree with it, do you?

Mr. HANSEN. No, I think he left out quite a few things in the illustration.

Vice Chairman PATMAN. The newspapers reported that the market was waiting on the announcement of the Treasury, it kept the market in suspense a long time. That was your understanding, was it not?

Mr. HANSEN. Yes.

Vice Chairman PATMAN. It said the expectancy over the new United States issue almost halts trading in Governments, so Mr. Humphrey was certainly mistaken about that. I noted a statement recently by a government bond dealer to the effect that the flexible tactics of the monetary authorities are turning the long-term bond market into a financial roller coaster. Don't you think that too much is being done to aid and encourage speculation in Government bond markets, Professor Hansen?

Mr. HANSEN. Well, as I said before, I would not undertake this program that seems now to be under way to raise some rates.

Vice Chairman PATMAN. You think that is a mistake?

Mr. HANSEN. I think that is a mistake.

Vice Chairman PATMAN. Don't you think it is unusual, too, for the Treasury to break the traditional policy not to issue bonds that are payable beyond a generation, that that is a pretty good policy to stick by, one which they have violated in both the 3¼ percent and the 3 percent?

Mr. HANSEN. This, of course, is a very complicated question. I would, in general, lean toward short-term issues, but I think it is a problem and it varies with conditions. A primary consideration would be to tailor the maturities to the demands of the market. The demands of the market, however, are fixed to a great extent by Government policies, including the policies of the monetary authority, but I lean toward short maturities and not long maturities.

Vice Chairman PATMAN. And these bonds are not callable, these 40-year bonds, and it should be pointed out, too, I think, that the last time we had such a long-term issue was in 1911, when the Panama Canal bonds were issued at 3 percent. They were 50 year bonds. Here we are issuing a 40-year bond for 3 percent.

By the way, on this farmer situation that I pointed out awhile ago, the farmers' parity ratio is down to 86 now. Don't you see in that an alarming situation and something that should be receiving the attention of the monetary authorities, Professor Hansen?

Mr. HANSEN. Well, it is an index of a larger movement.

Vice Chairman PATMAN. Now I would like to ask the whole panel, Mr. Chairman, how they feel—or should I do that later on?—on supporting Government bonds at par.

The CHAIRMAN. I would suggest that be handled later.

Vice Chairman PATMAN. I shall certainly defer to the wishes of the chairman. I will yield for the present, Mr. Chairman.

The CHAIRMAN. Mr. Wolcott.

Rpresentative WOLCOTT. No questions.

The CHAIRMAN. Senator Sparkman.

Senator SPARKMAN. No questions, Mr. Chairman.

The CHAIRMAN. Mr. Talle.

Representative TALLE. Mr. Chairman, I have a question which is not strictly related to this, so I will pass for the moment.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. No questions.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. No questions.

The CHAIRMAN. Well, let us take up question No. 2 then. How should these monetary policies be carried out: A, through open market operations; B, through changes in reserve requirements; or C, through changes in the rediscount rate.

Mr. Riefler.

Mr. RIEFLER. I did not think it would be appropriate for me to discuss prospective policies. I thought I would try to make my contribution to that question by describing concretely the way policies have worked.

During the greater part of 1954, when inventories were being liquidated and the normal business customers of banks had less occassion to borrow, the system sought to achieve its stated objectives by twice lowering, its rediscount rätes, first from 2 percent to one and three-quarters of 1 percent and, second, from 1¾ to 1½ percent. It also, in the summer, lowered reserve requirements on time deposits to 5 percent, on demand deposits to 20 percent at central reserve city banks, 18 percent at reserve city banks. and 12 percent at country banks.

Continuously throughout the year, open market operations were used to supplement or offset other factors supplying or absorbing reserves in such a way as to insure that there would be a volume of reserves in the market sufficient to stimulate banks to seek outlets for their funds.

Taking the year 1954 as a whole, total loans and investments of all commercial banks expanded by nearly $11 billion, of which about $4 billion was reflected in a growth in the active money supply. The growth for the year in the active money supply was around 3 percent, as compared with a growth of a little over 1 percent in the gross national product from the first quarter to the last quarter of the year. In each case, this growth was concentrated in the later months of 1954.

It seems to me that the question should be phrased a little differently. The result is a composite one achieved by a pattern of rediscount rates, open-market operations, and possibly reserve requirement adjustments. It is the composite that should be looked at, rather than any one activity.

The CHAIRMAN. Mr. Hansen.

Mr. HANSEN. I think I have nothing to add to that. I certainly agree that it is the general pattern, rather than any one specific measure. I would maintain monetary ease. I would not move in the direction of tightening up reserves. I would not move in the direction of raising interest rates. I think the move last summer, the lowering of those requirements, was a good one.

On the other hand, I also felt that once we had introduced monetary ease, there was not much use in "pushing the string." I rather doubted that much more could be accomplished than we had accomplished in late 1953 and early 1954 by monetary ease, and my own view was we ought to move further in the direction of tax reduction and increased consumption.

The CHAIRMAN. What about the effect of the earnings of the Federal Reserve System?

Mr. HANSEN. Well, that flows back to the Treasury, so I do not much care what they earn. Do you mean the commercial banks?

The CHAIRMAN. The open-market operation, the Federal Reserve System will receive about 18 percent; will it not have the profits through an increase in the money supply? Whereas by lowering reserve requirements, the entire increase accrues to the banks.

Mr. HANSEN. You are now referring to the commercial banks?

The CHAIRMAN. Yes.

Mr. HANSEN. Well, I would not primarily consider that. When I am considering monetary policy, I would not primarily consider the matter of the earnings of the commercial banks. That, of course, is an important question by itself, but I think we would do well not to mix that too much with the desirable monetary policy.

If commercial banks are earning too much, it may well be that they are in a short period earning too much by reason of a higher rate of interest, and if that is true over a long period, it can easily be taken care of by special tax measures applying to commercial banks.

I would not allow my monetary policy to be fixed by the question of commercial bank earnings.

The CHAIRMAN. Mr. Reierson.

Mr. REIERSON. Mr. Chairman, I agree that the objectives of monetary and credit policy should be achieved by use of all three of the major tools; open-market operations, reserve requirements, if needed, and changes in the rediscount rate. I might add—and this is, I think, related to this question—that I am of the opinion that the powers of the Federal Reserve are sufficient for it to perform its functions as a central bank, except under conditions of pronounced inflationary pressures and emergencies. I further suggest that the use of the three tools depends upon the objectives of Federal Reserve credit policy.

If time permits, Mr. Chairman, I have a few comments on the outlook for the application of these principles in 1955. With reference to the open-market operations, the present operating procedures of the Federal Reserve involve major reliance upon the use of open-market operations to effect changes in the money market and in the reserve position of the member banks.

I would anticipate continued reliance upon this tool as a major instrument of day-to-day operating credit policy in 1955. I think we should point out that involved in the use of this tool are some very complex and very difficult estimates.

The authorities are continuously engaged in trying to forecast the forces that will be operating in the money market, and some of the factors are sometimes very difficult to estimate; these estimates are made weekly, daily, and in some cases hourly.

The second instrument, change in reserve requirements, has been used relatively infrequently. It has not been relied upon as to a day-to-day operating tool; rather, the practice has been to limit its use to occasions and situations in which rather substantial actions are appropriate. This, to me, seems to be a sound policy and practice.

We had reductions in reserve requirements in 1953 and 1954, to which reference has already been made. Behind those reductions, presumably, and I have no direct information on this point, were a number of considerations. One consideration was a desire to get reserve requirements down below their statutory maximums in order to give flexibility for their future use in time of need. Another consideration may have been a belief that the reserve requirements were higher than were needed under the circumstances. I would point out that reserve requirments in the United States are still substantially higher than in other important financial nations.

Another consideration in the mid-1953 reduction may have been a desire to provide unmistakable evidence to the financial markets of a change in credit policy, to underline the shift in direction of credit policy that was first evident in the early part of May, and to ease the way for the impending financing operations of the Treasury. You will recall, Mr. Chairman, that the fiscal position of the Treasury deteriorated very badly, or at least the expectations deteriorated when the tax receipts came in during March and April, 1953. As a result, the second half-year financing requirements of the Treasury increased in amount above earlier expectations.

Much as commercial bankers would like to see further reductions in reserve requirements, conditions are probably not favorable to such action as long as business expansion continues. Therefore I would be surprised if we had a further reduction in reserve requirements in the near future.

A sharp resurgence of inflationary pressures, and in this world it is hard to tell what is going to transpire, might occasion an increase in reserve requirements.

But I come back to my initial point that, now that open-market requirements have been freed as a tool of credit policy, there is a desire on the part of the authorities to minimize changes in reserve requirements.

Finally, as to changes in the rediscount rate, these, of course, are related to the use of the lending facilities of the Federal Reserve banks. The past 2 to 3 years have shown an increased use in these lending facilities on the part of the member banks. The volume of member-bank borrowing averaged about a billion and a quarter, or a little higher, in early 1953; by mid-1954 it had been reduced to $200 million; it is running a little higher than that now, but certainly is not at high levels.

With the present operating procedure and practice, there is a reluctance on the part of member banks to borrow from the Federal Reserve, and I believe some feeling, at least on some occasions, on the part of the Federal Reserve, that regular and continuous borrowing on the part of member banks may be inappropriate and undesirable. Consequently, bank reserves provided by member bank borrowing are obtained with greater reluctance than reserves obtained through the sale of Treasury bills to the Federal reserve, that is, through open-market operation.

If the Federal Reserve wishes to foster easy conditions in the market, it can provide reserves by open-market purchases. If it is desirous of following a less-easy policy, it can provide fewer of the reserves required by the economy through open-market purchases.

If the banks are put in a position where they find it necessary to increase their borrowing from the Federal Reserve banks, short-term interest rates may be expected to increase, and in due course the expectation is that this will be followed by a higher rediscount rate. May I say that I think it is difficult to substantiate the point of view that the Federal Reserve is following, at the present time, a policy of credit restraint.

May I add that if we are committed to the principle of a flexible credit policy, then it seems to me that to follow a credit policy which is appropriate when business is going down, or stable, at a time when business shows a turn-around is not appropriate.

I think that there is another general principle that should be recognized, namely, that if we freeze interest rates and thus prevent economic forces from having their normal impact upon interest rates, then we have effectively destroyed the instrument of flexible credit policy. Since it is my personal belief that general credit policy can make a contribution to economic stability and sound long-term growth, such a course of events would be accepted by me with the greatest of reluctance. This would undo the results achieved in March 1951 in the Treasury-Federal Reserve accord. I need only refer to the excellent reports prepared by the subcommittees of this committee for a discussion of the underlying problems involved.

There is one further matter which I should like to mention. It seems to me by implication this question involves the expression of an opinion as to the need for selective-credit controls. It has been my opinion for some time that it might be appropriate to grant to the monetary authorities standby authority to use selective-credit controls in the fields of consumer and real-estate credit. It would be my philosophy that such controls would not be used normally or regularly, but that their use would be reserved for emergency conditions.

If a kit of tools is being readied for possible emergency use—and that I do not know—then I think the question might be considered as to whether provision should be made for the inclusion of standby authority to regulate consumer credit and real-estate mortgage credit.

However, I am impressed by the administrative difficulties and problems involved in the use of selective-credit controls, and by the difficult problems of compliance and enforcement. There is a further fact, which I think is clear from the record, that selective-credit controls are really not effective unless they are supported by general credit policy. It is futile, I think, to have selective-credit controls if we are following an easy-credit policy.

For all of these reasons I am not addicted to the regular use of selected-credit controls, but I do agree with Professor Whittlesey that the grant of standby authority would be appropriate.

The CHAIRMAN. Mr. Kelley, do you have a question?

Representative KELLEY. No, Mr. Chairman.

The CHAIRMAN. Mr. Stein?

Mr. STEIN. I would agree with what has been said here by the previous speakers about the need for using all of these instruments in various circumstances.

It seems to me that especially in the present circumstances, when it is very important for us to feel our way fairly gently, we should place main reliance on a day-to-day instrument over the open market policy.

I would like to comment, if I may, on points made by two previous panel members. Professor Hansen has said, and I believe entirely correctly, that monetary policy should not be judged to any significant degree by its effects upon earnings on the member banks. There are much more important standards by which we should judge its importance.

I think the same thing can be said about debt management, that the policy of the Treasury in determining what kinds of securities to issue should not be significantly influenced or judged by their effects upon the relative earnings of different classes of investors or different sectors of the economy. I think there are much more important consequences involved.

What we should be looking for is, Does this policy—does the decision to issue a 40-year bond at this time—contribute to present stability or present high level of activity, or the future stability of the economy, or not? If it is decided that the issuance of a 40-year bond or some other security will contribute over the long run, or presently, to economic stability, I think it is perfectly appropriate for the Treasury to be paying the price that is required to get those bonds sold. I think there is no evidence that the Treasury is paying a price greater than is necessary, or offering a price more than is necessary, to have those bonds sold.

It seems to me a wise position, that in the long run we do want to have a somewhat larger proportion of the Federal debt in long-term securities than we have recently had. The question of timing of that movement is, of course, a very delicate and difficult one. Nevertheless, I think it would be a mistake to proceed on the assumption that since the Treasury could issue a 90-day bill for less than 1 percent, and it has chosen to issue a 40-year bond for 3 percent, it is giving something to somebody. It is buying a quite different thing when it issues a 40-year bond than when it issues a 90-day certificate.

One might just as well say that the Department of Defense is giving something to somebody when it buys a very expensive four-engine jet bomber instead of a Piper Cub, since they are both airplanes, and one could get the Piper Cub cheaper. A 40-year bond does an entirely different thing for the economy, and for the Treasury, than a 90-day note, and one should expect to pay a different price for it.

I would like to comment on what Mr. Reierson said, that now that we are on the way up, flexilibity calls for a change in the degree of tightness in the monetary policy. That raises an important question, namely whether the standard by which you judge your action is your position or your direction. It is true we are on the way up, but it is lower than where we would like to be.

As long as we are below desirable levels of employment and are not experiencing inflation it would seem to me that no change in the policy is called for.

The CHAIRMAN. Mr. Whittlesey.

Mr. WHITTLESEY. I said I would pass on this question.

The CHAIRMAN. Mr. Wood.

Mr. WOOD. The problem of the criteria of monetary ease or pressure is involved in question 2, also.

The Federal Reserve should make its policies effective through open market operations, allowing their influence to override all other influences. In other words, if you retain the discount privilege, which it seems desirable to do, especially for small banks, it should be purely as a convenience to those banks and not as a means of regulating the money market. Since the immediate criteria of pressure should be the prices of debts, in practice, Government securities of different types, they should determine the prices of the Government securities directly—but always with reference to the more ultimate aims of policy.

The Open Market Committee should be free to enter all sectors of the Government securities market. Short rates reflect mainly the immediate degree of pressure. Long rates reflect expected monetary conditions over an extended period. The Federal Reserve by entering the long-term market can influence the market's expectation of policy in more than the immediate future.

The present procedure of changing the volume of reserves, as such, with operations confined to bills and other very short-term securities, allows unnecessary variations in rates, and particularly in long rates.

Mr. Chairman, we remember how long terms went down in June 1953. There isn't any reason to think that that was exactly intended, but with the procedure the manager of the account was operating under he could not intervene in the long-term market. It seems to me that the Committee could have indicated directly what their intentions were, The market got a wrong idea of what their intentions were. The market got the impression that this was a hard-money policy with teeth in it, and that there was no telling what levels securities might go to. They could have corrected such an impression if they had entered the long-term market.

The Federal Reserve must, of course, allow for changes in the debt structure and changes in the demand for debts of different maturities, but these are minor factors affecting the rates compared with monetary ease or pressure.

The objection to the use of the discount mechanism as a means of control is that it produces accidental changes in monetary ease or pressure, changes which have no meaning from the standpoint of control. There is no reason for allowing interest rates to reflect such irrelevant facts as the need of member banks to borrow as the result, say, of changes in the currency in circulation, or changes in the Treasury deposits, and the like.

I do not mean to give the impression that such accidental changes in reserves and in the consequent need of member banks to borrow ordinarily cause great variations in rates, but there is no use making a virtue of something which is a less accurate tool than one which they might use. And in May and June of 1953 I believe the procedure used was to an important extent responsible for the rise of rates.

One difficulty about regulating market rates by varying member bank indebtedness—by amounts determined partly by accident—and by changes in the Federal Reserve discount rate is that it tends to give credence to the theory that market rates are determined by the natural forces of supply and demand. It tends to give the impression to the public that the change in the market is something over which the Federal Reserve authorities have no control or very limited control.

In the past the discount rate has been a general symbol of policy, as well as an instrument, but there is the difficulty that the need to keep the rate at a level that will not permit the banks to profit from borrowing at the Federal Reserve interferes to some extent with its use as a symbol.

On the whole, it seems better not to go back to earlier analogies for procedure, but to start from the procedure developed during the past 15 years.

Changing the member banks' reserve requirements should not be used as a flexible instrument, but simply for influencing the earnings of the commercial banks and of the Federal Reserve banks. In recent years, especially, changing the reserve requirements seems to have been used as a symbol of policy to some extent, but that use of the power interferes with its purpose for influencing the division of profits from money creation.

At the present time some officials inside the Federal Reserve, but not all, consider that changes in yields on Government securities reflect mainly the natural forces of supply and demand in the market. Long rates, of course, do reflect to some small extent other than monetary factors, but in the main they show the market's reaction to what the Federal Reserve officials have done, and what this seems to portend for future action.

Mr. WHITTLESEY. Mr. Chairman, could I make one remark?

The CHAIRMAN. Mr. Whittlesey, yes.

Mr. WHITTLESEY. What I have to say is important, it seems to me, and has been overlooked. It is the relation of changes in the Reserve requirements to the interest rates.

Reference has been made a number of times to the dispute as to the extent to which the price of Government bonds is something that exists outside policy; in other words, outside the policy of the Federal Reserve, and outside the policy of the Treasury.

As I look back over the events of the last 2 years I am convinced above all else that basic economic forces, the state of business conditions, have had very little to do with the level of interest rates whereas the expectations put by the market upon actions to be taken or contemplated by the Treasury and Federal Reserve have been dominant.

The CHAIRMAN. Action by the Federal Reserve or action by the Treasury?

Mr. WHITTLESEY. Both, at different times.

We are familiar with the extent to which there was a reversal in the middle of 1953. That reversal was signalized by two events. The first was an indication that the Federal Reserve would intervene, notwithstanding what had been said by Treasury and Federal Reserve officials very shortly before that.

It was also and even more directly affected by the reduction of Reserve requirements, because the reduced Reserve requirements enabled banks to buy in the open market. Thus there was an addition to demand. Purchases of Government bonds by banks went up rapidly, and I am convinced that that was a factor which directly caused Government bonds to rise. That was the means by which the rise came about.

The other influence of the same sort was manifest in the middle of 1954, and some weeks in advance, when it was announced that reserve requirements would be lowered. Bankers knew that they would have funds available for the purchase of additional securities. Demand for loans was weak. Obviously, the one thing they were going to turn to was bonds. Consequently there was an appreciable improvement in the price of Government bonds at that time.

My point is that changes in reserve requirements, even the expectation of such changes, have been a very important factor in affecting bonds purchases by banks, and that that has at times been a decisive factor in Government bond prices.

Another factor is anticipation of what the Treasury is going to do in bringing out new issues. I could give various examples of that, but they are familiar enough to anybody who has followed the newspapers. The most recent manifestation of this influence is seen in the fact that in the last 3 or 4 weeks Government bond prices have declined sharply. One has read rumors that the Treasury was going to bring out a new issue, maybe a 40-year issue at 3 percent, or at some other rate. I feel sure that the decline in bond prices that occurred in the last 3 or 4 weeks was influenced decisively by a feeling that this movement would bring the market pattern of rates into line with the rate expected to be established by the Treasury on its new borrowing.

So I emphasize these two ways in which official actions have strongly influenced market rates of interest.

The CHAIRMAN. I would like to raise one point here. I do not like to embarrass anyone, but when Secretary Humphrey testified before the Flanders committee in November he took the position that the Treasury had no control or effect upon the interest rate, but that it merely accepted the interest rate which prevailed in the private sector of the money market. He used this analogy to which Congressman Patman has referred, that the Treasury was merely—in reply to question 5 in which he stated as follows:

> We are selling eggs, and the current price that eggs are selling for is 50 cents a dozen. Now, when we come along and have some eggs to sell we go out and offer those eggs for 55 cents, nobody is going to buy them. So if we have a dozen eggs to sell we have to offer them at a price that the market will take.

Now, I have my own opinion on this, and so expressed myself, but I would like to get the judgment of the panel on this subject.

Mr. Hansen?

Mr. HANSEN. I agree entirely with what Mr. Whittlesey has said. The statement by the Secretary obviously leaves out of account any possible action of the Federal Reserve System in enormously increasing the funds available for the purchase of Government bonds.

The CHAIRMAN. Even if you excluded the Federal Reserve, is not the Government bond market such a large proportion of the total money market that actions of the Government are not quite like a housewife selling a dozen eggs in a world market?

Mr. HANSEN. Quite right, and if officials make statements that indicate that it is their plan to lengthen the maturity of the debt, and in furtherance of that aim to raise the rate of interest with the idea that

that will attract purchasers, and then an issue is placed at a rate substantially higher than the prevailing market rate, that issue, backed up by these statements with respect to the plan of the Treasury, is bound to influence enormously the price of the bonds.

The expectations aroused will have a tremendous influence on the price of bonds.

The CHAIRMAN. Does anybody else wish to comment on this?

Mr. Stein?

Mr. STEIN. I think there is point to Secretary Humphrey's analogy. I agree with the tone of voice in which you read it, about the dozen. The dozen is the crucial thing, because if this were a million dozen, and especially if it were known you had many more million dozen in the back room, your action would probably influence the price of eggs, but I think there is another thing to be said, and that is that what is important is the volume the Treasury is offering and not the price that the Treasury puts on it. That is, if it is known that the Treasury is going to issue $1 billion of 40-year bonds, I do not think there will be any different effect on the market whether the Treasury puts a coupon of 3 percent, 4 percent, or 5 percent on them. I think the crucial thing is the volume, and the term of the securities it is going to issue.

The CHAIRMAN. What about the anticipation of policy that such an issue creates?

Mr. STEIN. That refers to the question of how many more dozen are in the back room. But it is the anticipation of the volume offered and what is now offered—and not the rate printed on those bonds—that makes a difference.

The CHAIRMAN. Mr. Whittlesey.

Mr. WHITTLESEY. I am sorry to disagree with my highly respected colleague. I have observed long-term lenders, and bankers too, approaching problems of setting rates with their customers in these terms: They say, "Well, we are entitled to 1 percent or 2 percent differential over and above what the Government has to pay." Immediately after the Government announces a different rate they say to their borrowers, "We have to have more." There hasn't been any change in the supply of their funds available; there hasn't been any change in demand in the market. There has, however, been a change in the grounds on which they negotiate with their customers.

I believe basically in the idea of supply and demand, and what I said about purchases by banks as the instrument through which that operates bears on that point, but I see no inconsistency in what I am saying. The action of the market is not so mechanical that supply and demand operate independent of psychological responses.

The attitudes of people negotiating for loans reflects a conception that the Government rate is rather unique. We see that elsewhere when it is said that the Government rate is basic. If the Government rate is basic, it follows, it seems to me, that when you change that rate you are going to change other things, as well.

The CHAIRMAN. Is it not a fact that following the quotation of the 3¼ that the interest rate on long-term issues rose?

Mr. WHITTLESEY. I think so, definitely. The position taken by representatives of the Treasury, it seems to me, was to assume that the market for long-term Governments, or for long-term bonds in general, is something that exists outside of the action of the Treasury. There is an analogy that I used at the time. Mr. Burgess said, in effect, we are going to meet the market. If the market goes up we will go beyond 3¼. We will pay whatever is necessary in order to sell these bonds. I think that that is analogous with Henry Ford saying that the price of a Ford today is $2,000. If it doesn't sell at this price next week it will be $1,900. The effect of that would be to alter the market.

The CHAIRMAN. Does anybody else wish to comment?

Mr. WOOD. Mr. Chairman, it seems to me that it is almost entirely, but not quite, a matter of the central bank—that is to say, rates reflect the terms upon which debts may be monetized. To some small extent, of course, they reflect the structure of outstanding debt, and if you are going to change that structure, of course, it may have some small effect upon the rate pattern. But I think to a very large extent the rates reflect simply monetary conditions, present and expected.

Mr. HANSEN. Mr. Chairman, could I add another point there?

The CHAIRMAN. Yes.

Mr. HANSEN. Let us assume that the Treasury announces that it is going to undertake in the next 20 years a large movement in the direction of long-term maturity of the public debt, changing the composition of the debt toward long terms. This means they are placing long-term securities in large volume in competition with private securities. The net effect of this action will be to raise the rate of interest unless it is tremendously countered by a vast increase in funds poured out on the market by the Federal Reserve.

The CHAIRMAN. Mr. Reierson.

Mr. REIERSON. There are several intriguing subjects, Mr. Chairman, on which I should like to make brief comment: It seems to me that the market appraisal of the investment outlook—in other words, the level of bond yields, reflects a lot of things other than monetary policy. We may look at the decline in the bond yields that occurred in 1954. That decline reflected (1) the change in Federal Reserve policy; (2) the growing expectation that the Treasury was not likely to issue a long-term bond in 1954, and (3) in addition, the thinking of investment officers, which was conditioned very definitely by their appraisal of the business outlook and by their appraisal of investment opportunities. I think that a questionnaire to investment officers would have disclosed quite clearly that, a year ago, they were rather dubious about being able to find adequate investment outlets. As a result, among some financial institutions, there was great activity not only in buying obligations currently but in entering into forward commitments; I understand the latter increased substantially in 1954.

So it is a broader question than credit policy or debt management.

Perhaps what Mr. Humphrey had in mind is that at the time of sale the Treasury has to meet the requirement of the market place if it is going to sell its bonds.

The CHAIRMAN. Well, it can exceed the requirements of the market, can it not?

Mr. REIERSON. It has to at least meet them.

That brings up a question Dr. Stein mentioned. I think upon sober reflection he probably would not be inclined to hold too strenuously to his belief that, either in the field of public policy or in the field of market appraisal, it is a matter of indifference whether the Treasury puts a rate of 3, 4, or 5 percent on a bond. Certainly the Members of Congress would be vitally interested if, in a 3-percent market, the Treasury were to put out a 5-percent bond.

The CHAIRMAN. It is always possible for the Treasury to put a rate in excess of the market on its issue and market its issue, though it cannot set one too low.

Mr. REIERSON. These are matters of judgment, and it may be possible to set a rate too low and have failure.

Now, I think on the present issues the indication is that a good job of pricing be done. The new issue is selling at a premium of about twelve thirty-seconds.

Vice Chairman PATMAN. May I interrupt.

The gentleman said there could be a failure; not if the Open Market Committee was supporting the Treasury, there couldn't be a failure.

Mr. REIERSON. If we are willing to embark upon an energetic policy of providing sufficient reserves to put the commercial banking systems in a position to provide large amounts of funds, I would agree with Mr. Patman.

Does time permit comment on the remarks of Mr. Wood, or would you prefer to go on?

The CHAIRMAN. I want to give Mr. Curtis a chance to ask questions.

Representative CURTIS. Mr. Chairman, the questions that I had on this particular thing were ably answered. I thought they were getting a little far afield from what Secretary Humphrey must have ment in his statement, and that was that the Government was limited to a certain extent by the market, and it has now been brought out and I believe anyone would admit that there is a limit to what the Government can do.

The CHAIRMAN. He not only said it was limited to a certain extent, but implied that the terms were completely dictated and that the Government had no more effect on it any more than a housewife selling a dozen eggs.

Representative CURTIS. I think you are taking the matter a bit too far. He was apparently illustrating one point, because I do not think anyone, on the other hand, would say this: What the Government does in the field of the market won't affect the market. That is obvious, too, but I think the Secretary's statement should be confined to the point he was trying to illustrate rather than to try to drive at a metaphor to all extremes.

The CHAIRMAN. Perhaps the gentleman from Missouri will read the passage in the testimony before the Flanders committee and see if he can draw any other inference from the one which I have.

Representative CURTIS. Well, I think the inference is limited to that extent, and I think if Secretary Humphrey were here on the stand he would, of course, say the obvious thing, that what the Government does in the market can tremendously affect the money market.

Mr. Chairman, I want to request that the full statement of Secretary Humphrey in regard to that selling of eggs, part of which was quoted, be inserted in the record.

That statement appears on page 207 of the hearings.

The paragraph after the one referred to reads this way:

Now, then, we do affect the market somewhat by the amount of eggs that we do offer. If we came out with thousands of cases, we would present an oversupply of eggs and it would tend to push the market down. If we came out with a very little bit and there was a strong demand, we would have to come at approximately the market.

And then the Secretary goes on to discuss exactly what I suggested Secretary Humphrey would say.

The CHAIRMAN. Well, of course, I would be glad to have that included. I think also my question to Mr. Humphrey and my reply to Mr. Humphrey should be included in the full statement.

Representative CURTIS. Well then, I further request to have the whole colloquy in here, because it all has bearing since Secretary Humphrey then answers you. I think the discussion was right along the lines of how it developed later, so I really think the whole colloquy ought to be included, Mr. Chairman.

The CHAIRMAN. Very well.

(The colloquy in the hearings by the Joint Committee on the Economic Report held December 6 and 7, 1954, on the subject United States Monetary Policy: Recent Thinking and Experience which is referred to above is as follows:)

Senator DOUGLAS. When the public debt was only a small fraction of the total debt, then perhaps you could argue that the Government merely has to accept the interest rate dictated by the market, but when, according to your own figures, it forms such a large percentage of the fluid capital, certainly the terms upon which you issue Government bonds affect other interest rates.

You do not merely accept the market. You help to determine the market, and that was evidenced in what happened to the price of previous issues at lower rates of interest, which went down because you were raising the interest rate. It is what happened in interest rates where other flotations had to be issued immediately afterward. I don't think you can say you merely accept conditions. You help frame conditions.

Secretary HUMPHREY. Let me see if I can explain that to you as we see it, and let's get it into very simple terms.

We are selling eggs, and the current price that eggs are selling for is 50 cents a dozen. Now then, we come along and we have some eggs to sell. If we go out and offer those eggs at 55 cents, nobody is going to buy them, so if we have a dozen eggs to sell, we have to offer them at a price that the market will take. If we come out and offer them at above the market, nobody is going to buy them. If we come out and offer them approximately at the market, we have a chance to sell them.

Now, then, we do affect the market somewhat by the amount of eggs that we do offer. If we came out with thousands of cases, we would present an oversupply of eggs and it would tend to push the market down. If we came out with a very little bit and there was a strong demand, we would have to come at approximately the market.

Now, the same thing is true of bonds. These bonds, the rate that people were buying bonds for at the very day we put these bonds out was, as nearly as we could figure it, about 3¼ percent. Now, by coming out and adding some more bonds to the supply we, of course, did to some extent affect the rate.

That is why we put out as small an issue as we did, because we didn't want to affect the rate any more than we could help, so we met the market with as small an amount as we could that we thought would not affect the rate, and in that way did not increase interest rates by these bonds over what they then were.

Senator DOUGLAS. Well, Mr. Humphrey, the analogy which you draw between the housewife who sells eggs, a few dozen eggs, on the market of millions of dozens of eggs, and therefore sells only an infinitesimal proportion to the total eggs sold, and hence has to accept the price, is not applicable to the Government, which sells a large proportion of the securities which are issued.

Secretary HUMPHREY. Now, wait just a minute.

Senator DOUGLAS. There is a difference. You are assuming perfect competition in the egg market and carrying it over into the bond market, which doesn't apply.

Secretary HUMPHREY. No, I don't think that is correct, Senator. We sold just a little over $1 billion, and compared with the Government debt outstanding at that time in the hands of the public—leaving out the Government accounts—it looks very small. We put out $1 billion or a little better, and there was outstanding in the hands of the public at that time about $220 billion. Now, when you put 1 out in 220, it isn't such a large proportion, after all.

Senator DOUGLAS. Then you were treating this as purely an extraordinary occurrence raising the interest rate on this one issue?

Secretary HUMPHREY. We didn't raise it.

Senator DOUGLAS. But it didn't indicate any permanent policy. Is that what you are now saying?

Secretary HUMPHREY. We didn't raise the interest rate. We accepted the interest rate as the market had it determined that day, and we took that interest rate and offered to sell our goods at the price the market was paying at that time.

Senator DOUGLAS. The previous issues of comparable bonds, as I remember it, drew some 2¾——

Secretary HUMPHREY. I don't know what their market yield was.

Senator DOUGLAS. Is that not true, that they drew 2¾ percent?

Secretary HUMPHREY. No, it is not true, and the reason is this: Interest is a function of both principal and rate, and unless you take into account both principal and rate you can't figure interest. Interest of $2 on $100 of principal is 2 percent. That same $2 on a principal of $50 is 4 percent.

Senator DOUGLAS. Then let me ask you this——

Secretary HUMPHREY. So you always have to take two things into account to figure what interest is.

Senator DOUGLAS. What was the yield on comparable Government securities at the time?

Secretary HUMPHREY. It was approximately this same rate.

Senator DOUGLAS. 3¼ percent?

Secretary HUMPHREY. That's right.

Mr. BURGESS. There is a difference in maturity.

Secretary HUMPHREY. For that maturity.

Mr. BURGESS. There weren't any Government bonds that long outstanding at that time. The longest bonds were 2½'s which had become medium-term maturities. They were selling around a 3 percent yield basis.

Senator DOUGLAS. Three?

Mr. BURGESS. That's right.

Senator DOUGLAS. That is what I understood.

Secretary HUMPHREY. But that was for a shorter maturity.

Senator DOUGLAS. May I just finish?

Secretary HUMPHREY. You have got to take maturity principal, and interest into account in figuring what a new interest rate should be.

Senator DOUGLAS. Now you have introduced a third dimension.

Secretary HUMPHREY. That is always true.

Senator DOUGLAS. May I say I can understand your raising the rate to 3 percent, but I have thought that that extra quarter of a percent was a mistake; that the yields were 3 percent on comparable securities.

Secretary HUMPHREY. No, they weren't comparable. Those were medium-term maturities, and were much shorter.

Now, we thought, based on all those rates——

Senator DOUGLAS. How long is this issue?

Mr. BURGESS. The longest marketable bonds outstanding then were December 1967–72's, so you were stretching this new issue very substantially into an area where there was no marketable debt outstanding. The new issue was more than 10 years longer.

Senator DOUGLAS. That raises the question immediately as to whether you should have issued it for so long a period.

Secretary HUMPHREY. All right. We thought that it was the right thing to do, and I still say that I believe it was the thing to do if it was helpful in deterring runaway markets in commodities, and I think it was.

Senator DOUGLAS. Now, when you speak of deterring runaway markets in commodities, I think there has been a lot of—I won't say issued by you, Mr. Humphrey, but a lot of—misapprehension on this point.

Sometimes this rise in the interest rate has been spoken of as a move to check price inflation. I am happy to see that this morning neither you nor Mr. Burgess have advanced that argument.

I have here a sheet of wholesale prices and consumer prices, and they indicate that wholesale prices fell from 116.5 in March 1951 when the accord between the Treasury and the Reserve was negotiated, to 109.6 in December of 1952, and approximately to 110 in March of 1953, so that there has been a fall in wholesale prices.

There had been a slight increase in consumer prices from 110.4, 110.3 in March 1951, to 113.6 in March of 1953, but if you take the two together, there was roughtly price stability. In fact, there was a slight price decline, so that I do not think it can be maintained as some have maintained in their speeches that this was necessary to check price inflation, and I hope the record is clear that whatever the justification may have been for it, that this was not a justification. Would you agree with that?

Secretary HUMPHREY. Let me put it this way, Senator, I have to get these things into very simple form or I don't understand them myself.

Senator DOUGLAS. You are a very clever man, Mr. Humphrey, to be able to put them in a simple form.

Secretary HUMPHREY. To just be simple about it, when you take controls off there are several things that have to be taken into account in judging where prices will go.

In the first place you have to judge as best you can looking ahead, and it is always easier to be a Monday morning quarterback than it is to do the job Saturday afternoon. Looking ahead you have to judge how the relative increase in productivity was coming up in production of goods. That was increasing.

There was a lot of plant capacity that was coming in, and it was increasing. You also had to look at what the demand probably was going to be.

Now in addition to all of that, there was the question of how purchasing agents throughout the country thought things were going. They don't study economics particularly; they just go the way you and I go along in judging how things are going to go. If they think prices are going to go up, they want to raise their inventories to protect themselves. If they think prices are going down, they cut down on their inventories somewhat.

If it costs them a little more money to carry an inventory, they are not quite so apt to speculate with it.

So that with all of these things, with the production, gaging the production that would probably be available, gaging the demand that would probably be made, and with it costing a little more to carry a speculative inventory, all those things converged to a point where you didn't have an increase in speculative inventory.

And it was the most fortunate thing in the world that we didn't get it because we were accumulating inventory at that time, anyhow, and if we had added substantially to our inventory accumulation at that time we would have had a much farther down curve in business, which was what you were predicting yourself only a few months ago.

Senator DOUGLAS. Mr. Humphrey, for the record I have never made any predictions. I have never made any predictions about the future. The record is perfectly clear on that point. I merely stated what was occurring, namely a decline in industrial activity or a recession.

Secretary HUMPHREY. In any event, we didn't have that severe down curve partly because we had not had that speculative inventory buying.

Senator DOUGLAS. Now, Mr. Humphrey——

Secretary HUMPHREY. All these things contributed to stop that, and I think that by and large the whole thing did stop the inventory accumulations that would have driven us further down had it occurred.

Senator DOUGLAS. Then what you were afraid of was not past increases in prices, but anticipated increases in prices.

Secretary HUMPHREY. That is right.

Senator DOUGLAS. Resulting from the removal of controls.

Secretary HUMPHREY. That is what many people said. That is what the big argument was, and there are many people who argued very sensibly that if those controls were removed, there would be an immediate rise in prices that would be uncontrolled.

Representative PATMAN. Would you permit an interruption there?

Senator DOUGLAS. Certainly.

Representative PATMAN. He said if those controls were removed.

Secretary HUMPHREY. That is right.

Representative PATMAN. Indicating that you were going to take them off.

Secretary HUMPHREY. That is right.

Representative PATMAN. The 83d Congress in 1953—isn't it a fact, Mr. Secretary, that the Defense Production Act of 1952 passed in the 82d Congress provided for the automatic decontrols that went into effect, and practically all of them had been removed before April 1953?

Secretary HUMPHREY. Only because we took them off.

Representative PATMAN. They were automatic.

Secretary HUMPHREY. And if they had been taken off earlier, we would have been better off. If that had been done in the fall before, we would all have been better off.

Senator DOUGLAS. As a matter of fact, Mr. Humphrey, even under the imposition of controls, what we had was a fall in wholesale prices. The controls pegged prices at their peak, of January–May 1951 but did not appreciably impede the rise in prices. The trouble had occurred by the time controls were imposed, and a business fall of 7 points.

Secretary HUMPHREY. Of course, you don't know what the peak would have been if you hadn't had them. When a control is put on, it will always peg it at the peak because that is where you stop the rise.

Senator DOUGLAS. What I am trying to say, is I see no evidence that there was any pent-up inflationary movement at the time the interest rate was raised so sharply, and that this was taken as an indication of Government policy.

The rise was not merely an isolated occurrence. It was said to be the shape of things to come, and the result was that it was not merely a coincidence that the yield on municipals went up, that other yields went up as well due to the falling of prices of securities already issued. It had a profound effect, and the very fact that it was not needed was shown in that within a month you reversed yourself. I wish that as public men we didn't always have to take the position that we are infallible. It is possible that we make mistakes, honest mistakes.

Secretary HUMPHREY. I am not taking that position at all, but if we had to do it again tomorrow, I would do exactly the same thing, and let me tell you why.

I think that one of the greatest things that has happened has been the stabilization that has resulted during this period, the maintenance of that stability, the stopping of inflation. We had been for 15 years in a period of self-imposed inflation that was fostered and carried on, and it was depreciating the value of the dollar very rapidly.

Now the value of the dollar stopped depreciating. It all has to do with the reduction of Government expenditures, with the handling of the taxation, with all of these things that all contributed, and it is not a bookkeeping fetish or anything of the kind.

The stopping of this inflation saved the people of America, the savers of America, the people of America a great deal of money, and it has stabilized the economy. It has helped to make jobs for them to work at, and I think it is the foundation of the conditions that we have today.

Senator DOUGLAS. It is always impertinent to play the role of amateur psychiatrist, Mr. Humphrey, but I would say that your subconscious has oozed out in your reply, because now you are making emphasis upon the checking of inflation, which a few minutes ago you disavowed.

Secretary HUMPHREY. No; I didn't disavow it. I never disavowed it. I have said right straight along that our objective has been to stop these inflationary pressures. Our objective has been to stop this depreciation of the dollar, and so far we have done it.

Senator DOUGLAS. This is my point: That had already been done by the Federal Treasury Reserve Board in March 1951, as indicated by what happened after that.

Secretary HUMPHREY. No; that is not the whole story.

Senator DOUGLAS. What I think happened is you carried over your impression of what existed prior to that accord into a period in which it no longer applied.

Secretary HUMPHREY. No; I don't think so. In any event, it has worked.

Senator FLANDERS. Will the Senator yield?

Senator DOUGLAS. I have taken up too much time.

Senator FLANDERS. I would just like to express this situation as I see it. I may not be seeing it rightly.

In the first place, inflation was checked before you, sir, came to the Treasury. In the second place, a new factor entered after you came to the Treasury in that controls were removed. The assumption you are making, which seems to me a valid assumption, is that positive action on your part was required to maintain an already existing situation in the face of the removal of controls.

That, at least, is the way I see the picture. And just one other point, and that is this: that you have disavowed the direct fixing of interest rates by saying that you put that issue out at the market.

There had to be an element of judgment in your case because there were no Government issues of that length of maturity in the market. You had to make a judgment as to what the market was for maturities for that length. It would seem to me then that your policy is either approved or disapproved on the basis of your decision to issue securities of greater length than any that were present in the market.

Secretary HUMPHREY. That is right, Mr. Chairman. You might want to add that there were, of course, other influences that also bore on this.

We inherited a $9½ billion deficit that year, which was an inflationary pressure in itself, so that to say that inflationary pressures were all removed is not correct.

We were under many inflationary pressures at that time. Consumer credit was rising rapidly. New issues of corporate and municipal securities were running very high and credit demands were threatening to spill over at a time when our productive capacity was already fully utilized. We felt it necessary to resist those pressures so that we would not have a runaway rise in prices, and we could stabilize the dollar.

Now, the proof of the pudding is in the eating. What was done did stabilize prices.

It did arrest the threatened rise and it continued stabilization and the value of the dollar didn't depreciate further. That is very beneficial for the American people in the form of jobs, in the form of savings, in the form of insurance, in the form of pensions, in all the things that the American people want to have.

Senator FLANDERS. Senator Douglas, you still have the floor.

Senator DOUGLAS I don't want to monopolize the questioning, but I would say this.

I think this argument that it was necessary for stabilization is very dubious. It is true that the money supply was increasing, but it is also true that production was increasing, and it is important to view those two together in relationship to each other.

If you have the normal increase in production of 3 percent a year, and as a matter of fact, it was going up close to 5 percent a year during the preceding year, you can have some increase, a corresponding increase in the money supply without any inflationary effect on prices, and that is precisely what had been happening.

The Federal Reserve had allowed the money supply to increase in absolute terms, but not in relative terms. This is something that I think monetary managers should consider, not merely the question of absolute increases, but relative increases, and it is only when the relative supply of money is increasing more rapidly than the index of production or physical production that you get into danger.

Our good friends at the Treasury, I think erred in just being frightened at the absolute increase, and disregarded that increase in production which counterbalanced the increase of money, and had enabled stable prices to be maintained, which would have continued.

And the very fact that it wasn't necessary is shown in that within a month the Treasury had to beat a retreat, that interest rates were lowered, that this issue now stands out as a sore thumb at a price of 110, that the verdict of the market to which the Secretary has appealed has been that that was not necessary.

Now, I say it was a bad mistake, but I believe it was an honest mistake. But I know how hard it is for public figures to admit mistakes. I sometimes find it difficult myself, Mr. Secretary. But I think nothing is gained by trying stubbornly to maintain a position that you are correct, when history indicates you were wrong.

Secretary HUMPHREY. Senator, I have made a great many mistakes in my life, and I expect to make a lot more, and I have never been a bit backward in admitting them.

On the other hand, when you are looking forward and making judgments and those judgments work in practice that is the test after all, I am not much of a theoretical economist. I don't care too much about the theory of it as long as it works.

This one worked, and it worked well, and therefore I think it was all right.

Senator DOUGLAS. Now, Mr. Secretary, I have kept off of this question of whether it worked, but since you have raised it, I want to address myself to that very point.

You say it has worked because prices have been stable, but there is no doubt that that rise in interest rates checked production, checked volume of output during the second half of 1953, and contributed to the recession and contributed to the unemployment of human beings.

Now, I do not say that it was the sole factor in the recession. I have never argued that. But I do say the rise of one-half percent in interest rates helped it along.

Secretary HUMPHREY. It is a mighty good thing it did check inflation.

Senator DOUGLAS. Did you consider the increase in unemployment, which has been very severe in many regions of this country? If you took that into consideration, then I think you would not be quite as self-satisfied with this decision that you say "worked."

Senator FLANDERS. May I interrupt a moment, Senator?

Senator DOUGLAS. Certainly.

Senator FLANDERS. It seems to me that one part of the production that it checked was the flow of production into inventories.

Secretary HUMPHREY. That is right; that is exactly right.

Senator DOUGLAS. Well, did it?

Senator FLANDERS. Yes.

Secretary HUMPHREY. Yes; it did, and if it hadn't we would have been in a lot worse trouble.

Senator DOUGLAS. But for about 5 months inventories continued to increase despite the rise in interest rates.

Secretary HUMPHREY. And think how bad it would have been if it hadn't helped to check it.

Senator DOUGLAS. Your own chart shows that the inventories did not begin to decline until October, and you had placed your increase in interest rates into effect in May.

The CHAIRMAN. Well, it seems we are moving to agreement on the facts even though not to agreement on what the Secretary intended.

Senator Sparkman.

Senator SPARKMAN. No questions at this time.

The CHAIRMAN. Mr. Talle?

Representative TALLE. No questions.

The CHAIRMAN. Mr. Patman?

Vice Chairman PATMAN. Mr. Chairman, I have 2 or 3 questions I would like to ask.

On the tools to work with, now this No. 2 question indicates there are only three ways to get money, to supply that money to expand our economy: One is through the open market operations, the other is through reserve requirements, the other is through a change in the rediscount rate.

Do all of the members of the panel agree that those are the only three tools that you have to work with?

The CHAIRMAN. I may say I dictated this question. I realize it is imperfectly phrased and, of course, there could be increase in the supply of currency, itself.

Vice Chairman PATMAN. Well, I do not think you are considering that.

So creditwise in the orthodox way, are these the only three tools to work with?

Do any of you know of a different tool except the one suggested by Senator Douglas, of course?

Mr. STEIN. Gold flow has an effect, the inflow of gold or gold production in the country.

Vice Chairman PATMAN. Of course, but that does not amount to a great deal now, and over a period of time it hasn't; has it?

Mr. STEIN. No.

Vice Chairman PATMAN. So it is not a big enough factor to consider or to rely upon?

Mr. STEIN. No.

Vice Chairman PATMAN. Now, then, do we all agree that this money that we get to expand our economy must be manufactured money, must be manufactured money? Do we all agree on that? And it must be manufactured on the Government's credit?

Mr. REIERSON. I think that I might beg to differ with Representative Patman on some of the implications of the latter statement.

Vice Chairman PATMAN. Well, now, on the Government credit: Suppose we take them up one at a time, open-market operations. All the open market has to use is the Government's credit that the open market creates; isn't it?

Now, then, how will the Open Market Committee operate except on the Government's credit and created credit at the time?

If any of you know of a way the Open Market Committee can buy bonds without buying them at the Government's credit created at the time for the purpose, I would like to know what the answer is.

Mr. REIERSON. I guess a Government bond is a Government bond.

Vice Chairman PATMAN. I wonder about the purchase, what with? At the same time, the banks have over $25 billion of Government securities. They purchased those securities with something. I say they purchased those securities with Government-created credit at the time.

If anybody takes the opposite view on that I wish he would speak up.

All right, they operate on Government credit.

Now, No. 2, through changes in the reserve requirements. If you change the reserve requirements now they can expand their loans about 5½ times. Of course, the country banks can expand much more than that, and the other banks so much more, but generally about 5½ to 1. If you reduce the reserve requirements and you create a billion dollars more money, that is manufactured money with the same security that you had before.

So isn't that operating on the Government's credit?

Does anybody take issue with that?

Professor Whittlesey?

Mr. WHITTLESEY. Well, the two cases are not exactly comparable. In the second case——

Vice Chairman PATMAN. It is not comparable to the first one, I know.

Mr. WHITTLESEY. Yes. Well, your remarks indicated they were the same.

Vice Chairman PATMAN. I mean manufactured money.

Mr. WHITTLESEY. In the second case you are freeing and releasing money that is already in existence. That is the difference.

Vice Chairman PATMAN. Well, from the standpoint of the bank it has the same security to offer but can issue a billion dollars more if the lowered reserve requirements will permit it.

That is true, isn't it?

Mr. WHITTLESEY. Yes.

Vice Chairman PATMAN. They have nothing additional to put up. They do not put up an extra dime. They do not put up any security at any time.

Mr. WHITTLESEY. Yes; but that is analogous with what happens in the first case at the next stage when banks utilize those "manufactured" reserves.

Since I have interrupted you and so that I will not feel obliged to do so again, may I say that to the extent that we concede that there are psychological effects of changing the discount rate, it could be argued that that also is somewhat different from what you suggested in your earlier statement.

Vice Chairman PATMAN. Well, I have not got to that one. That is No. 3.

All right. Now, then, No. 1, they operate entirely on the Government's credit. No. 2, the banks are allowed by a Government agency to expand their currency based upon their present reserves, and that is manufactured money. No. 3, on rediscount rate. Of course, since banks are not borrowing and 2 or 3 of you gentlemen mentioned why they were not borrowing, because they do not like to be in debt to the Federal Reserve, in truth and in fact the rediscount rate now as used is almost purely psychological.

Is that right, or not? The result is almost purely psychological. You do not agree with that, Mr. Riefler?

Mr. RIEFLER. No; the discount rate is a very important rate in an operating sense. If a member bank has a deficiency in its reserves, and has to make it good, it has the option of selling bills or of borrowing at the rediscount rate for a short period to make the adjustment. The level of the discount rate in relation to bill yields will determine frequently whether it takes the one option or the other.

So it actually has a market effect. It is a fulcrum in the market.

Vice Chairman PATMAN. I know, but in actual practice they do not use it much?

Mr. RIEFLER. Oh, no; I am talking about actual practice.

Vice Chairman PATMAN. That is the reason I say it is unimportant.

Mr. RIEFLER. They do use it in the sense I am talking about.

Vice Chairman PATMAN. Indirectly, but not directly.

Mr. RIEFLER. Yes.

Mr. REIERSON. They also use it directly. In 1953, borrowings were a billion and a quarter during the first part of the year.

Vice Chairman PATMAN. On deposits of 200 billion that would not be very much.

Mr. REIERSON. Not relatively.

Vice Chairman PATMAN. Now, the other point I want to make, if I can, is about this market of Government bonds. Does anyone disagree with this statement: That the market for Government bonds is determined by the Open Market Committee of the Federal Reserve System.

Does anyone disagree with that?

Mr. RIEFLER. I do.

Mr. HANSEN. There are, of course, real factors in the situation that are among the influences that determine the rate of interest. For example, if we are living in a period of great technological advance, and the opportunities for investment at high return are very great, that is another factor that influences the rate of interest, so that one can hardly say that the rate of interest is exclusively determined by monetary factors.

Vice Chairman PATMAN. Well, this is what I mean: Mr. Eccles one time was testifying before this Banking and Currency Committee here, and he was asked the question by Mr. Monroney who was sitting at my right then—Senator Monroney—he said:

> Do you mean to say, Mr. Eccles, that the Open Market Committee can keep the interest rate on Government bonds at 2 percent or 2½ percent, or any other amount, that it desires to keep it,

and he in effect said "Absolutely," without qualification; the Open Market Committee had the power to keep interest on Government bonds exactly the same at all times, or substantially the same.

Mr. HANSEN. Congressman, I would like to add there this qualification: The Open Market Committee could, indeed, keep the rate at 2 percent, but if the real factors to which I referred a moment ago, the opportunities for very profitable investment, were such that you could make 5 or 6 or 8 percent, and the Federal Reserve still acted to hold the money rate at 2 percent, the result would be inflation.

Vice Chairman PATMAN. Well, Professor Hansen, we are just talking about Government securities now. We are not talking about outside rates.

Therefore, I say that the Open Market Committee determines the rate of Government securities in the open market.

Mr. HANSEN. But it would have an effect on the economy if they did that. Of course, the Government could, on the other hand, influence the earnings by a tax policy. That is another policy that could enter into it.

Vice Chairman PATMAN. We are still getting off, Professor Hansen, of the point that the Open Market Committee is the all-powerful committee that can determine the rates for Government securities in this country, and, in fact, they can determine the expansion policies of the banks, too, through the reserve, of course, as you know.

Now, then, the point that I would like to have your opinion on: Since this Open Market Committee has such tremendous power over the economy do you believe that people selected to represent the public exclusively should have charge of that great power?

As it is now there are 12 members of the Open Market Committee, 7 members of the Federal Reserve Board when it is filled—there is a vacancy now; but the President, through Mr. Adams, told me awhile ago that he had someone under active consideration to fill that vacancy—but the 6 members of the Federal Reserve Board and 5 presidents of Federal Reserve banks—now, these 5 presidents of Federal Reserve banks owe an obligation to the bankers of the district. They are not devoted exclusively to the public like these 7 members of the Board are.

Now, to reduce it further, these 12 Open Market Committee members select an executive committee of 5 members, 3 from the Board and 2 from the banks, and then to reduce it even more they select a manager and that manager is employed by and paid by the Federal Reserve Bank of New York, and the operations that are going on every day that are influencing our markets are carried on really by 1 man, who is not necessarily charged with a public duty, but is representing the Federal Reserve Bank of New York. He is paid by the Federal Reserve Bank of New York, and do you gentlemen believe that that policy should continue or should be changed?

Would you feel free to express yourselves on that, please?

The CHAIRMAN. Mr. Reierson.

Mr. REIERSON. Mr. Patman, I take the position that the present system should be maintained for the following reasons: First, that on the Open Market Committee, the Federal Reserve Board has a majority of 6 to 5, or 7 to 5.

Vice Chairman PATMAN. One can change the result.

Mr. REIERSON. The Board has a majority of 1 now, and normally it has a majority of 2.

No. 2: I think your premise that the presidents of the Federal Reserve banks owe an obligation to the bankers is an unsound premise. It has been my fortune to know a number of them personally.

Vice Chairman PATMAN. I am not talking about individuals, but who selects them.

Mr. RIEFLER. They are elected by the directors of the banks, of which 3 represent large-, small-, and medium-sized banks; 3 are from business, large-, small-, and medium-sized—well, not business, but the large, small, and medium sized bankers select businessmen, and 3 are appointed by the Federal Reserve Board. Then the president and first vice president of each of the Federal Reserve banks must be specifically approved by the Federal Reserve Board.

Vice Chairman PATMAN. But you have not told the whole story, Mr. Riefler.

Now, 3 of those directors are selected by the banks, the small and medium sized banks, as you suggest; that is correct, there are 3 selected representing business and industry, and so on, but they can be stockholders of banks, and I think the records disclose that they are stockholders of banks, and then the larger banks select 3, and so there are your 9 directors stacked 6 bankers.

Mr. RIEFLER. No, the Federal Reserve Board selects the other three.

Vice Chairman PATMAN. That is right. The Federal Reserve Board selects the other three. You are right about that.

Now, it used to be that the Federal Reserve Board selected the Chairman of the Board who was the big man. He was the big man in these local banks, but that law was changed without much discussion in 1933 or 1935, I have forgotten the date, and the president of the bank was made the big man, and the president of the bank is not appointed by the Federal Reserve Board. He is selected by that board of directors.

Mr. RIEFLER. The Chairman of the Board has always been selected by the Federal Reserve——

Vice Chairman PATMAN. No, those selected by the Board do not serve on the Open Market Committee. They do not have any power over the Open Market Committee. It is only the presidents of the banks that have the power. Now, they have no power now. They are compelled to take these bonds. It is just like a crap-shooting game. They are carrying on a crap game up there, and if he buys a certain amount of bonds he distributes those bonds in proportion to resources of each bank, and each bank has got to take them, and each bank, if called on, will have to issue Federal Reserve notes to pay for them. Isn't that correct?

Mr. RIEFLER. Yes.

Vice Chairman PATMAN. But the individual bank has no power over buying and selling. It is just as helpless as a baby because the law was changed.

Mr. RIEFLER. Well, that is to eliminate the chance of private financial institutions having something to say about that very important thing.

Vice Chairman PATMAN. Well, they have turned it over to one man at the Federal Reserve Bank in New York.

Mr. RIEFLER. No, the Open Market Committee.

Vice Chairman PATMAN. Well, that is what I mean. The Open Market Committee selected a five-man board who selected him to take charge of the operation.

Mr. RIEFLER. But the Open Market Committee approves the manager.

Vice Chairman PATMAN. That is correct, but he is paid by the Federal Reserve Bank of New York. That is correct; isn't it?

Mr. RIEFLER. That is right.

Vice Chairman PATMAN. He is not paid by the Federal Reserve Board. He is not paid by the Open Market Commitee. He is paid by the Federal Reserve Bank that is run by 9 directors, 6 of whom were selected by the banks. That is correct, isn't it?

Mr. RIEFLER. Yes.

Vice Chairman PATMAN. Now, the question is, Is that a good arrangement or is that a bad arrangement? Should it be retained or should it be changed?

Mr. HANSEN. Well, Congressman Patman, I would say there is some virtue in this arrangement in that the 12 Federal Reserve banks are in immediate contact with banking operations. They run these banks. The Federal Reserve Board is a supervisory board and is not operating a banking business.

Vice Chairman PATMAN. Now, Professor Hansen, you say "run these banks." They are not doing much business now, are they?

Mr. HANSEN. You say the 12 Federal Reserve banks are not doing much business?

Vice Chairman PATMAN. Yes, except through bonds, and that is carried on in the New York bank.

Mr. HANSEN. I would say they play a very important role in the whole economy. I myself would believe that the representation of the presidents is too large. I doubt that it is a terribly important issue, though. I would like to see some representation, but less than we now have.

Vice Chairman PATMAN. What do you think about it, sir?

Mr. STEIN. I think we ought to look at the nature of these institutions as they have evolved and not just as the bylaws are written down on paper. I think the 12 banks have become public institutions, and that their presidents have become public servants.

It was interesting to see the lineup of the biography of the 12 presidents that was submitted here at the time of the Flanders hearings. This showed that only 1 of the 12 presidents had formerly been in private banking, that the overwhelming majority of them were Federal Reserve career men, most of whom came in in 1920 or 1921, or thereabouts. I think they regard themselves as public servants and have acquired great capacity, and it would be a shame to upset that arrangement. I do not think the identity of the system manager is a matter of great consequence. As I understand it, he operates day to day within policy limits that are set by the Open Market Committee, and the executive committee of the Open Market Committee.

Vice Chairman PATMAN. May I ask the representative of Mr. Martin, Mr. Riefler, how many people are engaged in the actual operation of the Federal Reserve Bank Open Market Committee operations in the New York market daily?

Mr. RIEFLER. I do not have those figures directly.

Vice Chairman PATMAN. I have heard it is about a hundred. Is that correct or not. I saw it in some article. About a hundred people were directly concerned with the operation of the Open Market Committee.

Mr. RIEFLER. If you confine it to the New York bank to the extent that all 12 Federal Reserve bank presidents are kept informed, that might be true. Of course, there would be somebody in each bank following the operation, and I suppose he would have assistants; I don't know how many there are in all. In New York it would depend on how far you go in including the people who have to enter the securities in the books, etc.

I do not know how many that would be.

Vice Chairman PATMAN. Fifty or a hundred, then, or even twenty-five.

Mr. RIEFLER. I think you are getting down nearer to it there.

Vice Chairman PATMAN. But the point is, the operations of that committee are so powerful that just the least information out could be worth a lot of money to people who are engaged in business. I am not saying that there have been any leaks.

Mr. RIEFLER. No, it is important that it be kept extremely close.

Vice Chairman PATMAN. It is seldom when you have 25 people that you do not have leaks. In fact, around here if you have two you usually have a leak of some kind.

Now, the reason I brought this up is to just pose this question: Does the influence of the big banks dictate the policies of the system, including the Federal Reserve Board. I am not making any bones about it. I believe they do.

They have done quite well in 1954. They have the biggest profits in history. The big banks. Big businesses associated with big banks did fine. But little business and little farmers had no representation, and they had it the worst that they have ever had it since the end of World War II, and I just wonder if we should not consider changing this banking influence so as to have the representatives of more of our economy there to represent the entire public rather than those that are prone—I would not say that there is anything wrong or bad about it, or dishonest, or anything like that, but I am just talking about people who are schooled and drilled and educated and trained in certain lines of work, they just naturally lean that way.

Now, you take Mr. Martin. I think he is a very fine man. I am sorry he is not here, because I wanted to ask him these questions. He has been head of the stock exchange, and he sees it that way, not corruptly, but honestly. And I think it is that way in every profession.

You see the viewpoint that you have been schooled in and trained in.

I wonder if we should not change this situation so that these two groups that President Eisenhower said, and I am quoting him now:

> The income shares of both farm and business proprietors in 1954 were at postwar lows.

are represented.

I just wonder if we should not do something to give these people representation on this committee?

Mr. RIEFLER. I once served as director of the Federal Reserve Bank of Philadelphia, when I was a professor, and certainly the nine directors of that institution did not represent big industry or big banks. Only two were selected by the large banks.

Vice Chairman PATMAN. Well, you can find some on each board that way, because the Board of Governors here selects three, and I imagine you were selected as a class C director.

Mr. RIEFLER. I was selected by the Board.

Vice Chairman PATMAN. They are charged with the public duty. I am not talking about them. I am talking about the other six.

Mr. RIEFLER. Well, only two are selected by the large banks.

Vice Chairman PATMAN. That is something I wanted the panel to discuss, but if they do not want to do it, it is perfectly all right.

Mr. WOOD. Mr. Patman, I will comment on that. I sympathize with your idea that monetary policy, being highest level policy, ought to be under the control of the Government in a very real sense. When we think, though, of what happened to monetary policy when it was under the control of the Treasury, it makes us wonder whether it ought to be handled by——

Vice Chairman PATMAN. Please be more specific. In what period of time?

Mr. WOOD. I am thinking of, say, 1942 to March 4, 1951.

Vice Chairman PATMAN. You had stable prices of Government bonds and stable interest rates, 2½ percent unexceeded.

Mr. WOOD. You shouldn't have had. You should have had higher interest rates.

Vice Chairman PATMAN. There is where we differ. I think when the money is created on the Government's credit, and, of course, the answer is usually but who owns the gold; the Government owns it.

The CHAIRMAN. I hope that Congressman Patman will not destroy a beautiful friendship which is growing up between him and myself.

I would like to say that this policy of stabilizing the price of Government bonds serves to increase the price level, so I will demur on that point.

Vice Chairman PATMAN. I am not talking about stabilizing them above par. But I think it is a terrible injustice and cruel to permit people who are supposed to represent the Government, to let them go down below par, down to 96 and something like that.

The CHAIRMAN. I am not speaking of the price of Government securities. I am speaking of the general price level.

Vice Chairman PATMAN. Well, I think taking care of unemployment comes ahead of the price level.

Mr. Wolcott, it is your turn.

Representative WOLCOTT. I am getting a little confused now.

The CHAIRMAN. You are at your most dangerous when you pretend that you are confused.

Representative WOLCOTT. Perhaps we should go back in history a little bit.

Mr. Chairman, the genesis of Mr. Patman's contention, whether it is correct or not, I recall the act of 1935 when it was sent down to us in the original draft. It would have compelled every commercial bank to have come into the Federal Reserve System. The President would be given the authority to remove members of the Federal Reserve bank at will, and without cause. The banks would have to come into the Federal Reserve System. Otherwise they could not participate in FDIC. So it put the absolute control of the banks and all credit—I hesitate to use this expression—credit being the lifeblood of the American economy—and I did not feel it advisable to allow the President to control the lifeblood of the American economy to the extent which the original draft of the Banking Act of 1935 would have required.

Possibly somewhere along the line to offset that influence and that recommendation, in our efforts to prevent the controls by the President of the lifeblood of the American economy, we perhaps decentralized more than we thought we would, but we have been proven out all right. It was not until about 1942 that we removed the dangers in those respects. I get all confused here sometimes because I think I have in mind what the Treasury and perhaps the Federal Reserve had in mind when they put out that 30-year issue at 3¼. It was to bring inflation under better control.

I understand that their idea at that time, their purpose at that time was to spread the debt out and make it more attractive for nonbanking institutions and individuals to hold the debt, so that the debt could not be monetized, and thereby remove the inflationary pressures.

Perhaps it is too fundamentally accepted, but does not debt monetization have something to do with the manner in which the banks raise this money with which they finance Government obligations, and if these Government obligations cannot be monetized, then Mr. Patman might not be correct in this premise that we immediately make the money with which to make a market for these bonds.

I think there is a connotation in what he says that the bonds which were being issued currently could be changed somehow or other into money for the purpose of buying the bonds. Is it generally accepted that monetization of the debt might have some influence on whether the banks could immediately convert them into cash for the purpose of buying bonds?

The CHAIRMAN. Does anyone wish to reply to that query?

Mr. HANSEN. Mr. Chairman, monetizing the debt, I take it, means either that the Federal Reserve is buying the bonds or the commercial banks are buying the bonds. Either one I would call monetizing the debts. If the Federal Reserve buys the bonds, they create larger member bank reserves, which gives the member banks the power to go out and buy bonds if they wish to use their excess reserves in that manner.

That seems to me to be all there is to it. Going back to the postwar, I would like to say, in reference to the price movements of that period, that I think it is a big mistake to consider the movement of prices from 1945 to 1950 purely in terms of monetary actions that were going on. We were living in a very abnormal world when you consider the vast scarcities that prevailed, and I see so often statements about the price movement in that period that make no reference to that whatever, but only talk about credit policy in this period.

I would like also to mention the fact that, in fact, deposits did not rise from 1945 to the middle of 1950, deposits and currency did not rise.

There was no increase in our money supply. If there was, it was utterly negligible. In this period, far from there being monetization of debt, there was a decrease in the holding of bonds by the Federal Reserve banks and the commercial banks combined. I so often see those statements.

Representative WOLCOTT. May I ask the panel this question, and the members of the committee: What is the purpose or what was the purpose of maintaining a differential between the total debt and the bonded debt until we changed it back in 1936 or 1937? It had something to do with that portion of the debt which could or could not be monetized.

Now if you will remember, to be more specific, in 1937, we will say—I am not sure about the date—our total bonded debt, authorized bonded debt, or total debt, was $35 billion. The limit on our bonded debt was $20 billion. We had a differential of $15 billion. It meant, of course, that the Treasury would have to indulge in the practice of short term financing for everything over $20 billion and up to the debt limit of $35 billion.

Now the charge was made at that time that when you removed the differential between the total debt and the bonded debt, you made it possible for the whole debt to be monetized and some contend that that was the beginning of the inflationary pressures which have resulted in inflation to a point where that bothered them.

I remember a very interesting colloquy which took place between Chairman Doughton of the Ways and Means Committee and myself, when the bill was under consideration, and the charge was made that it would be highly inflationary. Now what are the influences against inflation if we have a differential between the total debt limit and the bonded debt limit? Is it because the short-term debt cannot be monetized? I understand that it can be monetized under the existing law but was that the reason for it at that time?

Mr. Whittlesey.

Mr. WHITTLESEY. I would be happy to suggest some answers, although I find myself also a little confused.

Representative WOLCOTT. No, I attributed it to myself. Perhaps my questioning bears out that I am confused, having in mind the history of some of these transactions from 1935 up to the present time.

Mr. WHITTLESEY. The situation is that part of the debt is marketable and part is not marketable. The nonmarketable part includes the E bonds and other which cannot be sold in the market.

Vice Chairman PATMAN. And the 2¾ percents.

Mr. WHITTLESEY. That is right. Then there are other issues that have a restricted sale. During the war a good many issues were got out which were nonbankable for a specified period of time. They were marketable but nonbankable. They could not be monetized. In addition, there is the 2¾ issue just spoken about, which must be held by the owner. It can be disposed of only under certain circumstances by the exchange for notes.

Now when one gets through with all of these restrictions, the amount of securities that can be sold to the banks—and therefore converted into demand deposits, monetized—is much smaller than the total of all securities. It is not a matter of their being long or short, funded or not funded. That which is most suitable and most available for the banks is precisely the short-term debt, which is predominantly in the banks or the Federal Reserves.

Representative WOLCOTT. Let me get to the point I should have made first. What effect would it have upon our monetary policies with respect to the monetization of debt, particularly if we provided by legislation or otherwise that not more than a certain amount of the debt, notwithstanding that that would be held by the banks, could be monetized, thereby creating an artificial differential between the total debt and the monetized debt?

Mr. WHITTLESEY. I am not quite sure that I understood the question.

Representative WOLCOTT. Well, I suppose it would never reach this figure, but we are speaking now of a $275 billion debt and a $290 billion debt. If we provided that not to exceed $250 billion—that, of course, would be terriby high—could be monetized and no more than $250 billion could be monetized.

Mr. WHITTLESEY. The amount that is capable of being monetized now is very much in excess of the amount that is actually monetized. Such a restriction would mean changing the terms of a large part of the debt now outstanding, and I think it would probably be legally impossible to do. In any case, it would be morally objectionable.

Representative WOLCOTT. Well, I am not making my point very clear. If you put the debt limit at $290 billion and provided that no more than a certain percentage of the marketable debt—you might put it that way.

Mr. WHITTLESEY. With respect to the future, it seems to me that the policy could be carried out. That policy was attempted, and I believe with considerable success, during the war. As a rigid policy, it is open to dangers, inasmuch as there might be times when it would be very desirable to have it monetized.

Let me read one paragraph from the President's report; on page 100 it says this:

> More than half the overall expansion of bank loans and investments was in holdings of United States Government securities. These increased by about $6 billion, the increase being predominantly in intermediate and long-term securities.

This happened at a time when loans were going down. At the end of the paragraph that follows, it says:

> Had not commercial banks absorbed during the year about $6 billion of Federal securities, the supply of money would have grown less rapidly and economic events during the year might have been very different.

Now that, of course, is in answer to your point. It amounts to saying that if we were to freeze ourselves into a straitjacket, such as would be involved in an absolute limit, we might deprive ourselves of a favorable development such as this is alleged to have been.

Representative WOLCOTT. Then may we agree that the present system of monetizing the debt has taken into consideration all of the factors and should be considered? Would the panel have any recommendation for any change in the monetization of the debt.

Mr. WHITTLESEY. May I answer quickly? It seems to me that both positions are too extreme and that no simple answer would be valid. I could elaborate on that, but it would take too long.

Representative WOLCOTT. Do you suggest any formula by which we might inspect the evils, to keep a certain amount of flexibility that would be desirable?

Mr. WHITTLESEY. I have suggested it in my general statement. I feel that the Federal Reserve System should be given not less but more power, and then be charged with responsibility to carry out its assigned duties. As I have said in my statement and elsewhere, the record does not show that the Federal Reserve is irresponsible. Representative Patman is correct in saying that we have here a mechanism that gives great power, but I think that is true of all delegated authority under a democracy.

The manager of the Open Market Committee who has received so much attention executes directives handed down from above. The answer indicated earlier was that he was a very powerful person who would act of his own volition and do dangerous things. That is not true and it never will be true. We have a system of checks and balances and of representation. I feel sure that we can rely upon it to function in a responsible manner.

Vice Chairman PATMAN. Mr. Wolcott, would you yield for just one question?

Is it a fact while the manager is carrying policies of the Open Market Committee, those policies are more or less general policies and do not apply to buying or selling so many particular bonds at a particular time; they are general policies?

Mr. WHITTLESEY. I would disagree. It seems to me that the directives, as reported in the minutes of the Open Market Committee which have been referred to, show that the policies are rigidly restricted, so rigidly, in fact, that Mr. Sproul resents the degree of rigidity that exists. If there is uncertainty or disagreement, that is not decided by the manager who executes the contract.

The only point, it seems to me, that can be advanced in support of the position that you, as I understand it, have taken, is that there might be leaks. That is a matter of security, and I agree that it should be taken care of. I was not aware of its being a problem.

As for the machinery, clearly you have to have some machinery or you cannot act. There is no historical evidence, nor is there any likelihood that I can see, that Federal Reserve functions will be carried out irresponsibly. I am only afraid they may be carried out too cautiously—that the authorities may not act with as much vigor and flexibility as they should.

Representative WOLCOTT. Just one more question that was evoked by what Mr. Patman stated. I do not yield to anyone in my solicitude for small business or the farmer. There is no Member of Congress who is more interested or more concerned about small-business people and farmers than I am. I want that underlined.

Vice Chairman PATMAN. I certainly do not take issue with the gentleman. I know that he always has been.

Representative WOLCOTT. Now could we set up a different monetary standard or fiscal standard for small business and agriculture than we do for the economy generally? In other words, we are speaking about sound money. Mr. Patman insists upon calling it hard money, because I think there is a connotation there that it is hard to get.

Vice Chairman PATMAN. No; I call sound money "sound money."

Representative WOLCOTT. Anyway, if we make money and credit easy to get by small business houses and agriculture, wouldn't we have to do the same thing for big business, or what would be the result if we tried to set up different standards?

Mr. STEIN. Well, we have set up certain governmental institutions that did or were intended to work in that direction, various farm credit agencies and the Small Business Administration.

I think they have had a marginal effect on the supply of funds. It seems to me not an impossible thing to do. As I understood him, I think Congressman Patman was asking that monetary policy be judged by something that is not really within the province of monetary authority; that is, effects upon the distribution of income among various groups. I think the best we can hope is that we keep the national income high.

Vice Chairman PATMAN. The gentlemen misunderstood me.

The CHAIRMAN. Mr. Talle.

Representative TALLE. Mr. Chairman, I wonder if the gentlemen of the panel could state who the buyers are of this new long-term issue?

Mr. WHITTLESEY. We shall be able to state it in a few weeks after the sales are complete. The ownership of United States Government securities is reported regularly in the Federal Reserve Bulletin and Chart Book, and it is up to date within a month or two.

Representative TALLE. College and university endowment funds, and trust funds, pension funds and insurance companies might be interested.

Mr. WHITTLESEY. To a limited extent. Universities would hope to get more securities carrying a higher yield.

Mr. REIERSON. I might report on the thinking in the financial markets prior to the issue. It was the general feeling, and this is subject to verification when the facts are in, that State and local pension funds would be very much interested in this new issue. They are not in the mortgage market, and I have heard representatives of those funds say that a long-term 3-percent Treasury issue would be of interest to them.

I think the trusteed pension funds, that is, the business pension funds held by trustees, will likewise buy some of the new issues. I am reasonably sure that there will be some buying on the part of mutual savings banks. How much will be purchased by the life-insurance companies, or for that matter, any other group, it is difficult to say, but certainly they will buy some of the new issue. I would think that those 4 or 5 groups would account for the bulk of the buying of the new issue. At least that was the expectation prior to the announcement.

Representative TALLE. I should think this is the kind of investment they would welcome. In my opinion it is a very fine investment for organizations of that sort.

Now, finally, I want to ask Mr. Patman, who quoted Mr. Eccles, did he say that it would be desirable to have the interest rate fixed at 2 percent?

Vice Chairman PATMAN. At that particular time I do not remember. You know, Mr. Eccles has been on both sides of that issue. At one time he wanted it two and a half, and later he was against it, so I do not know what his attitude was at that particular time.

Representative TALLE. I wanted to be sure the impression was not left that Mr. Eccles, in making such a statement as Mr. Patman quoted, gave the impression that he was promoting the idea of a 2-percent unalterable interest rate.

Vice Chairman PATMAN. Well, unfortunately I said 2 percent. We were really talking about 2½ percent, but I do not think that particular question was brought up, Mr. Talle. I think it was more a question of the power of the Open Market Committee.

Representative TALLE. If there are any other questions, I will withhold mine for the moment.

The CHAIRMAN. I want to read into the record at this time a paragraph from the report of the ad hoc committee of the Open Market Committee, which is published in page 286 of the report on the Flanders hearing. Upon a motion I made that this report be made public——

Representative CURTIS. What year was this?

The CHAIRMAN. This last December. And it touches on some of the points that Congressman Patman raised. I would like to read it in order that it may be more widely known. I quote:

> The subcommittee finds many anomalies in the structure and organization of the Federal Open Market Committee, particularly (*a*) the absence of a separate budget covering its operations, (*b*) the absence of a separate staff responsible only to the committe, and (*c*) the delegation of the management function to an individual Federal Reserve bank. It recommends that the committee reexamine and review its present organization, and in particular that it consider the advantages and disadvantages that would ensue were the manager of the open market account made directly responsible to the Federal Open Market Committee as a whole, and not, as at present, responsible through the Federal Reserve Bank of New York.

That was made by a committee consisting of Mr. Martin and Mr. Mills, members of the Federal Reserve Board, Mr. Bryan, president of the Federal Reserve Bank of Atlanta, and as I understand it, it was unanimous. It touches on many of the issues that Congressman Patman raised.

It would be interesting to find out what action, if any, the Federal Reserve Board has taken with respect to this recommendation. I would like to ask Mr. Riefler if he could make a statement on that point.

Mr. RIEFLER. Well, it has been under discussion but no decision has been made.

(Whereupon, at 12:55 p. m., a recess was taken to 2:45 p. m.)

AFTERNOON SESSION

The joint committee met at 2:45 p. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Representative Patman, vice chairman, Senator Flanders, and Representatives Kelley, Wolcott, Talle, and Curtis.

The CHAIRMAN. Gentleman, we shall begin.

We finished with question 2. I will call on the panel now to perhaps discuss topics 3 and 4 together.

Mr. Riefler.

Mr. RIEFLER. I do not think that it would be appropriate for me to comment on No. 3, so I will confine myself to No. 4.

There is implicit in recent developments the possibility of sustained and growing prosperity and of steady absorption of our expanding resources, particularly our human resources, now unemployed.

For this possibility to be realized, however, it is important not only that the recovery be broadly based but also that activities in anticipation of rising demand, such as inventory accumulation, be held within prudent limits and that commitments to expand be soundly financed. These are the types of problems that always emerge during periods of recovery. It is still too early in the present recovery to tell to what extent they will emerge this time. Among the straws that bear watching is the fact that credit terms, both for consumer installment loans and for home mortgage loans, are now generally more liberal than they have ever been in the past. It is also possible that the volume of construction activity now underway or projected may be too high to be sustained.

I think that the suggestion in the Economic Report that the President be given power to vary the credit terms in the mortgage field is worthy of very serious consideration. I find there is more concern that overcommitment in mortgages may possibly produce some problems for us later than there is with respect to other areas.

The CHAIRMAN. Do you think that the level of home construction may be too high to be sustained? Do you mean at present prices the market will not exactly be exhausted but that the cream will be skimmed off of the market?

Mr. RIEFLER. Well, there is some fear, which I cannot verify, that it is getting a little harder to sell—that demand is being absorbed. There is also an edging up of prices of building materials. A rising tendency in building costs, coming in January is something to be watched, because the big demand comes when the weather opens later on in the year. I think that these are straws in the wind.

The CHAIRMAN. In view of the fact that the high rate of construction in the building industry has been one of the factors which kept the economy up in 1954, does that give you any concern about the stability of the recovery which we have thus far had?

Mr. RIEFLER. Not unless the expansion in 1955 is larger than present estimates. If the present estimates come out, I think it is all right, but if the growth is larger than that, we may run into some problems in that area. That is one of the things to be watched.

The CHAIRMAN. Mr. Hansen.

Mr. HANSEN. I have a feeling that we have been relying too much on the housing thing. By that I do not mean that we are building in the aggregate too many houses, but we have not been building very many low-cost houses for the lower-income scale and I think maybe there is a danger that the ease of credit for veterans has been too great. This might be sustained if we were going to have the expansion we want. My feeling is that if we had had a more general program of sustaining the economy and for growth, then the housing thing could well be absorbed within that and it would work out quite all right.

As it is, there is some danger because we are not adequately providing for growth and we might get to a situation where the housing situation can be rather weak.

The CHAIRMAN. Do you have any feelings about the volume of consumer credit?

Mr. HANSEN. I would rather have been a little less generous on consumer credit and more generous in a reduction on consumer taxation.

The CHAIRMAN. Mr. Reierson.

Mr. REIERSON. Mr. Chairman, as I read the President's report, it includes no specific recommendations for legislation in the field of central banking or general credit policy. Apparently this reflects the point of view that the present statutory authority is sufficient and that more laws are not needed at the present time. If that be a correct interpretation, I find myself in agreement with it. I feel that the authorities have sufficient power under existing statutes to use powers of general credit control as a tool of economic stabilization.

I also believe that the present allocation of powers within the Federal Reserve System is one that does not need change. It is my feeling that the present allocation gives adequate assurance that the public interest is being served and protected. I have already expressed my views on selective credit controls.

In the field of credit, the report includes numerous recommendations with reference to specialized forms of credit: for example, to extend the lending authority of programs designed to help small business, a variety of suggestions in the field of housing finance, endorsement of the proposed International Finance Corporation, and an announcement of the proposed 10-year highway program. Most of these suggestions relate to subjects outside my field of competence and I would therefore hesitate to express an opinion upon their merits or demerits at this time.

I am impelled, however, to express a view on a matter, which I think falls within the cognizance of this committee, namely, to express the hope that adequate and careful attention is being given to integrating and coordinating these various programs and proposals. Most of these programs are designed to facilitate investment on the part of individuals, business or Government, and to ease financing. The programs seem to be based on a common premise that efforts must be made continuously to achieve large and rising levels of capital investment.

Much has already been done along this line. I shall not enter into a discussion of the broad question of investment demands and savings, but I think the problem is one to which the credit authorities should give some attention.

In recent weeks we have undertaken some surveys in this area among members of the financial community, and I would like to point out, Mr. Chairman, if I may, that the investment requirements in 1954 were met only as a result of substantial assistance provided by the commercial banking system.

The commercial banks added approximately $6 billion to their holdings of Government securities. They provided a good secondary market for Treasury obligations and as a result the life-insurance companies and the mutual savings banks were able to reduce their investment in Government obligations by about $1,400 million. In addition, the commercial banks added to their holdings of securities, other than Governments, in an amount approximating a billion and a half. In other words, the equating of investment demands and investment funds in 1954 was achieved with the substantial assistance of the commercial banking system, and with the use of what has been described as a policy of active credit ease. I simply point out that in my judgment such a policy is not indicated currently and may not be indicated for the near future. I finish as I started, with the hope that the broader implications of the various efforts that are now being made to stimulate investment will be considered and appraised.

On one of the three particular subjects referred to in the question, residential building—what concerns me there is the spurt in private housing starts that was evident in the latter part of 1954. The annual average of private housing starts in the first half of the year was 1,116,000; in the second half of the year the average was 1,290,000, an increase of 15 or 16 percent. In the fourth quarter the annual average was 1,364,000, and in December, the annual rate was 1,437,000. I am not suggesting that the December figure is necessarily meaningful. The seasonal adjustment is a matter of judgment, and in any given month weather conditions and other factors enter in.

But I am suggesting that a continuation of this trend would contribute to economic instability in a variety of ways. First, it would mean higher prices of building materials; reference has already been made to this point. This would mean increased prices, or equally significant, reduced values in the housing offered to buyers. In addition, there is the question of whether residential building, certainly if these trends are allowed to continue, may not be attaining rates which are not sustainable. This is an industry which characteristically has displayed a substantial amount of cyclical fluctuation. We operate today in a new financial environment that may or may not help to stabilize the building industry. So I think that is one area which is deserving of continuing and careful exploration on the part of the authorities.

With reference to consumer credit, I am mindful of the fact that the estimates as of the end of last year show total consumer credit outstanding and installment credit outstanding both at record heights. I am also mindful of the fact that the relationship between consumer and installment credit and disposable income at the end of last year were at historical highs. It seems to me, in this environment, that any extension of terms of substantial proportions, any material reduction in downpayments, or any deterioration in credit risk that would contribute to a very rapid expansion of consumer credit would not be a contribution to long-run economic stability.

Therefore I conclude that this area also is one that will need the continuing attention of the credit authorities. The stock market is covered in question 5, and with your permission I shall defer my observations on it.

The CHAIRMAN. Mr. Stein.

Mr. STEIN. My main comment on the monetary and credit aspects of the President's Economic Report is that it is very difficult to tell from the report what the President's program is in these fields in their general implications; that is, aside from application to particular markets. A key sentence in the report is this one:

> The wise course for Government in 1955 is to direct its program principally toward fostering long-term economic growth, rather than toward imparting an immediate upward thrust to economic activity.

I am afraid that this sentence may be regarded as indicating that the Government no longer considers necessary any of those specific antirecession measures that were employed in 1954. One of the most important of these measures was the policy of active monetary ease. I would hope the Government does not interpret the very general proposition I have quoted from the report as calling for discontinuance of that policy.

It seems to me what we do have in the report is very large concern with the problem of speculative activity. I am myself very skeptical of the ability of anyone to detect unhealthful situations of speculative activity as distinguished from conditions of overexpansion or inflation in the economy as a whole.

Now, whether people are or are not able to detect unhealthful conditions of speculative activity, I would hope that concern with speculative activity, I would hope that concern with speculative activity in particular fields would not distract the monetary authority from what seems to me their main concern, or what should be their main concern, which is the overall state of the economy.

It would be most unfortunate if, in a preoccupation with speculative conditions in particular markets, the monetary authority should adopt measures of general credit restraint which would cut off or even substantially slow down the rate of recovery which so far in its general features has not brought us up to satisfactory levels of activity.

Those remarks would cover my approach to question 4. I am not an authority on any of the three fields mentioned there and have nothing to add to what has been said there, except a warning against preoccupation with conditions in limited fields to the exclusion or underemphasis of the general state of the economy.

The CHAIRMAN. Mr. Whittlesey.

Mr. WHITTLESEY. The Economic Report exaggerates, I believe, the extent to which economic stability, both realized and prospective, is the result of Government action and underestimates the extent to which it rests on continuing forces now present in the economy.

Such an emphasis upon the action taken by Government strikes me as bad strategy, mistaken, and dangerous. It is bad strategy, because it is inconsistent with the stress currently being placed on free markets and private initiative. Under somewhat different guise it endorses a spirit of direction and control and thereby plays into the hands of those who call for continuing interference with the operation of economic forces.

It is mistaken because it undervalues the significance of changes which have made the economy much more resistant than in the past to declines in economic activity. It is dangerous because it credits certain mild measures with a degree of effectiveness that can only lead to frustration and disillusionment, if put to a real test at some time in the future. A similar mistake of overestimating the effectiveness of Federal Reserve policies was made back in the 1920's.

The position to which I take exception could be illustrated by many examples from the report, but I shall limit myself to one only. On page 22 the report points to six lessons learned from the recent decline. The first three of these lessons are expressed in terms of the great power of governmental intervention:

> In the course of our latest encounter with the business cycles we have learned or relearned several lessons: First, that wise and early action by Government can stave off serious difficulties later. Secondly, that contraction may be stopped in its tracks even when governmental expenditures and budget deficits are de-

clining, providing effective means are taken for building confidence. Third, that monetary policy can be a powerful instrument of economic recovery so long as the confidence of consumers and businessmen in the future remains high.

Now note those words, "contraction * * * stopped in its tracks," "stave off serious difficulties," "wise action by the Government." I shall not go into the reasons why I do not believe for a moment that in the absence of the very mild action taken by the Government in the past year; serious difficulties would have resulted, but I must say that I did not expect to be told so soon and so smugly that "we planned it that way."

Now turning to the other two questions—I have lumped my answer to 4 and 5 together—I find no cause for alarm with respect to consumer credit, but I am deeply concerned over the outlook for the real-estate market in the coming few years. The rush of applications to Federal agencies for mortgage insurance or guaranties which is mentioned with such apparent satisfaction on page 24 of the report is open to the interpretation that it may have some of the attributes of a rush to a cyclone cellar. Surely the realities of the real-estate situation have been obscured by action taken in reducing downpayments and extending maturities.

It might be desirable to move in the direction of more downpayment and shorter maturities on new houses if only to be able to make better use of this particular shot in the arm at some time in the future when the need is more clearly evident than it has been in the past year.

Finally, I feel distinctly uneasy concerning the recent behavior of the stock market for no more subtle reasons than the rate at which stock prices have risen and the apparent character of public participation. Stock-market behavior has always seemed to me more rationalized about than rational. Insofar as I have an opinion on the recent change in margin requirements, it is that the Board should have moved sooner and farther than it did.

The CHAIRMAN. Mr. Wood.

Mr. WOOD. The great majority of economists would undoubtedly approve of the statement of the general aims of policy on page 6 of the President's report:

We must continue to coordinate all governmental programs, especially monetary and fiscal policies, in order to restrain and offset any tendencies that may develop toward recession or inflation.

In some parts of the report it seemed to be suggested that we should attempt to have a more normal growth by moderating booms, apart from preventing inflation. I would not agree with the idea of trying to stop the next depression by preventing the present boom from going too far. We should check the present boom only in the interest of preventing present inflation.

I agree with Mr. Stein's statement a moment ago that speculative activity in special areas of the economy should not distract the monetary authorities from their main concern, the overall state of the economy. For instance, we should not resort to general monetary restriction because there seems to be excessive activity in building.

The CHAIRMAN. Thank you.

Mr. Kelley, do you have any questions?

Representative KELLEY. No.

The CHAIRMAN. Mr. Curtis?

Representative CURTIS. Yes; I have. Mr. Chairman, I was a little concerned in the references by most of the members of the panel to their concern over the housing picture, as far as financing is concerned, and one reason—well, perhaps the best way to get at it is to ask some specific points.

No. 1, there was an expression of concern because the housing starts was increasing at the rate it was. An observation I would make is that the housing industry for the first time, not this year, but since the war, at any rate, has really gone into mass production, which was a field that housing had never been in before.

Don't you think that a great deal of the growth in the housing field stems from the fact that we have got these new techniques entirely apart from the financing?

Mr. REIERSON. I am not an authority on housing and I defer to my colleagues. However, the record will show two points; one, a very sharp increase in the amount of mortgage financing, and in the percentage of residential starts financed through the VA program; and No. 2, and these I quote from memory, the fact that as of December or thereabouts, that approximately 35 to 40 percent of the VA financing was in the 30-year no-down-payment mortgages. I would think, therefore, that the record shows that the financing environment and facilities are important, that the changes introduced by the Housing Act of 1954 made a significant contribution to this spurt. I share the views expressed by another member of the panel that the grant of additional authority to the executive branch to vary the terms under which insurance and guaranties are made available would be appropriate.

Representative CURTIS. Well, I certainly agree that the financing has had a definite effect but I was first directing my attention to the demand and the fact that actually we are now at a point in our society where we have mass production of low-cost and indeed medium-cost housing, but the next question then has to do with the concern of consumer or installment credit in this particular field, and I wonder whether the concern should be as great as seems to have been expressed by the panel for this reason: The consumer in this field, as far as housing is concerned, is going to have to live in a house. Now he might be living in a house and paying so much monthly rent, or he may be buying the house on an installment plan. The fact that you shift the obligation from paying rent to one of paying a monthly installment on a purchase to me is a desirable thing from the standpoint of the position of the consumer, I would not think it would matter too much, unless you said, which might be, that the differential between the amounts the citizen would be paying in rent is so much less than the amount that they are paying a month in installments.

Do you follow my reasoning on that?

In other words, I think in those housing fields, we have to pay particular attention to rental as opposed to home ownership.

Mr. REIERSON. I agree with that. I suggested in my original statement that, looking at the broad problem of economic stabilization, what concerned me was the fact that a continuation of recent trends would have repercussions upon the prices and materials and the housing values made available to buyers.

Representative CURTIS. Well, sir, wouldn't that be true of any expanding economy?

Take television—that undoubtedly has produced a lot of demand for electronics equipment, and so on, and would that not be true of anything that is expanding, and the question is, Is that expansion a healthy thing in response to a real demand, and will that demand continue?

Mr. REIERSON. Well, of course, the demand situation is changed by virtue of the financing terms available.

Representative CURTIS. It could be that, or the demand could be there, and perhaps we weren't setting up proper financing and the demand did not have an opportunity of expressing itself, and I think that is particularly true in the housing field where you have got this problem of the initial downpayment.

Mr. REIERSON. I think it is the elimination of the downpayment more than the extension of the maturity that has contributed to the recent increase in demand.

Representative CURTIS. From the standpoint of good financing, I would suggest that the risk of lending a substantial sum on a house with very little downpayment is much less than when you lend a sizable sum on the purchase of an automobile. When a person moves into a house, and that house becomes a home, it actually increases in value rather than decreases, and I have seen that, and I guess anyone has in these new subdivisions where the house that is 2 years old will actually be selling for more than the brand new homes in the same subdivision, because actually the value of the house has increased due to the fact that a family has lived in it. So from the financing standpoint I would suggest, although I do not know, I would suggest that maybe we have been backward in our financing of homes, and far from worrying about it I am rather happy that we have caught up with modern financing techniques in that field.

This could be the case, could it not, instead of being alarmed about how we are going, it could be that maybe we should have been alarmed in the past for not having done more in the home financing field?

Mr. REIERSON. Well, I will admit that being able to buy a house with no money down and 30 years to pay for it is an innovation, and I venture no judgment as to whether we were unwise 5 years ago in not having that program or wise now in having it.

What I have been talking about here are the economic implications arising out of this method of financing. I share with you a desire to have a continuing high rate of residential building and investment in general. I think they are an absolute necessity. But I am frankly alarmed when I see economic series moving at the rate that housing starts moved in the latter part of last year. I think it would be fair to keep in mind, looking down the longer road, that we appear to have no pressing shortage of housing at the present time, although vacancies are probably not yet up to normal. While this is not the whole story of residential building, we face a situation in which family formation is low, and is not likely to turn up in the near future, and where even the more optimistic estimates of household formation are well below the current rate of building of new residences. I think any tremendous upsurge in residential building raises a very real question as to whether we may be selling next year's market or the following years.

I would be much happier if we could see a continuing stable or gradually rising level of residential building. I am not wise enough to say that 1,200,000 starts, or any other figure, is the correct figure. I do not know what is the correct figure. But I am alarmed at the increases we have had, and I would much prefer to see a more gradual expansion.

Representative CURTIS. Do you know whether there have been any figures—I have never seen them—but there must be, of the relation of the switch from rental housing to homeownership. It seems to me a great deal lies in that particular switch. That is just a comment.

Has anyone ever seen any figures along that line? That seems to me to have great bearing.

You are not actually affecting the individual householder. If he is paying, let us say, $75 a month rent, and then he switches to buying a home on a 30-year basis, then he is still paying $75 a month, as far as his own financial situation is concerned.

Mr. HANSEN. Mr. Chairman, I would like to say that I agree very much with Congressman Curtis. We have witnessesd a tremendous switch, as you have suggested, between rental housing and homeownership. I think nearly 60 percent of the urban houses are owned at the present time. There has been a very great change, and I agree that these new financing methods are not only an innovation, but a very good innovation.

I only raise the question whether the extremely easy credit we have moved to, particularly with veterans, is going to turn out to be entirely satisfactory, unless we can fairly well assure an expansion in the economy equivalent to the growth that we are capable of. If we flatten out at the present high level I do foresee difficulties in the housing area as a result of this very easy financing program.

I think we could absorb this whole thing if we had adequate growth and expansion. If we don't, there may be some difficulty.

Representative CURTIS. I was interested in some figures I saw in some local St. Louis savings and loan companies, on their 20-year loans. I think the average payoff was 9 years, and on the 15-year loan it was 6 or 7. So the fact that you put that paper on your books at a 20-year or 15-year basis is by no means an indication of what happens to it. Apparently once people get some equity they try to build up on it quite rapidly.

I might further state that I was interested in the number of delinquencies in loans; particularly in the VA field it was practically negligible.

Mr. WHITTLESEY. Mr. Chairman, may I make a couple of comments?

It seems to me that the discussion is too much in terms of the safety of the particular mortgage and too little in terms of relation to the economic stability of the economy, which is our primary concern here.

Now, it is quite possible that the loans will pay out. That is going to be influenced, however, as Dr. Hansen has said, by the future movement of prices and the maintenance of full employment. The facts that real-estate prices have risen and delinquencies have been low are closely tied together. If you can imagine a situation where real-estate prices do not rise or perhaps fall, you can imagine a situation where difficulty might arise.

What concerns me is that this recent rise in construction is not based upon economic factors of the type which you have in mind. It seems to me that it is based to a great extent on the elimination of downpayments and the lengthening of maturities up to 30 years, and that means it has given an artificial fillip to the industry at this time.

Is this the time for that, a time when family formations are low because of the drop in births during the period of the thirties? It seems to me that it is not.

I find something inconsistent in the idea that we should not peg Government bond prices, which is the guaranty of a particular type of credit, but that it is perfectly all right to guarantee mortgages, which is another type of credit. I admit that it may be possible to defend that position; I do not mean to suggest that I have given an adequate answer, but I am pointing out the conflict in those two points of view.

Representative CURTIS. Could I ask you there, though, again, why do you feel that there would be this economic effect, as essentially what we are doing is simply replacing rental payments with installment payments on a home?

Mr. WHITTLESEY. Well, I do not agree with that in the first place.

Representative CURTIS. You think it is more than that.

Mr. WHITTLESEY. Very much more than that. I think that more houses are being built now than would be built and occupied if they were merely paying rent. I think that we are building houses way beyond the current demand as related to family formation.

It is easy enough to point out that human wants are insatiable, and that the housing demand is unlimited if people move into better, bigger, and finer houses. On the other hand, there is surely some significance in the number of new family formations; and here at a time when the number of new family formations has gone down we find new housing going up.

Representative CURTIS. Well, we still have a backlog, as I understand it, though.

Mr. WHITTLESEY. It was very high in 1946 because of many factors with which we are familiar, but it seems to me that at the present time it is not high, and that we are exceeding what we can expect. I share the feeling of Mr. Reierson that we are encroaching upon a normal expected demand for housing in the next 3 or 4 years, though I do not think this will be true for 1960.

I fear that we are running into trouble because of this artificial stimulus.

Representative CURTIS. Thank you.

The CHAIRMAN. Congressman Patman.

Vice Chairman PATMAN. Yes, I wanted to ask Mr. Riefler a couple of questions, first.

Mr. Riefler, exactly how did monetary policy work to check the reverse in the downturn. Mention specifically how it affected the inventory liquidation, the decline in spending by business firms for plant and equipment, the increase in consumer expenditures, and the rise of new construction activity.

Mr. RIEFLER. Well, the policies were directed toward putting reserves into the money market, to give banks more money, potential money to lend, and at the same time, the Treasury to issue short and intermediate term securities, so that the Treasury would not be competing in the market for mortgage and other long-term funds. Those are the policies you are referring to.

Vice Chairman PATMAN. When was it that the Open Market Committee met and agreed to reverse its policy? Was it somewhere along May 6 or 7?

Mr. RIEFLER. It met around May 6 or 7. I have not the exact date.

Vice Chairman PATMAN. The record shows they commenced buying on Monday, May 11, but Mr. Martin testified on some committee I was on that the board met preceding that by a few days.

Mr. RIEFLER. The Open Market Executive Committee met.

Vice Chairman PATMAN. What time was that, May 6 or 7?

Mr. RIEFLER. It was either May 6 or 7.

Vice Chairman PATMAN. Do you have any coordination between your agency, the Board of Governors, and the Open Market Committee, and the interest-fixing agencies like the Treasury and FHA?

Mr. RIEFLER. Well, we see the Treasury a great deal. They see us a great deal.

Vice Chairman PATMAN. Did the Treasury have reason to believe you were going to reverse their policy 3 or 4 days before that when they increased the interest rates on FHA and veterans' loans?

Mr. RIEFLER. I doubt it.

Vice Chairman PATMAN. You did not have any coordination to that effect, to that extent?

Mr. RIEFLER. Well, the decision hadn't been made.

Vice Chairman PATMAN. It had not been made, but I guess you had been talking about it a lot, and you were in a position to alert them as to some such thing being possible?

Mr. RIEFLER. At that time I do not think you could tell what the position would be until you counted the votes.

Vice Chairman PATMAN. All right.

Now, is the position of individuals and corporations today excessively liquid?

Mr. RIEFLER. It is liquid, I don't know what you mean by excessive.

Vice Chairman PATMAN. We will say normal, subnormal, and above normal.

Mr. RIEFLER. I would have difficulty.

Vice Chairman PATMAN. Would you say it was subnormal, normal, or above normal?

Mr. RIEFLER. If you want to take it in terms of the money supply, the increase was greater last year than the increase in gross national products. That shows that the money supply is adequate or large, or at least in some sense in an upward proportion.

Vice Chairman PATMAN. Would any other member of the panel like to comment on whether the position of individuals and businesses are excessively liquid today? Do any of you agree or disagree with that?

All right. I would like to ask Mr. Wood a question.

Mr. WOOD. All right, sir.

Vice Chairman PATMAN. Why should there be such a sense of urgency on the part of the Treasury to fund its debt—that is too greatly increase its maturity—as in the case of the 40-year maturity? How will this affect the liquidity of individuals and business?

Mr. WOOD. Taking the last part of the question first, in general, as you extend the period of the debt it tends to reduce liquidity. If it goes very far the reduction in liquidity would be significant.

Would you please ask your first part again?

Vice Chairman PATMAN. Yes. Why should there be such an urgency on the part of the Treasury to fund the debt, that is greatly extend its maurity as in the case of the 40-year issue?

Mr. WOOD. I see no reason why there should be any special urgency at this time to extend the period of the debt.

Vice Chairman PATMAN. You take the $2,600 million, 2⅞-percent securities: Now, they are held principally by the banks, are they not?

Mr. WOOD. I could not tell you.

Vice Chairman PATMAN. The reports that I get through the different financial journals indicate that they are held principally by the banks.

Senator FLANDERS. Mr. Congressman, would you yield for a moment?

Vice Chairman PATMAN. Certainly, I would be glad to.

Senator FLANDERS. It would seem to me that one of the reasons for extending maturities that is valid is to rearrange our maturities so that they do not come in blocks. So we are not faced at one time with the necessity for heavy refunding and at another time for light refunding.

I haven't examined this particular proposal with reference to that, but I think we could agree, could we not, that it is a valid reason for altering the lengths of securities as the occasion offers?

Vice Chairman PATMAN. Up to a reasonable point, but when you have a national debt of $281 billion there is hardly any way to arrange it that you will not have enormous amounts payable at one time.

Senator FLANDER. But still you would think it was a good thing to have a try at it?

Vice Chairman PATMAN. Yes, if you expect to pay them off; but you don't expect to pay them off.

Senator FLANDERS. Well, the maturities have to be taken care of, anyway, and it would be very embarrassing, would it not, to the Treasury to have a heavy block of maturities to be refunded all at once?

Vice Chairman PATMAN. I see no reason why it would. It migh cause them to work a little bit more, but they are not expecting to pay these things off, anyway. They have been extending them from time to time. I do not know that we have ever paid a substantial part of the debt.

Senator FLANDERS. We are not talking about paying; we are talking about refunding, and if you have a tremendous block to refund all at once the interest rate goes against you, does it not?

Vice Chairman PATMAN. I do not know whether it does or not. The Open Market Committee fixes the interest rate, and that should be taken care of very easily.

Senator FLANDERS. It does when the Treasury buys everything at a given rate.

Representative TALLE. I think Senator Flanders' point is a good one. I remember Mr. Eccles pointed out some years ago that he was concerned over the fact that a block of $57 billion had to be refunded at one time, and Mr. Humphrey pointed out in January of 1953 that one of the first visitors who knocked on his door was a collector with $81 billion in c. o. d.'s, short-term loans that were due. He found that to pay the collector was something of a task.

Senator Flanders' point is a very material one.

Vice Chairman PATMAN. It is strictly an administrative matter. I do not see why with the 12 Federal Reserve banks, and the unlimited power that the Open Market Committee has, I do not see any reason why it should be too much trouble. I doubt that many of them would have to spend many extra hours overtime taking care of those refunding issues, but if it is a burden on them we ought to make adjustments and lengthen them out and straighten them up so they would not be too burdensome, so they would have more and more time.

Representative TALLE. A difference of maturity is very important. Some years ago England found herself in a bad spot after she had lent considerable money to Russia on long term and had a lot of obligations herself on short term.

Vice Chairman PATMAN. You are talking about something different now. You are talking about owing a foreign country. If we owed a foreign country, that would be different, but we are doing business with ourselves.

Representative TALLE. I used that to illustrate that the maturity does make a difference.

Vice Chairman PATMAN. It would, with a foreign country, I agree. It would make a tremendous difference. But I do not think that the same difference would prevail to us.

Representative TALLE. The cost of refunding is a cost.

Vice Chairman PATMAN. I think a lot of that could be saved. I do not think there would need to be much added cost in refunding.

Senator FLANDERS. Mr. Patman, excuse me for prolonging this, but does not your point of view of refunding mean an apparently simple transaction rests on the previous practice of having the Federal Reserve System as the residual purchaser who took most of it if the rate was below a free market rate, and so are you not therefore supporting that previous practice?

Vice Chairman PATMAN. No; if the Federal Reserve banks, if they do not buy bonds, the commercial banks would buy them, and the commercial banks buy them with money made available by the Federal Reserve directly or indirectly.

There are 2 or 3 ways they could do it, by reducing requirements, or by open market operations; there are two good ones. If the Federal Reserve does not buy them the commercial banks will buy them with credit that the Federal Reserve makes available. That is the way I see it.

Senator FLANDERS. I think your position and mine are fairly clear.

Vice Chairman PATMAN. Thank you, sir.

Professor Whittlesey, in the last few month there has been a rise in wage rates and price increases in aluminum, selected steel items, rubber, and more recently copper. The current situation is, therefore, that money costs of production have risen.

Assume that the monetary authorities refuse to supply the necessary funds to support an increase in money demand sufficient to move current production off the market at prices corresponding to costs of production, what may we expect will happen to employment, income, production, investment, and savings?

Mr. WHITTLESEY. You have indicated the answer by your question, but I would like to challenge one implication that you made. That is that wages and cost of production are necessarily as closely related as you suggest.

I was greatly impressed by 2 charts on pages 30 and 31 of the President's report. One shows weekly man-hours; that is the bottom curve on the lefthand chart. I take it that that represents the result of the two curves above, one being the employed workers and the other the average weekly hours, while the curve at the bottom gives the result. That curve shows that in 1954 we were manufacturing with just about the same number of weekly man-hours as we were in 1948.

Now look at the middle chart on page 31 which gives an index of total manufacturing production. As I read these charts, that top curve in the middle chart represents the output produced by those weekly man-hours shown in the chart at the left. They show that at a time when weekly man-hours was practically stable, actually a little bit lower, total manufacturing output was up approximately 30 percent. That means that what has been going on is that we are paying higher wages but are producing more with those wages; evidently productivity has risen very markedly in this period.

It is an oversimplification to suggest that we are facing a squeeze simply because wages have gone up. I would hope that in the present situation greater efficiency, improved technology, and the like, would enable us to pay these higher wages without prices necessarily going up. If that is not true then it is the task of our monetary authorities to do whatever they find necessary to assure that stable prices and full employment are maintained, so far as they are able to maintain them.

Vice Chairman PATMAN. Then one other question here, if you please: What effect will the firming up of interest rates and the decline in prices of Government securities have on the banking system's ability to supply the needed funds to move current output off the market at prices reflecting cost of production? What effect will the firming up of interest rates and the decline in the prices of Government securities have on the banking system's ability to supply the needed funds to move current output off the market at prices reflecting the cost of production?

Mr. WHITTLESEY. I agree with what others have said that at the present time restrictive monetary policy measures are not indicated. For that reason, therefore, I would feel that this is not the time for interest rates to rise appreciably, which I believe is the general feeling shared by others here.

The statement seems to imply that we know that interest rates are going to rise.

Vice Chairman PATMAN. Well, 3 percent is an increase on a long-term bond.

Mr. WHITTLESEY. It is too early to say to what extent that is going to alter the level and structure of interest rates. Perhaps 3 percent was higher than was necessary, but I doubt that this particular issue is going to exert a great deal of influence. That is going to be tied in with the Federal Reserve policies that are followed from here on.

Vice Chairman PATMAN. Would any of the other members of the panel like to comment on that question?

Mr. WHITTLESEY. I would like to make one other point.

Vice Chairman PATMAN. All right, sir.

Mr. WHITTLESEY. This is on the point that Mr. Curtis raised a moment ago.

I would not be alarmed at the rise in long-term mortgages on dwellings which have no downpayments if this rise were the result of the free action of mortgage lenders. I would trust the interest of lenders in being repaid to protect the economy against overexpansion of mortgage credit. Where the expansion takes place with a Government guaranty that protects the lender against any appreciable loss, it seems to me that there is no comparable assurance that the expansion has the usual economic foundation, is in the public interest, or is equally secure against loss through default.

What alarms me is this: The mildness of the recent downturn and the early revival of business has been ascribed in considerable part to the strength of housing demand. Construction activity has apparently been one of the principal supports of economic activity in general.

I am troubled lest this support is artificial and has been borrowed from the future, that the artificial stimulus now will contribute to greater difficulties in the future than we would otherwise have had.

Representative CURTIS. Mr. Chairman——

Vice Chairman PATMAN. May I just ask one more question, and I will be through.

Representative CURTIS. Certainly.

Vice Chairman PATMAN. If you insist on coming in now, it is all right.

Representative CURTIS. I would just like to say that I appreciate that observation very much and I think there is a great deal of soundness to it, in my opinion.

The only other matter I would interject is we are concerned with the Government doing one of two things: It isn't just going into the housing field in a guaranty way, the other program is an extended public-housing program at least in the mind of many people. It is an either-or situation brought about by a belief that there is a real demand of our people for additional housing, and we have not really licked the problem of adequate housing for the people.

So in viewing the lending program, I think we have to think of alternate terms, of possibly extending the public housing program which is rental housing, to a very large degree.

Mr. WHITTLESEY. And from the standpoint of economic stability, timing of that program is all important.

Representative CURTIS. Yes, along with any other public-works program.

Mr. WHITTLESEY. Yes.

Representative CURTIS. Thank you.

Vice Chairman PATMAN. Mr. Chairman, before asking Mr. Stein a question, the last one I expect to ask of this panel on this particular matter, I would like to read into the record an excerpt from the hearings before this Committee on Banking and Currency of the House, March 3, 4, and 5, 1947, on page 85.

Mr. MONRONEY. Do you mean to say that with your present Open Market Committee and the operation of the Federal Reserve as it now stands, that regardless of what the national income is, or other economic factors, that you can guarantee to us that our interest rate will remain around 2.06 percent?

Mr. ECCLES. We certainly can. We can guarantee that the interest rate as far as the public debt is concerned is where the Open Market Committee of the Federal Reserve desires to put it.

The CHAIRMAN. You have a very good memory.

Vice Chairman PATMAN. Now, this question I would like to ask Mr. Stein and the panel to comment on.

There was an expression——

Representative TALLE. Do you recall when that figure—2.06 percent—was first arrived at in the House Committee on Banking and Currency?

Vice Chairman PATMAN. Well, that part was not so interesting to me. I was not considering that as much as I was the ability of the Open Market Committee to fix the rate at any point.

Representative TALLE. It was very interesting to me because I asked the question about average interest cost at that time.

Vice Chairman PATMAN. You did.

Representative TALLE. I asked the then administration witnesses to tell me the average rate, considering all maturities, at the time, and the average reported was 2.06.

Vice Chairman PATMAN. Well, I am glad to know that. There was an expression of the belief this morning that monetary policy could not be held accountable for changes in distributive shares.

Specifically, the reference was to the deterioration of the income shares of the farmer and small proprietor. I was referring to the sentence near the top of the page on page 83 of the President's report.

I should like to put the following question to Mr. Stein and the panel:

Given the relative sensitivity of individual commodity prices, utilization of monetary policy to stabilize the general price level, will result in changes in the relationship of individual prices to each other. Price increases will be canceled out by price decreases, and so the average of all prices will remain stable. However, the more sensitive prices, that is, prices that are more nearly subject to pressure of competition and market forces, will fluctuate more freely and frequently than the administered prices. These latter prices are characteristically stable.

The result will be to alter the exchange patterns existing between different segments of the economy and the cost price structure of difference industries, and particularly of individual firms within an industry.

Is not the procedure just described the way in which income shares of different segments of our economy, and the cost price structure of individual firms within an industry, are altered by the monetary authority when they exercise their power to control the general price level?

Mr. STEIN. Well, I believe that is a reasonable description of what happens. My reservation this morning, if I may explain further, was to the implication that the distributive shares ought to be a major criterion or guide of Federal Reserve policy.

It seems to me that there is an overriding objective of monetary policy which is to maintain a high level of employment and national income, and avoid inflation. If the Federal Reserve or the monetary authority, succeeds in making its maximum contribution to that, it will have done all that we can expect it to do as far as the distributive shares are concerned. If there should be an inconsistency between action to promote a high level of production and employment and action to have some desired effect on distributive shares, that the overall effect on the economy should have priority.

It seems to me that ordinarily there would not be any consistency.

Vice Chairman PATMAN. Would any other member like to comment on that question? Does the panel take issue with Mr. Stein?

All right, Mr. Chairman, I will yield.

The CHAIRMAN. Mr. Talle.

Representative TALLE. Mr. Chairman, I would like——

Vice Chairman PATMAN. Would you let me add one other statement from Mr. Eccles?

Representative TALLE. Yes.

Vice Chairman PATMAN. Mr. Monroney asked him if he thought it would be inflationary holding the rate at 2.06. Mr. Eccles:

> I would not say that; no, I would not say that holding it to this 2.06 rate would be inflationary at all.

I would like that right after my other reference to it, Mr. Chairman.

Representative TALLE. I do not recall whether my question about the rate was put at that very moment, but about at that same time I did ask for the average rate of all maturities.

Vice Chairman PATMAN. And he answered, I recall, that that was all securities except the E. F. and G. I do not think it included them. I am not sure about that.

Representative TALLE. Some of the short term rates were as low as twenty-five one-hundredths of 1 percent.

I would like to ask about the President's recommendations. There are four of them here. They are found on pages 69 to 71 of the President's Economic Report.

The first one is increase the insurance authorizations of the Federal Housing Administration. I gather there would be a difference of opinion as to that.

Do you agree, Mr. Whittlesey, that the insurance authorization for the Federal Housing Administration should be increased?

Mr. WHITTLESEY. I would not object to this since it seems to me that the power is all right to have in reserve. It is only that the timing with which the present power was used seems to me unfortunate. I feel that timing is dependent on economic conditions. The timing of recent changes is certainly not to my taste.

What bothers me now is looking ahead 1 or 2 or 3 years. I am alarmed that the present tempo cannot be maintained, and that there may be a reaction partly because of the overstimulus. It may be desirable to have the increased authorization in that then it will be necessary to move more actively partly because of the bad timing in the past.

Representative TALLE. In the same breath, may I ask you another question. This has to do with another recommendation, also on page 60.

To allow national banks to make amortized real-estate loans with maturities up to 20 years and to extend the maximum duration of construction loans?

Mr. WHITTLESEY. The banks are limited as to the amount of real-estate loans they can hold. This proposal is obviously intended to operate within the other present limitations. It seems to be an attempt to avoid discriminating against banks as compared with other types of lenders at a time when 20-year mortgages have become respectable for banks, as they weren't a few years ago. I do not object to this. The policy of stabilization which is our present concern is something that has to operate through the Federal Reserve and other agencies. This proposal is not in contradiction with that; but it is evidently concerned with a different problem, that of avoiding discrimination against commercial banks.

Representative TALLE. It does get into a field that has been a matter of controversy between National banks and State banks, doesn't it?

Mr. WHITTLESEY. I suspect that State banks already have the power, and that this change is designed to enable the National banks to meet that competition. If not, then the State banks wil presumably get their authority from the State legislatures. In short, this isn't, it seems to me, a stabilization proposal. While it may be related to future credit demands, the stabilization problem should be taken care of by other means.

Representative TALLE. Mr. Chairman, may I ask a third question?

The CHAIRMAN. Certainly.

Representative TALLE. This is the third recommendation of the President, at pages 60 to 62.

It relates to giving the President greater latitude with the exercise of his powers to vary, in the light of economic conditions, the terms on which home mortgages are underwritten by the Federal Government.

Mr. WHITTLESEY. Do you still want me to answer?

Representative TALLE. You are doing very well. I thought I would leave it open to all the panel members.

Mr. WHITTLESEY. I hope that they will come to my rescue shortly.

I question whether the President is the ideal place for that power to reside. The problem of stabilization by credit means is primarily a problem for the monetary authority, and I should prefer to see this power lodged with the central bank. It may be that under existing law it is necessary for the President to initiate action by an Executive order, but the actual implementation of the stabilization policy, as far as it is related to this phase of it, should, in my opinion, be in the hands of the central bank. To the extent that fiscal policy is involved, the fiscal policy and the monetary policy should, of course, be integrated.

Representative TALLE. Thank you very much.

Now, I should like to throw those recommendations open to the other five scholars.

Mr. HANSEN. Mr. Chairman, on that last point, if I am not mistaken this type of authority given to the President was first introduced in the Housing Act of 1948, in which it was specifically provided that a certain number of public housing units would be built in the next 6 years, and then it was provided the President might bunch that according to the economic conditions of the economy as a whole. That is to say, he could build all of it in 1 or 2 years, rather than 6 years, if employment conditions required.

I think it is within that kind of a context that this would be most useful. If it were just a general provision relating to the cerdit conditions, I would agree with Mr. Whittlesey it might perhaps reside in the hands of the monetary authorities, but with respect to the Public Housing Act, it seems to me that that was quite appropriate—it should be in the hands of the President.

That was a rather different kind of provision.

Representative TALLE. Thank you, Professor Hansen.

Mr. Reierson?

Mr. RIERSON. I share Mr. Whittlesey's conclusions on these three recommendations, with the exception of his suggestion that the authority be given to the central bank, and in that matter I concur with Professor Hansen.

It seems to me that in recent years we have had a tremendous increase in the definition of credit policy, far beyond the scope of the textbook concept of limiting credit policy to operations of the central bank. One lesson of 1954, I think quite clearly is that credit policy thus broadly defined, is a very potent instrument of economic stabilization, or lack of stabilization, as the case may be.

I am referring here to the Government insurance and guarantee functions of which the activities in the housing field are two, but by no means the entire list, and to the direct lending activities of the Government. It seems to me that there certainly is need for coordination of all of these diverse activities to the end that we may develop a consistent program of action. But I have great reservations that it is an appropriate function for the Board of Governors of the Federal Reserve System. I rather have the feeling that in the exercise of their policies, or powers of general credit control, they have enough to keep them busy. That problem is sufficiently complex and difficult in its own right. So while I think that there should be flexibility in setting standards for Government insurance or guaranties, and while I endorse that to the full, I certainly question the advisability of giving that authority to the Federal Reserve.

Representative TALLE. Thank you, Mr. Reierson.

Dr. Stein?

Mr. STEIN. I would agree on this last proposition that this authority ought not to be given to the Federal Reserve. It seems to me, while it is very largely a credit matter, it is not entirely a credit matter, and I would not like to put on the Federal Reserve the burden of withstanding the claims of the Veterans' Administration, and others, who may at some time be interested in promoting the program. There is really the question of policy beyond credit only.

There have from time to time been suggestions for the establishment of a Federal loan council, or some such organization, on which would be represented the main lending or loan guaranteeing agencies of the Government. It would seem to me that if such a council were established that the President might delegate to it the responsibility for advising him on the discharge of this function.

Representative TALLE. Thank you, Dr. Stein.

Dr. Wood?

Mr. WOOD. I agree with Mr. Reierson's position on that.

Representative TALLE. Thank you, Dr. Wood.

Professor Riefler?

Mr. RIEFLER. I am not sure I should be commenting on these official recommendations, but I do think that that provision to provide for some flexibility in the terms of the Federal mortgage programs is quite important from the point of view of general stabilization.

Representative TALLE. Thank you, Mr. Chairman.

The CHAIRMAN. May I ask this question: Did I sense a general feeling that the volume of residential construction would probably take a downturn some time later in this year because the effective demand for this type of housing, and the prices charged, would in all probability not be sufficient to maintain the present volume? Was I incorrect in that?

Mr. REIERSON. I did not express an opinion, and would hesitate to do so, Mr. Chairman. I think my position would be that if the rates of increase that have been in evidence in recent months continue, that more than a casual reduction is in prospect, whether it would occur in the second half of 1955 or subsequently I would hesitate to guess.

The CHAIRMAN. I say, some time later in the year.

Mr. REIERSON. Whether it would occur the second half of this year, or next year, I frankly have no real judgment.

The CHAIRMAN. But you think it will occur sometime?

Mr. REIERSON. If the trends of recent months persist, that is my feeling. I share Mr. Whittlesey's concern in this area.

The CHAIRMAN. Is this a general opinion. Have I correctly stated it?

Mr. HANSEN. I think, Mr. Chairman, it ought to be said that we do not have too many houses in this country, and we have an enormous number of substandard houses.

The CHAIRMAN. I said effective demand.

Mr. HANSEN. I think you are right. I think the implication of your question is correct, that without a public low-cost housing program, the effective demand is likely to decline. I do not know when. I agree with Mr. Reierson.

The CHAIRMAN. Is there general agreement on that?

Mr. WHITTLESEY. I have no idea what the timing will be.

The CHAIRMAN. But you agree it will happen?

Mr. WITTLESEY. Yes; I agree with the others.

It seems to me imminent, as matters now stand, but I have no reason for knowing that it will be this year rather than next.

The CHAIRMAN. I think this has a good deal of bearing on the question as to where the economy is headed, because while we have a great deal of discussion on the farm situation tomorrow, the general opinion of the group that we had last week was that farm incomes would continue to decline in all probability in 1955. We had testimony from the unions, the automobile industry, that it seemed to be fairly well reasoned that the present rate of production, which is approximately 165,000 cars a week, or close to a rate of 8½ million a year, cannot be maintained throughout the year, and that that would decline some time in the spring.

If this be true, that you have a decline in farm demand, a falling off in production of automobiles, with all the effects that will have upon steel and glass and rubber and parts, and a decline in the rate of building construction, the question naturally presents itself: Where will the increased effective demand surge come from to sustain and augment such recovery as we have had in the past 3 or 4 months?

Mr. HANSEN. I agree entirely with what you have said, Mr. Chairman. I might add that a part of the recent increase in production springs from the fact that inventory liquidation is slowing down.

Now, that is not any strong basis for any long-run recovery. That is a very short-run thing that inevitably happens in any inventory liquidation period. You reach a point where you are liquidating somewhat less than you did before, at which time your production index goes up. It is nothing to get excited about so far as optimism for the future is concerned.

Mr. REIERSON. Mr. Chairman, did you wish a discussion of this point?

The CHAIRMAN. Just to the degree that the people want to discuss it.

Mr. REIERSON. I share the very appropriate and important questions raised by the chairman. However, I think there are some increases in prospect for later on in the year. The continued increase in State and local spending, while modest, is fairly well assured. I think the drag caused by the cutback in Federal spending is largely behind us. I suppose the international situation will determine whether the level of Treasury spending will turn around in the latter part of the year.

It occurs to me that in the area of commercial building, as distinguished from residential building, there may be grounds for more protracted optimism. While no evidence is at hand to support the conclusion, I think there is just as much chance that plant and equipment expenditures on the part of business will be moving up as that they will be continuing flat in the latter part of the year.

Finally, the increase in consumer expenditures in recent months has been striking, and the full impact of that increase upon inventory policy and production conceivably could give more impetus to the economy than is commonly believed today.

The CHAIRMAN. Mr. Wolcott.

Representative WOLCOTT. Possibly I did not understand this correctly, but, Dr. Hansen, did you predicate your expression that there might be a cutback in demand for residential housing upon whether or not we create an effective public-housing program?

Mr. HANSEN. I was suggesting that if you rely simply upon the current market forces that it seems probable as other members of the panel have also indicated that the present very high rate is not maintainable, and that if we are going to have the same rate as now projected into the next year, or 2 or 3, that we would need a larger public low-cost housing program to supplement some decline that would take place in the housing that springs from regular market forces.

Mr. WOLCOTT. Well, would that supplemental program which anticipates an increase in the production of public-housing units be predicated on 1,400,000 units?

Mr. HANSEN. The total of public and private housing combined. I think production is running at about 1.4 million currently, and the question related to what would be necessary to maintain that.

Representative WOLCOTT. Do I get this correctly: I think that the economy can withstand or absorb 1,400,000 units, and if private enterprise does not do it the Government must come in with public housing to make up the difference?

Mr. HANSEN. If we are going to make any real progress in getting rid of our substandard houses, then I feel we have to have a public-housing program.

Representative WOLCOTT. Substandard houses to you are substandard rental houses?

Mr. HANSEN. They mainly are; yes. There are a lot of substandard rural houses that are not rental houses, and there are some urban, but the urban are mainly rent houses; yes.

Representative WOLCOTT. Do you affiliate that with our program for FHA financing on existing homes? I throw that in here because we have been told that that provision of the 1954 Housing Act resulted materially in this demand which, as you say, is now up to an average of 1,400,000. But you are thinking only in terms of substandard rental houses, and we define them mostly in our large cities.

Mr. HANSEN. I think that is the area where our deficiency for good housing is the greatest; yes.

Representative WOLCOTT. Do you think there would be a necessity for public housing in addition to the housing facilities which must be made available for people who are displaced from slum-clearance projects, or anticipated slum-clearance projects, or urban-development projects?

Mr. HANSEN. My impression from talking to people who are expert in this area, is that the present provision for urban redevelopment is lacking in the respect that there is not adequate provision for the housing of the people that are displaced by such redevelopment programs.

Representative WOLCOTT. Well, I do not care to follow through with it, but the law provides now that they can have public housing provided it is tied in with the necessity for housing people who are being displaced by urban-development and slum-clearance projects.

Mr. HANSEN. I am told that in practice the way it is working out——

Representative WOLCOTT. Pardon me. We have authorized 35,000 new units for this year, and the President has asked for 35,000 more for each of the next 2 years.

The CHAIRMAN. May I ask how many specific housing projects have been provided under this legislation?

Representative WOLCOTT. Very few.

The CHAIRMAN. Is it not true it was not until a few days ago?

Representative WOLCOTT. You are approximately right. I was going to say as an aid to you in developing this, there probably have been less than a hundred, so that is not very many.

Vice Chairman PATMAN. You mean a hundred houses, or a hundred thousand?

Representative WOLCOTT. A hundred units.

The CHAIRMAN. I do not wish to stir up a cat-and-dog fight, but qualifications are written into the act which would prevent any public housing.

Representative WOLCOTT. You hoped not to start a cat-and-dog fight, but let me say that was not the intention of the legislation. The intention was to always see to it that the people who were being displaced by slum-clearance projects and urban-development projects would have facilities with which to be taken care of, and it was not the thought behind that amendment that we were going to necessarily stop public housing altogether. The program on public housing had been stopped by the recommendation of the Appropriations Committee some years before that.

So it was not necessary for us to indulge in it to that extent.

I merely bring this up because it just so happened—I am very modest about this—that I drafted the amendment that was offered, but I do not want any inference that it was done to kill public housing.

The CHAIRMAN. That might not have been the purpose, but that was the effect.

Representative CURTIS. Is it possible that it turned out that they did not need any housing because no people were displaced in this urban redevelopment?

Representative WOLCOTT. That is the logical conclusion anyone can come to.

Mr. Reierson indicated this morning, perhaps, that the Federal Reserve should be given additional weapons on the control of credit in the field of consumer credit, and, I understood, housing credit.

Am I correct in that?

Mr. REIERSON. My position is this: As of today I would be content with the general credit powers now available to the Federal Reserve. Looking ahead to a possible emergency, I would not be adverse to the grant to the Federal Reserve of emergency or standby authority to apply selective credit controls in the areas of consumer credit, and mortgage credit, but I do not recommend that those controls be used as of today.

Representative WOLCOTT. Of course, selective credit controls mean that they be applied to particular commodities when the demand for those commodities is out of line, and might affect the entire economy.

That is your position, and the real-estate credit controls which we have in mind, and which you have in mind, are the controls which were similar to the controls which were exercised over downpayments and terms of amortization and interest rates.

Mr. REIERSON. Yes, sir.

Representative WOLCOTT. Now I am very glad you brought that up because I notice a comment in the President's report about what we need to have done along that line in the 1953 amendments, housing amendments. It says housing amendments of 1953 authorized the President at his discretion and in the light of economic conditions to alter the terms on which the Federal Government would insure mortgage lenders against losses on loans secured by residential properties.

This authority was limited in its potential application but it nonetheless provided a useful tool for the control of credit during inflationary periods and for the stimulation of home building during periods of contraction.

Last year's economic report proposed that this discretionary authority be widened, that the Housing Act of 1954 move in the opposite direction, and it goes on to say that Congress should again consider this proposal. In keeping with that, this committe recommended to the House a flexible home-mortgage credit provision having to do with the adjustment of interest rates within certain very well-defined limits and periods of amortization. The House, in its judgment, struck it from the bill.

Now would you think that something along that line, in keeping with the President's present recommendation which he reiterates, should be tried again?

Mr. REIERSON. Yes, sir, with this provision: That the authority extend not only to interest rates and term, but also to downpayments.

Representative WOLCOTT. Well, I am not sure whether it extended to downpayments or not. But, anyway, in keeping with the policy.

Now Mr. Stein suggested that he would rather see this in the hands of the President than the Federal Reserve, but I think most of the panel agrees this had better be left to the President and not the Federal Reserve.

On page 61, I notice further reference to that:

> In view of the magnitude of residential construction, its variability, and its responsiveness to changes in the terms of mortgage loans, a wide Presidential authority over terms, to be exercised with the aid of an advisory group, could make a major contribution to the maintenance of stable prosperity.

Is that what you had in mind, Mr. Stein, an advisory group with perhaps some administrative authority?

Mr. STEIN. Well, I do not know what the composition of this advisory group is that the Economic Report refers to. That may mean an industry advisory group. That was not what I had in mind.

Representative WOLCOTT. Let me reframe this. Assuming that the advisory group would be made up of representatives of those who would ordinarily have had control of the credit which would, of course, be the Federal Reserve, and the Treasury, would that be what you had in mind?

Mr. STEIN. Yes, I had in mind Government agencies such as Federal Reserve, Treasury, housing agencies, Small Business Administration, maybe the Budget Bureau.

Representative WOLCOTT. Thank you.

The CHAIRMAN. We come now to you, Senator Flanders.

Senator FLANDERS. The points in the testimony, as I have heard it, and in the discussion, which interested me most, or seemed the most important to me, were those which raised the question as to whether in housing and in automobiles we were or were not doing some of next year's business now.

That, it seems to me, is a fundamental question in regard to maintaining employment and production. I would like first to ask the members of the panel whether they feel that there has been or can be a calculation as to normal and useful needs of the people of the country for housing units, needs sufficient for present expansion, a volume sufficient for replacement of units that are becoming undesirable and substandard and a volume which takes into account the normal period of useful life and replacement?

Now, what is the volume which does substantially the same thing for the automobile that would be required for housing. There is just this difference, however; that on the whole, a rickety, old automobile is more useful than a rickety old house, so that, I think, there is a little bit of difference in the question of depreciation. But that is the question fundamentally.

Is it possible to set up rates of production for housing units and for automobiles which would represent a leveling off or a rate of leveling upward with increasing population?

Let me make clear that I am not proposing the setting of norms for housing or for automobiles, nor am I proposing that those norms be used as the means of setting the federally determined terms, of the terms of sale for automobiles and houses.

I was inquiring to get information and I am glad to say that I have had some, but I do not want to be charged with starting a crusade on those things.

Mr. Reierson. Well, Mr. Chairman, since I have the unhappy penchant of rushing in where angels fear to tread, the thought occurs to me, taking automobile production for example, that the people in the industry give a lot of time and thought to this question. They are well acquainted with the trends in automobile ownership, with the age distribution of existing cars, with turnover experience, and with the other factors that are important in appraising the market for passenger cars, subject, of course, to the normal statistical and other fallabilities. I think it would be possible in that area, to arrive at some ranges of reasonably long-term expectations, say over the next 5 years.

There would enter into that judgment, some assumptions as to the increase in automobile ownership and other important factors, but I think that the people in the automobile industry have made and are making those estimates and that they provide useful guides.

I think the housing situation is more difficult, for a variety of reasons, including the fact that public policy plays a much more important role, as we see in the record of recent months. There again, however, I suggest that there are certain basic estimates of households and families and much additional data that as to vacancies and the conditions of dwelling that could cast some light on the prospective demand for houses. There are some data that are already accumulated and others that could be, upon which it would be possible to erect, again not an accurate figure, but a range of reasonable expectations. In setting desirable goals for public policy in residential building, for example, consideration should be given to the expectations and requirements in other areas as well.

There are things we need in addition to residentail buildings and I am not one to pass judgment as to whether it would be better in a given situation to try to get more houses and less of something else, or vice versa.

There are also limitations upon what can be obtained by way of materials or labor or financing.

Senator Flanders. I would like to inquire whether any of the panel know whether such compilations for these two particular projects are publicly available.

Mr. Hansen. Mr. Chairman, I cannot cite the precise hearings involved, but there have been a great many hearings over the last 10 years, a great many hearings before congressional committees which have set forth in great deal the sort of thing you have asked for.

Senator Flanders. That is strictly on housing.

Mr. Hansen. On housing.

Senator Flanders. Have we done so on automobiles?

Mr. Hansen. I think not in public hearings, but I agree with Mr. Reierson that the automobile industry has done a lot on that.

Senator Flanders. This raises the question particularly as to automobiles, as to whether the industry, having some notion of what the practical limits are for a fairly stable condition, with its ups and downs, can practically control itself. Whether Ford or General Motors or Chrysler or any of the independents are going to stop selling because the total production is exceeding the limit which can be sustained, so that it would seem as though the responsibility for keeping the industry in hand cannot lie with the industry. That again brings us back to the question of installment credit in this area.

Does some branch of the Government have a responsibility which it should exercise through installment terms to restrain an industry which is riding for a fall which may not be a sharp and deep fall, but one which nevertheless will surely bring a good deal of distress to a good many people?

Mr. HANSEN. Mr. Chairman, I should say that the most important problem here is seasonal stabilization of the industry. For some years after the war the accumulated backlog was so large that for the first time in our history we had full production of automobiles throughout the full 12 months. Now we are back again at the old seasonal sharp fluctuation and that is a very serious problem.

With respect to the annual amount, past experience does indicate that it is a little dangerous to rely too much on compilations of this sort because there are all sorts of things occurring in the economy which seems to change the ratio of the probable optimum ratio of cars to the populations.

We have had some surprises there and perhaps on the whole the automobile producers have been more nearly right than those who have been pessimists in this respect.

I think it is a little dangerous to calculate closely the maintainable annual rate. We could do something on the seasonal fluctuation.

Senator FLANDERS. It would seem to me, Dr. Hansen, that the seasonal ups and downs were very serious but that they are in a sense separate from the proper annual rate and annual income. Would you be disposed to feel not too concerned about the annual rate and increment if 2 years from now we had hard work maintaining the automotive industry?

Mr. HANSEN. Yes, I would not feel too concerned about the annual rate this year or any year. In the event that we find, we discover that there will be a decline next year, then other measures should be taken to expand the economy.

I rather doubt that we can set down a precise maintainable annual rate for automobile production.

Senator FLANDERS. You would not feel, then, that there was any necessity for the application of the authority of the Federal Reserve Board to the terms for installment buying of automobiles?

Mr. HANSEN. No, only within the general context of control of credit. I agree with Mr. Reierson and Mr. Whittlesey that the Federal Reserve ought to have at all times the authority to impose real-estate and consumer credit and as far as the automobile industry is concerned, they should do so in accordance with the general economic activity rather than a preconceived idea of what is a maintainable rate of automobile production.

I rather doubt that we can do that later.

Senator FLANDERS. Now you would make general action applicable to all time payments apply to housing as well as to automobiles, or would you feel that in the case of housing, there is some reason for giving special attention to housing as a special proposition?

Mr. HANSEN. Well, I should only say this: The Housing Act of 1954 is extraordinarily generous, especially with respect to veterans housing on the downpayments and the maturity, and I repeat what I said before. I think we might live through that successfully if we could assume a growing and expanding economy at our growth potential. Then I think we can absorb that. If, however, we get little growth or no growth at all, I am a little afraid that the credit provisions were somewhat too generous in this respect. We may be in trouble.

Senator FLANDERS. You cannot see for any period ahead a need for 1,400,000 units annually?

Mr. HANSEN. As far as the needs of the public and having in mind elimination of substandard housing, very definitely.

Senator FLANDERS. I would like to ask if other members of the panel care to comment on those two questions as to whether we can set useful norms in these two fields, and the second, whether public policy should look toward Federal control of them through the terms of credit.

Mr. STEIN. Well, it seems to me that we could not set useful standard goals of that character. We cannot expect that a stable economy will be made up of stable industries, but that there will be within a stable economy annual and other fluctuations of the particular industries within it, so a stable and growing economy would not seem to me to imply necessarily that we would have a stable growing automobile or housing industry, but there will be fluctuations which will in some degree be offsetting.

Also I think that I would be afraid of the possible implications of the attempt to prevent one of these industries from exceeding some predetermined norm. Suppose one were to decide today that the automobile industry and the housing industry are going at an unsustainable rate. Still we have more people unemployed than we would like to have, and do we want to have our bigger recession now. I think the implications in a rate of automobile production and housing production that is not expected to be sustainable is not for contracting the automobile industries and housing industry now, but to think of something else to take up that slack we anticipate.

Senator FLANDERS. Do any of the others wish to comment on that?

Mr. WOOD. I agree with Mr. Stein's comment. Of course, where the Government is giving some kind of aid to housing, say, credit aid, naturally, they should be in a position to determine the extent of that aid with some reference to the extent to which there might be overbuilding. But they should not consider that there is overbuilding just because incomes have declined.

Senator FLANDERS. Mr. Whittlesey, do you wish to comment?

Mr. WHITTLESEY. One of the problems is the difference between a figure which people conceive of as a ceiling and one which they conceive of as a benchmark. Surely none of us want to set any figure for the automobile industry that we should not in a dynamic economy exceed, nor should we in any sense restrict our efforts and our potential growth. On the other hand, it is always the task of our stabilization authorities to study every possible business indicator, to obtain leads as to whether we are moving toward instability or not. It is in the latter context that I feel that we should take cognizance of the possibility we are building houses too rapidly and too many automobiles, with a view to fitting that possibility into a long-term stabilization program. Now is the time to take cognizance of this indicator that we may be headed for difficulties later on.

Senator FLANDERS. Any other comment?

Mr. Riefler, do you want to take on the control of the terms of purchase in these two fields, or any others?

Mr. RIEFLER. Our actual experience with them revealed a difficult administrative problem. I think there is a problem there, however.

Representative WOLCOTT. Mr. Chairman, I neglected to follow up one question that I had in mind on a subject very close to me. I will ask the entire panel whether they would think that there would be a difficulty if the Federal Reserve or anyone else were to exercise selective credit controls without also the authority to control prices.

Mr. HANSEN. Mr. Chairman, I did not hear the last part. Without what kind of authority?

Representative WOLCOTT. Without accompanying authority to control prices.

Mr. HANSEN. Do you mean by price control?

Representative WOLCOTT. Yes. Let's use the example we have been using here. Take automobiles, for example.

Mr. HANSEN. I should say that fiscal, and ordinary monetary action and control of real-estate credit and consumer credit are very, very powerful agents to control inflation without any general control of prices.

Representative WOLCOTT. It was the practical effect, I think, that was bothering me a little bit. It would seem to me that the subject is affiliated somewhat with cutting down the production of agricultural commodities through acreage allocations. If you cut down, for example, the number of automobiles which can be manufactured on the assumption that the market can only absorb a given number, by increasing downpayments, then we might expect that because they have decreased the amount of production that the present people employed in the automobile industry will demand higher wages to offset the fact that they are not working as constantly as they would otherwise, so that would anticipate perhaps wage controls.

Now unless you strike an exactly correct balance between supply and demand, then you might find that we are in a position of underproducing, which would force the price of the automobiles up, through which we would stand to dissipate price controls to prevent them from going sky high, and thereby affecting the economy.

That is why I propounded the questions I did. Was it a problem to indulge in selective consumer credit controls without an accompanying control of prices and wages in those lines in which we exercised consumer credit controls?

Mr. HANSEN. Well, Mr. Chairman, I feel it is a little bit unfortunate that we have been spending so much time discussing restraint on real estate and consumer credit at a time when we have a lot of unemployment and gross national product twenty-five or thirty billion below what we ought to have, and with respect to the automobile credit, I would not at this time introduce any change.

Representative WOLCOTT. In Congress today there is a great deal of thought being given to the advisability of resurrecting the old issue of standby consumer credit controls. Now, if standby consumer credit controls are to be activated only in time of attack, then that is one question. If they are to be activated as they were intended a few years ago and intended as lately as last year, when an emergency, any economic emergency is proclaimed by anyone, then that presents another problem and we have got to go into the question of wage controls, price controls, and the psychological effect which those controls will have upon our total production.

Wouldn't you think that is so?

Mr. HANSEN. Mr. Congressman, I would give these powers to the Federal Reserve authorities permanently at all times so that there would be no question of any special psychological reaction when used, and just now I think it would be very useful because I feel myself alarmed that people are already beginning to talk about the bogey of inflation when we are 25 billion short already of our potential gross national product, and if these controls were there when they need to be used, perhaps we would be less influenced by what I regard as an unreasoning fear about inflation.

Representative WOLCOTT. Well, the thing that bothers me a little bit is if we keep the production constant because of seasonal fluctuations sometimes by industry taking a chance on producing for inventory; that is what I mean by a psychological effect.

Would industry feel free to produce for inventory against a possible cut-back in their dollar values of those inventories so that sometime some morning they will wake up and find out that their million dollars of inventory was only worth, under price control or these artificial controls we would put on, only worth half that.

Mr. HANSEN. I would not impose these controls under present conditions, but I would like to have the Federal Reserve empowered to act when necessary and I would give them this power permanently.

Representative WOLCOTT. If they are applied selectively, wouldn't we run into this psychological factor which might reduce our total national production?

Mr. HANSEN. I do not see the psychological factor if the Federal Reserve has these powers continuously. It might be unfortunate just now because it would give the impression we are very much afraid of inflation. I am not.

Mr. WHITTLESEY. May I make an observation? I agree exactly with what Dr. Hansen says. The usual procedure when one wishes to criticize a particular instrument is to do so on the assumption that it is going to be applied in the wrong way. The example that I used this morning related to our having had these controls at the time of the Korean inflation. Actually we did not have the controls. There was delay and though Congress finally gave the controls, by that time much of the damage had been done.

I look forward, as I think anybody here would agree, not to the use of these controls at the present time. That would be a thoroughgoing mistake. But it is conceivable that we could meet a situation in the future like that of 1950, when it would be extraordinarily helpful to be able to apply these controls immediately and vigorously.

The time to provide such power is before the emergency arises. I well remember that I appeared before a committee that had some of the same members as this in 1949 and made a plea for consumer credit control on a standby basis. I stated that such controls are a brake upon inflationary spending and that it is desirable to have brakes when you are on a level, not that you are going to use them there, but that when you get on the declivity it will be too late to install them.

That, of course, is what happened within a year. It would be very unfortunate to repeat that experience. Putting these selective controls on a standby basis would furnish assurance that vigorous methods could be applied. People would be less likely to become alarmed and behave in such a manner as to contribute to inflationary movements.

Vice Chairman PATMAN. Had you finished, Mr. Wolcott?

Did you have some questions, Mr. Talle?

Representative TALLE. Mr. Chairman, I would like to bring up another matter.

Vice Chairman PATMAN. We have one more question of the members of the panel.

Representative TALLE. This is related to housing construction. It is an Associated Press article from Boston, Mass., and the title is "Slichter Thinks Vicious Cycles May Be Broken." Then it goes on to say:

> Writing in the current issue of the Harvard Business Review, Professor Slichter says, "the most remarkable fact about the recent recession in the United States was the way in which some parts of the economy resisted the recession and other parts seem to have been unaffected by it."

The article says further:

> "It is apparent that what the country experienced was not a general decline in business but a decline in some parts of business accompanied by stability or near stability in other parts and by actual expansion in still other parts."
>
> "The situation was the kind," says Professor Slichter, "which one might expect as a result of the business cycle's being broken up into a number of more or less independent cycles."

Vice Chairman PATMAN. Would you like to place the whole article in the record?

Representative TALLE. Yes, I would, after completing this paragraph (see page 480).

> "Among the changes tending to break up the business cycle," he says, "are developments in the financing of construction which in the future will affect the impact of the construction industry on the economy."
>
> "The replacement of short-term second mortgages with long-term amortizable mortgages (some of them guaranteed or insured by the Government)," writes Professor Slichter, "will prevent the accidental concentration of a considerable volume of maturities in years of depression (as in 1931 and 1932) and will prevent future recessions from producing large-scale distress selling of real estate"—

like the HOLC experience.

Now does this mean that Prof. Wesley Mitchell's four phases of the cycle are out and instead there are a lot of smaller cycles? Do you have any views on that?

Mr. HANSEN. Well, it is a rather long story, I think. I am afraid I do not quite agree with my colleague. We have always had independent cycles within the larger business cycle. That is not a new development. He is quite right, of course, that one of the sustaining factors in this particular depression was the Government housing programs, because without the Government program here of lending and guaranteeing, we should doubtless have had a considerable decline in housing, and this has certainly been a powerful sustaining factor, and the easy credit provisions of the 1954 act have played an important part in recent months. And moreover, we have built into our system certain cushions against depression, but I doubt it is true that this is something quite new, namely, that now we have individual cycles within the larger cycle.

That, I think, was always the case and in any cycle you can find industries that were expanding, right in the midst of the depression. That has always been true.

Representative TALLE. Well, I agree with you, Professor Hansen, on that. I should add that Professor Slichter mentions favorably some of the built-in stabilizers, like price supports and unemployment compensation. The Harvard Business Review article will be in the record.

If there are any further comments, we would appreciate them.

(The article referred to is as follows:)

SLICHTER THINKS VICIOUS CYCLES MAY BE BROKEN

BOSTON, MASS.—The old-fashioned business cycle is being broken up by recent economic changes, says Harvard economist, Sumner Slichter.

He sees independent, lesser business cycles now tending to offset one another.

This coupled with other factors, he suggests, may bring such stability that "the day will come when the growth of production and employment will not be seriously interrupted" by economic dislocation.

Writing in the current issue of the Harvard Business Review, Professor Slichter says, "the most remarkable fact about the recent recession in the United States was the way in which some parts of the economy resisted the recession and other parts seem to have been unaffected by it.

"It is apparent that what the country experienced was not a general decline in business but a decline in some parts of business accompanied by stability or near stability in other parts and by actual expansion in still other parts."

The situation was the kind, says Professor Slichter, "which one might expect as a result of the business cycle's being broken up into a number of more or less independent cycles."

CHANGES

In an analysis of "changes that are going on now," Professor Slichter concludes that as a result of recent and prospective developments, there is justification for expecting that the connection between different kinds of business activity is loosening up and that the old-fashioned business cycle is slowly being replaced by a number of more or less independent cycles—each with its own timing.

These independent cycles, Professor Slichter suggests, will at times reinforce each other, but in the main they will offset one another.

Hence, he concludes, the breakup of the old-fashioned business cycle will make for economic stability.

Among the changes tending to break up the business cycle, he says, are developments in the financing of construction which "in the future will affect the impact of the construction industry on the economy."

"The replacement of short-term second mortgages with long-term amortizable mortgages (some of them guaranteed or insured by the government)," writes Professor Slichter, "will prevent the accidental concentration of a considerable volume of maturities in years of depression (as in 1931 and 1932) and will prevent future recessions from producing large-scale distress selling of real estate."

MODERATE BOOMS

On the other hand, he suggests "building booms will also be moderated."

Professor Slichter further suggests that another "enduring change means that from now on the durable-goods industries will at all times have a far higher ratio of unfilled orders to sales and inventories than prevailed in pre-Korean days. One reason is the defense program," but "even if diplomacy in the next few years succeeds in substantially mitigating the vigor of the cold war, I suspect that the volume of unfilled orders in the durable-goods industries will be kept high simply as a matter of national policy."

In the unlikely event that a large additional drop in defense spending becomes possible," suggests Slichter, "the country will probably offset the drop in defense spending by a long-term development program.

In view of the obvious stabilizing influence of a high ratio of unfilled orders to sales, the maintenance of a high ratio will surely become a matter of deliberate public policy."

Professor Slichter also expects "both political parties to use fiscal policy" in such a way that "it will have at least some stabilizing effect."

He said that two other important changed developments which may help break up the business cycle are:

1.—Growth of influences that tend to check declines in personal income before taxes—such as farm price supports and unemployment compensation and pension payments.

2.—And, a changing basis for investment decision in business.

He lists among factors affecting investment decisions "the great gain in liquidity of business concerns—the rise of technological research—more careful and thorough planning of the future development of enterprises."

Professor Slichter concludes, however, that although "there is good reason to expect that each of the several influences which tend to break up the business cycle will grow in strength with the passage of time, one must not expect that the growth of production and employment will ever become steady."

Representative TALLE. I see a gleam in Professor Wood's eye.

Mr. WOOD. I would agree with Professor Hansen generally on this. I have a few more doubts, I think, than he has as to whether the business cycle is something that is inherent in the present-day economy.

Representative TALLE. Thank you.

Professor Riefler.

Mr. RIEFLER. I think that the comments on this present recession the last year are absolutely correct. The two most important factors to me in that case were, one, the early stabilization and the subsequent increase in internal consumption demand. That makes me feel confident that this particular recovery may continue.

The other factor is that this particular recession during this last year did not find a parallel abroad. Instead, there was a strong advance in economic activity in the rest of the free world. That certainly was a cushioning factor on this recession, a very important one. As to future developments, well, I am always cautious about forecasting the end of economic problems, because I think they have a way of generating themselves in each generation.

Vice Chairman PATMAN. Dr. Talle, we have to give up this room at 5:30, as I understand it, and if we are to get through this other question, we will have to start pretty soon.

Representative TALLE. Could we have a few words from the others on this?

Mr. REIERSON. I agree with Professor Hansen. There are certainly some factors that may ameliorate the savings in economic activity. I think the old-fashioned depression of the 1932 variety is unlikely. However, I think if all future business cycles are within the limits of the 1948–49 and 1953–54 fluctuations, we should consider ourselves fortunate. We might say that eternal vigilance is the price of economic stabilization.

Vice Chairman PATMAN. Are you through, Mr. Talle?

Representative TALLE. Yes, thank you.

Vice Chairman PATMAN. Now, No. 5. I will ask all of you to speak briefly on this because we do not have much time. What about the recent stock market's recent behavior? Are Government controls—that is, margin requirements—in this area adequate?

What about you, Dr. Hansen, let's have your comments on that.

Mr. HANSEN. I think we should not have dropped the ratio in 1953 and I ask the question whether any good purpose is served by having the ratio below 75. I cannot myself see that the public interest is furthered by having a ratio at any time below 75, so I would like to get back there as soon as possible. I do not like the accident that we now have to raise it in the midst of a period when we are trying to get further expansion, but the stock market situation may at the moment require it. I wish we did not have to raise it now. I would rather have had it 75 to begin with and then use the remaining margin when urgently necessary.

Vice Chairman PATMAN. Mr. Reierson.

Mr. REIERSON. Mr. Chairman, I think a short appraisal of the stock market situation is very difficult. Lots of reasons have been given to explain the present level of stock prices and the reasons for the recent increase in prices. Some of those reasons have a substantial amount of validity; I think any comparison of the levels of stock prices today with those that prevailed in 1929 is not too meaningful.

Nevertheless, I am concerned by the rapidity of the increase in stock prices and by the increase in the amount of credit used for stock market trading in recent months. Looking ahead, there is the possibility that optimism may run too strong, that prices may be bid up to the point that they will become vulnerable, more vulnerable than they are now, to some adverse development in the business situation or elsewhere.

I do not think that the Federal Reserve can be oblivious to this trend should it develop. Coping with stock market activity through credit devices is likely to be only partially successful, and very difficult at best. Certainly a further increase in margin requirements could be undertaken. But, there are many liquid assets around the economy which could be used to acquire stocks and which are not subject to the control of the credit authorities.

I think the stock market may pose some very complex and difficult problems, and I share Mr. Hansen's observations on that point.

Vice Chairman PATMAN. Mr. Stein.

Mr. STEIN. Well, I will answer very briefly.

I do not know whether the stock market is too high or not. I wish I did. As for the adequacy of Government controls, I have never been very clear about what the function of these controls is. It seems to me anamolous that we encourage lending 100 percent on a house and discourage lending more than 40 percent on a piece of stock which is a liquid asset.

I certainly would have no proposals for increasing Government controls in this area.

Vice Chairman PATMAN. Mr. Whittlesey.

Mr. WHITTLESEY. I spoke to this point earlier.

I will say nothing further.

Vice Chairman PATMAN. Mr. Wood.

Mr. WOOD. I think the essential point here is whether the Federal Reserve should be disturbed about stock market prices to the point where they would use general monetary restriction in the absence of inflation in other sectors of the economy.

Many people believe, and I think erroneously, that the stock market boom in the late twenties was the fundamental cause of the crash in the economy in the early thirties. I think this is a mistaken historical interpretation. I do not think that the terms on which you make available money should be determined by stock prices.

Vice Chairman PATMAN. Mr. Riefler.

Mr. RIEFLER. The regulation of margin requirements that is lodged with the Board of Governors by the law is designed specifically to prevent an excessive use of credit for purchasing or carrying listed securities. It was designed (1) to restrict sharply the ability of equity purchasers, to finance their activities on thin margins of cash, and (2) to avoid a situation ever arising again as it did in 1929 when a break in stock prices that in any event would have been severe was magnified into a crash because of the large-scale forced liquidation of securities that were being held on very small margins.

As far as these two purposes go, the present regulatory authority appears to be adequate.

Vice Chairman PATMAN. What I cannot understand is why the Federal Reserve Board reduced the margin requirement by one-third February 20, 1953, at a time when it was claimed that they were trying to stop inflation, and the statement you just read there indicates that the effect would be just the opposite, so why did the Board reduce margin requirements at that time?

Mr. RIEFLER. I do not think the effect would be the opposite. These two purposes, to avoid excessive use of credit for purchasers carrying listed securities, were fully met by a 50-percent requirement at that time. There certainly was not excessive use of credit for carrying securities.

Vice Chairman PATMAN. I do not care to argue with you, time is one reason, but it occurs to me that it is inconsistent to say you were fighting inflation February 20, 1953, and then make it easier for people to speculate on the stock market.

Mr. RIEFLER. At that time the stock market was not a cause of concern for demands on credit.

Vice Chairman PATMAN. Well, was the object to boost the stock market?

Mr. RIEFLER. No; the object was to have as simple a regulation as possible consistent with the purposes of law.

Vice Chairman PATMAN. Without asking you gentlemen to express yourselves, I just want to make this statement about the stock market.

February 20, when the margin requirement was reduced, I think that was strictly a psychological measure, and I think it had a tendency to advise people that the Federal Reserve Board and the money masters or managers were willing to encourage speculative investments in the stock market, and then very soon after that the installment buying was talked about, and about a year after that installment buying was effected to the extent that people were able to make purchases by depositing a small amount each month.

I think that was a great encouragement to speculation. Then, too, I think that because the big concerns have not been required to go into the market as they formerly did to get the capital for purposes of expansion, and other purposes, has reduced the opportunities for investors to invest their money, and not having the opportunity to invest their money in new issues they naturally will go into the stock market and bid up existing shares of stock. It will be noticed that last year, 1954, new money that was asked for by business and industry was less than 1953, and further, that trading for existing shares was spectacular last year, 1954, and that resulted in an unusually large increase in share prices.

The President's report indicates, on page 25, that continued economic recovery must not be jeopardized by overemphasis of speculative activity, yet the things that I have mentioned here are certainly encouraging speculative activity.

Now, I just cannot understand why the talk seems to be one way and the action seems to be the other way. They seem to go in opposite directions. I do not understand that.

Would you like to comment on that, Mr. Riefler?

Mr. RIEFLER. Well, I do not quite see the opposite directions that you are referring to.

Vice Chairman PATMAN. Well, it is very plain in my mind that the Federal Reserve Board first contended that they were fighting inflation, and yet they made it easier for the speculator to speculate in stocks and buy more stocks by reducing the margin requirements, on February 20, 1953.

Mr. RIEFLER. In 1953 there was a relatively small volume of issues of new common stocks, as you pointed out, and very large attempts to borrow funds.

Vice Chairman PATMAN. Well, was the object, then, to try to increase the demand for stock buying?

Mr. RIEFLER. Well, I would think that it would be a very good thing in the economy if the proportions between equity funds and borrowed funds was changed a little. I think that one of the problems in recent years has been the extent to which expansion has depended on borrowing, and not on raising equity funds.

Vice Chairman PATMAN. On borrowing and not on raising equity funds. In other words, they have been raising less and less equity funds each year.

Mr. RIEFLER. I would not say less, but I think it has been a low proportion, and I think that is something to be somewhat concerned about.

Vice Chairman PATMAN. I cannot imagine why the Board would be concerned about the speculation on the stock exchange. Suppose there was not much speculation February 20, 1953. Should the Board recognize that and say, "We do not have enough activity on the stock exchange; we want to do something to encourage more speculation?"

I cannot understand why they would do that.

Mr. RIEFLER. I do not think the Board ever felt that way.

Vice Chairman PATMAN. I wonder why they are thinking about the stock market and not these small farmers and small-business men that are pretty low on the totem pole.

Any other questions, gentlemen?

Senator FLANDERS. For our information, Mr. Chairman, I would like to ask Mr. Riefler, being an innocent in the stock market, if I have given my note for a margin, a certain authorized margin, in the purchase of stock, what kind of note is that, a demand note ordinarily, or is it a time note?

Mr. RIEFLER. Well, when the brokers and dealers lend on stock purchases, I think it is a demand. I do not know for certain myself.

Senator FLANDERS. Does anybody know?

Well, if nobody knows, I will move over to the next question.

If it is, for instance, a time note, I would assume that if in the interim the margin requirements were raised I would not be able to renew that note except at the new margin requirements?

Mr. RIEFLER. I can answer that one: No. The new margin requirements apply to new purchases. They do not disturb loans on the existing purchases.

Vice Chairman PATMAN. That is very important.

Senator FLANDERS. Yes.

Mr. RIEFLER. The purpose of that is to prevent a rise in margin requirements from dumping stocks on the market, forcing sales. The requirement simply applies at the window of availability of credit for additional purchases.

Senator FLANDERS. Thank you.

Vice Chairman PATMAN. That is the reason I am apprehensive that this talk about raising the margin requirements will cause a lot of people to rush in and get loans on the 60 percent basis when they know that customarily any raise will not apply on that particular loan.

In other words, they can get in and get secure on a 60-percent basis, and then if it is raised to a hundred it won't apply to them on that particular loan. Don't you think that is encouragement to them?

Mr. RIEFLER. There is a problem there.

Vice Chairman PATMAN. Yes, sir.

Now, there are 2 questions, if you gentlemen would like to answer when you leave here and when you go over your testimony, and the committee will give you permission to correct your testimony, that is to include your formal statements, and also to make any corrections that you desire. I have 2 questions here. I wish you would comment on them:

First, I am greatly disturbed about the lack of support of Government bonds. Now, you take the social-security trust fund that is invested in Government bonds and others. They amount to probably 19 or 20 billion dollars. Secretary Humphrey reminded us in December in his testimony that if there should be a big demand on these trust funds, and they could not meet the demand without selling the bonds, and they began to pour the Government bonds on the market, and they had no support, they might go to a very ruinously low level, and I would like to have your comments on whether or not we should have some support from the Open Market Committee, or from some source that would protect those bonds in the event of a situation such as Secretary Humphrey mentioned.

No. 2 is whether there should be some support of the Government bond at some level, at par, or below par; if so, how much, for all Government bonds?

The next question is what should be included in the national debt. There is a lot of talk about the national debt of $281 billion up, but my feeling is that we don't include the $25 billion of Federal Reserve notes, and they should be included.

I would like to have a comment from you gentlemen whether the Federal Reserve notes be included as a part of the national debt?

Here is the reason I believe they should be included: The Federal Reserve Open Market Committee, when it purchases a million dollars of Government bonds, in effect gives a million dollars in Federal Reserve notes for those bonds, whether it actually delivers them at that moment—of course they do not—but they obligate those Federal Reserve notes.

Now, a Federal Reserve note says on its face that the United States promises to pay to the bearer on demand so many dollars. That is as near a direct obligation that the Government can possibly issue. Yet when those notes are issued they are not carried as a part of our national debt. I would like to know whether or not you believe they should be included in the amount of our national debt.

Any other questions?

Representative WOLCOTT. You are giving them a lot of extra work here, aren't you?

Vice Chairman PATMAN. No; they can do it in a couple of lines.

Representative WOLCOTT. I was wondering if the committee members had an opportunity to pursue this question of the Federal Reserve notes. Perhaps the panel would like to discuss this with us further.

Vice Chairman PATMAN. They can state their personal views.

(The extended statements and replies to the above questions of the panel are as follows:)

CREDIT POLICY DECISIONS FOR 1955—SUMMARY OF STATEMENT BY ROY L. REIERSON, VICE PRESIDENT AND ECONOMIST, BANKERS TRUST CO., NEW YORK

The key to monetary and credit policy in 1955 will be found in business trends and developments during the year. There is convincing evidence that production and output began to move upward in the final quarter of 1954. The recovery to date may be described as vigorous and widespread.

Numerous factors have contributed to the upturn, including an end to the liquidation of business inventories, an increase in consumer buying, a conspicuous upsurge in building and construction, and the impetus provided to the automobile industry by the introduction of new models.

The business environment.—The prospects are that expansionary forces in the economy will persist for some time. Once a general economic upturn is under way it tends to continue without major setbacks until new high ground is reached. Furthermore, the outlook for many of the important factors in the business situation is favorable.

Consumer spending is likely to continue to rise, sparked by growing personal incomes and a continued willingness to spend. Some inventory accumulation may be expected in the months ahead, which will stimulate new orders and production. Business spending on plant and equipment has stopped declining and may very well show some increase later in the year. Finally, the decline in Treasury spending appears to be tapering off, while the rise in State and local spending continues unabated. The upsurge in building and construction is so strong that the question now is whether activity in this field may be excessive.

Assuredly, not all sectors of the economy can be expected to rise steadily throughout the year. For example, current rates of production of some important consumer durable goods appear higher than are likely to be maintained throughout the year. Nevertheless, the rising trend in business activity will probably continue for some time and new records may be expected in 1955 for such important and varied economic indicators as gross national output, industrial production, building and construction, retail sales, and others.

The international situation remains a big unknown in the business outlook, but it seems a reasonable guess that international developments are more likely to stimulate than to depress economic activity.

Shift in credit policy.—The upturn in business activity has already been reflected in some change in credit policy. Present policy can hardly be called restrictive, since money rates are still relatively low and short-term credit remains readily available. However, excess reserves have declined, and member bank borrowings and money market rates are higher than they were some months ago. Apparently the Federal Reserve, quite appropriately, believes that as business expands, the money market should not be kept as easy as it was during most of 1954, when business was either declining or on a plateau.

Credit policy cannot be prescribed in advance; it must develop gradually in the light of evolving business and economic conditions. Credit policy decisions in our complex economy must be based on careful analysis of numerous trends; they cannot be determined by mathematical formulas or by the movements of any single economic indicator, no matter how important. Trends in money supply and commodity prices, employment and unemployment, production, business inventories, and new and outstanding orders tell part of the story. Construction activity, the volume and use of credit, the terms and conditions under which credit is available, the behavior of interest rates, both long-term and short-term—all these and more are considered by the Federal Reserve in deciding on credit policy.

Unless inflationary forces take hold in a substantial way, the year 1955 is not likely to be a period in which credit policy criteria are self-evident. Employment is likely to be high, but less than full, while commodity prices may continue to show some strength. The development of an appropriate credit policy will require constant and meticulous scrutiny of all salient trends in our economy.

Specific questions for 1955.—Several sectors in our economy appear to warrant special attention by the credit authorities. Building and construction is a potential problem area in view of the sharp increases in recent months. Much of the recent strength in residential building reflects the liberalized financing terms incorporated in the Housing Act of 1954. The immediate grant of additional authority to the President to vary the terms under which home mortgage loans are underwritten by the Federal Government is highly desirable.

Business inventories in the aggregate still appear relatively low. However, inventory policies are volatile. A broad resurgence of inventory accumulation, whether in response to a speculative wave or because of high business optimism, should be of sufficient concern to the credit authorities to justify some added credit restraint.

Consumer credit is again on the rise and attained record levels at the end of 1954. The authorities may be expected to continue their scrutiny of conditions here in order to determine whether the rate of increase is keeping within reasonable limits or whether excessively rapid growth is being achieved by a reduction in downpayments, an extension of maturities or a downgrading of credit standards—developments that could have undesirable repercussions.

Commodity prices, at least until very recently, have been reassuringly stable in the face of the sharp recovery in business activity in the latter part of 1954. However, deterioration in the international situation might well jeoparidze this stability and could give real impetus to credit expansion and inflationary pressures.

Prices, trading volume, and the use of credit in the stock market bear continued watching with a view to preventing prices from rising beyond levels that appear justified by prospective earnings and dividends. The present system of margin requirements is a feasible and reasonably effective device for limiting the use of bank credit for stock-market trading. However, should the problem of regulating stock-market credit become more serious, the use of margin requirements should be accompanied and supported by general credit control.

Should we be so fortunate as to achieve a steady and orderly economic expansion, not accompanied by distortions, imbalances or growing inflationary pressures, a policy designed to reduce the hazard of the upturn gathering excessive momentum would be appropriate. Perhaps a more realistic possibility is that expansion may be uneven, that some sectors of the economy may push ahead too fast, that inflationary tendencies may grow, that credit may be used increasingly for nonproductive purposes, or that speculation may spread. Certainly the international situation may at any time give rise to renewed inflationary pressures. Developments such as these would increase the need for restrictive credit policies.

Credit policy and economic growth.—The Federal Reserve unquestionably desires to foster sound long-term economic growth; its endeavor is to minimize economic fluctuations around a rising trend. In a period of widespread business confidence and optimism such as the present, however, there is real danger that an upturn may develop into an unsound boom, or that particular sectors of the economy may expand so rapidly as to create instability for the future. Such developments the credit authorities doubtless would like to forestall.

Credit policy, wisely used, can make a real contribution to economic stability and to sound long-term growth. Unwisely used, it can contribute to economic instability. One danger is that too aggressive an easy credit policy in a period of reduced business can help create an environment in which investment spending may be stimulated to such a degree as to pose problems for the future. Another danger is that action to restrain expansion may be delayed for fear of hampering business recovery, with the result that expansionary forces develop a momentum which may make it more difficult to curb a boom. Restraining a boom is never popular but it is a prerequisite to sound economic growth.

Lessons from the Record.—The fear exists in some quarters that restrictive credit measures may provoke a cumulative downturn in economic activity. The experience of 1953 and 1954 in the use of credit policy is reassuring on this point.

The major reasons for the business downturn in 1953 were a cutback in Government spending and a shift from inventory accumulation to liquidation. Credit policy obviously had no bearing on the former, but probably helped bring to an end the rapid buildup of inventories that prevailed in the first part of 1953. That this brake upon inventory accumulation was salutary is evidenced by the modest pace and orderly character of the inventory liquidation that began late in 1953. At the same time, credit restraint in the first part of 1953 did not affect investment spending; construction activity set successive new records in 1953 and 1954.

General credit controls are fluid; they can be changed rapidly in response to economic and financial developments. This was clearly illustrated by the shift from a policy of credit restraint to one of credit ease in May 1953, even before the peaks of economic activity were achieved.

The policy of active ease followed by the authorities during most of 1954 also made a contribution to economic stability. This policy helped prevent a spiral of credit contraction and liquidation. The commercial banks were under no compulsion to call loans but instead were in position to engage in new lending activities. Pressure on commodity prices as a result of inventory liquidation that might have been brought on by the calling of bank loans was thus avoided. At the same time, credit policy maintained conditions in the investment markets that were conducive to a high level of investment activity, thereby helping to support the trend of business generally and to set the stage for the upsurge in capital expenditures in the latter part of 1954.

The good record of credit control in the 1953–54 business cycle should strengthen, rather than weaken, the determination to continue the use of flexible credit policy as a tool for promoting stable economic growth.

(The following replies were subsequently received for the record:)

REPLIES BY ROY L. REIERSON TO QUESTIONS PROPOUNDED BY MR. PATMAN

A. The first two questions posed by Mr. Patman relate to the degree, if any, of "stabilization" of Government security prices that should be undertaken by the monetary and credit authorities. My position is that the authorities should not undertake, by price support or price stabilization efforts, to prevent underlying economic forces from having their normal effect upon interest rates, and hence upon the prices of debt securities including Treasury obligations. In the case of national emergency, panic or the like, however, action to stabilize the Government security market would be proper and sound. My reasons are as follows:

(1) If we are to attain sound and stable long-term growth in our economy, we must seek to avoid excesses, and we must especially avert an inflationary boom, with its ensuing economic setbacks.

(2) Should the authorities manage to prevent interest rates from ffuctuating in response to underlying economic forces, it would become extremely difficult, or even impossible, to prevent investment actively from running ahead of savings, which would help generate inflationary forces and thus jeopardize sound economic growth.

(3) Fluctuating Government bond prices and interest rates in consequence of changing economic conditions, on the other hand, help to check excessive movements in the economy; rates tend to rise as demands for funds increase and to decline as investment activity eases, thus helping to counterbalance both excessive expansion and excessive contraction in our economy. Consequently, once the financial community is accustomed to an economic environment in which interest rates have some freedom of movement, these fluctuations come to be accepted as part of the normal functioning of the market place and serve useful purpose in achieving the balance of economic resources that is required for sound long-term economic growth.

(4) If conditions in the bond market become disorderly as the result, for example, of widespread shock to public confidence in response to some emergency, it would be necesasry and desirable for the authorities to step in and attempt to

stabilize prices. Action under these conditions would be perfectly consistent with the principle set forth above, since price declines in a market of this kind would not reflect the normal operations of economic developments but rather panic and fear. Such forces work harm upon the economy and are detrimental to stability; the authorities should endeavor to curb them if they arise.

B. Another question raised by Mr. Patman is whether Federal Reserve notes should be included in the Government debt. In my judgment, they should not be so included. My reasons are as follows:

(1) Federal Reserve notes were designed to provide a flexible medium for meeting the currency requirements of the economy. The volume of such notes outstanding fluctuates with the demands of the public for a circulating medium of exchange.

(2) Changes in the amount of Government debt outstanding essentially reflect the fiscal operations of the Treasury. The amount of Federal Reserve notes outstanding, on the other hand, does not reflect these operations and should not be subject to the statutory limitations imposed upon the United States Government debt. Although Federal Reserve notes are obligations of the United States Government, the liability is not one requiring the outlay of funds by the Treasury.

(3) Since the Federal Reserve holds substantial amounts of Government obligations, the inclusion of Federal Reserve notes as part of the Government debt would result in double counting of the Government's liabilities.

(4) Inclusion of Federal Reserve notes as part of the Government debt would reduce the effectiveness of Federal Reserve control over banking and credit conditions. The amount of currency outstanding, under such conditions, would tend to be affected not by the needs of the economy but by the fiscal position of the Treasury; it may be recalled that this was one of the limitations of our currency system before the establishment of the Federal Reserve. Furthermore, an increase in the volume of Federal Reserve notes, as part of the Government debt, above the amounts required by the public would be prejudicial to sound economic growth. Should efforts be made to prevent excessive issues from flowing back to the commercial banks and ultimately to the Federal Reserve, the result would be to build up holdings of cash balances in the economy and to contribute to inflationary pressures.

ROY L. REIERSON.

STATEMENT OF WINFIELD W. RIEFLER, ASSISTANT TO THE CHAIRMAN, BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM

The most recent facts and figures on the economic situation stand in strong contrast to those available at this time last year when the Joint Committee on the Economic Report held its February hearings. Then the economy was nearing the point where it leveled off from the recession that commenced in mid-1953. Now, each day's accretions of evidence point up the breadth of the recovery that started last fall. As of the moment, it appears to possess a considerable strength.

Two features stand out as noteworthy in recent economic developments. One is internal to this economy, the other external. On the internal side, there is the strength of consumer demand through 1954, first, in its resistance to declines in total output, and, later, in the way it sparked the upturn. As explained in the Economic Report, the sustained high level of disposable income, coupled with aggressive competition and retailing effort, was fundamental to this result. It is significant that consumer credit during most of the year added little in the aggregate to consumer demand. A renewed expansion of consumer credit, however, appears to have been a factor in the strength of the upturn in the last 2 months.

The response in consumption is most reassuring because the tapering off of the defense program and the working down of inventories posed a difficult problem to the economy. It was important that a large proportion of the resources released from defense be redirected to higher standards of civilian consumption, but it was not clear that the signs of readaptation would show themselves quickly.

The noteworthy feature of 1954 that was external to our economy was the continued strong economic expansion that continued to characterize many other countries of the free world, particularly Great Britain and Western Europe. This dispelled the fear that a recession in the American economy would upset world equilibrium. It contributed to our revival by providing a strong market for our exports, and registered the basic progress that has been made toward reconstructing a viable international economy. Despite rough spots and exceptions, balances of payments among countries of the free world are probably on a better basis today than at any time since the outbreak of the First World War in 1914.

There is implicit in these developments the possibility of sustained and growing prosperity and of steady absorption of our expanding resources, particularly our human resources, now unemployed. For this possibility to be realized, however, it is important not only that the recovery be broadly based but also that activities in anticipation of rising demand, such as inventory accumulation, be held within prudent limits and that commitments to expand be soundly financed. These are the types of problems that always emerge during periods of recovery. It is still too early in the present recovery to tell to what extent they will emerge this time. Among the straws that bear watching is the fact that credit terms, both for consumer installment loans and for home mortgage loans, are now generally more liberal than they have ever been in the past. It is also possible that the volume of construction activity now under way or projected may be too high to be sustained.

The monetary and credit policies pursued by the Federal Reserve System in 1955 will continue to be guided by the philosophy embodied in the Employment Act, i. e., the nurture and cultivation of sustained economic growth and stability at high levels of resource use. In more concrete terms, this means that credit and monetary policy will be directed toward furnishing the reserves needed by the commercial banks to perform efficiently their function of financing the economy at a high level of resource utilization without contributing either to inflation or deflation, and without encouraging developments that will make for instability. So far as the cost and availability of credit are concerned, it means that the System will try to promote a pattern of finance that will find a market for the economy's savings in constructive activities. So far as the quantity of credit is concerned, it will work for a rate of growth in the active-money supply appropriate to the growth in the resources available to the economy. It would not be wise to establish a fixed or mechanical formula to govern the relationship between growth in the money supply and growth in the economy. Both businesses and individuals hold cash balances for a variety of reasons which may change from time to time. The result will be registered both as a change in the velocity of circulation and a change in the appropriate relation between growth in the money supply and growth in real output.

During the greater part of 1954 when inventories were being liquidated and the normal-business customers of banks had less occasion to borrow, the System sought to achieve these cited objectives by twice lowering its rediscount rates, first, from 2 percent to 1¾ percent, and, second, from 1¾ percent to 1½ percent. It also, in the summer, lowered reserve requirements on time deposits to 5 percent, on demand deposits to 20 percent at central Reserve city banks, 18 percent at Reserve city banks, and 12 percent at country banks.

Continuously throughout the year, open-market operations were used to supplement or offset other factors supplying or absorbing reserves in such a way as to insure that there would be a volume of reserves in the market sufficient to stimulate banks to seek outlets for their funds.

Taking the year 1954 as a whole, total loans and investments of all commercial banks expanded by nearly $11 billion, of which about 4 billions was reflected in a growth in the active-money supply. The growth for the year in the active-money supply was around 3 percent, as compared with a growth of a little over 1 percent in the gross national product from the first quarter to the last quarter of the year. In each case, this growth was concentrated in the later months of 1954.

Prices of common stocks rose continually through 1954, indicating the confidence of investors in the economic outlook as well as the availability of funds for risk investment. Toward the close of the year when it became apparent that recovery was actually underway, there was a sharp acceleration of stock purchasing, which appeared to be increasingly motivated by speculative, in contrast to investment, considerations. While the total volume of credit loaned on stocks and bonds is relatively low by historical standards, the rate of increase in borrowing to finance stock purchases rose rapidly. As a result, the Board of Governors raised margin requirements from 50 to 60 percent on January 4.

The regulation of margin requirements that is lodged with the Board of Governors by the law is designed specifically to prevent an excessive use of credit for purchasing or carrying listed securities. It was designed (1) to restrict sharply the ability of equity purchasers to finance their acquisitions on thin margins of cash, and (2) to avoid a situation ever arising again, as it did in 1929, when a break in stock prices, that in any event would have been severe, was magnified into a crash because of the large-scale forced liquidation of securities that were being held on very small margins. So far as these two purposes go, the present regulatory authority appears to be adequate.

It is too early to be sure that the recovery underway will continue without interruption, but it is my personal judgment that the problems which will concern the committee during the months ahead will be increasingly associated with exuberance rather than lethargy in the economy.

(The following replies were subsequently supplied for the record by Mr. Riefler in response to Representative Patman's questions:)

The answer to the first question is that the Federal Open Market Committee is prepared to deal with a disorderly situation in the market for Treasury issues.

The answer to the second question is that any fixed level of support for debt obligations is potentially very inflationary.

The answer to the third question is that a considerable amount of double counting would arise if Federal Reserve notes were included in the national debt. On January 26, 1955, the Federal Reserve statement shows Federal Reserve notes in circulation amounting to 25,600 millions of dollars. At the same time, Federal Reserve agents held United States securities to the extent of 17,100 millions of dollars as collateral against Federal Reserve notes.

STATEMENT OF ALVIN H. HANSEN, PROFESSOR OF POLITICAL ECONOMY, HARVARD UNIVERSITY

The massive sustaining structure that has been built into the economy during the last 15 to 20 years—social security, farm price supports, Government housing programs, and a highly progressive income tax—have stood us in good stead. Happily we are at long last agreed that this structure is not an artificial prop, as we were formerly told, but instead a bulwark of strength in our economy. Together with the continuing support (despite a considerable cut) of a $70 billion budget, major tax reductions, and easy credit, we have pulled through without serious depression.

A year ago there was general agreement among those of us who appeared before your committee that the economy most probably would continue to move sidewise during the next 12 months. This in fact is what has occurred. And now a reduced inventory liquidation together with a strong seasonal increase in automobile production accounts for the slight recovery thus far. Neither of these provide any solid ground for believing that we are on the way back to our growth track. This would require one or more of these things: (1) A sharp upward shift in the consumption-income ratio, (2) a sharp increase in fixed capital investment, or (3) an increase in Government outlays.

No one, so far as I am aware, has projected any probable increase in fixed capital investment. Federal Government outlays are scheduled to drop slightly. Thus we are back just where we were a year ago when we had our hearings on the economic report. Any large forward thrust must come from consumption.

I suggested a year ago the great danger that we become complacent and satisfied with only a moderate rate of growth. To illustrate this, I used a model which I herewith reproduce, adjusted to conform to the revised gross national product figures in the 1954 report.

Growth models

[In billions of dollars]

	GNP (in 1954 prices) maximum employment and production potential (1)	GNP (in 1954 prices) assumed moderate growth pattern (2)	Loss of GNP (1)−(2) (3)
1953	$368	$368	$0
1954	381	357	24
1955	394	366	28
1956	408	371	37
1957	422	376	46
1958	437	386	51
1959	452	386	66
1960	468	396	72
Total			324

My potential growth model has as its base the average for 1953, not the peak quarter. The last half of 1953 was down. The figure therefore does not represent overfull employment. I presuppose a growth of 3½ percent a year, by common consent a reasonable figure. My second model, representing the complacency which I fear, happened to hit upon a figure for 1955 which is almost precisely the forecast recently made by Fortune magazine. While this represents a considerable recovery, it is none the less $28 billion below our potential growth line.

Now all this has a bearing on monetary policy in the year ahead. In the brief time at my disposal I shall not attempt to go over the ground covered in recent hearings. Instead I propose to strike a new note on an old theme. I refer to the matter of inflation.

I should like to propose a new definition—one, I hope, which might have some operational value for monetary policy.

I do this because the fear of inflation is again becoming an obstacle to recovery. Read, for example, the interview article by Secretary Humphrey in the January 14 issue of U. S. News & World Report. This preoccupation with inflation is of course in large part understandable due to the fact that we are living in a warswept century.

I suggest that we need a new concept which I propose to call pure inflation, and I propose to set this over against the concept of price adjustments to output changes.

Pure inflation (and I underscore the word "pure"), I should say, is a condition in which prices rise without any appreciable increase in output.

Countries which have suffered in the past from the evils of inflation have typically experienced large price increases with no substantial increase in output. Indeed in cases of hyperinflation, output has often actually decreased.

There are, to be sure, degrees of pure inflation. And I should like to suggest, to help clarify our thinking, the following general observation. I suggest that at no time in our history, nor indeed in that of any other country, can it be shown that price increases have injured the economy and the general welfare if in the period in question the increase in aggregate output has substantially exceeded percentagewise the increase in prices.

Frederick Mills, of the National Bureau of Economic Research, surveying 80 years of cyclical movements in our history, has shown that in periods of expansion, for every 1 percent increase in output, we have had eight-tenths of 1 percent increase in prices—a 5 to 4 ratio. Professor Mills' short-run ratios of output increases to price increases might of course develop against the background either of a long-run down trend in prices or a long-run up trend.

I repeat, one does not encounter the condition of inflation in any meaningful sense so long as percentage increases in aggregate output exceed by a considerable margin the percentage increases in the price level.

I should be prepared, in special circumstances, however, to go a bit further. There are times when a tremendous forward push is urgently needed, when a choice has to be made between permitting a price increase substantially greater than my rule suggests, or else foregoing the needed increase in aggregate output.

Consider, for example, the situation in 1946 after the removal of price and wage controls and the cut in wartime taxes. Having chosen to remove the main restraints on consumption (and I assume that political realism forbade any other choice) what then? The only way remaining to keep aggregate demand in check would have been drastic monetary restraint on investment. Would this have been desirable policy? I think not. A rapid transition to full peacetime production required massive investment in plant, equipment, and inventories to make good the accumulated shortages caused by the war. It was a choice of the lesser evil. It did indeed mean a price increase percentagewise considerably greater than the increase in aggregate output. But the massive investment laid the groundwork for a large increase in output later and contributed greatly to the slowing down of the price movement by 1948.

We are living in a century in which the long-run trend in prices has been upward. The two World Wars, and to a lesser extent the Korean war, afford, of course, the main explanation.

I think we might gain historical perspective if we take a look at the record of aggregate output and price trends during the last half century. I divide the half century from 1900 to 1953 into three periods. The first is the quarter century from 1900 to 1925; the second, the quarter century from 1925 to 1950; the third (by way of comparison) is the short recent period from 1948 to 1953.

With respect to each of these periods I ask two questions: (1) What was the rate of increase of output per annum, and (2) what was the rate of increase of prices per annum, calculated on the compound percentage rate basis. I believe you will find the results of this calculation both interesting and instructive.

In the first period 1900 to 1925, aggregate output increased at the compound rate of 3.5 percent per annum; prices at the rate of 3 percent per annum. For the second quarter century, 1925 to 1950, output increased at the compound rate of 3 percent per annum; prices at the much slower rate of 1.5 percent per annum. For the recent short period, 1948 to 1953, output increased at the rate of 4.5 percent per annum; prices at the rate of 1.5 percent per annum.

Percent increase (compound rate), per year

	1900–25 [1]	1925–50 [1]	1948–53 [1]
Aggregate output	3.5	3.0	4.5
Price index composed of:			
1. Consumer prices 2. Wholesale prices	3.0	1.5	1.5

[1] The index numbers are as follows:

A. For 1925 (1900=100):	
Aggregate output	240
General price index	203
Consumer index	221
Wholesale index	185
B. For 1950 (1925=100):	
Aggregate output	207
General price index	140
Consumer index	137
Wholesale index	153
C. For 1953 (1948=100):	
Aggregate output	124
General price index	108
Consumer index	111
Wholesale index	105

The record with respect to price stability during the last quarter century is considerably better (contrary to what is commonly believed) than in the first quarter of our century. Prices rose just twice as rapidly per annum in the first quarter of the century.

The greater price revolution of the earlier period also becomes evident when one compares the *lowest* prewar price years with the postwar price index after prices had settled down. Thus, using the years 1894–97 as the base, the index, wholesale and consumer combined (for the period in which both are available), stood at 243 in 1923–25. In the second period, using the low years 1931–34 as the base, the combined index stood at 200 in 1948–50.

The great gains in aggregate output, during the last two decades, have been widely distributed—more equally in recent years than ever before. The new price level has not given us, as sometimes in the past, increasing inequality.

Three criteria (all suggested years ago by Professor Pigon) can usefully be applied to test the general health of an economy. They are as follows: (1) Has the per capita real income increased? (2) Have the overall gains been widely distributed? (3) Has there been adequate capital formation to implement technological progress? The last quarter century stands up well under these tests.

Now let me emphasize one thing. We should pursue no rigid goal with respect to price stability. We should emphatically not aim at a constantly rising price level. Nor should we set up the goal of rigid-price stability. We should keep our eyes fixed primarily on "maximum production, employment, and purchasing power."

I should myself hope that over long stretches we could approach our full growth potential at substantially stable prices. I am encouraged in this hope by the record achieved in 1951–53, inclusive.

Just now we are nearly $30 billion below our growth potential, and we are rather complacent about it. Why do we do it? The inflation bogey is perhaps the main answer.

And now a final word directed at the questions on your agenda. First, what should be our policy with respect to the quantity of money?

I suggest that for a rich industrial country the correct quantity of money is not any precise fixed amount. It may be anything within a rather wide range. A rich, highly developed country desires and is capable of holding a very large amount of liquid assets in relation to its income. A poor, undeveloped country is not. In a rich country there is no close relation between the quantity of money and aggregate spending. In a poor country, there is. That is why the quantity theory of money applies quite well to poor countries. The quantity theory has very little relevance for rich advanced countries.

If the level of economic activity is low, we should actively promote high liquidity and a policy of easy credit. If activity is running very high, the monetary authorities should lean moderately against the inflationary pressures. Monetary policy should make a modest contribution toward the containment of inflation, but primary reliance should be placed upon fiscal policy and selective controls.

The monetary authorities should, I believe, follow no rigid formula with respect to the quantity of money. A rich advanced society does not hold money merely for transactions purposes, and therefore the old-velocity concept is more or less meaningless. It cannot function well without large liquid assets, ready to take advantage of changing investment opportunities and prepared to meet unforeseen contingencies. Such a society cannot prosper without a highly elastic monetary system.

Similarly, as I have tried to indicate, we should have no rigid rule with respect to price stability. We should aim primarily at full production and employment, and we should direct our productive energies toward the things most needed. We are too complacent about our current GNP and we are, I fear, seriously neglecting the matter of social priorities, but that topic would perhaps get us too far away from monetary policy. I had something to say about that in my statement last year.

A brief word about another question on your agenda—the stock market margin requirements. I should like to raise the question, if I may, for later panel discussion, whether any good purpose is ever served by dropping the ratio below 75 percent. I do not pretend to know the answer, but unless someone can enlighten me to the contrary, I find it difficult to see what purpose, in the general interest, is served by a ratio lower than 75 percent.

Statement of Herbert Stein

My name is Herbert Stein. I am associate research director of the Committee for Economic Development. I appear here today to present my own views, and not to represent the Committee for Economic Development. The views of the CED will be presented here at a later date by an officer of the Committee.

One's opinion of appropriate monetary policy at any time depends or should depend, upon one's appraisal of the economic situation as it exists and as it is foreseen for a short period ahead. It is one of the great advantages of monetary policy that the forward look need not be very long, since the policy can be changed in time if developments in the more distant future call for a change.

In general I agree with the diagnosis of the economic situation contained in the Economic Report. This diagnosis is that we are experiencing a recovery which is not yet complete, and that continued rapid movement to full recovery is possible, even promised, but not assured.

In my opinion this diagnosis calls for a prescription of continued active monetary ease. This means that banks should be so well supplied with reserves that they will be actively seeking opportunities to extend credit and will be increasing their investments in Government securities.

I do not see anything in the President's Economic Report that is necessarily inconsistent with this prescription. However, I believe that the report could have been clearer on this point.

A key sentence in the report is this one: "The wise course for Government in 1955 is to direct its program principally toward fostering long-term economic growth rather than toward imparting an immediate upward thrust to economic activity." I am afraid this sentence may be regarded as indicating that the Government no longer considers necessary any of those specifically antirecession measures that were employed in 1954. One of the most important of these measures was the policy of active monetary ease. I would hope the Government does not interpret the very general proposition I have quoted as calling for discontinuance of that policy.

Last week there were two indications of a shift in policy. One was Mr. Sproul's speech in New York confirming reports that the Federal Reserve's policy of active monetary ease was becoming somewhat less active. The other was the Treasury's announcement of the offering of a 40-year bond at 3 percent. The action taken so far has been slight. I am sure that the Federal Reserve has not committed itself so far that it could not resume a more active policy if the recovery should show signs of slowing down.

Nevertheless I am concerned about the possible development of inflation jitters on the part of the administration at this phase of the recovery. I think the administration showed great wisdom and courage in not being drawn into a crusade against depression last spring when there was no depression. I hope the administration will not now be drawn into a crusade against inflation when there is no inflation.

Possibly before the end of this year we shall need an anti-inflationary monetary policy. But this possibility does not mean that we do not need, or cannot have, an actively stimulating monetary policy now. The meaning of flexibility in monetary policy is that we can have a stimulating policy now and a restrictive policy 6 months from now.

In this short statement I have concentrated on a possible redirection of policy that seems to me a cause for concern. At the same time I want to express my agreement with the principles and objectives that guide the Federal Reserve and the Treasury and with their general conduct in the discharge of difficult responsibilities last year.

(The following letter from Mr. Stein in reply to Representative Patman's questions was subsequently received for the record:)

COMMITTEE FOR ECONOMIC DEVELOPMENT,
Washington 6, D. C., February 10, 1955.

Mr. JOHN LEHMAN,
Joint Committee on the Economic Report,
Senate Office Building, Washington 25, D. C.

DEAR MR. LEHMAN: I submit herewith brief answers to the three questions asked of all panel members by Congressman Patman at the January 31, 1955, hearings of the Joint Committee on the Economic Report.

1. I cannot conceive of a situation in which the Government trust accounts would have to cash all, or even a large part, of their holdings of Government securities. In a severe depression the trust accounts, particularly the unemployment insurance account, might need substantial amounts of cash. This they would obtain by turning in some of their bonds to the Treasury, not by selling them in the market. The Treasury in turn would raise cash by whatever kind of borrowing in the market seemed appropriate at the time. If the problem arose, as is most likely, in depression the Treasury would presumably be willing to borrow by issuing bills or other short securities. At the same time the Federal Reserve would be expanding the credit base and the short-term Government securities would be highly salable.

In other words, the contingency assumed does not seem to me a reason for departing from a general policy of not having the Federal Reserve support Government security prices.

2. The Federal Reserve should on occasion buy or sell Government securities. These purchases or sales will affect the prices of Government securities. But I do not believe that Federal Reserve buying or selling should be guided by the objective of achieving some predetermined level or behavior of Government security prices. The effect of accepting this objective is only to weaken devotion to a more important objective—stability of the economy at a high level without inflation.

3. Selection of a unique definition of the "national debt" is important only if some policy consequences flow from the definition. At present, the definition only has policy consequences because there is a legal debt limit. I do not believe that there should be a legal debt limit; congressional control of Federal expenditure is better assured by other means.

For various purposes of analysis different definitions of the national debt are appropriate. In any case we should be careful to avoid double-counting. If we include liabilities of the Federal Reserve banks in some variant of "the national debt" we should not also include the Government securities owned by the Federal Reserve banks.

Sincerely yours,

HERBERT STEIN.

STATEMENT OF C. R. WHITTLESEY

My introductory comments fall into three parts. The first part relates to the general tenor of the President's Economic Report; the second consists of my answers to questions laid before this panel; and the third offers certain observations on present day stabilization policy. What I have to say under these three divisions is closely interrelated and will appear, I hope, as part of a continuous argument.

The Economic Report for 1955 exaggerates, I believe, the extent to which economic stability, realized and prospective, is the result of governmental action, and underestimates the extent to which it rests on natural forces now present in the economy. Such an emphasis strikes me as bad strategy; mistaken and dangerous. It is bad strategy because it is inconsistent with the stress currently being placed on free markets and private initiative. Under somewhat different guise it endorses the spirit of dirigisme and control and thereby plays into the hands of those who call for continuing interference with the operation of economic forces. It is mistaken because it undervalues the significance of changes which have made the economy much more resistant than in the past to declines in economic activity. It is dangerous because it credits certain mild measures with a degree of effectiveness that can only lead to frustration and disillusionment if put to a real test at some time in the future. A similar mistake of overestimating the effectiveness of Federal Reserve policies was made back in the twenties.

The position to which I take exception could be illustrated by many examples, but I shall limit myself to one. On page 22 the report points to six lessons drawn from the recent business decline. The first three are expressed in terms of the great power of governmental intervention:

"In the course of our latest encounter with the business cycle we have learned or relearned several lessons. First, that wise and early action by Government can stave off serious difficulties later. Second, that contraction may be stopped in its tracks even when governmental expenditures and budget deficits are declining, provided effective means are taken for building confidence. Third, that monetary policy can be a powerful instrument of economic recovery, so long as the confidence of consumers and businessmen in the future remains high."

Please note the words, "contraction * * * stopped in its tracks," "stave off serious difficulties later," "wise * * * action by the Government." I shall not go into the reasons why I do not for a moment agree that in the absence of the mild steps taken by the Government "serious difficulties" would have developed. But I do want to say that I had not expected to be told so soon or so smugly that "we planned it that way."

Turning to the second part of my statement may I observe that the first two questions seem to call for some simple and categorical rule-of-thumb to remain valid throughout 1955. But monetary policies are contingent upon the conditions that prevail in the country. It will be the task of the monetary authorities to choose from among the alternatives mentioned and others not named—the policies appropriate to conditions as they unfold. It is entirely conceivable that within the coming year conditions will alter to such an extent that quite opposite measures will be called for at different periods. To suggest, as these two questions seem to do, that particular policies can be laid down this far in advance is largely to deny the necessity of having a central monetary authority.

My comments on question No. 3 are embodied elsewhere. I am not sure what is meant by the adjective "monetary' 'in the fourth question. However, I find no cause for alarm with respect to consumer credit but am greatly concerned over the outlook for the real-estate market in the coming few years. The "rush of applications to Federal agencies for mortgage insurance or guarantees" mentioned with such aplomb on page 24 is open to the interpretation that it may have some of the attributes of a rush to a cyclone cellar. Surely the realities of the real-estate situation have been obscured by action taken in reducing downpayments and extending maturities. It might be desirable to move in the direction of more downpayment and shorter maturities on new houses, if only to be able to make better use of this particular shot-in-the-arm at some time in the future when the need is more clearly evident than it has been in the past year.

I feel distinctly uneasy concerning the recent behavior of the stock market, for no more subtle reasons than the rate at which prices have risen and the apparent character of public participation. Stock market activity has always seemed to me more rationalized about than rational. Insofar as I have an opinion on the recent change in margin requirements it is that the Board should have moved sooner and farther than it did.

The third part of my statement is concerned with more general aspects of monetary policy. I submit that the economy is significantly different from what it was before 1939. In saying this I exclude actions that may be deliberately taken by the Government, though I do not exclude developments, such as social security, tax structure, and size of the debt, which involve the Government. In particular, the economy tends to be, comparatively speaking, more resistant to deflation and more susceptible to inflation than in the past. To the extent that the economy is inherently more stable, especially against contraction, stabilization measures will appear to be more effective than they actually are. This will be especially true in periods of contraction.

In his Treatise on Money published in 1930, Keynes declared that it was easier for monetary authorities to combat deflation than inflation. Under the influence of the experience in the thirties precisely the opposite opinion came to prevail. Attempts by central bankers to overcome deflation were likened to pushing on a string. However valid the conclusion at the time, the contention amounted to the substitution of analogy for analysis. It left wholly out of account the relation of the state of the economy to the effectiveness of monetary controls. We may now have a situation where Keynes' view approaches much closer to the truth—though not, may I say, for the reasons given by Keynes.

Closely related to the foregoing is the point that elements of liquidity in the ecoonmic system, including the relative stability (or more especially the reduced contractility) of the money supply, render changes in the rate of use of money more important and changes in the quantity of money less important than formerly. The effect has been to increase the importance of those instruments of policy which relate primarily to the use of money as contrasted with those which relate primarily to its quantity.

It follows that I consider the present exclusive concentration on the general instruments of credit control, notwithstanding a nostalgic hankering for them, not so much misplaced as anachronistic. For the same reason I feel that other selective controls such as regulations W and X should be made available to the Federal Reserve on a standby basis. I am convinced that the Korean inflation would have been far more moderate if the Board had had these instruments at their immediate command and had employed them promptly and vigorously.

That unfortunate and unnecessary experience was the price paid for our pathological fear of bureaucracy, a fear which keeps us from giving our monetry authorities the power they require to do their job adequately, lest they abuse that power. This is in spite of the self-evident fact that any limitation on the power of the monetary authorities to do harm, as in restricting their use of particular instruments of credit control, is likewise a limitation on their power, under other circumstances, to do good. It is in spite of the further fact that the history of Federal Reserve operations shows that the Board has often suffered from an excess of caution but never from an excess of adventurousness in the exercise of its powers.

In speaking of supplementing the present arsenal of stabilization measures I have gone somewhat beyond a discussion of monetary policies for 1955. At least I hope and expect that this year will present no crisis that will expose the inadequacies of present monetary powers. But I have no confidence that we shall escape such a crisis before the decade is out. And I firmly believe that the time to prepare for crisis is before crisis descends.

I trust I have made it clear that I would go much less far than the report in attributing economic stability, past, present, and future, to governmental interference. And I would go much further than it does in urging that a full complement of powers be available for more serious tests that surely lie ahead.

(The following replies were subsequently supplied for the record by Mr. Whittlesey in response to Representative Patman's questions:)

1. In the event of a general dumping of governments, the Federal Reserve should definitely intervene to support them.

2. I do not wholly approve of actions taken at the time of and after the accord. Nevertheless, I do not believe that it is now necessary or desirable to establish rigid price supports for Treasury securities.

3. Federal Reserve notes should not be included as part of the national debt. The promise form which circulating notes (United States notes, Federal Reserve notes, and others) still retain is a vestigial survival from the historical past. It is meaningless, a pure ritual, and signifies nothing as to their true economic character.

STATEMENT OF ELMER WOOD, PROFESSOR OF ECONOMICS, UNIVERSITY OF MISSOURI, TO QUESTIONS ASKED BY THE JOINT COMMITTEE ON THE ECONOMIC REPORT ON THE SUBJECT OF MONETARY POLICIES

1. What should be our monetary policy in 1955 with respect to the quantity of money and credit? Should we have (*a*) a fixed quantity of bank credit, (*b*) a decrease in the quantity, (*c*) an increase in the quantity comparable to the increase in physical production, or (*d*) an even more rapid increase in the quantity?

The ultimate tests of monetary policy that seem useful resolve into facts about prices and about employment. As long as employment is no higher than it is at present, and as long as prices are not rising significantly, it seems desirable to follow a policy of monetary ease—about such as we had in the latter part of last year. If we should have still further recession, monetary expansion should be stepped up.

If prices should start rising significantly during 1955 while there is still considerable unemployment, we should compromise. Everything considered, we should be willing to see some rise of prices if unemployment remains as great as it is now. On the other hand, we should not be willing to purchase full employment—with the percentage of unemployment, say, at the early 1953 level—at the expense of inflation at the rate, say, of 5 percent a year for very many years. These figures are illustrative and are not intended to suggest a formula. I do not think we can operate on a formula.

Because of upward pressures on prices from the supply side we are probably faced with creeping inflation over the long run. The monetary authorities cannot be expected to hold back these upward pressures simply by monetary restriction. The innocent would suffer more than those responsible. The problem needs to be attacked by policing the power groups. If it cannot be dealt with adequately that way, the monetary authorities will compromise in favor of some inflation. The public will demand that they behave that way.

We come now to a different aspect of the question as stated. The question seems to imply that the amount of money is the appropriate measure of monetary ease or pressure at any given time. Actually, the amount of money reflects mainly the demand for balances arising out of a given cost-price structure and level of economic activity. And since these do not respond immediately to the administrative procedures available to the authorities, but only slowly and cumulatively, the amount of balances shows a similar lack of responsiveness. Thus the amount of balances is a historical result of cumulative forces and not a measure of monetary tendencies at a given moment.

What the authorities need is an instant pointer reading of the change in monetary ease or pressure which they are exerting with the controls in their hands. This pointer reading is the prices of various types of debts.

Nor is the amount of money a very useful test of longer run policy. The longer run tests are prices and the volume of employment. Finally, let us note, a change in the quantity of money is not an instrument of procedure. No board decides administratively what it shall be.

(The above analysis assumes conditions we are likely to be facing. It is not appropriate for runaway inflation.)

2. How should these be carried out: (*a*) through open market operations, (*b*) through changes in reserve requirements, or (*c*) through changes in the rediscount rate?

The problem of the criteria of monetary ease or pressure is involved also in question 2.

The Federal Reserve should make its policies effective through open market operations—allowing their influence to override all other influences. Since their immediate criteria of pressure should be the prices of debts, they should determine the prices of Government securities directly—but always with reference to the more ultimate aims of policy.

The Open Market Committee should be free to enter all sectors of the Government securities market. Short rates reflect mainly the immediate degree of pressure. Long rates reflect expected monetary conditions over an extended period. The Federal Reserve, by entering the long-term market, can influence the market's expectation of policy in more than the immediate future. The present procedure of changing the volume of reserves as such, with operations confined to bills, allows unnecessary variations in rates, and particularly in long rates.

The Federal Reserve must of course allow for changes in the debt structure and changes in the demand for debts of different maturities. But these are minor factors affecting rates compared with monetary ease or pressure.

The objection to the use of the discount mechanism as a means of control is that it produces accidental changes in monetary ease or pressure—changes which have no meaning from the standpoint of control. There is no reason for allowing interest rates to reflect such irrelevant facts as the need of member banks to borrow as the result of changes in the currency in circulation, changes in Treasury deposits, and the like.

In the past the discount rate has been a general symbol of policy as well as an instrument. But there is the difficulty that the need to keep the rate at a level that will not permit the banks to profit from borrowing at the Federal Reserve interferes to some extent with its use as a symbol. On the whole, it seems better not to go back to earlier analogies for procedure but to start from the procedure developed during the past 15 years.

Changing the member banks' reserve requirements should not be used as a flexible instrument, but simply for influencing the earnings of the commercial banks and of the Federal Reserve. In recent years especially, changing the reserve requirements seems to have been used as a symbol of policy, but that use of the power interferes with its purpose for influencing the division of profits from money creation.

At the present time, some officials inside the Federal Reserve, but not all, consider that changes in yields on Government securities reflect mainly the natural forces of supply and demand in the market. Such ideas lead to confusion when one is trying to analyze Federal Reserve procedure and the criteria of immediate and more ultimate results. Long rates, of course, do reflect to some small extent other than monetary factors, but in the main they show the market's reaction to what the Federal Reserve officials have done and what this seems to portend for future action.

3. Comment on monetary and credit aspects of the President's economic program.

The President's program with respect to monetary policy is to "restrain and offset any tendencies that may develop toward recession or inflation." The great majority of economists would no doubt agree with this general statement.

The statement does not, of course, grapple with the problem of upward price pressures by power groups, and which may make it difficult to facilitate growth commensurate with our capacities without inflation.

4. Are monetary maladjustments developing in any major areas making sustained economic growth difficult, e. g., real estate, consumer credit, stock prices?

See comment under next question.

5. What about the stock market's recent behavior? Are Government controls—e. g., margin requirements—in this area adequate?

One apparent reason for the rise of stock prices is the widely held belief that the dollar is likely to be subjected to further attrition over a considerable period, especially with cold war conditions. Few people who are saving for retirement, for instance, want to trust mainly to fixed-income securities. However, the belief prevalent since 1946 that a postwar depression was not far away tended to hold off the rise of share prices. The public now seem less confident in their belief that a serious depression is near.

As to policy in the face of a stock market boom: It would be most regrettable for the Federal Reserve to adopt a restrictive monetary policy merely because of a rise in stock prices—even a very substantial rise. There is a common notion that the stock market boom in the twenties was the major cause of the great depression. I think this is a mistaken historical interpretation. High values for equities do stimulate real investment; but we need not fear a high level of real investment. In general, we should resist policies intended to dampen booms as such and without regard to whether they are accompanied by general inflation. We should not be satisfied with a low utilization of productive powers. The idea that booms must lead to depression and that depressions are curative and beneficient is very largely a matter of mere credo. Depressions lead to crackup.

The powers of the Federal Reserve to regulate margin requirements seem in general to be adequate. The actual need for such powers is overrated. However, the possession of this selective credit control may relieve the Federal Reserve somewhat from pressure from certain members of the public to resort to general monetary restriction merely in order to halt the rise of stock prices.

(The following replies were subsequently supplied for the record by Mr. Wood:)

Replies to the three questions asked by Congressman Patman at the end of the day.

Mr. Wood. 1. As to the support of Government bonds by the Federal Open Market Committee: The Committee should be prepared at any time to buy or sell Government securities in all sectors of the market whenever their prices do not seem to conform to the general aims of monetary policy. There is a practical question as to what the Committee's limits of tolerance should be. There needs to be some margin of tolerance, but I do not think it should be very large. The prices at which the Committee should be willing to buy or sell would not of course be known to the public in advance and the Committee would revise their targets as circumstances seemed to warrant.

2. As to whether support prices should be at par: The support prices should be selected with reference to the effective yields desired. There is no special significanc to par value as such—other than a psychological one under certain circumstances.

3. Whether the amount of the Federal Reserve notes in circulation should be shown as a part of the total Federal debt: Federal Reserve notes are a contingent liability of the Government, and this fact is presumably shown on some public record. But I think it would be misleading to the average person to add this amount to the interest bearing (and other miscellaneous) debt in publishing a figure of total debt. For one thing, it is not like other debt. Moreover, the Federal Reserve banks hold Government securities as a large partial offset.

(Whereupon, at 5:35 p. m., the committee adjourned until Tuesday, February 1, 1955, at 10 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

TUESDAY, FEBRUARY 1, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas (chairman), Senator Sparkman, Senator Flanders, Senator Goldwater, and Representative Patman (vice chairman), and Representatives Bolling, Kelley, Talle, Wolcott, and Curtis.

The CHAIRMAN. Gentlemen, the panel will come to order.

We have met to discuss the subject of monopoly and antitrust policies, with particular reference to the report of the Council of Economic Advisers. We invited the Attorney General to be present or to send a representative, and he has declined to do so.

I ask that this letter be included in the record.

Vice Chairman PATMAN. Now, why did he decline, Mr. Chairman?

The CHAIRMAN. The letter is as follows:

> While the Department concurs with the material on this subject contained in the President's Economic Report, I do not think it appropriate at this time either to file a statement or to have a representative of the Department take part in the panel discussion. The report of the Attorney General's national committee to study the antitrust laws is expected to be issued late next month. As we have advised other members of Congress, we believe it best to delay any expression of opinion on our part until the report has been made to the Attorney General and he has forwarded his recommendations to the Congress.
>
> I shall be happy to send an observed from the Antitrust Division, but, in view of what I have said, I do not believe he should either participate in the discussion or make a statement at this time.

May I ask if there is such an observer.

Mr. FOOTE. Yes, sir, Mr. Foote.

Vice Chairman PATMAN. That is another reason why Congress should take a look at these advisory committees. It is actually causing an important official to decline to come before a committee considering the President's report. I look with disfavor on those committees that have farmed out to them legislative work to do, and I think Congress in the future should give great consideration to the advisability of farming out legislative duties to any commission, that one or any other.

The CHAIRMAN. The chairman finds himself in intellectual and emotional sympathy with the point made by the gentleman from Texas.

We also invited the Chairman of the Federal Trade Commission to appear, but he states that it was necessary for him to undergo a minor eye operation and he is presently recuperating at his home. Mr.

Howrey did prepare a statement. I ask that this statement be made a part of the record.

(The statement referred to is as follows:)

STATEMENT OF EDWARD F. HOWREY, CHAIRMAN OF THE FEDERAL TRADE COMMISSION, AT A PANEL DISCUSSION ON MONOPOLY AND ANTITRUST POLICY BEFORE THE JOINT COMMITTEE ON THE ECONOMIC REPORT

After considering the subject of this panel discussion and the topical outline thereunder, it seemed to me that I could most effectively contribute to the preliminary discussion today by briefly describing current programs and progress at the Federal Trade Commission. Then I shall be glad to enter into such further discussion of the subject as the committee may desire.

LEGISLATION

Before I refer to the Commission's current program, I should like to state that as a member of the Attorney General's National Committee to Study the Antitrust Laws, I would prefer to withhold specific legislative recommendations until after that group makes its report. I do feel free, however, to discuss a proposal which is now before Congress, a proposal to raise the maximum fine that may be imposed under the Sherman Act. The Federal Trade Commission is on record as supporting such legislation. The Commission is not directly concerned with the matter of criminal penalties under the Sherman Act, but it does have duties and responsibilities under the Federal Trade Commission and Clayton Acts which are supplemental to the Sherman Act and which aid in carrying out the public policy expressed in that act. It is apparent from the experience of the Commission in this field that the present criminal penalties in the Sherman Act are inadequate. The Federal Trade Commission accordingly is in favor of strengthening substantially this deterrent to violation of the Sherman Act.

SMALL BUSINESS

We at the Commission are in full accord with the following statement which may be considered a keynote of the economic report in our field: "A public policy to encourage the expansion of a free economy must assign a high place to measures that keep the doors to opportunity open for new and small enterprises." Specific aids mentioned in the report are tax revisions, access to adequate financing, a fair share of Government contracts and competent counsel. It is in the latter field, counseling, that the Federal Trade Commission is able to render some assistance.

Before the enactment of the Federal Trade Commission Act, both political parties, the Congress and the President, envisioned a trade commission which would, as part of the administrative process, provide solutions to many complex competitive problems through consultation. It is my hope that the new Bureau of Consultation, which was established 7 months ago, will revitalize this intended program. The new Bureau includes, in addition to the Divisions of Trade Practice Conference and Stipulations, a Division of Small Business. The establishment of the latter Division was considered important in order to make the facilities of the Commission readily accessible to small business concerns. Among other things, the Division advises small-business men with respect to laws administered by the Commission, explains to them the method by which complaints are initiated, explains trade practice conferences and other services of the Commission, informs them of the status of investigations in which they are interested, and otherwise expedites small business matters through the Commission.

There has been a gratifying response on the part of the business community, particularly small business concerns, to the consultation program. Our new Division of Small Business has become one of the most hardworking sections of our staff.

COMPLIANCE

Another major step in the Commission which will be of great benefit to small business has been the institution of an integrated compliance program to provide a systematic review of the presently outstanding 4,500 cease and desist orders, 8,000 stipulations and 2,000 trade-practice rules. It is useless, it seems to me, for the Commission to enter orders unless it sees to it that they are obeyed either voluntarily or through appropriate enforcement proceedings against those who deliberately or willfully ignore them.

Failure to obtain compliance constitutes a waste of public money, has a demoralizing effect on competitors and members of the public who have been injured and tends to encourage a disregard of antitrust and trade regulation laws, oftentimes to the direct detriment of small businessmen trying to enter or remain in a highly competitive market.

Since August 1, 1954, more than 1,000 of the Commission's old cease and desist orders have been examined and the files reviewed. Of this number about 400 orders have been screened out as requiring no attention at this time; 366 supplemental reports of compliance have been requested; and in about 300 cases respondents are now known to be in compliance. As a result of this survey of old orders, 16 compliance field investigations have been instituted and 2 civil penalty suits are in preparation. This is in addition to other normal compliance work which during the calendar year included certification to the Attorney General of 5 civil penalty suits. Altogether there are pending 50 field investigations to determine the manner in which respondents are complying with the Commission's cease and desist orders.

MERGERS

Another field in which I am sure you have great interest is that of mergers. The new antimerger law, section 7 of the Clayton Act as amended, is an important and vital part of national antitrust policy. This act shows a strong and continuing purpose to curb acquisitions which adversely affect competition. We consider this one of our most important statutes and are pledged to enforce it with vigor.

The Federal Trade Commission, as most of you know, has undertaken an economic investigation of recent mergers and acquisitions. The purpose of the study is to determine facts regarding mergers for the information and guidance of the Commission, the Department of Justice, the Congress and the public.

In addition to its general economic study, the Federal Trade Commission is considering a large number of individual mergers. Competition may be injured by some mergers and revitalized by others. Each acquisition must therefore be tested in the light of relevant economic and marketing factors existing in the particular industry.

ROLE OF ECONOMICS

In merger work and other antimonopoly work of the Commission, economic and marketing problems are of great concern. For this reason the Commission's Bureau of Economics has been revitalized to enable economists to work closely with our investigators and trial lawyers. We are placing primary emphasis upon those practices that have significance in the market place and that have or are likely to have some economic consequence.

The Commission recently has published 2 economic reports, 1 on Changes in Concentration in Manufacturing, and the other on Coffee Prices. I believe both to be fair, honest and objective studies. I believe that the coffee report is one of the best economic studies ever published by a governmental agency.

DELAY

Looking back on the last 2 years, I believe one of the greatest contributions will be the result of our full-fledged attack on delay—the greatest enemy of administrative law. I am happy to say that we have been able to eliminate 50 percent of the procedural steps within the Commission and we have cut down the backlog of our cases over five times.

An example of the progress achieved relates to the speed with which litigated matters are being decided by the Commission. On April 1, 1953, when I assumed the chairmanship, there were 42 formal cases which had been briefed and argued and submitted to the Commission for decision and which had been assigned to individual Commissioners for 30 days or more. Of these, only 10 had been assigned in 1953, 27 in 1952, and 5 had remained unacted upon since 1951, 3 since January 5 of that year. In contrast, on December 31, 1954, only 9 cases had been unacted upon for more than 30 days and, with only 2 exceptions, all had been assigned during or after September 1954.

An important step contributing to the elimination of delays has been reorganization of the Commission to promote more efficient and economical use of manpower. In the revamping of our entire investigational setup, all investigative functions have been centered in a new Bureau of Investigation. The use of project attorneys to supervise cases throughout their entire course has already paid dividends in time savings. The adoption of a workable consent order procedure has speeded the litigation process.

CONCENTRATION ON IMPORTANT CASES

The Commission has adopted the view that it should proceed against the "hard-core" type of violation and forego peripheral cases of doubtful validity and questionable economic consequence. We feel we should not deplete our limited resources on fringe issues having no practical benefit. In this connection, we feel that the Sherman Act, the Federal Trade Commission Act and the Clayton Act, with its Robinson-Patman amendment, can be successfully administered as interrelated expresions of national antitrust policy—not as separate and conflicting statutes.

While the Commission is concentrating its big guns on the serious cases and is able to dispose of many more of the less serious matters through voluntary agreements to cease and desist, it should not be inferred that the Commission is reluctant to initiate litigation where required by the pubic interest. The following figures show that there has been no letdown in our litigation program:

Antimonopoly complaints issued during last 4 fiscal years

Fiscal year 1951	29	Fiscal year 1953	29
Fiscal year 1952	29	Fiscal year 1954	30

Antimonopoly orders issued during last 4 fiscal years

Fiscal year 1951	23	Fiscal year 1953	24
Fiscal year 1952	24	Fiscal year 1954	25

Deceptive practice complaints issued during last 4 fiscal years

Fiscal year 1951	80	Fiscal year 1953	72
Fiscal year 1952	75	Fiscal year 1954	93

Deceptive practice orders issued during last 4 fiscal years

Fiscal year 1951	98	Fiscal year 1953	82
Fiscal year 1952	108	Fiscal year 1954	80

FTC DECISIONS

Mindful of the fact that Federal Trade Commission decisions have often been criticised in the past for lack of clarity and for formal and legalistic phraseology, the Commission has taken the needed remedial steps. Facts are now stated clearly in narrative and descriptive reports. There are separate opinions in every case.

To assure a proper functioning of the Commission as a quasi-judicial agency, steps have been taken to increase the authority of the hearing examiners who, as the triers of fact, are of key importance in the administrative process. The Commission presently is engaged in a comprehensive study of its rules of practice. On the basis of this study, it is fair to expect that the Commission will be able to revise its rules and thus to improve its administrative procedures.

ADVISORY COMMITTEE ON COST JUSTIFICATION

In November of 1953, we announced the appointment of members of the Commission's Advisory Committee on Cost Justification. The purpose of this committee, which consists of outstanding specialists in the field of distribution cost accounting, is to ascertain the feasibility of developing standards of proof and procedures for costing for adoption by the Commission as guides to businessmen desiring to comply with the Robinson-Patman Act. The work of this committee should result in a strengthening of the administration of the act and result in wider compliance with its provisions.

LIAISON

Some mention should be made of the steps taken to improve the relationships existing between the Commission and other agencies of the Government. I have long deplored instances of overlapping and conflicting activities. It is inconceivable to me that there is justification for noncumulative remedies being sought by more than one agency against the same person, at the same time, for the same thing.

I am especially grateful for the fine arrangement that we have with Stanley N. Barnes of the Department of Justice. We discuss matters of mutual concern at frequent intervals, and I am strongly convinced that the great volume of our work is in no way overlapping.

In the field of food, drugs, and cosmetics, we have been able to work out with Secretary Hobby a very promising interagency agreement designed to correlate the work of the Commission and the Food and Drug Administration in such a way as to eliminate overlapping activities and duplication of effort. This agreement has been in effect since last July 1.

Similar liaison arrangements, although less formal, have been made with other agencies, including the Bureau of Standards, the Post Office Department, and the Patent Office.

The CHAIRMAN. This morning we have two primary questions which we wanted to ask the members of the panel, but, of course, they should not necessarily feel themselves circumscribed by those questions, and I think that we can call upon them in turn and have them present their views on both of them together in 5 to 7 minutes, and then we will have further discussion.

The two questions are these: First, are the facts and recommendations of the President's Economic Report adequate with respect to (*a*) competition, (*b*) monopoly, (*c*) bigness, (*d*) the merger movement, (*e*) business structure, (*f*) price policy, and (*g*) fair trade.

2. What is the general effect of monopoly, quasi-monopoly, or imperfect competition on (*a*) prices, (*b*) production, (*c*) costs, (*d*) profits? What are the social implications involved?

I am going to ask Mr. Adams to begin the discussion.

OPENING STATEMENT OF WALTER ADAMS, ASSOCIATE PROFESSOR OF ECONOMICS, MICHIGAN STATE COLLEGE

Mr. ADAMS. Thank you, Mr. Chairman.

My name is Walter Adams. I am associate professor of economics at Michigan State College and a member of Attorney General Brownell's National Committee to Study the Antitrust Laws. However, I appear here as a private citizen and do not purport to represent any institution or organization.

The prevention of monopoly and the promotion of competition receive only incidental treatment in the President's Economic Report. While the report recognizes the Government's

> responsibility to maintain easy entry into trade and industry, to check monopoly, and to preserve a competitive environment (p. 50)

it scarcely suggests how these generally accepted goals are to be implemented.

Fundamentally, it fails to face up to the crucial issues. Thus the report states that Congress has established a policy of assuring small business of a fair share in the procurement program, but it does not indicate to what extent the executive agencies have carried out the will of Congress. It does not indicate the extent to which legislative wisdom is being vitiated by administrative shortsightedness and incompetence. The report recommends increased Federal expenditures on research and development, but it does not recommend that the fruits of such research be made freely available to all bona fide business enterprise.

The report suggests an increase in antitrust fines as a deterrent to future violations, but it does not say that, at a time of virulent merger activity, the inadequate fine is hardly the most important obstacle to effective antitrust enforcement. Finally the report proposes that the line between public and private enterprise be redrawn, but it does not insist on redrawing this line with a view toward promoting competition and attenuating monopoly.

Deficient on these specific counts, the President's report is subject to a more general, and probably more crucial, criticism; viz, its total disregard of one of the most important monopoly forces in America today—the United States Government. Thus the report fails to show how the exercise of particular powers of government may create the very monopoly which the antitrust authorities are later called upon to destroy. A few illustrations should make my point clear.

Now, Mr. Chairman, if I am to be restricted to 7 minutes in the opening statement, I wonder if I could skip some of the portions in my prepared statement here and file this statement as a whole for the record?

The CHAIRMAN. Certainly.

Mr. ADAMS. I discuss here the spending power, the taxing power, the proprietary power, and that deals with the disposal program, and the legislative power, and finally I come to the regulatory power, and here we see in boldest relief the creeping paralysis of monopoly. Here we see the marasmus of the regulatory process, its injurious effects on the consumer and its debilitating influence on the industry concerned. Here we see the subversion of competition via regulation. Let me cite some recent examples.

In 1948, the Supreme Court ordered the vertical divorcement of the Big Five in the movie industry. Each of the Big Five was required to separate the production of movies from exhibition, so as to prevent foreclosure of the market by vertical integration. Then, in 1953, the Federal Communications Commission authorized the merger between American Broadcasting Co. and United Paramount Theatres, and acquiesced in the control of Paramount Pictures by DuMont TV. This meant not only a sizable horizontal combination between a movie exhibition chain and a TV network, but also the vertical integration between a movie producer and a TV exhibitor. It vitiated potential interindustry competition between two basic communication media, and brought about the very vertical integration which the Supreme Court had earlier sought to eliminate.

In another action, the Federal Communications Commission decided on an allocation pattern for TV channels which may doom competition in this young and dynamic industry. According to Allen B. DuMont—who is no academician and who has met a payroll—the Commission's allocation pattern will result in a two-network monopoly in the television industry.

Other witnesses before the Senate Interstate and Foreign Commerce Committee agreed with this contention. They pointed to the fact that competition hinges on the survival of UHF, and that UHF cannot survive unless the Commission equalizes the terms on which UHF competes with VHF. Thus it is clear that the FCC ground rules will determine whether newcomers in this concentrated industry are to have a climate in which competition can thrive and prosper, and whether the TV audience is to enjoy the variety of competition or accept the impositions of monopoly.

In the transportation field, there are especially strong indications that the type of regulation may be unwise and the amount of regulation excessive. There is more than a germ of truth in the observation that the regulatees have wound up doing the regulating.

When the I. C. C. Act was passed in 1887, the railroads possessed considerable monopoly power. But today the situation is different. In the passenger field, the airplane, the bus, and the private conveyance protect the consumer against potential exploitation. In freight, the common carrier, contract, and private trucks seem to give the railroads quite a run for their money.

Yet competition in the trucking business is artificially restricted. No common-carrier truck can operate in interstate commerce without first obtaining a certificate of convenience and necessity and without submitting to rate regulation and route determination by the ICC. Why? What is there about trucking to justify this kind of public utility regulation? Very little, in my opinion. Here is an industry which closely approximates the pattern of perfect competition. There are many firms in the industry and, in the absence of regulation, there would be more. The product is fairly homogeneous and standardized. Entry would be easy, because of relatively low capital costs and because the roadbed is provided at public expense. Moderate fixed costs make price discrimination and cutthroat competition an unlikely eventuality. Nevertheless, we refuse to rely on competition as a means of protecting the consumer interest. Instead we depend on a regulatory agency which shows an inordinate concern for sagging railroad properties and for the vested interests of established trucking companies.

In my view, this is ill advised. There seems no economic justification for limiting entry into this industry as long as the public is assured that common-carrier trucks are financially responsible, follow the necessary safety regulations, and possess the proper surety qualifications. Here is an industry which is no more a public utility than restaurants, laundries, or filling stations. Here is an industry where gradual, but substantial, deregulation seems feasible, practicable, and desirable.

Finally, we have the case of the airlines. When the Civil Aeronautics Act was passed in 1938, domestic trunklines flew 479.8 million revenue passenger-miles. By 1952, this total had increased to 12,188.7 million, a 2,500 percent growth. Despite this tremendous expansion, however, not a single new trunkline passenger carrier has been certificated. Established carriers have thus been given what amounts to a perpetual monopoly over a new and growing industry.

Here, again, there is no economic justification for what seems to be a complete and permanent bar against the entry of newcomers. The skyways are free and the airport facilities are provided with public funds. Capital costs are moderate and new facilities can be added in relatively small doses. Given the tremendous increase in the demand for air travel there seem to be no compelling technological or economic factors militating against the entry of at least 1 or 2 new carriers.

Moreover, the experience with the nonskeds shows how necessary the energizing and invigorating stimulus of competition is. It was the nonskeds who had enough faith in the future of air travel to introduce coach service at a time when the Big Four though that such service would entail substantial losses and would fail to promote an increase in the demand. It was the nonskeds who rejected the caution, conservatism, and restraint of the big companies, and who refused to bow before the apparition haunting every monopolist, the assumed inelasticity of demand. It was the nonskeds whose initiative, enterprise, and daring proved that competitive rate reduction is more effective than the belief in the might of inelasticity.

If for no other reason than past performance the certification of new competitors is urgently needed, competitors who do not demand subsidies from the Government, competitors who are dynamic enough to assure a phenomenal growth in a phenomenal industry. Such growth will benefit not only the consumer; it will not only enable Michigan residents to escape harsh winters with an airline trip to beautiful Arizona, it will also contribute to our national defense, which depends on a strong and vigorous airline industry.

In conclusion, let me say that contrary to the prediction of Karl Marx and the belief of his unknowing and unwitting disciples, monopoly in America is neither natural nor inevitable. Rarely is it a response to technological imperatives or economic necessity. Never is it the result of spontaneous generation or natural selection. More often than that monopoly is the result of unwise manmade privilege creating legislation which throttles competition and restricts opportunity.

I think it is idle to expect enforcement of the antitrust laws alone to assure us of a competitive economy in years to come. We cannot have competition if the Government creates what the antitrust laws are designed to prevent, if the Government itself helps fashion the economy in the image of the cartels.

The CHAIRMAN. Thank you very much.

(Mr. Adams' prepared statement appears at p. 572.)

The CHAIRMAN. Mr. George.

OPENING STATEMENT OF EDWIN B. GEORGE, DIRECTOR, DEPARTMENT OF ECONOMICS, DUN & BRADSTREET, INC., NEW YORK, N. Y.

Mr. GEORGE. With your permission, I will follow Mr. Adams' precedent and read extracts from my report. I have taken my lead directly from the Economic Report itself, giving the bulk of my attention to the question of assistance to new and small business.

The policy issues here can be grouped under five headings: General management, industrial relations, availability of capital funds, research and development activities, and taxation.

With respect to access to capital funds, the Economic Report calls attention to the apparatus established by Congress in 1953 to help small business to obtain adequate financing, claims that this has made a useful contribution and in consequence recommends that the lending authority made available—now almost fully committed—be enlarged. I do not have much in the way of general criticism to offer of SBA's operations under the statute. Their rules, especially that requiring would-be borrowers to explore private channels before turning to the

Government seem well devised and aid has still been given in a significant number of cases. However, I do not see where this kind of facility carries us far along the road to solution of what a study I made several years ago persuaded me may be the prime need, namely, provision of equity capital, or at any rate some combination of debt money, common-stock money, and preferred-stock money, as in the sandwich deals of the British I. C. F. C., for businesses with requirements that banks and other lending agencies cannot meet owing to a mixture of prevailing standards, legal barriers, and concern for their creditors' funds even though they recognize the merit of the objective, and which cannot obtain funds from security markets save at prohibitive cost. The area of primary interest has been defined by a fellow-panelist, Dr. Kaplan, as including "the kind of businesses that can really compete with larger businesses." It is the area between eight and a hundred employees, and in some cases a little more than a hundred employees.

After reviewing domestic and foreign experience and looking at the galaxy of remedies proposed, my impression was that the one most worth trying was that envisaging establishment of regional capital banks under Federal Reserve auspices—the approach embodied in bills introduced in several previous sessions of Congress by a former chairman of the Joint Committee, Senator O'Mahoney. The scheme has too many angles to permit full treatment here. I shall note merely that it seems best to begin on a pilot-plant basis, selecting one or a few FRB regions in which need for assistance is thought to occur most frequently and in which the resident Reserve banks themselves have been urging action, stipulating that firm arrangements should be made from the outset for provision of complementary managerial and technical aid and for compelling applicants to accept such aid, if the financing agency deems necessary.

As to research and deevlopment activities, my guess is that Mr. Lilienthal's book—despite imperviousness to the existence of a problem of diminishing returns—probably reflected a large body of opinion in claiming that our rate of progress during the past quarter century is attributable to a "new competition" characterized by incessant product and process innovation, which in turn largely arose from research by large concerns competing in this fashion. It seems to me that Dr. Kaplan takes a similar view in his recently published study of big enterprise in a competitive economy.

This general slant invites some comment. First, and of lesser importance, it is by no means demonstrably true. On the subject, Prof. Edward S. Mason made some pertinent observations last year:

> * * * the fact that research expenditures are highly concentrated in large firms does not mean that important product and process innovation is the product of large firms. This is something about which we know next to nothing. (The New Competition, Yale Review, autumn, 1953, p. 44).

Prof. M. A. Adelman has expressed himself similarly in Northwestern University Law Review, Symposium Review of Galbraith and Lilienthal, May-June 1954, page 157. Even if, however, large firms are now the main sources of progress, one may doubt whether this must necessarily be so. As Mason notes, the rate of advance during the past 25 years does not appear to have been greater than in the preceding 25 years, or the latter again above that in the last half of the 19th century. In other words, we grew as fast in a small-concern system as in one dominated by large units. Although, starting with a rich new country, to maintain the same percentage rate of growth over a long period of time is quite a feat, and the basic fact in itself has no bearing on reasons for the eventual growth of large concerns, which in its time has had great positive benefits; only the narrow point is involved.

It is possible that one of the reasons why not only large concerns but large-scale techniques are now so prominent in the economy may be found in a combination of growth in nontechnological hurdles confronting small concerns and of factors operating to place greater relative research emphasis in big outfits on large-scale methods.

On the latter point, there is no doubt that, absolutely speaking, the big research departments spawn many developments exploitable via small-scale methods. These, however, one would expect to be exploited often in product lines which are either altogether new in the system as a whole or, if not being somewhere, are possessed only by concerns other than the finder.

In dealing with their own lines, stress may often be laid upon developments yielding marginal cost savings with setups in which huge capital has already been sunk rather than upon competitive techniques of an entirely different order. Moreover, even where new possibilities do not present a threat to the company's established lines or production methods, one would expect less intensive inspection of the potentialities of those involving only moderate capital outlays than would occur in the case of concerns less well-fortified financially. Under stronger pressure to dig for methods of modest optimal scale, they might well find that these paid off a lot more frequently than is now judged.

It strikes me—and I come now to the nontechnological obstacles small units confront—that deliberate efforts to smooth the path for small concerns considering innovations are quite desirable. Recent liberalization in tax treatment of unusual research and development expenses, discussed below, should contribute to this end, and so, too, would improvements in access to capital—knowledge that if attractive prospects came to the fore there was a good chance of obtaining the capital necessary for commercial exploitation providing more incentive to experiment.

But I would not be surprised to learn that even under these conditions room would be found for direct encouragement of research.

Mr. Chairman, because of the shortage of time I will refer only to the remarks I had contemplated making on taxation, a few of which are on page 8, and close with that.

Several real improvements have taken place, notably in two major areas, viz., depreciation allowances and treatment of research and development expenses. Businesses now have more flexibility in dealing with the former and under the 1954 law all outlays for unusual research and development can be deducted as current expenses.

So far as concerns averaging, however, the recent extension of carry-back to 2 years simply restores an arrangement that had been in effect during the period I am using as a base and the long carry-forward, though much better than nothing, and of aid to new firms with enough cushion to withstand early year losses, is of uncertain value to small businesses running into trouble after a string of profitable years and being unable to tap outside sources for emergency needs. And, for the rest, the total picture is not much different.

There isn't yet any income exemption—at any rate, from the normal tax. Special treatment has not been accorded to reinvested earnings. The partnership option is still unavailable. And it seems probable that although on balance the jump in absolute fraction of pretax earnings taken by the Government was somewhat lower for small corporations, the dollar loss has injured the small outfit's ability to expand more than it has that of the large firm, because of lesser ability to take outside funds.

The CHAIRMAN. Thank you very much.

(Mr. George's prepared statement appears at p. 575.)

The CHAIRMAN. Mr. Kaplan.

OPENING STATEMENT OF A. D. H. KAPLAN, SENIOR STAFF MEMBER, THE BROOKINGS INSTITUTION, WASHINGTON, D. C.

Mr. KAPLAN. As has already been indicated, the Economic Report of the President, January 1955, explicitly defers the administration's general treatment of the subject of monopoly and antitrust policy until The Attorney General's National Committee To Study Antitrust Laws has reported its findings (p. 48). The withholding of any reference in the Economic Report to the current wave of corporate mergers is presumably on the same ground. The Federal Trade Commission announced last October it had embarked on a study of recent mergers in the light of the section 7 amendment of the Clayton Act of 1950, and that a report would be speedily prepared.

What comes closest to the subject of competition and monopoly in the Economic Report is the section under the subhead "Assisting New and Small Businesses," (p. 49). It refers to the Small Business Act of 1953 establishing an independent Small Business Administration in the Executive Office of the President, and recomends that the life of the agency be extended beyond the present expiration date of June 30, 1955.

The Small Business Administration was designed primarily to help small businesses in obtaining and carrying out Government procurement contracts, and in getting loans. But this temporary facility for supplying emergency aid to small businesses that are unable to obtain private financing does not cover the broader need (to which Mr. George has already referred) of a regular, continuing channel for investment banking at the small business level.

Bills introduced in earlier sessions of Congress by Senator O'Mahoney, and others, to help establish a system of investment banks to handle the capital financing of new and growing small-scale enterprises failed of enactment. The chairman of the Select Committee on Small Business in the Senate—and I see Senator Sparkman is here also as a member of this joint committee—has introduced a similar bill for this session. It directs the formation of a system of regional investment companies under the aegis of the Federal Reserve System, with the commercial banks and other appropriate agencies as subscribers. It provides for a wide range of equity and debt financing to new and growing smaller scale enterprises to which neither the Small Business Administration nor our present private banking facilities are geared.

The development of a regular channel of investment for small business, to parallel on a smaller scale the means of capital financing available to large-scale enterprise, must be regarded as a major step in maintaining the balance of power and opportunity in our private business structure.

Larger-scale enterprise has reaped benefits from increasing attention to research and innovation. but that is not to say that innovation is exclusively the province of big business. On the contrary, there is the continuous mutual stimulation and cross-fertilization of invention and ingenuity in production and market development between large and small business. Many familiar product innovations in modern business—like the diesel locomotive, the vacuum can, rayon, and cellophane—had their origin in the inventiveness of individuals and the enterprise of small concerns. At this very time, in what is loosely called the electronics industry, numerous small laboratories and plants are creating the basis for growth into what may in years ahead show up as another Sylvania, Carrier, or IBM. But more often the important innovations of individuals and small enterprises do not realize their full economic potential until they have been turned over to the larger enterprises, equipped with highly organized technical and financial resources.

It has frequently been pointed out that the underwriting of funds for expansion of small business is prohibitively expensive and unprofitable under present conditions. The regular investment banker is not equipped to handle that type of business. The commercial banks have been dissociated from investment affiliates and are not expected to share in the ownership risks of the small enterprise. Nor are they prepared to supply the managerial guidance without which the mere furnishing of capital may prove ineffective.

This is an area that has to be plowed and carefully nursed along until the techniques are learned whereby the capital financing of the small enterprise can be made a self-supporting and profitable institution in our economic structure.[1] Until this is done we shall continue to see small businesses selling out to big business because they have reached the limit of their own financial resources. We shall continue to see established small businesses abandoned or sold to the larger enterprise upon the retirement of the small-scale proprietor due to the financial inability of associates or other small entrepreneurs to take over. And many a promising venture will be stillborn for lack of a regular channel for screening, encouraging, and developing small-scale ventures.

This type of capital banking, supported by competent guidance in developing new and small enterprise, has already become a useful feature of the British and Canadian financing structures. It is hoped that Congress will speed the filling of this gap in our national banking system under conditions that will make the venture self-supporting and eventually profitable.

To maintain a vigorous small-business sector in the structure of our competitive system also requires that we do not standardize the small-scale operation to the point where it is deprived of needed

---

[1] I have previously testified at length on this subject before the Joint Committee on the Economic Report, hearings on volume and stability of private investment, 79th Cong., pt. 1, September 27, 28, and 29, 1949.

flexibility in competition and freedom of economic oportunity. Two aspects of this problem that appear timely for public consideration are retail pricing and labor relations.

In the 1930's some segments of small business took refuge in resale price maintenance legislation and other State fair-trade laws, reinforced at the Federal level by amendments to the Sherman and Clayton Acts. During the sellers' market that followed World War II relatively few overt inroads upon the legalized price-fixing barriers were attempted. The more recent trend toward a buyers' market has, however, stimulated a spontaneous undercutting of resale prices that had apparently been set to cover high distribution costs and margins for the orthodox retail market.

The time appears ripe to reexamine the effects of the fair-trade legislation and the support given to it by Federal legislation, on competition and consumer spending habits. The dollar-conscious consumer who has turned his patronage to the discount house has thereby raised the larger question as to how far the standardization of merchandising in the business population may be regarded an end in itself, for the protection of which the consumer public is to pay the price of substantial subsidies as it has done in other areas of the economy.

I come now to another trend toward rigidity in our business structure, in the labor area, which affects the prospect for the survival of small-scale enterprise. New business needs to be able to bid effectively for labor as well as for capital. Small business is involved in the progressive attainment by organized labor of a position where the strength of union membership in large-scale enterprise can be successfully mobilized behind the drives to standardize wage levels and income security across industry through collective bargaining. Where the industry pattern is set by negotiation with the dominant firms, little choice is left for collective bargaining with the smaller firms. The small enterprise must fall in line on wages, job classifications, supervisory personnel, time schedules, etc., without due regard to the differences in the conditions applicable to small-scale operation.

Government unemployment insurance and retirement programs have had the virtue that the benefit claims are vested in the worker and can move with him. His unemployment benefits help him to support himself and family while he is seeking other suitable work. Now, partly because Government insurance did not keep abreast of rising living costs, organized labor has sought to supplement Government insurance with unemployment guaranties by individual companies in particular industries; here the employee's claim to such supplementation is dependent upon his remaining attached to his company and industry. Here, obviously, it is the diversified big enterprise that will be in the best position to make the guarantee to recruit labor and hold it. If the two forms of benefits—the public and the private—are given simultaneously, the mobility supplied by Government insurance tends to be offset by the rigidity of the labor force which is fostered by company supplementations won in collective bargaining. It seems necessary, therefore, in the public interest, to withhold Government unemployment insurance until company guaranties have been exhausted, and thus save it as the reserve cushion when the worker realizes that his old job no longer exists for him. (This point of view is not intended to minimize, however, the importance of retraining, to provide suitable employment within the same company or industry in keeping with technological change.)

Taken singly, the income objectives advanced by the labor leadership have been defensible as coming for the most part within the bounds of what can currently be drawn from the economy. There is nonetheless a major long-range problem of reconciling the trend toward standardized worker security patterns with the survival of that mobility in the American economy which has been the basis of successful business entry and a potent force in raising and widely distributing real income.

The CHAIRMAN. Thank you.

(Mr. Kaplan's prepared statement appears at p. 579.)

The CHAIRMAN. Mr. Mund.

OPENING STATEMENT OF VERNON A. MUND, PROFESSOR OF ECONOMICS, UNIVERSITY OF WASHINGTON, SEATTLE, WASH.

Mr. MUND. Mr. Chairman, members of the Joint Committee, I have an 8-minute statement which I would like to read. Since everybody has a copy before him, I shall read it quite rapidly.

It is significant that the Employment Act specifically states that maximum production is to be promoted in a manner calculated to foster free competitive enterprise. The two, indeed, in our system, are closely related. The more effectively freedom of entry and price competition operate the less will be the need to resort to public spending and other monetary-fiscal measures.

1. THE PROBLEM OF RIGID PRICES IN DEPRESSION PERIODS

Why do business executives in certain industries, such as steel, maintain prices, and actually increase them in the face of declining demands? Why were industrial prices in the recession of 1953–54 more stable than in the recession of 1948–49? Has the upsurge of mergers accentuated price rigidity?

There is substantial agreement among economists that rigidity, or inflexibility, of industrial prices in the face of declines in demand associated with periods of recession is closely correlated with monopolistic behavior, such as basing-point and zone pricing, price leadership, and collusive trade association activity. Monopoly is the power to manage price and to fix a price at constant levels over a period of weeks or months, regardless of changes in demand.

In competitive industries, prices adjust downward with declining demands, to provide a selling outlet for available supplies. Monopolistic, oligopolistic, industries, on the other hand, typically peg their prices. This action prevents a clearing of the market or causes underutilization of plant facilities. It is an action, moreover, which has secular and long-lasting consequences. The evil is that for years monopolistic industries prevent and retard the reduction of prices which they control. Unemployment and unused capacity in these industries grow and persist.

The problem of rigid prices is twofold. First, there is the problem of the power to manage prices. When was this power achieved? How was it achieved? What forms of direct control or antitrust action should now be taken with respect to it?

Secondly, there is the problem of why business managers, having the power to manage prices, desire to peg prices, absolute constancy, for periods of months or even years. Subsequently, I shall discuss these questions, if it is desired.

2. THE ANTIMERGER ACT OF 1950 AND ITS APPLICATION BY THE FEDERAL TRADE COMMISSION

In applying the law in the Pillsbury case, 1953, the Commission rejected the proposal of its attorneys, based upon the reports of congressional committees, that the "substantiality test" should be used as a yardstick—that is, "where a leading factor in the relevant market having a substantial share of that market, acquires another factor in that market also having a substantial share of that market," and the effect may be substantially to lessen competition. Instead, the Commission adopted a rule-of-reason approach and declared that it would proceed on a case-by-case basis.

Despite the legislation of 1950, the merger movement is continuing at a rapid pace. Should the rule of reason be added to the act of 1950 when it was not included by Congress, itself? Has the legislation of 1950 been seriously weakened by administrative interpretation?

3. THE RIGHT TO SELECT ONE'S CUSTOMERS

The antitrust agencies report that refusal to sell is one of the most frequent complaints which they receive. Rarely is there any relief for this aggravated form of discrimination. Why is it that particular buyers cannot freely secure supplies, such as gasoline, for cash on the counter, even during periods of excess inventories and unused capacity? Is not freedom of access to markets an essential feature of a free competitive economy? Should Congress reconsider the original draft of the Clayton Act, 1914, which placed prohibitions on arbitrary refusals to sell?

4. IS THE SO-CALLED NEW CONCEPT OF COMPETITION COMPATIBLE WITH THE MAINTENANCE OF A FREE COMPETITIVE SYSTEM?

Currently, efforts are being made to get the courts and administrative agencies to construe the antitrust laws with a new concept of competition. The idea is to define competition so that it will describe existing business practice. As one leading antitrust lawyer has said, "The statutes can be construed administratively to fit the business pattern desired."

The new definition of competition contemplated by the Business Advisory Council of the Department of Commerce, D. E. Lilienthal, A. D. H. Kaplan, and others differ greatly from the concept long used by economists and the antitrust agencies. The essential idea of the new concept is the presence of alternatives from which buyers may choose. It is rivalry "between different ways of meeting the same or a similar need." In this view, competition is seen to be provided through the choices of aluminum or copper, cigarettes, or sweets.

The new concept omits an essential mechanism for the determination of prices, namely, price competition among sellers of a given class of goods. Substitute competition may be an important moderating force, but will it prevent the placing of undue burdens on the public? Does not the acceptance of the new concept mean a revolution in our basic antitrust policy?

5. IS PRICE DISCRIMINATION A COMPETITIVE PRACTICE IN THE PUBLIC INTEREST, OR IS IT A MONOPOLISTIC PRACTICE?

Vast amounts of public testimony and congressional investigation have led to the declarations of national policy in 1887, 1914, and 1936, condemning price discrimination as a monopolistic practice. Historically, the view of Congress has been that the law should protect competition—that it should not condone anything which would injure competition. Recent Federal Trade Commission policy on price discrimination and the Standard Oil of Indiana decision, 1951, have largely destroyed this principle. Today Congress must restudy and decide anew (*a*) if the law should permit discrimination to meet or match another's prices, even though injury to competition has, in fact, resulted; or (*b*) if discrimination should be condemned whenever the effect may be substantially to lessen competition.

6. THE POLICY OF THE FEDERAL TRADE COMMISSION AND THE ANTITRUST DIVISION WITH RESPECT TO BASING-POINT AND ZONE PRICING

In a series of cases, 1945 to 1948, the Federal courts declared that basing-point and zone pricing is a form and method of monopoly. The Pittsburgh-Plus, Corn Products, Staley, and Conduit (Count II) cases, it may be noted, were not based upon conspiracy charges.

In 1948 the Federal Trade Commission declared that most of the industrywide pricing systems were probably illegal. Vigorous efforts were thereupon made to change the law. These failed.

The basing-point industries, however, have been successful in changing the administration of the law. So long as basing-point pricing is carried on "innocently and independently," the Federal Trade Commission stated in 1951, action will not be taken against it. This view is quite erroneous. Legal and economic experts who have dealt with the problem know that the practice is never independently and rarely innocently indulged in.

As a result of its changed policies, the Federal Trade Commission has fallen into a great dilemma. Insofar as two or more geographically separate mills quote local f. o. b. mill prices, and then regularly discriminate, by absorbing freight, to meet delivered prices in each other's backyard, are they not getting the same results as the concerted use of basing-point pricing? How can the practice withstand the inference of conspiracy? Similarly, how effective is the work of the Antitrust Division in condemning conspiracies to maintain basing-point mechanisms, but then permitting systematic freight absorption to match prices? For example, the Ultramarine Blue case, 1954, and the Metal Abrasive case, 1954.

7. RAISING THE MAXIMUM FINE UNDER THE SHERMAN ACT

President Eisenhower is to be commended for his proposal to raise the maximum fine which may be imposed under the Sherman Act. In considering this measure, it is suggested that attention be given to the fact that there are relatively few instances today when Federal judges actually levy the present maximum of $5,000. In some cases, too, the judges levy a fine only on the corporation and not on the officers who devise the monopolistic schemes.

Further, there is the problem that defendants can escape treble-damage suits and stiff penalties through the plea of nolo contendere. Rasing the maximum fine under the Sherman Act, moreover, may not be effective so long as defendants found guilty of monopoly under section 5 of the Federal Trade Commission Act are allowed to go without any penalty whatsoever.

The CHAIRMAN. Thank you.

(Mr. Mund's prepared statement appears at p. 580.)

The CHAIRMAN. Mr. Quinn.

Mr. Quinn, as we all know, was formerly chairman of the General Electric Finance Corp. and vice president of General Electric.

STATEMENT OF THEODORE K. QUINN, PRESIDENT, T. K. QUINN CO., NEW YORK, N. Y.

Mr. QUINN. Thank you, Mr. Chairman.

I believe my statement comes within the 7-minute limit, and with your permission I shall proceed to read it.

The President's Economic Report refers to "encouraging private initiative" and "competition" and curbing "monopolistic tendencies." It mentions such sources of the Nation's strength as its "free institutions" and "opportunities."

I am concerned with the extent to which our economy is no longer free, opportunities restricted, and the capital and market power of the relatively few giant corporations daily becoming greater, and threatening our free institutions.

There are today 68 private billionaire corporations in the country, most of them with greater annual incomes than the separate 48 political States in the Union. As few as 200 giants own outright the most important half of all American industry. Their control, through enormous purchasing power, reaches back and over tens of thousands of suppliers who must either deal with them, on their price and specification terms, or be eliminated. It reaches outward also and covers through contracts hundreds of thousands of subservient distributors and dealers, dependent upon them for existence.

These giant collectives, so like dictatorships in their bureaucratic organization forms and methods, are now assuming political as well as economic roles, and through their skilled "public relations" publicity, lobbies, donations to schools and colleges, and the subtle and sinister influence of advertising expenditures on our communications media, they are transforming the organization of our society into a kind of American feudalism from which socialism appears to be the only ultimate escape.

The process of concentration has proceeded so rapidly that the new rule is 3 or 4 corporations controlling 75 percent or more of the production in each major industrial line. Traditional competition loses its constructive force under conditions where there are a few Goliaths and many little people. It means tragic and foregone conclusions when it marks contests between hundreds of millions of dollars, entrenched positions, and widely and intensively advertised brand names, on the one hand, against a few million or less, hopeful dollars, on the other—regardless of the relative merits of the goods or services involved. The cry for "free enterprise" comes as a mockery from those powerful giants whose real purpose is to be allowed to pursue further their excesses, without restrictions.

The existence of giants in any field forces others to combine and merge in self-defense—not necessarily for efficiency, as is so commonly misrepresented, but for compensating capital and market power.

Another alarming wave of mergers is presently sweeping the country, although strangely there is no reference to it in the Economic Report. We are moving headlong toward even bigger, dominating, undemocratic corporations with their self-elected and self-perpetuating officers and directors, and a less stable economy that looks increasingly to the Government for support. Powerful business is out after income relentlessly. Labor fights, understandably, for a larger share of that income. The result is an increasing wage and price spiral in inflation, in which the consumer and the small investor, urged by his Government to buy its bonds, is victimized.

The giant collectives certainly do not encourage private initiative or price competition. Neither do they curb monopolistic tendencies nor promote greater opportunity. On the contrary, concentrated economic power imitates the dictators, crushes individualism, makes mere numbers out of people, and threatens our democratic institutions. It is no answer at all to point to our great productive capacity or comparative prosperity. These are byproducts of a developing youthful economy. They need not be characteristic of the maturity that faces us. Neither is it any answer to play again the broken record of the alleged 4,000,000 small and independent businesses in the country without telling us how many are hot-dog-and-coffee stands, or hopeless little capital dissipating ventures destined to live like flies for only weeks or months, or gasoline station tenants of the big oil companies, misrepresented to the public as entirely free and independent dealers, but whose rents are constantly subject to prohibitive increase in a way that makes virtual serfs of them; or of the tens of thousands of suppliers living by sufferance; or of the hundreds of thousands of automobile, appliance, household, and specialty dealers, whose costs and sales prices are fixed, operating under contracts that give them no protection and are cancelable on 30 to 90 days' notice "with or without cause." Small and independent business is going the way of the American Indian, fighting a pitiful rear guard action, followed by our economic freedoms in retreat and then by our political freedoms, which historically never long outlast economic freedoms.

The remedy does not rest in small favors or benefits, skim milk or tossed bones, or any one measure. There must be a national reawakening to the vital implications of the problem. Given recognition of its deadly serious nature, its danger to our national welfare and revered institutions, and a determination to act while there is still time, we should proceed at once with courage and resolution to take the whole matter in hand.

Distinctions should be made between necessarily big business and those swollen giants for which there is a little or no justification from the standpoint of the good of our society. Our national policy should be directed toward the active encouragement of new ventures, of the genuinely independent and most efficient medium-sized firms, and the discouragement of the multiple-line giants grown huge through acquisitions and absorptions that should, for them, be made illegal. They should be forced, wherever possible and practicable, to decentralize physically and financially. Interlocking directorates among them should be prohibited. Corporate taxes should be graded gradually upward as are personal income taxes so that as little as 10 percent would be assessed against profits of $10,000, and as high as 75 percent when profits reach a billion dollars a year. Any remaining corporations with $250 million or more in gross assets, or more than 10 percent of the business in any major line, should be declared to be inevitably affected with a public interest. For each of these, at least, one new director should be appointed by the President of the United States, subject to Senate confirmation, and be in no way under any private influence. These directors, representing the public, would together constitute a national board of public directors where all of the policies and practices of the individual giants would be aired. The directors would be required through an effective central organization to widely publicize all irregular practices, coercion, undue advantages taken, illegal and unjust actions or contracts, bring to bear the full weight of public opinion in the public interest, and continually recommend remedial legislation to the Congress.

In the meantime, the antitrust laws should be strengthened in every possible way, and all other means taken to restore genuine and full freedom of opportunity and enterprise.

(The unread portion of Mr. Quinn's statement follows:)

The reality that confronts us is a decision as to the kind of a society we want. Expressions like "free enterprise," "equal opportunities," and "encouraging private initiative" no longer have the meanings ascribed to them a few decades ago. What we have in fact is a corporate-directed society in which three-fourths of the employed are working for someone else and more than one-half of all the employed are working for less than 1 percent of the corporations. A fundamental change is in process.

Essentially, the differences now between our system and Russia's is that we still have political freedom and a degree of economic freedom, at least at the consumer retail level, whereas the Russians are completely subject to a single, concentrated, nonrepresentative authority—the Kremlin. Politically, we have representative authority concentrated in Washington and in the 48 States of the Union. Economically, we have about 250 major centers of private, nonrepresentative authority. These are the huge corporations that are gradually assuming political as well as economic roles. They were never contemplated by our Founding Fathers, nor is there any provision for their commanding positions in our basic law. Nevertheless, they are more intimately related to our daily lives than the political authorities. For they largely determine, directly or indirectly, where and how we work, for whom, how much we are paid, our housing, the goods we consume, travel, entertainment, etc. Unless this picture is grasped one cannot hope to understand our society.

The current trend is toward fewer and bigger centralized, nonrepresentative, economic authorities, and in rather alarming fashion we appear to be accepting them. The President's report indicates little concern. Democratic government is responsible to a chain of command that rests finally with the people who vote. Private power is not democratic; control is held privately by the few and there is no effective vote. Those who would have us believe that freedom from a big government is the only issue are either grossly misinformed themselves or they seek deliberately to distract attention from the infringements of private power on our freedoms. This is one of the most disappointing aspects of the President's report. We are not partners in democratic government but merely subjects, under corporate domination.

How far we have gone toward accepting giant corporate power was indicated some months ago when the able and gentlemanly Harlow Curtice, president of General Motors, announced a projected expenditure of $2 billion for investment in the immediate future of that $10 billion gross-income corporation. It was widely acclaimed as a move that would help end the recession and bolster the economy, as it undoubtedly did. What was left publicly unchallenged was that any one man or a few should have that much power. No one reminded us that General Motors could have made a contrary decision with the reverse effect. While good deeds are always praiseworthy, we are in grave danger when the welfare of the whole country depends in any important degree upon the power and judgment of any one or few nonelected human beings, however gifted. That is the Russian, not the American way.

The employee of a big corporation which employs many or most of the people in any community is quite beholden to his employer, except perhaps as the employee may be heard through a trade union. It is for this reason that the unions would be well and patriotically advised to keep their organizations democratically controlled. Otherwise, they must be subject to the same criticism as the corporation employer. The employee can be discharged at any time at the will of his employer and be left without the means to live unless he can somehow pull up his roots, sell his home, if any, and move with his family to take a similar chance somewhere else. Indeed, the corporation may leave the community entirely, as has been done in a number of instances, with the result that it becomes a "ghost town"; or the employer may arbitrarily decide to move certain departments of its business elsewhere leaving behind permanently unemployed people, who must somehow be supported by the State or Federal Government. If the employee is a specialist, as are most of the highly skilled in industry today, on special machines or specific kinds of work or products, his discharge at any time may forever deprive him of the opportunity to capitalize on the skill he has acquired through years of devotion to that special work. Thus it is clear that the trend toward private concentrations of authority has serious social as well as political and economic effects.

There is continuing evidence of the growing power of the big fellows over the economy in the President's report. The 1954 income share of farmers fell to 4.1 percent of the total personal income, while that of small business dropped to 8.9 percent—both postwar lows. The share paid out in wages was 67.2 percent—lower than in 1953 and 1952. Personal income received in the form of dividends, from investments, rents and interest increased from 11.4 percent in 1952 to 12.1 percent in 1954. Since it is the nonowners of investment capital who spend most of their income for living purposes, it remains to be seen whether their relative reduction will not adversely affect the 1955–56 level of business activity.

The discussion at the committee hearing developed some misunderstanding of competition. Contrary to popular belief, competition is not always an unmixed good. Beyond a point it can be quite destructive if our aim is to preserve our democratic institutions. Competition between lions and dogs is not constructive unless the purpose is to build a society of lions and eliminate dogs. Competition in the automobile business, for example, has left us with only five companies. There is little question but that General Motors and Ford could eliminate the other three, and that eventually we may have only one, which again is essentially what they have in Russia. The long-run view of power and efficiency therefore requires us to consider now whether or not we should be better off with only one automobile manufacturer. Shall we then have what we want? Will one, single, private corporation doing an annual business of more than $20 billion, employing over a million people, with all of its attendant private power, be efficient in the larger social sense, or even the long-run economic sense? If we were wise we should act now by law to prevent elimination of the remaining three manufacturers, other than Ford and General Motors which have the capital to take care of themselves. Surely, five competitors is not too many in this great field.

One of the committee participants advanced the viewpoint, with respect to Government properties to be sold, that they must always go to the highest bidder, regardless. This is adhering with a vengeance to outmoded ideas of an imaginary free economy and competition. The notion eliminates every consideration except immediate cost or price—no thought of political, social or even long-run economic questions. It can only mean that the biggest, most powerful, the richest, not necessarily the most efficient, competent or desirable bidder, will prevail. Because the problems of modern society have become more complex there is a disposition to either duck them entirely or take the easiest way out, settle them according to wornout formulas and rationalize the method and the results.

One of the most dangerous of these rationalizations, expressed at the hearing, regards the trend toward giant, private concentrates as "natural" and therefore inevitable. It follows, unconsciously perhaps, the manner and logic of Karl Marx's dialectic reasoning. What he predicted would undoubtedly have come true and capitalism would indeed have failed, except for the changes, improvements and innovations we have wisely adopted. The doctrine of inevitability is fatalistic and fallacious. Why all of our efforts, our world building, our defense program, our hopes and aspirations if there is an unavoidable which is going to happen anyway? Every single act, every move we make denies its validity. "You can't do nuthin about it," is a complete and cowardly surrender.

The CHAIRMAN. Mr. Stocking.

OPENING STATEMENT OF GEORGE STOCKING, PROFESSOR OF ECONOMICS, VANDERBILT UNIVERSITY, NASHVILLE, TENN.

Mr. STOCKING. Mr. Chairman, and members of the committee, the President's Economic Report appropriately recognizes that the Attorney General has appointed a national committee to study the antitrust laws and to recommend improvements to promote competition and prevent monopoly. I understand that the committee's recommendations will be forthcoming by the end of this month. When they appear I assume the Congress will consider them carefully. Meanwhile, the President's report, without awaiting the committee's recommendations, recognizes the inadequacy of present penalties as a deterrent to violation of the Sherman Act and recommends a substantial increase in the maximum fines that may be imposed under the act.

Two other problems seem to me to be sufficiently pressing to justify the attention of Congress, and about one of them, at any rate, I believe we know enough to proceed intelligently. I refer to the McGuire Act amending the Miller-Tydings amendment of the Sherman Antitrust Act. These amendments, as you know, authorize resale price maintenance contracts in interstate transactions where States have authorized them in intrastate transactions, and they make them binding on third parties.

The economics of this arrangement is fairly clear. Resale price maintenance contracts have no meaning in a purely competitive market. For a farmer to undertake such contracts covering the wheat he sells would be both foolish and futile. For a resale price maintenance contract to have meaning, the seller of the trade-marked differentiated article must have some monopoly power in selling it. If he had no monopoly power, no distributor would contract with him to maintain its price.

By fixing a somewhat higher price for the resale of his product than some retailers would charge in the absence of resale price maintenance contracts, a manufacturer of a trade-marked article in effect puts a sales tax on it. Why does he do this? Manufacturers inaugurated the practice of fixing the retail price of trade-marked articles to protect the goodwill with which differentiation and advertising enveloped their products. They knew that retailers, when acting alone, might by their promotion and pricing policies push or retard the sale of one differentiated product at the expense of another and thereby might adversely affect the maker of any particular product.

Although in this way retailers may limit the monopoly power of the maker of a trade-marked article, in doing so they may defeat their own interests by engendering a vigorous competition among themselves. This has led them to favor a nonsigner clause in resale price maintenance contracts to insure that all of them will observe the manufacturer's resale price that any one of them contracts to maintain.

Lacking the power to insure common pricing policies without resorting to unlawful collusion and having learned from experience that some retailers will not voluntarily sign resale price maintenance contracts, retailers have sought authority from the Government to coerce recalcitrants. The McGuire Act supplies an element essential in making the monopoly of the trade-marked articles effective. Although some manufacturers have supported both the Miller-Tydings and the McGuire amendments, the drive for their passage came from various retail associations, chiefly the druggists' trade associations. Manufacturers instituted the practice to protect a limited monopoly, but retailers have used it to cartelize trade.

In two respects the Miller-Tydings amendment as amended by the McGuire Act is inconsistent with the aim of our antitrust statutes to preserve a free competitive economy.

First, in legalizing resale price maintenance contracts on articles in "free and open competition" with commodities of the same general class, the act embodies a conception of competition inconsistent with modern economic ideas. Generally, trade-marked articles are sold by relatively few rivals, among which "free and open competition" can scarcely exist. In one instance, the right of the makers of color films to fix the resale price of their product was upheld, although there were only two producers of color films in the entire country.

Second, although the law authorizes only vertical price-fixing arrangements, resale price maintenance contracts with a nonsigner clause permit retailers to enjoy the fruits of horizontal price fixing without paying its penalties. In doing so they not only tax consumers but penalize efficiency in retail distribution. I believe such contracts have no place in a program to promote competition and prevent monopoly.

The other problem which I regard as pressing is more complex and we know less about it. I refer to the significance of the structure of our contemporary economy and the position of the big companies in it. The Economic Report concludes that our economy is strong and progressive because it comprises—

> In addition to 5 million farm enterprises, 4 million independent centers of business decisions—each potentially free to experiment with new ideas, new men, new methods, and new products.

I believe this characterization overemphasizes the role of little business and underemphasizes the role of big business in the economy. The 4 million independent business enterprises comprise, on the one hand, tens of thousands of barbershops, beauty parlors, laundries, dry-cleaning establishments, small retail stores, and the like, together with a lesser number of moderate-sized corporations; and, on the other, a handful of giant corporations which in the aggregate control approximately one-half of the corporate assets of the country. Clearly a little businessman's decision signifies less to the functioning of the economy than the decision of any one of the large industrial giants.

I do not believe we know enough about the social, political, and economic significance of these large corporations, nor do we fully understand why they are so big. Sound public policy toward this question calls for more knowledge of the causes and consequences of bigness. On these issues economists differ. I for one believe that our several combination movements have played the major role in shaping industrial structure, and I have not found convincing those studies which come to a contrary conclusion.

While we cannot safely generalize about the economic consequences of bigness, I believe that if we wish to preserve a free private-enterprise economy—and I think we can agree on the desirability of this objective—public policy should be directed toward insuring as many firms in an industry as is consistent with the economies of scale. Many firms I believe have exceeded this limit, and mergers have played an important role in their doing so.

While the question of the extent and character of changes in our antitrust statutes may appropriately await the report of the Attorney General's committee, I believe the Congress should give serious consideration to a clearer declaration of their purposes, and I have the temerity to suggest that this might be done by amending our basic antitrust statute, the Sherman Act, through the incorporation of a preamble of the following sort:

"It is the policy of the Congress of the United States to encourage an effective competitive economy. This policy is designed to insure as many sellers in interstate markets as is consistent with the economies of scale. It is not intended to prevent growth through efficiency but to prevent the accumulation of market power, particularly through the merger of independent firms, the preemption of the supply of limited natural resources, or the abuse of patent privileges, and to prevent any and all restrictive agreements among business rivals. It strikes at power over the market, not economic efficiency."

The CHAIRMAN. If I may ask just a few questions of the panel? You make an interesting suggestion, Dr. Stocking, but, as I understand it, a preamble has no legislative effect. It merely enables the courts to try to judge legislative intent and I wonder if you had any specific ideas as to how this general purpose could be effected?

Mr. STOCKING. I think you are quite correct, but I believe that one of the reasons why Supreme Court decisions have sometimes given approval to existing industrial structures is the uncertainty which has been incorporated into the law by judicial decision with respect to the meaning of the statutes.

Section 1 of the Sherman Act prohibits every contract or combination, whether in the form of trust or otherwise, or conspiracy in restraint of trade. The language is comprehensive in scope. In my judgment, a study of the records of the Congress which enacted the statute will reveal that it was the purpose of the Congress to go as far as it could in restricting all interferences with free competition, but the adoption of the so-called rule of reason and its interpretation in the 1911 cases have resulted in court decisions which have legalized industrial combinations even though the record indicated that their size and growth were the result of the acquisition of independent firms and even though they had thereby obtained control over the market. I believe that a clearer declaration of purpose would have a significant influence on the manner in which the law is interpreted and enforced.

The CHAIRMAN. Well, I tend to agree with you, but I am wondering about specific provisions to implement that purpose. Some years ago a rather able inventor by the name of Raymond published a book in which he advocated that the total number of employees in a plant producing a given product with multiple shipping points should be limited to X—an unknown number—employees. He would permit economy's efficiency inside the firm to exist. He would permit integration and vertical combination insofar as that served efficiency, provided the products were sold from one point, but he would limit what is termed horizontal combination where he argued the advantages were not economic but market advantages where the advantages of the firm in question were disadvantageous for other firms, and not advantageous for the economy, and he therefore proposed a limitation, a simple rule that Congress fix X number of employees as the maximum to be hired by any one firm with multiple shipping points for a given product.

You probably read that book, and have some ideas about it. What is your judgment?

Mr. STOCKING. Well, I am skeptical of any arbitrary rule which would limit size. I believe that the number of employees appropriate to the optimum size plant will vary with technological conditions.

The CHAIRMAN. Well, he would permit the size of an individual plant to be as large as it was efficiently possible. It is merely that if you have a multiple shipping point the total would be limited.

Mr. STOCKING. Well, I am again somewhat skeptical of such a rule or provision. I hope I have an open mind about it, but in effect that would mean that a firm which by reason of its good fortune and foresight and administrative capacity or luck, as the case may be, had accumulated surplus funds available for investment, and had been permitted by Congress in the wisdom of its taxing power to retain those funds, or a firm which might go out into the market and obtain funds, would be prohibited from building, as I understand it, a plant in some other section of the country in which it would do business.

Now, that would seem to me to be a very far-reaching change in contemporary policy with respect to the rights of a business firm.

The CHAIRMAN. Well, let me make it clear that I am not necessarily advocating this idea, but in the absence of some concrete test, if you depend purely on administrative agencies and courts, do not the monopolies, the quasi-monopolies, the oligopolies, the big firms, always put out public representatives, with the result that the regulatory bodies come after a while to be controlled by the concerns which they are supposed to regulate; the nerves of the Attorney General being atrophied or cocainized, and, in general, the draft process, the intent of Congress is violated, the administrative agencies do not protect the public.

Those are harsh charges, and I see the representative of the Attorney General smiling, but is not that substantically a true statement?

Mr. STOCKING. I think there is considerable truth in the observation that a regulatory agency exposed continuously to the social and political and economic pressures of the agency regulated——

The CHAIRMAN. The group regulated?

Mr. STOCKING. The group regulated, I think there is a danger of the members of such an agency changing their point of view with regard to what constitutes sound public policy; hence, I am a little bit skeptical of Mr. Quinn's suggestion that you place on the board of directors of the large corporations a public representative. I am skeptical about the point of view which such a public representative might over the years come to hold. Moreover, I think there is a difference between a regulatory agency set up to establish rules and regulations with respect to the operation of business, and an agency which has the obligation under congressional enactment not to regulate an industry but to see that the industry does not regulate itself in such a way as to eliminate competition.

The CHAIRMAN. In other words, we need a virile Department of Justice?

Mr. STOCKING. I did not get your verb?

The CHAIRMAN. Virile, it is an adjective.

Mr. STOCKING. I think we always need a virile Department of Justice, particularly an antitrust division.

The CHAIRMAN. Do you think it is possible to attain that?

Mr. STOCKING. I think in the last two decades, dating back at least to the year in which I was first associated with the Antitrust Division, it has been a rather virile organization. That is to say, my observation in 1942 was that it was a very virile organization. It is my observation that within the limits of its funds today the Antitrust Division is still a virile organization, but I think it is being seriously handicapped by the loss of competent help; and I think that a Government department, like any other group in our society, is subject to the impact of public opinion with respect to what is good and what is bad. I think there are changes, there are vogues in the enforcement of the Antitrust Act, and I think that those vogues may reflect the changing public opinion with respect to it. I think it highly important that the law be so clear in its purpose and intent that its administration will not be affected adversely by passing vogues with respect to the economic theory or ideas which the public may hold with respect to the significance of size and to the importance of competition.

(Mr. Stocking's prepared statement appears at p. 582.)

The CHAIRMAN. Does anybody else want to volunteer a suggestion? Mr. Mund?

Mr. MUND. Senator Douglas, I would like to say that I can see real merit in your proposal.

The CHAIRMAN. Well, it is not my proposal. It is the proposal of Mr. Raymond.

Mr. MUND. Yes; but I suggest that there is danger that an administrative agency, as the FTC or the Department of Justice, might interpret it in such a way as to defeat the purpose of the law, as in the Antimerger Act of 1950. I think Congress spelled out very clearly what was to be prohibited in the Antimerger Act of 1950, and yet the tests spelled out by Congress have largely been set aside by the inclusion of the rule of reason.

The CHAIRMAN. It was the argument of Mr. Raymond that the naming of a specific number would preclude the rule, that you would simply have to find out, (*a*) if the concern had multiple shipping points, and (*b*) if it had more than X number of employees, say 50,000 or 100,000, or what have you.

Mr. MUND. That is true, but I think that an administrative agency could still find a way to get around it, if it so desired.

The CHAIRMAN. In other words, no matter what Congress intends the administrative agencies will subvert the principles of the legislation?

Mr. MUND. They can do so if they so desire.

The CHAIRMAN. Do you think they have in the past?

Mr. MUND. In a great many cases I think they have, and I think the answer must be found basically in the type of men that the President appoints, and the Senate confirms, for the Antitrust Division and the Federal Trade Commission.

The CHAIRMAN. Well, you know, if anybody defends the interests of consumers on a regulatory commission, he is immediately subjected to a crossfire of attack and it becomes extremely difficult for the President to reappoint him, and objections are raised to his confirmation by the Senate. You know that every feature of his past is gone over with a fine-tooth comb, and if anything derogatory can be found, it will be brought forward.

Under those conditions, those who protect the public interest are exposed to a terrific strain, and the safest thing is to go along, and when their term on the regulatory commission is over, most of them can find employment in private industry, frequently in the concerns which they supposedly regulated, at very large increases in salary, so that the road to promotion in private industry frequently lies through the regulatory agencies of the Government.

Mr. MUND. Mr. Chairman, some people have raised the question whether appointment, say, to the Federal Trade Commission, for example, should be subject to Senate confirmation. Perhaps, the party in power should have the opportunity to put across a program for which the voters have elected them to office.

That is true in certain foreign countries, such as Sweden. There, such appointees are not subject to parliamentary confirmation.

The CHAIRMAN. You seem to think the evils come from the Senate and not from the President. My observation is, on the whole, the legislative bodies are more anxious to enforce competition than the Executive.

Mr. MUND. I think you are right.

Vice Chairman PATMAN. They only exercise power through confirmation.

The CHAIRMAN. They exercise only negative power.

Vice Chairman PATMAN. That is right.

Mr. Quinn.

Mr. QUINN. As I recall Mr. Raymond's book, the title was "The Limitist." My reservation at the time had to do with a practical point. It seemed to be quite radical and less likely, therefore, to achieve any degree of acceptance.

Mr. Stocking has referred to my proposal for public directors and I think perhaps I am guilty of not making it clear that I would not introduce another regulatory agency. What I had in mind was to recognize the fact that these giant companies are quasi-public institutions and yet the public is not represented. The National Board of Public Directors would be a sounding board, if you please; a publicity organization more than anything else. That is where the offenders are vulnerable, not so much to fines.

Let it be known through some accredited group what the nature of each offense is. One of our great difficulties now is that because of the hundreds of millions of dollars that are poured into advertising, that support the newspapers and the magazines, television and radio, it is almost impossible to get both sides of the story printed anywhere. Even this week in Look magazine Mr. Gardner Cowles has an article in which he shows how the public approves of big business. He uses the word "big" indiscriminately without making any distinction between necessarily big and unnecessarily giant, but, of course, after all these years of pounding away during which no one of the slick publications, including Look, would ever dare print anything in the slightest degree inimical to giant business or even give the other side a hearing, why, of course, the public has been misled.

Mr. MUND. Senator Douglas, I would like to make two comments on this idea of consumer representatives. Under the NRA program the law provided for consumer representatives in the steel code. The steel people said "Yes, we will take a consumer representative, provided he is acceptable to us."

Secondly, when Senator Capehart had a committee to study basing-point pricing, he provided for the inclusion of consumer members on his committee, and one can examine the list to see whether or not they really represented the consumers. I question the wisdom of consumer representatives on the basis of those two examples—NRA and the basing-point inquiry.

The CHAIRMAN. There is only one more question that I would like to ask. Some years ago I introduced a bill, one of the variety of bills to provide capital for small business and for business which was just starting. I modeled it on the system in Germany with a provision for public funds, but with the public funds to be retired gradually out of the earnings of the system and with ultimate control in the hands of the small business borrowers.

Now, when I did that, I was met with a perfect barrage of objection and I was told that existing credit facilities were adequate for any small business which was sound. I would like Mr. George to comment on that, and perhaps differentiate between fixed capital and working capital.

Mr. GEORGE. Yes. Of course, it is a highly necessary differentiation. It is indispensable. Of all the people whose works I have seen, I don't recall any strong contention that small business could not have access to working capital. The main problem is the need for intermediate and long-term fixed capital, and I must say, in candor, that it is difficult to develop a well-documented case for a need of any specific magnitude. We were unable to do that.

As you know—and Senator Flanders is very familiar with efforts of this kind, having sponsored one himself—there are many private agencies in the country now that are trying to locate the small firms of particular merit and promise, and they have very tough going; that is, those that combine the properties of capable management and a good product and the other qualities that a man wants to see before he sinks his money.

Our conclusion in the end had to be based on spot evidence. We were convinced from the fact that cases are found that there must be many more of them that could be found and it was the kind of situation in which doubts ought to be resolved in favor of giving help rather than allowing good human resources to go to waste.

Now from that point on, you get into all sorts of questions as to the instrumentality which should be set up. We chose one in the end without any strong feeling of certainty about it, that it was the best. Our reasoning was that, particularly within the framework of this discussion, our concern should be in the main with the seed corn of business organization, the ones that could grow up and offer effective and vigorous competition to large business, an so we had in mind largely the firms within that bracket.

I think Dr. Kaplan did the same in his classification of firms having between eight and a hundred employees, and in the end we did prefer to have the effort made on a pilot-plant basis by the Federal Reserve banks, many of whom have been deeply interested in this quetion, although sitting on opposite sides of the fence as to the extent of the need.

The CHAIRMAN. Well, now, do you feel the lack is in getting capital for plant, for equipment, machinery?

Mr. GEORGE. Yes; it might also be in the case of a concern that had pushed ahead a little too vigorously, that was overextended on general grounds, and needed a little bit of parental help—because management has to go with these offers of money.

The CHAIRMAN. Well, why don't the local banks make these loans?

Mr. GEORGE. Local banks are restricted in many ways from making this type of loan. I never thought that local banks should go to the extent of making capital loans, loans for working captial, yes, but not long-term loans. Many of them have, of course.

The CHAIRMAN. Of course.

Mr. GEORGE. Many of them have, but I think they ran up to around 3-year or 5-year loans, and they are more restricted than the kind of accommodation that we have had in mind.

The CHAIRMAN. Well, are they restricted by their own decision or by the rulings of the bank examiners?

Mr. GEORGE. Well, of course, it is both. You have a large universe of bankers here, and as you well know, you will find a whole spectrum of ideas among them and convictions as to what they should do.

The CHAIRMAN. Do you think that legislative relaxation of the rules of bank examiners, national bank examiners, would help?

Mr. GEORGE. Well, on two counts I question it. One is that that is opening Pandora's box, in a way, and there are so many other considerations involved that I would hesitate to speak about them firmly as of this moment; and the second is that I think that there are other remedies more plainly available and we ought to try them.

The CHAIRMAN. That is, new institutions?

Mr. GEORGE. New institutions on an experimental basis. Bear in mind too that part of the need is for equity capital. Commercial banks can't supply this.

The CHAIRMAN. Mr. Wolcott.

Representative WOLCOTT. No questions.

The CHAIRMAN. Mr. Patman.

Vice Chairman PATMAN. Mr. Adams, you mentioned a $50,000 fine, and I believe increasing the fine. What effect would a $50,000 fine have on a giant corporation that is willing to pay $100,000 for an emcee on one of our radio or television programs?

Mr. ADAMS. Well, as you recollect, of course, Congressman Patman, the fine itself is a punitive device. It is not an instrument for correcting the basic cause of the malady.

Vice Chairman PATMAN. But shouldn't it be sufficient to deter the would-be offenders?

Mr. ADAMS. The fine itself is inadequate, and even if you raised it to $50,000——

Vice Chairman PATMAN. It would still be inadequate?

Mr. ADAMS. It would still be inadequate.

Vice Chairman PATMAN. Should you leave it up to the judge? He is appointed for life. He is a public servant, and if he makes an error, there is a certain court of appeals to correct it, there is the United States Supreme Court to correct it. Why shouldn't you leave it up to the judge of the court to determine what would be a deterrent and what would be the right kind of fine? Don't you think that should receive consideration?

Mr. ADAMS. Well, it should. I do not know what precedent there is for an indeterminate fine. Of course, the courts have been quite willing in the United Mine Workers case to impose quite a sizeable fine.

Vice Chairman PATMAN. And you mentioned about the prices of certain things increasing. Wasn't the price of selected steel items recently increased when the steel companies were only producing at a rate of about 80 percent of their capacity?

Mr. ADAMS. Yes.

Vice Chairman PATMAN. That can only be done where a monopoly is in control, isn't that so?

Mr. ADAMS. That is right.

Vice Chairman PATMAN. That is the only time it can be done and that same thing applied to other situations, like aluminum and copper, does it not?

Mr. ADAMS. That is correct.

Vice Chairman PATMAN. Thereby increasing the price of industrial raw and semiprocessed materials and squeezing the nonintegrated and small concerns unnecessarily.

You mentioned about the trucks awhile ago, having a roadway furnished them free. Of course, the trucks pay gasoline taxes and other taxes; do they not?

Mr. ADAMS. That is quite correct. All I meant to imply there, Congressman Patman, was that there was no fixed expense in the same sense as the railroad providing a roadbed, and if the expense can be met on a pay-as-you-go basis, entry into that kind of industry is easy, or could be easy.

Vice Chairman PATMAN. May I ask Dr. Stocking a question:

You are a member of this advisory committee; are you not, Dr. Stocking?

Mr. STOCKING. No, sir.

Vice CHAIRMAN. You were selected; were you not?

Mr. STOCKING. I was invited to be a member, but I did not accept the invitation.

Vice Chairman PATMAN. Well, I know originally you were offered a place. Are you on it, Dr. Adams?

Mr. ADAMS. Yes, sir, I am.

Vice Chairman PATMAN. Maybe I was mistaken about the way that was set up. I thought Congress had something to do with setting it up. I have been told by one of the staff members here it was set up by the Attorney General as a voluntary organization.

Where does the group get the funds with which to operate?

Mr. ADAMS. Of course, the members of the Commission are unpaid. I think such funds as the Committee has available come from the antitrust appropriation. Mr. Foote, I think, is in a better position to answer that question than I am.

Vice Chairman PATMAN. From the Department of Justice?

Mr. ADAMS. Yes, sir.

Vice Chairman PATMAN. Of course, Congress appropriates the funds and therefore we have a connection with it and a responsibility for it.

Mr. ADAMS. Yes, sir.

Vice Chairman PATMAN. I have certainly appreciated and enjoyed all of the statements that have been made, but there is one outstanding statement to my mind, having worked with the Small Business Committee now for about 15 years, since it was organized, and having given a great deal of time and attention to small and independent business, I think Mr. Quinn made one of the finest, the most intelligent and one of the most forthright statements I have ever heard.

There are a couple of paragraphs in this statement that I should shock every Member of Congress out of his seat. It is really shocking, it is disturbing, and yet it is the truth, and we all know it and recognize it and do nothing about it.

With your permission, Mr. Chairman, I want to read two short paragraphs here. Some of the members probably were not here, but I hope you listen to this. This is Mr. Quinn's testimony:

> There are today 68 private billionaire corporations in the country. Most of them with greater annual incomes than the 48 political States of the Union. As few as 200 industrial giants own outright the most important half of all American industry. Their control through enormous purchasing power reaches back and over tens of thousands of suppliers who must either deal with them on their price and specific terms or be eliminated. It reaches outward also and covers through contracts hundreds of thousands of subservient distributors and dealers, dependent upon them for existence. These giant collectives, so like dictatorships in their bureaucratic organization forms and methods, are now assuming political as well as economic roles, and through their skilled public relations publicity, lobbies, donations to schools and colleges, and the subtle and sinister influence of advertising expenditures on our communications media, they are transforming the organization of our society into a kind of American feudalism from which socialism appears to be the only ultimate escape.

Is it your opinion, Mr. Quinn, that about the nearest step to socialism in our country is through the monopolistic route?

Mr. QUINN. I think that we are on the way.

Vice Chairman PATMAN. In other words, when a whole industry gets into the hands of one concern, then we will go back and begin to consider what the Republican Party used to put in its platform all of the time, and what the Democrats used to put in their platform all of the time, there was no difference of opinion between them on the point that private monopoly was indefensible and intolerable; they will go back to that and say: Now if it is a private monopoly, we will just take it over.

Is that your concern about it?

Mr. QUINN. That is right. When you get to the point of where it is just a question of who is going to run it, I may be in favor of, and I am, of free enterprise, so-called, or what little is left of it, but when it gets to be a question of whether I am going to be controlled by relatively few or one private interest, on the one hand, where my vote means nothing, or on the other, where at least I am an American citizen and have an effective vote, the choice will be easy and I will vote, for democratic socialism.

Vice Chairman PATMAN. Well, there is one point that can be developed from what you said here that shows the public interest in these giant corporations, and that is the question of costless capital. It is my contention a small concern is vulnerable to the attacks of the large concern. I will tell you why. These monopolistic concerns can administer their prices. It has been proven recently. When the war was over, prices were not reduced. When the excess-profits tax was repealed, it was said that prices would be reduced, but they were not reduced. The reason was that they wanted to charge the consumers all the traffic would bear for the purpose of not only paying their operating expenses, and providing large dividends to their stockholders but in addition they wanted to have a huge amount set aside as retained earnings which they could use as costless capital. The little concern could not do that. It was not big enough to do it. With this costless capital, the large concerns put in plants and stores all over the United States in competition with small concerns, and what chance has the small man across the street from an outlet like that that is being provided and furnished with costless capital to sustain it when the little man has to go to the bank and pay a high rate of interest.

In other words, if he has got to borrow his money for expansion, what chance would he have, Mr. Quinn?

Mr. QUINN. I would say very little. The difference in the cost of capital would be a very generous contribution to the margin of profit for the very large company. That is why I think the question is one of policy, whether we want to go that way.

Vice Chairman PATMAN. That is right, and there is another aspect of this that is affecting our economy right now. It is affecting the stock market. I pointed out a year and a half ago before this committee the fact that people do not have the opportunities to invest now. These large billionaire concerns are not putting out as many new securities as they used to when they were smaller and had to have money. They were issuing new securities then and savers and investors had an opportunity to buy those securities but as they have gotten large, they can get their costless capital out of the consumer and they not only do not have to borrow new capital, but they can actually go into competition with investment companies and banks. They are doing it today. The opportunities to invest have been restricted with the result that investors go into the stock market and buy up existing securities in competition with other people.

Don't you think that enters into the stock market today, Mr. Quinn?

Mr. QUINN. I do.

Vice Chairman PATMAN. And it has a devastating effect. In February 1953, the margin requirement was reduced by the Federal reserve to encourage people to come in and invest, and expand margin trading. Then the brokers promoted the plan to buy stocks on the investment plan, $5 down a month, inducing them to come in. Then the Treasury sponsored a bill to exempt the first $100 of dividends from taxation to bring more of them in. Consequently with a large group looking for an opportunity to invest, with the incentives provided for investment, certainly we would have a boom stock market. But this is a boom based on "paper" not on "wheels."

It is just a question of how long it will last. One other point and I will be through.

A remedy has been offered which I think is a very sensible remedy for handling the problem of bigness. I am referring to the suggestion of Mr. Quinn. It is based upon ability to pay. That is what our present income-tax law is based upon, ability to pay. It is being violated, and laws have been passed disrupting it and changing its course, but that is the principle upon which it is based, ability to pay.

Now, Mr. Quinn suggests that these giant corporations should be made, wherever possible and practical, to decentralize physically and financially. Interlocking directorates among them should be prohibited. Corporate taxes should be graded gradually upward as are personal income taxes, so that as little as 10 percent would be assessed against profits of $10,000, and as high as 75 percent when profits reach $1 billion a year.

Now remaining corporations with $250 million or more in gross assets, or more than 10 percent of the business in any major line, should be declared to be inevitably affected with a public interest. I think that is a good suggestion and a fine remedy and I hope it is considered by this Congress.

I am going to keep on pointing it out to them, I can assure you of that.

Now, Mr. Chairman, I have a few other questions, but I will desist now until the other members have an opportunity.

The CHAIRMAN. Senator Flanders.

Senator FLANDERS. Mr. George, I noted your reference to the fact that I have had some experience with this problem of finding capital for small companies.

Mr. GEORGE. Yes, sir.

Senator FLANDERS. I have had that experience in three different ways. As president of the Federal Reserve Bank of Boston, I favored the extension of capital loans for business under certain conditions. The bank had had a good experience but only a few cases where it seemed warranted. Now, the second experience also occurred in Boston, where I joined with some other Boston people in the forming of the American Research and Development Corp. for channeling private and fiduciary funds into capital support of new undertakings. That has proved to be very good. It is broadening year by year.

There is one interesting thing about it, however, which I think is pertinent to these capital loans in general, and is in a way a discouraging feature. That is that it has been found necessary, in most cases, to supply management council as well as capital funds, so that the scale of the operation becomes dependent not merely on the supply of money available, but also on the supply of managerial ability available.

I think the managerial ability has set a lower limit for the operations than has the lack of capital which might be made available. Then, thirdly, I have had the experience of sponsoring in the Senate legislation which originated with the researches of Dr. Kaplan for the CED, and that we never were able to get to.

I believe you joined me, or I joined you. I forget who joined whom, but you inevitably feel that there is an unfilled spot of some sort in that area and I have had experience with two and have endeavored to set up a third one, but I did find, as I say, whether in the bank or in the American Research and Development Corp., that there was a need, particularly in the new organization ofttimes for management supervision, as well as for capital investment.

Now I would like to raise a couple of questions of Mr. Adams. We are supposed to be asking questions, Mr. Chairman, and I am making speeches.

The CHAIRMAN. I think we are not precluded from making comments.

Senator FLANDERS. Very well. One of the notes in Mr. Adams' paper, in section 4, legislative power, speaking of the Atomic Energy Commission, states that an open door does not afford equality of opportunity when some contestants are on the doorstep while others are miles away.

It would seem to me that throwing atomic energy open to competition, particularly in the field of power development, is a very difficult undertaking. So far, the private investors in atomic power have been invited in in accordance with their willingness to put millions into the project themselves. In other words, that is the door that has been thrown open, and that foot that is put into that open door is in the form of millions of dollars of the private corporations' own funds.

Now whether it could be done any other way, I do not know, but it seems to me that the conditions under which power development has been offered to the public should be noted.

Have you any comment on that?

Mr. ADAMS. Well, Senator, you have pointed to a real difficulty there. What I had in mind primarily on this open door question is the point that was made very clear in the Senate debate on the bill and that referred primarily to patents. There was a handfull of companies that had the advantage of being in the atomic energy program. They gained experience and know-how at Government expense and they were in a dominant position as of 1954, when the act was passed.

They had the know-how and newcomers would find it difficult to enter the field. Now, whether the protection afforded by the 5-year compulsory licensing period is adequate, I don't know. It is too soon to tell. But I think Congress might have been willing to extend that compulsory licensing period to about 10 or 15 years.

I think we would have played it much safer that way. Nobody has the power to predict the future and I would hesitate to do so, but on the record I think this is extremely dangerous.

Senator FLANDERS. I also note your reference to the ICC's control of the interstate common carrier truck. I may say that I am allergic to these highway boxcars. I do not like to meet them, I do not like to pass them, I do not like to see them. They are an abomination of desolation, spoken of by the prophet Jeremiah, yet I do not find any more than you do here the justification for controlling them, for getting a certificate of convenience and necessity and submitting to rate regulation.

In spite of the fact that I do not like them, I do not see that the regulation is justified on public grounds.

Mr. ADAMS. Senator, if I may expand on that point, one of the basic questions before the committee is how can we promote more competition, and I respectfully suggest that the Government itself has today become a promonopoly force in the economy and I hope Senator Douglas will bear me out on this, but if you read Adam Smith carefully, Adam Smith did not have in mind, when he opposed governmental interference in the economic life of a nation, he did not have in mind the things that the self-righteous and self-serving free enterprisers are today talking about. He objected to government in those days because it was an instrument for creating monopoly, because it was an instrument for creating privilege, and that was the thing that Adam Smith attacked.

Now I venture to say that Adam Smith and the lesson he tried to teach are as applicable today as they were in 1776, and one way to get more competition is by getting the Government to reduce the regulatory power that Government exercises in such fields as trucking and airlines, and so on. These are specific danger areas that Congress might pay attention to.

The CHAIRMAN. But where there is a natural monopoly, would you say that regulation should be amended, as, for example, in the transportation of natural gas?

Mr. ADAMS. Well, Senator, there is no question about that, but even where you have the natural monopoly, I would be very strongly in favor of a yardstick notion. Some competitive element being introduced, because the history of regulation shows that without a competitive yardstick, regulation is impossible; it is ineffectual; and it does not protect the consumer interest.

There was a time when the doctrinaire "Liberal"—and I use that word in quotation marks—used to think that all ills of society could be solved simply by regulating the monopolist or by taking him over. I venture to say that is no solution.

I think our experience with the regulated industries has shown that the solution lies in competition and not in regulation, because the regulatees will wind up doing the regulating.

The CHAIRMAN. Well, I agree with you, and I do not know the opinion of the other members; but where the cost of a pipeline is so great that you do not have alternative pipelines serving an area or a customer, is not that more or less natural monoply?

Mr. ADAMS. I would think so, yes, sir; but that, of course, does not apply in the transportation field.

The CHAIRMAN. I understand, but I did not want you to go too far in this attack on regulation.

Senator FLANDERS. The last item is a true bill of particulars against the Government. Is the effect of Government regulation on—what kind of airlines do we call it—nonscheduled airlines—are there any elements of natural monopoly in the airlines that requires holding down the nonscheduled ones and favoring the established airlines?

I do not see that you have gone into that question as to whether there are any, as to what the justifications may be.

Mr. ADAMS. Well, Senator, I think the basic question there is not how much monopoly do we dare to tolerate, but rather how much competition should we try to promote, and I would say that the answer to the latter question; that is, how much competition can be promoted in that field, is unknown, simply because the agency, the CAB in this case, has not taken an experimental attitude.

Since 1938, when the Civil Aeronautics Act was passed, not a single major carrier has been certificated, despite a tremendous growth in demand. Now, as I look at the economics of the industry, I do not see the justification for monopoly there. It is not a public-utility type of industry. Capital can be added in small doses, the danger of duplication, as in the case of the railroads, simply doesn't apply in the airlines.

Senator FLANDERS. Of course, we find the air terminals and the landing fields crowded about to the limit of their capacity. Who built the Washington airfield? Who paid for it? The Federal Government paid for that.

Sometimes municipalities pay for the local airfield. In general, there is no such prescriptive right to the use of an airfield, I would judge, for the airline, that there is for the railroad with its own privately built railroad stations and right-of-way, so that to that extent, at least, there is less justification than there is for the restricted entrances to the big cities by the railroads under their own.

Mr. ADAMS. That is quite right, sir.

Senator FLANDERS. I can see that the addition of new lines embarrasses the management of these Federal or municipal air terminals, but that is just simply saying that the expansion of the industry is embarrassing and if the industry is to be allowed to expand, those considerations have to be met.

It seems to me, in other words, that you make a good case for the Government having arbitrarily restricted competition in the airline field.

Now, I was going to—are there any official time limits on us?

The CHAIRMAN. No, certainly not. It would be impossible to impose them.

Senator FLANDERS. Should I promise to quit in 5 minutes? I would like to go just a little further. Looking at Mr. Quinn's document, I judge on page 2, at the foot of the page, Mr. Quinn, that you feel that the wage and price spiral of inflation is one, the generating of which the big corporation is especially susceptible to, more so than the small corporation.

Will you explain why you feel that way?

Mr. QUINN. Well, because the large corporation or corporations set the price pace, as was indicated a moment ago here with respect to steel, when even during a period of recession or declining prosperity, with the steel capacity only 70 percent of total, prices were raised.

Now the ability, therefore, of the larger company through price leadership, or however, to hold a price or even increase it, is the first move in the direction of inflation.

Senator FLANDERS. And your point is, then, that the big corporation makes the move in price inflation and the smaller ones follow?

Mr. QUINN. Yes.

Senator FLANDERS. And that if the smaller ones made the first move, the big ones would not necessarily follow?

Mr. QUINN. No, they would not dare do it unless forced, Senator.

Senator FLANDERS. They would not dare do it. Mr. Patman, as I understood him, spoke of a squeeze being offered by the big companies when they raised prices. I had thought of it as being a great boon to the small corporations to have this umbrella held over them.

I think Judge Gaylord invented the term, holding an umbrella over an industry.

Vice Chairman PATMAN. I do not see any comparable situation there at all. You see, what I meant was, Senator Flanders, these wholly integrated concerns, it doesn't bother them for the price of the raw material or semifinished goods to be raised, because they can absorb it. The little concern cannot pass it on or he will lose his share of the market. It is only the people who have price leadership who can pass it on, and they are the very large ones. Therefore, when I said that the little fellow is caught in the squeeze when these industrial raw material and semifinished goods prices are raised, I meant that he is less able to absorb these increases in his costs of production.

Senator FLANDERS. The little fellow can stay where he is and get more of the market, but my observation is he gladly follows the price leadership, and with some enthusiasm, in fact.

Mr. QUINN. Senator, may I comment on that?

Senator FLANDERS. Yes.

Mr. QUINN. The way it works is this: I have been there. The big fellow sets out a percentage of the market which he has in his mind. That is his aim, and he is going to maintain that percentage of the market at all cost. If he has to reduce the price to do it, he will.

Now, on the day of the association meeting, or however, he simply states what his prices are going to be. He does not violate any law. He indicates his prices are going to be so much. It is tacitly understood among the little fellows who may be present that they are allowed some reasonable lower differentiation. They may go 5 percent less or 10 percent less, but let them go further than that and they do it with full knowledge aforethought that the big fellow, having the power and might, will reach down and see that they do not increase their percentage of the market.

So any notion that the little fellow can increase his percentage of the business by lowering his price in the presence of a controlling oligopoly, if you please, or a limited number is, I think, mistaken.

Senator FLANDERS. But he can have that little differential to play with, which ought to be helpful. Now I am pretty near through, Mr. Chairman. I said 5 minutes and here it is 5 minutes sharp.

The CHAIRMAN. I must apologize to Congressman Patman. I invoked the 5-minute rule on him at our first meeting. I have since not invoked it on anyone else, so I have singled out Congressman Patman for discriminatory treatment.

Vice Chairman PATMAN. I have gone over that limit so many times since, I will forgive you.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Chairman, I would like to direct a question to Mr. Quinn. These monopolistic practices you set forth here, do they or do they not militate against the intent and the purposes of the Congress as set forth in the Full Employment Act; namely, that the objective should be the maximum employment, maximum production, and maximum purchasing power?

Do you think those practices militate against the carrying out of those purposes and intent?

Mr. QUINN. Yes, I do.

The purpose of a business is to make money, and the corporation will devote its strength and its resources and its ability to that objective. It will employ what number of workers will serve that purpose. At any point along the line where it appears that they are going to have a greater supply, greater production, than the demand, why, they simply lay off the workers and throw them on the bounty of the State.

Representative KELLEY. In my mind, they want full production and full purchasing power, regardless of the full employment.

Mr. QUINN. Yes, I think the objective of full employment is a highly desirable one, but whether we have it or not depends on whether the producer can sell his production, and if he cannot you won't have the employment, however many devout statements we make.

The CHAIRMAN. I interpret your statement, Mr. Quinn, as being that with monopoly prices tending to be higher than the competition, that therefore a smaller quantity will be produced, and, hence, employment will be dampened.

Mr. QUINN. Yes. Which is what happens. We have the facts in industry.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Quinn, you mention the political and economic role which these monopolies are exercising. I have the feeling that whatever measure the administration might wish to take to bring about full employment, is prevented by the monopolies because they want a surplus labor market for their own benefit. They do not want maximum employment. We hear a lot of talk about high employment. That is not the same thing.

Would you care to comment on that?

Mr. QUINN. I think that is true. It goes back to the question of what the basic purpose of the business is. It is not necessarily to foster full employment, but I hope that the slogan "full employment" is kept alive, and I hope that every Congressman and every Senator fights for it, however we get it, because it is more important to more people than any profit to anybody.

Representative KELLEY. How can you have maximum purchasing power without maximum employment?

Mr. QUINN. Well, of course, you can employ people in many ways. I understand that consideration is being given as a standby, for example, to the program for building a hundred billions dollars worth of roads. That would employ a lot of people, and create a lot of purchasing power, and that would be its purpose.

Representative KELLEY. Well, of course, there are many things that the Government can do, of course, to encourage maximum purchasing power, and I think that was the intent of the Full Employment Act, to bring that about, but my question was that I do not believe that the influence exercised by these monopolies are helping that. In fact, they are preventing it. If the Government wants to use those measures to bring about full employment, full production, they are prevented by the economic and political role which these monopolies exercise, in the face of whatever the Government might wish to do.

Mr. QUINN. With or without intent, that is the effect.

Representative KELLEY. That is all, Mr. Chairman.

(Whereupon, at 12:15 p. m., a recess was taken until 2:15 p. m. of the same day.)

AFTERNOON SESSION

The Joint Committee met at 2:15 p. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Senator O'Mahoney, Senator Goldwater, Representative Patman, vice chairman, and Representative Kelley, Talle, and Curtis.

The CHAIRMAN. We left off questioning this morning when it was Congressman Talle's turn.

Representative TALLE. Mr. Chairman, at the outset I want to say that I am delighted that you gentlemen are here. I will appreciate all of the education you can supply me. I confess the need for it.

Now, at the outset it is fair to say, isn't it, that this problem is not new but very old. In our own economic history it is at least 80 years old as a very important problem, starting with the early 1870's and carrying down through the various devices of trusts, pools, mergers, interlocking directorates, communities of interest, and gentlemen's agreements, and the other devices that culminated in the Sherman Act of 1890. Apparently that wasn't enough, and so teeth were put into the act in 1914, by passing the Clayton Act, and then the Federal Trade Commission was set up in 1914 also as preventive medicine to stop monopolistic practices from getting started.

What was the committee called, Mr. Chairman, that held extensive hearings about in 1937?

The CHAIRMAN. You mean the temporary National Economic Committee?

Representative TALLE. Yes.

On my bookshelf I have a large set of hearings of the TNEC. I believe my brief review proves that the problem is pretty old.

Furthermore, I think that we are agreed that monopoly is not necessarily bad, because we have natural monopolies like the diamond monopoly in the Kimberly mines, and we have a monopoly by statute in the Post Office Department. We can probably thin this down and get to the area that we are really concerned about. There are a good many monopolies we do want. I can remember trying to traverse San Francisco in 1915, and I found I had to take three different streetcars to get where I wanted to go. So in transportation, communication, and other utilities like waterworks, we agree that monopoly is a good thing, and we protect through rate regulation and franchises.

Are we agreed that what the monopolist is after is the highest net profit per unit of output?

Mr. MUND. I would not limit it to per unit of output. I would say the largest net after taxes for the company, as such, for its operation, as a whole.

Representative TALLE. All right. We are probably correct in generalizing that a monopoly price is ultimately a high price, and the monopolist will test various demand curves and supply curves until he finds the most profitable price. It is always a high price.

A person could get rich quickly by having 90 percent control of the supply of a good for which there is inelastic demand.

Now, how much of the supply of a good must you control in order really to control it? Let me define what I think a monopoly is:

Such control over supply as enables one to fix prices. In some cases do you think 30 percent would be enough?

Mr. MUND. Yes.

Representative TALLE. In other cases probably 90?

Mr. MUND. I think a person should qualify it also by the region in which the activity is located. For example, cement. Cement is really shipped over 500 miles. You could have a monopoly with only 10 percent of the national output, because transportation costs would permit you to control prices in a given area.

Representative TALLE. What would you say are the troublesome industries? What are the industries we are really talking about in connection with this panel? We are not talking about natural monopolies or those that we allow by statute. What are the fields that really concern the panel?

Mr. MUND. The basic industries, iron, steel, cement, nonferrous metals, products of general industry.

Mr. QUINN. All other fields except the public utilities.

Mr. MUND. That is right. Exclude banking and public utilities and take all of the other fields of industry, merchandising and manufacturing.

Mr. ADAMS. And I would want to qualify that. I would say there is more competition possible in some of the public utilities than we now have. I am not willing to concede the point that some of the public utilities are what may be called a natural monopoly.

Mr. GEORGE. I might add also that the economist is always confronted with great difficulty in defining the market, a fact which is familiar to everyone here. A product is not merely a product. A product has to take into account all of the variations, the differentiations, and substitute products that might be competing with them for the existing market, and sometimes they are very difficult to measure.

Representative TALLE. I was interested in Dr. Quinn's statement that there is not much free enterprise left. Now, if you single out the fields in which competition is still very active, wouldn't you put agriculture at the top?

Mr. QUINN. Yes, except to the extent that Government moves in with price supports, and I think also among consumers and at the retail level. There is competition among retailers.

Representative TALLE. Yes, that was my second question. The next in order after agriculture is retail merchandising, and moving from those two broad fields in which competition is still very active, you move toward more and more of a situation in which prices are pretty sticky.

Mr. MUND. Yes, that is right.

Representative TALLE. I suppose that is the field that we are concerned about.

Now, what shall we do? Shall we undertake to get more competition in that vast area where prices are sticky, or shall we permit the remaining competitive fields, agriculture and retail merchandising, to have rigidity all the way through, too? Isn't that the problem?

Mr. MUND. Yes.

Representative TALLE. Rigidity versus flexibility. Now, if I may pose a practical problem to you.

We start with agriculture, and we have competition. At the other end is the grocery counter, retail merchandising. We have competition at those two ends. But, what is the situation in the long road between those two points, and what can we do about it?

Mr. MUND. Well, we can surely attempt to create and maintain competition. By competition, I mean freedom of entry and price competition. Anybody is free to enter a trade or occupation of his own choice. We must preserve freedom of entry. The other feature is price competition, independent action on prices within a given field. I think that in the range between agriculture and retail trade, as you mentioned, on through to the types of monopolistic or oligopolistic industries where they manage prices, and entry is not free because of control of resources or patents or other factors, we should attempt to maintain and create competition by using the antitrust laws that we have.

That, I think, is the big problem, to make use of the laws which we have. We have many tools in our kit, and the thing is to use these tools through an effective, revitalized antitrust program on the part of the Justice Department and the Federal Trade Commission. I feel these agencies just have not been doing their job effectively.

Representative TALLE. You believe, then, that the solution lies in enforcement of the tools we have now rather than fresh in enactment?

Mr. MUND. That is basic. We must use them fully, and then if we find shortcomings and inadequacies, then we should try to add new tools to our kit.

Mr. ADAMS. May I add something to that, Congressman?

Representative TALLE. Oh, yes, indeed.

Mr. ADAMS. I think a competitive philosophy has to be built into every branch of Government. It is not enough to enforce the antitrust laws in a negative way. The Defense Department, for example, in awarding contracts has to be aware of the antitrust implications of the things it does. It should not by awarding contracts, for example, promote concentration. In enforcing the accelerated amortization provision in the tax laws, there, too, we ought to make sure that these certificates of necessity, so-called, be spread rather evenly, at least not in a way to enhance the degree of concentration that we now have.

That is, it isn't enough merely to enforce the law. You need positive, imaginative action on the administrative level.

Mr. MUND. On the part of all agencies?

Mr. ADAMS. On the part of all agencies.

Mr. MUND. Yes. That is correct.

Representative TALLE. The way it looks to me is we must face two realities: One is war, and I wonder how effectively we could carry on production for war purposes without these large concerns? I remember not many years ago we passed a law—my colleagues will check me on this—which loosened our restrictions upon the formation of trusts, an amendment which in effect permitted a trust operation; in other words, setting aside a part of our law against trusts. We did it by force of necessity. We will have to face this situation, won't we, that when we have big wars we may need big industry?

Mr. MUND. Well, I think that one question would be whether or not we need to permit this continuing wave of mergers, because the fact of mergers does not usually change the physical structure of the basic industry. It simply centralizes the control of the plants in one or a few hands. You do not have any more steel mills; you do not have bigger steel mills; you simply have 3 or 4 companies controlling the steel mills instead of 6 or 8 companies.

Representative TALLE. Monopoly through horizontal consolidation.

Mr. MUND. Yes. The fact of mergers does not make bigger and better industry; it just affects the control. It does not affect the size and efficiency of the plants, themselves. It would be as if one university, say the University of Chicago, were to buy up all of the State universities. I question whether concentrated control is necessary for the war effort.

Mr. ADAMS. And, besides, once you concede the great advantage of centralized control in the interests of national defense, you are in effect espousing the argument for socialism, centralized planning, which is the acme of efficiency you can reach, given that line of reasoning. I would disagree with it.

Mr. QUINN. Congressman, I have used the illustration on this subject, of the German airplane industry at the beginning of the war. You remember they just had one concentrated centralized control, and they got out the Messerschmidt, and it was a good airplane. For a while it was devastating, but in this country we had 8 or 10 companies—I have forgotten how many exactly, but a number of them, and they were in competition with each other. While we may have been behind at the start the competition in that industry soon led us into a superior position. We were able to get better planes because with the competitive influence, each one trying to outdo the other, eventually we were victorious, and we had a superior plane.

If they had all been under one command, the tendency would have been, presumably, for them to have stayed with some one model. There is less innovation, less incentive for new development.

Representative TALLE. I am wondering if we had a whole array of smaller plants and a big war came along, if the Government would not step in and take them over and utilize them all under the Government's command, because of the war situation?

Mr. QUINN. We would need another War Production Board.

Representative TALLE. I suspect another reality we must make allowance for is human nature. Judge Gary is reported to have said, when he was told in the late 19th century by his lawyer "You can't do this, you can't do that," "Mister, I employ you as a lawyer to tell me what I can do and not what I can't do." In view of the age of this problem, I suspect human nature will always find a way to do what it wants to do. Not even the laborious inquiry of 1937, which resulted in the big shelf of books I referred to earlier has solved the problem.

Isn't there something in human nature which requests we should spend some of our time studying psychology rather than trying to solve the problem here in the legislative halls alone?

Mr. MUND. "Eternal vigilance is the price of liberty." I suppose we shall have to keep at this forever. We shall probably always need speed cops and traffic policemen. I suppose that is just one of the prices of maintaining a free society.

A genuine, competitive economy isn't self-realizing. We have to create and maintain it. That is human nature. We have to learn this lesson. Competition is not automatic, it is not self-realizing. We must create it and that I think is our problem.

Representative TALLE. Well, I can see why we do not have an easy solution. As a person interested in agriculture, I look closely at the practical aspects of our economic structure—at *controlled prices* versus *competitive prices*. In a large part of our economy prices are controlled, or sticky. Will the final outcome be price rigidity all along the line, or can competition survive in agriculture and retail merchandising?

Do you have any comment on that, Mr. George?

Mr. GEORGE. Beg pardon?

Representative TALLE. Do you choose to comment on that?

Mr. GEORGE. Well, I find it a bit difficult, because the premises from which I start are not quite the same. We are tending in this conversation to equate competition with concentration. I think we are oversimplifying the situation somewhat.

It would be like drawing a curve and saying, "Here is a curve of concentration, industry by industry, as they lie on that curve, and the degree of competition or lack thereof is rigidly coordinated with points on that curve," and there is no such universe.

I think that the evidence that I have seen shows—and no evidence is conclusive or complete—but a lot of the evidence I have seen denies that there is any consistent correlation between concentration and price rigidity or between concentration and market control. It is possible to have some industries that are highly concentrated in the sense of 3 or 4 concerns dominating the market, the usual concept, and have it literally inundated with a wave of innovation that is highly competitive.

Competition is by no means limited to price. I think economists will generally recognize that. It is also in product improvement and innovation. Oddly enough, business concerns, and one would think mistakenly in view of the general attitude here, are very anxious to be judged by the very tests upon which it has been seemingly easy to condemn them, theoretically. I think that the members of the committee have all heard of this tug of war that goes on between structure and performance, in a sense involving the things that we are talking about here now, and there is one school of thought, largely centered in business but ramifying sufficiently to include a number of economists, that would dispense with the structural test altogether, or very largely, and have businesses judged only by their performance. In this connection, it may be useful to mention a set of criteria that was developed by Professor Mason of Harvard a while ago, if I may read the items without trying to expand on them:

(*a*) Progressiveness—a process of continuous improvement; (*b*) price relationships—Are the economies passed on, the economies of scale? (*c*) capacity-output relationships—Is investment excessive in relation to output and for what reasons? (*d*) level of profits as compared with similar industries; (*e*) selling expenditures—Is competitive effort chiefly indicated by these rather than by service and product improvements, and price reductions?

To find watertight cases is difficult. Some highly concentrated industries have done a good job, and some of the dispersed ones have done a very bleak job in the terms of the highly important test of supplying the American public with new and improved goods at lower prices.

Now, I do not want to read a meaning into Professor Mason's listings here that he would not accept. What he was doing was indicating some of the tests that would be valid in an examination of an industry's performance, and he would be the last to deny that there was also significance in the structure of the industry, which is another phrase for the degree of concentration found, among other things. He has said himself that structure and performance should be used to complement, not exclude one another.

As I remarked before, we are very much at sea in terms of performance. A lot of industries in which there is concentration might turn in a good job and others might not. It comes down in the end to what I think is recognized, the need for a very careful case-by-case examination.

Performance is certainly entitled to a place among the logical tests of an industry's behavior and practices. Most of the assumptions made about them here, in the case of large concerns and concentrated industries, have been heavily and sweepingly adverse. My mild objection is, not that they are positively invalid, but that they are valid if at all in varying degrees for different industries, and that the real starting point for such a discussion as this is a quest for more knowledge about what actually happens and why, the extent to which it is or is not socially beneficial on balance, and whether, where findings are adverse, there are remedies available that would do more good than harm. The problems of appraisal are tremendous, and I might add that in attacking them we will in the present state of both theory and data find ourselves choosing among values to which it is difficult to assign relative weights. And if I have opened any doubt on the subject, I wish to acknowledge further that even a fine record in turning out a rising volume of new and improved products and processes over time would not be conclusive if it were achieved at the cost of excessive market power, whatever that may mean. But how much excess in relation to how much benefit? Hardly anyone denies that business success in serving the public must also mean the gaining of some market advantages. As to the answer to such questions there is no clarity or agreement among economists or anywhere else.

The fact of the matter is that both data and theory are in bad state. We have little basis for judgment, let alone violent ones. It so happens that the latest responsible studies I have seen of the trend in overall concentration suggest that there has been none. It so happens that the latest responsible studies I have seen of merger economics suggest that the big boost that they gave to concentration occurred in the first wave around the turn of the century and that since then the big ones have turned bigger largely by dint of internal growth. Also, that even all told the fury of the mergers accounted for a little more than a quarter of the size of our present giants. To that of course a ready answer is that if it hadn't been for the mergers concentration would be still less—even though there is considerable agreement that by major industries it has declined considerably from the old peaks.

Now there have been statistical studies galore on the structure of industry and no doubt some other competent men would quarrel with the findings I have cited. My point—really two—is that such historical data as we have were not made for such purposes and do not serve them well, and that there is no particular significance in such figures standing alone anyway.

I said that theory about competition was also in bad state. It has been evolving and is still unsettled. Long ago we relied upon competition in a simple world, nonexistent, to bring out energies and capital, prevent profits from being excessive, and eliminate the incompetent. Then we graduated into more sophisticated ideas about price-cost equilibrium mentioned here several times today. This concept has been useful for thinking and instruction for several decades now. But as J. M. Clark of Columbia has been insisting, it is still a theory for a static and not a dynamic economy. We haven't a comparable apparatus to deal with growth and innovation, and as a result we very earnestly and honestly judge business by tests intended for some other world. This does not mean that all existing business structures could survive more realistic tests. It is simply that we do not know, and stand in need, I think, of a different starting point than conclusions. Whether the conclusions from some better grounded theory would be the same, is by definition anyone's guess.

Representative TALLE. Thank you very much.

Mr. Chairman, I do not think I should use more time. I have more questions, but I defer.

The CHAIRMAN. Senator O'Mahoney, this is a familiar subject to you.

Senator O'MAHONEY. Thank you, Mr. Chairman.

I am wondering, from what I have heard from the witnesses since I came into the room, and from what I have read here, whether perhaps the issue is not a litle bit beclouded in detail.

Dr. George, you just talked about case-by-case assessment of the effect of concentration of power. Did I understand you correctly there?

Mr. GEORGE. Yes, sir.

Senator O'MAHONEY. How can you have a case-by-case assessment of concentration of power? Do you mean by that that, let us say, a concentration in the steel industry, a concentration of power in the steel industry, and a concentration of power in the aviation industry, might be judged by different standards?

Mr. GEORGE. Not by different standards but by the different facts in the several situations.

Senator O'MAHONEY. Well, we find our problem confused a great deal by the terms which are used in the discussion. Congressman Talle has just now been asking the members of the panel if it is not necessary to consider the impact of war upon this problem, and whether a big industry or concentrated industry is not essential to the production of the instruments of attack and defense, yet I recall reading in the papers no later than Sunday a speech made by a member of the President's Cabinet in New York City, Secretary Benson, in which he was taking a great deal of satisfaction in what he considered to be the demonstration by the administration that peace and prosperity had been attained at the same time under its program.

Well, I do not see peace on the horizon at all. We would not have been passing the resolution on Formosa in the House and the Senate last week if these were times of peace. What we are driving at, it would seem to me, in considering the Economic Report of the President, is what sort of a policy toward curbing the concentration of economic power, curbing the monopoly, is recommended in the President's report, in both times of peace and war.

Do we have different standards for the different occasions?

Mr. GEORGE. Well, Senator, I was not prepared to enter into a discussion of the general issues, because it so happened in your absence this morning I was making my presentation on a matter of great interest to you in another sphere, and that was the question of financing small business, and I was drawn into this phase of the discussion only because Representative Talle asked me to comment, but I will certainly say, as you phrase the question, the answer is "No." I do not think that we can have in peacetime a standard that is addressed only to our requirements for wartime, if that is the meaning of the question.

Senator O'MAHONEY. Well, don't you believe it is a fact that in a democratic society, such as we have, and in a free world, which we are trying to win, it ought to be the basic objective of everybody in business and in government to maintain a free competitive economy, one that is not controlled either by government or by any group of business or industrial leaders?

Mr. GEORGE. It seems to me that the statement is unexceptionable. The problem lies only in definitions and tests.

Senator O'MAHONEY. And in applying it to particular cases?

Mr. GEORGE. That is right.

Senator O'MAHONEY. I know, Dr. Adams, that you have given some illustrations. I have not read all of this paper. You did write a book about the aviation industry a few years ago, or on this problem which you mentioned, concentration of power in aviation.

Mr. ADAMS. Yes; one of the chapters in the book which I edited was on the aviation industry.

Senator O'MAHONEY. Did you discuss that today?

Mr. ADAMS. Yes; I just briefly went into the airline problem in my prepared statement.

Senator O'MAHONEY. Well, as I recall, the conclusion of the chapter in your book was that there is a concentration of power in the aviation industry?

Mr. ADAMS. That is correct.

Senator O'MAHONEY. Is that your own personal conclusion?

Mr. ADAMS. Yes, that is true; and I might add that the degree of concentration in the airline industry is an unjustifiable degree of concentration.

Senator O'MAHONEY. What would be your recommendation to Congress as to what its policy should be toward concentration in this field?

Mr. ADAMS. I think a more experimental attitude toward the certification of new carriers is indicated, and I imagine that at least on the Senate side there will be an opportunity to do something about administrative discretion in the hands of the CAB.

I think the Senate in the near future will be confronted with the problem of confirming a Presidential appointment to the CAB, and I think the man who is finally confirmed ought to have the competitive philosophy at heart. Because the CAB, in my opinion, at least, has been very deficient since it has been created in promoting as much competition as I would consider feasible and practical and desirable.

Senator O'MAHONEY. And you are pointing out to the Senate, and particularly to the Senate Committee on Interstate Commerce, that it has an opportunity to take a step or two away from the concentraion of control in a particular industry?

Mr. ADAMS. There is no question about it.

Senator O'MAHONEY. That is your definite recommendation to this committee to pass on, if it sees fit, to the Senate, either through its committee or as a whole?

Mr. ADAMS. Yes, sir. I think when the Civil Aeronautics Act was passed in 1938 there was some justification for restricting new entry. It was a small industry, an infant industry, and the agency could not afford to be experimental on this one score of admitting newcomers, but I think the industry has grown to such an extent now, and the rate of future growth that can be forecast at the present time is so great that new carriers certainly should be allowed to participate in the growth that is foreseen and, as a matter of fact, I think that certification of new carriers would make the growth even greater than it would be in the absence of that competitive stimulus, that competitive urge.

Senator O'MAHONEY. Now, that is a very interesting statement that, in your opinion, the admission of new carriers into the field would make the general growth of the industry better than it is and create a better condition; right?

Mr. ADAMS. Yes, sir.

Senator O'MAHONEY. Does that apply in any other industry which you have studied? You refer here to steel, and the sale of the Oregon plant.

Mr. ADAMS. Yes. I have a quotation here somewhere from the opinion of Judge Wyzanski, in the United Shoe Machinery case, where he talks about the desirability of keeping freedom of entry open, and he says, and I quote the judge now:

> One of the dangers of extraordinary experience is that those who have it may fall into the grooves created by their own expertness. They refuse to believe that hurdles which they have learned from experience are insurmountable can, in fact, be overcome by fresh, independent minds.

Now I think the truth of that statement has been borne out in the airline industry. If you look back on the testimony of presidents of the major airlines, at one time they believed that coach service was impossible; if coach would be introduced, severe losses would be suffered by the major airlines. Their experience had led them to believe that the demand for air travel was inelastic.

Along came these nonscheduled carriers. They had not had this experience which Judge Wyzanski talks about. They did not think that certain things were impossible, and they went right ahead and they did the impossible, and they showed that air coach was something quite feasible, and I think that is the great value of competition. You have to maintain that invigorating and energizing force in the economy which is responsible for a great deal of economic growth.

Senator O'MAHONEY. I see Dr. Kaplan here sitting beside Dr. George. Dr. George tells me this morning he discussed the problem of new capital for small business. I take it that you are a proponent of such a program, are you not?

Mr. GEORGE. Well, yes, sir. My subject was a little broader. I took in several aspects of the small business survival and growth problem, such as the provision of more assistance for research and development as well.

Senator O'MAHONEY. I was assuming that you were in favor of encouraging small business.

Mr. GEORGE. Oh, yes.

Senator O'MAHONEY. And Dr. Kaplan, do you still retain that view?

Mr. KAPLAN. I do, and I hope, Senator, that we can go on where you left off, in the efforts to get a new channel of investment financing, and fill the gap in the facilities available to small business for equity and other long term capital. I was glad to see that measures to that end have already been introduced in this session..

Senator O'MAHONEY. Well, now, there are no if's, and's, and but's about it, you two members of the panel believe it would be in the public interest for the Government to pursue a policy that would stimulate and foster small business?

Mr. KAPLAN. Yes; except that in the present context I would make the distinction between the Government being around to hand out financial aid and Government stimulating the creation of an institution designed to become a private institution—one which has a chance to prove that the investment financing of small business can be a self-supporting and profitable enterprise.

Senator O'MAHONEY. Well, I think that is a pretty good modification of the proposal.

Having discussed that matter in the past, we can agree on what our objective was. It was not to provide new debts for small business, but to provide a regime under which the investment of private money could be protected from monopoly, on the one hand, and the Government on the other; isn't that right?

Mr. KAPLAN. I think that is correct. I think we have to develop the techniques that will make it profitable to get behind a small business that can make constructive use of new capital. I have in mind not only the new enterprise, but also the established small business that is about to fold up because the owner can no longer carry on and no suitable successors have the necessary capital backing. I have in mind the investment bank that can take part of the equity of the promising small business (which no commercial bank is expected to do today) and stay with it; share in the profits, if necessary, but let the firm bail itself out eventually and own the assets independently. In other words, enable the financial agency to share some of the risks and returns of the small enterprise.

That kind of mixed banking was common in Europe, and we had it in this country in an earlier day. Since the compulsory separation of commercial banks from their investment affiliates, no broad program for the capital financing of small business has emerged.

The British have acquired it over the last 11 years. The Canadians have, and so far as I can see they are doing a successful job with it. It is time we acquired the equivalent banking structure.

Senator O'MAHONEY. Now as far as lipservice is concerned, everywhere we find people acknowledging that monopoly is bad and that competition is good, that private enterprise is fine, but when we talk about private enterprise we do not always distinguish between the enterprise which is owned and managed by the same person and the collective enterprise which is owned by thousands of stockholders who possess of themselves, each of themselves, only a fragment of the total capital stock. Does anybody in the panel suggest anything that should be included in our comment upon the President's report with regard to a public policy, which would promote the owner-manager type of business, free and competitive?

Mr. MUND. Senator O'Mahoney, I think that basic to this whole consideration is the need to reexamine the proposal frequently made, made by yourself, too, of a system of Federal charters or licenses for business concerns engaged in interstate commerce. I think that is basic to the whole consideration.

With such a program or plan, a system of Federal charters or licenses for all concerns engaging in interstate commerce, it would be possible for Congress to stipulate certain provisions with respect to the responsibilities of managers to the stockholders, to the laborers, and to the public.

Senator O'MAHONEY. Would you regard that as socialistic?

Mr. MUND. Not at all. That would be the very essence of a program to maintain free entry and price competition in a free society. It is the superstructure, the very basis for doing it.

Senator O'MAHONEY. It would be a preventive rather than a stimulant for socialism?

Mr. MUND. Very definitely. There is a great void today in our country in that regard because Congress is not facing up to its problem of laying down rules of the game for businesses concerned with interstate commerce. I think there is a real need, and I would like to suggest that the committee give serious consideration to that proposal.

Senator O'MAHONEY. I think I will reintroduce my bill for Federal charters.

Is there any disagreement among the members of the panel?

(No response.)

Senator O'MAHONEY. There is none.

Mr. Chairman, I think this is a good time for me to stop.

The CHAIRMAN. Senator Goldwater.

Senator GOLDWATER. Mr. Quinn, you comment in your paper that there are today 68 private billionaire corporations in the country, most of them with greater annual incomes than the 48 States. You say 200 industrial giants own the important half of American industry. How has that ratio changed since 1939?

Mr. QUINN. Well, there is great argument and dispute about that. I think Mr. Claire Wilcox was the first one who produced figures some years ago, and Mr. Adolph Berle, who, you will recall, wrote perhaps the best book, with Gardner C. Means, on the modern corporation. He has lately repeated that statement.

Now, whether the trend toward further concentration has increased, and the extent to which it has, is a matter for study and dispute. To me there is no question about it. It seems to me evident on all sides, witness this renewed merger wave. But I have not myself undertaken such a study. Professor Adelman, of MIT, did one some years ago, in which he questioned whether the trend toward further concentration was increasing, but my guess is that if he did it over again today, he would come out with a conclusion that the tendency has been for it to increase further.

Senator GOLDWATER. I do not think we can argue the point. There is a tendency to do so, but what I wanted to get at—because we are discussing the tools, we either have them or not, and we either use them or do not if we have them—is this question: Was this problem acute enough in 1939 to warrant active interest of the Antitrust Division of the Justice Department?

Mr. QUINN. Yes; I think it was. You will remember that 1939 was just a year or two after the temporary National Economic Committee and it must have been sufficiently acute then to have given rise to that committee.

Senator GOLDWATER. Well, then, how long has this acuteness been going on that you say we are aware of today? Is it something that has been going on for a great number of years?

Mr. QUINN. I suppose you could go back to the turn of the century.

Senator GOLDWATER. In other words, it is not a new problem?

Mr. QUINN. No; but my own feeling is that it is growing more acute.

Senator GOLDWATER. Do you feel that the Antitrust Division of the Justice Department is working now toward the solution of the problems?

Mr. QUINN. I think with the tools that they have and the money that is allowed them, the Antitrust Division does a pretty good job, but the fact that it is failing, that the whole movement is failing, is attested by the way in which both the Sherman law and the Clayton Act have been so largely circumvented. We see this trend ending up now where we have practically, in all of the major industries, 3 or 4 companies having 75 percent or more of the business. So whatever the intention of the law was, and surely it was to prevent that, it has not succeeded.

I do not know that you could put the blame entirely on any of the agencies of Government. The law apparently was not sufficiently specific or strong enough to enable them to prevent it.

Senator GOLDWATER. But you would say over the years, equipped with the tools that they have, and with the moneys that Congress has given them, that the Justice Department has done a good job?

Mr. QUINN. I would not hold any brief to the contrary on that point although the present administration in not doing very well.

Mr. MUND. Senator Goldwater, I would like to comment on a statement which Senator Kefauver made a few weeks ago in New York City, in his speech before the antitrust section of the New York Bar. He concludes with this statement, that in 1946, the Attorney General started out on a program of dissolution, divorcement, and divestiture, attempting to decentralize certain industries, such as shoe machinery, A. T. & T. and Western Electric, Du Pont and General Motors, but he says actually, where is there any dissolution program today?

Senator Kefauver comes to the conclusion that present-day efforts to use the so-called DDD treatment are nonexistent. We can ask also what have the Department of Justice and the FTC done with respect to the antimerger law of 1950? What have they done with the amendment to the Clayton Act which was looked upon with so much hope and expectation to stem the tide of mergers? From 1914 until 1950, Congress was asked to plug the loophole in section 7 of the Clayton Act. They finally did, in 1950. What has been done with this new legislation? I think we have to ask how effective the antitrust agencies have been.

Senator GOLDWATER. Well, I think that is a good observation. Now I would like to pose a question here. I do not know who can answer it. I would like to preface it with a few remarks to show that the tendency toward merger is not confined wholly to the so-called industrial giants. It starts down with the corner drug store. It becomes to me an effort at survival, whether it is small or big. Now what causes that scramble to join your competitor or join your neighbor in business?

As a businessman, I have found without incentive, which you all really have to have, you do not have competition. Without incentive, in fact, you do not have business. Now, isn't it true that the excessive taxation of American business over the last 20 years has contributed terrifically to this almost necessity of merger, where the small-business man is allowed to retain so little of his profits today, that in order for him to see any chance for expansion, he has to go to his neighbor and say, "George, I think it is time you and I got together, we can't go it alone."

I would like some comment on the thesis that taxation policies of the Federal Government have contributed a lot to this trend.

Mr. GEORGE. Senator, I have a note on it. There was a study at Harvard devoted to an effort to unearth the cause of mergers, and among those considered was the one that you mentioned; that is, the effect of the tax system, and they found a considerable influence which they felt, however, was exaggerated; I mean exaggerated only relatively speaking, in comparison with the force that was popularly attributed to it in some quarters, but they studied the effect of taxation on corporate mergers over the period of 1940 to 1947, and they found in those years that sales of businesses attributable in very significant degree to tax considerations constituted about 10 percent of the total number of mergers, and close to 25 percent of those involving absorption of units with assets between $5 million and $30 million. Now, measured by the index of concentration that they used in their study, the overall effects of all mergers, and thus naturally all those into which the tax elements entered importantly, were not terribly impressive during the period covered, but nevertheless there was a significant loss of what we might regard as centers of initiative because of the oblique impact of the tax structure.

Senator GOLDWATER. It would be interesting to pursue that study from 1947 on because I believe that is where we find the real trend toward merger. I think there you find not only the direct effect of the governmental tax policy, but also the effect of inflation added to it, where an examination of a small business' statement shows the business to be, on paper, in good condition, but there is no money left the next year to buy new merchandise at the increased prices; that is, the period from late 1947 through 1950, and probably a month or two in 1951.

But I have often considered that that was a cause of this trend toward getting together. I see it in small business just as much as I see it in big business.

Now I do not condone it in big business because I happen to be in a business that is probably worse hit by mergers than any other group, and that is the retail industry, and I myself would like to see some study made at the Government level, but I would like us to look into all of the aspects.

What can the Government do, business asks, to keep these monopolies from growing larger and to keep mergers from growing. It is my own personal feeling that another look at the excess-profits tax would do more to stop these things and do more to encourage small business than anything we can do at the present of a hurried nature.

Would you comment on that?

Mr. STOCKING. Senator, I believe some provision in our tax system to encourage risk-taking on the part of small enterprises would have a salutary influence upon the smaller concerns, but I do not believe that the situation with respect to working capital in big business in recent years explains any mergers that have taken place.

As a matter of fact, an extraordinarily interesting phenomenon has developed in business. No longer has it been necessary in recent years for business to look to the flotation of equities in order to get capital. Actually, the financing has been self-financing out of earnings after taxes have been paid.

Senator GOLDWATER. You are talking about big corporations?

Mr. STOCKING. I am talking about big business firms. It is well known that they have found adequate funds for self-financing and that they have not had to go to the capital market to get funds, except in a few exceptional cases.

General Motors has announced a proposed flotation, I believe, of $325 million of securities sometime in the near future, but General Motors has found it possible, I believe, to finance an extraordinarily large expansion in the postwar years without turning to the public or to the capital markets or its stockholders. So much for big business.

If a shortage of working capital on the part of Company A leads it to merge with Company B, which also has a shortage of working capital, I do not see how Company A, plus Company B, would be any better off, as far as working capital is concerned.

Senator GOLDWATER. Of course, working capital is not the only consideration in these mergers. You get into the merger of markets in small areas, but it does have a decided effect. The 10 percent figure, I think, is a very small figure. I would suspect that today you would find it greater than that.

Now I would like to get into two other questions here on which some others might develop. We are all pretty much agreed that big monopolies are not good for the free-enterprise system or for the American way of life or business.

What is the attitude of the panel on the increasing monopoly of the co-ops on markets; is that healthy?

Mr. MUND. I would say, Senator Goldwater, that that is a problem which should be studied, too. Insofar as a co-op controls a whole market, such as oranges, it could be monopolistic, too.

Senator GOLDWATER. I am talking about marketing and the marketer, too, the person that is buying. I am wondering if it is wrong for business to become big, and I certainly agree that there is a limit to which it should go and no further. Shouldn't some thought be given to the size that cooperative market ventures might go? I am speaking of the co-op that provides the clothing, the tractor, the gasoline, the products of the market at a lower price than a competitor in the open market can produce or can give, thereby dominating more and more of the spending market. For instance, what happens to the small-business man, the small merchant, when a co-op dominates a community? Is that healthy?

Mr. MUND. Well, that is a part of the total problem, I think. You have got to go into the situation to see why it is that the local group of farmers dominates the local retail market. I think you are speaking of a big co-op?

Senator GOLDWATER. Yes.

Mr. MUND. Well, why were they forced to grow; were they faced with a situation of monopolistic prices for gasoline, for example? Did they have to go into the marketing business to protect themselves? How about cement? I think you have to make a study to see what the dangers and problems are.

Senator GOLDWATER. I agree. I would like to see us study that particular picture when we study the whole situation. We should study the original beginnings of co-ops. There is unquestionably a need for them. I wonder if they should be in other areas besides agriculture.

Now I think we all agree that business can become so big when it is monopolistic that it is bad for the country. What happens in the labor market when we have a monopoly on the labor of the country? Let's say that the two big unions merged. We would, in effect, have a merger of a similar stature of Ford and General Motors, where 85 percent of the automobile market would be controlled by 2 companies; we would have at the present time probably 25 or 30 percent of the labor market controlled by 1 union; is that right?

Mr. MUND. I think that Professor Stocking had a very fine statement on the problem in a recent journal article.

Possibly he can comment on the question.

Mr. STOCKING. Well, I think if we are interested in preserving a competitive society, and I assume we all are interested in doing that, that the concentration of power is undesirable. I think that it can be undesirable whether it is in the hands of a labor organization or whether it is in the hands of a business group.

I believe that industrywide collective bargaining tends to rigidify an important element in costs. I think it is easy to justify industrywide collective bargaining from the standpoint of labor, and to understand the development of strong labor power groups as long as they have to negotiate wages and working conditions with large aggregations of capital.

Senator GOLDWATER. I agree with that thesis entirely.

Now I have just one other comment to make, and that is regarding Mr. Adams' paper and his writings on the airline and aircraft industry. Are we forgetting, in assuming that there should be more competition in the transcontinental and feeder lines, that we probably sometime between 1938 and the present time reached the point of no return on profits in the airline industry? Do you feel that there are a sufficient number of airlines making money today without Government subsidy to encourage you, let us say, to invest money in a new transcontinental airline? I am not talking about feeders, because I think we should treat them separately.

Mr. ADAMS. Well, of course, the subsidy issue has been raised by the CAB as the primary justification for refusing the entry of newcomers, but I think it is a partially misleading issue in this sense: The major airlines have taken the position, well, if you certificate new carriers, we are going to suffer losses, there will be diversion of traffic with those losses. This will increase the need for Government subsidy.

Senator GOLDWATER. Yes.

Mr. ADAMS. I think the record would tend to show that the market for airline services has not been of fixed size. The demand is fairly elastic. Some people say highly elastic. Therefore I think the action of the nonscheduled carriers, for example, has created an entirely new demand, a demand that did not exist before, and in that sense there was no diversion of traffic from the major airlines. This was an entirely new segment on the demand curve that had not been explored by the major airlines.

Senator GOLDWATER. I wish we could pursue this a little further. We have a vote that I have to attend. I would just like to comment that I lost my shirt on an airline once waiting 3 years for the Government to certificate it. I would just like to comment on something Mr. Quinn said about the Messerschmidt. I think if he would study that situation he would find it was a pretty strong argument for monopoly, because Messerschmidt 109 was a perfected flying machine in 1938, while our eventual good plane, the 51, was perfected in 1941, but the haggling over it did not get it into the air until 1944, and the 109 was never equaled.

Mr. QUINN. Temporarily, monopoly may be effective.

Senator GOLDWATER. It was the stupidity of the German high command that caused them to lose that air war, not their production.

Mr. QUINN. It was also because democracy is stronger and better.

Vice Chairman PATMAN (presiding). Mr. Curtis.

Representative CURTIS. I want to pick up just briefly one little matter that Senator Goldwater was discussing with you, Dr. Stocking, in regard to the source of corporate financing. You have commented that, of course, retained earnings were one of the sources of corporate financing, but did I gather the impression that you felt that that was an increased situation or was that just about standard in recent years?

Mr. STOCKING. Will you repeat that question, please?

Representative CURTIS. Whether, in your comment on corporate earnings, retained earnings, as a source of corporate financing, the ratio was about the same as it had been before, or is this something new in the picture?

Mr. STOCKING. Well, I am not quite sure of my answer to that question, because I do not have all of the facts in mind, but I believe—and this is an impression based upon observation rather than any careful and analytical study—I believe that in recent years the corporations have had to turn to the capital market less frequently than in earlier years to finance expansion.

I think that the statistics will show that the financing of expansion has been largely through retained earnings and the investment of depreciation reserves. The actual payment of earnings in the form of dividends has represented, I believe, a relatively small part of the total earnings net of taxes in recent years.

Representative CURTIS. Wouldn't you say that theoretically, of course, depreciation is return of capital? You are ending up with the same plant that you had to begin with, as far as production is concerned. You might have better machinery, but the theory of depreciation is certainly not refinancing.

Mr. STOCKING. I do not think it would be profitable for us to become involved in a problem of accounting theory or practice.

Representative CURTIS. I am not talking about accounting, I am talking about an actuality. If you have a plant that can produce so much and that plant wears out, if you do not replace that capital investment, you end up with nothing, you have actually used capital, so I am suggesting that depreciation in theory is not refinancing.

Mr. STOCKING. Sir, I am not quarreling with you about the meaning of the practices that have been pursued. I am just saying that because of these two sources—retained earnings and depreciation reserves—apparently the corporations have not found it necessary to resort to the capital market to carry through a rather extensive expansion program.

Representative CURTIS. The reason I asked that question is that I have felt all day long in this panel discussion that there has been too little attention paid to what is happening today in relation to what happened yesterday and what happened in the years before that.

Now, actually looking at the facts and figures on Government finance, 1954–55, put out by the Tax Foundation, if their figures are right, in their Chart No. 26: Sources and Use of Corporate Funds, on page 42, they take only the years 1946 to 1953, I cannot see much of a change in trend, and if anything, it has been a swingup to relatively more new stock and bond issues on the part of the corporations. I want to go on to something even more basic in our discussion here today, and that is this whole problem, as the question is posed, of monopoly, competition, bigness, and so forth, and there have been a great many statements made about what the present situation is in the opinion of the panel, and indeed, in the opinion of some of my colleagues up here on the committee. But as was brought out by my colleagues, Mr. Talle and Senator Goldwater, the important thing is that this old problem, and so the really important thing is to consider what switches have there been, how many changes have there been, and information do we have on that subject.

Now I want to go into that a little bit because I am interested in knowing what that ratio of change has been, and I, too, think that there should have been more in the Economic Report on the subject, but again referring to Facts and Figures on Government Finance, 1954–55, in their chart No. 101, on page 140, they have a chart that has corporate income by net income classes, and it ranges from 1941 to 1951, which is their last figure, and the breakdown on that takes the number of returns by corporations earning under $1,000, then $1,000 to $2,000, $2,000 to $3,000, and on up to the top figure of $5 million and over.

Then coupled with total returns for 1951 is net income in thousands, and as I look over the ratios from year to year, there has been a constant increase in all brackets in the number of returns, and that ratio has been fairly proportionate among the various groupings, with the exception in 1951 there was a singnificant decline in the number of returns by corporations from $25,000 up to $1 million, both in terms of number of returns and in terms of dollars.

Even more significant is that it shows from 1945 to 1950 the ratio of corporations $5 million and over, in terms of net income in relation to the total, $22 billion was the total in 1945, and the corporations of $5 million and over had $9 billion of that $22 billion, which is less than 50 percent, I haven't figured out the percentages, and yet in 1950 that ratio had increased to more than 50 percent. In other words, $44 billion in 1950 is the total, and $23 billion of that was corporations of $5 million and over.

There, from this chart, was the big jump. Now there is a jump from 1950 to 1951, but it seems to be more along a level increase rather than a tremendous increase. Now I want to ask the panel generally this question : What sort of studies have been made, if you know, along this line of actually pinning down what the trend has been toward increase, in bigness and that is getting away from all of these generalities and getting down to actual studies?

What studies have been made along this same line that would give us a real picture of this instead of guessing that there have been a lot of mergers or guessing that there has been an increase in bigness, and so on? I would like to ask that question of any of the panel, what studies there are that would show that, and what have those studies actually shown, as far as this increase, if there actually has been an increase?

Mr. KAPLAN. Congressman, I could hardly give you the description of what has been done, in the next few minutes. The Brookings Institution has recently published my study, Big Enterprise in a Competitive System. In it an attempt has been made to see what shifts have taken place in the percentage of our total economy that has been accounted for by the 100 largest industrials. I would say in general the findings indicate that there has been a slight increase in the percentage of total industrial assets held by the very large companies.

It was almost inevitable that the scale of investment should have expanded since World War I. In 1909 a company was among the 100 largest industrials if its total assets amounted to $23.5 million.

To get on the list of the 100 largest industrials today a company must have at least $250 million of total assets. When we had the $23 million corporation ranking as No. 100, in 1909, the national product of goods and services was $34 billion. Today, when we have a $250 million company barely getting into the first hundred in business size, we have a gross national product of $360 billion, as against the gross national product of $34 billion in 1909. In other words, when we talk about billion-dollar corporations, huge companies, middle-sized companies, over a period, let's make sure that as we go along we are adjusting ourselves to the increasing scale of the whole economy.

This perhaps is an opportunity to put in a footnote on the question of mergers. It should be clear that what my colleagues at this table have in mind is not picking on the word "merger" as inherently a term of evil connotation. They are thinking rather of merger in those situations in which corporations, already large, are using the merger as a means of acquiring still greater power and leverage that is not related to normal growth in their operation. But I want to point out that for smaller business enterprise, the merger is an indispensable tool of competition.

In any year—take the year 1954, for example—out of every hundred businesses in operation, and we have about 4 million, about 10 out of a hundred have started within the year; another 10 will discontinue during the year; and there will be anywhere from 8 to 10 business transfers. There is constant reshuffling of businesses. Now in that setting there may be as many as 100,000 "acquisitions," or, if you will, "mergers" of assets and resources.

Representative CURTIS. Now, Mr. Kaplan, that is not unusual, is it?

Mr. KAPLAN. No, I say this is the story of a typical year. From the standpoint of smaller business, the merger is an indispensable tool. You cannot conceive of a situation in which a small enterprise would not be allowed to sell out, nor an entrepreneur to join hands and assets with others. You would not conceive of a situation compatible with free enterprise in which a man who is to buy another plant would not have the choice between buying a new one and buying an old one that he may remodel, any more than you would want to be denied the chance to buy an old house and remodel it as against buying a new one.

It is only, then, when you get to the point of thinking of a merger as a club to achieve domination and undermine competition that the burden of proof is put on the merging corporation to indicate why this merger is necessary.

Representative CURTIS. I appreciate your comments. Now, Mr. Mund referred to a wave of mergers, which, of course, to me, would mean that it is an abnormal number, and I wonder if that is so, or is that just a figure of speech. We have in any given year, any normal year, as Mr. Kaplan has referred to this year or last year, for example, quite a number of mergers.

Now is the ratio of mergers for this year and the past few years unusual, or what do the graphs and curves show on that? I do not know. I did not know that it was.

Mr. MUND. I would say the statistics show that we are in what might be called a third great wave of mergers in our economic history.

Representative CURTIS. When did that begin, sir?

Mr. MUND. It began at the close of World War II, it shot up very markedly. I have a chart I could show you.

Representative CURTIS. That is very interesting. That is what I wanted to get to. Now have we had in our economic history other periods when there was what you describe as a wave of mergers?

Mr. MUND. Very definitely. The first period got started in the 1890's. It got going in a substantial way around 1896 and 1898, and came to a close in 1903. At that time, some 100 corporations had come to dominate the principal industries. Take the United States Steel Corp., for example. It was formed in 1901. It acquired a control of around 80 percent of the production capacity.

Representative CURTIS. Now was there another period of mergers?

Mr. MUND. Yes, there was. The second great period was 1920–29. Now these waves of mergers, I would like to emphasize, were not just natural growths, reflecting a technological change in our society. Why did the first wave come in 1896 and 1898? It came at that time because the more informal arrangements for acquiring monopolies, such as combinations, gentlemen's agreements, and so forth, proved to be unsatisfactory. Business leaders, moreover, had been able to get a change in our corporation laws legalizing the holding company device which permitted a corporation to acquire the corporate stock of competitors and to hold and vote it as a natural person.

Representative CURTIS. Now what year are you referring to there? What wave of mergers?

Mr. MUND. That was the first period.

Representative CURTIS. You are still talking about the 1890's?

Mr. MUND. Yes. The first wave came to a close in 1903.

Representative CUTIS. When was the next period?

Mr. MUND. The first period of mergers ran its course, and people became incensed at these monopolies. Federal action thereupon was taken to dissolve some of these giants, leading to the dissolution cases of 1911. That put the fear into the minds of business leaders seeking to bring about aggregations of capital.

In 1920 the Supreme Court in the Steel case held that not all mergers which restrained competition are bad, but only those which unduly restrained competition. So long as a business concern did not buy out all of its competitors, and did not engage in ungentlemanly conduct, the Supreme Court indicated that it would not frown upon mergers. This decision initiated the second great wave of mergers.

Representative CURTIS. Then that wave of mergers lasted how long?

Mr. MUND. The second wave of mergers culminated in the stock market crash of 1929.

Representative CURTIS. You are saying this all started because of this one decision. Now, the next wave you say came in 1946?

Mr. MUND. 1945 and 1946. It is explained by a variety of reasons. I do not think any one reason can explain it.

Representative CURTIS. Those are the things I should think we are interested in, this Committee on the Economic Report.

Mr. MUND. The facts indicate that a continuing factor in this third great wave of mergers is the desire on the part of larger companies to buy out smaller ones and to consolidate their position on a horizontal basis as well as on a vertical basis. The real problem is not one of two small companies merging. It is rather one of a large company buying out a smaller one, or a medium-sized one.

Representative CURTIS. In other words, what you are saying is that there are a lot of mergers that are a healthy economic process, but in this merger and what produces a wave, we shall say, is the unhealthy mergers?

Mr. MUND. That is right.

Representative CURTIS. I notice Mr. Adams wanted to comment on this.

Mr. ADAMS. I want to supplement the remarks made by Mr. Kaplan and Mr. Mund to the effect that it is not the absolute size of the corporation that we are concerned with primarily in the monopoly sense, but, rather, the relative size within an industry.

Now, the most serious thing about the current merger movement from our point of view is the interpretation accorded the congressional intent as expressed in the Antimerger Act of 1950. I think the Federal Trade Commission in the Pillsbury case has perverted, subverted, and undermined the will of Congress. I think it was clear that Congress, in passing section 7, in amending section 7 of the Clayton Act, wanted to stop any substantial lessening of competition through the acquisition of assets. Yet in the opinion recently issued by the Federal Trade Commission, Chairman Howrey did not, as I see it, adopt the proper test of what is lawful and what is unlawful. I think he accepts the "market as a whole" test. That is, he focuses primarily on how much competition remains rather than how much competition is lost in the market as a result of a merger.

Now, once you adopt the test: "How much competition is left? Is that amount adequate to protect the public interest?" I think you are on a hopeless toboggan.

Then you finally permit an increasing degree of concentration in an industry until you have reached the situation which now prevails in automobiles, where no one can really object to the merger of Studebaker and Packard, and so on.

Representative CURTIS. I am happy you mentioned autos because I was going to ask this very general and basic question: It is true, is it not, in the course of a new enterprise, or new industry, like the automobile back in the turn of the century, that almost any new business or new industry, rather, starts out with many, many small concerns, and the normal growth of an industry produces mergers, and would you comment as to whether it is normal growth that they do end up or would naturally end up with just a very few extremely large ones as, for example, in the automobile industry?

Mr. ADAMS. Well, I do not like to regard certain economic processes as normal or natural or inevitable.

Representative CURTIS. I did not say inevitable.

Mr. ADAMS. I did not mean to attribute that to you, Congressman, but there is a strong feeling in the academic community, in the business community, and in Congress, too, that certain things are inevitable, and monopoly is one of them, and we might as well accept it. I do not hold to that theory. I think monopoly is very largely created by human action, by unwise action, by privilege-creating action.

Representative CURTIS. Wait, I was not talking about monopoly. Let us phrase it this way:

Referring to this normal merger which some of our panel, at least, regard as healthy, isn't it the normal process in a new industry as it grows to have a lot of this normal merger, and if it were healthy—and I would like your comment if you disagree, of course you can reach a point where you get unhealthy mergers which would be the point of monopoly. Now, isn't that true in the development of any new industry? Isn't there a normal growth of that nature which is healthy?

Mr. ADAMS. Let me answer your question obliquely, if I may: What should be done on the application of Bethlehem and Youngstown to merge? Here you have the second largest steel company and the sixth largest steel company——

Representative CURTIS. You are getting to the extreme again. I am trying to get to the middle process where you still have lots of companies in a field.

Mr. ADAMS. Well, I think we are in substantial agreement, Congressman. You see, if you permit mergers which substantially lessen competition while the industry still has a large number of competitors, you gradually work yourself into the situation that you now are confronted with in the automobile industry. There the situation is too far advanced to do anything about the concentration process. If you accept the notion that small companies may merge to compete more effectively with large ones, or that large companies may merge to compete more effectively with the giants, you are, in fact, inviting a proliferation of oligopoly and an extension of concentration.

Representative CURTIS. Yes, but you could still have competition. The fact of bignes does not necessarily eliminate the competition.

Mr. ADAMS. You can always have competition. You can even have competition in a monopoly situation. For example, many people have argued that if you permit a monopolization of the automobile industry by General Motors there would still be Buick competing against Oldsmobile, and Chevrolet against Plymouth, assuming that Plymouth is acquired by General Motors. But is that the kind of competition envisioned by the antitrust laws?

Representative CURTIS. As I understood your testimony previously, thought, you thought the desired goal was competition; so if you are getting competition, where is the danger, then, in your opinion? If you have your big companies, and there is actually competition between them, wherein lies the danger?

Mr. ADAMS. Well, what kind of competition is it, and is it carried to the degree that would be posisble in the absence of centralized control?

I do not think this intrafirm competition that I have described just a moment ago, assuming that General Motors were to monopolize the automobile industry, I do not think that is genuine competition.

Representative CURTIS. You mean that the competition between Ford, General Motors, and Plymouth is not genuine?

Mr. ADAMS. I did not say that.

Representative CURTIS. I am not trying to put words in your mouth. I am asking you whether you don't think that is genuine? That is an example of bigness, of course, and it looks like there is competition there. I fact, there was testimony here the other day saying that the competition was too keen, and actually would cause future difficulties.

Mr. ADAMS. Well, my question would be how much benefit is that competition to the consumer? How much price reduction have you had?

Representative CURTIS. Now, you are going off. I thought that you had already agreed that as long as competition was provided there is not any danger. Now, maybe I am wrong in assuming that is what you said.

Mr. ADAMS. Well, there are different kinds of competition.

Representative CURTIS. Well, what is the difference? To me competition is competing. What do you mean different kinds of competition?

Mr. MUND. We have said that it is so very important to maintain freedom of entry and independent price competition in the basic industries such as iron and steel, the nonferrous metals, cement, the primary materials, so that everybody can have access to them. I think we should focus our attention particularly at the moment not on finished fabricated goods so much as on the basic industries. We should ask ourselves is it possible for anyone with cash on the counter to go into these basic industries and get products.

Representative CURTIS. Well, you can move around on examples endlessly. We have taken the automobile industry, so let us stick to that, if we may.

Is that the kind of competition we are discussing, or isn't it?

Mr. MUND. We should be happy and very pleased that we do have the independent rivalry that exists on the part of the major automobile companies. I think that is very important. When we talk about competition, our main problem is to maintain independent action on price for a product which is fairly homogeneous, like cement or steel.

Now, when you get to these specialized products like Cadillacs and Fords, they do not compete in the same way. That is a case of substitute competition.

Representative CURTIS. Chevrolet competes with Ford.

Mr. MUND. In a degree.

Representative CURTIS. I would say they are in direct competition.

Mr. MUND. It is what we call substitute competition.

Representative CURTIS. You mean Chevrolet competing against Ford is not direct competition?

Mr. MUND. Not in the same way you and I would be competing if we were selling steel, not in the same way.

Representative CURTIS. Well, all I am trying to do is follow the thinking of the panel, and I understood, at least Mr. Adams indicated that as long as there was competition that the danger of bigness or, of course, if there were monopoly, you would not have competition, according to my definition.

Now, Mr. Adams is suggesting, well, there are different kinds of competition.

Mr. MUND. That is true.

Representative CURTIS. Which you are now trying to set forth, but in setting it forth you are telling me that you do not interpret competition between Ford and Chevrolet as direct competition, so I do not think we can go any further than that; if we do not agree on that I do not think I would understand what you are talking about.

Mr. MUND. I question whether we can use the term "competition" without an adjective. I question that.

Do we mean price competition; do we mean substitute competition; do we mean sales competition; advertising competition?

Representative CURTIS. It could be any of those, of course. But competition is a simple thing, to me. You are either competing, or you are not, and I do not get these degrees.

Mr. MUND. There is this distinction: The Sherman Act and the Federal Trade Commission Act and the Clayton Act are based upon the principle of maintaining price competition on the part of sellers of a homogeneous class of products such as cement or steel, and also freedom of entry.

Now, we want sales competition, quality competition, we want those things, yes we do, but the law says we must go further, we must have price competition and freedom of entry, so our attention focuses on those two things.

Representative CURTIS. I see what you are driving at. I was not breaking it down in that sense. I simply thought you meant that there was a different method, that you could have half competition, or something like that. You are now breaking it down on the basis of where they might be competing, whether it is in the labor field or price or what?

Mr. MUND. Advertising and so on.

Representative CURTIS. I wonder if Mr. Kaplan would comment on this.

I understand you have just written a book, have you not, on whether or not there is competition in big business?

Mr. KAPLAN. Well, I had expected to confine my remarks in this session to little business, because there was no discussion or recommendation in the Economic Report on big business monopoly, and I thought I would let it wait.

Representative CURTIS. I wonder if you would just answer the one thing.

Mr. KAPLAN. I will say this: Your discussion with Professor Mund confirms the fact that it isn't easy for economists to see eye to eye on how many different kinds of what one economist would call competition are real competition, or and how much of it may qualify as compatible with the good old-fashioned price against price offering that any economist would accept as competition.

Now, with the rise of big business, there has been an increase of what we call differentiated products, identified with the name and brand of the firm. It becomes feasible for a business to have a policy with respect to its products and the terms of their disposal. That kind of competition seems a far cry from what we regard as pure competition, where the supply of a product goes into the market and buyers bid against sellers without regard to who the supplier is. No one is in a position to be more than a bystander, watching the market settle at a price where the maximum sales can be made.

Typically, a big business has a nationwide market interest. It has a pipeline that runs from its suppliers through its own production lines and on to intermediate fabricators or distributors. Considering the whole line it has to watch, it is going to try to direct a policy toward keeping that pipeline flowing so that its product may have a satisfactory market.

Now, of course there is a market against which it has to test its policy. And I would say that if the market is the final determinant of what that company can do and how far its policy can go, then you have effective competition. But it isn't the pure competition of a free wheat market or the stock exchange, which registers its equilibrium with every hour.

Representative CURTIS. Well, do you regard that type of competition that you say exists in big businesses, or can exist in big business, as a sufficient regulatory feature as far as Government is concerned? Once the Government has created that climate, does that solve the problem?

Mr. KAPLAN. Not altogether, any more than I would regard jungle competition, totally untrammeled, as socially desirable. You have to reconcile the desires of any individual with the need of a body politic for a framework of social order and economic balance. There are very few businessmen big or little who would not give a high degree of lip service to the antitrust laws as being essential. They do not have enough confidence in each other to want to be without the antitrust acts. Complete dependence on the market represents a theoretical ideal. But if the market is not the main arbiter, then, of course, the competitive system has fallen down. I happen to be one of those who, on the basis of what I can see of the going market process, believe that the market does catch up with the big firm as well as with the little firm. Our differences in appraising competition hinges on the issue of how sensitive the big corporation is to the competitive market, on how quickly it responds. That differs with the product and the industry, including the relative size and number of the firms and markets involved.

Representative CURTIS. Then you do not regard this wave of mergers as necessarily being something that the Government should be alarmed at?

Mr. KAPLAN. I think that the present mergers can be successfully handled through the general tests of the antitrust acts. I do not think that the new section 7 added anything to the principles of the Sherman act. It just pointed out explicitly that we are concerned with merging of physical assets as well as with mergers by stock manipulation, which was the chief cause of worry and got special mention when the Clayton Act was passed in 1914. With or without section 7, a merger is unlawful if it tends to substantially restrict competition.

Representative CURTIS. Mr. Chairman, I have about 3 or 4 questions I want to ask Dr. Adams in regard to his statement which, incidentally, I was very much interested in, in regard to the comments on the various ways the Government has been contributing to the monopolistic tendencies.

Incidentally, I was a little surprised that you felt that this Federal licensing and issuing of charters for industry in interstate commerce met with your approval. I gathered you felt there was too much Government regulation, and yet you seemed to be in accord when Senator O'Mahoney asked that question.

Mr. ADAMS. Well, I did not express myself specifically on that question.

I think a corporation operating in interstate commerce ought to get its charter from the Federal Government, because it is engaged in interstate commerce, and it is the Federal Government rather than the State government which under the Constitution is supposed to regulate interstate commerce.

Representative CURTIS. You are talking about getting the charter now, and the mere getting of the charter is further regulation.

Now, at the present time, a firm engaged in interstate commerce does not have to go either to the State or Federal Government, does it?

Mr. ADAMS. It has to go to the State government.

Representative CURTIS. You mean to get its incorporation?

Mr. ADAMS. Yes, and that was the O'Mahoney bill.

Representative CURTIS. Oh, rather than licenses, then—I was probably fooled by the term "licenses" in there—rather than that you meant Federal charters for incorporation?

Mr. ADAMS. Yes.

Representative CURTIS. Now, under spending power you refer to the situation on the M-48 tanks. It would seem to me that the real question involved there wasn't whether one concern got the entire control, but whether the bidding for the contracts was open and fair and competitive.

Wouldn't you say that is the test rather than who got the contract?

Mr. ADAMS. Well, there were some strang aspects to the bidding. If my recollection is accurate, I think it was shown that Chrysler had a lower bid on labor.

Representative CURTIS. Well, wait. You would agree, then, that the question is not who got the bid, it is whether the procedures followed in negotiating the bids were open and fair to all bidders?

Mr. ADAMS. That is one question, you see.

Representative CURTIS. Well, that is the only question I asked you.

Mr. ADAMS. Beyond that you have a problem. If the contract is awarded to the lowest bidder, what position will the Government be in 5 years hence trying to solicit competitive bids on the M-48 tank, once you create a monopoly by awarding a contract to a single company? Five years from now you will just have one bid on that particular kind of product.

Representative CURTIS. I do not think that follows at all, of course, because certainly these other companies are perfectly capable of submitting a bid 2 years later just as they were at the beginning. They are not going to be out of business just because they did not successfully get a particular bid on a specific item.

I just do not follow your logic.

Mr. ADAMS. Well, I do not think you can start and stop tank production quite with the ease you indicate, Congressman.

Representative CURTIS. Of course not, because you are going to be changing your design, but they do let specific contracts, and as they let new contracts these same companies, and probably several others, can bid on them. That is the point I am getting at.

Would you indeed have it on a different basis than the lowest bid?

Mr. ADAMS. I think the lowest bid ought to be one of the considerations, but I do not think the contract ought to be awarded to that company if it will in the long run create monopoly and prevent competitive bidding in the future.

Representative CURTIS. You are just assuming that that would, and for the sake of this discussion I think it is fair to go along with your assumption. In other words, your assumption here was that this would create monopoly. I cannot agree with your assumption, but, on the other hand, I can see your point.

Now, in this taxing power, you comment on the certificates of necessity. Now, of course, you do not discuss why the certificates of necessity were created. Do you disagree with the philosophy that lay behind that, and do you think that it was for the purpose of creating a big bonanza?

Incidentally,I was on the committee that wrote that report, only that was not my language.

Mr. ADAMS. As I remember the report, Congressman, it was a unanimous report of the committee.

Representative CURTIS. Yes, but not of the subcommittee. I was on the full committee, I should have said.

My point is this: The device of using a certificate of necessity was not for the purpose of creating a situation like this. You will agree with that, will you not?

Mr. ADAMS. I never address myself to questions of intent. I just look at the effect. I do not think there were any evil motives.

Representative CURTIS. I am not talking about evil motives, either. I am talking about why they did it. They had a good economic motive in mind when they did it. They might have not accomplished that, but you do not mention what they were trying to achieve.

I am always disturbed when I get a one-sided presentation.

Would you suggest, then, that the difficulty here was not the law but the administration of the law, or do you think the law itself was bad?

Mr. ADAMS. I think it was primarily the administration of the law. The principle behind these certificates of necessity was to induce the construction of plant facilities, to create expansion.

Representative CURTIS. Yes, and if there was not the need of going out of existence in the event Korea was buttoned up.

Mr. ADAMS. I think I mentioned that in my statement, on page 2, the reason for the tax provisions.

Representative CURTIS. Now, going to the next one, proprietary powers, you refer to Government disposal. The reason I am interested in this is, I reemphasize, that I was on the committee that did a lot of this work, and I am deeply concerned about it, too, but you refer to the disposal of some of these war plants, and so on.

What would have been your suggestion? Wouldn't you have offered it on an open market in that fashion and taken the highest bid on this particular plant, for example?

Mr. ADAMS. On the Geneva steel plant?

Representative CURTIS. Yes.

Mr. ADAMS. I would not have taken the highest bid in that case because, again, looking at the long-run trend in the steel industry I think it would have been desirable from the public's point of view to create additional competition in the west coast steel market.

Representative CURTIS. And so subsidize that competition, in other words?

Mr. ADAMS. No.

Representative CURTIS. Well, it would have.

Mr. ADAMS. Congressman, it isn't a question of subsidy. The plant was built at a cost of $202 million. It was sold at a cost of $47½ million, which was quite a loss to the Government.

Now, if the next highest bid was, say, $40 million, I think the Government should have taken that extra beating of $7½ million in order to give us more competition in the west coast steel market, and I think consumers would have been handsomely repaid in the form of lower steel prices.

Representative CURTIS. Now that might be, but why do you object to my saying this would be in effect subsidizing to the extent of $7.5 million the operation that would have taken it over, because that is what it is, the Government loses 7.5 million less on the bid?

Of couse, you are getting into some pretty dangerous techniques, I might say, when you go away from the device we have always, or generally used, which is the lowest or in this instance of a purchase, the highest responsible bid.

Mr. ADAMS. Congressman, may I point out that in the aluminum industry we did not follow the principle of the highest bid. As a matter of fact, Alcoa tried to buy all the efficient plants made available by the Surplus Property Board, but there was handed down a ruling that under no condition would those plants be hold to Alcoa.

Representative CURTIS. There you actually did have a monopoly. It is pretty well agreed that we did.

While in the steel situation you may have a concentration of power, I do not think, though, that the purchase of Geneva Steel, or the sale of it, violated our antitrust laws. Do you think it did?

Mr. ADAMS. Congressman, I would not accept concentration where there is an alternative open, that is, if the choice is between selling the plant to United States Steel and reenforcing the present degree of concentration in the steel industry, or selling Geneva Steel to some independent enterprise and thus diffusing economic power; I would choose the diffusion of economic power in each instance.

Representative CURTIS. Now, who should make that decision? Of course, the executive branch cannot make that, in my opinion. Congress would have to write legislation that would bring that about. Don't you agree with that?

Mr. ADAMS. I think you are quite right, and I think Congress did, in its wisdom, provide in the Surplus Property Act of 1944 that the surplus Government plants should be sold in such manner as to promote free and independent enterprise, and if you check the disposal goals I think there were about 5 or 6 that specifically addressed themselves to the creation of a competitive economy.

Representative CURTIS. So you feel in this instance it actually violated the specific intent of a specific statute?

Mr. ADAMS. I think very definitely so, and I am still at a loss in trying to understand how the Attorney General at that time could ever approve the sale of Geneva Steel to the U. S. Steel Corp.

Representative CURTIS. Now, referring to No. 4, Legislative Power, you refer to the Atomic Energy Act. Of course, the debate on the floor of the House and the committee's report clearly indicates that the intent was to develop competition. Now, I take it that you are mainly objecting to the fact that they did not achieve what they were trying to do; is that my understanding of your comments before?

Mr. ADAMS. That is correct.

Representative CURTIS. I presume you have read the debates and the committee report in making this statement?

Mr. ADAMS. I have read the debates in great detail, Congressman, and I have also read both the majority and minority views on the committee.

Representative CURTIS. Because this is neither here nor there, I just happen to disagree with you completely on the conclusions. I think that Congress did a very good job in providing that very competition, but that is an honest difference of opinion.

Now, finally, a comment with regard to the Federal Communications decision in this television matter. I do not want to get into the full thing, but I just was interested in your comment, it is a matter I was particularly interested in.

When they first began issuing licenses for new TV channels they would issue one to one particular station in one community and then we had the freeze. Then they opened up again, and the philosophy that they were going to follow was to first open up new areas that had no TV at all. I tried to point out to the FCC that what they should do, first, is to provide competition in areas that they had already opened up, like St. Louis, Mo., where for 4 years there had been a TV monopoly.

I was wondering if you would think that my position on that was sound, that it would have been better in opening up an area to provide competition initially instead of permitting just one station to have a monopoly situation for 4 and 5 years. To a certain extent this was unanticipated because of the freeze, but nonetheless the situation was there, and it seemed to me that competition was a great deal more important than opening up an area that had no TV at all.

Mr. ADAMS. I think there is much to be said for that position; yes.

Representative CURTIS. That is all.

Thank you, Mr. Chairman.

Vice Chairman PATMAN. If the panel will bear with me a few minutes I would like to ask a few questions.

Now, Dr. Kaplan, you said something about encouraging small concerns. I want to ask you how you would encourage a small concern like this: Say it is a concern that is making pots and pans of aluminum. That is the only business it has. It is not an integrated concern. It is a nonintegrated concern. It is not a distributor. It is not a producer of ingots. It is a fabricator.

Now, the large concern that has a pipeline like you so ably described a while ago, that goes from the raw materials clear on through the door of the consumer, how would this particular fabricator, this corporation X, that is just in that one business of fabricating, compete with the big concern that produces the ingots, and everything else, when the price of the raw material is increased?

Now, the big concern, of course, can absorb that. It is just a bookkeeping operation. How would you recommend that help be afforded to that small concern in a case like that, Dr. Kaplan?

Mr. KAPLAN. You are assuming a situation——

Vice Chairman PATMAN. Well, it actually happens. It is a real genuine situation.

Mr. KAPLAN. You are citing a situation in which the integrated company is making exactly the same product as the small business that is operating at only one level—in this case at one fabricating level?

Vice Chairman PATMAN. That is right.

Mr. KAPLAN. In a situation of that sort the integrated large company would be expected to start from the same cost basis, as far as that particular material is concerned, as the nonintegrated company to which it sells that material.

Vice Chairman PATMAN. Well, that would be price fixing, would it not? We have no law like that.

Mr. KAPLAN. No; we have no law like that, and I do not think that the same base means that it has to be in terms of a fixed price.

Vice Chairman PATMAN. Well, what would be your remedy? Do you recommend a law?

Mr. KAPLAN. No; I do not recommend a special law in a situation of that sort. Ordinarily I don't expect the small company to meet the big firm's competition by exact imitation. But in any event I would rather put the big company on the uneasy seat there to know that any pressure that is exerted that is deemed to be unfair against that small company is subject to antitrust action, without attempting price fixing.

Vice Chairman PATMAN. Well, you would not scare them at all.

Mr. KAPLAN. Well, you do not stop them by a price-fixing law, either. Suppose you had a law for price fixing. It would be a simple bookkeeping matter to indicate that you are starting from there, but the big firm says "We are making a satisfactory profit on the price we offer." Or suppose it makes its case on the basis that "We are making as good a profit starting from the same base, or a better profit starting from the same base, as our competitor because he is not operating as efficiently."

You would have to check on the facts in that kind of case. I think the burden of proof is on the large corporation to show that it is not putting on a squeeze, other than the squeeze of a more efficient operation which it could justify whether or not the nonintegranted competitor were around.

Vice Chairman PATMAN. Well, you are just saying that in so many words, Doctor, with all due respect to you, they would not pay any attention to it.

Mr. KAPLAN. I would like to reverse it and have you tell me how the price fixing, which is an artificial paper figure, would change things?

Vice Chairman PATMAN. I am not advocating price fixing. I am not advocating it at all, but I am talking about doing something to the big concerns to place them in a position where the little concern can compete with them. Otherwise you are not helping the little concern. Unless you are helping them to meet the competition.

Mr. Mund.

Mr. MUND. I think you have raised a very proper fundamental problem there, Mr. Patman, and I think that the small independent fabricator faces not only the rise in cost of the basic product, he may also face the refusal to sell it at all.

Vice Chairman PATMAN. Yes.

Mr. MUND. I might suggest as a first step—this is no remedy—but as a first step, Congress could provide that all interstate businesses operating on a multiplant basis shall prepare profit-and-loss statements for each separate plant and for each distinct kind of business. We would deny the right to have consolidated profit-and-loss statements, and then we would get a line on these people to see where they are getting their profits and losses.

Vice Chairman PATMAN. I do not think you would get anywhere there. That would be 10 years reaching the problem. That is just my honest opinion. You would never be getting to it. You have to have something that is more direct, I think. I do not know what it is, but you have to have something that is more direct and that will operate more quickly than that.

Mr. MUND. I agree with you.

Vice Chairman PATMAN. Because anything that would get you into court and take 10, 15, or 25 years, the whole picture is changed by the time you get through. That is just turning it over to the big concerns because you cannot compete with them in the lawsuits.

Mr. KAPLAN. Senator, part of the job in competition is to find for oneself the kind of notch in which one has an advantage over his competitor, and not try to outdo the big company on ground where size is a special advantage.

58422—55——37

Vice Chairman PATMAN. I am not afraid of the little fellow trying to outdo the big company.

Mr. KAPLAN. I would like to see it.

Vice Chairman PATMAN. You might like to see it, but I have not heard of any remedy that would enable them to do it.

Mr. MUND. Congressman Patman, I suggest that you might limit the powers of a corporation to a single main purpose and kind of business.

Vice Chairman PATMAN. Well, you have got something there. That would be more direct. In other words, define business, say you can be in this business but you cannot get into all kinds of business. I think you have got something there, and I think we have to meet that problem there.

You take a huge corporation that is in every kind of business, what chance has the little man that is just in one kind? He cannot compete with that big concern. They could put him out of any territory they wanted to.

Mr. GEORGE. Congressman, you really get into trouble on that one, because that blocks one of the most effective remedies that economists can find for oligopoly.

Because when an oligopoly develops, a concentration of a few plants in an industry that have what is regarded as more than desirable control——

Vice Chairman PATMAN. Well, let us don't try to get the remedy now, let us just think about it, and I want to ask Dr. Kaplan this question:

How would you help a little fellow like this: There is a national chain store operating all over the country, and the independent merchant is in competition. Now, the national chain sells at a loss there to put that fellow out of business, and puts him out of business. It takes them time. He spends all of his savings, his wife, and kin folk come in and put in all of their efforts, but they finally get him after many years.

All during that time he is suffering, but the big concern is taking a tax loss on that business every year that they did in order to put that little fellow out of business.

How would you treat that?

Mr. KAPLAN. I would regard that case as criminal under the Sherman Antitrust Act on the facts you have stated.

Vice Chairman PATMAN. Just one independent unit against another independent unit?

Mr. KAPLAN. I think that if you can find a situation in which the larger firm is deliberately operating continuously on a below-cost basis——

Vice Chairman PATMAN. But they claim they are meeting competition.

Mr. KAPLAN. Not if they are showing a persistent loss operation. If they were coming into a territory and they showed a loss the first few weeks because they were pricing at what is their usual price level with regard to other chains, so as to build up volume, the court might find that up to a certain point you have to do that while you are breaking in.

Vice Chairman PATMAN. Now you are getting into court again and when you get into court the little guy just cannot stay in.

Mr. KAPLAN. I do not know how to stop all juvenile delinquency or other crime, either, except by bringing it before the law.

Vice Chairman PATMAN. They haven't a chance. We have to have quicker action. What did you want to say, Doctor?

Mr. MUND. I agree with you. There is no adequate remedy at the present time.

Vice Chairman PATMAN. This court remedy doesn't amount to much for the little fellow. He has not got a chance. He can hire a good lawyer if he has the money, but that good lawyer cannot prevent postponements and continuances and appeals and then reconsideration and everything else. His day in court is too long for him to stay in.

Now one other point. This costless capital. I want you to look at the President's Economic Report, page 193. You will notice in 1946, total sources of corporate funds was $18.2 billion, but internal sources; that is, your costless capital, retained profits and depreciation allowances and amortization allowances amounted to $11.4 billion. That is only 60 percent.

Your costless capital was only 60 percent that year, but go over to the year 1954 and you will notice that your total sources amounted to $21 billion, and your costless capital or internal sources was $19.5 billion or 90 percent.

Now how can a little concern compete when the little concern is borrowing its money, running in competition with a big concern across the street that is getting 90 percent of its capital from internal sources or costless capital?

Just tell me how a little concern can compete with that. Will you do that, Doctor.

Mr. KAPLAN. I do not think it is expected to compete exactly under those circumstances.

Vice Chairman PATMAN. Well, that is the kind of situation we are in today all over the Nation.

Mr. KAPLAN. We should recognize the special situations that have made for heavy plowing back of funds for capital formation since the end of the war—the long delay in plant replacement, the low levels of inventories, the need to catch up with expanding population, the high fraction of capital reserves built up through the special depreciation and amortization allowances, including special privileges that were given to support our war effort, and I——

Vice Chairman PATMAN. Wait just a minute, the war was over in 1945.

Mr. KAPLAN. I was thinking of the Korean war period as well. And I was about to note that some small firms also got accelerated depreciation and other internal funds. But I should make it clear that I can't go along with you on the premise that the internal sources of investment are costless capital.

Vice Chairman PATMAN. Well, it does not cost them anything. It costs the consumers something. The consumer had to pay it.

Mr. KAPLAN. I think the term "costless capital" there is a misnomer.

Vice Chairman PATMAN. Well, you know Mr. Clarence Francis, don't you?

Mr. KAPLAN. Yes, I do.

Vice Chairman PATMAN. He is the head of General Foods. He said it was costless capital at one time.

Mr. KAPLAN. I think he said it in another context.

Vice Chairman PATMAN. Maybe so.[1]

Mr. KAPLAN. Part of that costless capital is from retained earnings on which the stockholders are abstaining from getting immediate returns; use of the depreciation reserves for plant and equipment is at the expense of other interest- or dividend-bearing uses of the funds. The choice to use the funds for plant and equipment does not make them costless.

Vice Chairman PATMAN. Let's not argue about it. Let's say half of it is costless capital. You know that half of it is?

Mr. KAPLAN. Any funds employed for capital purposes must have attached to them something in the way of an interest rate, or alternative cost, as against the immediate satisfaction by consumption. You cannot refer to capital as costless merely because it is from internal sources.

Vice Chairman PATMAN. But you did not touch one point, Dr. Kaplan, let me invite your attention to that. That one point is that after the excess profits tax was repealed they did not reduce the prices to the consumer. They kept on charging the same price. Therefore they got in more money. That gave them more costless capital. They took it away from the consumer in higher prices. They should not have charged those higher prices. That is the answer to that, but they did, and they got the money, and they got the money from the consumers and they are using that money to beat down and destroy independent business in this country.

Now can't you see something to that argument, Dr. Kaplan?

Mr. KAPLAN. I can see the argument that instead of translating some of what they got back in excess profits into immediate price reductions, that they used it for additional capital formation.

Vice Chairman PATMAN. Well, their capital formation was figured with costless capital.

Mr. KAPLAN. I won't argue that with you, because I think it will take more time. But I think that you are certainly entitled to your view that one way of treating that excess profits "windfall," if you please, was to reduce prices.

Vice Chairman PATMAN. I know they have been holding prices up for another reason, and that was they had a feeling there might be some kind of emergency, with all of this fringe emergency around the world, and prices might be frozen and they did not want to get prices frozen low. They wanted them frozen high. They have been caught with their prices down before and they don't want that to happen again. That is why they held the prices up. At the same time they have benefited by it because it has been a source of costless capital to them.

On this merger business, Dr. Mund, I know that the mergers started in 1946, but it was kind of in low gear, and I do not think it even got into second gear until the last two years, but the last couple of years it has been in high gear with green lights, no red lights, high speed.

Mr. MUND. For the most part, I think that is right.

---

[1] Clarence Francis, Chairman of the Board, General Foods Corp., testified before the Joint Committee on the President's Economic Report during the Hearings on Corporate Profits, 1948. He said, "* * * capital raised by reinvesting earnings in the business is costless capital." (Hearings, p. 211.)

Vice Chairman PATMAN. They have been going very rapidly. I wanted to ask a question relating to that. Is the current saturation technique used by the Big Two in the automobile industry compatible with the maintenance of a competitive situation in the automobile industry?

For example, isn't there a danger that by saturating the market with an oversupply of General Motors and Ford automobiles, the independents will be squeezed out of their dwindling share of the market? What do you think about that, Dr. Mund?

Mr. MUND. That is a big question. I would like to think about for a longer time.

Vice Chairman PATMAN. All right. What do you think about it, Mr. Quinn?

Mr. QUINN. I do not think there is any question about it. If you load the dealers with cars, the dealers competing with each other will cut prices, and the fellow with the least capital, the least lasting power, manufacturer and dealer, will be the first to be eliminated.

Vice Chairman PATMAN. What weapon do the automobile dealers have against this saturation technique?

Mr. ADAMS. None at all that I can see.

Vice Chairman PATMAN. Dr. Stocking, will you answer this one, please: Do the recent trends in acquisitions and mergers indicate that the rate of growth of new industry will be seriously curtailed? What effect will this development have upon economic growth in general?

Mr. STOCKING. Well, that is a question that I think requires more thought than I can give it here and now.

Vice Chairman PATMAN. All right. I see that the time is late and I would not want to insist on your taking too much time.

Mr. George, I wonder if you would answer this one. This is about banking. You are familiar with that.

Mr. GEORGE. To some extent.

Vice Chairman PATMAN. Do you see anything contrary to the public interest in the concentration of financial resources arising out of the merger movement in banking?

Mr. GEORGE. I could always rely on the stock answer, that this requires more thought. No evidence has come to my attention on that score. I have found a number of mergers that were quite justified when I looked into them from the standpoint of attracting deposits more widely and handling bigger deals with money at its inflated value. Now there may be other circumstances to the contrary, but that could be a consideration.

Vice Chairman PATMAN. All of you gentlemen will have an opportunity to extend your remarks, and if any of you want to extend your remarks, whether they were asked of you or elaborate on them or answer them in any way, it will certainly be a favor to the committee and we will appreciate it. I certainly will.

Now what steps are being taken to protect the independent banking system from encroachment by the large metropolitan banks?

Mr. George, do you know of any effort being made to protect them?

Mr. GEORGE. I do not know any effort is being made to stop what you are calling encroachment.

Vice Chairman PATMAN. I do not, either. In fact, I can see evidence of the encouragement. It is true that the supervisory agencies do not look with favor upon the establishment of new independent banks in which the majority, let us say 51 percent, of the capital stock is owned by the enterpriser who starts the bank?

Would you like to comment on that, Mr. George?

Mr. GEORGE. I am sorry, you spoke too rapidly for me.

Vice Chairman PATMAN. In summarizing it, the agencies do not look with favor on chartering a new bank where the real sparkplug behind it, the enterpriser who really gets it up, owns as much as 51 percent of it? They are discouraging the chartering of banks under those circumstances?

Mr. GEORGE. Well, Congressman, all I can say is, I profited from your phrasing of the question. It is something I want to know more about, but I am not qualified to answer.

Vice Chairman PATMAN. All right. I am asking these so that you gentlemen will have the privilege, if you desire to use it, to elaborate on it.

Now, then, the last question: Doesn't there seem to be an absence of competition in the behavior of industrial commodity prices in the last 3 years? For example, these prices, particularly for finished goods at wholesale have been rising steadily, but surely, through the two cycles we have had since early 1951.

Now I ask that last question. It will be in the record, and if you gentlemen will elaborate on it, I will appreciate it very much, or any of the rest of these questions.

Is there anything else to come before the committee?

(No response.)

Vice Chairman PATMAN. Tomorrow there will be a session on agricultural policies here in this room, 1301, at 10 a. m. We will have Mr. Murray R. Benedict, Mr. John H. Davis, Mr. Murray D. Lincoln, Mr. William H. Nichols, Mr. Theodore W. Schultz, Mr. Frank J. Welsh, and a representative of the Department of Agriculture.

The committee desires to thank the members of the panel for their attendance and for the very interesting testimony that you have given the committee. It will all be first transscribed and you will have the privilege of going over your remarks and making any corrections that you desire to make or any additions that you desire to make. After that, the testimony is printed, and as printed, it is circulated to all of the Members of the House and Senate and to all Government agencies, not only throughout this country, but throughout the world, so I feel like, and I know the committee feels like, you have made a great contribution.

Thank you very much.

(The extended statements of the panel are as follows:)

STATEMENT OF DR. WALTER ADAMS, ASSOCIATE PROFESSOR OF ECONOMICS, MICHIGAN STATE COLLEGE

My name is Walter Adams. I am an associate professor of economics at Michigan State Colege and a member of Attorney General Brownell's National Committee To Study the Antitrust Laws. However, I appear here as a private citizen and do not purport to represent any institution or organization.

The prevention of monopoly and the promotion of competition receive only incidental treatment in the President's Economic Report. While the report recognizes the Government's "responsibility to maintain easy entry into trade and industry, to check monopoly, and to preserve a competitive environment" (p. 50) it scarcely suggests how these generally accepted goals are to be implemented.

Fundamentally, it fails to face up to the crucial issues. Thus the report states that Congress has established a policy of assuring small business of a fair share in the procurement program, but it does not indicate to what extent the executive agencies have carried out the will of Congress. It does not indicate the extent to which legislative wisdom is being vitiated by administrative shortsightedness and incompetence. The report recommends increased Federal expenditures on research and development, but it does not recommend that the fruits of such research be made freely available to all bona fide business enterprise. The report suggests an increase in antitrust fines as a deterrent to future violations, but it does not say that, at a time of virulent merger activity, the inadequate fine is hardly the most important obstacle to effective antitrust enforcement. Finally the report proposes that the line between public and private enterprise be redrawn, but it does not insist on redrawing this line with a view toward promoting competition and attenuating monopoly.

Deficient on these specific counts, the President's report is subject to a more general, and probably more crucial, criticism, viz its total disregard of one of the most important monopoly forces in America today—the United States Government. Thus the report fails to show how the exercise of particular powers of government may create the very monopoly which the antitrust authorities are later called upon to destroy. A few illustrations should make my point clear.

(1) *Spending power.*—In a period when Federal budgets run in excess of $60 billion, Government procurement, especially defense contracts, have a significant impact on the economy. Yet the executive departments are not always aware of the antitrust implications of their decisions. In 1952, for example, there were four producers of M–48 tanks, but the Defense Department suddenly decided to concentrate production in a single supply source. By administrative fiat, therefore, we moved from an oligopoly to a monopoly situation. Similarly, between January 1953 and June 1954, while independents in the auto industry were withering on the vine, the net new defense contracts going to General Motors increased by $1.7 billion while the net new contracts going to all other auto companies combined declined by $395 million. Such actions by the Defense Department are hardly conducive to greater competition in highly concentrated industries.

(2) *Taxing power.*—In every emergency, from World War I to the Korean war, the tax code was amended to authorize accelerated amortization as an incentive for industrial plant expansion. The companies receiving such amortization privileges got a valuable tax rebate or, at the very least, an interest-free loan. They received what one congressional committee has called the biggest bonanza ever to come down the Government pike. Unfortunately this bonanza was unequally shared. To the extent that it accrued primarily to the dominant firms in highly concentrated industries, the Government was underwriting the growth and expansion of industrial giantism.

(3) *Proprietary power.*—During World War II, the Government spent about $11.6 billion on industrial facilities which were usable in the postwar period and were sold to private industry. Here, too, however, the record indicates that—with the notable exception of aluminum—the disposal program did not effectuate an appreciable increase in competition. In the steel industry, for example, almost all the major facilities directly financed with Government funds were sold to the largest firms at bargain-counter prices. The Geneva Steel plant in Utah, built at a cost of more than $200 million, was sold to United States Steel for a mere $47.5 million—a sale which increased United States Steel's control over the rapidly expanding west coast market from 17 to 39 percent, and raised its percentage of ingot capacity in the area to 51 percent. Ironically enough, the Attorney General, after approving this sale, filed an antitrust suit against United States Steel for merging with a firm which accounted for 3 percent of fabricated steel production in the same market.

(4) *Legislative power.*—As in the case of atomic energy, this involves establishment by Congress of ground rules for industries being transferred from the public to the private domain. While I regret to do so, candor compels me to say that last year's atomic energy law is likely to preclude the development of competition in this vital industry. At a time when only a handful of large corporations had been allowed to participate in the atomic energy program, Congress suddenly decided to fling the doors open. But an open door does not afford equality of opportunity when some contestants are on the doorstep while others are miles away. This is not the way to assure effective competition in a new industry.

(5) *Regulatory power.*—Here we see in boldest relief the creeping paralysis of monopoly. Here we see the marasmus of the regulatory process—its injurious effects on the consumer and its debilitating influence on the industry concerned. Here we see the subversion of competition via regulation. Let me cite some recent examples:

(*a*) In 1948, the Supreme Court ordered the vertical divorcement of the Big Five in the movie industry. Each of the Big Five was required to separate the production of movies from exhibition, so as to prevent foreclosure of the market by vertical integration. Then, in 1953, the Federal Communications Commission authorized the merger between American Broadcasting Co. and United Paramount Theaters, and acquiesced in the control of Paramount Pictures by Dumont TV. This meant not only a sizable horizontal combination between a movie exhibition chain and a TV network, but also the vertical integration between a movie producer and a TV exhibitor. It vitiated potential interindustry competition between two basic communication media, and brought about the very vertical integration which the Supreme Court had earlier sought to eliminate.

(*b*) In another action, the Federal Communications Commission decided on an allocation pattern for TV channels which may doom competition in this young and dynamic industry. According to Allen B. DuMont—who is no academician and who has met a payroll—the Commission's allocation pattern will result in a two-network monopoly in the television industry. Other witnesses before the Senate Interstate and Foreign Commerce Committee agreed with this contention. They pointed to the fact that competition hinges on the survival of UHF, and that UHF cannot survive unless the Commission equalizes the terms on which UHF competes with VHF. Thus it is clear that the FCC ground rules will determine whether newcomers in this concentrated industry are to have a climate in which competition can thrive and prosper, and whether the TV audience is to enjoy the variety of competition or accept the impositions of monopoly.

(*c*) In the transportation field, there are especially strong indications that the type of regulation may be unwise and the amount of regulation excessive. There is more than a germ of truth in the observation that the regulatees have wound up doing the regulating.

When the ICC Act was passed in 1887, the railroads possessed considerable monopoly power. But today the situation is different. In the passenger field, the airplane, the bus, and the private conveyance protect the consumer against potential exploitation. In freight, the common-carrier, contract, and private trucks seem to give the railroads quite a run for their money.

Yet competition in the trucking business is artificially restricted. No common carrier truck can operate in interstate commerce without first obtaining a certificate of convenience and necessity and without submitting to rate regulation and route determination by the ICC. Why? What is there about trucking to justify this kind of public utility regulation? Very little, in my opinion. Here is an industry which closely approximates the pattern of perfect competition. There are many firms in the industry and, in the absence of regulation, there would be more. The product is fairly homogeneous and standardized. Entry would be easy, because of relatively low capital costs and because the roadbed is provided at public expense. Moderate fixed costs make price discrimination and cutthroat competition an unlikely eventuality. Nevertheless, we refuse to rely on competition as a means of protecting the consumer interest. Instead we depend on a regulatory agency which shows an inordinate concern for sagging railroad properties and for the vested interests of established trucking companies. In my view, this is ill advised. There seems no economic justification for limiting entry into this industry as long as the public is assured that common carrier trucks are financially responsible, follow the necessary safety regulations, and passes the proper surety qualifications. Here is an industry which is no more a public utility than restaurants, laundries, or filling stations. Here is an industry where gradual, but substantial, deregulation seems feasible, practicable, and desirable.

Finally, we have the case of the airlines. When the Civil Aeronautics Act was passed in 1938, domestic trunklines flew 479.8 million revenue passenger-miles. By 1952, this total had increased to 12,188.7 million—a 2,500 percent growth. Despite this tremendous expansion, however, not a single new trunkline (passenger) carrier has been certificated. Established carriers have thus been given what amounts to a perpetual monopoly over a new and growing industry. Here again, there is no economic justification for what seems to be a complete and permanent bar against the entry of newcomers. The skyways are free, and airport facilities are provided with public funds. Capital costs are moderate, and new facilities can be added in relatively small doses.

Given the tremendous increase in the demand for air travel, there seem to be no compelling technological or economic factors militating against the entry of at least 1 or 2 new carriers. Moreover, the experience with the nonskeds shows how necessary the energizing and invigorating stimulus of competition is. It was the nonskeds who had enough faith in the future of air travel to introduce coach service—at a time when the Big Four thought that such service would entail substantial losses and would fail to promote an increase in demand. It was the nonskeds who rejected the caution, conservatism, and restraint of the big companies and who refused to bow before the apparition haunting every monopolist—the assumed inelasticity of demand. It was the nonskeds whose initiative, enterprise and daring proved that competitive rate reduction is more effective than a belief in the myths of inelasticity. If for no other reason than past performance, the certification of new competitors is urgently needed—competitors who do not demand subsidies from the Government, competitors who are dynamic enough to assure a phenomenal growth in a phenomenal industry. Such growth will not only benefit the consumer, it will not only enable Michigan residents to escape harsh winters with an airline trip to beautiful Arizona, it will also contribute to our national defense which depends on a strong and vigorous airline industry.

In conclusion let me say that contrary to the prediction of Karl Marx and the belief of his unknowing and unwitting disciples, monopoly in America is neither natural nor inevitable. Rarely is it a response to technological imperatives or economic necessities. Never is it the result of spontaneous generation or natural selection. More often than not, monopoly is the result of unwise, manmade, privilege-creating legislation which throttles competition and restricts opportunity. I think it is idle to expect enforcement of the antitrust laws alone to assure us of a competitive economy in years to come. We cannot have competition if the Government creates what the antitrust laws are designed to prevent, if the Government itself helps fashion the economy in the image of the cartels.

Statement by Edwin B. George, Director, Department of Economics, Dun & Bradstreet, Inc., New York, N. Y.

The assignment of this panel is necessarily broad and cannot be covered in brief compass. Yet picking and choosing is quite a problem in view of the many substantial matters worth discussion. After some reflection, I have decided to take my lead directly from the Economic Report. Those who have read the latter will be aware that—due no doubt to the fact that the final report of the Attorney General's National Committee To Study the Antitrust Laws has not yet been made—it contains nothing (beyond a recommendation to increase substantially the maximum fine imposable for Sherman Act violation) on those matters which come first to mind when one considers problems of competition and monopoly, giving the bulk of its attention to the question of assistance to new and small business. Obviously this does not bind our panel. We are as free to discuss bypassed subjects as those given consideration. The subject dealt with, however, is so important and the treatment given it sufficiently limited as to warrant further comment. There will be no gaps in the agenda because my fellow panelists can be trusted to give bigness and other matters of great current interest a thorough going-over. Accordingly, I shall concern myself with selected aspects of the item upon which the report concentrates.

The exact scope and focus of my comments can be indicated briefly. Some of the questions bearing upon new and small business fall within what most observers would regard as the antitrust field. But to much greater extent than in many other connections (e. g., bigness), basic policy issues are either unrelated or very indirectly related to this area. I shall restrict my analysis to matters that are largely nonantitrust in character. Without undue violence to their interrelationships, the policy issues here can be grouped under five headings: general management, industrial relations, availability of capital funds, research and development activities, and taxation. I shall skip the second and touch upon the first but incidentally, reserving most of my time for consideration of the last three. The material in the Economic Report is concerned largely with two of these.

ACCESS TO CAPITAL FUNDS
