The Economic Report calls attention to the apparatus established by Congress in 1953 to help small business to obtain adequate financing, claims that this has made a useful contribution and in consequence recommends that the lending authority made available—now almost fully committed—be enlarged. I do not have much in the way of general criticism to offer of SBA's operations under the statute. Their rules, especially that requiring would-be borrowers to explore private channels before turning to the Government, seem well devised and aid has still been given in a significant number of cases. However, I don't see where this kind of facility carries us far along the road to solution of what a study I made several years ago persuaded me may be the prime need, namely, provision of equity capital (or at any rate some combination of debt money, common stock money, and preferred stock money, as in the sandwich deals of the British ICFC) for businesses with requirements that banks and other lending agencies cannot meet owing to a mixture of prevailing standards, legal barriers, and concern for their creditors' funds even though they recognize the merit of the objective, and which cannot obtain funds from security markets save at prohibitive cost.

The area of primary interest has been defined by a fellow panelist, Dr. Kaplan, as including "the kind of businesses that can really compete with larger businesses. It is the area between 8 and 100 employees, and in some cases a little more than 100 employees. It does not add up to millions, but it adds up to a core of 150,000 units that are the very heart of independent enterprise."[1] Add new firms of demonstrable promise and I would agree.

After reviewing domestic and foreign experience and looking at the galaxy of remedies proposed, my impression was that the one most worth trying was that envisaging establishment of regional capital banks under Federal Reserve auspices—the approach embodied in bills introduced in several previous sessions of Congress by a former chairman of the joint committee, Senator O'Mahoney. The scheme has too many angles to permit full treatment here. I shall note merely that it seems best to begin on a pilot-plant basis, selecting one or a few FRB regions in which need for assistance is thought to occur most frequently and in which the resident Reserve Banks themselves have been urging action, stipulating that firm arrangements should be made from the outset for provision of complementary managerial and technical aid and for compelling applicants to accept such aid, if the financing agency deems necessary.

RESEARCH AND DEVELOPMENT ACTIVITIES

What about research and development? My guess is that Mr. Lilienthal's book—despite imperviousness to the existence of a problem of diminishing returns—probably reflected a large body of opinion in claiming that our rate of progress during the past quarter-century is attributable to a "new competition," characterized by incessant product and process innovation which in turn largely arose from research by large concerns competing in this fashion. It seems to me that Dr. Kaplan takes a similar view in his recently published study of big enterprise in a competitive economy. This general slant invites some comment.

First, and of lesser importance, it is by no means demonstrably true. On the subject, Prof. Edward S. Mason made some pertinent observations last year. "* * * the fact that research expenditures are highly concentrated in large firms does not mean that important product and process innovation is the product of large firms. This is something about which we know next to nothing."[2] Prof. M. A. Adelman has expressed himself similarly.[3] Even if, however, large firms are now the main sources of progress, one may doubt whether this must necessarily be so. As Mason notes, the rate of advance during the past 25 years does not appear to have been greater than in the preceding 25 years or the latter again above that in the last half of the 19th century. In other words, we grew as fast in a small-concern system as in one dominated by large units. (Although, starting with a rich new country, to maintain the same percentage rate of growth over a long period of time is quite a feat, and the basic fact in itself has no

bearing on reasons for the eventual growth of large concerns, which in its time has had great positive benefits; only the narrow point is involved.) It is possible that one of the reasons why not only large concerns but large-scale techniques are now so prominent in the economy may be found in a combination of growth in nontechnological hurdles confronting small concerns and of factors operating to place greater relative research emphasis in big outfits on large-scale methods. On the latter point, there is no doubt that absolutely speaking the big research departments spawn many developments exploitable via small-scale methods.

These however, one would expect to be exploited often in product lines which are either altogether new in the system as a whole or, if not being somewhere, are possessed only by concerns other than the finder. In dealing with their own lines, stress may often be laid upon developments yielding marginal cost savings with setups in which huge capital has already been sunk rather than upon competitive techniques of an entirely different order. Moreover, even where new possibilities do not present a threat to the company's established lines or production methods, one would expect less intensive inspection of the potentialities of those involving only moderate capital outlays than would occur in the case of concerns less well-fortified financially. Under stronger pressure to dig for methods of modest optimal scale, they might well find that these paid off a lot more frequently than is now judged.

It strikes me—and I come now to the nontechnical obstacles small units confront—that deliberate efforts to smooth the path for small concerns considering innovations are quite desirable. Recent liberalization in tax treatment of unusual research and development expenses, discussed below, should contribute to this end and so too would improvements in access to capital—knowledge that, if attractive prospects came to the fore, there was a good chance of obtaining the capital necessary for commercial exploitation providing more incentive to experiment. But I would not be surprised to learn that even under these conditions room would be found for direct encouragement of research. Preferable efforts to capitalize this fact should aim at stimulating growth of specialized private outfits, including industry research agencies. If progress along these lines proved too sluggish measures to strengthen present Government agencies and establish others would have to be considered.

TAXATION

Broadly speaking, the small-business tax issue has two major aspects. One concerns the relationship between tax structure and rates of establishment and growth of small or medium-sized firms. The other has to do with indefinite survival of those firms that have in some way or other achieved a firm place in the economy.

A helpful way of gaging how matters stand in these respects is to contrast our present position with that prevailing in the first several postwar years, when it was widely held that the tax structure had very unfavorable effects in both connections. With respect to the problems of birth and healthy growth, proposals to improve the situation usually involved one or more of the following: more flexibility in methods of depreciating property for tax purposes; reversal of the trend toward forcing unusual research and development outlays to be capitalized rather than treated as current expenses; introduction of a higher degree of partial income-averaging through extension of the periods during which losses could be carried back or forward; and exemption of some part of income. In most cases, it was suggested that these changes be made effective for all concerns—one argument being that even if this were done small firms would benefit relatively more than large, established units. Sometimes, however, proponents advocated limitation of some of the liberalizations to firms below a certain size or certain age. One prominent tax economist went so far as to urge that reinvested earnings of all new noncorporate businesses be exempted during the first 5 years of its life. And one device receiving support—the partnership option, extending to closely held corporations the privilege of being taxed as partnerships—in effect would be applicable primarily to small firms with simple security structures.

So far as concerns taxation, the problem of disappearance of healthy small concerns had to do with other effects of the then-existing structure—primarily those resulting from the interplay of personal income, capital gains, and estate taxes. Much the best evaluation of the picture here was the study of the effects of taxation on corporate mergers over the period 1940–47 made by Butters, Linter, Cary, and Powell. These authors found that in these years sales of businesses attributable in very significant degree to tax considerations constituted about 10 percent of the total number of mergers and close to 25 percent of those involving absorption of units with assets between $5 million and $30 million. Measured by the indexes of concentration used in their study, the overall effect of all mergers—and thus a fortiori all those into which tax elements entered importantly—upon concentration was not impressive during the period covered. Nonetheless, a significant loss in the number of centers of initiative in the economic system took place; and for this development tax considerations were among the important causative factors.

How does the picture look now? Taking impact-on-mergers first, it seems considerably better. Section 115 (g) of the 1950 Revenue Act has led to substantial changes in the picture for a large fraction of closely held concerns. In some respects it overshot and in others fell short of what might have been the best solution possible given our jerry-built tax pattern. On balance, however, the tax incentives promoting unhealthy disappearance of independent businesses via mergers were strongely reduced. Further lessening of such incentives will result from last year's change in rules affecting inclusion of life-insurance proceeds and the value of property transfers arranged before death but only effective at death in a person's estate. In consequence, we may expect much less in the way of perverse tax-induced effects henceforward.

The net effect of recent changes affecting new and small units in other respects is more difficult to determine. Several real improvements have taken place, notably in two major areas, viz., depreciation allowances and treatment of research and development expenses. Businesses now have more flexibility in dealing with the former and under the 1954 law all outlays for unusual research and development can be deducted as current expenses. So far as concerns averaging, however, the recent extension of carryback to 2 years simply restores an arrangement that had been in effect during the period I am using as base and the longer carryforward, though much better than nothing and of aid to new firms with enough cushion to withstand early year losses, is of uncertain value to small businesses running into trouble after a string of profitable years and being unable to tap outside sources for emergency needs. And for the rest, the total picture is not much different. There isn't any income exemption—at any rate from the normal tax. Special treatment has not been accorded to reinvested earnings. The partnership option is still unavailable. And it seems probable that although on balance the jump in absolute fraction of pretax earnings taken by the Government was somewhat lower for small corporations, the dollar has injured the small outfit's ability to expand more than it has that of the large firm (because of lesser ability to tap outside funds). It may well be that the relative improvement resulting from the change in treatment permitted for depreciation allowances and research and development expenditures more than offsets any deterioration here. But for all that, it seems likely that a deal more could be done to strengthen the position of new and small concerns.

Because of the many considerations involved I do not have any specific recommendations to make but believe close study of the problem to be worthwhile.

SUMMARY

Broadly speaking, I would say in conclusion, the picture is about this. One very important means of insuring a healthy competititve economy is to insure propagation of new and small business. Real scope remains for improvement in the conditions governing successful operation and growth of such concerns—a judgment that can be extended beyond matters treated above to cover managerial problems. Furthermore, need to effect such improvement is in some respects more urgent than in the late forties due to the greater relative burdens in tax and related record keeping imposed by such things as extensions of coverage under unemployment insurance; and also from parallel growth in other incentives for executives and superior workers—private pensions in the case of the former, pensions and seniority in the case of the latter—to remain with large concerns rather than take off on their own. And finally, a good part of the job lies outside what we usually regard as antitrust policy.

NOTES FOR JOINT COMMITTEE ON THE ECONOMIC REPORT PANEL DISCUSSION ON MONOPOLY AND ANTITRUST POLICY, BY A. D. H. KAPLAN

The Economic Report of the President, January 1955, defers the administration's general treatment of the subject of monopoly and antitrust policy until the Attorney General's National Committee To Study Antitrust Laws comes out with its report (p. 48). The withholding of any reference to the current wave of corporate mergers is presumably on the same ground. The Federal Trade Commission announced last October it had embarked on a study of recent mergers in the light of the section 7 amendment of the Clayton Act of 1950, and that a report would be speedily prepared. Perhaps we may expect, therefore, that later in the present session of Congress there will be opportunity to consider specific conclusions and recommendations from the executive branch concerning competition, monopoly, and antitrust policy.

Not unrelated, however, to the subject of competition and monopoly is the section in the Economic Report under the subhead, "Assisting New and Small Businesses." It refers to the Small Business Act of 1953 establishing an independent Small Business Administration in the Executive Office of the President, and recommends that the life of the agency be extended beyond the present expiration date of June 30, 1955. The SBA was designed primarily to help small businesses in obtaining and carrying out Government procurement contracts, and in getting loans. But this temporary facility for supplying emergency aid to small businesses that are unable to obtain private financing, does not cover the broader need in our business structure of a regular, continuing channel for investment banking at the small business level.

Bills introduced in earlier sessions of Congress by Senator O'Mahoney and others to help establish a system of investment banks to handle the capital financing of new and growing small-scale enterprises, failed of enactment. The chairman of the Select Committee on Small Business in the Senate has introduced a similar bill for this session to support the formation of a system of regional investment companies, under the aegis of the Federal Reserve System, with the commercial banks and other appropriate agencies as subscribers. It provides for a wide range of equity and debt financing to new and growing smaller scale enterprises. This type of capital banking, supported by competent guidance in developing new and small enterprise has already become a useful feature of the British and Canadian financing structure. It is hoped that Congress will not delay the effort to encourage the filling of this gap in our national banking system, under conditions that will make the venture self-supporting and eventually profitable.

Other aspects of the need to maintain a vigorous small-business sector in the structure of our competitive system, that may well come in for consideration at this time, have to do with the flexibility of competition and freedom of economic opportunity. There may be time to speak of two—distributors' pricing and labor relations.

In the 1930's some segments of small business took refuge in resale price maintenance legislation and other State fair-trade laws, reenforced at the Federal level by amendment of the Sherman and Clayton Acts. During the sellers' market that followed World War II, relatively few overt inroads upon the legalized price-fixing barriers were attempted. The more recent trend toward a buyer's market has, however, stimulated the undercutting of prices that had apparently been set for high distribution costs and margins wide enough to encourage the penetrating of the orthodox retail market with substantial discounts.

The time appears ripe for reexamination of the effects of fair trade legislation and support thereof by Federal legislation. The dollar-conscious consumer who has turned his patronage to the discount house has thereby raised the larger question as to how far the preservation of the maximum number in the business population may be regarded an end in itself, for which the consuming public is to pay the price of substantial subsidies as it has done in other areas of the economy.

New business needs to be able to bid effectively for labor as well as for capital. Small business is increasingly concerned in the attainment by labor unions of a position where the strength of their membership in large-scale enterprise can be mobilized behind their drives to improve wage levels and income security of their members generally. There is the growing problem of the industries in which the pattern is set by negotiation with the dominant firms, leaving no choice of bargaining for the small firm other than to fall in line without due regard to the differences in working conditions or capacity of the business. Government unemployment insurance and retirement programs have been supplemented by unemployment wage guaranties and pensions obtained for the working forces of particular companies through collective bargaining; job classifications, supervisory rules, and time schedules have been standardized, fitting into the pattern of mass production, yet untenable for new and smaller enterprises. Taken singly, the income objectives advanced by the labor leadership have been defensible as coming for the most part within the bounds of what can currently be drawn from the economy. There is nonetheless a major long-range problem of reconciling the trend toward standardized worker security patterns with the survival of that mobility in the American economy which has been the basis of successful business entry and a potent force in raising and widely distributing real income.

SOME CURRENT PROBLEMS IN THE MAINTENANCE OF "FREE COMPETITIVE ENTERPRISE"

BY DR. VERNON A. MUND, UNIVERSITY OF WASHINGTON, SEATTLE

It is significant that the Employment Act specifically states that maximum production is to be promoted in a manner calculated to foster "free competitive enterprise." The two, indeed, in our system, are closely related. The more effectively freedom of entry and price competition operate, the less will be the need to resort to public spending and other monetary fiscal measures.

1. THE PROBLEM OF RIGID PRICES IN DEPRESSION PERIODS

Why do business executives in certain industries—such as steel—maintain prices, and actually increase them, in the face of declining demands? Why were industrial prices in the recession of 1953–54 more stable than in the recession of 1948–49? Has the upsurge of mergers accentuated price rigidity?

There is substantial agreement among economists that rigidity, or inflexibility, of industrial prices in the face of declines in demand associated with periods of recession is closely correlated with monopolistic behavior—such as basing-point and zone pricing, price leadership, and collusive trade-association activity. Monopoly is the power to manage price and to fix a price at constant levels over a period of weeks or months, regardless of changes in demand.

In competitive industries, prices adjust downward with declining demands, to provide a selling outlet for available supplies. Monopolistic (or oligopolistic) industries, on the other hand, typically peg their prices. This action prevented a clearing of the market or causes underutilization of plant facilities. It is an action, moreover, which has secular and long-lasting consequences. The evil is that for years monopolistic industries prevent and retard the reduction of prices which they control. Unemployment and unused capacity in these industries grow and persist.

The problem of rigid prices is twofold. First, there is the problem of the power to manage prices. When was this power achieved? How was it achieved? What forms of direct control or antitrust action should now be taken with respect to it?

Secondly, there is the problem of why business managers, having the power to manage prices, desire to peg prices (absolute constant) for periods of months or even years. Subsequently, I shall discuss these questions, if it is desired.

2. THE ANTIMERGER ACT OF 1950 AND ITS APPLICATION BY THE FTC

In applying the law in the Pillsbury case (1953), the Commission rejected the proposal of its attorneys, based upon the reports of congressional committees, that the "substantiality test" should be used as a yardstick—that is, "where a leading factor in the relevant market having a substantial share of that market, acquires another factor in that market also having a substantial share of that market," and the effect may be substantially to lessen competition. Instead, the Commission adopted a rule-of-reason approach and declared that it would proceed on a case-by-case basis.

Despite the legislation of 1950, the merger movement is continuing at a rapid pace. Should the rule of reason be added to the act of 1950 when it was not included by Congress, itself? Has the legislation of 1950 been seriously weakened by administrative interpretation?

3. THE RIGHT TO SELECT ONE'S CUSTOMERS

The antitrust agencies report that "refusal to sell" is one of the most frequent complaints which they receive. Rarely, is there any relief for this aggravated form of discrimination. Why is it that particular buyers cannot freely secure supplies for cash on the counter, even during periods of excess inventories and unused capacity? Is not freedom of access to markets an essential feature of a free competitive economy? Should Congress reconsider the original draft of the Clayton Act (1914) which placed prohibitions on arbitrary refusals to sell?

4. IS THE SO-CALLED NEW CONCEPT OF COMPETITION COMPATIBLE WITH THE MAINTENANCE OF A FREE COMPETITIVE SYSTEM?

Currently, efforts are being made to get the courts and administrative agencies to construe the antitrust laws with a new concept of competition. The idea is to define competition so that it will describe existing business practice. As one leading antitrust lawyer has said, "The statutes can be construed administratively to fit the business pattern desired."

The "new" definition of competition contemplated by the Business Advisory Council of the Department of Commerce, D. E. Lilienthal, A. D. H. Kaplan, and others, differs greatly from the concept long used by economists and the antitrust agencies. The essential idea of the new concept is the presence of alternatives from which buyers may choose. It is rivalry "between different ways of meeting the same or a similar need." In this view, competition is seen to be provided through the choices of aluminum or copper, cigarettes, or sweets.

The new concept omits an essential mechanism for the determination of prices—namely, price competition among sellers of a given class of goods. Substitute competition may be an important moderating force, but will it prevent the placing of undue burdens on the public? Does not the acceptance of the new concept mean a revolution in our basic antitrust policy?

5. IS PRICE DISCRIMINATION A COMPETITIVE PRACTICE IN THE PUBLIC INTEREST OR IS IT A MONOPOLISTIC PRACTICE?

Vast amounts of public testimony and congressional investigation have led to the declarations of national policy in 1887, 1914, and 1936, condemning price discrimination as a monopolistic practice, Historically, the view of Congress has been that the law should protect competition—that it should not condone anything which would injure competition. Recent FTC policy on price discrimination and the Standard Oil of Indiana decision (1951) have largely destroyed this principle. Today, Congress must restudy and decide anew (*a*) if the law should permit discrimination to meet or match another's prices, even though injury to competition has, in fact, resulted; or (*b*) if discrimination should be condemned whenever the effect may be substantially to lessen competition.

6. THE POLICY OF THE FTC AND THE ANTITRUST DIVISION WITH RESPECT TO BASING-POINT AND ZONE PRICING

In a series of cases (1945–48) the Federal courts declared that basing-point and zone pricing is a form and method of monopoly. The Pittsburgh-Plus, Corn Products, Staley, and Conduit (Count 2) cases, it may be noted, were not based upon conspiracy charges.

In 1948, the FTC declared that most of the industrywide pricing systems were probably illegal. Vigorous efforts were thereupon made to change the law. These failed.

The basing-point industries, however, have been successful in changing the administration of the law. So long as basing-point pricing is carried on "innocently and independently," the FTC stated in 1951, action will not be taken against it. This view is quite erroneous. Legal and economic experts who have dealt with the problem know that the practice is never independently and rarely innocently indulged in.

As a result of its changed policies, the FTC has fallen into a great dilemma. Insofar as two or more geographically separate mills quote local f. o. b. mill prices and then regularly discriminate (by absorbing freight) to meet delivered prices in each other's "backyard," are they not getting the same result as the concerted use of basing-point pricing? How can the practice withstand the inference of conspiracy? Similarly, how effective is the work of the Antitrust Division in condemning conspiracies to maintain basing-point mechanisms, but then permitting systematic freight absorption to match prices? (E. g., the Ultramarine Blue case (1954) and the Metal Abrasive case (1954).)

7. RAISING THE MAXIMUM FINE UNDER THE SHERMAN ACT

President Eisenhower is to be commended for his proposal to raise the maximum fine which may be imposed under the Sherman Act. In considering this measure, it is suggested that attention be given to the fact that there are relatively few instances today when Federal judges actually levy the present maximum of $5,000. In some cases, too, the judges levy a fine only on the corporation and not on the officers who devise the monopolistic schemes. Further, there is the problem that defendants can escape treble damage suits and stiff penalties through the plea of nolo contendere. Raising the maximum fine under the Sherman Act, moreover, may not be effective so long as defendants found guilty of monopoly under section 5 of the FTC Act are allowed to go without any penalty whatsoever.

Statement on Antitrust Policy by George W. Stocking

The President's Economic Report appropriately recognizes that the Attorney General has appointed a national committee to study the antitrust laws and to recommend improvements to promote competition and prevent monopoly. I understand that the committee's recommendations will be forthcoming by the end of this month. When they appear, I assume the Congress will consider them carefully. Meanwhile the President's report, without awaiting the committee's recommendations, recognizes the inadequacy of present penalties as a deterrent to violation of the Sherman Act and recommends a substantial increase in the maximum fines that may be imposed under the act. Two other problems seem to me to be sufficiently pressing to justify the attention of Congress, and about one of them at any rate I believe we know enough to proceed intelligently. I refer to the McGuire Act amending the Miller-Tydings amendment of the Sherman Antitrust Act. These amendments, as you know, authorize resale price maintenance contracts in interstate transactions where States have authorized them in intrastate transactions, and they make them binding on third parties.

The economics of this arrangement is fairly clear. Resale price maintenance contracts have no meaning in a purely competitive market. For a farmer to undertake such contracts covering the wheat he sells would be both foolish and futile. For a resale price maintenance contract to have meaning, the seller of the trade-marked differentiated article must have some limited monopoly power in selling it. If he had no monopoly power, no distributor would contract with him to maintain its price. By fixing a somewhat higher price for the resale of his product than some retailers would charge in the absence of resale price maintenance contracts, a manufacturer of a trade-marked article in effect puts a sales tax on it.

Why does he do this? Manufacturers inaugurated the practice of fixing the retail price of trade-marked articles to protect the good will with which differentiation and advertising enveloped their products. Retailers, when acting alone, may by their promotion and pricing policies push or retard the sale of one differentiated product at the expense of another and thereby may adversely affect the maker of any particular product. Although in this way retailers may limit the monopoly power of the maker of a trade-marked article, in doing so they may defeat their own interests by engendering a vigorous competition among themselves. This has led them to favor a nonsigner clause in resale price maintenance contracts to insure that all of them will observe the manufacturers resale price that any one of them contracts to maintain. Lacking the power to insure common pricing policies without resorting to unlawful collusion and having learned from experience that some retailers will not voluntarily sign resale price maintenance contracts, retailers have sought authority from the Government to coerce recalcitrants. The McGuire Act supplies an element essential in making the monopoly of the trade-marked article effective. Although some manufacturers have supported both the Miller-Tydings and the McGuire amendments, the drive for their passage came from various retail associations, chiefly the druggists' trade associations. Manufacturers instituted the practice to protect a limited monopoly, but retailers have used it to cartelize trade.

In two respects the Miller-Tydings amendment as amended by the McGuire Act is inconsistent with the aim of our antitrust statutes to preserve a free competitive economy. First, in legalizing resale price maintenance contracts on articles in "free and open competition" with commodities of the same general class, the act embodies a conception of competition inconsistent with modern economic ideas. Generally, trade-marked articles are sold by relatively few rivals, among which "free and open competition" can scarcely exist. In one instance, the right of the makers of color films to fix the resale price of their product was upheld although there were only two producers of color films in the entire country. Second, although the law authorizes only vertical price-fixing arrangements, resale price maintenance contracts with a nonsigner clause permit retailers to enjoy the fruits of horizontal price-fixing without paying its penalties. In doing so, they not only tax consumers but penalize efficiency in retail distribution. I believe such contracts have no place in a program to promote competition and prevent monopoly.

The other problem which I regard as pressing is more complex and we know less about it. I refer to the significance of the structure of our contemporary economy and the position of the big companies in it. The Economic Report concludes that our economy is strong and progressive because it comprises "in addition to 5 million farm enterprises, 4 million independent centers of business decisions—each potentially free to experiment with new ideas, new men, new methods, and new products." I believe this characterization overemphasizes the role of little business and underemphasizes the role of big business in the economy. The 4 million independent business enterprises comprise, on the one hand, tens of thousands of barbershops, beauty parlors, laundries, dry-cleaning establishments, small retail stores, and the like; together with a lesser number of moderate-sized corporations; and on the other, a handful of giant corporations which in the aggregate control approximately one-half of the corporate assets of the country.

Clearly a little-business man's decision signifies less to the functioning of the economy than the decision of any one of the large industrial giants. I do not believe we know enough about the social, political, and economic significance of these large corporations, nor do we fully understand why they are so big. Sound public policy toward this question calls for more knowledge on the causes and consequences of bigness. On these issues economists differ. I for one believe that our several combination movements have played the major role in shaping industrial structure, and I have not found convincing those studies which come to a contrary conclusion. While we cannot safely generalize about the economic consequences of bigness, I believe that if we wish to preserve a free private enterprise economy—and I think we can agree on the desirability of this objective—public policy should be directed toward insuring as many firms in an industry as is consistent with the economies of scale. Many firms I believe have exceed this limit, and mergers have played an important role in their doing so.

While the question of the extent and character of changes in our antitrust statutes may appropriately await the report of the Attorney General's committee, I believe the Congress should give serious consideration to a clearer declaration of their purpose. I suggest that this might be done by amending our basic antitrust statute, the Sherman Act, through the incorporation of a preamble of the following sort:

"It is the policy of the Congress of the United States to encourage an effectively competitive economy. This policy is designed to insure as many sellers in interstate markets as is consistent with the economies of scale. It is not intended to prevent growth through efficiency but to prevent the accumulation of market power, particularly through the merger of independent firms, the preemption of the supply of limited natural resources, or the abuse of patent privileges, and to prevent any and all restrictive agreements among business rivals. It strikes at power over the market, not economic efficiency."

(Whereupon, at 4:45 p. m., the committee adjourned to reconvene on Wednesday, February 2, 1955, at 10 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

WEDNESDAY, FEBRUARY 2, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senators Douglas, Sparkman, Flanders, Watkins, and Goldwater, and Representative Patman, vice chairman, and Representatives Bolling, Mills, Talle, and Curtis.

The CHAIRMAN. The session this morning, as you know, is on farm policy.

We appreciate the fact that the Department of Agriculture, unlike some of the other departments, has sent a representative this morning. I think Mr. Paarlberg would prefer to be last, so we are going to accord him that right and privilege.

We have addressed to you a number of questions that we would like your judgment on. The first is: Will you state just what the Agricultural Act of 1954 and the rulings of the Secretary of Agriculture will do to the support levels of basic and other commodities? What will be the effect on the demand for and supply of those commodities? Will there be adequate storage facilities for agricultural commodities? If not, what can be done about it?

I would like to ask Mr. Benedict to begin the discussion; and, Mr. Benedict, if you can cover such a large subject in not more than 5 or 7 minutes I think that will be helpful.

Mr. BENEDICT. This is the main opening statement that you have in mind?

OPENING STATEMENT OF MURRAY R. BENEDICT, PROFESSOR OF AGRICULTURAL ECONOMICS, GIANNINI FOUNDATION, UNIVERSITY OF CALIFORNIA, BERKELEY

Mr. BENEDICT. Only 2 or 3 of the points listed by the chairman can be touched on in this opening statement.

Agriculture, like the rest of the economy, has come through the postwar years in rather good shape. Because of this we have our sights set pretty high. Most of us, I am sure, agree that they should be set high. However, our striving for these new and higher goals needs to be tempered with realism. The achievements and phenomenal prosperity of the past 15 years are things of which we all are justly proud. We do need, I think, to recognize that this high rate of increase in farm production, farm incomes, and general prosperity has few, if any, parallels in past history. One does not always stand at the peak.

There are plateaus and valleys to be crossed as well as mountain ranges, in economic affairs as in transcontinental travel. If we choose our course wisely, we will avoid the deeper depressions and the more difficult routes. But there are bound to be some setbacks and some periods in which progress will not be all we would like to have it be.

After World War I, farm prices fell to little more than half what they had been 2 or 3 years earlier. Farm mortgage debt, created by speculation and inflation, had placed on agriculture a back-breaking burden for which there was little offsetting increase in real wealth. Our farm plant was perhaps even in poorer condition than when the war began. The World War II situation has been markedly different. The postwar years have been the best American agriculture has ever known. Furthermore, we have come out of them with a vastly better-equipped farming industry and a rather moderate level of indebtedness. However, there were artificial elements in the agricultural prosperity of these postwar years that it may not be easy to reproduce even with the most active cooperation of Government. Some of the demand, both farm and nonfarm, grew out of delayed spending of high wartime earnings. Some grew out of the continuance of deficit spending and some was a result of an almost unique combination of great need abroad for American farm products and a willingness of our Government to supply funds with which to purchase them.

Coupled with these, there has been in recent years an enormous accumulation of unsold farm products in Government holdings which could, unless very wisely and skillfully handled, act as a delayed pressure on the supply side and thus be a price-depressing influence. The current holdings of the Commodity Credit Corporation should be worked down to more suitable levels as fast as that can be done practically.

There was an inflationary upsurge in both farm and nonfarm prices and incomes in 1950 and 1951 which stemmed mainly from the outbreak of war in Korea. Farm prices reached 107 percent of parity in 1951. Since then they have eased off and stand now at 86 (December 1954), a drop of about 20 percent. Both gross and net incomes have fallen off somewhat less, about 15 percent.

Are they likely to go lower or to level off about where they are? It seems to me the immediate prospect is for a leveling off, assuming a continuance of prosperous conditions in the nonfarm economy. The most serious setback to farmers and to the Government's farm program would be a severe slump in nonfarm employment and incomes. The maintenance of high activity in the nonfarm economy is, therefore, the most important objective both from the standpoint of farmers and of the Nation as a whole.

The national economy has shown remarkable strength and resiliency in the past year. There seems reason to hope that we have now learned enough about fiscal and monetary management to be able to hold in check the more violent changes in economic activity. However, it is too early to be sure of that. A full, or nearly full, employment situation is a brittle thing and could be badly upset by anything that would seriously affect confidence and optimism.

Such a change in consumer and business expectations could set in motion deflationary influences that might be harder to control than those of the past year. This, I think, is one of the hardest things to predict and the one we know least about. Can we maintain continuously the buoyant optimism that has characterized the economy in recent years? I was particularly impressed by what seemed to me the realistic and sensible reservations mentioned in the first full paragraph of page 22 of the economic report of the President.

Factors of that kind could more than offset such corrective devices as were used with apparent success in the past year. On the other hand, a renewed outbreak of hostilities could, in the situation we now have, give rise quickly to an inflationary situation similar to that of 1950 and 1951.

We have, I think, made real progress toward the achievement of a more stable economy but we do not yet know how much and what kinds of Government action may be needed if deflationary or inflation forces become more powerful than those of the past year. Both the timing of the actions taken and the skill with which the situation is interpreted and handled are of great importance.

If we assume a continuing high level of prosperity, it seems to me the more serious problems in agriculture can be narrowed down to a relatively few commodities. The livestock industries, except in butter production, are in fairly good shape. They have shown remarkable ability to make necessary adjustments. Cattle prices are lower than cattlemen would like them to be, but it should be remembered that the price parities reported for them, which are well above present prices, reflect the extremely favorable price situation of the early postwar years.

Hogs are in a relatively good position and adjustments in that industry are carried out rather quickly if such action becomes necessary. Furthermore, if needed adjustments are made in grain prices, the profitability of hog and cattle feeding may increase, even if prices of the end products do not increase materially. Poultry producers are in a less favorable situation, but, here, needed adjustments in output are customarily made even more quickly and effectively than in other livestock industries.

Cotton is not far out of balance. A rather moderate adjustment in its price would apparently clear the markets and give cotton producers more freedom of action. I do not think corn production is seriously out of balance or that any drastic action by the Government is needed at this time.

The big and difficult problems are in wheat, butter, and rice. I shall not discuss rice, a minor crop, though the problems there are acute and difficult. Wheat production is overexpanded in terms of present needs. This is an aftermath of war influences, but the measures taken in the postwar years have tended to keep it overstimulated instead of aiding in the readjustment needed. We should cease as soon as possible to treat all wheat as one commodity. There is no overexpansion in the durum wheats and little in the hard red spring. The big problem is in hard red winter, soft white—that is, Pacific Northwest—and soft red winter. In those areas, wheat production will inevitably have to be cut back or much of the crop will have to be channeled into feed uses. The price programs should be revised so as to face that problem realistically. The danger of a disastrous price break from continuing increase in the stockpile of wheat is potentially of far greater importance to what growers than the price adjustments that would be needed to bring the industry into better balance with available outlets.

The wheat growers responded magnificently in the period when national and world needs for wheat were large. They should not be left out on a limb. But the program must, in their interest as well as that of the Government, be brought into closer touch with realities. They should be given effective help in making the changes needed. The set-aside provided in last year's legislation seems to me an appropriate action, but it is purely a stopgap arrangement. It does not solve the basic problem.

The butter problem is far more perplexing, and as yet no satisfactory solution seems at hand. Some help can be given, but the kind of help given in recent years is, in my opinion, more damaging to the industry than helpful to it. The current program of price support and storage is weakening to the very sizeable market for butter that still exists. The approach to this problem should be revised as soon as possible.

There are other and longer term problems that will need continuing study and action. Some of them no doubt will be discussed later today. Generally speaking, I would not expect any severe decline in farm prices, provided buying power remains high, and if production is not overstimulated by actions taken by the Government itself. The major problem is that of how to carry through, with as little hardship as possible, until the postwar adjustments still required can be made.

Looking ahead 5 to 10 years, it seems to me likely that the market for farm products will be relatively strong. Our population is growing rapidly. Many of the babies born in the early postwar years are now coming into the age of heaviest per capita food consumption. At the same time, the farm population is strinking. Our overall farm output will, no doubt, continue to increase, but I think there is a good possibility that, for most products, demand will increase fast enough to absorb the increase if the economy continues to be active and prosperous.

In the interim, there is need for some support for farm prices and for some aid in making needed readjustments. But once the needed postwar adjustments have been made the farm programs should, in the main, be designed to aid farmers in stabilizing their industry, achieving reasonable flexibility as to time of sale and obtaining help when difficult situations arise with respect to particular industries or areas. Normally, such agencies as the Commodity Credit Corporation should not be under heavy strain in times of strong demand and customary volumes of output. They should, so far as possible, be kept in a position to give needed and prompt help if emergencies arise. It is necessary to keep in mind that the reservoir that is full cannot absorb a flood when and if the flood comes.

The CHAIRMAN. Mr. Benedict, I don't want to start discussion, but I wanted to see if I understood your thought. You speak of readjustments, in your judgment, as being necessary in the case of cotton and wheat. Do I gather that you lean toward price decreases in those products or acreage restrictions or output quotas?

Mr. BENEDICT. I think in the case of cotton that it would not imply any very large change in the price situation to get it where it would largely take care of itself, that is a moderate increase in the amount exported and possibly some restraint on production for a few years I believe would give us a better cotton program than the one we have now.

The CHAIRMAN. How much of a decrease in the price of cotton?

Mr. BENEDICT. Possibly 2 or 3 cents a pound.

In the case of wheat, the situation is different. I do not think the wheat problem could be handled by price adjustments alone. It is greatly overexpanded. We are producing some two or three hundred million bushels more of wheat than there seems to be any prospective outlet for as a foodstuff, either at home or abroad, and it would seem to me that it will be necessary for some years to maintain some restrictions on wheat acreage, and to try to get some of that land into other uses. The biggest problem, as I see it, is how to handle the very large accumulation we already have on hand without breaking the market seriously.

It used to be assumed that if we let prices find their own level the surplus would find an outlet abroad. I do not think even the world market can absorb for food use the amount of wheat we have to spare at the present time.

The CHAIRMAN. You mean if sold at market prices?

Mr. BENEDICT. Yes. It would seem to me logical to approach the wheat problem in two ways; one, differential pricing by types and grades and, two, some readjustment in acreages grown or the uses made of the wheat grown. We have been treating wheat as though it were all one commodity. Actually it is several commodities. There is no surplus production of Durum wheats and there isn't any very serious problem in the Hard Red Springs. Our big accumulations, something over 500 million bushels, are in hard red winter and there is proportinately as large an accumulation in the soft wheats of the Pacific Northwest.

I do not see anywhere, either at home or abroad, a likelihood that we can dispose of the amounts of wheat of these types we are now growing without creating chaos in the world market as well as in our home market unless considerable amounts can be channeled into feed use.

The CHAIRMAN. How would you get this wheat acreage withdrawn, just order them to do it, or pay a subsidy to it, or give them an alternative?

Mr. BENEDICT. I think we might very well make some modification in our soil conservation program creating special incentives to restore to grass some areas such as the southern and western Great Plains area, the old Dust Bowl area. There are probably several million acres there that might well go back into a more extensive type of agriculture.

The CHAIRMAN. Through subsidies, you mean?

Mr. BENEDICT. I would think so, yes.

Along with that probably some subsidization of the rather expensive task of making that kind of shift. Perhaps supplying grass seeds, some help in reseeding, and so on. I think that area in particular is extremely vulnerable, even if we continue with the present program. If we get another serious dry year or two they are going to be in trouble regardless of what the price of wheat is.

The CHAIRMAN. Well, aren't they in trouble now?

Mr. BENEDICT. To some extent, yes.

(Mr. Benedict's prepared statement and supplemental material appear at pp. 706, 708.)

The CHAIRMAN. Mr. Davis.

OPENING STATEMENT OF JOHN H. DAVIS, DIRECTOR, MOFFETT PROGRAM IN AGRICULTURE AND BUSINESS, GRADUATE SCHOOL OF BUSINESS ADMINISTRATION, HARVARD UNIVERSITY, AND FORMERLY ASSISTANT SECRETARY OF AGRICULTURE

Mr. DAVIS. Mr. Chairman, considering the time element, I have assumed that what you wanted from us was, first, a very brief statement which presented ideas rather than complete arguments, and then I have followed such a statement with an attempt at answering specifically each question which you set forth here for us. I have the feeling that the setting before us of an objective of some kind such as the $500 billion national product as a 10-year goal is very worth while, and I think that what we should do, then, is to ask ourselves who does this mean to agriculture, or what steps, if any, are necessary to assure that agriculture will be a full participant in such economic growth and expansion?

By "full participant," I mean that farm people should have an opportunity to earn and enjoy a standard of living consistent with that of other economic groups, considering, of course, the degree of training, skill, entrepreneurship, etc., required in farming. Full participation in economic growth by agriculture helps not only farm people but increases the economic potential of the whole Nation.

Today agriculture in many respects is unprepared for such a destiny.

The solution of such matters is made still more difficult by the dynamic forces which today are at work within our farm economy. Currently American agriculture is being subjected to the tremendous twin forces of change as a result of science and technology and adjustment from wartime dislocations.

And with respect to the latter, the adustment from wartime dislocations, I think that we haven't been nearly as conscious of that as we need to be. The adjustment to scarcities as a result of war hit us immediately after hostilities ceased and its greatest impact was then. We recognized it for what it was.

Agricultural adjustment from war did not start until late in 1951, and actually we are only in about the third year of it or so now, and the impact of the agricultural readjustment after the war has been borne almost entirely on the North American Continent, and I think that our failure to see that clearly has clouded our action to some extent on the agricultural front in this postwar period.

While the impact of war is gradually diminishing, the impact of science and technology is continuing to increase. Therefore, the task of formulating farm policy and improving our rural economy becomes an endless one. It is an evolutionary undertaking which has no terminus. Therefore, it is a mistake to attempt to establish farm policies and programs on a permanent basis. Instead, our permanent policy should be one of creating procedures for constantly improving farm programs and policies while "on the march."

In order to organize the undertaking so as to make it manageable, let us approach the farm situation by setting up three major theaters of operation, very much the same way we established theaters of military operations during World War II. These theaters might be described as (1) a hold-the-line action on the economic front to give us time for preparing for more basic operations, (2) action to expand and develop bigger and more adequate markets for farm products, both at home and abroad, and (3) action to resolve the problems of low-income farm units.

By means of action on the No. 1 theater we will be buying time in terms of economic balance and stability to permit us to undertake more basic operations on the other two fronts. By acting on theater No. 2, the developing of more adequate markets, we will be putting new dynamics into our farm economy. By action on theater No. 3 we will be making our farm plant more efficient and strengthening our total economy by rehabilitating those families who have been left behind in the march of progress.

I speak of these undertakings as theaters of operation rather than as farm programs because of their dynamic, changing nature. Both policies and methods must be subject to change as conditions alter.

Within each theater there is need for teamwork and cooperation by all interested groups and organizations all up and down the line.

At the national level there also is need for coordination and teamwork in relating the operations of the separate theaters of action into a unified whole. Also, there is the task of relating all of this to the rest of the economy and to our international responsibilities. The need is to tackle the farm problem in the same comprehensive manner we did the creation of the atomic bomb. By this I mean that we should bring to bear on the subject the best know-how of the various interested groups, producers, handlers, processors, distributors, nutritionists, industrialists, Government, etc., all working in an integrated effort. By doing this, the various groups will be acting in their own enlightened self-interest, as well as that of the Nation.

What about contained improvement in production? Is not this still important? The answer is yes, it is fully is important as ever. There is every indication that research and progress in production will continue with even greater momentum in the future than in the past. The new emphasis on market development and the solution of the problem of the low-income farms, which I am suggesting, would itself tend to give new impetus to progress in production. Also, it will tend to give a better alinement to production efforts by more closely relating them to our economic goals, both for agriculture and the Nation.

What about such functions as conservation, research, extension education, credit, and the like, where do they fit into this picture? The answer is that all of these are important and essential. They are tools for implementing the major operations which I have described. They should be provided to the extent necessary to get the total job done. My guess is that careful study will show that we actually need more, not less, of each such service than we are providing today. To the degree that such services are essential for the achievement of a dynamic and prosperous economy, they are a wise investment. Not to provide for them is to be penny wise and pound foolish. Also, in the case of resource conservation it is possible, during periods of acute imbalance, to relate conservation practices and payments to the diversion of selected acres for use in building a fertility reserve for the future, thereby hastening the readjustment toward a balance betwen supply and demand.

The American philosophy is that government should enter the farm field as little as possible. The degree of government in agriculture is going to be determined more in terms of what we do than what we say. The surest way to move toward less government and more private initiative is for farmers and private business firms to take increased responsibility for improving farm markets, making the total market structure more adequate to meet the farmer's needs without extensive aid from government.

To do this, farm and business management will have to look beyond the operations of the particular farm or firms and, also, concern itself with the problem of the adequacy of the total market structure for the commodity involved. They will have to evaluate not only the economic operations at each successive step in the market process, but, also, must concern themselves about the adequacy of the total market stairway from farm to consumer as a whole.

The CHAIRMAN. Do you mean the spread between the prices which the consumer pays and the price the farmer receives is excessive?

Mr. DAVIS. That is one of the things.

It seems to me that one of the difficulties in this area is that different firms provide different operations at different levels. Between the farmer and the consumer you have people in storage operations, wholesaling, retailing, etc. I think each such firm studies its function pretty objectively and does a pretty good job. But, in addition to that, they do not take any major responsibility in general for the adequacy or inadequacy of the total market structure for that commodity.

The CHAIRMAN. Do you mean there may be too many steps on the flight of stairs?

Mr. DAVIS. Well, there may be too many, although this will vary by commodities. When you add the whole thing together it does not result in adequately serving the needs of agriculture particularly in terms of orderly prices and economic stability, and I think it is in that area that we need to look more closely at the total structure. Everybody involved in marketing and producing needs to look at that.

The CHAIRMAN. Let us translate this into very direct terms: In other words, you think there may be too many middlemen?

Mr. DAVIS. I think in some cases there are, and there is a need to be conscious of this fact at all times. But there is also a tendency to go in the other direction because of the services offered.

The CHAIRMAN. I am just trying to translate this beautiful speech of yours into reality.

Go ahead.

Mr. DAVIS. It means a broader sense of a stewardship and teamwork all up and down the line. It may even mean modifying the antitrust laws to give sufficient latitude for this purpose, of course, at the same time protecting the interest of the public.

The CHAIRMAN. Does this mean weakening the antitrust laws or strengthening them?

Mr. DAVIS. I am thinking of the type of situation such as marketing agreements where you create a vertical structure for policy coordination as a means of adding stability to the market when there is an excess supply.

The CHAIRMAN. Does this give them the power to restrict production?

Mr. DAVIS. The marketing agreement does not allow them to restrict production.

The CHAIRMAN. I am speaking of private agreements such as the orange growers.

Mr. DAVIS. I am thinking more about the marketing agreement type of thing and marketing agreements do not themselves restrict production. They do result in allocation of supplies for different use within a market.

The CHAIRMAN. I had never thought that they were in violation of the antitrust laws.

Mr. DAVIS. They do have some immunity from the antitrust laws. You see, in general, elements in the market cannot assemble together to discuss policy matters which may affect price without some immunity from the antitrust laws, and the market agreement acts which we now have do provide some latitude under the antitrust laws, and then they impose upon the Secretary of Agriculture responsibility and vest in him what amounts to a veto authority in the public interest.

Now, in the light of the general comments I have made, I shall attempt categorically to answer the general questions which you have listed for discussion by the panel. Recognizing that to do this will result in oversimplifying the issue, I submit these answers as "targets" for discussion by the panel.

Question 1. Analyze just what the Agricultural Act of 1954 and the rulings of the Secretary of Agriculture will do to support levels of basic and other commodities. What will be the effect on the demand for, and supply of, those commodities? Will there be adequate storage facilities for agricultural commodities? If not, what can be done about it?

Answer. Assuming weather conditions to continue as in recent years and no new international emergencies, I should expect support prices to show more of a downward than upward tendency. In general, this would have relatively little effect on the demand for or supply of commodities subject to price supports. This situation will vary some by commodities. Of course, in the case of wheat, consumption would increase if the price were to become competitive with feed grains. The storage problem will be similar to that of the past 2 years—the principal problem relating to grain. The answer is to encourage the building of some more permanent storage facilities at selected locations, and the expanded use of on-farm storage, steel bins, mothball ships, etc.

Question 2. What farm price movements do you anticipate during the coming year? During the long run? What can we expect the parity ratio to show this year and next?

Answer. Again, assuming weather similar to that of recent years and no new hostilities, we will do well to maintain average farm prices where they are during the current year. The same is true of the parity ratio. In the long run the picture should be brighter provided we aggressively strive to expand markets at home and abroad.

Questions 3, 4, and 5. What modifications in existing farm policies are needed to assure farmers as full participation as possible in the expected rapid growth and progress of our economy in the next decade?

What can be done to increase the productivity and levels of living of lower income farm families?

What effect would the realization of maximum employment and production during the next decade have upon the demand for various farm products?

Answer. I think that my answer to all three of these questions has been given in my earlier statement. However, I would like to stress the importance of maintaining a relatively high level of farm income as an incentive for speeding up adjustments. Adjustments within agriculture require capital formation at a relatively high rate. Also, the migration of people from agriculture to urban employment requires expanding productivity and employment outside of agriculture. In general, both of these conditions are related to the maintenance of a relatively high level of income within agriculture.

Question 6. In view of the decline in farm prices and incomes while national income is rising, when do you expect farmers' incomes to rise again and what forces will bring about a recovery?

Answer. It seems to me unlikely that higher farm prices or income will be generated by existing farm programs. Of course, higher income is the thing we seek. This, then, will come from reducing farm costs, expanding farm markets, or both. The achievement of this depends upon how aggressively and successfully we proceed on theaters 2 and 3 as I outlined them earlier.

Question 7. Are the prospects for developing continuing new market outlets promising?

Answer. The prospects of developing continuing new market outlets do look promising.

Question 8. Under the Agricultural Act of 1954 the support level for wheat may be reduced to 75 percent of modernized parity within a few years if supplies continue large. Would this bring about a reduction in wheat prices of 30 to 35 percent from present levels? In your opinion would this reduction in wheat prices result in a restoration of the submarginal wheatlands to grazing?

Answer. It is conceivable that wheat prices may be reduced by as much as 30 to 35 percent from present levels under the existing law. Should this happen, and should it result in the withdrawal of considerable acreage from wheat production, the use of such acreage would vary by location. In the diversified farming areas most land going out of wheat would be put to other crops or grazing. However, in the Great Plains area the tendency would be to abandon submarginal wheatland and let nature take its course. This land would not be returned to grazing readily unless special incentives were created.

Question 9. To what extent are lands not suitable for crops in the Western States (primarily because of wind-erosion hazards) now being cropped?

Answer. The needs of World War II and the prices which then prevailed caused several millions of acres of land to be put under the plow in Western States which should not be cropped.

Question 10. Is there any reason for concern over current prices of agricultural land or over the availability of agricultural credit for land purchase or operating purposes?

Answer. At present, I feel we need to be more concerned over credit requirements than over agricultural land prices. Credit needs are increasing for several reasons—the growing capital requirements for mechanization and larger sized farm units, the squeeze between falling farm prices and high production costs, and the constant subdivision of estates among heirs upon the death of current owners.

In conclusion, I reemphasize the importance that agriculture participate as a full partner in the achievement of our goal of a dynamic, growing, prosperous national economy. It is only as all major segments of the economy progress in unison that optimum results will be realized.

The CHAIRMAN. Thank you, Mr. Davis.

(Mr. Davis' prepared statement appears at p. 703.)

The CHAIRMAN. Mr. Lincoln.

OPENING STATEMENT OF MURRAY D. LINCOLN, PRESIDENT, COOPERATIVE LEAGUE OF THE UNITED STATES, COLUMBUS, OHIO

Mr. LINCOLN. Mr. Chairman, I think everyone on this panel except myself is a trained economist, and I am a little hesitant to speak out as a layman with so many learned professors around here.

I think we have to have them, and their advice, but I am concerned with this agricultural situation. I think agriculture is the forgotten man in this report, as I read it. I do not know whether depressions are farm bred or farm led, but I went through one before, as secretary of the Ohio Farm Bureau from 1920 on.

As far as I can see, Mr. Chairman, and members of the committee, it looks as if I can say, "Here we go again," because farm income is going down. Farm costs are not going down proportionately, and I think you are going to wake up some day with a real problem on your hands, and I think we are going to find it entirely different this time than we did last time because we tried so many things in the interim, in the 1920 downturn and the present one, that I think you are going to be up against a real problem.

Now, the whole situation is so vast and so complicated that I do not know that any of us are qualified to adequately give any suggestion, but I would like to confine myself to 1 or 2 areas.

Like the rest of you, I have given a report here which you can read if it is worth reading, but it seems to me that we are trying to solve this farm problem by going at it the wrong way. I think what we need is a national food policy rather than national farm policy, because everybody is concerned with food. It is a most important commodity not only for the health and welfare of our own people, but for people in other countries who certainly need food wherever and however they are going to get it.

So it seems to me before we spend too much time on what we are going to do to maintain price supports—and I cannot agree, yet, Mr. Chairman, and gentlemen, that the approach to agriculture is one of writing scarcity into our agricultural program. I think we have just got to simply turn around and find out methods by which we can get more food to more people wherever they are at a price and, of course, under conditions that have got to maintain a healthy farm economy.

Now, the thing that always has disturbed me, if I read history right, is that agriculture is only in a good position just before, just during, and just after a war, and I do not like to think that war is the only answer to the farm problem.

Now, I would, of course, grant that until we find some better solution we had better hang on to what we have and try to work with it, but I would like to point out to the committee that I think we need a broader approach to trying to find out if we cannot eliminate some of the toll gates between the farmer and the consumer, whether he is an individual in the United States or an individual somewhere in the world that needs the kind of food we can produce.

I see a whole series of things building up which lead me to think you cannot solve the farm problem. You cannot raise prices fast enough to keep up with the concentration of power, the increase in the spread between the farmer and the consumer, and then you are giving fast writeoffs to a lot of companies. You give us a fast writeoff for some of this distribution machinery, and I think we will show you something.

Maybe in our economy we cannot do it that way, but the farmer used to farm with his own power, he had oats and hay to feed the horses. Now, we are geared to gasoline.

I saw a report the other day that some oil companies only pay 4 percent of their net income in taxes because of depletion and depreciation, and all of those things, and the rest of us have to pay about 41 percent of our net income, in the form of taxes, out of the income that we get.

Then you are piling one combination on another and today the farmer does not live by himself as he used to. We are in the market and nearly everything we have to have comes from sources that are making more return on their capital and a higher return on their labor than we are getting ourselves, and I say that is not good.

Now what I would like to see among all of the other things you are going to discuss here today is some additional effort toward reducing the cost of providing goods for people, wherever they are. I do not know whether I can support it or not, but my contention is that at a price you can get rid of everything you have. I have yet failed to see anything that would not move into the channels of trade at a certain price, so the problem is at the price we would have to sell farm products, how is the farmer going to keep going, and that is where I think we need a broad approach to try to build machinery, either with Government help or without it, and I think if somebody would put a bomb under the Farm Credit Administration, we might get them to do some things that need to be done.

I think they are getting more conservative than the old bankers, and helping farmers and consumers get machinery that can serve to reduce the cost of getting goods to people, that is in the general interest, and along with that, the farmer is going to be taken care of as well as everybody else.

Now, of course, we have to have an expanding economy, and I grant the figures of Mr. Benedict, but I do not thing we are paying enough attention to the need for economic growth because, with the new people coming into the labor market, we cannot be content with the kind of gross national product we have.

So I say, No. 1, we need to maintain our present policies as near as we can until we get something better, but we do need a larger approach to try to cut down the cost of getting goods to the consumers, wherever they are, here or foreign, and unless you can do something to reduce the income and net return on capital of those interests that supply the things the farmer has got to have now, you are going to continue to be in a ring-around-the-rosey that some day is going to make some real trouble, unless we have another war, and only then will it be postponed.

You will have the problem just as soon as we get back, so in the main, that is the one point that I would like to make; that we need at the present time a very much larger approach—we need to turn our thinking around and think in terms of how to get food to people and to maintain an ever-expanding economy, and I do believe there are many places where, with the proper help and direction, we could return more to the farmer and at the same time not raise the price to the consumer, and in fact reduce it, and that is where, of course, I think cooperatives come into the picture, and they are the only institution I know of that legally can do this kind of job without it falling into the hands of people who are trying to make more money. The returns of cooperatives go to a lot of people to increase purchasing power, to do more business and to make more profits for everybody along the line, and that is my story, gentlemen.

The CHAIRMAN. Thank you very much.

(Mr. Lincoln's prepared statement appears at p. 698.)

The CHAIRMAN. Mr. Nicholls, I believe you want to concentrate on the low-income families.

OPENING STATEMENT OF WILLIAM H. NICHOLLS, PROFESSOR OF ECONOMICS, VANDERBILT UNIVERSITY, NASHVILLE, TENN.

Mr. NICHOLLS. Yes, I was going to remark that, in my very limited time I did want to concentrate on the low-income problem. To lend more adequate support for the brief comments I can make here, I should like to submit for the record, for whatever use the committee would like to make of it, a rather substantial document on the low-income farm problem that I prepared a few months ago. I think this document is important because it makes clearer that agriculture is a very heterogeneous part of our economy and that the several sectors of agriculture require quite different public policies if their several problems are to be solved. I would therefore like to submit this document for the record.

The CHAIRMAN. That will be made a part of the printed record.

(The document referred to and Mr. Nicholls' prepared material appear at pp. 658, 664.)

Mr. NICHOLLS. Thank you very much.

Further more, I will only read part of my statement, which is in your hands, omitting the middle part in order to hold by oral comments to the allotted time.

In 1949, farm families accounted for 1 out of every 3 to 4 low-income families in the United States. However, many of these low-income families had heads not in civilian employment because of age, disability, widowhood, or divorce. If the latter are eliminated, farm families constituted about one-half of all low-income families. In absolute terms, there were about 1.25 million complete farm-operator families, with ablebodied male heads in their more productive years, which had net cash incomes from all sources of less than $1,500; and 0.8–0.9 million of such families with net cash incomes under $1,000. Presumably, most of these latter families could have made a substantially larger contribution to the Nation's product if they had better nonfarm job opportunities or if they had more productive farm resources to work with.

Of all farm families with net cash incomes from all sources of under $1,000 (an average of only $456), 71 percent were in the South. Were it possible to eliminate the aged, disabled, widowed, and divorced, we would undoubtedly find an even heavier concentration of the Nation's low-income farm families in the South. Furthermore, while Negroes constituted 9 percent of the Nation's families, they accounted for 21 percent of all families with incomes under $1,000. (However, even in the South, 61 percent of the farm operators in this low-income group were white.) We may conclude that the low-production family problem is primarily centered in the Southern States because of their relatively heavy dependence upon a low-production agriculture and because of their relatively large Negro population.

As victims of rural poverty, many of whom could earn more and consume more in nonfarm occupations, these farm people should be of great public concern as the Nation's greatest reservoir of underemployed and largely wasted resources. Unfortunately, given the unsatisfactory nature of national employment statistics, such people are considered "fully employed" although at best their employment is part time and very unproductive. Their inclusion among America's farmworkers also pulls down the farm income per worker or per capita to levels which compare very unfavorably with nonfarm income, lending support to public farm policies which help them hardly at all while concealing the need for a positive public program, largely nonagricultural in nature, to alleviate their low state of productivity and income.

The magnitude and difficulties of the low-income rural problem in the United States almost stagger the imagination. But they should make clear that, despite our deep concern for assisting underdeveloped nations abroad, we may have overlooked comparable problems—different in degree but not in kind—of underdeveloped regions within our own Nation. In the interest of a strong and growing national economy, we can no longer afford to neglect these serious regional problems.

In tackling the problem of rural poverty, we must first recognize that there are far more American families trying to make a living from farming than our agricultural resources can possibly support at a level of living comparable with that afforded by similar nonfarm occupations. Second, we must at long last recognize that, while primarily benefiting those farm families which are least in need of public financial aid, our agricultural price-support policies can contribute practically nothing to a solution of rural povery. At the same time, because of their great cost in treasure and in administrative effort, they strongly divert public funds and public concern from a million or more underemployed rural people who require substantial and sustained assistance. Finally, we must develop a consistent, coordinated, and integrated set of public policies which will, by attacking the fundamental causes, go far toward solving the problem of rural povery during the next decade or two.

In my view, a positive program for reducing rural poverty would have the following major elements:

(1) The development of a substantial program of Federal grants-in-aid for public-school education and for expanded public-health services.

(2) The maintenance of a stable and steadily expanding national economy.

(3) The extension and improvement of the United States Employment Service in rural areas, with fuller integration of the objectives and administration of farm and nonfarm placement.

(4) A considerable increase in congressional appropriations for vocational training grants-in-aid to the States, with a revision of the allocation formulas to encourage nonfarm training in rural high schools and to break down the administrative barriers between the farm and nonfarm phases of the program.

(5) The abandonment of present provisions for minimum-acreage allotments (below which the small farmer may not be required to reduce his acreage of price-supported crops) in our basic farm legislation because of their deleterious effect on productive efficiency and labor mobility.

(6) The revision of the basic statute on unemployment compensation, and of its administration, to eliminate factors tending to discourage labor mobility.

(7) The development of Federal policies favoring location of defense plants in areas of rural underemployment as well as of urban unemployment.

(8) The development of a Federal power policy which will, through a combination of public and private sources, assure the South of a power supply consistent with its industrialization needs.

(9) A general revision of the Department of Labor's concept of "labor surplus" areas broad enough to include underemployed rural labor as part of the local labor surplus.

(10) The introduction of a regional differential if the minimum wage is raised.

(11) Expansion and improvement of the services of the Area Development Division of the Department of Commerce.

(12) The development of intermediate-term types of credit by the Farm Credit Administration.

(13) A substantial increase in the resources of the Farmers Home Administration.

(14) Increased emphasis in the programs of the agricultural experiment stations and agricultural extension services on the problems of the small farm.

(15) Further development of the programs of the Federal Reserve banks aimed at increasing the participation of commercial banks in agricultural development.

(16) A modest program in rural home improvement, probably under the Farmers' Home Administration, with due regard for the farm as a production rather than as a residential unit.

(17) Increased benefits and extended coverage for farmers and rural people under the OASI, public assistance, and rehabilitation programs.

The CHAIRMAN. Thank you, Mr. Nicholls.

The chairman regrets that a pressing engagement elsewhere requires him to leave in just a few minutes. Before I do leave, I would like to put into the record a report from the Department of Agriculture on the distribution of surplus foods to needy persons. I would like to present this summary. In the 6 months from January to June of last year, there was 1,087,000 persons receiving surplus food. In the 5 months from July to November, 1,948,000, or virtually double. In the last 5 months, the total pounds of surplus food distributed was 48.9 million pounds, and division indicates that this would be about 25 pounds per person, assuming this is the average number.

Since there were approximately 151 days, this would indicate about 3 ounces a day per person.

Senator SPARKMAN. Does it show the principal commodities?

The CHAIRMAN. Yes; and those will be inserted in the record, and it shows the numbers by States also.

(The report referred to is as follows:)

UNITED STATES DEPARTMENT OF AGRICULTURE,
AGRICULTURAL MARKETING SERVICE,
Washington 25, D. C., January 28, 1955.

Mr. JAMES W. KNOWLES,
Staff Economist, Joint Committee on Economic Report,
United States Senate.

DEAR MR. KNOWLES: This is in reply to your telephone request of January 27 for information concerning the quantities of surplus foods being made available to needy families and the number of persons in such families. The information on the quantity of surplus commodities is provided in the attached table for the period July through November 1954, which is the latest date for which we have complete information for all States. The data for the number of persons participating is for the month of November.

We do not have a detailed breakdown of the types of families now receiving surplus commodities. The figures, however, include families receiving cash public assistance, other needy families determined to be eligible by State and local public welfare organizations including those whose wage earner is unemployed, employed only part time, or unemployable, as well as needy Indians in some parts of the country.

Sincerely yours,

O. U. WELLS, *Administrator.*

UNITED STATES DEPARTMENT OF AGRICULTURE,
AGRICULTURAL MARKETING SERVICE,
Washington 25, D. C., February 1, 1955.

Mr. JAMES W. KNOWLES,
Staff Economist, Joint Committee on Economic Report,
United States Senate.

DEAR MR. KNOWLES: In accordance with your telephone request of January 31, we are enclosing a table showing the volume of individual surplus commodities distributed to needy persons for the period January through June 1954. The table also shows the number of persons receiving such commodities during June.

There has been some distribution of surplus foods to needy families for the past several years, but it was on a very limited basis prior to the early part of 1954. Such distribution was limited because the volume and variety of surplus foods available was not sufficient to justify the necessary expenditures by State and local welfare organizations to provide the storage and handling facilities required to make these commodities available to persons on relief. In the last half of calendar year 1953 the number of commodities available for distribution increased and items such as canned beef and shortening, which are particularly adapted for family distribution, became available in large volume. As a result, more States took advantage of the availability of these foods and set up the necessary machinery for distribution to drought victims, the unemployed, and regular public assistance recipients already on their relief rolls.

Sincerely yours,

ORIS V. WELLS, *Administrator.*

2 Participated in distribution during 6 month period but no distribution in June.

The CHAIRMAN. Now I am going to ask Senator Sparkman to take over as chairman. At the conclusion of the statements by the members of the panel, Senator Flanders wishes to make a statement.

Senator FLANDERS. I shall make a request to join the panel temporarily.

Senator SPARKMAN (presiding). Mr. Schultz, may we hear from you, sir.

OPENING STATEMENT OF THEODORE W. SCHULTZ, PROFESSOR OF ECONOMICS, UNIVERSITY OF CHICAGO

Mr. SCHULTZ. I want to associate myself completely with what Professor Nicholls has just said as to the low-income problem, and since it is one of the main points on which I want to dwell, I will not elaborate in my statement on this, but rather find myself associating with his more elaborate and more complete and better statement than my own.

I do want to add for the record two things on the low-income problem. One is a memorandum that my colleagues and I prepared for the Secretary of Agriculture on the low-income problem, and another is an estimate of the low-income numbers in agriculture in 1950, prepared by Dr. Hendricks, a colleague of mine, which confirms and is consistent with what Mr. Nicholls gave you in his opening statement, and if I may do that, Mr. Chairman——

Senator SPARKMAN. Without objection, they will be included.

(The information referred to appears at pp. 654, 655.)

Mr. SCHULTZ. Thank you. I will restrict my statement to the three policy issues. One I have called the haphazard way in which we are disposing of very large stocks now under Government control, as these policies appear to the foreign producer countries. Second, to the requirements of a price policy in agriculture which has in it the prospect of reducing price variability to farmers and also increasing the efficiency of agriculture. The third is the gross negligence of the large number of low production, low income farmers in parts of the United States, the poverty of which is a national disgrace, and this is the one that Mr. Nicholls has put to you so very satisfactorily.

Now, in a sense, the Economic Report of the President is silent on each of these three policy issues which I deem to be very important. Before I consider these issues, may I say a word about the economic setting in which agriculture finds itself against which my statements are made. They differ somewhat in terms of what has been said by one or two of my colleagues in the preceding comments.

I would say first that the domestic demands for United States farm products is of slow growth. It gets very little growth from additional income. This is a different way of saying that the income elasticity, when we speak of farm products, is very low, so most of the growth really comes from population.

I am more technical on that in my paper.

On the supply side, additional production is readily forthcoming. As a country, we have benefited greatly from the many new techniques of production in agriculture. This is the technical revolution about which Mr. Davis spoke. With little or no increase in the total quantity of factors committed to farming, this country can, for many years, surely for the next 5, 10 years, or longer, stay abreast of the demand as a result of the advances underway in agricultural technology. I do not, therefore, share Mr. Benedict's view that the larger population in 3, 4 or 5 years is going to catch up and solve the supply problem which you men are wrestling with as it becomes part of the surplus problems of stocks.

One needs to bespeak the dynamic strength of most of the farm families that produce the bulk of the farm products entering commercial channels.

These are not the poor. This is not where the poverty problem is. I think there is a tendency to underrate the flexibility, the competitive capacity and also the income earned by these particular family farms. This underrating arises partly from bad statistics and then, too, from lumping all farmers together, and thus not separating out the million or so farm families who really produce very little and who are really very poor.

The technical and economic developments that the Corn Belt farmers have taken in their stride in recent years not only illustrates but demonstrates the dynamic capacities of these farm families that I am talking about for the moment.

There has been a technological revolution in the Corn Belt. There has been the mechanization of fieldwork, hybrid corn, commercial fertilizer, and many other techniques. In adjusting to these advances, the corn farmers of the United States as a whole have reduced by 30 million acres the amount that is planted to corn, and this reduction in acreage—this is from 1932 to 1953 or 1954—this is a reduction in corn acreage that is as large as the total corn acreage of 3 important nations, Argentina, Brazil, and Mexico.

There have also been big fluctautions and shifts on the demand side. But one observes that most family farms in the Corn Belt have achieved a satisfactory adjustment to these technological developments and to these other supply and demand changes, and I think we should not underrate the real strength that one can see in what we observe in this very large number of farm families.

Now my last point on the setting of the problem here is to comment on farm product prices. I would say that they are not nearly as far out of touch with the market values as is now generally believed to be the case.

We are getting an illusion from these large stocks, and this may very well cast us into terms that are unreal if we try to sense about where the market would be if markets were clearing. In terms of prospective production and demand—for the moment let me hold these stocks aside—most farm products are clearing their respective markets. Those that are not doing so stand about as follows, and I am saying this very categorically, but in my judgment, having considered it very carefully, I would say that the price of corn, which is the key to all the feed grains, is not more than 5 percent above the market levels. It is virtually in touch with the markets.

Nobody can get worried about a misalinement that is that small. Cotton, too, is not far from market values, 5 to 10 percent. If it were that much lower at the present time, it would, I believe, compete and clear markets both at home and abroad. This is a very different story from what we have had at times in the past.

Now, dairy products and also butter are very difficult to gage. They are no longer appreciably out of line. Wheat represents the major exception as Professor Benedict pointed out so very well. While durum wheat which was selling yesterday at well over $4 cash in Minneapolis, is in short supply, and prospective production of spring wheats generally come close to clearing the markets.

Production forthcoming in the next few years of spring wheat will be just about enough to take care of the demands at the present market level. This is what I am saying as to the durum and spring wheats.

Now, in the soft wheats and especially very important hard winter wheats, the product is overvalued.

Now, these are different kinds of wheats in a very true sense. They are overvalued by 20 to 25 percent, and here you have really a serious problem.

Now, with this brief sketch, let me turn to the three policy issues that I mentioned at the outset. We need to correct the apparent haphazard policy of disposal of CCC stocks abroad. To foreign producers, and others, it looks as if we were prepared to dump the stocks we have accumulated in an arbitrary and wholly irresponsible manner. To them it appears that we are prepared simply to dump on them our farm problems and the mistakes of our past farm policies. In the main our administrative actions have been less arbitrary than has been the legislative history on policy urging and authorizing the disposal of farm products abroad.

I want to underscore this. If you get outside and get anywhere close to a producer country our legislative history looks very bad to them because it seems much more irresponsible in the way we appear to be willing to dump, than has been our administrative history. The administrative agencies have really responded to the record. I think we could be better.

Let me say a word here about wheat. This is not true of corn. It is not true of butter. Let me just take wheat to illustrate the point. The Commodity Credit Corporation has, as you know now, in loans of inventory, well over a billion bushels of wheat. This is enough to keep the world market upset for years to come.

Now, we can reduce greatly, as I argued we should, this uncertainty abroad arising from what we may do with the excessive stocks under Government control. My proposal is that the Department of Agriculture be authorized and required to announce at or about August 1 a schedule of the quantity of wheat that will be sold abroad during the following 12 months. This schedule may be by months or by quarters. Sales may be either through private or by some combination of public and private agencies.

Suppose we had announced a schedule of 300 million bushels for the current crop year. It would have been more than we are likely to sell as things are now going and, more important still, we would have done it in a framework which would have reduced very substantially the uncertainty which our now well over 1 billion bushels of CCC wheat creates for producers and buyers of wheat throughout the world.

We can draw a leaf of experience here from what the British did in getting rid of their large stocks after the war. You can take the example of zinc. I think we can dispose of a lot more in the world market than we have been.

Now, in overhauling the farm price policy of the Government I wish, once again, to urge the adoption of a system of forward prices for farm products geared to the prospective normal value of each product. The theory underlying this approach and some of the administrative problems have been presented elsewhere before committees of this kind in Congress by myself and others of my colleagues.

In any case, this is not the time or occasion to restate the analysis and the case for this proposal except to say that it very likely would serve both consumers and agriculture well, for it would reduce measurably the price uncertainty facing farmers and further enhance the productivity efficiency of United States agriculture.

I will not comment again on the low-income problem which is as important and as serious as Professor Nicholls pointed out.

Thank you.

Senator SPARKMAN. Thank you.

(Mr. Schultz' prepared statement appears at p. 652.)

Senator SPARKMAN. Mr. Welch, we will hear from you now, and our vice chairman has arrived, so I am going to ask him to move over and take my place.

Senator Flanders is going to become a member of the panel as soon as Mr. Welch has completed.

Vice Chairman PATMAN (presiding). We are delighted to have him.

STATEMENT OF FRANK J. WELCH, DEAN AND DIRECTOR, DIVISION OF AGRICULTURE AND HOME ECONOMICS, UNIVERSITY OF KENTUCKY, LEXINGTON, KY.

Mr. WELCH. Mr. Chairman, members of the committee, I appreciate this opportunity of appearing before you to think about some of our farm problems that are serious and challenging. Unfortunately, I did not have an opportunity to prepare a statement for distribution at this time, but, with your permission, Mr. Chairman, I would like to present a fuller manuscript that might be included in the record.

Vice Chairman PATMAN. Without objection, that will be done.

(The material subsequently furnished by Mr. Welch appears at p. 644.)

Mr. WELCH. Mr. Chairman, my analyses and remarks are directed primarily toward the low income farm operating unit. I should like to say, however, before commenting on some of the problems that I see here, that I believe our present overall agricultural policy and programs are working reasonably well, recognizing that they are a composite of compromises and recognizing further that they are based partly on a lack of full understanding of all the casual factors involved. I believe that we should live with what we have until experience suggests possible changes. We will never have a policy and program that will be finished because of the dynamic and evolutionary characteristics of our agricultural economy.

Now, I am going to abbreviate my remarks because of the comments that have already been made on the low income small farm group. I do believe there are some points that are worthy of mentioning again, if for no other purpose than emphasis.

It is a little difficult for some of us within the context of a booming national economy and an optimistic industrial outlook for many people to realize that some segments of the agricultural economy face serious problems and an outlook much less rosy. Furthermore, when one considers only averages and national figures it is easy to overlook the permanently depressed and marginal condition of the large numbers of farm people who live on very small or low-productivity farms and must be classed, by any standards, as low-income families. It is difficult to realize that in America at midcentury approximately a million and a half farm families had cash incomes, from all sources, of less than $1,000 and that additional thousands of families were attempting to make their living from farms having a gross value of products amounting to less than $2,000.

These families are widely distributed, but I agree with Mr. Nicholls that they are largely concentrated in the southern part of the United States and in the Appalachian Mountain areas. It is within this area, within some 200 counties, that we find a total of some 8 million people that fall within the classification that we have given here as low-income groups.

In the consideration of remedial measures, it cannot be emphasized too strongly that the poverty of an area in which low-income farmers are concentrated is not merely the poverty of people by families but it is also a poverty of the social organizations and social institutions on which persons and families depend for fulfillment of their lives. Whatever one may mention, whether schools, libraries, churches, businesses, local government, civic-service groups, or the whole range of institutional services, as we know them in America today, there are conspicuous deficiencies. Strengthening institutions thus becomes a part of business and community development.

Any approach to these rather desperate problems is ill-founded and dangerous in terms of the welfare of our total economy if it is based upon the assumption that progress, or lack of progress, is a matter only of local concern or local responsibility. As indicated above, it is not only a matter of poverty in terms of individuals and families, and institutional service, it is poverty in terms of tax resources out of which services may be provided by the local people, and it is also poverty in terms of imagination, resourcefulness, and the ability of a people to lift themselves by their own bootstraps.

Specifically, the following areas of program service may be mentioned, without any effort to expand or describe them in detail; and I do not believe we can approach these problems in terms of a single program or a single solution. I think we are going to have to approach these problems through the broad range of institutional services that we now have—reexamining, reappraising, and redirecting these to a more realistic application to the problems that exist.

Perhaps the greatest need in these areas is for an adequate educational program for both youth and adults. The rapidly growing population creates a tragic and desperate situation in terms of public school services, and, although somewhat less pressing, in terms of adult education programs. Few, if any, programs can help an individual or a group of individuals unless they have the understanding and motivation to help themselves. Hence improved and adapted educational programs are imperative if any types of effort are to be fruitful or effective within any reasonable period of time in the future.

And within these some 200 counties to which I have made reference the increasing number of children that are moving into the schools and the inadequate buildings and facilities there create indeed a desperate situation.

Even with the present highly concentrated and disproportionate ratio of people to land in these areas, from 25 to 50 percent of the youngsters reaching maturity will have to find employment away from the land just to maintain the status quo and, of course, with the unsatisfactory ratio that now exists even greater numbers of youth will eventually have to find employment opportunities away from the land if the ratio is to be improved.

If we are to improve this ratio of people to land in the future, then more than 50 percent of youngsters are going to have to find employment opportunities off the land, and I do not believe this is a concern restricted to the areas where these youngsters are found. They are going to be citizens in your States, and in all the States of the Union, as they must find opportunities elsewhere.

This means that in addition to improved general educational opportunities for both youth and adults, much greater attention needs to be given to vocational training that provides skills and social adjustments and adaptations that will fit the people into a different environment, in which they are going to have to live, and in which they are going to make their contribution.

Coupled with general educational and vocational training, our employment services must be adapted and adjusted within the area, not only to bring alternative employment opportunities to the attention of the people, but also to make it possible for them to move to other areas of opportunity.

Our social-security program needs to be rigorously reexamined and reappraised, and adapted to the extent possible to the needs of the people found in these areas.

Our credit facilities at the present time, while generally adequate in terms of the purchase of land, are certainly inadequate in terms of intermediate credit for the purchase of machinery and equipment and improvement of buildings, and the adding of livestock to these units. There is much that needs to be done in the way of additional research pertaining to the problems in these areas. We have an accumulated backlog of research information that could be used if adapted and applied to the conditions that exist. There is a deficit, however, of research information that is integrated and related to specific problems. We need to know more about the actual limitations within the areas and how the various public and private groups can join together as a team in attacking the problems effectively.

People unacquainted with low-income areas can scarcely understand the rather desperate needs and problems associated with medical, health, and sanitation problems. Again lack of resources within the areas causes them to continue to be neglected.

Thank you, Mr. Chairman.

Vice Chairman PATMAN. Thank you, sir.

Now, the assistant to the Secretary of Agriculture, Mr. Don Paarlberg.

OPENING STATEMENT OF DON PAARLBERG, ASSISTANT TO THE SECRETARY OF AGRICULTURE

Mr. PAARLBERG. Mr. Chairman and members of the committee, I am an economist in the office of the Secretary of Agriculture. My work consists primarily of economic analysis and presentation of economic facts to the Secretary and his policy-determining staff. I am not a member of the policy staff in agriculture. Therefore, my remarks today will be directed primarily to the economic situation affecting agriculture, and not to questions of a policy nature.

I might comment briefly on the contributions from the panel with respect to the problem of low income in agriculture. In the Department of Agriculture we have been much aware of this problem. We have been much aware of the concern of this particular committee with this problem and the excellent work that has been done in the past, and the fine reports that have been made available.

As you know, President Eisenhower in his state of the Union message indicated that he had requested the Secretary of Agriculture, with the help of the National Agricultural Advisory Commission, to undertake a study of the problems of low-income farmers, and that he would at a later date submit to the Congress a message embodying recommendations with respect to what might be done to alleviate difficulties in this area.

The Department with the help of——

Vice Chairman PATMAN. When will the message relating to the small farmers be out, if I may ask?

Mr. PAARLBERG. The President has not indicated a date, Mr. Chairman.

Vice Chairman PATMAN. Do you expect it within the next 2 or 3 weeks, or the next 60 days, or 90?

Mr. PAARLBERG. It probably will not be within the next 2 or 3 weeks; it might well be within the next several months, although no date has been set, and I cannot give you any particular date.

The study is under way that the President requested, and it will embrace the recommendations from a large number of groups and individuals. The farm organizations have participated in the review with the agricultural colleges, and a number of other research institutions. There has been participation from groups representing labor, industry, church groups, and contributions from many individuals, both private and public.

I will abbreviate my remarks, Mr. Chairman.

Vice Chairman PATMAN. If you please. You can place the remarks in the record as they are.

Mr. PAARLBERG. I shall.

A number of these points have already been covered adequately by members of the panel.

The general economic health of America is good. We have been enjoying a period of relative economic stability during this past year. The general price level of the United States has fluctuated within a relatively narrow range.

On January 1, 1955, it was 1 percent below the figure for a year earlier. Fluctuations of such small magnitude are evidence that general stability of prices has been achieved, and such a circumstance is advantageous so far as the accomplishment of needed adjustments within agriculture are concerned. Farm prices, likewise, have fluctuated within a relatively narrow range of 8 percent during the past year. This past year January prices received by farmers were about 5 percent below the corresponding month of a year before.

Farm prices have risen 2 percent from 1 month ago. The 1954 yearly average of prices received by farmers was about 3 percent below the average for 1953. This compares with a decline of 5 percent from 1951 to 1952, and a decline of nearly 10 percent from 1952 to 1953.

Realized net income of farmers last year was approximately $12½ billion. Farm income has about stopped its postwar decline.

Our outlook people in the Department of Agriculture feel that net farm income in 1955 will approach that of 1954. Prices received by farmers may be expected to average close to levels which are prevailing at the present time, and the cost rates or prices paid by farmers probably will not change much in the year ahead. This means that the parity price ratio likewise would remain fairly stable in the year ahead.

While our total farm income was declining from 1947 to 1954 by some 25 percent, our farm population was also declining about 20 percent. This means, therefore, that per capita income in agriculture has declined markedly less than total agricultural income. In the last 7 years, per capita income from agriculture has declined only about 5 percent, and if we take account of the income that farm people receive from nonfarm sources, realized per capita income of farm people from all sources actually increased 6 percent from 1947 to 1954.

I would like to comment briefly on the levels of price support for agricultural commodities, both currently and for the 1955 crops.

Wheat support for the 1954 crop is 90 percent of parity, or $2.24 per bushel. The 1955 crop will be supported at 82½ percent of parity, or not less than $2.06 per bushel.

Cotton support for the 1954 crop is 90 percent of parity, or 31.58 cents per pound. There has been no definite announcement of the support price for the 1955 crop of cotton, but indications point to a support level of 90 percent.

Corn support for the 1954 crop is at 90 percent of parity, or $1.62 per bushel in the commercial corn area. No announcement has yet been made of a support level for the 1955 level, but the Secretary has indicated informally his anticipation that support would be in the neighborhood of 88 percent of parity.

Rice support for the 1954 crop is at 90 percent of parity, $4.92 per 100 pounds. No announcement has been made with respect to the support level for 1955, but prospective supplies, if they remain as now expected, support for the 1955 crop would be expected to be near 90 percent of parity.

Peanut support for the 1954 crop is 90 percent of parity, or 12.2 cents per pound. In view of the relatively short supplies of peanuts this year, the support level for the 1955 crop will probably be at or near 90 percent of parity.

Marketing quotas for the 1955 crops of wheat, cotton, rice, peanuts, and the major types of tobacco, have been approved by the producers of these commodities and will be in effect. Acreage allotments for corn will be in effect in the commercial corn area.

I might indicate the levels of price support for certain of the designated nonbasic commodities. Milk and butterfat support levels for the 1954 marketing year were 75 percent of parity, or $3.15 per 100 pounds for milk for manufacturing and 56.2 cents per pound for butterfat. The same level of supports are being continued for the marketing year beginning April 1, 1955. As of January 15, 1955, these prices represent 76 percent of the parity price for butterfat and 80 percent of the parity equivalent for milk for manufacturing.

I would like to comment just very briefly on the movement of our surplus stocks of commodities. The rate of disposal of Government-owned stocks of surplus agricultural products has been stepped up markedly in 1954. Sales have been made from CCC stocks to the private United States trade totaling $940 million in 1954. About $500 million of this total has been sold for export. The total value of all disposition of CCC stocks during 1954 have totaled about $1.4 billion. The best market for our farm produce is here at home. That market is being cultivated actively. The dairy situation is a case in point. Consumption figures for 1954 indicate that per capita use of butter increased about 5 percent over a year earlier, thus reversing the downward trend of 15-year duration. The average American ate a fraction of a pound more cheese and drank a little more milk last year than in 1953.

There is a trend toward an unmistakably better balance between dairy supplies and demand, a balance which is being brought about not through distasteful and uneconomic production controls, but rather through increased consumption of health-giving dairy foods.

In December of 1954 the Government bought not a single pound of butter. This was the first full month in 2 years in which no purchases were made. During December 1953 we bought more than 11 million pounds of butter and the heavy flow was just beginning.

All of the things I have cited are reflected in the fact that milk prices have increased in recent months. For the final quarter of 1954 wholesale prices received by farmers for all milk averaged 86 percent of parity, the same as in March of 1954, when price supports were still at 90 percent of parity.

In conclusion, the basic philosophy underlying the Agricultural Act of 1954 will encourage individual farmers who are efficient and ambitious to participate profitably in the thrilling opportunities immediately ahead of us in the growing science of agriculture.

Agriculture offers equally as good an opportunity over the next generation as any other comparable vocation for the young man or young woman who desires a satisfactory living standard, an opportunity to live and rear a family in a wholesome environment, and the ability to provide one's own security for his declining years.

Our constant objective in the United States Department of Agriculture is to do all in our power to promote a stable, prosperous, and free agriculture.

Thank you, Mr. Chairman.

(Mr. Paarlberg's prepared statement and additional information appear at p. 709.)

Vice Chairman PATMAN. Thank you.

I would like to bring up 1 or 2 points before yielding to other members of the committee for questioning.

First, would the Senator like to be heard now? Permisison is granted.

Senator FLANDERS. Thank you.

Vice Chairman PATMAN. We are delighted to hear from the distinguished gentleman from Vermont.

STATEMENT OF HON. RALPH E. FLANDERS, UNITED STATES SENATOR FROM VERMONT

Senator FLANDERS. The present means of supporting farm prices is complicated in administration, wasteful of perishable products, and burdensome to the consumer; he has to pay twice, once in taxes and again in prices artificially high.

Besides this, high level price support stimulates surpluses and thus multiplies to the taxpayer and consumer the cost of price support.

The Brannan plan would have given to the consumer the benefit of free market prices. It would have assured the farmer receiving parity prices, but at the expense of losing his freedom. The size of the crop he could plant would have to be determined for him by the Government.

Neither the Brannan plan nor our present price support is satisfactory. Yet we must have some means of assuring the farmer that he will not again have to endure the hardships of the early thirties when at times the price of wheat would not pay the cost of bringing it to the market.

A plan fair to farmer and consumer alike would assure the farmer of income protection comparable to that afforded the wage earner by unemployment compensation. It must likewise leave him a freeman. No Government official must have an authority to tell him what or how much to plant, when to sell, or at what price.

It is in the national interest to protect farm income from the effects of drastic declines in the price of farm products. But it is not wise to insulate farmers from all the effects of price fluctuations. In determining his own planting and production the individual farmer should be free to follow the guidance of moderate and gradual changes in the relative prices of farm products.

For his part the consumer should have the advantage of free market prices. With free prices his only bill for supporting farm income would be taxes to finance payments to the farmers in periods of depressed prices. But he would not be expected to pay large subsidies to farmers to enable them profitably to continue producing larger and larger surpluses.

These specifications can be met in the following manner:

(*a*) Let price support begin at 90 percent of parity.

(*b*) If the free market price drops below 90 percent, let the Government send the farmer each month a check for one-half the difference between 90 percent and the price received during the month for sales of protected crops.

(*c*) Let monthly reports of support payments be published, county by county, to make sure that no "wash" sales" or other unfair practices are indulged in.

(*d*) A floor would be set at 50 percent of parity, which corresponds to the wage protection of the wage earner.

Examples follow:

(1) If the free market price is 80 percent of parity, the difference with 90 percent is 10 percent. The Government will send the grower a check for one-half of this, or 5 percent. The grower will then net 80 percent plus 5 percent, or 85 percent of parity.

(2) If the free market price sinks to 60 percent of parity, the Government will send a check for one-half of 90 percent less 60 per-

cent, or 15 percent. The grower will then net 60 percent plus 15 percent, or 75 percent of parity.

(3) If the market price sinks to 10 percent of parity, one-half of the difference would be 40 percent and the farmer would net 50 percent. This is the floor and the price would have to sink to an incredibly low point to reach it. Should it sink lower yet, to 5 percent for instance, the Government check would make up the difference between that and 50 percent and would be for 45 percent of parity.

To recapitulate, the consumer would have a lower cost of living since agricultural products would no longer be sold to him at inflated prices.

The consumer would pay but once, in taxes.

The farmer would receive protection at least equal to that afforded the wage earner by unemployment compensation.

The farmer would be a free man, dependent for his success on his own business and agricultural skill, but protected from disasters beyond his control. Government operations, though numerous, would be simpler. There would be no loans, no commodity credit administration, no purchases of butter, wheat, and so forth, no responsibility for storage.

The obvious difficulties with this plan are political. Shortsighted leadership will fight this, or any similar substitute for our present unjust and expensive price-support laws.

There are enough good honest American farmers to welcome a just and practical means of protecting farm income from disaster.

That is all, Mr. Chairman.

Senator SPARKMAN (presiding). I suppose if we do this right, the panel should have an opportunity to question you.

Senator Flanders is going to have to leave shortly, so if any of you do want to ask him questions pertaining to his plan, suppose we do so now.

Senator Watkins.

Senator WATKINS. Well, I can see one thing his proposal would do, it would put a lot of people out of work; individuals in the administrative program. What would you do with those people?

Senator SPARKMAN. Use them as bookkeepers to keep up with all of these payments.

Senator FLANDERS. It has been suggested to me that this would be more expensive than administration of the present plan. That I do not think is true. There would still be some unemployment. The cost, according to the figures I have gotten from the Department of Agriculture, of warehousing, maintenance, and processing, but exclusive of administration costs, during 1954 ran at the rate of from $400 million to $600 million, and this does not include the cost of removing commodities, selling those overseas, and school-lunch programs.

Since the total number of farmers under support is approximately three and a quarter million, and since there would be around $600 million of expenses would would not be required, a rough figure would seem to indicate to me that you would have 1 clerk for every 20 farmers, without increasing the cost of the present farm program, so I think that that objection that it would increase costs falls down in that respect, and besides that, there is the possibility of market prices of commodities being reflected more or less hopefully in prices of foods and products to the consumer.

Senator WATKINS. You use that word "hopefully." I think that is the philosophy.

Senator FLANDERS. Well, we always hope when the farmer sells for less, the consumer will buy for less. That is often the hope deferred that makes the heart sick, but that point has been mentioned in the panel and I think the spread between the farm price and the consumer price is something that is worth studying. Of course, part of that spread is due to putting stuff in cellophane instead of selling it out of a box. We seem to want it that way.

Now I am open to questions from the panel or other Senators.

Senator SPARKMAN. I wonder if Congressman Curtis has any questions.

Representative CURTIS. No questions.

Senator SPARKMAN. Senator Goldwater.

Senator GOLDWATER. I should like to ask the Senator if he has introduced a bill along this line.

Senator FLANDERS. I have not. I have had a peculiar experience with this plan. It is 3 or 4 years old. When Secretary Benson first came here, I talked it over with him, he was interested and said "Let's get this published and see what the public reaction is to it."

Believe it or not, the farm papers would not touch it. They would not have it in their pages. Now that is something it is difficult for me to understand. I tried the Reader's Digest. The Reader's Digest had an article deploring the present farm price situation and not only that, but it reprinted and distributed it and broadcast it all over the country. They did not want this solution in their papers. There is a market for deploring. There is a market for criticizing. There is a market for painting pictures of how terrible everything is, but as far as my experience goes, there is no market for suggestive remedies.

That is why I asked to be a member of this panel.

Mr. WELCH. Mr. Chairman, may I ask the Senator if under his proposal there would be provision for accumulating stocks beyond what the trade would normally hold, say wheat and cotton, and so on.

Senator FLANDERS. Well, the assumption would be that there is a price at which the stuff will move. The advantages of this, as compared with dumping abroad—we might sell abroad at a very low price, but it would not be a dumping price.

You protect the farmer, but even if it goes down to 5 percent of parity, as I suggested for wheat, he would at least have 50 percent, and you could move wheat abroad at those very low prices. Let prices move the crop.

Senator SPARKMAN. Mr. Davis wanted to ask something.

Mr. DAVIS. Suppose that this had been in effect at the time that the postwar adjustment started; have you made any estimate as to where prices would be in this scale now? Would it be at this 50-percent floor or would it be somewhere above that?

Senator FLANDERS. I cannot answer that one. There are some things I do not know, and that is one of them.

Senator SPARKMAN. Well, don't you think the answer to that one would depend on the question that was just asked as to whether surpluses would accumulate? The theory is, and I believe you advanced it in your paper, Mr. Davis, that crops would move, farm products would move if the price was such as to permit it. Didn't you have some such statement?

Mr. DAVIS. No.

Senator SPARKMAN. One or two did. Mr. Lincoln did.

Mr. LINCOLN. Isn't that right?

Senator FLANDERS. I think so.

Mr. LINCOLN. Everything we know would move at a price.

Senator SPARKMAN. May I inject a thought there? I worked on a farm when we did not have supports and it did not always work then, so I think you have got to have a rather ideal distribution system for it to work, and we have not got that yet.

Mr. DAVIS. I have one more question. Suppose that this had been in effect and suppose that the prices would have dropped near to this 50 percent. What would have been the impact of that on our total economy?

Senator FLANDERS. Well, if the prices had dropped to 50 percent——

Mr. DAVIS. In this postwar adjustment.

Senator FLANDERS. The farmer would have gotten 70 percent, half of the difference.

Mr. DAVIS. No; I mean if it had dropped to where he got 50 percent.

Senator FLANDERS. You mean the prices had dropped to 10 percent?

Mr. DAVIS. Yes.

Senator SPARKMAN. Could it? I do not see how it ever would.

Senator FLANDERS. The impact there would be something to look at, but still I think the crops would move and the farmer would get the distress protection of 50 percent of parity.

I remember during the 1930's there was a Kansas farmer who brought his wheat into the elevator at Kansas City and he could not get enough for it to pay for the gasoline that he spent to bring the wheat in and take it back again, so he raised the tailboard of his truck and spread the wheat on the main street of Kansas City.

He could at least have gotten 50 percent if they would have taken it at all, for nothing.

Senator SPARKMAN. Professor Schultz asked a few minutes ago for permission to make a comment.

Mr. SCHULTZ. Let me act as a critic of my distinguished friend here, Senator Flanders. I would say, Senator Flanders, that I just made some simple calculations here. If you had had this the last 4 years, it would have cost just about half of what the present programs may cost.

Senator FLANDERS. You think this would have cost about half?

Mr. SCHULTZ. About half. This is one comment I make. Another comment is that it is two-fifths Brannan plan.

Senator FLANDERS. This is what you say.

Mr. SCHULTZ. This is two-fifths, not quite half of the Brannan plan.

Senator FLANDERS. It is a result of cross fertilization.

Senator SPARKMAN. A hybrid.

Senator FLANDERS. I want to suggest that the mongrel pup is usually smarter and healthier than the purebred pup.

Mr. SCHULTZ. I would suggest that you get a little more mongrel, if you can. There are two things. If you start with the flat 90, this will make some products completely out of line with others. Last year this would have cost $280 million on wheat. If you started wheat at 90—it is probably 25 percent out of touch with the markets, where others are close to it, so you will pick up a very big bill in wheat.

You would not in cotton, actually, because cotton is quite close to markets, I would guess. So if you just take history, 90 percent is not realistic with what the markets are worth. Since you tie it to 90 percent, you run into problems there. The only other point I would make is you would not have a storage problem, and with our kind of weather and our economy, you have a storage problem. But you could build one.

Senator FLANDERS. Perhaps there is some useful mongrelization in that suggestion.

Senator SPARKMAN. Mr. Benedict wanted to make a comment.

Mr. BENEDICT. I am not prepared to comment generally about this proposal, though I think it is a very interesting one. I do think there would be need to consider somewhat a statement that has been made elsewhere here this morning that there is a market at some price for all of these products. I am not at all sure that you could actually sell all of the wheat, for example, in the last year or two, without completely demoralizing the market.

In other words, I think there would need to be some escape provisions in that kind of a setup. Amounts that cannot be sold at any price rise from time to time in such products as potatoes and some of the fruits as well as wheat and cotton.

The other point that I think needs some clarification occurs by implication in something Mr. Davis said. Actually, we have been operating under free-market prices for the most part since 1945. The prices all through until just the last year or two, and for a short time in 1949, have been, for most of the products, above support levels rather than below, so we are not without experience in doing this sort of thing.

I think there is a good deal of merit in the idea that there should be an incentive for downward adjustment if the price or quantity is outrunning what can be sold at reasonable prices.

The other point that I think should be emphasized is one that was implied by Mr. Welch's question. I do not think the trade will carry as large reserves as we ought to carry in a time of world tensions such as we are now in. This phase of the thing should be in the picture somewhere.

Senator FLANDERS. Mr. Chairman, I thank the panel for its observations, and I just want to express one point as I leave, and that is it has been very satisfying to see these new and strong statements of the importance of the problem of agricultural poverty.

You will remember that 3 years ago we examined that and Mr. Schultz, at least, made a really fine contribution to our study, and people too often think of poverty as being a city problem and we have discovered—that is, our panels at that time discovered—that perhaps the most serious poverty problem in the Nation lies in the country.

Thank you.

Senator SPARKMAN. I remember those studies with a great deal of interest and satisfaction, and I am hopeful that during this present year we may resume those studies and bring them up to date. I presume that all of you have seen the reports that were made. If not, I hope you will let us send you a copy of each one of them, because I think they are right in line with the suggestions that have been made here this morning.

I have a general question, that I would like each member of the panel to reply to in 1 or 2 sentences because, after all we are studying the President's Economic Report. I wonder if each one of you, in just 1 or 2 sentences, would give us your view as to the adequacy of the Economic Report in its dealing with agriculture's problems. It would be most helpful as this committee evaluates that report.

Mr. Benedict.

Mr. BENEDICT. Now, do you mean?

Senator SPARKMAN. Yes.

Mr. BENEDICT. Well, it seems to me the President's report says very little about agriculture. I assume that the reason for that was that, by implication, many of the actions taken during the last year were in line with the President's program with respect to agriculture, and that would imply to me the idea that perhaps with the adjustments now taking shape, as they come fully into effect, they would meet most of the problems that we have been talking about. I do not think they would meet fully the problems of wheat or butter, but for some of the other commodities, I think a moderate relaxation of the parity formula; that is, a shift toward the modernized formula and some increase in the adjustability of the level of support rates would meet most of the problems that we see ahead, assuming that the economy as a whole stays prosperious.

Senator SPARKMAN. Mr. Davis.

Mr. DAVIS. Well, I will be very brief. Personally, I was quite disappointed that the report was as silent as it was on the problems of agriculture.

They were barely mentioned at all. Only, I recall, in connection with the low-income families. I think that the problems of agriculture as they relate not only to farm people but to the total economy, would justify a greater treatment within the report than was given.

Senator SPARKMAN. Mr. Lincoln.

Mr. LINCOLN. Senator, the first thing I said was that I thought the farmer was the forgotten man in this economic report, and that certainly those of us in farming, that have farm problems right in our own family, are not as optimistic as some of the people seem to believe about the future, and my concern, as I said, is here we go again with farm income going down.

I think it dropped something like 35 percent since 1947 or 1949, something like that, and whether this is the beginning of a depression or not—but I do not like the implications, and I think that is one of the most important omissions of the President's report, and I do not understand why nobody is ready to look into this situation of the spread between the producer and the consumer.

We have tried to get the Federal Trade Commission to make a study and I think the 83d Congress just would not give any appropriations. It seems, though, that we are afraid to look into that area and I think that is one of the most important areas that need to be examined.

Senator SPARKMAN. Mr. Nicholls.

Mr. NICHOLLS. I agree with my colleagues that there is not much to be said because there are only 2 or 3 sentences on agriculture in the entire report. I think those were with reference to the low-income problem. I assume that there is no more there on that because the administration had not pinned down its program in this particular area at the time the report was written. I simply hope that, when it does come out, the administration's program will be adequate for taking care of many of the things I mentioned in my own presentation.

Senator SPARKMAN. Mr. Schultz.

Mr. SCHULTZ. Well, I think that the Congress and certainly people would want to know at an early date, either from the staff of the Economic Council or the Department of Agriculture, what we are going to do with our $8 billion in CCC stocks. This is a major policy issue. You need something on it. It is not there.

Second, as Mr. Flanders said, we have got to get to a more satisfactory pricing policy. This is highly political, however, and the economist does not get much of a hearing on it, but it ought to be thought through afresh.

The third is the low-income problem, and apparently you are going to get a document, a report, and there has been a good deal of staff work on that, as you know, and many of us know in the country and so this is coming, but it is not in the report as such.

Senator SPARKMAN. Mr. Welch.

Mr. WELCH. Well, as has been indicated, the President's comments were both brief and general, and I would say, by and large, that I thought the specific statements and the implications were to the affect that the outlook for agriculture is a little more rosy and favorable than it actually is.

It was encouraging for him to take recognition of the low-income group and to indicate that he was going to present a special message later. I hope he does, and I hope it is a realistic program.

Senator SPARKMAN. Mr. Paarlberg, we won't ask you to comment, but if you wish to add anything, we would be very glad to hear from you.

Mr. PAARLBERG. I concur in general with Mr. Benedict's comments.

Senator SPARKMAN. Thank you.

Senator Watkins.

Senator WATKINS. Well, I have been very much interested in the statements that have been made. I am a farmer by proxy. I used to be a dirt farmer, and when I get home, which is not very often now, I like to get out and see at least what they are doing on the fruit farms that I am keeping rather than being supported by.

Mr. Lincoln mentioned the problem that I personally have come in contact with, as have many of my neighbors, and that is how we find some way to get to the consumer the products of these farms, particularly in the field of fruit, at such prices that the consumer can afford to buy them. The spread there is very big between what we actually get on the farm and what the food is sold at.

The result is that many times fruits are not even sold. Nobody can harvest them. They are dropped on the ground. That has been true in certain other fields in agriculture as well. I think there ought to be a lot of attention given to that matter of distribution.

As I understand, Mr. Lincoln, one of the jobs of the farm cooperative is to get a better price for the farmer's product.

Mr. LINCOLN. And to narrow the spread.

Senator WATKINS. But it is the duty of the cooperative to get as much as it possibly can for the farmer. I have never yet seen a cooperative that would not take advantage of a scarcity and get all the market will pay. But we run into a situation, do we not, where the interests seem to conflict—the consumer and the cooperative.

Mr. LINCOLN. Well, of course, there are two types of cooperatives, Senator. One is the producer and one is the consumer. In the main, most of our activity in this country, so far, has been along the producer end. But we would like to have more facts set forth by some impartial study as to just what does happen between your price for fruit and what somebody pays for it in the city.

I think there is need for some more research there, and then we think, of course, on the other end, the consumer cooperative is also interested in lower prices, and somewhere those two meet, but I would rather see the producer and the consumer sitting around the table than have a distributor system that is only concerned in making as much out of both as they can, and I think that is possible.

We have demonstrated it in some areas.

Senator WATKINS. Of course, the consumer cooperative tries to buy cheaper.

Mr. LINCOLN. That is it. It is to put an economic squeeze on the distributor system. We are convinced there is plenty of opportunity there if it can be applied on a broad enough scale.

Senator WATKINS. Your background, now, is in the field of consumer cooperatives; isn't it?

Mr. LINCOLN. Both farm and consumer.

Senator WATKINS. You do not represent the National Farm Bureau?

Mr. LINCOLN. Oh, no, sir. I am at the present time president of the Cooperative League of the U. S. A., and president of CARE, and a farmer, and the league is concerned both with the producer and the consumer.

Senator WATKINS. The insurance group with the name Farm Bureau is now being changed to something else. This is simply because the farm bureaus are not connected with them in any way; is it not?

Mr. LINCOLN. No; we are not directly connected with the State farm bureaus.

Senator WATKINS. Well, I am interested also in this other field of the small farmer because I had a practical illustration in my own State, and I am convinced that we never, by price supports, take care of the small farmer. We would either have to make a special class for that group which would be putting a reward on inefficiency or else make it extremely profitable for the large farmer, that is the small percentage of farmers who now really get some benefits out of price support.

I think the move will have to be in the direction of finding some other field in which many of the fringe farmers can operate more economically, and I think training, vocational training, and all of those things have to be tried. At the same time, no matter which way you go, you find there are still many economic problems. I know in our community we have a large number of small farmers. When the depression came, 50 percent of them went on relief.

The war came along and helped solve the problem temporarily, until the large steel production came into our area, and now the farmers work at the steel plants and do something in the mornings and evenings on their farms. They are taken care of, provided the steel plant continues in operation.

You cannot do that all over the United States. I hoped some of you would come up with a solution for this small farmer group, the lower one-third that we speak of many times.

Mr. LINCOLN. Could I ask, Mr. Chairman, does any member of the committee know why it was impossible to get a study? In 1953 we tried to get a bill—I think Senator Gillette handled it—to try to get a study of this price spread, but we could not get anything done. Does anybody know what stopped that?

Senator SPARKMAN. There were 2 things that happened. I think both of them were in 1953. There was the Federal Trade Commission's study. For some reason that I have not been able to understand, Congress did write a limitation into the Appropriations act to the effect that none of the money to the Federal Trade Commission could be used for making this study. Senator Gillette and some dozen other Senators of both parties, equally divided—I am glad to say that I was one of them—sponsored a resolution which likewise failed to clear Congress. Why, I do not know, but the purpose of it was to make a study as to the price spread between the farmer and the consumer.

I have not seen figures recently; that is, within the last month or two, but in last fall, the Department of Agriculture in one of its statement brought out the fact that the farmer's share of the dollar that went for the purchase of commodities was down, I believe, to 44 cents, and was the lowest since 1934.

Now whether that has changed since then or not, I do not know. Mr. Paarlberg mentioned in his statement that wtihin the last day or two the Department of Agriculture said that the farm prices had increased during the last month by 2 percent, but during the same time the cost to the farmer had gone up 1½ percent. That is a little better. At least it shows a relaxation of the squeeze, even though by a minimal amount.

Mr. NICHOLLS Mr. Chairman.

Senator SPARKMAN. Mr. Nicholls.

Mr. NICHOLLS. I do not want to be too much of a dissenter on this particular point, except that I do think we should be realistic on this matter of the declining share of the consumer's dollar going to the farmer. First, I might say in preface that I spent 10 years, probably more than any other agricultural economist, studying monopoly problems in agricultural processing industries. Hence, I am perfectly aware of that type of problem in distribution and I am certainly in favor of better antitrust procedures, and so on, to eliminate such monopoly as exists. I also favor marketing research which will eliminate any inefficiencies that may exist. But I think it only realistic to say that another important reason for the farmer's declining share of the consumer's dollar is the fact that consumers want more services attached to their food than they did when their incomes were lower. Furthermore, farm prices could remain the same absolutely and yet the spread could widen simply because consumers wanted boxed rice instead of rice dipped out of a bin, and maybe want minute rice instead of plain rice, and were willing to pay a higher retail price for the added services which the middlemen have produced.

In other words, when incomes go up per capita, as they have been doing, consumer demand for the extra services attached to food expands rapidly. Hence, I do not think we ought to lose sight of the fact that demand for food—that is, the raw food, the original food—does not increase very much as incomes go up; but demand does increase substantially for the attached services. Under these circumstances, it is actually quite remarkable that the farmer in 1954 still got about the same share of the consumer's dollar as in 1910–1914, when the services attached to food were far less.

Mr. LINCOLN. I would like also to point out, Doctor, that somebody ought to find it out.

Some of this packaging and the like we are doing today, we think may reduce the cost of distribution. You eliminate a lot of individual work where stuff is packaged at the source of supply. Look at the way carrots are coming through now. They used to come through with the tops and iced and everything else. Now the tops go back for fertilizer and they eliminate a lot of the icing because they are put in these bags, and I am not at all sure but what some of those things are actually tending toward the reduction of a lot of costs that used to go in there. That is why we think we need a study.

Senator WATKINS. They do not pass them on to the producer, however.

Mr. LINCOLN. Well, that is part of the trouble, I think, as I have brought out here. I think the House Committee on Agriculture said that thus far none of the lower prices received by farmers since 1951 have been passed on to the consumer in the form of lower retail prices.

Senator SPARKMAN. By the way, in that connection, in July 1954, the House Agriculture Committee had a staff study made dealing with the relationship between farm prices and the cost of food.

It is not a very complete adequate study. It is good as far as it goes, but a brief study, and one that was made from a compilation of facts and charts rather than a thorough discussion and checking into all of the different steps and processes and procedures.

(Whereupon, at 12:30 p. m., the committee adjourned to reconvene at 2 p. m. in executive session.)

AFTERNOON SESSION

The joint committee met at 2:45 p. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Senators Sparkman, Watkins, and Goldwater, and Representatives Bolling, Mills, Talle, Curtis, and Patman, vice chairman.

The CHAIRMAN. Come to order, please.

I will ask Mr. Curtis if he has any questions he wishes to address to the panel at this time.

Representative CURTIS. No, not at this time.

The CHAIRMAN. Senator Goldwater.

Senator GOLDWATER. No, sir.

The CHAIRMAN. Mr. Mills.

Representative MILLS. Not at this point.

The CHAIRMAN. Mr. Bolling.

Representative BOLLING. No, sir, Mr. Chairman.

The CHAIRMAN. Congressman Talle.

Representative TALLE. Yes, Mr. Chairman.

I do not recall that any panel member said anything about the cost to the farmer of the equipment which he must now have because of mechanized agriculture. I am interested in your views as to the cost of what the farmer must buy and what he gets for his product when he sells it.

Mr. LINCOLN. That was one of the things that I was saying we ought to do something about, and it seems to me, in view of the fact that the farmer has to spend so much of his income now to buy things he does not produce himself that come from places other than the farm, like gasoline and machinery and many other services—and in almost all of those fields, if my information is right, they have return on capital and pay wages higher than the farmer gets in many cases—that unless you can do something to bring down the cost of the things the farmer has to buy, you will never be able to put enough money in the other side of the pocket to balance it out.

I thought both in this question of the cost of distribution from the farmer to the consumer and from the city to the farmer of the things he has to buy is one area—I am not saying this is any solution, but it is one area in which I think we need a lot of information that we do not have at hand at the present time.

Representative TALLE. It reminds me of what an old farmer friend of mine used to say "times ain't what they used to be, but then they never were." It was once thought that anybody could farm, but now he must not only be a jack-of-all-trades, but a master of many of them. So he needs a lot of skill, knowledge, and expertness, and then he must have quite a little money in order to acquire the means for carrying on his operations. I should like to hook this up with our panel discussion of yesterday, when I suggested that the two fields in which competition is still pretty important and rather free are primarily agriculture and retail merchandising.

We do have competition in agriculture, in the barnyard and out on the acres where range materials are produced. Then at the grocery counter we have the retailer, who sells the finished products to the housewife. We have competition at those two ends, but along that long road between those two points we do not have flexibility of prices, but rigidity. I do not need to review to you gentlemen what those costs are, but they are costs set by rate-fixing bodies and by collective bargaining contracts, and so on.

Now, my question is, shall we attempt to get some competition into that long road along which we have rigidity of prices, or shall we give the thing up and make prices rigid at both ends also? In other words, rigid prices from start to finish.

Mr. LINCOLN. I will let some of the other folks answer it, but my point, Congressman, was, I think we need more specific information as to just what is happening in that whole field, so that we can all go on the basis of facts and not just our own opinions, and I think more studies ought to be made.

Representative TALLE. One distinguished gentleman who used to serve in the less numerous branch of Congress asked that investigations be made, although he knew what the facts were. My question is: What can be done about the problem by law?

Mr. SCHULTZ. I might first offer this observation, because you spoke of the growing size of farm expenditures all over, and particularly in the Corn Belt. This has two immediate implications which need to be thought through, and I think where it leads you is pretty clear. One is that the young farmer starts, and we are right in a period when young farmers are much more numerous than normal, because of the backlog held in during the 1930's. People did not have enough earnings and they lost their savings, so that the people between 65, 70, and 75 were pulling out and young farmers taking over.

We have quite a large proportion, larger than normal, and this now takes $15,000, $20,000, $25,000, and this needs really to be thought through.

In the main, it means better intermediate credit facilities. Our public credit and our private credit is not very good for this kind of use, particularly where there needs to be 3-, 4-, 5-, and 10-year loans. We have plenty of land, and when you get to the 20 and 25 or longer, there is no difficulty at all, but it is really in this very area, and for the purposes implied by your comment or statement.

The other comment deals with the rigidity aspect. We may mislead ourselves if we think that there is as much rigidity on many of the important expense items that you indicate. I am thinking of fertilizers here. You see, fertilizers are relatively important in this, and through Iowa and Illinois, and so on, this is not a very well-developed market, but it cannot be characterized as rigid. The prices of fertilizer are relatively higher than before the war. Machinery is about the same. I won't go into any more detail on that.

Those were the two comments I wanted to make.

Representative TALLE. Thank you, Dr. Schultz.

Mr. BENEDICT. I would agree with what Dr. Schultz said. It is not to be expected that a good-sized commercial farm can be equipped much more cheaply in the future than it can now. It may even cost more, but the investment in farming has become so large now that it is not to be expected that a man will be able to finance it out of owned capital to as large an extent as he could at one time. So it is partly a credit problem, but I think we are apt to be somewhat deceived about the rigidity of the prices of equipment because of the period we have just been going through.

There was a tremendous upsurge in the demand for farm machinery just after the war and for almost all of the other production durables and consumer durables. The market for these was so strong that manufacturers did not have to shade prices. But, as we saw in the market for automobiles last fall, while the list prices did not go down, the actual price to the buyer was shaded considerably. I think we may see more of that in farm machinery, in refrigerators, and so on, so that it seems to me a mistake to assume too easily that there is not pretty active competition in some of these other fields. It does not take quite the same form as in agriculture.

Mr. WELCH. While we may admit that these prices are not as rigid as some may believe them to be, I do not think we are likely to be deceived in terms of higher wages, in terms of social security, in terms of increasing transportation costs, as to who is going to pay for those ultimately. The farmer is going to pay for these when he buys machinery and the other things that he uses in his production enterprise. These costs, therefore, that are an integral part of the prices the farmer pays for the tools of his production makes it difficult for him to adjust to lower prices for his own products.

Representative TALLE. Thank you.

Mr. DAVIS. I think that if we look at this problem over a longer period of time, we can expect that these costs will remain relatively high, even with all of the competitive factors that have been mentioned here. I thing farm costs will tend to remain high, because your wage structure is probably going to be pretty rigid; certainly there will be considerable resistance, to any reduction in it, and as was mentioned, social security, and items of that kind will remain in the picture. Then we are entering and are in and are going to continue to be in a period in which agriculture is undergoing a terrific adjustment to technology, and improvements and so forth. Well, any period of rather rapid adjustment is a period in which the capital requirements are greater than if you are just operating on even keel.

Then you can add to that, in the case of agriculture, the problem of refinancing the farm unit each generation as the inheritance process takes place. Your capital requirements, I think, in agriculture are going to be greater in the future than they have been.

You have to consider the bigger sized units that are essential. In addition you have the adapting to new methods, which requires capital. The capital requirements are going to be quite high.

Now, I think that while we are talking about the Economic Report, we need to look at farm income not just in absolute terms or in terms of the past, but even more pertinent, it seems to me, essential that we look at the farm income in terms of achieving the goals that we have set for the future, goals of total growth for the country, and within this the goals of growth within agriculture.

Now, I cannot help but think that actually those requirements are pretty demanding and that we need a fairly high level of income within agriculture to bring about the adjustments that we want. Now the adjustments are of two types; fundamentally. There is adjustments within agriculture to technology which I already described. Then there is the adjustment of getting people out of agriculture and into more productive employment elsewhere. That requires a very prosperous growing economy outside of agriculture with new jobs coming along.

Well, I think in general that both of those take place when there is a fairly good level of income within agriculture.

The CHAIRMAN. Mr. Nicholls.

Mr. NICHOLLS. I would like to point out just one more thing with reference to Congressman Talle's question, namely, that part of this cost-price squeeze is attributable to the price-support program itself. In other words, the price of a lot of things farmers buy are the product of other farms and the price-support programs, particularly on the feed grains, represent a cost item to other farmers who may be selling in a free market. This leads me to comment that I think one of the most objectionable features of our price-support program has been the discrimination in favor of the so-called basic commodities (specifically the feed grains) where the livestock farmer may be selling in a free market at declining prices, but where his cost structure is held up by price supports on feed grains.

This discrimination in favor of basics takes two forms: One is that they have higher price-support provisions than do other commodities; and second, that price supports on the basics are mandatory, whereas on other farm commodities they either do not exist or are discretionary.

The CHAIRMAN. Mr. Benedict.

Mr. BENEDICT. Are we leaving that particular topic now? I had just 1 or 2 comments I wanted to make that are on another line.

The CHAIRMAN. Well, if you would withhold those, until Congressman Patman has a chance.

Vice Chairman PATMAN. Mr. Chairman, I will be as brief as possible. I know that other members want to interrogate this fine panel, and I know they have some information on these subjects we are discussing that would be very helpful to us.

First, I want to mention about how the Economic Report of the President has dealt with the farm problem. On page 83, near the top of the page, it says the income shares of both farm and business proprietors in 1954, 4.1 percent and 8.9 percent respectively, were at postwar lows.

Now the disappointing thing to me is the fact that the President's report points that out, and I am unable to find any satisfactory remedy suggested to relieve the situation. Putting in language that is more understandable for all of us, the President is saying in his report that the small-business man and the farmer are suffering more than any other group, since World War II. However, I fail to find where any satisfactory solution has been offered. I have prepared here a chart.

Could I get someone over here, please, to move this chart so it can be seen? I had this chart prepared several months ago before this particular report was prepared, but there is a chart in the Economic Report of the President that is very similar to this one. It is on page 98, if you have the report there, and you will note, in fact, it is almost exactly like it, Mr. Ensley, the same data.

Well, I cannot be accused of copying the President's report because it was gotten out before. At any rate, it makes no difference, it truly states the situation. I just wonder how much the monetary matters have influenced the farm products.

Now on all of these charts like on page 42, chart 26, you will notice that the farm prices, raw material industrial prices, they go way down when the finished goods and semiprocessed materials, all administered prices go straight along, they do not fluctuate. I just wonder if you members of the panel agree with me that monetary actions affect the farmer more quickly and more effectively than any other group, because his prices are the least controlled and administered. In other words, they have no protection. I will ask you if you agree with me that farm prices respond more quickly to monetary action than prices generally. Do we all agree on that? Dr. Schultz, do you agree on that?

Mr. SCHULTZ. I am not going to take your next step, though. I will take this one, yes.

Vice Chairman PATMAN. All right, do the other members of the panel agree that the farm prices are more responsive to monetary actions than other important prices?

Mr. WELCH. Yes.

Mr. SCHULTZ. In both directions.

Vice Chairman PATMAN. Now, then, if you will notice this chart here, the prices that the farmer has had to pay have not gone down much. In fact, in 1951—I know the distinguished chairman is not going to agree with me about this—in 1951, when the so-called accord was agreed to and money was made hard and interest high, other prices did not respond too much, but farm prices responded very quickly. They took a nosedive, and they have been going on down ever since because this same policy has continued, the hard-money policy, and in 1953, when the hard-money policy really got into high gear, the farm prices that the farmers received went down further, but the prices paid by farmers not only leveled off, but they got a little higher.

Do we all agree on that?

Mr. BENEDICT. No.

Vice Chairman PATMAN. All right, what is your answer there?

Mr. BENEDICT. Well, I do not discount at all the importance of monetary management and interest-rate management, but it seems to me that that is putting the cart before the horse. There were other factors that had, in my opinion, more to do with the easing off of farm prices than did the interest rates. I do not think the hard money program had very much to do with that. In part, we are in a process of readjustment from a period of very high and very abnormal demand for form products, and we have had a continued high production of farm products. It seems to me that the balance between supply and demand has affected farm prices rather more than the monetary policy is followed.

Vice Chairman PATMAN. Well, I believe we all agree that the bankers have a lot to do with the monetary policy in this Government. I do not think our Republican friends would object to that statement. I think it is obviously true. In one capacity or another, bankers have occupied bottleneck positions in monetary policies, and since they have, the banks have done mighty well.

The bankers have done mighty well, and while the bankers were doing so well and big business was doing so well, the President says in his report that the small-business man and the farmers hit an all-time postwar low. I just wonder if we had not better try to get some advisers and somebody in these bottleneck positions that will take care of these two groups just a little bit better. That is what I wonder about, because it seems like the prosperity is going more to the big man, and the little man is not only not getting any of the prosperity, but he—I do not think there is any deliberate attempt to penalize him—but the net effect is that he has been penalized.

What do you gentlemen think of that? Would you mind commenting briefly on it?

Mr. SCHULTZ. Mr. Patman, I want to concur in the implied criticism. The Treasury has very seriously missed the mark in the way it handled its long-term loan. That is certainly subject to very serious criticism.

Vice Chairman PATMAN. You mean the three and a quarter percent?

Mr. SCHULTZ. Yes.

Vice Chairman PATMAN. And then the 3 percent the other day.

Mr. SCHULTZ. This may not be as serious. At least I cannot speak with hindsight on this one. On the other one, one can, and they certainly missed on that one badly. And it is true that we can be too concerned about the roles of different groups in our economy and there, again, your implied criticism may well have merit and point. That point that I wanted to make, which runs off a bit from your general line ,your argument here, runs as follows:

This is a judgment about the way the economy lay. If we could have an economy that was fully employed the next 5 years and if in that economy we could have steady general prices, neither inflation nor deflation, as far as the general level of prices is concerned—now I have put two conditional notions here—I am trying to avoid the effects of a rise in the general price level where raw materials move fast or a drop in this where raw materials or farm products, especially, do not move fast—but if you had full employment and if you had a general level, price level, today in the American farm economy, the costs are such that if you took the old parity ratio, things would clear the market at about 85 to 90 percent of parity.

This is in some general sense, now, and probably closer to the lower figure. In other words, the terms of trade reflected by the general costs and demands of 1910–13 have changed that much. This, therefore, is to say that this is not an abnormal thing that one sees up there.

Vice Chairman PATMAN. You mean it is not abnormal for prices to continuously go down?

Mr. SCHULTZ. Not down, but where they are 86 or 89 percent of parity in the old sense, that is getting to where the cost of these things really lie in our economy.

Vice Chairman PATMAN. I know, but what about the costs they pay? You do not want one line to run one way and the other line the other.

Mr. SCHULTZ. I am not interested in the lines, I am interested in how the economy is set. The economy is really set so that costs have come down in agriculture.

Vice Chairman PATMAN. Come down?

Mr. SCHULTZ. Yes, about 15 percent per unit of product, that is what this means.

Vice Chairman PATMAN. Well, I think the cost the Treasury is shooting for is 4–percent money. There is no question about that. There was no reason for that 3¼-percent bond that you mentioned being issued. They had twice as much money as that in the banks that they could draw on. They did not actually need the money in the first place. But just out of the clear sky they offered a 3¼-percent bond for about a billion dollars. They gave the F and G bondholders, who happened to be the big fellows, an opportunity to get 3¼-percent bonds for the F and G's, but they did not give that opportunity to the little fellows. The E's were not given that opportunity. In February of 1953, when they were looking around to see who they could help, they did not see the little farmer, they saw the stock market.

The market was not dong well, so they leased the margin requirement in order to create the credit to buy stocks, reducing it from 75 percent to 50 percent. They did not help the little-business man or the farmer. They did not help the farmer on the dividend tax exemption; they helped the man who owned stock in corporations. That does not make sense to me, when two segments of our economy, the little-business man and the farmer are screaming for help at all times.

Then installment buying of stocks helped stimulate the shock of inflation. It looked like all eyes were centered on helping the stock market. I think their eyes should be centered on agriculture and the small-business man. That is what I am trying to get at. We have just got to prevail on our leaders to give more attention to relieve basic problems like those in agriculture and small business, rather than the stock market.

It seems they have been too intent on booming the stock market. I just want to make the point that I think that relief is going to come from changing the thinking of the people in those bottleneck positions who are shooting for 4-percent money and discriminating against the farmers and the small-business men.
as much as we can, but I particularly want to help the family-sized farmer. It has been suggested to me that we should consider giving the farmer who produces, we shall say, up to $7,500 a year worth of products a hundred percent of parity through the Brannan plan, or any other practicable way. In other words, just give him an opportunity to earn a living if he works for it, if he produces enough, up to $7,500, give him a hundred percent, and all above that, up to say, $15,000, give them 75 percent or 50 percent, providing that for production above $15,000, we do not have any supports at all.

What would you gentlemen say about that? If you wouldn't mind, I would like to have a brief statement on it. Just start up at this end of the table, if you will, and just briefly state what your opinion would be on something like that. You see, that is for the family-sized farmer.

Mr. WELCH. Mr. Congressman, you put that in a context that is a little bit difficult to get at. As I understand it, you would say all farmers for the first $7,500 worth of gross product, they would receive 100 percent of parity, and I assume you are talking about parity where it is now?

Vice Chairman PATMAN. Well, for the purpose of this discussion, we will say "yes."

Mr. WELCH. It seems to me you are picking out certain groups and you might have some discriminatory legislation pointed toward helping this group and hurting another. I do not know whether a person who produces a bale of cotton that flows into the channel of trade should be guaranteed a hundred percent of parity and another person over here who is on an efficient producing unit, but a unit that would produce more than it would take to bring in $7,500, whether you would want to penalize him there or not.

Vice Chairman PATMAN. Well, I am looking at it from the standpoint of the family-sized farm and how to give them an opportunity to earn a living. I think out of about 6 million farmers, about 4 million of them are not farming as a business, they are farming as a mode of living. In fact, many of the farmers I have known who have produced some fine boys and girls—they have eked out an existence and finally sent their boys and girls to college and they have become fine men and women, and a large percentage of them are from those mode-of-life farms. I just look with great disfavor and disappointment on the mode-of-life farmer going out. I just have a feeling that this great country of ours could at least make it possible for that little family to have a living if they went out there with their hands and worked for it and produced it.

They ought to have enough to give them a decent living. That is the point I am trying to get at.

Mr. WELCH. As indicated this morning, we have about a million and a half of these small farms that have about a thousand dollars or less income, and you could add about another 500,000 units to that and put your level at $2,000. Now, Mr. Congressman, it is a little difficult for me to see——

Vice Chairman PATMAN. That is net income, isn't it?

Mr. WELCH. No, gross. It is a little difficult for me to see how you can get at that group on any kind of a monetary reward for products, because they are really not commercial producers, without complicating your total system, unless you do set aside certain groups and say that we will support you but this group over here, we won't.

Vice Chairman PATMAN. That is what I am saying. I am setting them aside and saying they ought to be supported in particular because of their contribution to society.

Mr. WELCH. I am all for encouraging the family-sized farm, whatever size that may be. It is going to have to be larger than the unit that we knew as a family-sized farm a few years ago. I think that is a unit in our society that we need to encourage and promote and help develop, but I do have some misgivings as to whether you can extend a support price for those groups and exclude your other producers who are also contributing to our total resources.

Vice Chairman PATMAN. Well, I would do it as a matter of public policy. I would just say we want to encourage the man who lives on a farm and wants to make a living. If he is willing to work for it with his hands and produce enough he ought to have a living wage, and we are going to make it possible for him to have a living wage. If that is discriminating against anybody else, it is all right with me.

Mr. WELCH. I would be glad to hear from some of these other panel members.

Mr. SCHULTZ. Congressman, I think the idea—let me just buy the idea much more boldly than you have put it—provided you really define parity as some sentence.

Vice Chairman PATMAN. We won't quibble about that. This is just for the purposes of discussion.

Mr. SCHULTZ. This is weak at the very point where you want it to be strong. We said this morning, and Mr. Welch has just said, again, there are a million farm families in the United States, full time in this business, able bodied, who had a cash income from all sources of less than $1,000 in 1949. These fellows are not helped by this kind of a proposal at all. They sell so little that we do not get to their poverty until we bring them more economic opportunity, which means they must have more resources to work with.

Vice Chairman PATMAN. Are you overlooking the fact that they are handicapped now by the allotments?

Mr. SCHULTZ. That is a minor point. But we have really now for a decade just been talking and talking around and not coming to grips with this low-income group in agriculture. We have thought we could do it with price supports, but the problem is deeper. You have to give these people the economic opportunities so they can sell the $7,500 of agricultural products. Then they would benefit from this program, but they really don't.

Vice Chairman PATMAN. You know, I do not agree with you just exactly there. Did you ever own a little farm?

Mr. SCHULTZ. Yes, I did.

Vice Chairman PATMAN. Did you ever leave a little bundle of oats before a colt? If you hold this in front of them, they will work their heads off. In this competitive market there are disadvantages, but if you give them a guaranty, if you work for it and earn it on parity prices, we will give you up to—I am not exactly sold on $7,500 as the exact amount, but give them enough to assure them a decent living under decent conditions if they work for it.

Mr. SCHULTZ. This means something else. This means you have to do more than parity prices. I am not afraid of having prices on a head 100 percent or some fraction of real values which can be put before the farmers so he can make plans accordingly, forward prices. Therefore, I am not against parity prices if these prices have meaning, if they have long-run value. Then we can bring much greater certainty to farming as it deserves and there will be much greater efficiency. But let me repeat, the really small poor farmer, 1 million and more, we do not get at in prices. Prices can only contribute a little there until we get more resources for the farming unit.

Vice Chairman PATMAN. I hear what you say, but whenever you let them know they will get a certain price if they work for it, they will work their heads off.

Mr. WELCH. Of course, Mr. Congressman, in connection with that, of course, you would have economic forces working toward putting into the hands of these small producers more land. A person who owns land to go beyond $7,500 would have no support.

Vice Chairman PATMAN. He would get tenants and give family farmers an opportunity.

Mr. WELCH. That is the point I wanted to give emphasis to. Then you are giving an incentive to break up these larger units.

Vice Chairman PATMAN. Certainly, and they would get a good price for it. Suppose we go on down the panel, if you please.

Mr. NICHOLLS. I certainly agree with Congressman Patman on the objective of trying to help this small farmer. The only thing is I do not think that his suggested solution is the right one or the effective one. I would call your attention to some tables that I have appended to my statement.

Vice Chairman PATMAN. Yes, sir, I noticed them.

Mr. NICHOLLS. To simply back up Dr. Schultz' comment, you will notice on page 1, appendix table 1, that 9 percent of the farms produced 51 percent of the total value of farm products sold, and

22 percent produced 74 percent of the total value of farm products sold.

Obviously, price-support programs, as we now know them, primarily benefit those larger farmers, and I would probably agree with you that they are the ones who need financial aid from the Government least, because they are large and efficient and have rather high incomes.

On the other hand, I think that at the lower end of the scale, the end of the scale that you are speaking of, price support will simply not do much good. Let me give an example. You know, we have minimum tobacco allotments in burley of, I believe, about seven-tenths of an acre now, and this is the minimum, as far as the small farmer is concerned. He cannot be cut below that, as I understand it, but what does this mean in terms of income? Seven-tenths of an acre would produce, let us say, a thousand pounds of tobacco, that is $500 gross income per year, and that is certainly not going to make any small farmer very well off, it seems to me—especially after he has paid for his seed, fertilizer, and other expenses.

In other words, I think the solution to the low-income farmer's problem really lies largely outside of agriculture.

Vice Chairman PATMAN. I am afraid you do not understand. I would not restrict him just to tobacco or just to cotton or just to dairying. I would let him grow anything of certain basic products at a parity price, he could mix them up. He could grow 10 percent of one and 10 percent of another, or 50 percent of another, but have some coordinated program, which you would naturally have to have.

But the main thing is to permit him and his family, if he works hard enough and produces, to be assisted in getting prices which would give him a good living for himself and his family.

Mr. NICHOLLS. May I refer to another part of this table. If you will look on page 2, appendix table 1, I call your attention to the figures over on the right on the number of operator family incomes from $2,000 and up; that is, $2,000 to $2,999, and then over $3,000, looking at the "other farms"; that is, the part-time and the residential farms. These farms, by census definition, have gross sales of farm products of $1,200 or less, so that they are certainly small farms in this sense. Yet, according to my addition of that column, we have 650,000 such farmers who have net cash incomes of $2,000 or more, and we have 370,000 who have net cash incomes of $3,000 or more.

The significance of that, as I see it, is that these are people who are able to supplement from nonfarming sources their income from farming.

Vice Chairman PATMAN. Well, that is a special case. They would not be entitled to all of these guaranties, because they are supplementing their farm income with industrial work of some type.

Mr. NICHOLLS. My point is that I think part of our solution is in getting more farmers into that class. Let me put it this way: I think also you perhaps tend to romanticize a little bit this mode-of-life farmer. I am worried, if you will pardon the pun, about the commode-of-life farmer. By that I mean the farmer who has a miserably low income from farming and is not able to do anything about it because he has no way of supplementing this low income from nonfarm employment or otherwise. In my opinion, this is an argument in favor of industrialization of many of these areas of low-income farmers.

Vice Chairman PATMAN. You mean your argument.

Mr. NICHOLLS. That is right.

Vice Chairman PATMAN. I do not want to take up too much time. Thank you very much, you have been very helpful.

Mr. LINCOLN. Congressman, I share your concern and particularly when you keep hammering at that. As you know, I do not share the complacency that some of my compatriots take toward those figures. I would rather pass on the specific aspects of that plan with one comment. What was it—the Farm and Home Administration—through what we called supervised credit, I think, started to write one of the grandest histories of helping those low-income farmers of anybody, and why in the world we cut down on that program and did not go ahead, I never could understand.

I think, it was opposed by the American Farm Bureau and some of our other farm groups, but I think if you give that program more of an opportunity, which I know you are always for, we will eventually find more answers than we have now.

Vice Chairman PATMAN. When was that program cut down, Mr. Lincoln?

Mr. LINCOLN. I don't remember

Mr. DAVIS. It was during the war. It never came back after.

Mr. LINCOLN. To me it never any more than just got started. But the payoffs on that thing, what happened to those people——

Vice Chairman PATMAN. I know about it.

Mr. LINCOLN. I think that was one of the great historic things we did, but for some reason we have not done anything along that line, and, to me, that is where we can do more than in any other regard in this area.

Vice Chairman PATMAN. Thank you.

Mr. Davis.

Mr. DAVIS. As I understand your objective what you are really trying to do for these people is to give them a labor income of somewhere around $3,000 or $4,000 a year, and still retain for them an opportunity to live in a rural environment.

Vice Chairman PATMAN. That is right.

Mr. DAVIS. Well, now, even with your 100-percent support on the things that we are going to grow, there is not going to be enough land and resources to maintain all of these 2 million, and it is more than 2 million when you get up to $7,500 a year gross income, you are not going to have enough land, and so forth, to take care of all of the families in that status.

Vice Chairman PATMAN. Well, all of them in the farming business. We would not want to induce them out of other work.

Mr. DAVIS. I think that your objective of trying to raise the level of income of these people to a status of actual labor income of somewhere around $3,000 or a little more, is a very worthy one, plus the fact that you want to retain their living in a rural environment. I think that is very worth while.

It seems like the answer to that, though, is a combination of 2 things: 1, an adjustment-type program to try to get those that would study in agriculture to that level, and that is going to take more than just supports at a 100 percent of parity—it is going to take credit as well as a procedure for helping to consolidate small units. Then in addition, if we could have a program of decentralizing appropriate industry into overpopulated rural areas, and thus give more employment in a still basically rural setting, you would really come nearer achieving your goal than by a 100-percent support on the first $7,500 of gross income.

Vice Chairman PATMAN. Thank you.

Would you like to comment on that, Mr. Paarlberg?

Mr. PAARLBERG. Congressman, we are familiar with your proposal, having studied your speech on this subject in the Senate last summer.

Vice Chairman PATMAN. In the House, you mean.

Mr. PAARLBERG. In the House; excuse me.

We undertook a study of it, and one aspect of this proposal that came out of our studies was this: A program of this sort could not be operated with the conventional system of price support and loans. It would have to be a payment program if it were to be effectuated because if you endeavored to support the prices for these small farmers you would in effect hold an umbrella for the large farmers as well, and your price support would be effective for all groups rather than for just one group as you intended it. So that the only means by which this program could operate would be through a payment program.

Vice Chairman PATMAN. Thank you, sir.

Mr. Chairman, I think I have taken up enough time.

The CHAIRMAN. Mr. Curtis.

Representative CURTIS. I just wanted to ask 1 or 2 questions, Mr. Chairman.

One was in regard to Mr. Patman's remarks, because I appeared on a panel with him at one time discussing this hard-money policy, as he calls it. I was looking at the charts in the economic report of the President, chart 27, which is money supply, and chart 28, bank loans and investments, and chart 29, consumer installment credit, and I cannot figure out just where in those particular charts there would be any indication of hard money. So I am wondering if the panel had any comment on it, because it looks to me like in all of those items there seems to have been a constant upgrade except in one instance, and that was in investment in United States Government securities for a short period of time.

I wonder if anyone on the panel would comment on this question of the term used "hard money," because it seems to have no meaning as near as I can see in relation to the actual situation of the money supply, and the traffic in investment. And I might add, too, as a further feature of this question, that I see no relationship at all between those charts and the chart that Mr. Patman has referred to which is the same one as on page 98 of the Economic Report, prices received and paid by the farmers.

Would anyone on the panel care to comment?

Mr. SCHULTZ. Well, you have asked a very complex question in the field of money supply and the operation of the economy as a whole.

Representative CURTIS. That is why I asked it. I just picked out those three charts, because I couldn't see the significance.

Mr. SCHULTZ. This is one area in which I would want to beg off, and you ought to turn to my former colleague, the distinguished chairman of this committee, and not turn to one member of the panel.

Representative CURTIS. I won't pursue it for this reason, because, after all, it has to do with another field than what this panel is devoting itself to.

Now, I have one other line of questioning. It is a matter of my own personal interest, perhaps. I was interested in Mr. Welch's statement, and inasmuch as I had to more or less jot it down because he did not have a prepared statement for us—you made the remark that the social-security needs in the rural area, particularly the farmer, need to be appraised and further strengthened.

Mr. Mills and I both were on the Social Security Subcommittee in the House, and I thought we had gone a long ways toward that in the last social security extension bill, and I wondered where you felt that it needs to go further than what we did in the last Congress?

Mr. WELCH. Mr. Congressman, my reference to that was to give emphasis to the fact that you did a good job as far as you went. You are moving in the right direction but, strange as it may seem, there are still thousands, and I would say perhaps—well, many thousands of our farmers that do not have enough income to come within the purview of this new program that you put into existence last time.

Now, the various phases of the social-security program, the old-age pension, the various benefits that run to the blind and the handicapped, and so on, I think that phase of the program is very good.

My comment that it probably needed reexamination and extension was really to give emphasis to the fact that the act of last year still leaves a lot of our rural people uncovered and untouched by this program.

Representative CURTIS. I thought we had pretty well covered it except for the itinerant farm laborer which involved the problem of identification as much as anything, and techniques. I would not regard itinerant farm labor particularly as farmers, would you?

Mr. WELCH. Well, they are usually classed as farmers.

Representative CURTIS. Well, from the practical standpoint, it is the itinerant farm labor that we are talking about that is not covered by social security—I don't know just where they do come from, they are frequently from the city, a lot of them. They travel around just as an itinerant labor population that we have that works not only as farm labor but at other odd jobs as well.

Mr. WELCH. Well, many of them are tied down to the farm. Some of them are itinerant in that they are moving in and out, into the city and back to the farm. I have no specific suggestions as to what can be done about this group that are on the farm with gross incomes of less than $800, but I say any kind of social-security program pointed toward relief of that group on the assumption that they are capable of carrying part of the cost, or part of the burden, is an unrealistic program in terms of service to them.

Representative CURTIS. Now, one other question, Mr. Welch, and here I am going to have to rely on your refreshing my memory because all I jotted down was I remember you were listing a number of things where you felt the Federal Government should be doing this and that in regard to the farm situation, and I was disturbed at your constant emphasis on the Federal Government with no reference, for example, to Kentucky.

What position do you feel that the State governments have, particularly in the field of agriculture?

Mr. WELCH. I think that the States and counties and local communities have a very large part to play in terms of facing up to the problems involved in our low-income farm groups. The thing that I think is unrealistic, however, is to assume that in these low-income areas they are capable of meeting their requirements for school, health, and other institutional services we have come to regard as a necessary part of the American way of life, and I also think that some of the States are unable out of their own resources to do this job.

Now, the migration out of about 31 of our counties last year, if I remember the figures correctly, was about 14 times as high as the migration from the rural areas of the South as a whole. Those youngsters came along and went to our schools. We did the best we could by them. But they are going to Indiana, Ohio, Illinois, and Michigan, and many of the other States, to make whatever contribution that they will make as economic producers. The interdependence of our national economy at the present time is such that I think you are going to have to take the tax supporting ability where you find it and disperse it, and distribute it in such a way that our youngsters wherever they may be are going to have an opportunity for education, and we do not have that in these 200 counties that I had reference to in the Southern Appalachian region.

Representative CURTIS. Your primary emphasis, then, is on the youth and education rather than other aspects, or am I to assume that you meant the whole general picture, the old-age problem, too?

Mr. WELCH. We have a serious old-age problem that I think is a matter of alleviation of suffering and a rather desperate situation. I do not think there is any easy formula or any panacea for the problems found in these areas.

Representative CURTIS. No, I was just directing my attention solely to one thing, and that is the problem of the relation of the Federal Government to the State government, and I was a little concerned, as I got your statement, that you were placing the burden on the Federal Government, and I just wanted to be sure that you felt the State governments and local governments had a very basic and, of course, in my opinion, a primary responsibility in this field, and the Federal Government in an ancillary way, perhaps.

Mr. WELCH. Well, I certainly would agree that you must have State and local responsibility, and that those groups must face up to those responsibilities, but in terms of school buildings and facilities and school opportunities, I do not believe that we are going to solve the problem if you push that responsibility back there. The resources are not there to do the job.

Now, if I may, Mr. Chairman, I do think that the State agricultural experimental stations and the State agricultural extension services have distinct opportunities for adapting and improving their programs of service that run to these matters.

Representative CURTIS. Thank you.

Senator SPARKMAN. Mr. Chairman, I would like to pass at this time.

The CHAIRMAN. Senator Goldwater?

Senator GOLDWATER. Mr. Chairman, I think we are dealing with a very fundamental and difficult problem here. I do not think we have made much progress toward its solution. I dislike as much as anybody else the introduction of political speeches into these hearings. I am sorry the gentleman has left who made it, and before I ask my questions I want to put the record straight.

I do not recall any such so-called hard money period between 1940 and 1944, and yet corporate profits went up from 6.5 to 10.4. I don't recall any so-called hard money being in existence between 1945 and 1949 and yet corporate profits went from 8.3 to 15.8, with a high of 20.3, and in the period when so-called hard money has existed corporate profits have actually gone down.

Now, we have heard this hard money talk. It was brought up at great length in the meeting we had in December on economic stabilization. I thought the whole subject was pretty much cleared up. I do not like to bring this matter up, but it was brought in and I feel as a member of the committee that I have a right to comment on it, and I just wanted to set the record straight that during the periods when money was so-called soft this country had the greatest increase in corporate profits in its history, and during the period of time when we have gone through so-called hard money, which, by the way, that movement of money was less than 1 percent of the total debt of the country, which is something over $650 million. We are talking about nothing.

Now, to refer to this chart up here, and I am looking at the one in my book, because this question has often come to my mind, I would like to see what the panel can seriously suggest about this: We look at that chart on page 98 of the Economic Report. We go through a period back in early 1949 where we see a situation developing where the farmer had to pay out more than he was getting in.

By the way, that was a period of soft money.

Then in 1950 with the advent of the Korean war we find that the farmer received above what he was paying out; in other words, he was in a profitable position. That continued past the end of the Korean war.

Now, we have peace again, and we find ourselves in a position where those two lines are going farther and farther apart. The question that first comes to my mind is does this approach work in periods of peace or will it only work in periods of war, and I am talking about the theory of high supports or flexible supports?

To put it in a simpler way, has it done for the farmer what we hoped it would do for the farmer? In other words, enabled him to compete in our economy in a very risky business, being guaranteed somewhat by the Government an income from his business?

Mr. LINCOLN. Are you saying, Senator, has the present program——

Senator GOLDWATER. Has it worked except in times of war or high demand?

Mr. LINCOLN. I do not think you were here when I made my comment on that, but the thing that is disturbing me is the fact that it seems as though we are going through the same thing that I went through working with farmers from 1920 on, and that as far as I can read history, it looks as though the only time this price received or price paid is in the favor of the farmer is just before, during, and just after wars, and, therefore, I say that the program that I think we all have had some part in advocating and carrying out, I do not think has met the situation and that we have got to find some other approach to it.

Mr. SCHULTZ. Senator Goldwater, I wonder if what throws us off here is that we tie ourselves to a standard that came from history and that was accurate in 1910–14. I would argue that 1910–14 price relationships, and this is what this measures, has no meaning today; it would be just an accident if it had meaning.

Senator GOLDWATER. Have you ever translated 1910–14 to more recent periods?

Mr. SCHULTZ. I would say, and this is restating something that I said to Congressman Patman, that if we had 5 years' peace and had a steady price level, neither inflation nor deflation, then the cost in agriculture changed, cheaper fertilizers, and many other things, and then you look at the demand, the whole thing now suggests a continuing relationship between 85 and 87 and I said up to 90 percent of parity.

This is now in the cards, and if we forced it back to 1910–14, which was a hundred, we would just ruin it.

Senator GOLDWATER. In other words, if we went to a hundred now——

Mr. SCHULTZ. We could not live with it.

Senator GOLDWATER. Let me ask you a step further there: Would a hundred today be an immediate solution?

Mr. SCHULTZ. No.

Senator GOLDWATER. It would still be in the hole?

Mr. SCHULTZ. Well, the solution really involves letting these prices in some sense find themselves, and they have; they aren't far out of line; we are close to really what these values are worth, and then these farm families are reorganizing themselves, have been, in a very dynamic fashion in some parts of agriculture, so that the income that they can generate and produce is on a par.

Now, unfortunately, this isn't in all parts of agriculture, but you take the best part of the Corn Belt now, the incomes generated there by a human being for his effort and industry or the area where I grew up in eastern South Dakota, and in parts of southern Minnesota, and so on, is on a par today with what one can earn anywhere in the economy with the same abilities, let us say, and the same amount of capital.

I want to repeat, though, that I think we will be very much misled if we take seriously the standard from 1910 to 1914. It has no meaning because there are so many changes in this economy and in agriculture.

Senator GOLDWATER. Well, would you recommend that the Department of Agriculture change their formula?

Mr. SCHULTZ. I would get rid of parity entirely.

Senator GOLDWATER. You would not use it at all?

Mr. SCHULTZ. No; it is doing us harm every day we try to use it.

Senator GOLDWATER. In its absence would you use any indexes at all?

Mr. SCHULTZ. No; I would anticipate what these products are worth. You can safely say next year corn is worth $1.50. You can safely say cotton is worth 30 cents next year. This is because of what production will be forthcoming, and this is what the demands of our society look like. That has meaning, and this is a changeover time. Then we could get steady prices. What the farmer really wants is something he can bank against, and what is steady. I do not think he really wants these prices 15 or 25 percent above any chance of clearing markets. I hope not.

Senator GOLDWATER. Thank you very much.

Did you have an observation?

Mr. DAVIS. Well, I thought your question earlier was reflected the fact that our farm policy has been wrong or hasn't worked at all——

Senator GOLDWATER. Let us not say. I said is it an indication that the approach that we are making has not worked?

Mr. DAVIS. Well, it seems to me we have to take this into the picture: We did increase our agricultural production around 40 percent in the early 1940's, and the wartime, and postwartime needs were even greater than that, and we had to hold prices down and allocate goods for foreign use for about 10 years. During this period our population increased some, so that by the time we got to the point that prices were starting down we were consuming at a rate 30 or 35 percent above prewar. This meant that our surpluses then amounted to somewhere around 5 or 10 percent of our production capacity.

Now, burden of surplus has been faling upon our economy, and it has been bolstered by our farm-support program. I think looking at it in the overal picture that we have really done quite well in this adjustment period. It has really been quite a heavy adjustment, an adjustment of great magnitude, really, an adjustment, as I mentioned this morning, not only from war needs but at the same time to the terrific impact of new technology that is coming along at the same time. I think all things considered that we have done right well to have held the line as well as we have.

Senator GOLDWATER. What effect do you gentlemen think the flexible approach would have had had it been put into operation, let us say in 1952, early after the cessation of hostilities?

Mr. DAVIS. Well, I don't——

Senator GOLDWATER. Breaking away from the rigidity, what would the results have been?

Mr. DAVIS. I don't think the results as of now would have been greatly different. You might not have accumulated as much dairy products, but outside of that your accumulation wouldn't, I do not think, have been too much different, and I do not think your exports, your domestic consumption, would have been much greater.

Senator GOLDWATER. Now, I have one other question here about this situation. What do you gentlemen think the effect of the Government tax program, that is high taxes, for this prolonged period we have been through has been on the earning ability of the farmer? It is a question of business, but I do not think the farmers' activities are too much removed other than the element of chance. Do you think the effect of taxes today, that a balanced budget and a greater reduction in taxes would be helpful to the farmer?

Mr. WELCH. Senator, it seems to me when you are talking about the farmer, that is sort of a generic term. Of course all farmers along with all other taxpayers would like to pay less and I presume in terms of the graduated tax structure that we have at the present time that those farmers whose incomes are up to the levels where they pay significant sums in taxes—I am not an expert in this field, I wonder if it has anything to do with surpluses or the amount of resources that go into agricultural production, and so on?

Senator GOLDWATER. Well, of course, I think it has a great deal to do with it. I think a lot of our problem, frankly, results from high taxes that are not in a small way imposed by our trying to rob Peter to pay Paul in a program that has been extremely expensive, and there is some question now about its value.

I think that a part of the high cost to the farmer for farm equipment has been the high taxes paid by the equipment manufacturer; there is no question of that. In other words, what helps one helps all, and if we tax the farmer and the rest of the economy to help the economy, then the farmer has to pay his share of it. He might not pay it in direct taxes but he is going to pay it in higher prices.

I do not know if you gentlemen as economists have gotten into it, but I think it is something that certainly should be considered in any argument, and to not waste any more time I want to thank you for making the statement that we think of the farmer as a generic term. I think that is our whole problem. We talk about farmers, and we forget that we have hundreds of thousands of farmers who live on the farm because they have lived no other place, who live on an acre or half acre where the economic unit in their area might be 40 acres. So we should not think of them in the same terms as we do of the man with 40 or 60 or 80 acres.

I think when we realize that we will be a lot better off instead of heaping it into one group.

I thank you, Mr. Chairman.

Senator SPARKMAN (presiding). Any further questions?

Mr. Talle.

Representative TALLE. Mr. Chairman, I certainly agree with the statement made a moment ago that the transition from a war economy to a peace economy has been most remarkable.

Now, if I might refer to what I discussed before—perhaps I did not make my point clear—I am fearful because in our economy as a whole so many prices are sticky. There are controls of various kinds. There are ways of keeping prices from moving freely up and down, so that fields like agriculture and retail merchandising in which we still have a lot of competition may find that in self-protection they are forced to adopt some measures of rigidity, too, because otherwise they will simply be lost.

Maybe I did not make myself clear in the first place.

Mr. WELCH. Mr. Congressman, I think I understood your point there, and I certainly would agree with that, and I for one certainly would not suggest that we can do away with all of our programs at the present time. We are going to have to have some kind of supporting program for the farmer. That is not to say whether it should be rigid or flexible price supports, or some other measures. I think a larger element of that need to have some kind of public policy and program pertaining to agriculture grows out of this very thing you are talking about, because he lives in an economy of rigidities and administered prices, protections are thrown around workers, and I am not saying that is good or bad, but they are there, and they enter into the cost of the thing that the farmer has to buy that goes into his operations, and if I understood your point I certainly would agree that so long as the farmer lives in this kind of world we shall have to have some kind of public policies and programs pertaining to agriculture.

Representative TALLE. Around 2 cents of wheat in a loaf of bread costing, say, 23 or 24 cents, points out pretty clearly that between the wheatfield and the grocery counter something happens to bring the price up high. An appreciable decline in the price of wheat appears not to alter the price at the grocery counter, so the rigidity between the acres and the grocery counter is certainly effective.

Now, price supports supply some rigidity in agriculture. So-called fair trade laws in retailing serve the same purpose. So at these two ends that we have talked of, where competition moves more nearly freely than anywhere else, we find both activities turn to rigidity in some degree, and I am wondering—will we culminate in pretty stern rigidity all along the price line?

Mr. NICHOLLS. You highlight one problem. It does seem to me that, speaking of the commercial farmer with a fairly good gross income, one of his greatest problems is a problem of instability of price rather than too low a level of price, and I do think the two things might be at least considered separately. I would say that we have been trying to support farm prices or certain specific commodity prices at too high a level, but that still, I think, does not say that we should not try to find means of stabilizing farm prices over time. I think that that is a very great problem from the farmers' standpoint.

Mr. DAVIS. I would agree that one of the big problems is this one of stability, and it grows out of the fact that the management in agriculture, cannot accurately control production and keep it in a given relationship with demand, first because you have got the growing season that is a rather fixed thing, and during that period you cannot change what you planted, and then, too, the weather is such a big factor in agriculture. The farmer has a tougher problem in that respect when it comes to relating supply to a given demand than industry has in general.

Representative TALLE. And most of his costs are fixed?

Mr. DAVIS. His costs are relatively fixed as compared with business generally; that is right.

Representative TALLE. Now, if I may just have another moment, it was interesting to hear what Professor Schultz had to say about parity, and I know he is a very fine student in the field. I am wondering if you announced 2 or 3 years in advance that the price of corn was going to be so much per bushel—that is what I understood him to say—you would have to do some estimating there, which a person even might call broad guessing, with the weather in there as a factor just mentioned, and so on.

Do you think it would be possible to name prices in that way and to keep them in their proper relationship considering the important fact of interdependence among prices? I wouldn't undertake to do the guessing, but then I am not an expert agricultural economist, either.

It seems to me that poses a terrific problem.

Mr. WELCH. I think Dr. Nicholls could best comment on that. I believe Mr. Schultz said we could do this annually and put a price that would just about clear the market in terms of what would be coming forth, and if we produced more than what would sell in the market price this year, next year we would place a forward price taking into account the supply situation that we had experienced the year before.

I do not think he intended to project that beyond a year in terms of these forward prices.

Representative TALLE. Do you think he had in mind that existing surpluses might assist him as a guide in that estimate of the future?

Mr. WELCH. Well, I think at the end of the year we would take account of the carryover plus what would be anticipated to be produced under a declared price, and these forward prices would be set at such levels as might be guessed would just about clear the market for that product.

Representative TALLE. I am sorry Professor Schultz is not here. He could clarify that for me.

Mr. NICHOLLS. I think his idea was that this would eliminate a great deal of uncertainty as far as the farmers' expectations about future prices were concerned.

Representative TALLE. Oh, it would.

Mr. NICHOLLS. And the farmer would gain a lot by making wise plans because he knew in advance what price he could obtain. At the same time, I think you realize that for some commodities this might mean a lower level than parity or 90 percent, or whatever the present support level would be. In other words, I think this ties in with my previous remark that it might mean a somewhat lower level, but greater certainty in advance about what the level would be.

Representative TALLE. It would be of prime importance that whoever was in charge of announcing prices did it on time.

Mr. NICHOLLS. Well, as you well know from your State of Iowa, farmers have always made the wrong decisions as to how many hogs to produce. They often have made the opposite decision from the one they should have made. If Dr. Schultz' idea of forward prices had been in effect, the hog-production cycle would tend to be eliminated, because farmers would know that, if they bred so many sows now and got so many pigs, their hogs were going to bring a certain price when they were marketed later.

Representative TALLE. Well, that throws light on it. I think both of you gentlemen have supplied light.

Senator SPARKMAN. Is that all?

Representative TALLE. That is all; thank you.

Senator SPARKMAN. Well, I think while we have still got part of the panel here, I had better bring this to a close rather hurriedly.

Many questions come to my mind, but I shall not indulge myself in asking them at this time.

I want to compliment the members of the panel, those who are here, and those who have gone, on the excellence of the statements they have presented, and also on this very fine discussion that we have had.

By the way, Mr. Nicholls, there was one point in the different points that you laid down—there were several points you laid down relating to relief for the farmer and particularly the low-income farmer. The one that interested me was with reference to the minimum wage, a differential. I assume that was for the purpose of encouraging industry to locate in those areas where there is a surplus of farm labor. Was it an encouragement to locate industry?

Mr. NICHOLLS. It is, and I do not think the Federal Government should take away the right of an area with a surplus labor supply to attract industry on that basis.

Senator SPARKMAN. The reason I was raising this point is that the other day we had a panel before us, and the question came up about the migration of industry from New England to other areas of the country, and the South was particularly singled out. Dr. Harris of Harvard said that the wage rates in large part were responsible for the differential. Mr. Barkin, the economist for the CIO Textile Workers, said that the wage differential played a part, but that it was a minimum factor. It was a rather interesting observation to me.

I thought you might be interested in knowing about that.

Mr. NICHOLLS. Well, I might add that, in the main body of my report which I have made part of the record, I do say that in my opinion this is a minor factor. I do not think that the wage differential——

Senator SPARKMAN. It probably has been overemphasized.

Mr. NICHOLLS. It probably has been overemphasized. At the same time, I do think it makes good sense from an economic point of view for labor to be cheaper where it is more plentiful. And do not forget this. Even at 75 cents an hour, many low-income farm people would be glad to work in a local industry as an alternative to the 25–30 cents an hour they are now earning in agriculture. In other words, I think you have got to look at the alternatives that these people have.

Senator SPARKMAN. There is just one question I would like to ask again on this matter of overemphasis. A great deal of the discussion has been spent today on price supports. I often think that perhaps we overemphasize the importance of price-support programs. I believe in them and I think they are necessary until we develop a program that will eliminate the necessity for them, but I think so many people think of price supports as being the ultimate rather than the temporary or the expedient.

Do you agree with me on that?

Mr. WELCH. I do.

Mr. DAVIS. I do.

Mr. WELCH. I wonder, Senator, if some of that does not stem from the fact that we speak of "the farmer" without taking account of these various segments with their different problems and maybe price support is only one facet of a total phase that we need to be concerned about in the terms of rural life as we find it in the various segments of our agricultural economy at the present time. I agree with your statement.

Mr. NICHOLLS. I think it deserves emphasis again that the so-called basic commodities only account for about 21 or 22 percent of the total cash income from farm commodities, and all price-supported items account for only 46 percent. I feel very strongly that because of the problems of a few commodities we have centered all of our attention on them, while there are other commodities receiving little or no price protection which, from the standpoint of what we need to expand as a long-run trend, deserve more attention.

Senator SPARKMAN. Mr. Davis, do you have any comment?

Mr. DAVIS. No; I would agree generally with what you have said, the comment you have made.

Senator SPARKMAN. There is one other point I want to mention. I have had to be in and out through the day. I believe in some of the discussions the statement has been made several times that the price-support program did not benefit the small farmer.

I assume it was meant anything like it does the big farmer, and, of course, that is right, and yet from my experience with the small farmer and in the field of small farmers, and from an area made up of small farmers, it would seem to me that while what we might call the big farmer gets a big amount out of the price-support program, the amount that he gets is not as important to him as the relatively small amount that the little family-sized farmer gets. Whereas for the big farmer it is helpful in that it builds up his income, to the average small farmer it is often the very lifeblood, it may mean whether he makes anything that year or not.

Do you agree with that?

Mr. NICHOLLS. What benefits the small farmer does get from these price supports are so small compared to what he should receive to get a reasonable standard of living, that we should look to other means to assist him.

Senator SPARKMAN. I agree with him, but I think at the same time we should not dismiss the idea of price supports or argue against them on the ground that the little farmer gets no help. I think many times the little farmers simply manage to keep above water because of price supports.

I would never accept a price-support program as the cure-all. I do not think it is at all. I think we must continue building a program that will eliminate perhaps the necessity of maintaining price supports or at least rigid price supports, but I do not think we are there yet.

Mr. WELCH. I think, Mr. Chairman, that the emphasis today with reference to the small farmer in relation to the price-support program may have been put out of context just a little. I would certainly agree with what Dr. Nicholls has said, that in terms of a long-term solution to the problems of the rural people that have failed to progress and develop, in terms of commercial agricultural production, in terms of income, I do not think it can be the answer, but at a given point of time within the framework of what we have, we know that that $10 that comes to that little farmer means a lot to him in terms of trying to get along with what he has, but looking at it over a long period of time, maybe we should give more attention to these broader aspects of the problem in trying to lift him out of that context and put him where he can be an effective and efficient producer, and at the same time earn an income.

Senator SPARKMAN. I would agree completely with that statement.

Representative TALLE. Mr. Chairman.

Senator SPARKMAN. Yes, sir, Mr. Talle.

Representative TALLE. Just as a matter of information, Dr. Nicholls, when you mentioned the percentage of 25—is that the figure you used——

Senator SPARKMAN. I think 23 is what the Secretary used last year.

Mr. NICHOLLS. I was giving it from memory.

Senator SPARKMAN. Twenty-three was the figure the Secretary used last year.

Mr. NICHOLLS. In that neighborhood.

Representative TALLE. I was relating it to my own district. We produce a lot of corn, as all of Iowa does. We prefer to sell our corn on the hoof and not on the ear. Does your percentage take into account the fact that it is sold on the hoof and not on the ear?

Mr. PAARLBERG. This figure is based on sales, so the part of your corn that went through livestock into market would not be a part of this 23 percent. If we put all of the corn in, including corn sold plus corn fed, the figure would be substantially higher than the 23 percent.

Representative TALLE. That answers my question. Thank you very much.

Thank you, Mr. Chairman.

Senator SPARKMAN. By the way, Mr. Paarlberg, today you and Mr. Patman had some discussion about the proposal he offered and you said the department had analyzed it. Mr. Patman had to leave but I wonder if you could give me a copy of the Department's analysis, if it was reduced to writing.

Mr. PAARLBERG. Yes, I could.

Senator SPARKMAN. And make that available to the other members of the committee.

We certainly appreciate the contributions that you gentlemen have made.

(The extended statements of the panel are as follows:)

PROTECTING FARM INCOME, BY RALPH E. FLANDERS, UNITED STATES SENATOR FROM VERMONT

The present means of supporting farm prices is complicated in administration, wasteful of perishable products and burdensome to the consumer; he has to pay twice—once in taxes and again in price artifically high.

Besides this, high-level price support stimulates surplusage and thus multiplies to the taxpayer and consumer the cost of price support.

The Brannan plan would have given to the consumer the benefit of free market prices. It would have assured to the farmer receiving of parity prices, but at the expense of losing his freedom. The size of the crop he could plant would have to be determined for him by the Government.

Neither the Brannan plan nor our present price support is satisfactory. Yet we must have some means of assuring the farmer that he will not again have to endure the hardships of the early thirties when at times the price of wheat, for instance, would not pay the cost of bringing it to the market.

A plan fair to farmer and consumer alike would assure the farmer of income protection comparable to that afforded the wage earner by unemployment compensation. It must likewise leave him a freeman. No Government official must have any authority to tell him what or how much to plant, when to sell, or at what price.

It is in the national interest to protect farm income from the effects of drastic declines in the price of farm products. But it is not wise to insulate farmers from all the effects of price fluctuations. In determining his own planting and production, the individual farmer should be free to follow the guidance of moderate and gradual changes in the relative price of farm products.

For his part, the consumer should have the advantage of free market prices. With free prices, his only bill for supporting farm income would be taxes to finance payments to the farmers in periods of depressed prices. But he would not be expected to pay large subsidies to farmers to enable them profitably to continue producing larger and larger surpluses.

These specifications can be met in the following manner:

(a) Let price support begin at 90 percent of parity.

(b) If the free market price drops below 90 percent, let the Government send the farmer each month a check for one-half the difference between 90 percent and the price received during the month for sales of protected crops.

(c) Let monthly reports of support payments be published, county by county, to make sure that no wash sales or other unfair practices are indulged in.

(d) A floor would be set at 50 percent of parity, which corresponds to the wage protection of the wage earner.

Examples follow:

(1) If the free market price is 80 percent of parity, the difference with 90 percent is 10 percent. The Government will send the grower a check for one-half of this or 5 percent. The grower will then net 80 percent plus 5 percent or 85 percent of parity.

(2) If the free market price sinks to 60 percent of parity, the Government will send a check for one-half of 90 percent less 60 percent, or 15 percent. The grower will then net 60 percent plus 15 percent or 75 percent of parity.

(3) If the market price sinks to 10 percent of parity, one-half of the difference would be 40 percent and the farmer would net 50 percent. This is the floor and the price would have to sink to an incredibly low point to reach it. Should it sink lower yet, to 5 percent for instance, the Government check would make up the difference between that and 50 percent and would be for 45 percent of parity.

To recapitulate, the consumer would have a lower cost of living since agricultural products would no longer be sold to him at inflated prices.

The consumer would then pay but once, in taxes.

The farmer would receive protection at least equal to that afforded the wage earner by unemployment compensation.

The farmer would be a freeman, dependent for his success on his own business and agricultural skill, but protected from disasters beyond his control. Government operations, though numerous, would be simpler. There would be no loans, no Commodity Credit Administration, no purchases of butter, wheat, etc., no responsibility for storage.

The obvious difficulties with this plan are political. Shortsighted leadership will fight this or any similar substitute for our present unjust and expensive price-support laws.

There are enough good honest American farmers to welcome a just and practical means of protecting farm income from disaster.

THE PROBLEMS OF LOW-INCOME FARM FAMILIES—STATEMENT BY FRANK J. WELCH, DEAN OF THE COLLEGE OF AGRICULTURE AND HOME ECONOMICS, DIRECTOR OF THE AGRICULTURAL EXPERIMENT STATION, DIRECTOR OF AGRICULTURAL EXTENSION, UNIVERSITY OF KENTUCKY

Within the context of a booming national economy and an optimistic industrial outlook it is difficult for many people to realize that the agricultural segment of our economy faces serious problems and an outlook much less rosy. Furthermore, when one considers only averages and national figures it is easy to overlook the permanently depressed and marginal condition of the large numbers of farm people who live on very small or low-productivity farms and must be classed, by any standards, as low-income families. It is difficult to realize that in America at midcentury a million and a half farm families had cash incomes—from all sources—of less than $1,000 and that thousands of families were attempting to make their living from farms having a gross value of products amounting to less than $2,000.

THE PROBLEMS ARE BOTH NATIONAL AND LOCALIZED

The problem of low-income farmers is not confined to any one locality, area, or region. It is national in scope, and there are some low-income families in most agricultural areas that are otherwise generally prosperous. But the problem is found in its most acute form in a few well-known areas where small-scale low-productivity farms predominate. These are areas where technological changes in farming have been slow to come about and opportunities for alternative employment are limited.

Where low-income rural families are thus concentrated in a particular area rather than dispersed among others in a more varied population, there has usually developed a characteristic "way of life" that all families share and which differs from the patterns of living in other parts of American society. The area of concentration may be small, as in the case of an open-country neighborhood with only a few families.[1] It may include only the scope of a single community

---

[1] For example, in counties of commercial agriculture in Kentucky, certain neighborhoods have been found where farmers have not taken up the recommended improved practices in farming that have been widely accepted in other parts of the same counties. This nonacceptance of new methods is a clue to distinctive way of life, only one part of which can be accurately described as that of "low-income."

as an island in a specialty type-of-farming area, or it may be a region such as that of the southern Appalachians, embracing more than 200 counties in portions of nine States.

THE PROBLEMS ARE TYPIFIED IN THE SOUTHERN APPALACHIAN REGION

In fact, the straits of the small farmer and low-income rural family are conspicously typified in the southern Appalachian region, which is one of the well-known focal points of poverty in America. Our colleges, universities, experiment stations, extension services, and numerous other institutions in or near the southern Appalachian region have been long-time observers of the situation there. Generalizations can therefore be presented here in brief summary form, although capable of extensive development and documentation.

Assertions made in this statement can be validated especially by reference to studies of the Kentucky segment of the Appalachians, with confidence that for the most part they apply to the whole region and to large parts of the Southeastern United States, the Ozark country, and other places of chronic smallness in agriculture—places of small farms, small production, small incomes.[2]

THE REGIONAL PROBLEMS HAVE NATIONAL CONSEQUENCES

A compelling reason for stress on the need to improve living in the southern Appalachian Highlands is that the consequences are not only local. In the mobility of today's high-energy society there is a diffusion throughout the whole Nation of ignorance and of low levels of living from areas characterized by this way of life. The youth who migrates from these areas disperse themselves to all parts of the Nation, carrying with them the educational levels, the mindset, and the habits of living to which they have become accustomed. The basic patterns of their lives have been developed in Appalachian mountain homes, but their adult lives are spent in the industrial centers of Ohio, Michigan, Illinois, Indiana and elsewhere. This makes it clear that "the way of life" of the mountain people is of great importance to the entire society.

The Appalachians, of course, are not uniformly a problem area. Within the area as usually dilineated there are several large cities and considerable industry. The centers of population and industry are mostly in the broader valleys which, though surrounded by mountains, are not properly "mountain" themselves. Even in these valleys the agricultural resources are not outstandingly good. Nonfarm employment opportunities partly offset this. But it is the narrower valleys and the more isolated areas that more nearly typify the area.

THE EXTENT OF THE SOUTHERN APPALACHIAN REGION

Nearly every writer about the southern Appalachian region gives it a somewhat different map. This is to be expected since the area is not everywhere sharply distinguishable from adjacent territory. For different purposes it is reasonable to include different areas. However, the various delineations do not differ greatly.

One of the best delineations, from a physiographical viewpoint, is that by Marchner.[3] He included 236 counties comprisiing parts of nine States: Alabama, Georgia, Kentucky, Maryland, North Carolina, South Carolina, Tennessee, Virginia, West Virginia. The area of this region encompasses 109,500 square miles, larger by far than any one of the nine States of which it is a part, and more than twice as large as the State of New York.

---

[2] Most of the generalizations presented in this statement are based on research publications of the University of Kentucky. t least 50 relevant research bulletins have come from the departments of agricultural economics and rural sociology there. Other units of the University of Kentucky with a record of interest and activity in the Appalachians include the bureaus of business research, community service, governmental service, and school service; the Agricultural Extension Service and the general extension service of the university; and the coal research laboratory. Berea College is an institution of distinguished service to the area, and certain departments of the Government of the Commonwealth have been prominently involved. This footnote merely illustrates and emphasizes the availability of data on the problem. Similar observations could be made from the work of institutions in each of the other States with Appalachian counties.

[3] Marschner, F. J., Economic and Social Problems and Conditions of the Southern Appalachians (U. S. D. A., Miscellaneous Publication No. 205, Washington, D. C., January 1935).

MORE THAN 8 MILLION PEOPLE LIVE IN THE SOUTHERN APPALACHIAN REGION

In 1950 this area had a population of more than 8 million. Only four States in the Nation—New York, Pennsylvania, California and Illinois—had more people than this. Growth of population in this region has always been very rapid until quite recently. Although the southern Appalachians had nearly 700,000 more people in 1950 than in 1940, the rate of increase during that decade (slightly more than 9 percent) was less than in any of the 3 previous decades. From 1930 to 1940 the population increased 12 percent; from 1920 to 1930 it increased 17 percent; and from 1910 to 1920 the increase was 15 percent.

The census of 1950 shows that this population is overwhelmingly rural. Whereas the Nation as a whole is approximately two-thirds urban, the southern Appalachian region, by contrast, is two-thirds rural.

Kentucky's portion of the Appalachian region, commonly referred to as eastern Kentucky, is 31 counties comprising Kentucky economic subregions 8 and 9 in the United States census reports. This is approximately the same delineation as that of Marschner.

The population of these 2 subregions in 1950 was about 745,000, more than a fourth of the population of the State. The proportion of rural population (four-fifths) was somewhat higher than for the Appalachian area as a whole (two-thirds).

A REGION OF CHILDREN

Salient characteristics of the Appalachian population and society may be reflected in a few selected observations for these 31 counties in Kentucky. In 1950, children under 15 years of age constituted about 27 percent of the total population of the United States, but in eastern Kentucky this percentage ranged from 8 to 18 percentage points higher (from the lowest to the highest of the 31 counties). Thus, in the county at the extreme, nearly half of the population was in this dependent age group. The median age of the United States population was 27 years; the median age for the 31 counties of eastern Kentucky ranges from 3 to 10 years younger. Size of family is shown in the census figure on number of persons per household, which stood at 3.4 in the Nation. In the 31 eastern Kentucky counties the range was from 3.9 to 4.9 persons per household. This is a region of children.

EDUCATION, INCOME, AND MIGRATION

The educational level of the population is reflected in median school years completed by persons 25 years and over, representing the adult population. In the United States in 1950 this stood at the all-time high of 9.3 grades. The 31 counties of eastern Kentucky ranged from 1 to 3 grades lower.

Median income in 1949 may be taken to show all of those economic facts which are symbolized in "amount of income." Median income per household in the United States was $2,619; it ranged from $400 to $1,900 less in the eastern Kentucky counties. In the extreme county the figure was only one-fourth of the United States median.

Although Kentucky as a whole loses many more people than it gains from migration, the net out-migration from the 31 eastern Kentucky counties was much greater than for the State as a whole. During the first 3 years after the 1950 census was taken, for example, it is estimated that these eastern Kentucky counties lost 16.7 percent of their total population from migration: This was nearly 3 times as large as the percentage for the whole State, and 14 times as large as the percentage for the South.[4] Even with these recent population losses and the long history of out-migration while the population continued to gain, there is no doubt that there are more people than the resources of the region can adequately support.

THE AGRICULTURAL SITUATION IN EASTERN KENTUCKY

The pattern of agricultural production in the Appalachian region has been developed to fit in with off-farm employment. Both the extent and intensity of farming change with levels of employment in nearby coal and forest indus-

[4] Richardson, P. D., and Brown, J. S., Population Estimates for Kentucky Counties, April 1, 1953, Progress Report 14, Kentucky Agricultural Experiment Station, University of Kentucky, Lexington, Ky., October 1953.

tries, and employment levels generally in the Nation. When income from nonagricultural sources is available and high, much land that is farmed in depression years is idle or largely so. Agricultural resources, especially land, are used to "fall back on" in case of need. Because of the rough topography and low fertility most of the land is not well suited for commercial farming. However with some saw timber and coal in many parts of the area, the small farms have been utilized for part-time and subsistence farming. But the quality and quantity of these resources are such that they provide very inadequate insurance against an uncertain future. And even in the most prosperous years the opportunities for off-farm employment within the more isolated areas are extremely limited.

The agricultural situation in the southern Appalachians is represented also by information on eastern Kentucky.[5]

In 32 eastern Kentucky counties (the following data include one more county than was considered above) there are reported 57,064 farms averaging about 70 acres in size but having only 26.5 acres of reported cropland, even with a "liberal" definition of cropland. Estimates indicate that only 5 percent of the total land surface in this region is really suited for cropland. This means that each farm on an average will have only 6 or 7 acres of land suitable for cultivation.

Most farms are owner-operated; the percent of tenancy in nearly all counties is below the State average of 22.5 percent. It takes more and better land than is found here to support a normal tenancy system. Over half (52.5 percent) of the farmers had nonfarm income that exceeded the value of the agricultural products they sold. However, 59 percent of all farms had sales of less than $250 (gross); in some counties the proportion was as high as 90 percent. Two-thirds of the farms in the area sold less than $400 worth (gross), and in the extreme county 96 percent of the farms sold this little. Three-fourths of the farms in the area sold less than $600 worth, and in some counties 99 percent had sales of less than $600.

Less than 10 percent of the total value of livestock and less than 10 percent of the value of all crops harvested in Kentucky are accounted for by these eastern mountain counties which comprise about a third of the area and a fourth of the population of the State. Farmers in the mountain area sold 49 percent of the value of all their harvested crops, as compared to 58 percent for the whole State. In many counties, tobacco constituted 96–99 percent of the value of crops sold, but tobacco acreage per farm in these Appalachian counties averaged less than one-half acre per farm.

Farmers there rely on hand or one-horse methods in farming.[6] In 1950 nearly a third of the farmers had no work animals or tractors and about a third had nothing but one work animal. About 96 percent had either no power or animal (mostly mule) power entirely.

"Smallness of units is one key to an understanding of the [Appalachian] economy. The farm is small in size and value; the product of the worker is small; the product of the land is small. The unit is reduced in size as the pressure of population increases."[7]

AN EXPLANATION IN TERMS OF A "WAY OF LIFE"

However, it must be emphasized that the situation of rural families in a low-income area is not simply one of income but is generally a complex resultant of many factors, including strong tradition and slow change. The region, community, or neighborhood of low-income rural families has typically been a resistant stronghold of a way of life that elsewhere exists mostly in history books and in the memories of the older men and women. It is important to stress this "way of life" explanation of the Appalachian situation in order to guard against over simplifying an analysis of the problem in terms of 1

[5] No special collation of 1950 data for the whole group of 236 southern Appalachian region has yet been made available.

[6] A typical supply of tools has been listed as including "only such items as a garden hoe, sled (instead of a wagon or cart), single-shovel (bull-tongue) plow, turning plow, hand corn planter, draw harrow, axe, crosscut saw, pick for digging coal, a few carpenter tools, and minimum "gear" for one work animal. Rail boundary fences of the early period either were not replaced or were followed by barbed wire. Paling enclosures for gardens became customary. There were also almost always a shotgun, rifle, and fish pole, which could be classified as farm tools because of their use in providing food." (Ky. Agr. Expt. Stat. Bul. 500; p. 16.)

[7] Ibid., p. 17.

or 2 factors such as income, resource limitations, or biological stock. We do not face here one problem or the consequence of one factor, nor is there a solution in the adoption of one policy or the initiation of one program.

THE PROBLEMS ARE CUMULATIVE

Not only is there a high concentration of low-productivity farms and low-income people in the southern Appalachian area, but a chief feature of the situation is a kind of "piling up" of other problems in the same area. There is a concentration of illiteracy and low education. Communication and transportation are poor, and the topography makes it more expensive than in many other areas to provide or improve such facilities. Birthrates are among the highest in the Nation and though in "normal" or "good" times outmigration provides some relief from the pressure of population on resources this and the birthrate both contribute to making the dependency ratio one of the highest in the Nation. That is, a relatively small number of people in the productive, working ages must support a relatively large number of children and old people. This increases the burden of education and compounds the problem of overcoming illiteracy and poor education. The disproportionate number of children and old persons also increases the need for medical care, but physicians and hospitals are much less available than elsewhere. The combination of low income, topography, and poor transportation make for a paucity of churches, organizations, and other institutions in the region. All of these conditions are interdependent, and no doubt each is both a cause and an effect of others. There is a "package" problem, then, and it will require a "package" of answers and a "package" policy.

POVERTY OF INSTITUTIONS AND SOCIAL EXPERIENCE

Another aspect of the situation may be illustrated by reference to data on church membership. In a group of Appalachian counties in Kentucky in 1947, only 18 percent of the population belonged to the churches, and there had been no proportionate gain in 60 years. By contrast, a nearby group of counties with commercially productive farms had three times as large a proportion of church members, and this proportion had doubled in the 60 years. In number of members, the average country church in the areas of profitable farming was three times as large as the average country church in the Appalachians (177 : 62). The percentage of churches with full-time ministers in the better counties was twice that of the Appalachian counties (30 : 15. More than half of the churches in the Appalachian counties were limping along on a minimum program of one Sunday service per month; only one-eighth of the churches in the better farming areas had services this infrequently.

In the Appalachian hill country the services ordinarily performed by the formal organizations, established institutions, and agency programs of a modern well-developed community have been left largely to the family and the kinship group. Even "neighborhood feeling and community spirit tends to be weak in most parts of the mountains" because the family and kinship groups have performed such a large share of the necessary functions in the society. "Neighborhoods and communities have relatively little reason for existence." [8]

Although membership in formally organized groups is not in itself an adequate measure of the quality of living, one simple statistic on this point highlights the general statement made above: Among 100 persons in mountain counties there are about 67 memberships in organizations; among 1,000 persons in nearby counties with commercial agriculture there are about 158 memberships—between 2 and 3 times as many. The low index of participation symbolizes, though imperfectly, a certain paucity of social experience according to modern or contemporary standards of community life.

Thus, the poverty of an area in which low-income families are concentrated is not merely the poverty of people, family by family, but it is a poverty of the social organization and social institutions on which persons and families depend for fulfillment of their lives. Whatever one may mention—whether churches, schools, businesses, libraries, local government, civil groups—there are conspicuous deficits. The strengthening of institutions thus becomes a prerequisite to personal and community development.

---

[8] Brown, J. S., The Family Group in a Kentutcky Mountain Farming Community, KentuckyAgricultural Experiment Station Bulletin No. 588, p. 38.

PROTECTIVE ISOLATION HAS BEEN DESTROYED

Moreover, one of the tragedies of the situation in the southern Appalachians and other low-income areas at the present time is that they can no longer be isolated and inviolate. They have been caught up in the network of highway, powerline, and mass communication that exposes them against the rest of society as maladjusted, disorganized, or underdeveloped. Above the level of bare existence poverty is more a matter of mind than of objective condition. As recently as a half-century ago, to live in the southern Appalachians with little or no money was not necessarily to live in great discomfort. To live there now with little or no money is to live in conscious and painful deprivation.

Probably the hardest fact for the people of a low-income locality to accept is that there is no possibility of restoring the storied way of life to which the childhood of many present men and women was tuned. There is no road back, and no circumstance introduces greater confusion than this.

WAYS OUT: MANY TYPES OF PROPOSALS HAVE BEEN MADE

A catalog of the suggestions that have been made from time to time for solving the problems of the southern Appalachians would be a list of many items ranging all the way from, at one extreme, a somewhat romantic exhortation to return to the simple and allegedly idyllic life of a former period to, at the other extreme, a coldly "rational" demand to "take the people out of the hills and the hills out of corn." Probably each of these extremes and each intervening suggestion has some merit, but none, by itself, is a solution.

AGRICULTURAL PRICE POLICIES ARE UNRELATED TO THESE PROBLEMS

Is price policy important? Agricultural price policies practically bypass the small-farm, low-income families with which this report is concerned. There are repercussions of whatever price policies are operative, but the effects tend to be indirect and of small consequence. Price policies affect directly only farmers who produce commercially. Other kinds of policies must be devised for low-income, small-production rural families.

EDUCATION IS A PRIMARY NEED

Are educational policies important? Several of the most promising policy ideas germinate in the study of educational problems. Children in low-income areas are numerous and dollars are few. To prepare the mountain child for citizenship in Detroit or Dayton may prove to be as serious to Michigan and Ohio as the preparation of their own native sons and daughters, native to these States. Equalization of educational opportunity among the communities of the Nation must have exceedingly high priority in the formulation of policies to help low-income families in rural areas.

REENFORCEMENT OF EXTENSION AND RESEARCH

Promotion of better farming and more enlightened economic decisions is also an educational objective of high priority. The system of extension services in agriculture and home economics, both the work with adults and that with children and youth, operates in low-income as well as high-income communities, but with differential effectiveness. For best service to low-income families it needs to be evaluated and retooled, to some extent.

This would seem to involve:

(1) Building better knowledge and public awareness of needs and possibilities; this depends upon the more vigorous prosecution of research in these fields, especially research in the agricultural experiment stations.

(2) Shifting the focus toward more intensive teaching and counseling of families on a farm-and-family-unit basis; this awaits largely the provision of enough workers to do the job.

(3) Recruitment and/or training of extension personnel who will have interest in, commitment to, and skills for helping rural low-income families; this depends in part on college programs to train them, and salaries to pay them.

More and better research and extension services are in themselves major targets in policy development.

SOCIAL SECURITY NEEDS RECONSIDERATION

Is social security an "out" for low-income farmers? So far as the old-age and survivors insurance program is concerned, it is not the answer for most of the low-income persons with whom this report is concerned. Their dollar incomes are often too small for them to qualify as contributing self-employed persons, and their opportunities to qualify through industrial employment are limited.

So far as aid to various categories of dependents is concerned, each variety (e. g., to the blind, the handicapped, dependent children, etc.) is important, but they are of a "stop-gap" nature, are costly, and offer only small support for any individual family. For long run improvement, more fundamental actions must be undertaken.

BETTER USES OF RESOURCES FOR FARMING

What about various influences that can be brought to bear to promote wiser and more productive uses of land? Everything possible must be done by education to get farmers to enlarge, as much as they can, their units of tillable land, to get farmers to shift from exploitive to conservational treatment, letting trees recapture the hillside cornfields, merging small farms into larger ones, more capable of profitable operation.

Policies directed toward this release of land ill-suited to farming for public recreation and long-time timber culture will tend to prevent further spreading of the low-income patterns of living in the southern Appalachians, and will tend to get resources used in the ways to which they are appropriate.

HEALTH QUESTIONS

Policies in the interest of health are of paramount importance. To live adequately and to bear the responsibilities of a citizen member in a democratic society today one needs health, as much as our forefathers needed literacy. The impetus given in recent years to improve health programs and facilities in rural areas must be a continuing policy concern. Health problems are especially acute for the families in low-income areas.

POSSIBILITIES FOR INDUSTRY

Modern industry is a giant that seems to grow from internal urges and pressures. As a usual thing, industry accumulates where it is already well-developed. Some dispersal to small communities does occur, but, only intermittently and in spotted ways, and most industrial development continues to cluster around well-established and dominant nuclei. The promotion of local industry in small towns and at the mouths of mines is a worthy goal and may eventually have more results than can now be predicted. It doesn't seem possible, however, that the local industries can become so widespread as to relieve the present congestion of areas where low-income families have concentrated.

EMPLOYMENT SERVICES

Facilitating labor's mobility must become a purpose of policy. We can't, and don't want to, in our society, "move people" toward better opportunity. Freedom of movement, above all else, means freedom to decide to move. Next it means freedom of obligations that prevent movement. Finally it means choices of destinations. Mobility is the consequence of decisions to move by all the persons involved. Better decisions can be made when there is better knowledge to permit them. This means policies to disseminate widely knowledge about locations and kinds of jobs and training opportunities, policies to minimize the risks and costs of moving, and policies to prepare the young potential migrant with skills and attitudes that are needed. For half to two-thirds of the mountain children their school experiences are their orientation to urban living hundreds of miles away.

SUMMARY AND RECOMMENDATIONS

By way of summary and recommendation, it is my belief that the million and a half to two and a half million low-income small farmers in America are probably the most neglected in terms of policy and programs and have perhaps the lowest standard of living of any comparable group in our society. The extent and plight of this large group of our population need to be better understood by people generally, and our policy and programs pertaining to economic development of the whole population need to be geared more realistically to their needs and their possibilities.

In the consideration of remedial measures, however, it cannot be emphasized too strongly that the poverty of an area in which low-income farmers are concentrated is not merely the poverty of people by families but it is also a poverty of the social organizations and social institutions on which persons and families depend for fulfillment of their lives. Whatever one may mention, whether schools, libraries, churches, businesses, local government, civic service groups or the whole range of institutional services as we know them in America today, there are conspicuous deficiences. Strengthening institutions thus becomes a part of business and community development.

Any approach to these rather desperate problems is ill-founded and dangerous in terms of the welfare of our total system if it is based upon the assumption that economic progress or lack of progress is a matter only of local concern or local responsibility. As indicated above, it is not only a matter of poverty in terms of individuals and families and institutional servces; it is poverty in terms of tax resources out of which services may be provided by the local people, and it is also poverty in terms of imagination, resourcefulness and the ability of a people to lift themselves by their own bootstraps.

Specifically, the following areas of program service may be mentioned, without any effort to expand or describe them in detail:

1. Perhaps the greatest need in these areas is for an adequate educational program for both youth and adults. The rapidly growing population creates a tragic and desperate situation in terms of public-school services and, although somewhat less pressing, in terms of adult-education programs. Few, if any, programs can help an individual or a group of individuals unless they have the understanding and motivation to help themselves. Hence, improved and adapted educational programs are imperative if any types of effort are to be fruitful or effective within any reasonable period of time in the future.

2. Even with the present highly concentrated and disproportionate ratio of people to land in these areas, from 25 to 50 percent of the youngsters reaching maturity will have to find employment away from the land and, of course, with the unsatisfactory ratio that now exists, even greater numbers of youth will eventually have to find employment opportunities away from the land.

This means that in addition to improved general educational opportunities for both youth and adults, much greater attention needs to be given to vocational training that provides skills and social adjustments and adaptations that will fit the people into a different environment.

Coupled with general educational and vocational training, our employment services must be adapted and adjusted within the area, not only to bring alternative vocational opportunities to the people but also to make it possible for people in these areas to move to other areas of opportunity.

3. Social security, including especially the old-age and survivors insurance program, needs to be reexamined and adapted to the extent possible to better serve the people within these areas. The program that was initiated last year is a commendable one, but obviously it is not adapted to the thousands of families within these areas whose income falls even below that required for participation under the acts.

4. One of the causes for inefficiency and low productivity is poor combination of productive factors, particularly as involving the important one of capital. Our credit facilities need to be reexamined and made realistic in terms of the needs of the people with low income. Considerable credit is now available for the purchase of land for capital investment, but too little is available in terms of intermediate credit needs associated with the acquisition of farm machinery, the purchase of increased livestock numbers, and the adoption of improved practices that could raise the income of the people. Within this area there is considerable promise if realistic, practical programs are developed.

5. There is much that needs to be done in the way of additional research pertaining to the problems in these areas. We have an accumulated backlog of research information that could be used if adapted and applied to the conditions that exist. There is a deficit, however, of research information that is integrated and related to specific problems. We need to know more about the actual limitations within the areas and how the various public and private groups can join together as a team in attacking the problems effectively.

6. Because of limitation of funds and the interest in expending them in areas that would bring the greatest return in increased production, too small a portion of Agricultural Extension funds have been used in the past in working on the problems of and with the people in the low-income areas. This is not to indicate criticism of past programs. There undoubtedly could be much more effective work done by our Agricultural Extension programs if funds were appropriated and set aside to be used within these areas, so that Extension would be working on specific enterprise developments, and working with individual farm families in encouraging them to analyze, appraise, and develop to the fullest capacity the limited resources that are available.

7. People unacquainted with low-income areas can scarcely understand the rather desperate needs and problems associated with their medical, health, and sanitation problems. Again lack of resources within the areas for the support of these kinds of programs causes them to continue to be neglected and forgotten.

If the Congress, in its wisdom, can devise policies and programs in these specified fields of education, employment, social security, credit, research, extension, and health, that lead the hundreds of thousands of families in areas of low-income concentration toward better living, a great humanitarian goal will be approached; I am convinced that American life in general will have been greatly enriched. Throughout the rural United States, and especially in the southern Appalachian region, there are local leaders who understand the problems of their communities and who will be responsive to and grateful for such programs as may be arranged.

A Statement on Agricultural Policy by T. W. Schultz, University of Chicago

This statement is restricted to three policy issues in the agricultural area, namely:

1. To the haphazard policy of disposing of the very large stocks now under Government control as that policy is seen by foreign-producer countries.
2. To the requirement of a price policy that will both reduce some of the price variability confronting farmers and increase the efficiency of agriculture.
3. To the gross public neglect of the large number of low-production, low-income farms in parts of the United States, the poverty of which is a national disgrace.

The Economic Report of the President is silent on each of these important policy issues.

However, before I consider these issues and present certain positive proposals, I do want at least to touch on the economic setting and some of the characteritics of agriculture:

1. The domestic demand for United States farm products is of slow growth. The demand for farm products has a very low income elasticity of about 0.25. Thus, even when we are fully employed and per capita income increases 2 percent in a year this would shift the demand schedule to the right only one-half of 1 percent. Most of the new demand, therefore, comes from the growth in population.

2. On the supply side additional production is readily forthcoming. As a country we are benefiting greatly from many new techniques of production in agriculture. With little or no increase in the total quantity of factors committed to farming, this country can for some years—surely for the next 5 to 10 years and longer—stay abreast of demand as a result of advances underway in agricultural technology.

3. One needs to bespeak the dynamic strength of most of the family farms that produce the bulk of the farm products entering commercial channels. There is a tendency to underrate the flexibility, competitive capacity, and the income earned by these particular family farms. This underrating arises partly from bad statistics and then, too, from lumping all farmers together and, thus, not separating out the million or so farm families who really produce very little and who are very poor.

The technical and economic developments that Corn Belt farmers have taken in their stride in recent years not only illustrates but demonstrates their dynamic capacities. There has been a technological revolution—mechanization of fieldwork, hybrid corn, commercial fertilizer, and many other new techniques. In adjusting to these advances, corn farmers, in the United States as a whole, have reduced by 30 million the acreage planted to corn, a reduction which is as large as the total corn acreage of the Argentine, Brazil, and Mexico—three major corn countries. There have, also, been big fluctuations and shifts on the demand side. One observes that most family farms in the Corn Belt have achieved a satisfactory adjustment to these technological developments and to other supply and demand changes.

4. Farm product prices are not nearly as far out of touch with market values as is now generally believed to be the case. In terms of prospective production and demand, holding aside for the time being the very large CCC stocks, most farm products are clearing their respective markets. Those that are not doing so stand about as follows:

Corn, which is the key to feed grains, is about 5 percent out of line.

Cotton, between 5 and 10 percent, and it would then compete and clear abroad and at home.

Dairy products and possibly also butter, while more difficult to gage, are no longer appreciably out of line.

Wheat represents a major exception. While durum wheat is in short supply and the prospective production of spring wheats would come close to clearing their markets (again leaving CCC stocks of these aside) the soft wheats and especially the very important hard winter wheats are overvalued by 20 to 25 percent.

With this brief sketch of the setting, let me turn to the three policy issues introduced at the outset.

We need to correct the apparent haphazard policy of disposal of CCC stocks abroad. To foreign producers and others it looks as if we were prepared to dump the stocks we have accumulated in an arbitrary and wholly irresponsible manner. To them it appears that we are prepared simply to dump on them our farm problems and the mistakes of our past farm policies. In the main, our administrative actions have been less arbitrary than has been the legislative history on policy urging and authorizing the disposal of farm products abroad.

One needs to distinguish between, for example, what we have done and are doing with CCC stocks of corn and cotton in this context where there has been little, if any, of this haphazard dumping from what appears to be occurring in the case of wheat, butter, and some others.

In wheat, the CCC reported as of November 30, 1954, that it held 762 million bushels as inventory and another 346 million bushels pledged for loans—a total of 1,108 million bushels, enough to keep the world markets of wheat upset for years to come.

We can reduce greatly, as we should, this uncertainty aborad arising from what we may do with the excessive stocks under Government control. My proposal is that the Department of Agriculture be authorized and required to announce at or about August 1 a schedule of the quantity of wheat that will be sold abroad during the following 12 months. This schedule may be by months or by quarters. Sales may be either through private or by some combination of public and private agencies.

Suppose we had announced a schedule of 300 million bushels for the current crop year. It would have been more than we are likely to sell as things are now going and, more important still, we would have done it in a framework which would have reduced very substantially the uncertainty which our now well over 1 billion bushels of CCC wheat creates for producers and buyers af wheat throughout the world.

In overhauling the farm-price policy of the Government I wish, once again, to urge the adoption of a system of forward prices for farm products geared to the prospective normal value of each product. The theory underlying this approach and some of the administrative problems have been presented elsewhere.[1] In any case, this is not the time or occasion to restate the analysis and the case for this proposal except to say that it very likely would serve both consumers and agriculture well, for it would reduce measurably the price uncertainty facing farmers and further enhance the productive efficiency of United States agriculture.

The third policy issue, that of undertaking public measures to correct the low income of that large number of farm families who produce compartively little for sale cannot be developed adequately in this statement. Two lines of action

---

[1] See especially my book, Agriculture in an Unstable Economy, McGraw Hill, 1945, pp. 258-266; and D. Gale Johnson, Forward Prices for Agriculture, University of Chicago Press, 1947.

are required to increase the productivity of these farm families: One is to help reduce the number of such families dependent upon farming as a source of employment, and the other, to increase the economic opportunities available to those remaining in agriculture.

My colleagues, D. Gale Johnson and W. E. Hendrix, and I, in response to a request of the Secretary of the Department of Agriculture, Mr. Benson, have set forth in some detail our insights on this problem in the statement which is attached.

FARM OPERATOR FAMILIES WITH LOW INCOME: AN ESTIMATE FOR 1949, BY W. E. HENDRIX

This particular estimate of the number of farm operator families who in 1949 had less than $1,000 of (money) income, where the operator was able-bodied and less than 65 years of age and where female operators are excluded and with some other adjustments is as follows:

Farm operator families

	Number
1. In South	800, 000
2. North and West	200, 000
3. United States, total	1, 000, 000
4. Those farm operators in 3 above, who may enter nonfarm employment	500, 000

The above estimates are derived from data shown in table 1 adjusted as shown in the following discussion.

Numbers and some characteristics of farm operator families with less than $1,000 of cash in income in 1949, in the United States

[In thousands]

Item	United States	South	Non-South
(1) Number reporting family income under $1,000	1, 366	976	390
(2) Number on low-production farms [1] not reporting income	304	194	110
(3) All families with incomes under $1,000	1, 670	1, 170	500
(4) Number on farms of economic classes I, II, and III	80	24	56
(5) Number with operators 65 years of age and over [2]	370	210	160
(6) Number with operators 50 to 64 years of age [3]	510	370	140
(7) Number not husband and wife units	445	315	130
(8) Number with operators not completing elementary school	1, 070	890	180
(9) Number with operators having 0 to 4 grades schooling [4]	435	385	50

[1] Farms of economic classes V and VI and part-time and residential farms are classed as low-production farms.

[2] In this and the following items it is assumed that families in (2) had about the same characteristics as those in (1).

[3] The median age of operators reporting family incomes under $1,000 were 51.9, 49.8, and 56.8 years for the United States, the South, and the non-South respectively.

[4] This estimate is based upon educational data reported by the Bureau of the Census for the operators of low-production farms. It is assumed for the purpose of these estimates that the operators on farms with family incomes under $1,000 have about the same educational characteristics as do the operators of low-production farms. It is most likely, however, that the latter have a lower average level of schooling.

In estimating the number of the farm-operator families with incomes under $1,000 that are underemployed viewed from the standpoint of the farm operator, the following adjustments have been made:

(1) All families on farms of economic classes I, II, and III have been excluded.

(2) All families with operators 65 years of age or over have been excluded.

(3) One-fifth of all farms that are not husband and wife units have been excluded to account for female operators who are not in the above classes.

(4) Ten percent of the remaining operators have been excluded to account for physical and mental disability and other human limitations of an irremedial nature that stand in the way of appreciably raising their productivity and incomes.

With these adjustments, there are left about 1 million low-income farms with able-bodied male operators. Of these about 800,000 are in the South, and 200,000 in the North and West.

Of this number, however, there are many for whom a major occupational change is probably not feasible. This number would include most operators 50 years of age and over who have not already had non-farm-employment experience. There are also probably many younger low-income operators who, under present employment standards, could not meet the physical requirements for entry into kinds of work for which they would otherwise be qualified. Finally, there are many who are severely handicapped for entry into nonfarm employment because of their very low level of schooling. With available data, one cannot ascertain how many of the 1 million able-bodied male operators could meet the age, physical, and educational requirements for new entrants into nonfarm employment. In view of the number of operators 50 to 64 years of age and the number not completing elementary school, probably not more than half of them could meet usual non-farm-employment standards. Moreover, among those who can meet the standards for entry into nonfarm work, there are some for whom farming would be the more profitable alternative if they could secure additional capital. There are others who have such strong preferences for farming that they would not move except at much larger differentials in earning than they could now expect.

This suggests that the low-income problem, viewed from the standpoint of present low-income farm operators, is predominantly a problem to be solved largely in place. There are, however, about 500,000 such operators who are prospects for nonfarm work under present employment standards.

These estimates, of course, considerably understate the amount of underemployment in the Nation's low-income families; also they understate the need for emphasis upon farm-to-industry migration. For it is mainly in facilitating such movement on the part of the younger farm people, including those who will be entering the labor force in the years ahead, that we must largely depend to prevent a continuance of the low-income problem as a problem of the next generation.

The letter which follows addressed to the Secretary of Agriculture sets forth our insights at this stage of our research work on the problems related to "underemployed rural people." The Secretary, Mr. Ezra T. Benson, had written us early in May asking us to make available to him these materials. We are very pleased to have this privilege and also to find the use that he has made of them in his recent report.—THEODORE W. SCHULTZ.

JUNE 16, 1953.

Hon. E. T. BENSON,
Secretary of Agriculture,
United States Department of Agriculture, Washington, D. C.

DEAR MR. BENSON: Your letter of May 13 raises important and significant questions concerning the possibilities of developing programs to help low-income groups in agriculture improve their economic position. Your letter and the interest that it expresses are especially welcome because we have long felt that the particular problems of the low-income groups in American agriculture have been long neglected, not only by the Federal Government but unfortunately also by research workers as well. It has only been in recent years that some studies have been undertaken to advance our understanding of the reasons for the persistence of such low-income groups in agriculture and to determine the kind of programs that would contribute to a solution of the various problems that confront these farm people. We have been particularly fortunate in having had generous financial support from the Rockefeller Foundation to carry forward a considerable number of studies concentrating on the economic problems underlying these low-income groups in agriculture.

Before stating what we believe should be the objectives of a program for underemployed rural people, we would like to make an important distinction between low incomes and underemployment. While underemployment in agriculture is usually associated with low incomes, it need not be true that all low-income workers in agriculture are underemployed. Underemployment is a relative concept and implies that a worker could achieve a higher level of productivity, either at farm or nonfarm work, than is possible in the existing cicumstances. Many farm families or individuals who have low incomes may be achieving as high a level of income in farming as would be possible anywhere else. This will be true of families consisting of elderly people, of families headed by a female or a disabled male, or of families consisting of relatively young people.

Many of the families or individuals who have low incomes, but are not underemployed, do not represent a social problem. This would be true of elderly persons who can maintain a satisfactory level of living based on low current earnings plus accumulated savings. It would also be true of the youth who may look forward to much higher incomes as their experience and skills increase. But low income situations due to broken homes and mental and physical disabilities which will be found in all farm communities, rich and poor alike, do represent a social problem. But it is not a problem different than that existing in nonfarm communities, and solutions should be found in general programs applicable to all similarly situated persons, such as old-age and survivors insurance, training and rehabilitation activities, and similar welfare programs.

Persons who are underemployed represent a waste of the Nation's resources in that the productivity of these persons could be substantially increased. Though we believe that it is desirable to reduce inequalities in the distribution of real income, we believe that the major objective of a program for underemployed rural people should be to increase their productivity and, as a consequence, the real production of the Nation. In this instance, increasing output and reducing inequality are consistent objectives, but the program will be most successful if it seeks to achieve greater productivity rather than greater equality.

The persistence of underemployment in agriculture on its present scale after a decade of full prosperity and the operation of large-scale agricultural programs reaching nearly every farm in the Nation attests to the complexity of the problem. It attests to its lack of responsiveness, both to price-improvement programs and to the general run of other agricultural pograms such as have been operative in recent years. It suggests that a mere across-the-board increase in the funds and facilities of existing agencies without a considerable reorientation or redirection of their efforts can contribute little or nothing to a solution of the problem. On the other hand, we believe that much can be done without an increase in national expenditures and to the lasting benefit of our national economy by a redirection of our agricultural policies and programs more specifically toward a solution of the low-income problem.

Two major adjustments are required to increase the productivity of the existing underemployed farm people. One necessary adjustment is to reduce the number of such persons dependent upon farming as a source of employment. One characteristic of all communities having large numbers of underemployed farm people is the high ratio of labor to land. This ratio must be reduced before the adjustments which are required to increase the productivity of those remaining in agriculture may be increased. A second kind of adjustment involves increasing the economic opportunities available to those who remain in agriculture.

The second adjustment, that of increasing the economic opportunities available to those remaining in agriculture, requires numerous changes in the economic structure of agriculture. Farm communities with underemployed labor are generally dependent upon home consumption of farm products as the major source of income (subsistence farms) or upon 1 or 2 labor intensive cash crops, especially cotton or tobacco. In either type of situation, efficient farm operating units require farm enlargement, the introduction of new farm enterprises and methods of production, and in many cases new or more efficient market outlets for farm products and sources of supply of production goods. In making these changes, the managerial capacities of most of the existing farm operators will be taxed to the fullest and without some help many would be found wanting.

How can these two adjustments be made? The first adjustment, reduction in the number of persons employed in agriculture, may be made through migration from the farm to a nonfarm community or by increasing the number of jobs available in the local area thus permitting part-time farming. Data from the 1950 Census of Population and Census of Agriculture indicate that the income position of part-time farm families is not, on the average, an unsatisfactory one. If full employment conditions are maintained, an increase in opportunities for off-farm work in such areas would contribute to greater total productivity. However, one limitation of part-time farming as a solution is that it does not seem to permit the necessary recombination of labor and land for those who wish to engage in full-time commercial farming. Migration to nonfarm areas, either nearby or at some distance, does permit farm sizes to be increased and provides the basis for more efficient organization of agricultural resources.

It is one of the anomalies of our times that more resources are devoted to provide information about the market for wheat, corn, or cotton than the market for labor. A first step in any attempt to reduce underemployment in agriculture is to increase the available knowledge of alternative labor opportunities and to make this knowledge available to farm people. While the Bureau of Employment Security is now studying certain aspects of urban labor markets, even this limited information is not in a form that is or could be made available to farm people. The various State employment services are essentially urban oriented and seldom reach farm people. Except for certain important reservations of a political nature, the Extension Service could perform the function of providing information about employment opportunities. A second step would be to provide positive aids to migration through loans and grants, assistance in the location of jobs, and, in the case of families, help in obtaining adequate housing. On the basis of our present knowledge of migration, it cannot be said with certainty that positive aids to migration would be required if farm people had more adequate knowledge of alternative employment opportunities. But while courses of action can now be indicated in a general way, there remains a need for research into many phases of the problems of migration from farm to nonfarm employment. How to help farm people to adapt themselves and to find a place in a new kind of social environment may be about as important to facilitating their movement as helping them to find jobs. This is particularly so for families.

A third step would be to encourage the location of new employment opportunities in or near communities with underemployed farm people. In a private enterprise economy, there is not much the Federal Government can do directly to encourage location of business enterprises, except in periods of mobilization or war. However, research that would add to knowledge of the opportunities for new investment in low income rural areas might have an important impact through time.

The programs that would help in achieving the necessary recombination of agricultural resources are generally of the type that are quite akin to the experiences of Federal and State agencies dealing with agriculture. Except for the need to improve the marketing structure, little that is new is required; what is involved is an extension and redirection of existing efforts. Only some of the more important ways of aiding farmers to increase their productivity may be noted here.

(1) Farmers or landlords will need additional credit to enlarge the size of farms and to make the necessary investments in land improvement that would be required in many cases (clearing, seeding, and fertilizing pastures; contouring; original massive fertilization on cropland; new fencing; new or enlarged buildings). In many areas such credit is not readily available, especially for the purchase of land and making the desired improvements on the land.

(2) Farmers will need credit and managerial assistance in making the necessary modifications in the scale of their farms and in introducing new enterprises. There is considerable value in combining the provision of credit and managerial assistance, as was done in the Farm Security Administration and as is now being done by the Farmers' Home Administration. An increase in administrative funds, an increase in loanable funds, and a concentration of effort in thte areas of greatest need are required if the FHA is to make a substantial contribution in this direction.

(3) Research work on production methods, farm enterprises, and soil maintenance and conservation needs to be redirected to more consistently bear on the problems of farms in the low-income areas. While some research work is going forward that relates to the production patterns that are likely to emerge in the areas of underemployed farm people, the quality and the amount of the work now being done leaves much to be desired. Too much emphasis is being placed on the traditional crops, usually tobacco and cotton, and too little on livestock and feed crops.

(4) At the local level there is a real need for some person or group to perform an integrating function. Piecemeal approaches will certainly fail as will programs that are not based on an understanding of the potentialities of each area. Changes in type of farming frequently require new market outlets; unless such outlets become available, many changes cannot be made or, if attempted, will fail. Similarly, attempts to modify the kinds of products produced without recognizing the usual need to expand the usable land area for each farm will frequently result in a level of income lower than that now prevailing.

While much of our research work related to the underemployment problem is still in process, we would be able, with fairly short notice. to make most of it available to you and your staff. We have completed or have underway the following studies:

1. Income differences as affected by region, community size, race, and occupation.
2. Productivity of farm migrants in nonfarm occupations.
3. Factors that influence the rate of migration from farm to nonfarm areas.
4. Interrelationships between outmigration of labor and the mechanization of cotton production.
5. Estimates of underemployment of farm labor in the Southeast.
6. The economic and social experiences of farm migrants to a midwestern city.

If we may at any time be of service to you in your efforts to improve the circumstances of the low-income groups in agriculture, we wish that you would so inform us.

Sincerely yours,

W. E. HENDRIX.
D. GALE JOHNSON.
THEODORE W. SCHULTZ.

A POSITIVE PROGRAM FOR REDUCING RURAL POVERTY—STATEMENT BY WILLIAM H. NICHOLLS, PROFESSOR OF AGRICULTURAL ECONOMICS, VANDERBILT UNIVERSITY

THE MAGNITUDE OF THE PROBLEM

In 1949, farm families accounted for 1 out of every 3 to 4 low-income families in the United States. However, many of these low-income families had heads not in civilian employment because of age, disability, widowhood, or divorce. If the latter are eliminated, farm families constituted about one-half of all low-income families. In absolute terms, there were about 1.25 million complete farm-operator families, with able-bodied male heads in their more productive years, which had cash incomes from all sources of less than $1,500; and 0.8–0.9 million of such families with cash incomes under $1,000. Presumably, most of these latter families could have made a substantially larger contribution to the Nation's product if they had better nonfarm job opportunities or if they had more productive farm resources to work with.

Of all farm families with cash incomes from all sources of under $1,000, 71 percent were in the South. Were it possible to eliminate the aged, disabled, widowed, and divorced, we would undoubtedly find an even heavier concentration of the Nation's low-income farm families in the South. Furthermore, while Negroes constituted 9 percent of the Nation's families, they accounted for 21 percent of all families with incomes under $1,000. We may conclude that the low-production family problem is primarily centered in the Southern States because of their relatively heavy dependence upon a low-production agriculture and because of their relatively large Negro population.

As victims of rural poverty, many of whom could earn more and consume more in nonfarm occupations, these farm people should be of great public concern as the Nation's greatest reservoir of underemployed and largely wasted resources. Unfortunately, given the unsatisfactory nature of national employment statistics, such people are considered fully employed although at best their employment is part time and very unproductive. Their inclusion among America's farm workers also pulls down the farm income per worker or per capita to levels which compare very unfavorably with nonfarm income, lending support to public farm policies which help them hardly at all while concealing the need for a positive public program (largely nonagricultural in nature) to alleviate their low state of productivity and income.

THE WAY OUT

The magnitude and difficulties of the low-income rural problem in the United States almost stagger the imagination. But they should make clear that, despite our deep concern for assisting underdeveloped nations abroad, we may have overlooked comparable problems—different in degree but not in kind—of underdeveloped regions within our own Nation. In the interest of a strong and growing national economy, we can no longer afford to neglect these serious regional problems.

In tackling the problem of rural poverty, we must first recognize that there are far more American families trying to make a living from farming than our agricultural resources can possibly support at a level of living comparable with that afforded by similar nonfarm occupations. Second, we must at long last recognize that, while primarily benefiting those farm families which are least in need of public financial aid, our agricultural price-support policies can contribute practically nothing to a solution of rural poverty. At the same time, because of their great cost in treasure and in administrative effort, they strongly divert public funds and public concern from a million or more underemployed rural people who require substantial and sustained assistance. Finally, we must develop a consistent, coordinated, and integrated set of public policies which will, by attacking the fundamental causes, go far toward solving the problem of rural poverty during the next decade or two.

In my view, a positive program for reducing rural poverty would have the following major elements:

(1) The development of a substantial program of Federal grants-in-aid for public-school education and for expanding public-health services.

(2) The maintenance of a stable and steadily expanding national economy.

(3) The extension and improvement of the United States Employment Service in rural areas, with fuller integration of the objectives and administration of farm and nonfarm placement.

(4) A considerable increase in congressional appropriations for vocational-training grants-in-aid to the States, with a revision of the allocation formulas to encourage nonfarm training in rural high schools and to break down the administrative barriers between the farm and nonfarm phases of the program.

(4) The abandonment of present provisions for minimum acreage allotments in our basic farm legislation because of their deleterious effect on productive efficiency and labor mobility.

(6) The revision of the basic statute on unemployment compensation, and of its administration, to eliminate factors tending to discourage labor mobility.

(7) The development of Federal policies favoring location of defense plants in areas of rural underemployment as well as of urban unemployment.

(8) The development of a Federal power policy which will, through a combination of public and private sources, assure the South of a power supply consistent with its industrialization needs.

(9) A revision of the Department of Labor's concept of labor-surplus areas broad enough to include underemployed rural labor as part of the local labor surplus.

(10) The introduction of a regional differential if the minimum wage is raised.

(11) Expansion and improvement of the services of the Area Development Division of the Department of Commerce.

(12) The development of intermediate-term types of credit by the Farm Credit Administration.

(13) A substantial increase in the resources of the Farmers Home Administration.

(14) Increased emphasis in the programs of the agricultural experiment stations and agricultural extension services on the problems of the small farm.

(15) Further development of the programs of the Federal Reserve banks aimed at increasing the participation of commercial banks in agricultural development.

(16) A modest program in rural home improvement, probably under the Farmers Home Administration, with due regard for the farm as a production rather than as a residential unit.

(17) Increased benefits and extended coverage for farmers and rural people under the OASI, public assistance, and rehabilitation programs.

APPENDIX

TABLE 1.—*Selected characteristics of families, resources, and family incomes on commercial and other farms, by economic class of farm, United States, South, and non-South, 1950* [1]

Item	Area [4]	Commercial farms [2]						Other farms [3]		
		Class I and II	Class III	Class IV	Class V	Class VI	Total	Part-time	Residential	Total

[1] Compiled from U. S. Bureau of Census, Farms and Farm People, Washington 1952, chs. 3, 4, and 5; House Committee on Agriculture (committee print), Long Range Farm Program: Technical Studies * * *, Washington 1954, p. 161.

[2] Commercial farms are classified as follows according to total farm-product sales in 1949: Classes I and II, over $10,000; class III, $5,000 to $9,999; class IV, $2,500 to $4,999; class V, $1,200 to $2,499; and class VI, $250 to $1,199 with operator working off farm less than 100 days and other family income less than farm-product sales.

[3] Part-time farms had farm product sales of $250 to $1,199, differing from class VI commercial farms only in that operator worked off farm more than 100 days and other family income exceeded farm-product sales. Residential farms had farm-product sales of less than $250.

[4] South (S) consists of the 16 States of the following census regions: South Atlantic, East South Central, and West South Central; combined North and West (N, W) the remaining 32 States.

[1] Compiled from U. S. Bureau of the Census, Farms and Farm People, Washington, 1952, ch. 5, tables 4 and 5, pp. 80–88. "Family income" includes income from wages and salaries; net money income from own farm, business, or professional practice; and other income (interest, dividends, veterans' allowances, pensions, or rents) received by all family persons 14 and over during 1949.

[2] The South (S) consists of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas. The combined North and West (N, W) consists of the remaining 32 States.

[3] "Commercial farms" are those with a value of farm products sold in 1949 of more than $1,200, plus those with a value of products sold of $250 to $1,199 whose operator worked off farm less than 100 days and whose family income from off-farm sources was less than its income from farm-product sales.

[4] "Other farms" include part-time farms (with farm products sales in 1949 of $250 to $1,199 but whose operator worked off-farm more than 100 days and whose family income from off-farm sources was more than its income from farm-product sales), residential farms (product sold less than $250), and abnormal farms.

LOW-INCOME FARM FAMILIES AND ECONOMIC PROGRESS—STATEMENT BY WILLIAM H. NICHOLLS, VANDERBILT UNIVERSITY

I. INTRODUCTION

In 1949, of 36.4 million American families (excluding unrelated individuals) reporting income, 5.3 million had cash incomes under $1,000, 7.9 million had cash incomes under $1,500, and 10.7 million had cash incomes under $2,000 (table 1).

Low incomes and agriculture

The median cash income of all United States families was $3,073, with medians of $3,431 for urban families, $2,560 for rural nonfarm families, and (excluding income in kind from farm housing and farm-produced food consumption) only $1,729 from all sources for rural farm families. Of the 5.2 million rural farm families reporting, nearly 32 percent had cash incomes of less than $1,000, as compared with 18 and 10 percent, respectively, of the rural nonfarm and urban families. For incomes of less than $1,500, the corresponding percentages were 45, 27, and 15 percent; for incomes under $2,000, 56, 37, and 21 percent, respectively.

Rural farm families, which constituted only 14 percent of all families reporting income, accounted for 29 percent of all families with cash incomes under $1,500. If (in order to allow for farm income in kind) rural farm families with cash incomes of less than $1,000 are combined with all other families having incomes under $1,500, rural farm families still constituted 23 percent of the resulting total. Thus, farm families accounted for 1 out of every 3 or 4 low-income families in the United States in 1949.

TABLE 1.—*Cash income in 1949 of low-income families, urban and rural, white and nonwhite, United States and major regions, 1950* [1]

Item	Number of families (thousands)					Median income

[1] Sources: Census of Population, 1950, Rept. PB-1 (1952), table 57, p. 104 and Preliminary Report PC-7, No. 2 (1951). Unrelated individuals excluded.

[2] These United States totals differ because the upper ones are final figures and the lower ones preliminary and later revised (cf. Rept. PB-1, table 85, p. 137, for regional breakdown of all families, rural and urban, as revised). The preliminary figures were used here because the farm-nonfarm and race breakdowns of the data by regions were not available in revised form.

[3] Not available.

[4] Farm-operator families only (U. S. Bureau of Census, Farms and Farm People, Washington, 1953, p. 26), omitting some farm-laborer families which pull the United States rural-farm median income down from $1,867 to $1,729.

From the standpoint of production rather than consumption, however, farm family units were of considerably greater importance. Thus Mr. Stanley Lebergott of the Bureau of the Budget has made rough estimates which indicate that, of some of 5.8 million families with money incomes under $1,500 in 1951, 2.6 million families had heads who were not in civilian employment, largely for reason of age, disability, or (for female heads) widowhood or divorce. This group obviously constitutes an important part of the Nation's low-income problem but any improvement in its well-being depends primarily upon larger transfer payments from the productive sector of the national economy rather than upon any potential increase in its own contribution to the national product. If this group is eliminated from Mr. Lebergott's computations, his estimates indicate that the families of farm operators and farm laborers constituted 49 percent of all families with heads in civilian employment and money incomes under $1,500. (Of the remainder, 36 percent of all families had male heads, and 15 percent female heads, in nonfarm civilian employment. Thus, looking at the low-income sector as a production, rather than as a consumption, problem, farm families accounted for about 1 out of every 2 potentially more productive low-income families.

In 1949 there were an estimated 3.29 million United States farm-operator families (61 percent of all such families) on low-production farms, i. e., those with gross cash income from farm-product sales of less than $2,500. Of these, about 1.01 million (nearly two-thirds living on part-time and residential farms) had cash incomes from all sources of $2,000 or more, leaving 2.28 million with total cash income under $2,000. If, from the latter, we subtract[1] 0.36 million farm operators aged 65 and over, 0.07 million operators of less than 25 years, and 0.10 million operators single, widowed, or divorced, we arrive at a net estimate of 1.75 million underemployed farm families.[1]

On a roughly parallel basis, we may estimate that of the 3.29 million operator families with gross farm sales under $2,500, about 1.76 million had cash incomes from all sources of less than $1,500 and about 1.33 million less than $1,000. Allowing for operators who were aged, very young, or single, widowed, or divorced, these latter estimates of underemployed farm-operator families would be about 1.2 to 1.3 million and 0.8 to 0.9 million, respectively. We may conclude that there were, in 1949, from 800,000 to 1,750,000 (depending upon the maximum cash income considered "low income") complete farm-operator families with able-bodied operators in their more productive years which were unable to earn adequate incomes from their present employment opportunities on or off the farm.

Low incomes and region

Just as a substantial part of the Nation's low-production family problem is associated occupationally with agriculture, so it is associated regionally with the Southern States (table 1).[2] The South, with 31 (30) percent of the Nation's families in 1949, had 49 (49) percent of all United States families with cash incomes from all sources under $1,000 and 46 (46) percent of all families with cash incomes under $2,000. About 24 (24) percent of all southern families had cash incomes from all sources amounting to less than $1,000 and about 45 (45) percent incomes under $2,000. The corresponding figures for the non-South were 11 (11) and 24 (23) percent respectively. In 1949 median cash incomes of all rural and urban families in the Northeast, North Central States, and the West were nearly on a par, averaging $3,330 ($3,339) for the 3 regions combined. On the other hand, the median cash income of all southern families was only $2,248 ($2,248), about 67 (67) percent of the median income in the non-South. For urban and rural nonfarm families, the southern median income was 77 (76) percent of the nonsouthern; for rural farm families (operators only) 52 percent. In the South, farm-operator families had a median cash income only 49 percent of that of urban and rural nonfarm families in the same region, as compared with 73 percent outside the South.

Low incomes and race

Finally, much of the Nation's low-production family problem is associated with race (table 1). Nonwhites, constituting 9 percent of the Nation's families in 1949, accounted for 21 percent of all United States families with cash incomes under $1,000 and 19 percent of all with cash incomes under $2,000. In the South, with 19 percent of the region's families, nonwhites comprised 34 and 32 percent, respectively. In 1949, the median income of all United States nonwhite families was $1,426, only 46 percent of that of all white and nonwhite families combined. The corresponding figures for the South only were $1,168 and 52 percent. However, even southern nonwhite families, urban and rural nonfarm, had a median income of $1,389, 8 percent above that of all southern farm-operator families, 79 percent of whom were white. Bishop recently estimated from census sources that in 1949 the mean income of white nonfarm families in the non-South was $4,025, only 14 percent above that of white nonfarm families in the South. The smallness of this differential is consistent with the findings of several recent studies that differences in cost of living (as measured indirectly by community

[1] Deductions only taken from 83d Cong., 2d sess., House Committee on Agriculture, Long Range Farm Program: Technical Studies (committee print), Washington. 1954, p. 160.

[2] Most figures in this paragraph are preliminary, but revised figures are also given in parentheses insofar as available.

size) account for most of the relatively small difference in incomes of white nonfarm families in the South and non-South.[3]

We may conclude that the low-production family problem is concentrated in the South primarily because of its heavy dependence upon agriculture and its relatively large Negro population.

II. The Economic Structure of American Agriculture and Public Policy

The economic structure of American agriculture is exceptionally heterogeneous. Public policies, both agricultural and general, can make a significant contribution to solving the problems of the low-income farm family only if the nature and extent of this heterogeneity are fully understood and properly evaluated.

A. LARGE-SCALE AND LARGE FAMILY-SCALE COMMERCIAL FARMS

Characteristics

In 1949, there were 484,000 farms in the United States with gross cash farm sales in excess of $10,000 (classes I and II, appendix table 1). These farms had average cash sales of farm products of $23,328 per farm and a (two-class-average) median family net cash income from all sources of $4,259 (mean income $6,518), of which an average of only 15 percent was from off-farm sources. Of all operators of these farms, only 4 percent were primarily engaged in a nonfarm occupation and only 5 percent worked off the farm 100 days or more. Of the farm-operator families, only 10 percent reported nonoperator members working off the farm and only 4 percent had off-farm income in excess of their gross cash farm income. Even for these large farms, averaging 362 acres of cropland and $55,936 value of land and buildings per farm, reported some low family net cash incomes—6 percent of them less than $1,000 and 17 percent less than $2,000. However, most of the low-income families on these farms should be considered temporary (farm prices fell substantially during 1949) rather than part of the permanent class of low-income farm families.

These large (classes I and II) farms, constituting only 9 percent of the Nation's farms and 9 percent of the farm-operator family population, accounted for 51 percent of the Nation's total value of farm products sold in 1949. They had 40 percent of the Nation's farmland (and 33 percent of the cropland) by acreage and 36 percent (including buildings) by value. They accounted for 65 percent of the total outlay for hired farm labor. The South, with 49 percent of the Nation's farms and 44 percent of its commercial farms, had only 20 percent of all class I and II farms in the United States. However, the South had 23 percent of all class I and II farms, and 25 percent of all commercial farms, with family incomes in excess of $10,000—reflecting the peculiar plantation (multiple-unit) type of organization of some of the South's larger land holdings, each cropper- or tenant-operated subunit of which was reported as a separate census farm, along with the higher-income home-farm subunit.

Policy implications

In general, class I and II farms presumably are large enough and command enough resources to afford, from strictly agricultural sources, a family level of living well above that of most American nonfarm families. These large farms are usually relatively efficient, productive, well capitalized, technologically advanced, and well suited for taking full advantage of agricultural research, extension, and credit services. On the other hand, being among the most highly commercialized of America's farms in terms of both product and factor markets, they are relatively vulnerable to short-term price instability and unfavorable trends in price-cost relationships. These farms, while least in need of income supplementation, stand to gain most incomewise from public price-support policies unless made to bear the brunt of acreage restriction programs.

Klarman, A Statistical Study of Income Differences Among Community, Studies of Income and Wealth, vol. VI (National Bureau of Economic Research, 1953); and D. Gale Johnson, Some Effects of Region, Community Size, Color, and Occupation on Family and Individual Income, Studies of Income and Wealth, vol. XV (Natl. Bur. Econ. Res., 1952).

B. MEDIUM-SIZED FAMILY-SCALE COMMERCIAL FARMS

Characteristics

In 1949, there were 1.6 million farms in the United States with cash farm sales of $2,500–$9,999 (classes III and IV, appendix table 1). Their cash farm-product sales averaged $5,151 per farm, with a two-class-average median family net cash income of $2,380 (mean income $3,040), of which an average of about 25 percent was from off-farm sources. Of the operators of these medium-sized farms, only 5 percent were primarily engaged in a nonfarm occupation and only 9 percent worked off the farm more than 100 days. Of the farm-operator families, only 15 percent had nonoperator members working off the farm and only 8 percent had off-farm income in excess of their gross cash farm income. Of these medium-sized farms, averaging 134 acres of cropland and $17,552 value of land and buildings per farm, 15 percent had operator-family net cash incomes under $1,000 and 40 percent under $2,000.

These medium-sized (class III and IV) farms, comprising 29 percent of the Nation's farms and 31 percent of the farm-operator family population, were responsible for 37 percent of the Nation's cash sales of farm products in 1949. They accounted for 33 percent of all land in farms (and 42 percent of all cropland) by acreage and 38 percent (including buildings) by value. Of the Nation's total wage bill for hired farm labor, they paid 26 percent. The South had 30 percent of all class III and IV farms, as compared with 49 and 44 percent, respectively, of all farms and all commercial farms.

Policy implications

In general, these medium-sized farms provide their operator families with a moderately good income, even without supplementary income from off-farm sources. However, on many of these farms—particularly those in the lower part of the range—family incomes could still be substantially increased by better farm organization and practices. In many cases, the production pattern could be made to conform more closely and more promptly to changing relative prices. In other cases, production techniques and the scale of operations need to be adjusted to make fuller use of progress in agricultural technology. Insofar as these medium-sized farms have a low-income problem, it can be largely solved by the traditional means of agricultural research and extension services and cooperative farm credit. Here the problem is, to a substantial extent, one of the inefficient use of resources rather than a deficiency in the amounts of those resources. Even so, more direct technical assistance in the planning and development of the individual farm and more adequate intermediate-term credit appear to be desirable. These farms derive moderate benefits, in both stability and level of income, from price-support programs. But such programs, in conjunction with acreage allotments, tend to penalize the more efficient for the benefit of the less efficient, thereby discouraging the adoption of those improved techniques, practices, and product combinations which would make price-support programs far less necessary.

C. LOW-PRODUCTION FARMS

Thus far, we have centered our attention upon the Nation's 2.1 million large- and medium-sized farms, all of which had gross cash sales of farm products of more than $2,500 in 1949. These farms, constituting only 38 percent of the Nation's farms and 40 percent of the operator-family population, accounted for 88 percent of American agriculture's gross cash income. Together, they had 73 to 75 percent of the Nation's acreage of farmland, acreage of cropland, and value of land and buildings. About 89 percent of these farms had total family net cash income from all sources of $1,000 or more, about 68 percent of $2,000 or more. By and large, even the farm families on such farms which earned less than these levels of income were temporary rather than permanent low-income families.

Characteristics

On the other hand, there were in 1949 about 3.3 million farms with farm product sales less than $2,500 (appendix table 1). These low-production farms accounted for 62 percent of the Nation's farms and 60 percent of the farm-operator family population, but only 12 percent of all cash sales of American farm products. They had only 25 to 27 percent of the Nation's farmland and cropland acreage and of the total value of the Nation's farmland and buildings. Of the operators of the 3.3 million low-production farms, about 35 percent reported family net cash incomes from all sources less than $1,000 and about 59 percent family incomes less than $2,000. Of all farms in the South, 78 percent were low-production farms, as compared with only 43 percent in the non-South. The South, with 49 percent of the Nation's farms, had 64 percent of all low-production farms, 73 percent of all such farms with family incomes under $2,000, and 77 percent of such farms with family incomes under $1,000. Of the last-named group, only 39 percent had nonwhite operators. However, of all low-production farms in the South having nonwhite operators, 72 percent reported family incomes under $1,000; of those with white operator families, the corresponding figure was 39 percent, as compared with 24 percent for all operator families on such farms in the non-South.

Policy implications

Low-production farms are so heterogeneous that consideration of public policies directed at their solution requires substantial subclassification. To this we now turn.

III. Low-Production Farms and Public Policy

Of the 3.3 million low-production farms in 1949, 1.0 million were residential farms, 0.7 million were part-time farms, 0.7 million were small-scale commercial farms, and 0.9 million were small family-scale commercial farms.

A. RESIDENTIAL FARMS

Characteristics

In 1949, there were about 1 million (66 percent in the South) residential farms with cash sales of farm products of less than $250 (average $82), hence almost wholly dependent upon off-farm income. Residential farms constituted 19 percent of the Nation's farms and 18 percent of its farm-operator-family population. But they had an average of only 17 acres of cropland, the average value of their land and buildings was only $4,675 per farm, and they made a negligible contribution to the Nation's commercial farm output (appendix table 1). Relatively high proportions of the operators of residential farms were over 64 years of age (21 percent) and widowed or divorced (12 percent). These farms had about the same proportion (34 percent) of population under 15 years as other classes of farms, but had a relatively high proportion (9 percent) over 64. Hence, their operator families were characterized by relatively high fertility ratios (standardized for age and marital status of woman) and dependency ratios.

The median family net cash income for residential farms was $1,650 (mean income $2,175), of which an average of 84 percent was derived from off-farm sources. About 58 percent of their operators reporting on occupation were primarily engaged in a nonfarm occupation, 4 percent more were primarily farm laborers, and 54 percent (48 percent in the South, 68 percent in the non-South) worked off the farm more than 100 days. A relatively high proportion (26 percent) of the operator families reported members other than the operator working off the farm, with 65 percent deriving more income from off-farm sources than from farm-product sales. Of all operator families on residential farms, 25 percent (18 percent in the South, 39 percent in the non-South) reported net cash incomes from all sources of $3,000 or more. Nonetheless, 37 percent (44 percent in the South, 21 percent in the non-South) reported incomes of under $1,000 and 58 percent (67 and 39 percent in the South and non-South) of less than $2,000.

Policy implications

While there is a substantial number of low-income families residing on residential farms, it is clear that the latter are only nominally farms at all. Hence, except insofar as agricultural extension programs can help their operator families improve their subsistence in the form of increased food production and preservation for household use, the solution to their low-income problem lies almost wholly outside of agriculture. For example, members of these families in their productive years might best be benefited by public policies directed toward increased local non-farm-employment opportunities, vocational training for nonfarm occupations, and more adequate and effective information services about employment opportunities elsewhere. For the aged, increased social-security and public-assistance benefits may be indicated. For the children, there is need for improved educational opportunities (the median years of school completed by the operators of residential farms were 7 in the South and 8.7 in the non-South), rural home-improvement programs (the dwelling unit was "dilapidated" on 28 and 12 percent of the residential farms in the South and non-South), and more extensive public-health services.

B. PART-TIME FARMS

Characteristics

In 1949, of the 3.3 million low-production farms, another 0.6 million (56 percent in the South) were part-time farms. Farms were so classified if they reported cash sales of farm products of $250 to $1,199 (average $612), and if the farm operator worked off the farm 100 or more days or if the nonfarm income received by him and members of his family was greater than the value of farm products sold. Except for residential farms, part-time farms were closer to a trading center median distance 4.9 miles) than any other class of farm and, excepting also large commercial farms, were most often (34 percent) located on a hard-surface road. Part-time farms, constituting 12 percent of the Nation's farms and farm-operator family population, averaged 30 acres of cropland and land and buildings worth $6,117 per farm (appendix table 1) and accounted for only 3 percent of the Nation's gross cash income from farm-product sales. As compared with residential farms, part-time farms had somewhat larger land resources; a substantially smaller proportion of operators over 64 (12 percent), operators widowed or divorced (7 percent), operator-family population over 64 (6 percent); and a lower dependency ratio. While their operator-family population had about the same proportion (32 percent) under 15 years of age and about the same median age (27 years), their standardized fertility ratio was considerably less than that on residential farms. The fertility ratio on part-time farms was lower than on any other class of farm in the non-South and among the lowest in the South, indicating that part-time farm families conform more closely to urban population patterns than other classes of farms.

The median family net cash income for part-time farms was $1,940 (mean income $2,400), of which an average of 82 percent was derived from off-farm sources. Thus, through off-farm employment, part-time farm families were able to earn almost as much total cash income as those on smaller medium-sized (class IV) commercial farms and substantially more than small (classes V and VI) commercial farms. Of part-time farm operators reporting an occupation, 49 percent (somewhat less than on residential farms) were primarily engaged in nonfarm work and another 3 percent were primarily farm laborers. But 62 percent (51 percent South, 74 percent non-South) of the part-time farm operators worked off the farm 100 days or more—slightly more than those on residential farms. A larger proportion of the part-time farm-operator families reported nonoperator members working off farm (32 percent) and off-farm income exceeding gross cash farm sales (87 percent) than families on any other class of farm, including residential. Of all operator families on part-time farms, 28 percent (17 percent South, 43 percent non-South) reported net cash incomes from all sources of $3,000 or more. However, 22 percent (28 percent South, 15 percent non-South) reported incomes under $1,000 and 51 percent (63 percent South, 36 percent non-South) under $2,000. As compared with families on residential farms, part-time farm families had relatively much fewer incomes under $1,000, with the greatest relative advantage in the income class $1,000 to $1,999.

Policy implications

Clearly, America's part-time farms have such limited resources that they are both actually and potentially incapable of furnishing their operator families with full-time on-farm employment and a satisfactory level of living from farming. Nonetheless, in combination with local off-farm employment, many of them provide a satisfactory total family income, a pleasant and healthful way of life, and a modicum of security against industrial unemployment and old age. In fact, it is quite possible that, in numerous instances, a part-time farm family with one or more members earning substantial wages in off-farm employment will actually produce as much or more farm output from a small farming unit than could a full-time farm operator on the same unit. This follows because the off-farm cash income may become a source of self-financing of needed capital improvements on the farm, such as labor-saving devices for the operator employed in a nonfarm occupation and additional livestock and pasture development for making better use of underemployed family labor.

Thus, in many instances, industrial development of densely populated rural areas may pay off in higher family levels of living. Such a process is by no means a mere matter of interregional competition—of moving given plants from one area to another. First, given better local non-farm-employment opportunities, low-production farm families offer a significant new market for farm-production goods and—especially if the women of the family find off-farm employment—for consumer goods. (Witness the burgeoning of business interest in reaching the special Negro market since this race raised its economic status substantially after 1940.) Second, even low-wage industries, which are no longer attractive to most workers outside of largely rural areas, may be a boon to workers whose only alternative employment is in a near-subsistence agriculture. Finally, given the need for the dispersal of industry for defense reasons, new plants could be located with more attention to the existence of widespread underemployment in the Nation's rural areas.

Thus, insofar as part-time farm families still lack adequate off-farm employment opportunities, public encouragement and assistance in local industrial development would appear to be desirable where other local resources are appropriate. Where they are not (notably in the Appalachian coal-mining areas), increased public investment in general education, vocational training for nonfarm employment, in employment-information services, and public-health services are especially important in facilitating needed out-migration and increasing the vigor and productivity of the next generation. There is also a real need and opportunity for the agricultural extension services (particularly in States east of the Mississippi) to direct more attention to the special production and home problems of their growing numbers of part-time farm families. Finally, with 22 percent of the southern part-time farm dwellings (and 8 percent of the nonsouthern dwellings) reported as "dilapidated" in 1949, the need for a rural home-improvement program is again apparent.

C. CHARACTERISTICS OF PART-TIME AND RESIDENTIAL FARMS BY FAMILY INCOME

If the 1.7 million residential and part-time (noncommercial) farms are combined and their characteristics classified by family income, the following generalizations may be made ("Other farms," appendix table 2). While farm ownership was much more general for noncommercial than for full-time commercial farms, the lower the income, the higher the rate of tenancy. The proportion of farm operators who were nonwhite was less on noncommercial farms, reflecting the less ready access of Negroes to local nonfarm employment in the South, but the percentage of nonwhite was higher the lower the family income. The lower the family income on noncommercial farms, the smaller the proportion of operators and other family members reporting off-farm work, the higher the median age of operators, the smaller the average family size, and the smaller the proportion of complete operator families with 1 to 4 children. The lower incomes were also associated with lower levels of education, higher percentages of farms located on unimproved roads, and poorer and less improved housing.

More specifically, in 1949 there were about 440,000 part-time and residential farms (78 percent of them in the South) with net cash family incomes from all sources of under $1,000 (average $466). Of these farms, 75 percent were owned by the operators, 23 percent of whom were nonwhite. Only 29 percent of the operators reported 100 or more days of work off the farm and only 19 percent of the families had nonoperator members working off the farm. The average size of the family consisted of 3.8 persons and the median age of the operator was 55.7 years. Only 33 percent of the operator families consisted of husband, wife, and 1 to 4 children under 18, the remainder consisting mostly of families with no children under 18, broken families, and single-person families. Some 69 percent of the operators had not completed elementary school and only 5 percent had completed high school or more. Of the farm dwellings (averaging 4.8 rooms), 48 percent were located on an unimproved road, 47 percent had been built before 1920, and 33 percent were "dilapidated." Although 55 percent had electricity, only 14 percent had a telephone and only 18 percent had piped running water inside the house.

By way of contrast, there were about 376,000 part-time and residential farms (42 percent in the South) with net cash family incomes from all sources of $3,000 or more (average $4,337 excluding the 5 percent with incomes in excess of $10,000). Of these farms, 95 percent were owned by the operators, only 1 percent of whom were nonwhite. Fully 85 percent of the operators worked off the farm 100 days or more and 41 percent of the families also had nonoperator members working off the farm. The average family size was 4.5 persons and the median age of the operator was only 46 years. Families consisting of husband, wife, and 1 to 4 children under 18 accounted for 56 percent of all operator families. Only 25 percent (36 percent South, 18 percent non-South) had failed to complete elementary school and 28 percent (22 and 23 percent) had completed high school or more. Of the farm dwellings, which averaged 5.9 rooms, only 19 percent (29 percent South, 12 percent non-South) were located on an unimproved road, 55 percent were built before 1920, but only 8 percent were "dilapidated." About 91 percent had electricity, 51 percent (35 and 63 percent) had a telephone, and 16 percent had piped running water inside the house.

The relationship between education of operator and the extent of operators' work off farm is a significant one, especially pronounced for part-time and residential farms. For operators of the latter who had not completed elementary school, only 46 percent worked off the farm 100 or more days in 1949. The corresponding figures for those completing elementary school (but not high school) and for those completing high school or more were 65 and 80 percent, respectively. But education was also related to age, the younger farm operators having more schooling as well as having more work off the farm. Most of the operators who worked off the farm 100 or more days were under 55 years of age. Of all part-time and residential farm operators, 65 percent were under 55 years. However, of those with family incomes under $1,000, only 49 percent were below 55 years; of those with family incomes over $3,000, 75 percent were below 55. Hence, the importance of higher social-security and public-assistance benefits in helping low-income people on noncommercial farms should not be overlooked.

D. SMALL-SCALE COMMERCIAL FARMS

Thus far, we have been concerned with the 1.7 million low-production farms which were residential or part-time, hence dependent primarily on off-farm work and nonfarm sources of income, in 1949. However, there were almost an equal number (1.6 million) of low-production farms which were small-scale (class VI) and small family-scale (class V) commercial farms.

Characteristics

In 1949, there were in the United States about 0.7 million (74 percent in the South) small-scale commercial farms. Like part-time farms, these class VI farms had gross cash sales of farm products of $250—1,199 (average $720). However, they were distinguished from part-time farms in that their operator worked off the farm less than 100 days and their net cash family income from nonfarm sources was less than the value of their cash sales of farm products. They were closer (median distance 5.4 miles) to a trading center than any class of farm, other than part-time or residential, and were most often (43 percent) located on an unimproved road. Small-scale commercial farms constituted 13 percent of the Nation's farms (19 percent of its commercial farms) and had 13 percent of the Nation's operator family population. However, with only 5 percent of the Nation's farmland (6 percent of the cropland) by acreage and 4 percent by value, they accounted for only 2 percent of the Nation's gross cash sales of farm products (appendix table 1).

The average acreage of their cropland was only 37 acres and the average value of their land and buildings only $4,648. With land resources approximately equivalent to those of part-time farms, these small-scale farms were clearly incapable of providing a satisfactory income for their operator families who, at the same time, almost wholly lacked off-farm employment opportunities. Their human resources more closely resembled those on residential than on part-time farms. For example, 25 percent of their operators were over 64—the highest percentage of any class of farm, including even residential—and 10 percent were widowed or divorced. They also had more operators under 25 (5 percent), more of their operator family population over 64 (11 percent), and slightly fewer under 15 (31 percent), than did any other class of farm. The median age of their operator family population was also the highest (28.6 years) of any class of farm.

However, there was a striking difference in family age structure between South (25.0) and non-South (46.2), while the median age of operators was 50.3 and 60.4 years, respectively. Similarly, the average family size was 4.1 and 2.9 persons, and the percentage of all operator families which consisted of husband, wife, and 1 to 4 children under 18 was 38 and 22 percent, respectively. (In contrast, the differences between South and non-South were relatively minor for families on part-time and residential farms.) These wide regional differences suggest that the low-income problem of small-scale farms was primarily one of the aged in the non-South but was largely attributable to lack of off-farm employment opportunities for people in their productive years in the South. The fertility ratio, standardized for age and marital status, was also higher on small-scale farms than for any other class of farms in the United States (563), the South (578), and (except for residential farms) in the non-South (481)—accentuating the problem of low incomes, particularly in the South.

The median family net cash income for small-scale farms was $730 (average income $975), of which 44 percent of this income was indicated as being derived from off-farm sources. However, given the definition of class VI farms, the Census considered it highly probable that this percentage was actually much less, resulting from an estimated underreporting of their cash farm sales of 25 to 50 percent in relation to the average of total family net cash incomes actually reported. (The Census estimated that, for all farms, net cash income from farming was understated by about 20 percent, with a more-than-average underreporting for part-time and residential farms as well.) At any rate, only 5 percent of the operators of small-scale farms reported that they were primarily engaged in a nonfarm occupation, 1 percent more that they were primarily farm laborers, while only 11 percent of the families reported any nonoperator member working off the farm. Of all operator families on small-scale commercial farms, 67 percent (71 percent South, 56 percent non-South) reported net cash incomes from all sources under $1,000 and 91 percent (93 percent South, 85 percent non-South) under $2,000. Only 4 percent (3 percent South, 7 percent non-South) reported incomes of $3,000 or more, as compared with 25 and 28 percent on residential and part-time farms, respectively. Of the dwellings on small-scale farms, the percentage reported as "dilapidated" was 34 percent in the South, 9 percent in the non-South.

Small-scale farms are found in nearly all regions of the United States, but are most numerous in the southeastern and delta cotton areas and in the general farming areas of the Appalachian Mountains. As a percentage of all commercial farms, small-scale farms constituted 43 percent in the Delta States (Arkansas, Mississippi, and Louisiana), 38 percent in the Southeast States (South Carolina, Georgia, Florida, and Alabama), 31 percent in the Appalachian States (Virginia, West Virginia, North Carolina, Kentucky, and Tennessee), and only 10 percent in all 36 other States combined. They constituted 46 to 52 percent of all commercial farms in the eastern hilly cotton areas of Mississippi, Alabama, and Tennessee; in the southern Appalachian Valley and Mountains and the Cumberland Plateau extending from southeastern Ohio through Kentucky, West Virginia, Tennessee, and North Carolina, to northern Georgia; and the southern Piedmont cotton area of North and South Carolina, Georgia, and Alabama. They also constituted 35 to 40 percent of all commercial farms in the Ozark-Ouachita Mountains and southwest sandy lands of Missouri, Arkansas, Oklahoma, Texas, and Louisiana and in the interior plateaus and western coal fields of Kentucky and Tennessee. Outside of the South, smaller concentrations of small-scale farms are found in the cutover areas of the Lake States, in northern New England, the Adirondacks, the Allegheny Plateau, and north central New Mexico. In general, small-scale farms are most numerous in thickly populated areas where technological and structural changes in farming are slow in coming about and opportunities for alternative employment are limited. Only in the southern Piedmont and southern Appalachian Valley has a substantial beginning been made toward industrialization and, even so, these remain among the areas with the heaviest concentration of small-scale farms.[4]

Policy implications

The low-income problem of small-scale farm families, while especially severe, can hardly be solved by public agricultural policies such as the price-support program. They have so little to sell that, however high the prices which they may receive from their farm products, few can hope to achieve even a modest level of living from the soil. Generally speaking, small-scale farming areas have very high rates of natural increase and land resources not only very limited in amount but often of poor quality and unfavorable topography. Given the pressure of the rural population on the local supply of arable land, land values may reach fantastic levels, sometimes approximating those of the best farmland of the Corn Belt. Agriculture offers the only means to a livelihood for those

who fail to migrate and, lacking other employment opportunities, the local farm people place a very low value upon their own labor. Hence, they tend to bid up the price of local farmland to the point where, by any rational accounting process, the net return on their labor is extremely low if not negative. Under such circumstances, a small tobacco allotment (say, 0.9 acre producing an annual gross cash value of product of not more than $800) may contribute out of all proportion to the purchase price of a small farm.

Such a situation prevails in many parts of the Southeast where—despite a substantial exodus of people to other areas—the rate of migration has been inadequate to encourage, through lower land values, farm consolidation, and reorganization on a higher-productivity basis or the retirement of submarginal farmland to forestry and other uses where more appropriate. Hence, insofar as industrialization of such areas is impracticable, increased public investments in general education (the median years of school completed by small-scale farm operators was 6.1 in the South, 8.3 in the non-South), vocational training for nonfarm employment, and employment-information and public-health services are again clearly needed to step up the rate of outmigration substantially. Such public policies would appear to be justified on the grounds that small-scale farming areas contribute a major part of the Nation's urban population and nonagricultural working force, while lacking the fiscal resources to provide adequate educational, vocational, and health services.

At the same time, it should be recognized that, inadequate though the low-income rural community's investment in these people may be, outmigration (except for remittances to the folks back home) represents a severe drain on such limited capital resources as it may possess. A recent sample survey by the University of Tennessee indicated that, in that State, white owner-operator families with disposable net cash incomes under $1,250 (average $813) in 1949 spent an average of $3,134 per child reared to age 15 for food, clothing, medical care, education, and other direct outlays—not allowing for family overhead costs but charging interest on exenditures at 2 percent, compounded semiannually. The community expenditure for education alone amounted to another $160 per child to age 15. Since, in the same year, Tennessee lost some 42,000 people to other States by outmigration, this represented a total loss to Tennessee farm families and their communities of about $138 million of past "investment" (or about $600 per Tennessee farm) in their excess population in that single year.[5] Thus, the southern people annually invest large though inadequate sums in their crop of children in the unproductive years, while losing them to the more industrial and urban regions of the Nation for their productive life. Clearly, equalization of educational opportunities through Federal grants-in-aid would be justified in easing the fiscal burden of the regions suffering outmigration and in improving the quality of the people migrating into the wealthier recipient regions.

It should also be emphasized that even a fully adequate rate of outmigration from small-scale farm areas may be a necessary but not sufficient condition for their economic readjustment. At best, such areas are bound to have a serious deficiency of capital available for reorganization of the local agriculture into a smaller number of larger, more efficient, and more diversified farming units. Hence—if these areas are not submarginal for larger-scale, more extensive agriculture—they will require the inmigration of considerable farm capital, particularly of intermediate term, as well as the decline in population dependent upon the land. In the absence of the development of public farm-credit policies to serve this need, the result will be abandoned farmland, social disorganization, and (as the selective process of outmigration takes its qualitative toll) stranded and isolated farm people. Of course, if the small-scale farm area is submarginal for agricultural land use (as in the cuttover regions of thte Lake States and in parts of the coal-mining areas of the southern Appalachians) public zoning, mandatory population relocation, and a long-run program of reforestation may be necessary.

Meanwhile, it is clear that the Farmers' Home Administration should scrupulously avoid loans which encourage the perpetuation of uneconomic, essentially subsistence farming units. Similarly, the minimum restrictions which Congress has placed on acreage allotments (particularly on tobacco) in its farm program should be lifted on the grounds that they have atomized production to the point of extreme inefficiency, and have diverted production from the areas of greatest comparative advantage, while retarding the outmigration of farm people from

[5] Erven J. Long and Peter Dorner, Excess Farm Population and the Loss of Agricultural Capital, unpublished paper (1954).

other areas where, under any circumstances, even a modest level of living cannot possibly be gained from small-scale agriculture.

On the other hand, considering the human and social costs of outmigration as well as the extreme difficulties of achieving a sufficient rate of migration, the desirability (where feasible) of the alternative of industrialization of small-scale farm areas is again apparent. Of course, in many instances, such areas lack the local resources, the transportation and power facilities and the public services whcih are prerequisites to much industrial development. However, in other instances, the local facilities would meet the needs of some types of manufacture. Hence, the activities of State industrial development commissions and of Federal activities in community and area development need to be improved and expanded considerably. Through these public services, rural communities with much underemployment can be assisted in appraising their local resources, in determining the types of industries for which they are best suited, and in techniques for attracting and holding such industries. At the same time, public agencies can serve as clearinghouse of information which will help industrialists to find satisfactory plant locations in such communities.

The Department of Labor's designation of labor surplus market areas needs to be broadened considerably to include those characterized by agricultural underemployment, not just these (as now) experiencing current industrial unemployment. The precedent for this step was recently established when Newport, Tenn., was so classified. Unfortunately, there are hundreds of other southern communities which, according to the same standards, deserve a similar status. If these communities could be identified and thus brought out into the open, the considerable amount of hidden underemployment would be revealed as a serious national problem, even under statistically full employment conditions. Then, in financing defense plants and in letting defense contracts, the Federal Government should favor, other thing being equal, location in underemployed rural areas. Finally, in defining its public-power policy—particularly with reference to TVA—the Federal Government should recognize the crucial importance of an adequate power supply to the underdeveloped Southeast. At the present time, largely due to the tremendous power requirements of the atomic-energy plants at Oak Ridge and Paducah, TVA can neither supply new private plants with power nor promise them power connections within the foreseeable future. The real danger is that with Congress niggardly because TVA represents public power and with private utilities reluctant to expand because of public competition, a substantial part of the South will fail to achieve a supply of public or private power commensurate with its rapidly growing industrial needs.

Certainly, to the fullest extent consistent with industrial efficiency, there is a need for improving the low family incomes of small-scale farm areas by the provision of supplementary local off-farm employment. This would mean a change of occupation without change of residence, with the least amount of disruption of family ties and social organization. According to the census classification, small-scale farms would become part-time farms without significant reorganization, not (except to only a limited extent) larger scale commercial farms through the difficult process of consolidation. Whatever the limitations of their physical resources, relatively few small-scale farm areas yet are lacking in a supply of human resources wholly suitable for industrial employment. There has been much misunderstanding of this point, commonly expressed in terms of the alleged preference of such rural underemployed for hunting and fishing. The plain fact is that local nonfarm employment opportunities in rural communities are rationed in the sense that far more farm people would shift to local nonfarm jobs at prevailing wages if these jobs were available.

Time and again, officials of southern industrial development commissions have reported applications for local industrial employment many times greater than the openings which resulted from the establishment of a new plant with a substantial labor force in a rural area. Gale Johnson[6] has found that, in terms of income, farm migrants to nonfarm areas from South and North do about equally well and about 90 to 95 percent as well as urban-born workers and, except for older migrants, close the gap completely within 4 to 5 years. In a study of the experience of Indianapolis employers with southern migrant labor, Eldon Smith[7] did find some reluctance to hire mountain people, particularly if not accompanied

---

[6] Comparability of Labor Capacities of Farm and Nonfarm Labor, American Economic Review, June 1953.

[7] Urban Adjustments of Rural Migrants, Ph. D. dissertation, University of Chicago, 1953.

by their families. The reason given was that they were often too hotheaded and independent to stay on the job long enough to justify their training costs. Nonetheless, southern migrants have generally proved to have considerable capacity and adaptability in shifting to nonfarm employment in other regions.

There also does not appear to be any reason to expect that, through a selective process, outmigration has yet gone far enough to leave behind only those who prefer leisure or who are more limited in capacity. In fact, industrialists with actual operating experience in the South have found the labor supply very satisfactory with regard to "the abundant * * * supply which offers a better selection of workers, excellent trainability * * * high productivity because of cooperative attitudes and low rates of turnover and absenteeism, good labor relations, wage differentials in many cases, low labor costs in virtually all cases." The principal labor disadvantages reported were "shortages of key industrial and supervisory skills, * * * shortages of vocational training programs, and somewhat different industrial relations problems arising out of the developing unionism." [8] Everything considered, the evidence appears to indicate that, given the abundant supply of underemployed labor in the South, those who hunt and fish by preference, rather than by reason of the lack of more lucrative uses of their time, are still a distinct minority. Only given alternatives can their preference for leisure be put to the test. Furthermore, insofar as such a preference is genuine, it can be expected to change with their general pattern of wants if they are drawn into an as yet unexperienced industrial-urban orbit, offering many attractive goods and services not now available to them locally at any price.

E. SMALL FAMILY-SCALE COMMERCIAL FARMS

Characteristics

Finally, in 1949, the United States had about 0.9 million (58 percent in the South) small family-scale farms, with gross cash sales of farm products of $1,200 to $2,499 (average $1,813). These class V farms were a median distance of 5.9 miles from a trading center and were more often (37 percent) located on an unimproved road than any other class of farm except small-scale farms. Small family-scale farms comprised 17 percent of the Nation's farms (27 percent of the commercial farms) and operator family population. However, having only 10 percent of the Nation's farmland (11 percent of the cropland) by acreage and 9 percent by value, they were responsible for only 7 percent of the gross farm product sales (appendix table 1). They averaged 58 acres of cropland and land and buildings worth $7,829 per farm.

As compared with large and medium commercial farms, class V farms had only moderately higher proportions of their operators over 64 (14 percent), under 25 (5 percent), and widowed or divorced (6 percent), and about the same proportions of their operator-family population over 64 (7 percent) and under 15 (33 percent). The median age of their operator-family population (26 years) was the lowest of any class of farm for the United States, but showed a marked regional difference—22 years in the South, next to the lowest class (IV) of farm; and 33.2 years, next to the highest class (VI) of farm, in the non-South. (On the other hand, there was little regional difference in median age for class I, II, and III farms.) Similarly, in the South and non-South, respectively, the median age of the operator was 45.2 and 51.2 years; the percentage of all operator families which consisted of husband, wife, and 1 to 4 children under 18 was 49 and 37 percent; and the average family size was 4.5 and 3.6 persons. Finally, standardized for age and marital status, the fertility ratio was 527, next to the highest class (VI) of farm, in the South; but only 458, on the low side, in the non-South. Thus, as for class VI farms, we must conclude that the low-income problem on class V farms is more largely associated with the aged in the non-South and with lack of off-farm job opportunities for people in their productive years in the South.

The median family net cash income for small family-scale (class V) farms was $1,470 (average $1,900), of which 48 percent was derived from off-farm sources. Of the operators reporting an occupation, 12 percent (the highest for any class of commercial farm) were primarily engaged in a nonfarm occupation and 2 percent were farm laborers. About 18 percent (12 percent South, 26 percent non-South) of the operators of class V farms worked off the farm more than 100 days. Of the operator families, 18 percent reported other members of

[8] Stefan H. Robock and John M. Peterson, Fact and Fiction About Southern Labor, Harvard Business Review, March–April 1954.

the family working off the farm and 21 percent (16 percent South, 28 percent non-South) reported that their off-farm income exceeded gross cash sales of farm products. Of all operator families on small family-scale commercial farms, 18 percent (11 percent South, 27 percent non-South) reported family cash incomes from all sources of $3,000 or more. However, 32 percent (40 and 21 percent) reported incomes under $1,000 and 65 percent (75 and 51 percent) under $2,000. It is interesting to note that, while having higher average agricultural resources than any other class of low-production farms, small family-scale commercial farms had a lower median family income than either part-time or residential farms, and a substantially larger percentage of families (in South and non-South alike) with incomes under $1,000 than did part-time farms. The percentage of dwellings on small family-scale commercial farms reported as "dilapidated" (26 percent South, 9 percent non-South) fell between the comparable percentages for part-time and residential farms.

These class V commercial farms were concentrated in the same areas as were small-scale (class VI) commercial farms. In the delta, Appalachian, and southeast regions, 33 to 34 percent of all commercial farms were class V farms, as compared with 19 percent for the rest of the United States. The heaviest concentration (42 percent) was in the delta cotton area of Mississippi, Arkansas, and Louisiana, followed by the Coastal Plains (37 percent) stretching from Virginia to Florida and Alabama; the cutover area of Minnesota, Wisconsin, and Michigan (37 percent); and the southern Piedmont (36 percent) from Virginia to Alabama. Throughout the Southeast, class V and VI farms together accounted for 50 to 78 percent of all commercial farms in 1949, with the former of somewhat greater relative importance in the areas of better soil and more favorable topography, the latter in the more hilly and mountainous areas.[9]

Policy implications

It is quite possible that a considerable number of the Nation's small family-scale (class V) commercial farms have enough resources to produce from farming a family income comparable with that the same family could earn in nonfarm occupations. The median family cash income for this class of farms was $1,470 in 1949. At least $400 to $500 more should be added for the average value of farm products produced and consumed on the farm[10] in the same year, bringing the median family income in cash and kind (excluding allowance for rent-equivalent of farm dwelling) up to $1,900 to $2,000. Thus, perhaps half of all class V farm families should be considered outside of the real low-income family group, although some of them would be so considered because they had significant off-farm income rather than depending wholly upon income from farming. Because of the greater heterogeneity of class V farms, some subclassification is necessary for policy purposes. Before doing so, however, we should again emphasize the ineffectiveness of price-support programs in solving the low-income problem of small commercial farms. The following comparisons of the average amount of the five largest CCC loans and the average CCC loan on the 1953 cotton crop lend striking support to this argument:

---

[9] McElveen and Bachman, op. cit., pp. 67 and 70.

[10] McElveen and Bachman (op. cit., p. 73) estimated the average value of farm products produced and consumed on the farm for all commercial farms in selected low-production area in 1949: Mississippi Delta $194 (reflecting the small return in kind of the specialized, usually nonwhite, sharecropper in the best cotton areas of the South), $350 to $449 in the Georgia Coastal Plains, interior plateaus of Tennessee, and southwest sandy lands of Texas: $450 to $549 in the eastern hilly area of Mississippi, the North Carolina Cotton Piedmont, and the Missouri Ozark-Ouachita Mountains; and $581 to $667 in the Appalachian Valley of Tennessee and the Appalachian Mountains of North Carolina. The average for the 9 areas was $470, for the 8 areas omitting the Delta, $504.

Prof. Margaret Reid, of the University of Chicago, in an unpublished study of the comparability of farm and nonfarm incomes, concluded that for all farms an allowance of $1,000 should be made for farm income in kind, including food and housing. For low-production farms, however, the average quality of housing (hence its imputed rental value) is relatively low, though $240 to $360 might be a reasonably close rough approximation.

State	Average 5 largest CCC loans	Average, all CCC loans	State	Average 5 largest CCC loans	Average all CCC loans
California	$649,335	$1,731	South Carolina	$87,880	$368
Mississippi	479,535	372	Louisiana	74,823	452
Arizona	231,209	1,378	Tennessee	42,655	299
Texas	219,440	337	North Carolina	42,438	403
Arkansas	192,517	407	Oklahoma	31,932	229
Missouri	153,191	395	Georgia	27,516	309
New Mexico	144,835	500			
Alabama	100,712	318	Average	177,001	536

These data clearly indicate the inefficiency and inequity of a Government price-support program which—in order to add a few hundred dollars (actually the competitive market value of the collateral should be deducted in determining the net benefits) to the average cotton farmer's gross income—must add thousands and thousands of dollars to the income of the relatively few large commercial farmers who are far better off than the typical urban family.

Among the class V farms, there are undoubtedly a significant number of farms which have sufficient land resources for efficient operation but which have low family incomes from farming because of insufficient working capital, deficiencies of management, and the failure to keep abreast with technological progress and changing market demands. More agricultural research needs to be directed toward the special problems of the small commercial farm and more effective ways (such as Kentucky's family plan) of reaching them through the agricultural extension service should be developed. They are also particularly in need of supervised credit for improvement of their buildings, fencing, pasture improvement, and the purchase of machinery and livestock. Their managerial know-how is likely to be particularly deficient if an appropriate farm-reorganization plan would require a shift in their type of farming from a single cash crop to a more diversified crop-livestock combination. They may be excellent cotton or tobacco producers, while knowing very little about efficient production of hogs, cattle, or poultry. Too frequently, even the State research and extension programs are strongly oriented toward a single regionally important cash crop, although this tendency is gradually breaking down.

Local commercial bank resources, in the absence of nearby industrial-urban centers, are likely to be extremely limited and devoted almost wholly to short-term seed and fertilizer loans for the prevalent cash crop. Even if local rural banks are able and willing to make loans for sound improvements which will pay off handsomely but only after 3 to 5 years, they usually will do so only on either a 1-year renewable basis or on the basis of a real-estate mortgage—terms which most cautious farmers will be unwilling to accept. Much the same is true of the agencies of the Farm Credit Administration, which primarily serve the larger commercial farmers, which provide intermediate-term credit needs only in a limited and indirect way through renewable PCA loans, and which are not very active in the South.

In part the credit needs of such farms could be taken care of by the more widespread employment and use of agricultural specialists by rural commercial banks and by the development of intermediate-term types of credit by the FCA. In part private processing firms could play an important role—as they already have in the development of the Southern broiler and dairy products industries—by providing small farmers with the market, the capital, and the managerial knowledge necessary to permit them to shift to profitable but once unfamiliar new farms products. (The southern broiler industry has been an almost unique example of a situation involving sufficient movement of farm capital into highly rural communities to employ much of the local farm population fully in agriculture without requiring a concomitant out-migration of the farm labor force.) But, in large part—given the regional deficiency of capital and the need of careful supervision of its use—the more suitable small commercial farms in the South can solve their credit problem only through the extension and further improvement of the activities of the Farmers' Home Administration. After many vicissitudes this agency has now developed a sound basic statute and a plan of action and supervision well suited to the needs of the Southern low-production commercial farm, particularly if its land resources are adequate, but much await the availability of intermediate-term credit resources if they are to be improved and developed on an efficient basis. A substantial increase in the Government's financial backing of the Farmers' Home Administration would appear to be called for, even at the sacrifice of much of the present costly price-support program.

For a substantially larger number of class V farms, the operator families lack the land as well as other capital resources to produce a satisfactory family income from farming. Insofar as class V (and class VI) farms consist of cropper subunits (each a census farm) of multiple-unit plantation operations, the problems of providing greater land and capital resources per operator family are probably least acute. For purposes of farm reorganization, plantation operations have distinct advantages. First, they usually consist of contiguous tracts of land under common ownership so that the total landholding can rather readily be subdivided into a smaller number of operating subunits as the occasion arises. Furthermore, the owners of multiple-unit operations are likely to have greater resources for self-financing and greater access to local credit agencies in providing a more adequate supply of capital per operator family. Finally, they probably possess more of the managerial know-how and ability to make fullest use of the latest available agricultural research and technology.

With the substantial outmigration of sharecroppers (largely Negro) from the South during the 1940's, much of this type of reorganization took place. As a result of the increasing scarcity of farm labor and higher wage rates, mechanization of cotton production and farm diversification were strongly encouraged, without social hardships, in the areas most suitable for mechanized operations. However, because some gaps remain in the mechanization of cotton, there is still considerable need for labor at certain crucial parts of the cropyear. This fact, in conjunction with a slackening of the pace of outmigration and the lag in the development of sizes of farm machinery adapted to small-scale cotton-farming operations, has put a damper on further plantation reorganization in more recent years. As a result, much inefficiency in the use of farm labor resources remains even under plantation conditions. Certainly, no one would want to promote the displacement of cropper families, in the absence of better off-farm opportunities, through mechanization. However, given such opportunities, public policy should be directed toward facilitating their outmigration and toward eliminating the remaining technological barriers to full mechanization.

In this connection, it should be observed that low-income Negro families face particularly difficult problems in the South. Given racial discrimination in local nonfarm employment, even nearby industrial-urban development may offer them only limited opportunities for bettering themselves. To some extent, certain all-Negro jobs (e. g., broiler processing) may be developed locally; in other cases (notably, in the new International Harvester plant at Memphis) a firm management policy of nondiscrimination is gradually gaining a surprising degree of social acceptance. Nonetheless, progress in this area is of necessity slow and evolutionary in character. Under such circumstances, given industrial-urban development in parts of the South, one might expect that, through a process of occupational selection, the relative importance of Negroes as farm operators might actually grow in the South. In fact, the opposite has happened. Even more than whites, Negroes probably face very great barriers in getting access to the local capital market for farming purposes. Thus, if they become independent farm operators locally, it is usually on the basis of such limited capital and managerial talent that they must locate on the poorer and rougher soils, with resources too small to produce more than the most meager living. As a result of these factors, most low-income Negro farm operators have few alternatives to long-distance migration as a means of improving their economic and social status substantially. In doing so in large numbers, they have run counter to the generally positive association between educational attainment and propensity to migrate. For these reasons, public-education, vocational-training, and employment-information services need to give more attention to the special economic problems of Negroes. Similarly, insofar as it is not yet doing so, the Farmers' Home Administration should make a conscious effort to follow nondiscriminatory loan policies.

Speaking more generally, for whites and Negroes alike, a solution of the low-income problem of areas dominated by class V farms must await either a considerable long-distance outmigration of people from those areas or a considerable amount of nearby industrial-urban development. In our discussion of low-income class VI farms above, we have already indicated the process by which long-run farm reorganization might take place and be facilitated in rural areas which lose sufficient excess population by outmigration. Much the same holds for low-income class V farms except that the latter are perhaps more often located in areas somewhat more suitable in soil and topography for an efficient agriculture, and already have larger land and capital resources per farm upon the basis of which farm enlargement, improvement, and development can more readily proceed.

The institutional and locational barriers to land consolidation are very great. Nonetheless, given sufficient outmigration, farmland does begin to become available for rental or purchase at prices which make farm enlargement possible and economical. As such areas are found, the Farmers Home Administration should be alert to the possibilities of farm enlargement and improvement on a higher productivity basis. It should also be given the financial resources to provide the types of credit and managerial assistance required to bring about the establishment of a smaller number of larger, more efficient, and better diversified farming units in areas in which such a development is feasible and economically sound.

This kind of areawide reorganization of agriculture is a slow process, and the magnitude of the necessary adjustments is exceptionally great. For example, the Mississippi Agricultural Experiment Station recently estimated that the optimum long-run readjustment of the agricultural resources of the Mississippi uplands would require a 150-percent increase in total farm capital and a 60-percent reduction in the farm labor force, accompanied by a substantial increase in the average size of farm. Readjustments of this magnitude can be left wholly to evolutionary forces only at great human and social cost. Certainly, the process must be hastened and facilitated by sound public policies.

At the same time, though the goal is clear, such policies must be gradualistic and voluntary. For underemployed farm people, the objective must be to promote better nonfarm employment opportunities and their knowledge and ability to take advantage of such opportunities on a strictly voluntary basis. In meeting farm-credit needs in areas of extensive rural underemployment, public and private resources must be expanded gradually, with due regard for sound farm planning and the need for extensive managerial assistance. But, within this framework of democratic values and sound economics, public policies must be promptly evolved and generously financed to reduce as rapidly as possible the incidence of rural poverty and rural slums in America.

Once again, as already covered in detail in our discussion of small-scale (class VI) farm areas, we should emphasize the importance of industrialization of areas of rural underemployment as a frequently superior alternative to large-scale outmigration of underemployed farm people. We do not need to repeat that discussion here with reference to means of improving the low incomes of class V farm areas, although much the same principles would hold. The principal difference is that, given nearby industrial-urban development, class V farms may more often than class VI farms have the capabilities for reorganization into full-time farming units, which might produce a more satisfactory family living from farming alone, instead of following the alternative route of becoming additional part-time farms. Hence, the only significant thing we can add here is to describe how industrial-urban development can serve as the dynamic factor which brings about local agricultural reorganization at a minimum of human and social costs and of public intervention.

There are a limited number of local areas in the southeast which, for one reason or another, have had considerable industrial-urban development—accompanied by a significant influx of nonagricultural capital and a rising per capita income—during the past several decades. Yet, 30 to 50 years ago, these economically advanced counties were as rural and as dependent upon agriculture (and had comparably low farm output per worker and family levels of living, and similar resources and cultural history) as contiguous counties which, lacking industrial-urban development, have remained economically backward until the present day. Observation and comparison of such groups of counties suggest that industrial-urban development has had very important effects in improving the efficiency and family income of the local agriculture in the economically advanced areas. What appears to happen is as follows:

By creating nearby nonfarm employment opportunities, local industrialization increases the actual cost of hired farm labor and the imputed cost of operator-family labor used in agriculture. The full-time farm operator, faced with higher labor costs, is forced to reorganize his farm business so that the productivity of the worker remaining in agriculture is raised enough to cover his greater cost.

Such reorganization may take the form of farm enlargement, improvement and more intensive use of existing farms, or subdivision into smaller part-time and residential farms, depending primarily upon location relative to the growing urban center. But, in every case, it involves a higher ratio of capital to labor on the farm.

The important thing is that, by breaking down imperfections in the local labor and capital markets, industrial-urban development of rural areas greatly speeds readjustments in the direction of higher productivity and higher family incomes for agriculture. First, because it is much easier to get underemployed people to change occupations without changing residence (migration), local nonfarm job opportunities have a far more immediate and marked effect upon local labor returns than do distant opportunities. Second, the drain on local community capital which accompanies outmigration is avoided. Third, the influx of nonagricultural capital which accompanies industrialization increases local banking and credit resources and personal savings. Hence, local financial institutions become more adequate to thte need for local economic development and, in the process, more willing and able to provide nearby agriculture with much-needed capital resources.

Fourth, with the growth of industrial-urban centers, additional nonfarm jobs are generated in the service industries. Thus, with new markets created for locally produced farm products, local business leadership has new incentives to establish and extend farm marketing and processing facilities and to develop sources of supply by providing local farmers with the capital and know-how needed to shift to new and more profitable lines of production. Furthermore, with improved local markets for consumer and farm-production goods, local farmers are likely to gain by the availability of a wider range of goods and services, provided on a more efficient and more competitive basis and with more adequate informational and credit facilities. Finally, with greater concentration of population and rising per capita incomes, such developing communities can supply much-improved public services (e. g., education, health, transportation, and communication) which raise nearby rural levels of living and stimulate further economic development.

Unfortunately, outside of a few older metropolitan areas, industrial-urban development in the South has been relatively spotty and has not yet been widely enough diffused to alleviate much of the low-income problem in areas of rural underemployment. Where industrial-urban development has taken place, however, the ameliorative effects on the nearby agriculture have been substantial and clearly point to its desirability as one major route to raising the productivity and income of this region and its vast underemployed farm population. Hence, public policies need to be developed to help rural communities industrialize; to stimulate the growth of small business; and to assure low-income regions of adequate power supplies and auxiliary public educational, vocational, informational, and communication services.

The magnitude of the problem is too great to leave wholly to private evolutionary forces. For example, during 1950–60, the 7 Tennessee Valley States will have a natural increase in their labor force of 1,600,000 and (conservatively) 500,000 more will leave agriculture. Thus, during the present decade, this region will need to find nonfarm outlets for at least 2,100,000 workers. These 7 States enjoyed as great an expansion in nonagricultural employment during 1940–50 as in the previous 50 years. But, even with the same large volume of outmigration as took place during that decade, these States must provide additional nonfarm job opportunities, as great as those produced in the phenomenal 1940's, if the expected accretions to its labor force are to be fully absorbed. With no outmigration, even such progress would absorb only one-half of the expected accretions to their nonagricultural labor force.

F. CHARACTERISTICS OF COMMERCIAL FARMS BY LEVEL OF FAMILY INCOME AND PRODUCTIVITY

Characteristics by size of family income

It is not possible to determine the characteristics of low-production (class V and VI) farms only by family income. Such information is available only for all commercial farms, although low-production commercial farms accounted for 74 percent of all commercial farms with family net cash incomes from all sources under $1,000; but only 42 percent of all with incomes of $1,000 to $2,999 and only 17 percent of all with incomes of $3,000 or more. Hence, the characteristics of commercial farms with incomes under $1,000 largely reflect those of class V and VI farms only.

Among all commercial farms, lower family incomes were associated rather closely with greater tenancy and sharecropping in the South but not in the non-South, where owner-operators were of considerably greater relative importance (appendix table II). Nonwhite operators and operators and family members with little or no off-farm work or income were more common in the lower income group. There was little relation between family income and median age of operator or average family size in the South but there was a negative relationship in the non-South. Lower family incomes were also associated with lower educational achievement, more frequent location on unimproved roads (but, in the South, location closer to a trading center), and smaller and more poorly maintained and equipped housing.

More specifically, in 1949, there were about 927,000 commercial farms (68 percent in the South) with family cash incomes under $1,000. Their average family income was $440 in the South and $513 in the non-South but, taking regional differences in average family size into account, the difference in per capita cash income was greater—$102 in the South and $160 in the non-South. Of these farms, 57 percent (46 percent South, 81 percent non-South) were owned by the operators, 27 percent (39 percent in the South) of whom were nonwhite. In the South, of all commercial farms with incomes under $1,000, 25 percent were operated by tenants and 29 percent by croppers. For the Nation as a whole, only 2 percent of the operators of these farms worked off farm 100 or more days, only 11 percent had other family members reporting any nonfarm work, and only 4 percent of the families received off-farm cash income in excess of their gross farm-product sales.

For commercial farms with less than $1,000 family income, there were distinct differences in the character of the operator family population between South and non-South—median age of operator 47.8 and 55.2; average family size 4.3 and 3.2; and percentage of complete operator families with 1 to 4 children under 18 years, 41 and 31 percent. About 63 percent (76 and 35 percent) of the operators had not completed elementary school and only 6 percent (4 and 11 percent) had completed high school or more. In the South, 50 percent of these low-income commercial farms depended primarily upon cotton production and 24 percent on other field-crop specialties (principally tobacco and peanuts). In the non-South, most of them depended primarily upon dairy or poultry (37 percent) or other livestock (28 percent). These farms averaged 5.5 miles from a trading center and 43 percent (50 percent South, 31 percent non-South) were located on an unimproved road. Of their farm dwellings—averaging 4.6 rooms in the South and 5.9 rooms in the non-South—54 percent (45 and 69 percent) were built before 1919 and 26 percent (32 and 12 percent) were dilapidated. While 64 (60 and 75) percent of these farms had electricity, only 20 (7 and 49) percent had telephones and only 23 (15 and 40) percent had piped running water inside the dwelling.

It is interesting, by way of contrast, to review the characteristics of the Nation's commercial farms with family incomes over $3,000, which should represent the high-production and high-income minority of the Nation's farms. In 1949, there were 1,044,000 of these farms (only 25 percent in the South), of which 8 (8 and 9) percent had family incomes of $10,000 or more. Excluding the latter, their average family income was $4,618 in the South and $4,704 in the non-South or, on a per capita basis, $1,100 and $1,120, there being no regional difference in family size among upper-income commercial farmers. Of these farms, 77 percent were operated by owners, but only 6 percent by croppers and only 3 percent by nonwhites. Of their operators, 16 percent (20 and 14 percent) reported more than 100 days of off-farm work, 21 percent (22 and 20 percent) reported other family members working off farm, and 14 percent (20 and 12 percent) reported off-farm income greater than gross cash sales of farm products. With virtually no regional differences, these farms had operators with a median age of 46.2 years, an average family size of 4.2 persons, 53 percent of their operator families consisting of husband, wife, and 1 to 4 children under 18, and 27 percent of their operators with a high-school education or better. Even in this upper-income group of farms, however, 24 percent (35 and 21 percent) had not completed elementary school.

In the South, 53 percent of these upper-income commercial farms (as compared with 76 percent of those with incomes under $1,000) were primarily dependent upon cotton, tobacco, cash-grain, and other field-crop specialties. But 47 percent (as compared with 24 percent for the low-income group) derived their major farm income from dairy, poultry, other livestock, and general farming. In the non-South, the corresponding figures were 26 and 74 percent, respectively. These farms were a median distance of 6.1 (6.8 and 5.8) miles from a trading center but only 23 (42 and 17) percent were located on an unimproved road. Of their farm dwellings, which averaged 5.7 and 6.9 rooms, 65 percent (34 percent in the South, 75 percent in the non-South) were built before 1919 but only 5 (9 and 4) percent were "dilapidated." Fully 91 (90 and 91) percent had electricity, 70 (64 and 72) percent had piped running water inside the dwelling, and 63 (38 and 72) percent had a telephone.

Levels of productivity on commercial farms

In table 2, we present some basic productivity indexes for all commercial farms combined in selected low-production farm areas, mostly in the South. Among the 9 southern low-production areas, the average value of product (including home-produced food) per farm ranged from $1,910 in the eastern hilly area of Mississippi to $3,242 in the coastal plains area of Georgia, or from 30 to 52 percent of the national average and from 20 to 34 percent of the average in central Iowa. Perhaps a more significant measure of output is "the value of product added" after allowing for major production expenses. Among the southern areas, the value of product added per farm ranged from $1,525 in the eastern hills of Mississippi to $2,421 in the delta of the same State, or 38 to 60 percent of the national average and 25 to 40 percent of the central Iowa average. Considering these wide ranges in output per farm, there was a very narrow range in labor input per farm, after adjustments for off-farm work and other factors. Among the southern low-production areas, the range was from 1.30 (eastern hilly) to 1.79 (coastal plain) man-years per farm, or fully 77 to 107 percent of the national average and 92 to 126 percent of the central Iowa average. On the other hand, there was a much wider range in capital input per farm, from $5,563 in the eastern hills of Mississippi to $12,993 in the interior plateaus (central basin and highland rim) of Tennessee, or 24 to 57 percent of the national average and only 12 to 28 percent of the central Iowa average.

TABLE 2.—*Output and labor and capital inputs, per farm and per worker; resources used per unit of output; acres of cropland per farm and average land values per acre, all commercial farms in United States, central Iowa, and selected low-production areas, 1949* [1]

Selected area	Average per farm				Average per worker [4]			Per $1,000 of product added [2]		Cropland per farm (acres)	Value of land and buildings per acre	
	Product added [2]	Value of product [3]	Labor input (man-years) [4]	Capital input [5]	Value of product [3]	Product added [2]	Capital input [5]	Labor input (man-years) [4]	Capital input [5]		Cropland	Cropland and open pasture
United States	$4,063	$6,282	1.68	$22,923	$3,739	$2,418	$13,645	0.41	$5,642	88.5	$200	$86

Mississippi eastern hilly	1,525	1,910	1.30	5,563	1,469	1,173	4,279	.85	3,648	28.4	143	92

[1] Compiled or computed from McElveen and Bachman, Low Production Farms, U. S. Department of Agriculture, Information Bulletin 108 (1953), tables 10–14, 33.

[2] Value of farm products produced (including estimate of product consumed on farm) less expenditures for purchase of livestock and poultry, feed seed, fertilizer, fuel, and tractor and machinery repairs.

[3] Including estimate of value of product produced and consumed on farm.

[4] Man-years of 2,500 hours, adjusted for operator's work off farm, age of operator, and seasonality, quantity, and quality of family labor inputs.

[5] Sum of value of land and buildings, power and machinery, and productive livestock.

These comparisons mean, of course, that the typical Southern farm worker had far less capital to work with, so that his productivity was far less. For example, labor input per farm in the Appalachian Valley of Tennessee and the Cotton Piedmont of North Carolina (despite local manufacturing employment well above average for the selected southern areas) was virtually the same as in central Iowa, but their farm workers had only 20 to 24 percent as much capital to assist their efforts and (in terms of product added) produced only 29 to 31 percent as much. Among the southern areas, capital per worker ranged from $4,279 in the eastern hilly section of Mississippi to $7,863 in the Appalachian Valley of Tennessee—or 31 to 58 percent of the national average and only 13 to 24 percent of the central Iowa average. Product added per worker ranged much more narrowly, from $1,173 in the eastern hills to $1,494 in the Delta—or 49 to 62 percent of the national average and 28 to 35 percent of the average for central Iowa.

Put another way, it took about twice as much labor to produce $1,000 of product added in these low-production areas as in the Nation as a whole and all of 3 to 4 times as much as in central Iowa. On the other hand, per $1,000 of product added, capital input in the southern areas were surprisingly high, ranging from $3,024 in the Delta to $6,255 in the Appalachian Valley—or 54 to 111 percent of the national average and 40 to 82 percent of that of central Iowa. This suggests that the low-production problem in the South may be less a deficiency of capital in present production techniques than an inefficient scale of operations which hampers changes in these techniques, the unsatisfactory composition of present total capital investment, and the existence of a large element of hidden underemployment in present labor inputs.

First, on the matter of scale, these interregional comparisons conceal the fact that the typical commercial farms of central Iowa are large and medium (classes II–IV) family farms, whereas in the low-production areas they are small-family (class V) farms. Thus, the average commercial farm in central Iowa has 136.7 acres of cropland, as compared with only 16.2 acres in the Appalachian Mountains and 28 to 46 acres in the other southern areas, and typically that land is much more adequately improved, has considerably better soil, and has a topography more favorable to mechanized operations. Because of their larger average scale, Iowa farms can make more efficient use of machinery in crop production, can obtain a substantially larger output from a given investment in livestock, and can more generally take advantage of the latest advances in agricultural technology, such as improved seeds and strains of livestock, knowledge in the use of fertilizers and insecticides, and the like. Thus, while central Iowa farms have several times as much farm power and machinery per worker as do commercial farms in the low-production areas, power and machinery comprise a smaller proportion of their total capital investment than they do in any of the low-production areas where, because of the small scale of operations, even the present stock of machinery is underemployed. Similarly, except in the Delta and Cotton Piedmont, all southern low-production areas had a larger proportion of their total capital invested in productive livestock than did central Iowa, even though the latter had many times more livestock per worker.

Second, despite the fact that the commercial farms in no low-production area had as large a proportion of its total capital investment in land and buildings as did those in central Iowa, this proportion was probably unduly high in the South in terms of total productive investment. It should be emphasized that the value of the farm dwelling (an unproductive investment) is included in the value of land and buildings, which in turn accounted for 65 to 82 percent of the total capital investment on commercial farms in our low-production areas. Given the small scale of southern farms, even farm dwellings quite modest by Iowa standards would bulk relatively large in the total capital inputs of such farms, as compared with more sumptuous dwellings in Iowa. Hence, for this reason, the data of table 2 may somewhat overstate the productive capital inputs for southern farms.

Furthermore, given the pressure of population on the land in the South for both residential and productive uses farmland is likely to be over priced relative to its productivity as compared with Iowa land. Hence, $1,000 of investment in Southern farmland (particularly in tobacco areas) will frequently buy less in the way of quality of soil, topography, and productive improvements than the same amount invested in Iowa land. Thus we find (table 2) that the value of land and buildings per acre of cropland in commercial farms was $508 in the Appalachian Mountains of North Carolina and $300 in the Appalachian Valley of

Tennessee, as compared with $281 in central Iowa. The comparable figures per acre of cropland and open pasture combined (omitting only woodland) were $277, $148, and $245 with land values in the Cotton Piedmont ($162) and the Delta ($150) exceeding the Appalachian Valley on this basis.

These considerations indicate that, of the total capital now invested in southern commercial farms, an excess amount is invested in farm dwellings and relatively unimproved land and too little is invested in productive improvements (other farm buildings, fencing, pasture improvement, etc.) in the farmland proper. Clearly, in the absence of local industrialization which will convert many of these small farms into part-time or residential farms without reorganization, a correction of this situation will require a combination of considerable outmigration with much land consolidation and improvement by those families which remain behind.

Difficult though such an areawide reorganization of agricultural resources is to achieve, table 3 makes clear that, in every low-production area of the South, there are already some farms of sufficient size and capital resources to attain relatively high levels of productivity, hence satisfactory family incomes from farming alone. Unfortunately, such farms constitute only 20 to 50 percent of all commercial farms in the low-production areas, as compared with 88 percent in central Iowa and 62 percent for the Nation as a whole. The paramount problem for public policy is to develop means of facilitating the reorganization of American (particularly southern) agriculture, so that the proportion of medium-to-large family farms can increase at the maximum rate consistent with voluntary action and democratic values.

TABLE 3.—*Output and labor and capital inputs, per farm and per worker; resources used per unit of output; acres of cropland per farm and average land values per acre, by economic class of farm in United States, central Iowa, and selected low-production areas, 1949* [1]

[1] Compiled or computed from McElveen & Bachman, op. cit., tables 15, 16, 17, 18, 38, and 40. Where data are not shown, it is because they are not available.

The first step is to realize the fundamental fact that there are far more American families trying to make a living from farming than our agricultural resources can possibly support at a level of living comparable with that afforded by comparable nonfarm occupations. The second step is to recognize that, while primarily benefiting those farm families which are least in need of financial aid, our agricultural price-support policies can contribute almost nothing to a solution of the problem of rural poverty. At the same time, because of their great cost in treasure and in administrative effort, they strongly divert public funds and public concern from millions of underemployed rural people who require substantial and sustained assistance. The final step is to develop a consistent, coordinated, and integrated set of public policies which will by attacking the fundamental causes, go far toward solving the problem of rural poverty during the next decade or two.

IV. A Positive Program for Reducing Rural Poverty

Agriculture and economic progress

All of American agriculture has a strong interest in public policies directed toward the maintenance of economic stability. In fact, for the medium to large commercial farmer, it is the instability of farm prices and incomes, rather than their level, which is his principal problem. Hence, it is quite important to American agriculture that the national economy be stabilized at a high level of employment and income, that (as a second line of defense) public policies provide for a moderately high floor under farm incomes should a general economic recession nonetheless ensue, and that public-storage and crop-insurance policies be developed which will give him considerable protection against drought and other hazards of nature. While meeting these objectives would require considerable modification of present national agricultural policies, our present interest lies elsewhere. What concerns us here is the longer-term problem of national economic growth and the means of assuring that agriculture will receive and contribute its full share in that economic growth, consistent with the general public interest in a highly productive national economy and high and equitably distributed real incomes.

It is of the essence of economic progress that the proportion of a developing national economy's labor force engaged in agriculture should decline. This is true on the demand side because of the slackening rate of population growth in an industrial-urban economy and the low income elasticity of demand for foods and fibers (apart from attached services) as a nation's real income rises. It is also true on the supply side in that, in a progressive economy, agriculture fully shares in the fruits of technological research and progress, so that fewer and fewer labor resources are needed to produce a given output. As a result, quite contrary to the dreary Malthusian thesis, an economically advanced nation is likely to be faced with a strong secular tendency for the growth in the supply of farm products to outspace the growth in the demand for them. This follows because of the difficulty and slowness with which basic structural readjustments in the occupational composition of the labor force take place, particularly where the basic forces requiring such readjustments are constantly reinforced by further progress.

As a consequence, there tends to be an almost perennial oversupply of labor in the agriculture of an advanced economy, exerting (apart from wartime periods of extraordinary demand) a rather continuously depressing effect on farm prices and, even more, average family incomes. Opinions differ as to whether the demand for American farm products will catch up with their supply during the next two decades. Population projections for the United States have been revised upward substantially as a result of the sharp rise in birthrates since 1940. On the other hand, more general application of present knowledge about efficient farming practices could add substantially to the Nation's farm output and there appears to be reason to expect that further technological progress in agriculture will be substantial. At the very least, the United States has the prospect of meeting fully its prospective food and fiber needs during the decades that lie ahead. At the same time, there are 2 million or more farm families which, in any case, add too little to agricultural output to be of public concern as actual or potential producers of foods and fibers.

Nonetheless, as victims of rural poverty who could earn more and consume more in nonfarm occupations, they should be of great public concern as the Nation's greatest reservoir of underemployed and largely wasted resources.

Unfortunately, given the unsatisfactory nature of national employment statistics, these people are considered "fully employed" although at best their employment is part-time and very unproductive. Their inclusion among America's farm-workers also pulls down the farm income per worker or per capita to levels which compare very unfavorably with nonfarm income, lending support to public farm policies which help them hardly at all while concealing the need for a positive public program (largely nonagricultural in nature) to alleviate their low state of productivity and income.

Obstacles to the reduction of rural poverty

The principal obstacles to a reduction in the degree and extent of rural poverty are the inadequacies of investment in the vigor and productivity of our human resources and the barriers to mobility of both labor and capital.

Even the richest of communities, urban or rural, is bound to have its hard core of permanently poor as a result of old age, physical and mental disability, and broken families. Outside of the South, a major proportion of the low-income farm families are poor for such largely unavoidable reasons and, generally speaking, their communities are wealthy enough to alleviate such occasional poverty and to provide adequate public services which will enable the children of such poor families to rise above their initial poverty. In much of the South, however, the low-income problem is community-wide and largely self-perpetuating, because the local community lacks the resources to provide adequate public education and health services for the younger generation. While many of those in their productive years do seek escape from their poverty by the difficult route of long-distance migration, they are ill-prepared for such a drastic change in their way of life, drain their community of even its limited capital resources, and yet bring to the richer communities to which they mirgate an undesirably low level of general education and skills. Many others who should also migrate—lacking the knowledge, vigor, and productivity which such a serious step requires—fail to do so. Thus, as a result of the inadequacies of public investment in improving the quality of these potentially valuable human resources, both the low-income area and the Nation at large suffer an incalculable loss.

Among the other obstacles to labor mobility, several deserve special emphasis. First, insofar as the national economy is unstable or fails to expand at a sufficiently rapid rate, the lack of satisfactory alternative job opportunities in other occupations or regions is a paramount barrier to the reduction of rural poverty. Second, given sufficient opportunities elsewhere, the lack of adequate public employment-information services is a serious one. In rural areas, where the larger farmers are most concerned with an adequate supply of hired labor, local political pressure may cause the local employment service to emphasize farm placement rather than to facilitate much-needed shifts of labor out of agriculture all together. In any case, the administrative compartmentalization of farm and nonfarm placement is likely to cause the employment service to work at cross purposes. Third, there is in most rural areas a serious lack of vocational training for occupations other than agriculture. Few rural high schools offer vocational training other than agricultural, and the congressional formulas for allocation of Federal vocational-training grants-in-aid to the States and the almost complete administrative compartmentalization of farm and nonfarm vocational training programs tend to perpetuate this situation.

Fourth, while a facet of the problem of capital mobility, the rate at which industrialization of rural areas is proceeding is still so slow as to discourage adequate labor mobility. The reason is that it is much easier to induce underemployed rural people to change occupations locally than to change their place of residence and way of life as well. Finally, certain public policies may actually discourage labor mobility. Certainly, while being too small to return a satisfactory family income, minimum acreage allotments (particularly for tobacco) may cause low-income families to hang on to a meager subsistence from agriculture rather than to shift to another occupation. Similarly, under the peculiar circumstances of part-time farming, unemployment compensation may create an incentive for them to refrain from migration. In the South, many part-time farmers who work seasonally at nonfarm employment qualify for unemployment insurance, which may constitute a major sources of cash income. At the same time, local industrial plants can follow unstable and even irresponsible employment policies with impunity.

The obstacles to capital mobility into low-income rural areas are great with regard to both industrial and agricultural investments. To a major extent, the flow of industrial capital is a matter for private enterprise rather than public policy. However, Federal policies toward the location of defense plants and toward public and private power have thus far failed to take adequately into account the crucial importance of additional industrialization to much of the low-income rural South. While certain spectacular developments in the atomic-energy field have been located in the South, these are such mammoth users of power as to seriously retard the development of new private power-using industries in that area, given a shortage in the total power supply. The Federal concept of "labor-surplus" areas has also been much too narrow to reveal the existence of an abundant underemployed rural labor supply in most of the southern region. Much of the interest of labor organizations in a uniform national minimum wage has also been motivated by a drive to eliminate North-South wage differentials the existence of which would appear desirable, though a relatively minor factor, in encouraging much-needed industrial development in the South. Certainly, the Federal Government has done relatively little, on an informational level, either to help low-income rural areas to help themselves or to provide industrialists with an appreciation of the need and the opportunity for industrialization which many of these areas offer.

On the agrcultural side, the obstacles to capital mobility have been nearly as great. As presently organized, the agriculture in most low-income areas is not in a position to make extensive use of additional capital. In the long view, however, given a sufficient reduction of the excess farm labor supply by out-migration or by local industrial-urban development, the opportunities for farm consolidation, reorganization, and improvement are great. However, even where such opportunities exist, most financial institutions are not yet equipped to take care of the credit needs of the more promising farmers and low-production farming areas. Intermediate-term credit is virtually unavailable from any source and few commercial banks in rural areas are able or willing to provide supervised farm credit on acceptable terms or of sufficient magnitude to do the job.

The agencies of the Farm Credit Administration have failed to develop means of meeting the credit needs of the small farmer or of the low-production farm areas. Only the Farmers' Home Administration and, in isolated instances, private processors of farm products of farm products have made a real start on this serious credit problem and their resources have been far less than adequate as measured against the size of the task. Finally, agricultural experiment stations have tended to neglect the small farm and its enlargement, reorganization, and diversification in their research programs while few agricultural extension services have developed effective means of reaching the operators of small or part-time farms. In the absence of the influx of capital which accompanies industrial-urban development, there seems to be no alternative to Federal farm credit as a means of raising farm incomes in low-income rural areas, since there is bound to be an areawide capital deficit and the agriculture in such areas is quite unlikely to attract much private capital from other regions.

The way out

The magnitude and difficulties of the low-income rural problem in the United States almost stagger the imagination. But they should make clear that, despite our deep concern for assisting underdeveloped nations abroad, we may have overlooked comparable problems—different in degree but not in kind—of underdeveloped regions within our own Nation. In the interest of a strong and growing national economy, we can no longer afford to neglect these serious regional problems.

At various places in this memorandum, we have discussed the policy implications of the low-income farm problem in some detail. Hence, we need do no more than summarize them here. In my view, a positive program to reduce rural poverty would have the following major elements:

(1) The development of a substantial program of Federal grants-in-aid for public-school education and for expanded public-health services.

(2) The maintenance of a stable and steadily expanding national economy.

(3) The extension and improvement of the United States Employment Service in rural areas, with fuller integration of the objectives and administration of farm and nonfarm placement.

(4) A considerable increase in congressional appropriations for vocational-training grants-in-aid to the States, with a revision of the allocation formulas to encourage nonfarm training in rural high schools and to break down the administrative barriers between the farm and nonfarm phases of the program.

(5) The abandonment of present provisions for minimum acreage allotments in our basic farm legislation because of their dilatory effect on productive efficiency and labor mobility.

(6) The revision of the basic statute on unemployment compensation, and of its administration, to eliminate factors tending to discourage labor mobility.

(7) The development of Federal policies favoring location of defense plants in areas of rural underemployment as well as of urban unemployment.

(8) The development of a Federal power policy which will, through a combination of public and private sources, assure the South of a power supply consistent with its industrialization needs.

(9) A revision of the Department of Labor's concept of labor-surplus areas broad enough to include underemployed rural labor as part of the local labor surplus.

(10) The introduction of a regional differential if the minimum wage is raised.

(11) Expansion and improvement of the services of the Area Development Division of the Department of Commerce.

(12) The development of intermediate-term types of credit by the Farm Credit Administration.

(13) A substantial increase in the resources of the Farmers' Home Administration.

(14) Increased emphasis in the programs of the agricultral experiment stations and agricultural extension services on the problems of the small farm.

(15) Further development of the programs of the Federal Reserve banks aimed at increasing the participation of commercial banks in agricultural development.

(16) A modest program in rural home improvement, probably under the Farmers' Home Administration, with due regard for the farm as a production rather than as a residential unit.

(17) Increased benefits and extended coverage for farmers and rural people under the OASI, public assistance, and rehabilitation programs.

[1] Compiled from U. S. Bureau of Census, Farms and Farm People, Washington 1952, chs. 3, 4, and 5; House Committee on Agriculture (committee print), Long Range Farm Program: Technical Studies * * *, Washington 1954, p. 161.

[2] Commercial farms are classified as follows according to total farm-product sales in 1949: Classes I and II, over $10,000; class III, $5,000 to $9,999; class IV, $2,500 to $4,999; class V, $1,200 to $2,499; and class VI, $250 to $1,199 with operator working off farm less than 100 days and other family income less than farm-product sales.

[3] Part-time farms had farm product sales of $250 to $1,199, differing from class VI commercial farms only in that operator worked off farm more than 100 days and other family income exceeded farm-product sales. Residential farms had farm-product sales of less than $250.

[4] South (S) consists of the 16 States of the following census regions: South Atlantic, East South Central, and West South Central; combined North and West (N, W) the remaining 32 States.

[1] Compiled from U. S. Bureau of the Census, Farms and Farm People, Washington, 1952, ch. 5, tables 4 and 5, pp. 80–88. "Family income" includes income from wages and salaries; net money income from own farm, business, or professional practice; and other income (interest, dividends, veterans' allowances, pensions, or rents) received by all family persons 14 and over during 1949.

[2] The South (S) consists of Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas. The combined North and West (N, W) consists of the remaining 32 States.

[3] "Commercial farms are those with a value of farm products sold in 1949 of more than $1,200, plus those with a value of products sold of $250 to $1,199 whose operator worked off farm less than 100 days and whose family income from off-farm sources was less than its income from farm-product sales.

[4] "Other farms" include part-time farms (with farm products sales in 1949 of $250 to $1,199 but whose operator worked off-farm more than 100 days and whose family income from off-farm sources was more than its income from farm-product sales), residential farms (product sold less than $250), and abnormal farms.

STATEMENT ON AGRICULTURAL POLICIES BY MURRAY D. LINCOLN

Mr. Chairman and gentlemen of the committee, my name is Murray D. Lincoln. I am appearing here today as president of the Cooperative League of the U. S. A. I am also president of CARE and of the Farm Bureau Insurance Cos. of Columbus, Ohio. In addition, I operate a thousand acres for dairying and grain farming in Ohio.

You have asked me to give you my views on the present agricultural policies and programs and the general outlook for the farmer. First, let me say that the farmer seems to be the forgotten man in the Economic Report of the President. I cannot understand the slight attention paid to our national policy for American agriculture, which, on the basis of most evidence, is a major failure.

I don't know whether "depressions are farm bred and farm led." I do know that agriculture is still at the base of the American economy, and I feel deep concern over the long and drastic downward trend in farm income.

This is a farm crisis because our present farm policies have failed to produce the results expected of them. Actions which we once supposed would bring solutions to our problems have not withstood the tests of adversity. And, in my opinion, the changes that were made in the Agricultural Act of 1954 were changes for the worse.

Because this is so I am asking that we here today take a "new look" at the problem. The "new look" which I propose is not destructive. Obviously, we cannot scrap the present program of price supports and acreage allotments until we can put something better in its place. But merely to continue down the same unproductive road is folly. We should be trying to expand consumer demand upward to overtake farm production rather than trying to restrict production downward to meet demand. Our basic approach is wrong. We should be using our total farm output to improve living standards both at home and abroad. Unfortunately, in neither case will our present price-support policies and acreage allotments help to expand consumption. Quite the opposite is true.

To me anyway, it is unthinkable that we should regard the farm problem as one of surpluses and overproduction and therefore try to figure out ways not to produce so much food. Neither should we try to fill caves with cheese, to cram warehouses with butter, or to load ships taken out of mothballs with grain.

What is the thing that stands out as we take this "new look?" The dominant thing that we see, I think, is that better times for farmers go hand in hand with an expanding economy and higher consumer spending power for all people. A full, growing economy is the best way to expand the demand for food upward to keep pace with farm production.

Full production and full purchasing power in our economy are also the solution to poverty in agriculture. About one-third of our farm families are working uneconomic farms and living at levels far below our American ideas of decency. No conceivable price-support program would raise these families up to a "parity" standard of living with urban groups.

When the country is growing, jobs open up. The marginal farmers shift to more productive and better paying occupations. To illustrate, in the prosperous year 1953, agricultural employment declined more than 660,000, while nonagricultural employment increased by 1.3 million. The shift raised productivity in agriculture and resulted in more needed goods for everyone.

If the country stagnates, however, poverty in agriculture is aggravated. For example, the recession of 1954 caused a relatively larger part of total employment to be located in agriculture. Whereas nonfarm employment fell by almost 1.4 million, the farm labor force was almost stationary. Productivity on the farm came to a virtual standstill in 1954 after very rapid increases during the postwar full employment years. Nor was this surprising, since depressed income conditions in agriculture far exceeded those for the whole economy, and farmers could not improve their land and their tools at anywhere near the earlier postwar rate.

The forced shift into agriculture of a larger percentage of the labor force—induced by unfavorable economic developments—must cause deep concern at a time when agricultural income is declining sharply; when many people are bewailing agricultural "surpluses"; when people on the farms are being exhorted to find jobs in industry where it is said they will be more "efficient"; and when the most genuine surplus in agriculture is a surplus of low-income people whose low consuming ability is hurting the whole economy.

What I am saying is that the solution to the farm problem depends more upon our achieving and maintaining maximum employment, production, and purchasing power for the whole economy than upon the type of level of price suports.

Agriculture is one important sector of our interrelated economy. Its purpose is to grow food and fiber—and food and fiber are for people to consume.

This is a simple and an obvious idea, yet when you think about it, you see that it leads to the creation of a national food policy instead of to the present notions of national farm policy.

What are the differences between a national food policy and a national farm policy? Well, a national food policy starts with food and the needs for food instead of the farmer, and aims to benefit both the producer and the consumer. It is based on the premise that every person should get a maximum amount of needed food at the lowest possible price. It seems clear to me that our attempts to solve the farm problem must benefit the whole economy—all the people—not just some of them. As a matter of fact, all people, not just farmers, are involved in this matter of a food policy. Certainly, it is clear that all people are involved as consumers.

Whether the food business is prosperous or depressed affects almost everyone. One-third of our total working population is in agriculture or related industries—6½ million on farms, 6 million producing for and servicing farmers, and 9 million processing and distributing farm products. These people are directly affected and—just as important—national prosperity depends on their well-being. A national food policy could and should protect everybody.

When your wife—or mine—goes to the grocery store, she makes her contact with this business of food. She doesn't do business with the farmer and, for that matter, neither does the grocer. The grocer is only the last link in the chain of food production and distribution.

The grocer buys from the processor and the packer. Every one of these are middlemen, intermediaries between the farmer and the housewife. But the important point is that they are as much in the food business as is the farmer, and a food policy must be comprehensive and include them.

That is also true of the manufacturers of fertilizer, of chemicals, of steel, and of the makers of electric power, and of the refiners of oil. How much these enterprises are part of the food business comes up clear in the fact that the farmers' biggest expenditures are for these items. In our time farm implements, electrical appliances and the fuel for them as as much the raw materials of farming as are fertilizers and seed.

The point is that if it is a food policy we are concerned with, we must be concerned with all of these enterprises. And we must assure that all do well, including the farmer. Each now has some sort of protection.

Business has its tariffs, its fair-trade laws, its tax-depletion allowances and its fast tax writeoffs. (Since Korea, rapid writeoffs have covered 61 percent—$16.8 billion—of the total cost of new defense facilities.) Labor has its guaranteed minimum wage, unemployment insurance and other guaranteed benefits. Farmers have their price supports and production controls.

It is good that all these groups should have these legal protections and benefits—and it would be even better if the benefits were more nearly balanced, with corporate business getting only a fair share instead of the lion's share. But when we think in terms of a national food policy we must thing first of ways by which to get food to people and that means we must seek to eliminate bottlenecks wherever they exist.

A business indulging in a monopolistic practice—rigging the price and limiting the supply—creates such a bottleneck. Labor when it "featherbeds" or uses some other restrictive practice creates another bottleneck.

There are many groups between the farmer and the consumer who set up such economic toll bridges to collect tribute from both sides. Not only do they deprive the farmer of his proper share of the consumer's dollar, but they deprive the consumer of the savings of mass production and mass distribution methods. Some of them I suppose work on the theory that if everyone sells at a high enough price, all will prosper.

In my opinion, many families, even today, are not buying the food they need—they buy what they can afford. What they spend for waste, inefficiency and extra charges levied by price-fixing monopolies comes directly out of their diets; and this means that it directly reduces the amount of farm products they can buy.

These trade restraints and price-fixing operations between the consumer and the farmer result in both higher prices to consumers and lower prices to farmers. Not only does the consumer's dollar buy less than it should, but the farmer's share of this dollar has been squeezed smaller and smaller.

Today, due to the perpetuation of inefficiencies and the seizure of market power, the retail price of milk is so high that it interferes with the consumers' health and the farmers' prosperity, and yet the cost of distributing milk continues to go up. Our per capita consumption of dairy products ranks well down the list when compared to other countries.

Here is a list of what the farmer actually gets from the housewife's food dollar in certain cases:

He gets:

2.3 cents for the wheat in a 17-cent loaf of bread
3.0 cents for the corn in a 22-cent box of corn flakes
3.4 cents for the carrots in a 10-cent bunch
6.5 cents for the milk in a 15-cent can of evaporated milk
3.8 cents for the corn in a 25-cent can
30.0 cents for the cotton in a $3.50 shirt

This is a consumers' problem as well as a farmers' problem. Some of the increasing spread is clearly due to increased labor costs in processing, transportation, and marketing. The middlemen say that another part is due to consumer demand for more and better processing, more conveniences (ready-to-serve foods plus their "built-in kitchen services") and improved packaging. This may be true in part, but high labor costs have led to more self-service, eliminating many clerks and delivery boys. And self-service, rather than the consumer, has demanded more and more prepackaging. There should have been no increase in distribution costs on this score.

Last year, the House Committee on Agriculture reported: "Thus far almost none of the lower prices received by farmers since 1951 has been passed on to consumers in the form of lower retail food prices * * *. Consumers can expect little benefit from lower farm prices, unless recent tendencies to increase marketing and processing charges are curbed." Yet, in 1953, the appropriations bill carrying funds for the Federal Trade Commission specifically forbade any inquiry into what was happening to the consumers' dollar. To me, this was an unprecedented admission by middlemen that the rising costs of distribution will not stand close examination. We must have a nationwide investigation of the costs of processing and distributing food. On the face of it, some part of the food business is obviously doing better than ever because of the bottlenecks it is able to impose on the flow of food from the farmer to the housewife.

And there is proof also that bottlenecks are paying off for the other side of the food-production picture—that side is where the steel, the fertilizer, the oil, and the electric power are supplied.

In the last year, farmers realized a decreasing share of their gross income as net income—the smallest percentage of any year since 1932. This is shorthand for saying the farmer had to pay out the same number of dollars to buy machinery and supplies as he had to pay in better years—and it took more of his diminishing income to do it.

There is, I think one immediately available way by which to get food to people without these bottlenecks, which means they will get it at lower prices even while the farmer gets a fairer share of the whole. I do not hold that my way is the only way, but I contend that for the creation of a proper national food policy—which seeks a way out of the scarcity and surplus—the use of cooperatives deserves not only a hearing but a large-scale test. Cooperative business can be an integral part of a national food policy. They can help farmers and consumers break some of the bottlenecks through which their goods must pass on their way from the farm to the dinner table.

Cooperative businesses are ideally suited to the job of fulfilling farm needs as well as the needs of consumers. Cooperative laws make it impossible for a few stockholders to control them or exploit them. In most cooperative businesses no person can own more than 5 percent of the total voting stock. Each member-stockholder gets one vote—and only one—in electing directors and determining policy.

In a cooperative business each stockholder gets a limited amount of interest (or dividend) on his invested capital. Cooperative businesses, again by law, must make patronage refunds in proportion to the use each patron makes of his co-op. Earnings cannot go to just a few. No other legal form of corporation meets these simple but significant qualifications.

Cooperative businesses are by no means a cure-all for farm or other economic ills. But their legal structure goes far toward guaranteeing that the benefits of cooperative action are reflected in real income. And I might mention that the late Senator Taft, though he did not always see eye to eye with me, did share my conviction on this point. "The cooperative movement," he said, "has made great strides and cut down the margin between the producer and the consumer. It should be encouraged still more by legislation and by sympathetic Government assistance." I might remind you, too, that only this year, Secretary of Agriculture Benson declared. "Farmer cooperatives now are accepted as an important part of our free enterprise system."

Well, a good many other people think a lot of cooperatives, too. Some 3 million farmers had invested more than a billion dollars in their cooperative businesses. The Farmer Cooperative Service of the Department of Agriculture reports that this investment was almost four times that of 1936. Today 1 out of every 2 farm families holds ownership in his own cooperative business. This is in sharp contrast with corporate business. The majority of the stock in all United States corporations is held by only the top one-half of 1 percent of the population—those with incomes of $25,000 and over.

Right here, let me tell you the Welch grapejuice story. It shows how farmers can acquire ownership of facilities for distributing their products from corporate business and thereby benefit everyone concerned. For 3 years now, almost 5,000 members of the National Grape Cooperative Association have been engaged in the process of becoming owners of the Welch Grape Juice Co. The transfer of ownership will take place under an agreement which requires the Welch company to turn over to the cooperative the entire net earnings of the company up to August 31, 1957, and 40 percent in subsequent years, in the form of 20-year promissory notes of the company. The cooperative, in turn, distributes allocation certificates to its members.

As soon as the Welch promissory notes issued to the cooperative reach $15 million, the Welch company is to transfer all of its assets to a company controlled by the cooperative. This would be done at cost, plus 1 percent of net sales for 10 years or whatever time the name "Welch" is used. During the first year the contract was in operation, cooperative members got $90 a ton for grapes in cash and $38.67 in allocation certificates, or a total of $128.67. For the 1952 crop the cash price was $95 a ton, and the allocation certificates mounted to $55.53 or a total of $150.30. This represented a total return to the farmer of more than half as much again as he would have received in the open market.

After 3 years of operation, the cooperative has accumulated almost $9 million of the $15 million needed to acquire ownership of the Welch plants. With expanded membership and rising sales, the cooperative can probably buy the company within 2 more years. Welch's president points out: "This program enables more people to enjoy a real participation in ownership and profits. It is free enterprise at its finest, a living proof that American capitalism can give men security and freedom, and is therefore in itself a complete refutation of Marxism."

Well, that's the way a cooperative business is helping the grape growers who own it to increase their income and to boost their standard of living. And it just occurs to me that if it's a good idea for grape farmers, it ought to be equally good for, say, dairy farmers. Take the National Dairy Products Corp. I figure that the same kind of a program would enable a cooperative business set up by milk producers, to buy all of the corporation's equity shares (at book value) in less than 3½ years, or at the current market value in less than 6½ years. It would take about a year longer to buy all the equity shares of the Borden Co. at market value.

And it might also just be that if farmers could have the opportunity to acquire ownership along these lines, the need for farm subsidies would not be nearly so great.

Cooperative business helps to market farm products more economically—and that is a cardinal need for a national food policy. Cooperative business aims to move the product to the consumer at the lowest possible cost with the least possible waste all along the line. Cooperative businesses already sell directly to consumers, and where they do there is no price-spread problem—nothing of the sort of bottlenecks so obvious in the corporate distributing setup in which food prices go up while farm prices go down.

One of our own insurance companies the other day loaned $4 million to a cooperative business known as American National Foods so that it could in turn buy American Fruit Growers, Inc., and become a nationwide fruit and vegetable marketing organization with terminal sales and shipping point service. Here we have funds pooled by farm and city people being invested to help farmers market their produce more efficiently so that, in the long run, it can lead to higher prices for the farmer and lower prices for the consumer—and that, gentlemen, is I submit, what a national food policy must do.

Cooperatives—now, right now—do dozens of helpful things outside the realm of supply and distribution, but their greatest role, so far as this discussion is concerned is (1) in providing farmers at low cost with the goods and services they need in order to farm—and so reduce the cost of producing food—and (2) in providing distribution machinery for delivering food to consumers at the lowest possible prices—and so helping to get our foods used up instead of stored.

This means that cooperative business can be of help to the Nation in eliminating the payment of the half million dollars which it now costs us every day just to store our surplus and it means that cooperatives can also help to save some of the billions of dollars we spend in subsidies now.

There are many who argue that cooperatives are some form of creeping socialism—that they have an unfair advantage in being free from taxes and that therefore they are not really more efficient. It's only, they say, cooperatives live on Government subsidy.

How wrong this is I can explain in one sentence. No business pays taxes. They simply collect taxes from the consumer for the Government and in this cooperative and corporate businesses are the same. But there are some differences between corporate business and cooperative business. It was corporate and not cooperative business which got all—or nearly all—of the $16.8 billion melon in fast writeoffs which have been delivered since Korea. Corporate business—not cooperative business—gets the lion's share of benefits of tariffs, depletion allowances, and fair-trade laws. If money saved by the Government is money earned, cooperative business serves both the National Treasury and the national interest.

But there is a bigger argument than that for boosting cooperative business. Cooperatives make owners. By the nature of the cooperative institution, these owners retain their right to determine policy and maintain their freedom of choice. Now if you want to make a conservative out of someone, see to it that he has something to conserve. A farmer who owns his land has more reason to be conservative than a tenant farmer. You won't find people who have something to conserve turning to communism or any other radical- ism, unless, of course, you threaten to take it away from them. Yes, cooperatives offer a way to make responsible citizens—something which was never more necessary in our Nation or in our world.

Now please don't misunderstand me. I'm not trying to tell you that all you have to do to solve the problem of the farmers is to make every farmer a member of a cooperative business. That would certainly help but I'm afraid the problem of the farmer isn't quite that simple.

However, it is will this in mind that I venture to propose that:

1. We must maintain a healthy, growing economy in America, and the sooner we gear it primarily to consumption rather than to production, the better. The core of any healthy economy is full employment and high consumer spending power. It is estimated that at the end of 1954, our total national output was running about $30 billion a year below the normal requirements for a growing American economy. It's a warning of unemployed manpower and other idle resources that should stir us to immediate action.

2. We must study future production needs. We'll need from 15 to 20 percent more farm production in this country to feed our increasing population in the next 10 years. We'll need more if we are to help ill-fed families in this country improve their diets. We'll need far more if we work out plans for distributing our foodstuffs to people of other countries. We must also get down to cases on costs of productin, particularly investigating the bottlenecks in farm implements, steel, oil, electric power, and fertilizer, to eliminate rigged prices and monopolistics practices. They bleed the farmer and penalize the consumer.

3. We must make an intensive study of ways to expand the market for farm commodities at home and abroad. One way to achieve effective use of agricultural resources is to launch a consumption expansion program which is broader in scope than anything previously proposed. We should look closely at possibilities for entering into reciprocal agreements with other nations under which we would trade foods for raw materials or minerals. Roger Babson has suggested a program of coöperative, rather than exploitative, investments abroad to develop foreign markets. The school-lunch program and food-stamp plans to get food to low-income people are other expansion plans which shuld be explored and acted upon more than they have.

4. We must seriously study distribution costs, with an eye to narrowing the price spread between the farmer and the housewife. Such studies have been proposed from time to time—the Marketing Act of 1946 authorized one—but they

have never been carried out effectively. Development of consumer cooperatives which could deal directly with marketing cooperatives would, it seems to me, narrow the price spread considerably. They would surely expose the bottlenecks imposed now in the distribution process and bring us closer to a national food policy.

5. We must stimulate the use of cooperatives, for cooperatives are good and useful, not only for farmer, but for America and the world. They have already been of much help; but we have barely scratched the surface of their possibilities. One way to apply stimulation would be through credit. Despite existing facilities, the development of cooperatives is limited by credit resources. The farm credit system should promptly, prudently, and generously deal with cooperative requests for credit.

Cooperative businesses have proved their worth as agencies of distribution. I think if the 11 million Americans who own the cooperative businesses of the United States were given the same opportunities for fast tax writeoffs and for credit that other groups have, they could make a historic contribution to the distribution of the abundance we know how to produce.

Let's not overlook the contribution that cooperatives, with governmental encouragement, can make in word trade. Indeed, if all of the world's marketing and purchasing cooperatives could be brought together to work at the problem of facilitating world trade, much of importance might be done. I'd like to suggest now that the United States, through its representatives in the United Nations Food and Agriculture Organization, ask the U. N. agency to call a meeting of the world's co-ops as an aggressive, nongovernmental attempt to solve this problem.

All this is part of a national food and fibre policy to replace the present farm policy. Let us stop this growing of unwanted crops for the warehouse and for the Govenrment loan—and let us compensate the farmer as part of a public program for growing wanted foods. Let us move the now immobilized mothball fleet—so heavy laden with wheat—to the hungry of the world. In all ways let us open the valves of our abundance and ease, in every practical way, the movement of food at the lowest possible price to the widest possible number of people.

Today most of us in the world are deeply troubled by the menacing shadow of the H-bomb. We need an antidote of faith in ourselves, of confidence in our neighbors. We need a symbol of our faith in human values. And, gentlemen, I humbly submit that we have that symbol. It is in this abundance that we can find the tool toward prosperity and peace. The motto of my organization, a cooperative, is "People have in their hands the tools to fashion their own destiny." Let us use the tools of plenty and abandon forever the fears and the ways of scarcity.

STATEMENT ON THE ECONOMIC REPORT OF THE 84TH CONGRESS, BY JOHN H. DAVIS[1]

Mr. Chairman and members of the Committee on the Economic Report, if it is agreeable with you, I first would like, briefly, to summarize the agricultural picture as I see it in relation to the Economic Report of the President and then give you categorical answers to the questions which you have submitted for discussion by the panel.

As a starting point let us accept as a general goal the recommendation of the President that we strive to expand our national productivity by 40 to 50 percent within the next 10 years. Then the specific question before us should be—what steps, if any, are necessary to assure that agriculture will be a full participant in such economic growth and expansion? By "full participant" I mean that farm people have an opportunity to earn and enjoy a standard of living consistent with that of other economic groups, considering, of course, the degree of training, skill, entrepreneurship, etc., required in farming. Full participation in economic growth by agriculture helps not only farm people but increases the economic potential of the whole Nation.

Today agriculture in many respects is unprepared for such a destiny. Among the major problem areas which need to be tackled agressively are (1) the vul-

---

[1] Director, Moffet program in agriculture and business, Graduate School of Business Administration, Harvard University.

[2] This in large measure is because agricultural production is dependent upon factors which management cannot control such as the cycle of growth and the weather. It is further augmented by the fact that typical production units are too small to have any appreciable influence in the market.

nerability of agriculture to chronic periods of low prices because of the inability of farmers to adjust supply to demand,[2] (2) the improvement and expansion of markets for farm commodities at home and abroad and (3) the "reclamation" of the substandard units in our rural society. Actually, each of these problems is a complex of many knotty problems within problems.

The solution of such matters is made still more difficult by the dynamic forces which today are at work within our farm economy. Currently American agriculture is being subjected to the tremendous twin forces of change as a result of science and technology and adjustment from wartime dislocations. While the impact of war is gradually diminishing, the impact of science and technology are continuing to increase. Therefore, the task of formulating farm policy and improving our rural economy becomes an endless one. It is an evolutionary undertaking which has no terminus. Therefore, it is a mistake to attempt to establish farm policies and programs on a permanent basis at any one setting. Instead, our permanent policy should be one of creating procedures for constantly improving farm programs and policies while "on the march."

In order to organize the undertaking so as to make it manageable let up approach the farm situation by setting up three major theaters of operation, very much the same way we established theaters of military operations during World War II. These theaters might be described as (1) a hold-the-line action on the economic front to give us time for preparing for more basic operations, (2) action to expand and develop bigger and more adequate markets for farm products, both at home and abroad, and (3) action to resolve the problems of low-income farm units.

By means of action on the No. 1 theater we will be "buying time" in terms of economic balance and stability to permit us to undertake more basic operations on the other two fronts. By acting on theater No. 2, the developing of more adequate markets, we will be putting new dynamics into our farm economy. By action on theater No. 3 we will be making our farm plant more efficient and strengthening our total economy by rehabilitating those families who have been left behind in the march of progress.

I speak of these undertakings as theaters of operation rather than as farm programs because of their dynamic, changing nature. Both policies and methods must be subject to change as conditions alter.

Within each theater there is need for teamwork and cooperation by all interested groups and organizations all up and down the line. The desired approach is for these various interests, themselves, to take initiative in solving their own problems, thus minimizing the role of Government.

At the national level there also is need for coordination and teamwork in relating the operations of the separate theaters of action into a unified whole. Also, there is the task of relating all of this to the rest of the economy and to our international responsibilities. The need is to tackle the farm problem in the same comprehensive manner we did the creation of the atomic bomb. By this I mean that we should bring to bear on the subject the best know-how of the various interested groups—producers, handlers, processors, distributors, nutritionists, industrialists, Government, etc., all working in an integrated effort. By doing this, the various groups will be acting in their own enlightened self-interest as well as that of the Nation.

What about continued improvement in production—is not this still important? The answer is yes, it is fully as important as ever. There is every indication that research and progress in production will continue wth even greater momentum in the future than in the past. The new emphasis on market development and the solution of the problem of the low income farms, which I am suggesting, would itself tend to give new impetus to progress in production. Also, it will tend to give a better alinement to production efforts by more closely relating them to our economic goals, both for agriculture and the nation.

What about such functions as conservation, research, extension education, credit, and the like, where do they fit into this picture? The answer is that all of these are important and essential. They are tools for implementing the major operations which I have described. They should be provided to the extent necessary to get the total job done. My guess is that careful study will show that we actually need more, not less, of each such service than we are providing today. To the degree that such services are essential for the achievement of a dynamic and prosperous economy, they are a wise investment. Not to provide for them is to be penny wise and pound foolish. Also, in the case of resource conservation it is possible, during periods of acute imbalance to relate conservation practices and payments to the diversion of selected acres for use in building a fertility reserve for the future—thereby hastening the readjustment toward a balance between supply and demand.

The American philosophy is that Government should enter the farm field as little as possible. The degree of Government in agriculture is going to be determined more in terms of what we do then what we say. The surest way to move toward less Government and more private initiative is for farmers and private business firms to take increased responsibility for improving farm markets, making the total market structure more adequate to meet the farmer's needs without extensive aid from Government.

To do this, farm and business management will have to look beyond the operations of the particular farm or firms and, also, concern itself with the problem of the adequacy of the total market structure for the commodity involved. They will have to evaluate not only the economic operations at each successive step in the market process but, also, must concern themselves about the adequacy of the total market stairway from farm to consumer as a whole. This means increased teamwork between business firms and producers for the purpose of policy integration. It means a broader sense of a stewardship and teamwork all up and down the line. It may even mean modifying the antitrust laws to give sufficient latitude for this purpose, of course, at the same time protecting the interest of the public. Above all else, after the planning stage, it will mean the investiment of new capital behind new ideas.

Now, in the light of the general comments I have made, I shall attempt categorically to answer the general questions which you have listed for discussion by the panel. Recognizing that to do this will result in over-simplifying the issue, I submit these answers as "targets" for discussion by the panel.

Question 1: Analyze just what the Agricultural Act of 1954 and the rulings of the Secretary of Agriculture will do to support levels of basic and other commodities. What will be the effect on the demand for, and supply of, those commodites? Will there be adequate storage facilities for agricultural commodites? If not, what can be done about it?

Answer: Assuming weather conditions to continue as in recent years and no new international emergencies, I should expect support prices to show more of a downward than upward tendency. In general, this would have relatively little effect on the demand for or supply of commodities subject to price supports. This situation will vary some by commodities. Of course, in the case of wheat, consumption would increase if the price were to become competitive with feed grains. The storage problem will be similar to that of the past 2 years—the principal problem relating to grain. The answer is to encourage the building of some more permanent storage facilities at selected locations, and the expanded use of on-farm storage, steel bins, mothball ships, etc.

Question 2: What farm price movements do you anticipate during the coming year? During the long run? What can we expect the parity ratio to show this year and next?

Answer: Again, assuming weather similar to that of recent years and no new hostilities, we will do well to maintain average farm prices where they are during the current year. The same is true of the parity ratio. In the long run the picture should be brighter provided we aggressively strive to expand markets at home and abroad.

Questions 3, 4, and 5: What modifications in existing farm policies are needed to assure farmers as full participation as possible in the expected rapid growth and progress of our economy in the next decade?

What can be done to increase the productivity and levels of living of lower income farm families?

What effect would the realization of maximum employment and production during the next decade have upon the demand for various farm products?

Answer: I think that my answer to all three of these questions has been given in my earlier statement. However, I would like to stress the importance of maintaining a relatively high level of farm income as an incentive for speeding up adjustments. Adjustments within agriculture require capital formation at a relatively high rate. Also, the migration of people from agriculture to urban employment requires expanding productivity and employment outside of agriculture. In general, both of these conditions are related to the maintenance of a relatively high level of income within agriculture.

Question 6: In view of the decline in farm prices and incomes while national income is rising, when do you expect farmers' incomes to rise again and what forces will bring about a recovery?

Answer: It seems to me unlikely that higher farm prices or income will be generated by existing farm programs. Of course, higher income is the thing we seek. This, then, will come from reducing farm costs, expanding farm markets, or both. The achievement of this depends upon how aggressively and successfully we proceed on theaters 2 and 3 as I outlined them earlier.

Question 7: Are the prospects for developing continuing new market outlets promising?

Answer: The prospects of developing continuing new market outlets do look promising.

Question 8: Under the Agricultural Act of 1954 the suport level for wheat may be reduced to 75 percent of modernized parity within a few years if supplies continue large. Would this bring about a reduction in wheat prices of 30 to 35 percent from present levels? In your opinion would this reduction in wheat prices result in a restoration of the submarginal wheat lands to grazing?

Answer: It is conceivable that wheat prices may be reduced by as much as 30 to 35 percent from present levels under the existing law. Should this happen, and should it result in the withdraway of considerable acreage from wheat production, the use of such acreage would vary by location. In the diversified farming areas most land going out of wheat would be put to other crops or grazing. However, in the Great Plains area the tendency would be to abandon submarginal wheat land and let nature take its course. This land would not be returned to grazing readily unless special incentives were created.

Question 9: To what extent are lands not suitable for crops in the Western States (primarily because of wind erosion hazards) now being cropped?

Answer: The needs of World War II and the prices which then prevailed caused several millions of acres of land to be put under the plow in Western States which should not be cropped.

Question 10: Is there any reason for concern over current prices of agricultural land or over the availability of agricultural credit for land purchase or operating purposes?

Answer: At present, I feel, we need to be more concerned over credit requirements than over agricultural land prices. Credit needs are increasing for several reasons—the growing capital requirements for mechanization and larger-sized farm units, the squeeze between falling farm prices and high production costs and the constant subdivision of estates among heirs upon the death of current owners.

In conclusion, I reemphasize the importance that agriculture participate as a full partner in the achievement of our goal of a dynamic, growing, prosperous national economy. It is only as all major segments of the economy progress in unison that optimum results will be realized.

Remarks of M. R. Benedict, Panel Session of the Joint Committee on the Economic Report

Only 2 or 3 of the points listed by the chairman can be touched on in this opening statement.

Agriculture, like the rest of the economy, has come through the postwar years in rather good shape. Because of this, we have our sights set pretty high. Most of us, I am sure, agree that they should be set high. However, our striving for these new and higher goals needs to be tempered with realism. The achievements and phenomenal prosperity of the past 15 years are things of which all are justly proud. We do need, I think, to recognize that the high rate of increase in farm production, farm incomes, and general prosperity has few, if any, parallels in past history. One does not always stand at the peak. There are plateaus and valleys to be crossed as well as mountain ranges, in economic affairs as in transcontinental travel. If we choose our course wisely, we will avoid the deeper depressions and the more difficult routes. But there are bound to be some setbacks and some periods in which progress will not be all we would like to have it be.

After World War I, farm prices fell to little more than half what they had been 2 or 3 years earlier. Farm mortgage debt, created by speculation and inflation, had placed on agriculture a back-breaking burden for which there was little offsetting increase in real wealth. Our farm plant was perhaps even in poorer condition than when the war began. The World War II situation has been markedly different. The postwar years have been the best American agriculture has ever known. Furthermore, we have come out of them with a vastly better equipped farming industry and a rather moderate level of indebtedness. However, there were artificial elements in the agricultural prosperity of these postwar years that it may not be easy to reproduce even with the most active cooperation of Government. Some of the demand, both farm and nonfarm, grew out of delayed spending of high wartime earnings. Some grew out of the continuance of deficit spending and some was a result of an almost unique combination of great need abroad for American farm products and a willingness of our Government to supply funds with which to purchase them.

Coupled with these, there has been in recent years an enormous accumulation of unsold farm products in Government holdings which could, unless very wisely and skillfully handled, act as a delayed pressure on the supply side and thus be a price-depressing influence. The current holdings of the Commodity Credit Corporation should be worked down to more suitable levels as fast as that can be done practically.

There was an inflationary upsurge in both farm and nonfarm prices and incomes in 1950 and 1951 which stemmed mainly from the outbreak of war in Korea. Farm prices reached 107 percent of parity in 1951. Since then they have eased off and stand now at 86 (December 1954), a drop of about 20 percent. Both gross and net income have fallen off somewhat less, about 15 percent.

Are they likely to go lower or to level off about where they are? It seems to me the immediate prospect is for a leveling off, assuming a continuance of prosperous conditions in the nonfarm economy. The most serious setback to farmers and to the Government's farm program would be a severe slump in nonfarm employment and incomes. The maintenance of high activity in the nonfarm economy is, therefore, the most important objective both from the standpoint of farmers and of the Nation as a whole.

The national economy has shown remarkable strength and resiliency in the past year. There seems reason to hope that we have now learned enough about fiscal and monetary management to be able to hold in check the more violent changes in economic activity. However, it is too early to be sure of that. A full, or nearly full, employment situation is a brittle thing and could be badly upset by anything that would seriously affect confidence and optimism.

Such a change in consumer and business expectations could set in motion deflationary influences that might be harder to control than those of the past year. This, I think, is one of the hardest things to predict and the one we know least about. Can we maintain continuously the buoyant optimism that has characterized the economy in recent years? I was particularly impressed by what seemed to me the realistic and sensible reservations mentioned in the first full paragraph of page 22 of the Economic Report of the President.

Factors of that kind could more than offset such corrective devices as were used with apparent success in the past year. On the other hand, a renewed outbreak of hostilities could, in the situation we now have, give rise quickly to an inflationary situation similar to that of 1950 and 1951.

We have, I think, made real progress toward the achievement of a more stable economy but we do not yet know how much and what kinds of Government action may be needed if deflationary or inflationary forces become more powerful than those of the past year. Both the timing of the actions taken and the skill with which the situation is interpreted and handled are of great importance.

If we assume a continuing high level of prosperity, it seems to me the more serious problems in agriculture can be narrowed down to a relatively few commodities. The livestock industries, except in butter production, are in fairly good shape. They have shown remarkable ability to make necessary adjustments. Cattle prices are lower than cattlemen would like them to be, but it should be remembered that the price parities reported for them, which are well above present prices, reflect the extremely favorable price situation of the early postwar years.

Hogs are in a relatively good position and adjustments in that industry are carried out rather quickly if such action becomes necessary. Furthermore if needed adjustments are made in grain prices, the profitability of hog and cattle feeding may increase, even if prices of the end products do not increase materially. Poultry producers are in a less favorable situation but, here, needed adjustments in output are customarily made even more quickly and effectively than in other livestock industries.

Cotton is not far out of balance. A rather moderate adjustment in its price would apparently clear the markets and give cotton producers more freedom of action. I do not think corn production is seriously out of balance or that any drastic action by the Government is needed at this time.

The big and difficult problems are in wheat, butter, and rice. I shall not discuss rice, a minor crop, though the problems there are acute and difficult. Wheat production is overexpanded in terms of present needs. This is an aftermath of war influences, but the measures taken in the postwar years have tended to keep it overstimulated instead of aiding in the readjustment needed. We should cease as soon as possible to treat all wheat as one commodity. There is no over expansion in the durum wheats and little in the Hard Red Springs. The big problem is in Hard Winter, Soft White (that is, Pacific Northwest) and Soft Red Winter. In those areas, wheat production will inevitably have to be cut back or much of the crop will have to be chaneled into feed uses. The price programs should be revised so as to face that problem realistically. The danger of a disastrous price break from continuing increase in the stockpile of wheat is potentially of far greater importance to wheat growers than the price adjustments that would be needed to bring the industry into better balance with available outlets.

The wheat growers responded magnificently in the period when national and world needs for wheat were large. They should not be left out on a limb. But the program must, in their interest as well as that of the Government, be brought into closer touch with realities. They should be given effective help in making the changes needed. The set-aside provided in last year's legislation seems to me an appropriate action, but it is purely a stopgap arrangement. It does not solve the basic problem.

The butter problem is far more perplexing, and as yet no satisfactory solution seems at hand. Some help can be given, but the kind of help given in recent years is, in my opinion, more damaging to the industry than helpful to it. The current program of price support and storage is weakening to the very sizable market for butter that still exists. The approach to this problem should be revised as soon as possible.

There are other and longer-term problems that will need continuing study and action. Some of them no doubt will be discussed later today. Generally speaking, I would not expect any severe decline in farm prices, provided buying power remains high, and if production is not overstimulated by actions taken by the Government itself. The major problem is that of how to carry through, with as little hardship as possible, until the postwar adjustments still required can be made.

Looking ahead 5 to 10 years, it seems to me likely that the market for farm products will be relatively strong. Our population is growing rapidly. Many of the babies born in the early postwar years are now coming into the age of heaviest per-capita food consumption. At the same time, the farm population is shrinking. Our overall farm output will no doubt, continue to increase, but I think there is a good possibility that, for most products, demand will increase fast enough to absorb the increase if the economy continues to be active and prosperous.

In the interim, there is need for some support for farm prices and for some aid in making needed readjustments. But once the needed postwar adjustments have been made, the farm programs should, in the main, be designed to aid farmers in stabilizing their industry, achieving reasonable flexibility as to time of sale and obtaining help when difficult situations arise with respect to particular industries or areas. Normally, such agencies as the Commodity Credit Corporation should not be under heavy strain in times of strong demand and customary volumes of output. They should, so far as possible, be kept in a position to give needed and prompt help if emergencies arise. It is necessary to keep in mind that the reservoir that is full cannot absorb a flood when and if the flood comes.

(The following statement was subsequently submitted for the record:)

ADDITIONAL STATEMENT OF M. R. BENEDICT

While I concur in most of the comments made about the importance of aiding low-income farmers to better their situation, I would make one reservation. In general, I think the program outlined by Mr. Nicholls is appropriate. I do think, however, that we should recognize that, even with the best of programs, changes

of that kind can be made only slowly. There is some danger of overselling this program.

The low-income farm group is extremely diverse, and we tend to oversimplify the reasons for the conditions that exist. Those in the older age group may not want to change their way of life very markedly. Many of the part-time farmers have worked out solutions that are reasonably acceptable to them and to society. Some members of the low-income farm group are there because of physical or other handicaps which make their present way of life one that is best suited to their abilities and capacities.

Many of these may need help of one kind of another but it will not necessarily be through farm enlargement, more credit or improved methods of farming. The kind of program outlined by Mr. Nicholls can be very helpful to a sizable group of full-time, small-scale operators in the younger age groups. It will not reach or help all low-production farmers and the program required is a long-term, gradual one, not something that can be expected to show sensational results quickly.

STATEMENT BY DON PAARLBERG, ASSISTANT TO THE SECRETARY, UNITED STATES DEPARTMENT OF AGRICULTURE

Mr. Chairman and members of the committee, I am an economist in the office of the Secretary of Agriculture. My work consists primarily of economic analysis and presentation of economic facts to the Secretary and his policy determining staff. I am not a member of the policy staff in Agriculture. Therefore, my remarks today will be directed primarily to the economic situation affecting Agriculture, and not to questions of a policy nature.

The general economic health of America is good. Our country has been enjoying a period of relative economic stability during the past year. During the past year the general price level in the United States has fluctuated within the very narrow range of 2 percent. On January 15, 1955, it was 1 percent below the figure for a year earlier. Fluctuations of such small magnitude are evidence that price stability has been achieved. Inflation has been stopped.

The widely advertised business readjustment of 1954 evidently reached its bottom about last July. The slow erosion of prices and business activity which had been in progress since shortly after the Korean boom halted. Business has turned up modestly. Although the upward course has not been spectacular, it has been fairly steady for the past several months. Our economy is experiencing a healthy growth rate, production is increasing, consumer incomes are rising, consumer spending continues at a record rate, and still higher average standards of living are in prospect.

We have achieved a fairly stable economy at a high level. The transition from post-Korean inflation to semipeace conditions has been made with the least disturbance to our general economy of any similar postwar economic adjustment in our history.

Farm prices likewise have fluctuated with in a relatively narrow range of 8 percent during the past year. On January 15, 1955, prices received by farmers were about 5 percent below a year earlier. They were 2 percent above 1 month earlier. The 1954 yearly average of prices received by farmers was about 3 percent below the 1953 yearly average. This compares with a decline of 5 percent from 1951 to 1952, and a decline of nearly 10 percent from 1952 to 1953.

Although farm income has declined slightly more in the last year than has that of the general economy, it is significant that the decline has been very markedly slowed from the rapid drop of 2 years ago. The most rapid drop in farm prices and farm income both occurred in 1951 and 1952 following the Korean inflation.

The price parity ratio likewise has been remarkably stable during the past year. It stood last month at 86, which is 8 points below the figure for 2 years earlier when this administration assumed office. In the 23 months before January 1953, the price parity ratio had dropped a total of 19 points. In the last 8 months the parity ratio has fluctuated in the very narrow range of 3 points. The postwar decline appears to have been stopped.

Realized net income of farmers last year was approximately $12.5 billion. The United States farm income has about stopped its postwar decline. Net farm income in 1955 should approach that of 1954. Prices received by farmers may be expected to average close to the levels prevailing at the present time, and cost rates or prices paid by farmers probably will not change much in the year ahead. This means that the parity ratio likewise will remain fairly stable in the year ahead.

The small changes in farm income and farm prices between 1953 and 1954 suggest that most of the postwar adjustment has been completed, and that we are in a period of comparative stability. The adjustment agriculture has undergone the last few years has been difficult. However, statistics alone don't tell the full story.

While our total farm income was declining from 1947 to 1954 by some 25 percent, our farm population was also declining about 20 percent. This means, therefore, that per capita income in agriculture has declined markedly less than has total income. In the last 7 years, per capita income from agriculture has declined only about 5 percent. If we take account of the income that farm people receive from nonfarm sources, the realized per capita income of farm people from all sources actually increased 6 percent from 1947 to 1954.

It is essential that we maintain fluidity in our agricultural population. As we increase efficiency of our production of food and fiber, it is possible to do our production job with fewer workers on farms. This results in a higher living standard for our farmers as well as for our urban people.

AGRICULTURAL ACT OF 1954

The Agricultural Act of 1954 established a new direction in the price support activities of the Department of Agriculture. This act became effective January 1, 1955, just 1 month ago. The record shattering stocks of surplus food and fiber owned by or under loan to the Commodity Credit Corporation were accumulated under the rigid price support programs of previous legislation.

No abrupt changes in levels of price support are contemplated under the Agricultural Act of 1954. The act itself provides for graduality in shifting to the plan of flexible price supports.

The Agricultural Act of 1949 as amended provided for price support for basic commodities at 90 percent of parity through the 1954 crops year. It also provided for the use of the old parity formula through 1955 for those basic commodities for which the old parity was higher than the new (wheat, corn, cotton, and peanuts).

In the absence of any additional legislation, that act would have required support levels for 1955 crops of basic commodities (except tobacco) to be not more than 90 percent of parity and not less than a percentage of parity determined in accordance with a schedule of supply percentages specified in the law. A support level of 75 percent of parity was indicated when the supply percentage exceeded 130 percent of a normal supply. Parity prices for four of the basic commodities would have ben reduced in 1956 as a result of the change from the old to the new parity formula. On the basis of present relationships the following reductions would have been indicated: Wheat, 14 percent; corn, 11 percent; cotton, 3 percent; and peanuts, 18 percent.

The Agricultural Act of 1954 modified the Agricultural Act of 1949 as amended in several respects. It provided that support prices for 1955 crops of the basic commodities could not be less than 82½ percent of parity regardless of the supply situation and that in the transition from old to new parity, the parity price would not be reduced by more than 5 percent of the old parity price per year. The Agricultural Act of 1954 also provided for a set-aside of agricultural commodities. This set-aside will tend in the direction of somewhat higher support prices for wheat and cotton than would have otherwise been the case. The Agricultural Act of 1954 also provided for somewhat higher support levels for wool. Price support for major types of tobacco remains mandatory at 90 percent of parity.

It may be of interest to this committee to indicate the probable level of price supports for basic and designated non-basic commodities.

Basic commodities

Wheat support for 1954 crop is 90 percent of parity, or $2.24 per bushel. The 1955 crop will be supported at 82½ percent of parity, or not less than $2.06 per bushel.

Cotton support for 1954 crop is 90 percent of parity, or 31.58 cents per pound. While there has been no definite announcement of the support price for the 1955 crop of cotton, indications at this time point to a support level of 90 percent.

Corn support for 1954 crop is 90 percent of parity, or $1.62 per bushel in the commercial corn area. No announcement has been made of support level for the 1955 crop. Available information on supplies indicates that minimum support will probably be about 88 percent of parity.

Rice support for 1954 crop is 90 percent of parity, or $4.92 per 100 pounds. No announcement has been made of support level for the 1955 crop, but if prospective supplies remain about as now expected, support for the 1955 crop of rice is expected to be near 90 percent of parity.

Peanut support for the 1954 crop is 90 percent of parity, or 12.2 cents per pound. In view of the relatively short supplies of peanuts this year, the support level for the 1955 crop will probably be at or near 90 percent of parity.

Marketing quotas for the 1955 crops of wheat, cotton, rice, peanuts, and the major types of tobacco have been approved by the producers of these commodities and will be in effect. Acreage allotments for corn will be in effect in the commercial corn area.

Designated nonbasic commodities

Milk and butterfat support levels for the 1954 marketing year were 75 percent of parity, or $3.15 per 100 pounds for milk for manufacturing and 56.2 cents per pound for butterfat. The same level of supports are being continued for the marketing year beginning April 1, 1955. As of January 15, 1955, these prices represent 76 percent of the parity price for butterfat and 80 percent of the parity equivalent for milk for manufacturing.

Wool and mohair prices of the 1954 clip of wool are being supported at 90 percent of parity, or 53.2 cents per pound grease basis. The incentive price for the 1955 clip has been announced at 62 cents per pound, or 106 percent of the September 1954 parity price. The 1954 support level for mohair was 83 percent of parity, or 64.3 cents per pound. For the 1955 clip the support level has been announced at 70 cents per pound, which is 91 percent of the September 1954 parity price.

Tung nuts. The 1954 crop is being supported at 60 percent of parity, not less than $54.96 per ton. The 1955 support level has not yet been announced.

Honey. The support level for 1954 marketing season was 10.2 cents per pound. This is equivalent to 70 percent of parity adjusted to the 60-pound container level. There has been no announcement on 1955 support level.

Other nonbasic commodities

The 1954 and 1955 support levels for the 1955 crops of oats, barely, rye, grain sorghums, and crude pine gum in percentages of parity and dollars and cents are as follows:

Item and unit	1954		1955	
	Percent of parity	Dollars	Percent of parity	Dollars
Oats ... bushel	85	0.75	70	0.61
Barley ... do	85	1.15	70	.94
Rye ... do	85	1.43	70	1.18
Grain sorghums ... hundredweight	85	2.28	70	1.78
Crude pine gum ... production unit	90	130.33	90	129.02

While the provision for flexible price supports in the act of 1954 did not become effective until the 1955 crops, it has been possible to eliminate the earlier requirement for rigid controls on total diverted acres and for cross compliance. It is anticipated that as flexible price supports go into operation with the 1955 and succeeding crops, it will be possible still further to relax controls on production and marketing.

THE AGRICULTURAL SURPLUS SITUATION

The rate of disposal of Government-owned stocks of surplus agricultural products has been stepped up markedly in 1954. Sales have been made from CCC stocks to the private United States trade totaling $940 million during 1954. About $500 million of this total has been sold for export. The total value of all disposition of CCC stocks during 1954 have totaled about $1.4 billion.

The best market for our farm produce is at home. That market is being cultivated actively. The dairy situation is a case in point. Consumption figures for 1954 indicate that per capita use of butter increased by about 5 percent over a year earlier, thus reversing the downward trend of 15 years duration. The average American ate a fraction of a pound more cheese and drank a little more milk last year than in 1953.

There is a trend toward an unmistakably better balance between dairy supplies and demand—a balance which is being brought about not through distasteful and uneconomic production controls but rather through increased consumption of health-giving dairy foods.

In December of 1954 the Government bought not a single pound of butter. This was the first full month in 2 years in which no purchases were made. During December 1953, we bought more than 11 million pounds of butter and the heavy flow was just beginning.

During the final 3 months of 1954, butter purchases totaled only half a million pounds, as compared with 15 million a year earlier. Although we have bought some butter in recent days, purchases are well below the rate of a year ago.

Government buying of cheese and nonfat dry milk has also declined greatly in recent months. Last December cheese purchases totaled about 1¼ million pounds, compared with nearly 7 million for December of 1953. This was the smallest amount we had bought in any month for 2 years. We purchased 11.2 million pounds of dry milk in December 1954—less than one-third of the amount of a year earlier.

An important factor in the generally improved dairy situation is the aggressive merchandising and promotional campaign which is being carried forward by the industry with our full cooperation. We have yet to see the full effect of this program. It is steadily gathering momentum. In the months ahead we may confidently expect to see more dairy advertising, greater emphasis upon making milk more readily available through vending machines and other outlets.

All of these things which I have cited are reflected in the fact that milk prices have improved somewhat in recent months. For the final quarter of 1954, wholesale prices received by farmers for all milk averaged 86 percent of parity—the same as in March of 1954, when price supports were still at 90 percent of parity.

THE SCIENTIFIC REVOLUTIONS IN AGRICULTURE

This is the age of science and technology in agriculture. Expanded emphasis on research and education is paying tremendous dividends in more efficient production and better living for progressive farmers.

Total output from agriculture in 1954 was 14 percent greater than in 1947, the year when net realized income from agriculture was at an all-time high. This output was produced by 18 percent fewer workers than we had on farms in 1947. This means that output per man was about 40 percent above the 1947 level and nearly double 1939, when World War II began. These comparisons give eloquent proof of the continuing technological revolution that has made American agriculture the most efficient in all the world.

American agriculture remains a dynamic industry. As in any growing and dynamic sector of our economy, some parts of it will always fare better financially than other parts in a particular year. Some areas will fare better financially than other areas. Some individual farmers will be better off than others. This is one of the essential characteristics of a dynamic industry and a free economy.

Within the framework of modest economic fluctuations of this character, and as a part of a growing prosperous general economy, American agriculture faces a challenging decade ahead.

The basic philosophy underlying the Agricultural Act of 1954 will encourage individual farmers who are efficient and ambitious to participate profitably in the thrilling opportunities immediately ahead of us in the growing science of agriculture.

Agriculture offers equally as good an opportunity over the next generation as any other comparable vocation for the young man or young woman who desires a satisfactory living standard, an opportunity to live and rear a family in a wholesome environment, and the ability to provide one's own security for his declining years.

Our constant objective in the United States Department of Agriculture is to do all in our power to promote a stable, prosperous, and free agriculture.

(Whereupon, at 4:30 p. m., the committee adjourned to 10 a. m., Thursday, February 3, 1955.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

THURSDAY, FEBRUARY 3, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, and Representatives Bolling, Kelley, Talle, Curtis, and Patman, vice chairman.

The CHAIRMAN. This morning we are going to discuss the subject of public works. We appreciate the willingness of all of you to take part and be with us.

Mr. Dupont, whom we invited, cannot come because the President's highway program has not yet been submitted to Congress, but we are very glad to have General Itschner, who is the Assistant Chief of Engineers for Civil Works, and Assistant Secretary Aandahl who is here from the Department of the Interior.

In previous sessions of the panel, we have called upon the Government representatives first; but I would like to experiment, and this morning I am going to call on the nongovernmental members of the panel and then ask the governmental members to conclude.

I shall ask Mr. Fisher to begin the discussion.

OPENING STATEMENT BY JOSEPH L. FISHER, ASSOCIATE DIRECTOR, RESOURCES FOR THE FUTURE, INC., WASHINGTON, D. C.

Mr. FISHER. I have been asked to comment briefly on the proposals in the field of conservation of resources, as set forth in the January 1955 Economic Report of the President. More particularly, and along with other members of the panel, I have been asked to comment on the two questions: (1) What should be the Nation's public works policy in 1955, especially in the resources field; and (2) what part if any of the costs of construction and maintenance of resource facilities should be shared by the Federal Government, and how should these costs be shared? I would like also to blend with my remarks concerning resources conservation and development a number of basic points regarding public works policies in general.

First, I would like to note the high quality of the report and compliment the Council of Economic Advisers and others who aided in preparing it for the emphasis upon economic growth. I hope that this attention to economic growth represents a continuing interest rather than a viewpoint stressed only at this particular time when the general business movement is upward and there seems to be no critical need for policies relating primarily to business cycle movements—

either those suitable for times of recession or those suitable for impending boom and possible collapse.

In my view, there is a gradual and subtle blending of factors which are important to stabilization and to growth, and that a sharp separation of the two is most unrealistic. Indeed, economic decisions are always made in the present, even the decision to postpone is a present decision. The effects of these decisions, however, may be left at different times in the future, unless these considerations are kept to the forefront in our thinking; there is always the tendency to defer basic public and private investments in natural resources, highways, and the like.

Fiscal or budget policies which make such expenditures the bond servant of short-run considerations, whether they are to make larger deficits or reduce them, are not in my view in the long-run public interest. In the end, such policies will defeat the establishment and continued expansion of the very base of resources and facilities without which growth is severely handicapped and the business cycle becomes much harder to manage.

Therefore, in a general way, the Nation's public-works policy in 1955 should be one of proceeding steadily and confidently with investment and investment decisions which will serve to expand basic public works and facilities in the interests of long-term growth. The budget outlook clearly is not so severe, nor the need for balance in conventional terms so impelling, as to indicate any less in spending for natural resources and other public works than the recent 1956 budget envisages. In my view, a good case can be made for somewhat higher expenditures in the resources field than the budget proposes.

I have here to address my remarks more to the budget than to the Economic Report, since the Economic Report says very little directly about resources.

During the 5 years, 1951–56, as estimated in the budget, the amount spent by the Federal Government for water-resources development, to name the natural resources of greatest budget concern, has decreased by roughly 10 percent. Federal water-resources expenditures as a percent of total Federal expenditures reached a high of 4.1 percent in 1938; according to the 1956 budget estimates, they will be 1.9 percent. As a percent of gross national product, estimated Federal water-resources expenditures for 1956 are one-fifth to one-quarter less than in 1951.

The CHAIRMAN. Now, by water, do you mean power, irrigation, and navigation?

Mr. FISHER. That is correct. Those are the large items.

It would seem that Federal Government spending for the development of water resources is not keeping pace either with other items in our Government and national economic accounts or with the opportunities and needs of the times. Yet the Economic Report states—

> of all our natural resources, none requires more immediate attention than water.

The way to reconcile emphasis on the need for water development with declining budget allocations is to offer convincing evidence that resources investment funds will be forthcoming from non-Federal sources. This brings up the "partnership" concept. This approach has a genuine appeal. I think it to be excellent, and in its general form

I endorse it highly. It strikes a good note and one which most Americans will applaud. However, I believe the general idea needs to be thought through more carefully, if it is to be made to work effectively. The biggest single difficulty, as I see it, is to enlist the responsible cooperation of States, localities, and private groups. This means financial responsibility and participation as the acid and final test of genuine partnership. If the partnership idea is to amount to more than it has in the past, if it is to be a genuine thing, then both local and State governments, and in some instances private groups, must participate substantially in investment and repayment.

The 1956 budget proposes $20 million in Federal expenditures for partnership projects under the Corps of Engineers and the Bureau of Reclamation. I hope the amount may be enlarged in future years. It would be advisable to follow the working out of these initial partnership projects with an eye to revealing the strong and weak points and finding out what really can make the idea work. I think it is important not to oversell the partnership idea lest the day come when people realize that more has been held out under the attractive label of partnership than can be delivered.

Particularly, I think the Federal Government will have to act sternly in refusing Federal participation except upon terms which require significant State, local or other participation. There will have to be a tougher resistance to political pressures, in which public agencies and private pressure groups sometimes combine, than has been characteristic of the past. The will of people to raise money at the State and local levels will have to be strengthened, as well as their desire to see through the long repayment periods which may be involved. The partnership program is a hopeful one, it deserves to be nourished and tended carefully; but proclaiming it does not necessarily make it work.

Another question we were asked to deal with briefly is the amount which the Federal Government should contribute to various public works programs. Here I do not think definite general rules can be set out very easily. The emphasis has to be upon the uncovering and the experimenting and testing of suitable criteria to work out the degrees of participation from State, local, and Federal governments, and even private sources. Flexibility seems to me to be desirable, especially in the resources field, where formula treatment has never been as successful as it has in highways, hospitals, and some of the others.

The CHAIRMAN. What do you mean by "flexibility"? That is a commonly used term, but I have often been puzzled as to what precisely it meant.

Mr. FISHER. I think it is partly a dodge for getting away from thinking through exactly what you mean. In the resources field the programs are extremely varied, all the way from very small flood control and agricultural projects to large dams and to research programs, and so on. It is impossible to find a single formula, or at least it is difficult to find a single formula such as in the Highway Act which sets up three definite criteria, and say this is the way the Federal money shall be distributed, whatever that sum may be. The purposes of resources projects, the nature and characteristics of them, are much more varied, in my view.

The CHAIRMAN. Then would you allow this to be determined entirely by administrative discretion?

Mr. FISHER. Not necessarily. I propose a little later on that this needs to be the subject for a considerably more intense examination than heretofore.

I think, further, that the resolution of such problems lies, in large part, in the fields of public organization and finance, since if the States and localities are to become partners with the Federal Government, they must have the sources from which additional funds can be raised, as well as the will to do it. The Council correctly recommends that outmoded State tax rate and debt limits be relaxed.

The possibilities for interstate or regional development corporations for resources development might well be explored more intensely than has been true in the past. I think ways might be found for the chartering of such corporations with power to issue mortgage or revenue bonds and which could also receive appropriations from State, local, and Federal Governments. An extension of this idea would encourage private participation for certain phases of multiple purpose projects such as electric power production and distribution, for which there is clearly a market and a determinable market price. I do not think we have begun to exhaust our organizational administrative resourcefulness along this line. An important consideration is that any development corporation operates over a sufficiently wide geographical area and span of resources so that a truly balanced and integrated development may be achieved.

At another place in the Economic Report the proposal is made that advance planning loans to States and localities should be enlarged and made permanent on a revolving fund basis, instead of having an on-and-off activity of this sort. I would suggest careful study be given to an extension of the advance planning approach to embody the idea of planning for total readiness for antirecession public works activities. Such a readiness would recognize that even with plans and specifications all prepared, there would still be made many roadblocks in the way of actually spending money for antirecession public works. Financial arrangements between Federal, State and local Governments would have to be arranged. Appropriations would have to be made, construction organizations perfected, and decisions as to precise time, place, and type of project reached.

I would propose careful consideration of an antirecession fund, established by Congress, and with its use limited by Congress to authorized projects. Congress might limit the fund as to total amount, and specify general criteria which should trigger its actual use. It might also lay down general rules regarding the geographical distribution of the spending. The establishment of such a fund would place in the hands of the President the authority to engage in antirecession public works spending in speedy and timely fashion, but with appropriate safeguards and general directives laid down by the Congress.

I am not so much proposing the establishment of such a fund as I am proposing that it be examined with greatest care looking toward the advisability of recommendation at a later date. This is not a new idea, but it is a good one which so far as I know has never been adequately investigated. Perhaps the chief value of such a study would be to point out the severe limitations of antirecession public works because of timing difficulties. The study should specify the kinds of projects which lend themselves to antirecession use, as well as those that do not. It should be realistic with respect to the methods of financing.

My final point, and one which I think is of major importance and one overlooked almost entirely in the Economic Report, relates to resources development, and the need for a partnership arrangement, not by which projects would be built, but by which they might be planned cooperatively. Surely this goal cannot be achieved if miscellaneous private companies, localities, even States, acting separately, pick off such projects as suit their interests and leave the scraps for the National Government. I think a guiding general plan, or at least a set of general objectives and procedures is needed. This is especially true in the water and related land field, in my view.

The CHAIRMAN. You are not speaking of the upper Colorado project, by any chance, are you?

Mr. FISHER. I have that and some others in mind. Such planning need not be in detail, but it should block out the main development potentials, appraise the benefits and costs of each, provide for wide public consideration, and in short, make possible the emergence of general approaches and plans of development which will permit any private concern or public body to undertake a project, and in such a way so as not to foreclose on other projects more clearly in the long-run interest.

I think we have to look beyond TVA and beyond the interagency river committees to find new patterns for cooperative planning of this character. Which group actually builds or owns a structure seems to me of far less importance to the Nation than that the river valleys are developed intelligently, comprehensively, and economically.

During these few years we are committing ourselves to the structures and programs which will fix the general character of river basin development in this country for perhaps a century or longer, just as the location of our main railroads in the 19th century set a pattern of location of people and industry which continues to this day.

Cooperative planning of the type I have suggested, it seems to me, is the way to assure an intelligent arrangement of investments by public and private bodies and that the long-range national interest will be enhanced.

The CHAIRMAN. Thank you very much.

(Mr. Fisher's prepared statement appears at p. 801.)

The CHAIRMAN. Mr. Greer, I understand you are going to speak on the highway question.

Vice Chairman PATMAN. I can state, Mr. Chairman, he is mighty well qualified to speak on that question.

STATEMENT OF DEWITT C. GREER, STATE HIGHWAY ENGINEER, TEXAS HIGHWAY DEPARTMENT

Mr. GREER. The President of the United States is definitely correct in his statement that the highway improvement program of this country is not keeping pace with the expansion of our economy, and consequently, must be expanded if our Nation is to continue its forward progress.

The State highway departments throughout the country are now in the process of developing the public road systems with the aid and benefit of the Federal-Aid Highway Act of 1954 as passed by the 83d Congress and placed into effect May 6, 1954. In order that there may be no cessation in the roadbuilding program of this country, this act must be supplemented by the Congress at least by the spring of 1956.

The annual income to the Federal Government this year from taxes relating to the motor vehicles of this country is estimated at $2,577 million. Our highway system is within itself a modern, industrial machine yielding a $2,577 million income to its owner, namely, the people of the United States. If this profitable machine is permitted to deteriorate and become obsolete, the reduction in net profits to the owner will be inevitable. Any efficient private industry, for business reasons alone, constantly endeavors to keep its machinery in good repair and modernized in order to continue the flow of profits to its owner.

The highway system of this country is no exception. We, the owners, must do a major overhaul job primarily for the public good and also to guarantee the continued flow of income as paid by the users of motor vehicles to Federal, State, and local branches of government.

Our Federal Government enjoys the privilege of providing inspiration and leadership to the States in many fields of endeavor, including highways. In providing this leadership during the past year, the Federal Government has contributed approximately 13 percent of the expenditures on the highway transportation system of this country, and the States and local political subdivisions have contributed the remaining 87 percent. It would seem that with the established need, the Federal Government could lend additional impetus to the expansion of the highway program of the country.

The National Congress is to be commended for its balanced program of improvements on public roads, which program has been in effect for the past 11 years. The four categories of roads and streets constituting the major portion of the Federal-Aid Highway Act give balance to the improvement of our transportation arteries. This balanced program should be continued in full force and effect with some added emphasis on the primary and interstate systems. The Federal Government should continue this balanced program of work, increasing the overall allotment to the road system of the country each year, commensurate with the increase in tax yield from the motor vehicle user accruing to the Federal Government. Public roads should be built in accordance with present and anticipated traffic volumes. For the greatest value to the economy of the country, these roads should be so built as to serve a threefold purpose, namely, through traffic, local traffic, and some aid rather than deterrent to the development of real properties. These factors are more forceably brought to attention when we realize that 70 percent of the vehicle miles of travel on our highway system actually goes less than 30 miles per trip.

The President of the United States has repeatedly urged in his discussion of this problem that the States' rights principle should continue in any expanded highway program. (For the President's highway message submitted subsequent to these hearings, see p. 1264.) In my estimation, this can only prevail if the States do their part in the plan of finance, as has been true in the past 34 years of Federal-State highway relationship.

I would suggest that the present policy providing for the maintenance of public roads and streets by the responsible local agency be continued. I would further suggest that the matching ratio on the secondary, the urban, and the primary highway systems be continued at the 50–50 ratio as now provided in the Federal-Aid Highway Act and that the matching ratio on the interstate system be increased to 75 percent Federal and 25 percent State in order that a priority in this system might be purchased by the Federal Government, due to the interstate and military characteristics of this particular system of roads.

The allocation of Federal grants-in-aid to the States should be on a specific formula and definite allocations among the four systems of roads; however, sufficient flexibility should be used in the law to permit the interchange of funds among the systems when just cause can be shown for such transfer.

The CHAIRMAN. I want to commend you for the brevity as well as the conciseness of your statement. If the Federal Government were to meet 75 percent of the cost on the interstate highways, who should let the contracts, the Federal Government or the States?

Mr. GREER. I mentioned that the three systems should be 50–50.

The CHAIRMAN. I understand, but on the interstate.

Mr. GREER. That would be 75 percent and 25 percent, and herefore I think the contracts should be subject to the concurrence of the Federal Government.

The CHAIRMAN. Would you have the States still let the contracts and supervise the construction, even though they meet only one-quarter of the cost?

Mr. GREER. Yes; subject to the concurrence of the Federal Government as to any contract.

The CHAIRMAN. You would have 25 percent of the appropriation really determining the policies. If the Federal Government is called upon to pay three-quarters of the cost, why should not the Federal Government carry through the letting of contracts? Aren't you insisting that the tail wag the dog?

Mr. GREER. The present matching basis is 60 percent Federal and 40 percent State and, under that, the States are now handling the operation.

The CHAIRMAN. I understand, but you propose to step it up to 75. I am struck with the fact that the States seem to love to come to the Federal Government for money, but they are not always anxious to contribute funds themselves. Then they are very anxious to control the expenditure of such Federal money as is appropriated. This is all done in the name of States rights.

Mr. GREER. Mr. Chairman, if you will permit this statement, I was speaking generally for the majority of the States on that score. Insofar as Texas is concerned, we would prefer that all systems be on a 50–50 basis.

The CHAIRMAN. Oh, I see. That is, you would not want 75 percent.

Mr. GREER. Generally we prefer all of it 50–50. That is a better partnership arrangement. However, not all States are, let us say, quite as fortunate as we are in being able to provide the funds that are necessary.

The CHAIRMAN. I commend your consistency. We wish it were more widespread.

Vice Chairman PATMAN. Mr. Chairman, may I comment briefly on your statement. It looks unusual for the State to ask for 75 percent and insist on letting the contracts. In view of the statement used by the witness, that it would be subject to the concurrence of the Federal Government, wouldn't that be a great advantage to the Federal Government? In other words, the States would look after all of the deals, and all of the contracting part, up to a point, and then we would have to get the concurrence of the Federal Government; in other words, the Federal Government would have the veto power over it, and I assume they could actually demand, the Federal Government could, Mr. Greer, that they even ask for new bids, if necessary.

Mr. GREER. That even happens under present conditions. We submit all of the data to the Federal Government before we ask for bids. They sit in on the actual receiving for bids, the opening of bids, tabulating of bids, and they review everything before they concur in the award of the contract.

Vice Chairman PATMAN. And they have a veto over it if the officials desire to use it?

Mr. GREER. Yes, sir.

Vice Chairman PATMAN. Therefore, I do not think it should be disturbing to the chairman.

The CHAIRMAN. Well, knowing something of the circumstances under which some States let highway bids, I would say that there is more to this subject than has been touched on this morning. I think we should proceed to the next witness.

Mr. Olds.

OPENING STATEMENT OF LELAND OLDS, DIRECTOR OF ENERGY RESEARCH ASSOCIATES, PUBLIC AFFAIRS INSTITUTE

Mr. OLDS. I was asked to comment on the President's proposals in the field of power resources:

The Economic Report of the President is completely lacking in recommendations with regard to electric power or recognition of the part played by ample supplies of low-cost electricity in an expanding economy with provision for defense.

The report fails to recognize that the electric-power field is one in which the proved shortsightedness of private monopoly can result in seriously retarding the vigorous economic growth which the report offers as the best way to avoid recessions.

The President's power policy, if carried out in terms suggested by his report, would result in a power-short America, measured by the requirements of an expanding economy, which will call for supplies of electricity multiplying at least 3 times over within 15 years and 10 times over by the beginning of the last decade of this electric-power century. It would result in an America hampered by rising power costs. It would mean a slowing down of automation in industry, on the farm, and in the home, which will enable us to couple rising living standards with reductions in the working week to 35, 30, and ultimately 25 hours.

And there is a direct tie between adequate power and employment because, as President Gadsby of the Utah Power & Light Co. points out, electric energy now required per man-hour in industry is equivalent to 154 unseen workers under the direction of each visible worker, with the prospect that the number of invisible helpers will rise to 250 for each worker on the production line.

The President's power policy, as set forth in the Economic Report, by favoring private monopoly in the business of power supply, will result in underdevelopment of our hydro, hesitant development of low-cost atomic power, slower progress toward all-electric homes, cramped expansion of farm electrification, and a general restriction on improvement in American living standards.

In terms of national security, this may prove serious, for although the Office of Defense Mobilization and the Department of the Interior disagree on the adequacy of planned capacity to 1957, both agree that the prospect of power shortage in the Pacific Northwest and the Southeast is serious.

In this connection, we may note the effort of Westinghouse Electric Co. to spur timely orders for new generators. Westinghouse shows that although 9.3 million kilowatts of new generating capacity will be required for installation in 1956, only 5.1 million had been ordered as of September 21, 1954. According to their statement:

> It is too late to furnish the 4.2 million kilowatt deficiency on a 30-month production schedule. Practically no commitments have been made for 1958 and 1959.

With what seems a careful avoidance of the mention of electric power, the Economic Report apparently takes some pride in the administration's reversal of the power policy of the last 25 years. Advocating expansion of investment in conserving and utilizing soil, water, mineral, and other resources, the President indicates that—

> to speed this process, the Federal Government has attempted to distinguish as clearly as possible the field of Federal enterprise from the field of private or local enterprise.

He applies this to water resources by setting forth the administration's so-called "partnership" policy under which, broadly speaking, the people would put up the nonreimbursable investment and non-Federal interests, mainly private, the reimbursable.

This means in the main a shift of Federal partnership in the field of electric power from partnership with local community public or cooperative electric systems to partnership with private monopoly. It will ultimately destroy the type of public or cooperative competition which has proved the most effective supplement to the otherwise largely ineffectual efforts to regulate utilities in the public interest.

The type of public or cooperative competition provided by Federal power legislation, including the Tennessee Valley Authority, Rural Electrification, Bonneville Power Administration, Reclamation, and Flood Control Acts, has stimulated neighboring private power companies to greater reductions in rates and greater expansion in business than has occurred where this influence is lacking.

The power policy set forth in the President's Economic Report purports to be based on the premise that power supply is a local responsibility. This is technologically inaccurate. Today low-cost power is power from integrated regional systems, and where the Federal Government abdicates responsibility most public and cooperative systems are thrown upon the mercy of their private competitors or must depend on relatively high cost, small local generating stations.

Except in rare instances, public and cooperative systems cannot hope to take full advantage of river basin or atomic power unless the

Federal Government takes a portion of the responsibility for wholesale power supply. The shift in partnership described in the President's report will mean that the people of the country will get less power from their water and nuclear power resources at higher cost.

(I am going to change slightly the order of my presentation from that of the copies which have been distributed here.)

We can interpret the contrasting power policies, one leaning toward private monopoly, the other toward public competition, including Federal investment in some generation and transmission, rather specifically in terms of immediate effects on employment.

In the first place, the sensitive response of the private-power industry to fear of overbuilding in the face of business recession tends to accentuate those recessions, as well as to cramp later recovery when power supply becomes tight. Thus the September 20, 1954, issue of Electrical World forecasts capital expenditures by all agencies for electric generating capacity falling from a high of $2,088 million in 1953 to an estimated $1,475 million in 1957, or by more than $600 million. Already by its January 24, 1955, issue this trade journal reports actual investment in generation for 1954 at less than the prediction of 4 months earlier and drops its 1955 estimates by nearly 10 percent. This recalls the Westinghouse figures for generators on order, to which I have already referred.

Such reductions in new investment have far-reaching effects on business and employment, as well as reducing the power supply available for future expansion. The Federal program I am recommending can help to remedy this situation.

In the second place, reductions in electric rates, due to an effective competitive power program, will mean hundreds of millions of dollars savings in electricity costs which will be available for consumer expenditures on such soft goods as textiles and shoes which need such a spur to absorb unemployed workers in a number of depressed areas. Figures prepared by the Federal Power Commission for a former Member of Congress in 1952 showed possible savings of over $2 billion in 1950 if all electric sales in the United States had been billed at rates prevailing in the TVA area. Of course, if all rates had been so reduced the result would have been big boosts in sales of electricity and appliances, so that actually power revenues would not have been reduced by anything like this amount. In other words, the savings would have been distributed among the soft goods and electrical appliance industries.

In the third place, if the expansion of power requirements is not cramped by the proposed change in Federal power policy, it will mean a tremendous boost in employment in the depressed coal-mining areas. The forecast for 1970, even assuming reasonable expansion in hydro capacity and atomic power, will require approximately double the 117 million tons burned to produce coal's share of electric generation in 1954. This assumes coal continuing to provide 65 percent of the total thermal generation, although as the last half of the century unfolds the share carried by oil and gas is due to decrease. With the requirements for cement mills, the steel industry, the coke, gas, and chemical industry, rail transportation, other industries, and retail sales, this would call for bituminous coal production in excess of the present Bureau of Mines' estimates of full-time production of existing mines, with this year's work forces.

Table 1 and table 4 in the report suggest that the authors fail to be influenced by their own proof of the relationship between dynamic power policy and an expanding economy. Table 1 shows expansion of electric power production outdistancing all other growth factors between both 1939 and 1946 and the present.

Table 4 shows some rapidly growing commodities and services to illustrate the widening economic horizons of consumers, with the comment that "one of the marvels of our generation has been the growth of consumer capital." The significant fact is that 8 of the 15 rapidly growing commodities shown are electric appliances and a ninth involves electric freezing.

The influence of Federal power policy, as embodied in the TVA and the Bonneville Administration, in producing this result is apparent in the annual statistics of electric appliance sales, published in the January 1955 issue of Electrical Merchandising, a trade journal. These statistics show that in 1954 sales of electric appliances, the States of Tennessee and Washington exceeded the United States average per 1,000 residential customers for 10 of the 13 appliances covered. Both also equaled the national average in 2 of the 3 remaining appliances.

The administration should reread the subtitle under which this table appears. It reads: "Lessons From the Past and Guides to the Future."

The President's report stresses the importance of assisting new and small businesses, stating that our economy is strong and progressive because it contains, in addition to its 5 million farm enterprises, 4 million independent centers of business decision. My comment is that the Federal rural electrification program has probably been the outstanding Federal contribution to the strengthening of small-business enterprise and that it is an integral part of the larger Federal power program, in which the Government assumes a partnership responsibility for assuring rural electric systems, directly or indirectly, low-cost wholesale power supply.

The report specifically claims credit for ending Federal power responsibility for power supply, which has played an important part in this boost to America's premier small businesses.

The President finds the history of our country and the Western World demonstrating—

> that economic progress depends fundamentally on the enterprise and initiative of millions of people seeking to better themselves.

No clearer illustration of this could be cited than the economic progress of the country's farms which has come through the enterprise of millions of farmers in organizing and managing their nearly 1,000 rural electric cooperative systems, raising the percentage of electrified farms from 11 percent in 1936 to over 92 percent last year.

Yet the testimony before the Senate Judiciary Antimonopoly Subcommittee shows that the new power policy, set forth in the President's report, is making it possible for private power monopoly, which contended that areawide rural electrification was not feasible, to undermine these very vital cooperative enterprises.

Low-cost electric power in abundance is an important key to an expanding economy. So said the Paley Commission. And the expansion in power demand is always exceeding private company expectations. So says Westinghouse. General Electric says industry expectations of 1 trillion kilowatt-hours in 1970 are now advanced to 1965, and the Paley Commission estimates of 1.4 trillion in 1975 are advanced to 1970. General Electric says that the upward trend of total residential use will pass industrial use by 1973 and that prophets look for an overall requirement of 5 trillion kilowatt-hours in the year 2000. I predict it will be reached by 1990.

And the newspapers carried just yesterday and today the story that the 10 billion kilowatt-hours a week purchase of electricity mark in this country has just been passed.

To meet this challenge of the electrical age, with all that it will require in hydro, conventional fuels, and nuclear energy, will require expansion of Federal, State, and local public, private, and cooperative generating capacity, all working together, and all stimulating each other by the special brand of competition deriving from the freedom of all communities to choose whichever form of ownership best meets their needs. Without Federal participation in the wholesale field, making possible public and cooperative competition, private monopoly will dominate and will prove a restrictive influence on expansion. And we must not forget the wider implications, stated by Representative Jensen of Iowa in last year's atomic energy bill debate. Warning of possible Federal monopoly, in words even more applicable to private monopoly, Mr. Jensen said:

> Mr. Chairman, the man who controls the electric energy of any nation, especially in a nation that is dependent on electric energy as we, controls that nation. Any one of you Members of the House, or any other American, could control America lock, stock, and barrel today if he or she had control of the electric energy of America. Let us not forget that.

The recommendations of the economic report should have included, as a part of the public works program, (1) the undertaking of new Federal multipurpose river-basin projects, including Federal development of power, in the Columbia, Colorado, Central Valley (Calif.), Missouri, Arkansas-White, Alabama-Coosa, Chattahoochee, Roanoke, Connecticut, Merrimac, St. John, and Kennebec River Basins——

The CHAIRMAN. Are there any rivers that you do not want to develop, Mr. Olds?

Mr. OLDS. Not rivers that have the possibility of sound multipurpose developments with power involved, and where the use of Federal investment will make possible a fuller development of the potentialities than would be possible with the use of private funds.

The CHAIRMAN. When you speak of the Colorado, do you mean the upper Colorado?

Mr. OLDS. Yes.

The CHAIRMAN. Including irrigation?

Mr. OLDS. Yes.

The CHAIRMAN. Have you noticed the costs per acre on the upper Colorado, including irrigation?

Mr. OLDS. Yes.

The CHAIRMAN. Including interest, is it not true that the cost would be around $2,000?

Mr. OLDS. That is so.

The CHAIRMAN. Do you think it economic to construct land at a cost of $2,000?

Mr. OLDS. With our population going up by 1970 to 200 million and by the year 2000 to 270 million, that will put such a strain on our resources that, in the same way the Government has found it possible to secure copper production from relatively uneconomic copper mines, it will warrant bringing in all of the land that can be irrigated to make this kind of subsidy to irrigation development as a long-run proposition.

The CHAIRMAN. Is it not true that the administration is planning to withdraw 40 million acres, roughly, from circulation and turn it back to grasses?

Mr. OLDS. That is a temporary thing, in part, and in part involves a desirable shift of acreage which should never have been put under wheat, for instance, and grains, and should have been put under grass as a conservation measure.

The CHAIRMAN. Well, if it is desirable to add additional acres at high altitudes at a cost of $2,000 an acre, which is roughly 4 times or 3 times the cost of the more fertile land in the United States, do you think the administration might consider the possibility of constructing land on the skyscrapers of New York and growing vegetables on the terraces? I think it would cost less than $2,000 an acre to create very rich land there, and I wondered if that might not be included in your program.

Mr. OLDS. I think if the administration was set on doing that kind of an investment job it would better put the money into harnessing of the energy of the sun with the possibility of being able to achieve control of the photosynthesis process.

The CHAIRMAN. As you know, I tend to support the public power projects, but I have very real reservations as to whether we have not gone too far in the field of irrigation, and whether the costs are not excessive in terms of yields on extremely fertile land. It seems to me that we are expending enormous amounts of money which are uneconomic.

Take the richest belt in this land, running from the Indiana line to the Mississippi River, across my State, that is now selling from five to six hundred dollars an acre, including the land across the river in Iowa.

Representative TALLE. Thank you, Mr. Chairman.

The CHAIRMAN. To take arid land and build it up at $2,000 an acre which when finished would be worth $150 an acre, always seems to me to be an extraordinary performance explainable only by the great political power of the semiarid States in the United States Senate.

Representative TALLE. Mr. Chairman, would it be permissible to say just a few words at this point?

The CHAIRMAN. Oh, certainly.

Representative TALLE. As a case in point, Mr. Chairman, right along the lines that the Chairman has spoken, there is practically no waste land in the State of Iowa. We have 25 percent of the grade A land of the Nation. We don't take credit for that. That is nature's gift. We do take credit for good use of that land, though. We have very good farmers in Iowa. But there is a river in my district in which siltation occurs every year. It has worked back from the mouth of the Mississippi westward. It has worked back now to the extent of 7 miles. The acres that used to produce excellent corn crops when the grandfathers of the present owners farmed that land and the fathers of the present owners raised good crops, that land to the extent of

36,000 acres is practically wasteland every year because of floods. In successive years the siltation fills the channel upstream.

After all, if the channel is filled with silt, the water can do nothing but fan out over the acres, and crops are destroyed. The channel, while reopening has been authorized, is still silted up, and I am hunting around for some money that the Congress does not vote for aid to some remote part of the world, so this channel can be opened up and these 36,000 acres be put back to good corn production.

Mr. Olds, any help that you can give me along that line to make good use of what used to be very good land, I will appreciate, and I think you will agree with me that we should do that before we spend a lot of money making new land.

Mr. OLDS. Well, because my discussion runs primarily to power, and I think the power resources of the upper Colorado are going to be very important in the development of that whole intermountain area——

The CHAIRMAN. I was trying to rescue you from an entangling alliance, Mr. Olds.

Mr. OLDS. Thank you very much. I am still willing also to support the objectives on a long-range basis of the people that are interested in irrigation.

The CHAIRMAN. Do you mean that you have to get the votes of the people who are interested in irrigation in order to get the power projects?

Mr. OLDS. No, sir; when I was in charge of the studies for the President's Water Resources Policy Commission, I made a series of studies in the field of land and land economics, as I did in power, and I was convinced by that study, and the men working on it, that on a long-range basis we are going to be able to justify the bringing in of more land, a great deal more land, in order to meet the requirements of the future population.

On the question of siltation, I think that is one of the very important problems in water resources that has to be dealt with. When I was chairman of the Federal Interagency River Basin Committee, I worked very closely—it is my recollection I appointed a committee—on the study of the whole question of sedimentation and siltation. This has been a serious problem in the corn country, not only in Iowa but in Illinois, where Lake Sangamon is, and near the city of Decatur. They have had that same problem of siltation and sedimentation filling up in that case a lake which was designed to furnish the water supply of Decatur and also to provide recreation.

But the great problem there and the great problem in the corn country is due to the fact that many farmers feel that it is more important to get at relatively high prices what they can get out of the production of corn than it is to actually undertake the kind of farming that is necessary to keep the soil from washing into those rivers.

Decatur appointed 2 land conservationists to work with the University of Illinois, and the Federal Soil Conservation people in an attempt to control about 2,000 square miles of the Sangamon Valley in Illinois, and up to the time of about 3 or 4 years ago that I talked on the subject at the Department of Agriculture I was told that only 15 percent had been brought under conservation, that the answer they frequently got was a nickel under the foot was worth more than a dollar 10 years from now.

Representative TALLE. I think it is fair to state that the Congress has taken a much more constructive view of conservation for a good many years than was the case quite some time back, and in the 83d Congress I thought that legislation pertaining to conservation on the basis of watersheds was very good legislation, and in this specific instance in my district, I am not asking that the channel be opened, and then be permitted to fill up again. I am working with the conservation people to prevent the filling up again after that channel had been opened up, and I think that is the way to deal with it, to prevent siltation from occurring again.

Mr. OLDS. I concur entirely with your view, and I would support entirely that kind of program.

I mentioned what I felt the Economic Report should have recommended in the way of a public-works program as far as rivers are concerned, particularly with reference to power.

Second, it should have recommended assurance of public development of the Niagara-St. Lawrence power resources, under conditions that will bring down the restrictive high rates still prevailing in the Northeastern region; third, legislative and administrative action to initiate the immediate construction of large-scale Federal atomic powerplants in addition to licensed private construction; fourth, active pressing of a cooperative program for development of economically feasible small-scale atomic powerplants adaptable to the needs of small community power systems; fifth, placing of the TVA on a sound basis for continuing to assume utility responsibility for the power requirements of its distributors; and, sixth, provision and such Federal transmission facilities as prove necessary to assure public and cooperative systems first call on power generated at Federal projects.

That, in general, covers my recommendations in connection with the Economic Report.

I might just mention one other thing briefly: In referring to the effect of the growing power requirements of the country on the coal industry, I neglected to point out that when the requirements of the country reach the 5 trillion kilowatt-hour mark suggested by General Electric, even with more than half of the electric energy produced by hydro or atomic power, the power industry alone is likely to call for from 5 to 8 times as much coal as was used for the generation of electricity in 1954, or considerably more than total production in that year.

Thank you.

Representative KELLEY. Does that hold out hope for the coal industry?

Mr. OLDS. Definitely. I think the coal industry has a definite stake in a program which will lead to the greatest expansion of the use of electricity in this country, and I think that is the prospect of the industry at present.

Representative KELLEY. The coal industry is in such a poor state now that any hope that is offered I am sure will be received with gratitude.

Mr. OLDS. One of the interesting things is that as you bring in this larger production of coal even though as predicted you may run into situations where you are getting into thinner veins, perhaps, and what is normally considered more expensive mining, nevertheless, and this is based on my contacts with the Bureau of Mines, when you get your coal industry on a full production basis with a market for your fines, as well as your better grades of coal, you are actually going to be able technologically to bring down the cost of your coal so that I think coal will be in a better competitive position as the rising demand for power calls for more and more coal.

Representative KELLEY. I do not think we need to worry very much about the cost of production of coal because there has been a great reduction in the production of coal due to the mechanization of mines, and I am sorry to say to the elimination of labor.

(Mr. Olds' prepared and supplemental statement appears at pp. 804, 808.)

The CHAIRMAN. Mr. Renne.

OPENING STATEMENT OF ROLAND R. RENNE, PRESIDENT, MONTANA STATE COLLEGE, BOZEMAN, MONT.

Mr. RENNE. Mr. Chairman, as so happens when one is fourth or fifth in presentations, some of the points which I would emphasize have already been covered. Mr. Fisher brought up several of those points. I was asked to discuss water resources, and I will limit my discussion to irrigation and to flood control and the watershed situation, because I think Mr. Olds has covered the power end of it.

The President's report concludes that it is desirable to expand investment in facilities for conserving and bringing into economic usage, more of our soil, water, mineral, and other resources. I am in full agreement with this conclusion. The report also concludes that of all our natural resources none requires more immediate attention than water, and effective conservation, control, and utilization of the Nation's water resources requires energetic implementing of sound policies. I can find no fault with this point.

The report then expresses full approval of the present partnership policy of the Government of developing water resources whereby State and local governments and private interests—

> are encouraged to provide all physical facilities they can, leaving for Federal execution only those parts of water-development projects which serve national purposes—

and I find great difficulty, Mr. Chairman, in separating the national interest in certain projects from the other interests—

> or which, because of great size or complexity, are beyond the capability of others.

The report argues that this approach will accelerate the development of water resources, but will not involve the Federal Government in huge expenditures for operations.

This statement of policy sounds perfectly logical and in principle is basically sound, yet its execution may very easily result in serious damage to the public welfare and to the ultimate growth and progress of our country. The first, and probably most important, question raised by this policy is whether private development or partnership development result in less than maximum use of a particular resource situation. In the case of water resources, good reservoir and dam sites are definitely limited. Moreover, the structures to be placed upon such sites are of a very permanent nature. Since construction is completed it is difficult and usually impossible to build onto the first structure, or to modify the original structure to any great extent. It is highly important, therefore, that the first structure be one which will make maximum utilization of the site and the water resource. The Nation cannot afford less than the maximum development and use of its water resources in the light of the limited number of good development sites available and the projected future population and demand.

The CHAIRMAN. Dr. Renne, I do not want to get you into difficulty, but would you be willing to comment on the application of this principle to Hells Canyon?

Mr. RENNE. Yes, I feel that Hells Canyon is the type of project in which the Federal Government not only should take the lead in the planning, but in the development and operation.

The CHAIRMAN. And you feel it is better to have one high dam which will store the surplus waters during the period when the snows are melting than a series of low dams which will not have such storage capacity and which will result in an ultimate wasting of the waters down the Columbia into the Pacific, going through the spillways on the way, rather than creating power?

Mr. RENNE. That is correct.

The CHAIRMAN. I congratulate you for your courage and also for your good sense.

Mr. RENNE. Thank you for the statement on courage. I have lived in that country for 25 years, and I feel that the Pacific Northwest particularly is an area where we have to take a courageous stand unless we are to prevent making some mistakes now which 25 or 50 years hence will be much more serious than they look today.

I cannot forget in the case of Hungry Horse, for example, that for many, many years that was considered not feasible at all, and I am sure would not be feasible taken alone and developed as an intra- or interstate project, but when tied in with the Bonneville and the rest of the system of power, Hungry Horse has a definite place.

I am also reminded in the case of Fort Peck, in the case of floods in the Kansas City area, the figures I have been able to get indicate that the flood-control functions of Fort Peck resulted in a reduction in the flood tide peak at Kansas City of 14 inches.

Private development or partnership development in which the Federal Government is cast in a residual role of undertaking only those projects that State and local governments or private interests do not care to or cannot undertake, is certain to result in less than maximum development and use of water resources in many instances. Private interests are ordinarily concerned primarily with immediate needs and with only a part of the total services the water resources may be able to provide. The interests of State and local governments are frequently such that only a part of the total services are of major concern. The Federal Government is the only agency clothed with responsibility for, and concerned with, maximum development of the resource in the interests of the welfare of all the people. It cannot perform this function effectively in a residual capacity, but only in a leading role.

The second question raised by the partnership policy concerns fiscal policy of the Government. The desire to avoid heavy Federal expenditures and to achieve a balanced budget is understandable, but we should not abandon sound water resources development policy simply because traditional budget procedures may result in a bookkeeping deficit. Federal expenditures for construction of water development projects should be distinguished from Federal expenditures of the usual operation type. Water resources development project outlays which expand the capacity of these resources to support the needs of a growing population—and I might insert that our births this year exceeded 4 million, and our net gain is such that at this rate we shall have 200 million by 1975—should be set up in an investment account as distinguished from the regular operating budget. Establishment of an Office of Coordinator of Public Works Planning within the Executive Office of the President, as recommended in the report, is highly desirable.

The CHAIRMAN. Will you permit me to interrupt at this point?

Congressman Bolling was too modest to state this, but I am not, so I will say that we jointly introduced a bill which met with very cold reception from the executive department on the subject, but we are delighted to see the child adopted this year. We point out that the paternity of the child is a little bit different from what might appear on the surface.

Mr. KELLEY. Mr. Chairman, I am not quite so modest. I also introduced such legislation.

The CHAIRMAN. Good. I think that on occasion modesty can be carried to too great an extent.

Mr. RENNE. So much for the two general and perhaps theoretical discussions.

The next is the consideration of the costs. I think the staff asked especially that that be commented upon.

In the case of conservation treatment of watershed lands, the head of the Federal agency responsible for the conservation treatment function should execute repayment contracts with organizations representing the primary beneficiaries. These contracts should provide for payment of an annual amount sufficient to cover that part of the annual operation and maintenance costs allocated to conservation treatment, the cost of replacements allocated to conservation treatment, and repayment without interest for a period of not more than 50 years, beginning the first year after the initiation of such conservation treatment of so much of the capital investment allocated to conservation treatment as the agency head annually determines after consideration of ability of the beneficiaries to pay in relation to their net income derived from the project or activity during the preceding year, and to current agriculture production and market conditions.

The CHAIRMAN. I suppose their ability to pay over a period of 50 years is considerably less than the cost of the project. Who would assume the difference?

Mr. RENNE. I think that is where the National and State interests come in. If contracts could be worked out between the Federal and State I think the State should assume some of those costs, but I think over and above those there will be national considerations and I think the Federal Government should pay those.

The CHAIRMAN. It is a very grave problem of national policy and I know people who defend local interests have a deep concern about this, but I think it is very questionable as to whether we should have the taxpayers of the country subsidizing at great cost building of additional land into cultivation, when it is said that the increased productivity per acre and per man in the old agricultural sections of the country is such that our problem is really a surplus of goods, certainly in some of the commodities, rather than a deficit. We know the great political power of the semiarid States, but I wonder if they have not pushed their advantage a little too far? I would like to point out that we have a section of the country which is drying up now, extending from Texas up through Illinois and Indiana. It seems to me it would be a wiser policy to conserve the acres we have rather than to bring additional acres into cultivation. Without wishing to indulge in sharp adjectives, I think the East and the Middle West have been taken for a buggy ride on a lot of these irrigation projects which hitherto we have borne uncomplainingly; but perhaps the time has come for the East and the Middle West to assert their interests rather than implicitly to go along with these proposals.

I honor you, sir, and I realize that you are representing your locality, but we have interests, too.

Mr. RENNE. I want to make it clear that I am in full agreement with watershed conservation, and particularly in areas like Iowa, where so much of our good land is located, but I don't want to get now into a discussion of buggy rides by regions, because I think maybe the Northwest and the Rocky Mountains might have a point, but I do feel that in the overall consideration there are certain national implications in which the National Government has some responsibility, too.

In the case of flood control, I think our policy should be one of executing contracts with State or local governments to provide payments sufficient to cover that part of the annual operation and maintenance costs allocated to flood control, the cost of replacements allocated to flood control, and repayment without interest, and within 50 years, of the capital investment allocated to flood control to a degree corresponding with the production of primary benefits and secondary regional benefits. All remaining flood-control costs should be borne by the United States.

I realize this may sound general, but I don't think you can develop concise formulas. I agree with Mr. Fisher. You have to keep the objectives in mind, and apply them to individual projects.

Local contributions should be secured to reimburse the United States for any navigation benefits conferred specially upon local interests, otherwise, all navigation costs should be borne by the United States until and unless Congress prescribes a general reimbursement standard after further consideration of charges for transportation by all means, including transportation by water.

The investment of the Federal Government in irrigation projects should be recovered by the head of the responsible Federal agency executing contracts with organizations representing primary beneficiaries——

The CHAIRMAN. May I interrupt a minute. Perhaps this will stir up a discussion with my good friend from Pennsylvania.

There has been a proposal for a $90 million development of the Delaware River, of which $30 million is a proposal to deepen the channel from 38 to 43 feet. The only group which will be benefited by this is the United States Steel Corp., which has put a new mill, Fairless Mill, around Trenton, N. J., to enable South American oil to come up the Delaware River, and the local interests want this cost borne by the Federal Government.

Isn't this a subsidy of the United States Steel Co. by the taxpayers?

Mr. RENNE. I was raised on the Delaware River. I am not sure the only beneficiary would be United States Steel.

The CHAIRMAN. The immediate beneficiary?

Mr. RENNE. The immediate beneficiary, yes. But I am not sure that the immediate beneficiary should pay the entire cost.

The CHAIRMAN. Shouldn't they pay some in the form of tolls because of the lower navigation costs which will accrue to them?

Mr. RENNE. Definitely, I would agree with that.

Representative KELLEY. Mr. Chairman, would that establish a precedent in cases of the improvement on rivers and harbors? Heretofore it has always been in the hands of the Federal Government.

The CHAIRMAN. I think it might check some of the pork-barrel requests that pour in on this.

Representative KELLEY. It is not only in the interests of Pennsylvania, but for the benefit of New Jersey and Delaware. While United States Steel Corp. is a beneficiary, it will open up for other industries the whole area bordering on Pennsylvania and New Jersey and Delaware.

The CHAIRMAN. It seems extraordinary that you need a 43-foot channel for these other industries. I have always thought 38 feet was an adequate channel.

Vice Chairman PATMAN. Mr. Chairman, I have a little information on that subject, I believe, that I would like to bring up in view of what has been said.

It is my understanding that last year during the second session of the 83d Congress there was a bill to authorize this project; is that correct, Mr. Kelley, and our committee in the House recommended, at the request of the Corps of Engineers, that with the channel deepened from 38 to 43 feet that the industry that will directly benefit should pay the cost, and the bill in that form went through the House; is that correct?

Representative KELLEY. I believe so.

Vice Chairman PATMAN. Then it went to the other body, and then the other body put the amendment in—I do not recall whether there was any fight over it over there at the time.

The CHAIRMAN. I was ill at the time and was not able to walk onto the floor, but if I had had the physical strength, I would have fought that proposal.

Vice Chairman PATMAN. I am not trying to place responsibility, but it seems to me that amendment went in without objection. Oftentimes that happens in that great body over there, because they are told that conference will take care of that. You have heard that before.

The CHAIRMAN. Yes, sir.

Vice Chairman PATMAN. Well, it went in, and then the conference takes care of it. There was pressure brought to bear to allow that. So I do not know who was asleep at the switch, but that is when it started.

The CHAIRMAN. I was not asleep. I was feeble.

Mr. OLDS. Mr. Chairman, may I introduce one thought on this specific thing: One of the very interesting parts of this whole debate on this Delaware deepening is that the United States Steel Corp., in justifying the thing done entirely at the expense of the Government, is using the same arguments which the United States Chamber of Commerce condemns when they are applied to the justification of assigning values to the navigational facilities of the whole Tennessee Valley Authority development of the Tennessee River.

Vice Chairman PATMAN. Since we all reserve to ourselves the right to be inconsistent, I guess we can allow that to the United States Chamber of Commerce.

Representative KELLEY. Has there ever before in the history of our Nation been an instance where outside interests are asked to bear the costs of river improvement?

The CHAIRMAN. We have the St. Lawrence situation.

Vice Chairman PATMAN. This is a benefit just for United States Steel. The extra 5 feet is just for them. Nobody else needs it. Only United States Steel needs it.

Representative KELLEY. Well, for the present.

The CHAIRMAN. Well, why should it not be paid for by tolls?

Vice Chairman PATMAN. You are not that archaic in your views.

The CHAIRMAN. If you have lower costs for iron ore, why not have the iron ore pay it.

Vice Chairman PATMAN. I was trying to be facetious.

Representative KELLEY. Well, I have in Pennsylvania some immediately affected.

Mr. RENNE. I live in Montana, so am not immediately affected.

The CHAIRMAN. Well, that is the trouble we get into.

Vice Chairman PATMAN. I think it would be an interesting study to find what pressure was brought to bear to cause the conference committee to agree to that very unusual amendment.

The CHAIRMAN. I can say this: On any appropriation bill this year I shall strive to undo the effect of Senate negligence last year.

Mr. RENNE. Just to finish up, Mr. Chairman, on irrigation, I certainly am not proposing that we have an extensive development of irrigation lands at a cost of $2,000 an acre, but I do think in some parts of our country population has already exerted pressure on resources to the extent where we are going to have to consider some of the long-range benefits, and we find in many parts of the Western States that we can make as much net per acre from irrigated lands raising cattle and sheep, but particularly cattle, beef, as we can farming the land. I think with a population of 220 million, if we are to continue to be the kind of meat-eaters we have been in these recent years, we are going to need more of our basic western resources, and many of them irrigated acres that will raise pasture and hay and barley to fatten off and finish our cattle, because now our hogs and our cattle are moving more and more to the west coast, with its tremendous population expansion. In that Rocky Mountain-Pacific Northwest area I think there are many projects involving irrigation which, while they will take a long time to develop, because after the structure is finished it takes 20 to 30 years to develop the irrigation lands, I think if we do not go too fast, and there is nothing which requires us to put all of the irrigation structures in when you build the dam, if we do our accounting properly it seems to me we ought to plan our structures for the overall multiple-purpose long-term needs instead of just the immediate.

(Mr. Renne's prepared statement appears at p. 814.)

The CHAIRMAN. We have with us Dr. William G. Carr, executive secretary of the National Education Association. He is going to speak on school needs.

STATEMENT OF WILLIAM G. CARR, EXECUTIVE SECRETARY, NATIONAL EDUCATION ASSOCIATION

Mr. CARR. I would like to state that we regret it was impossible for the president of the National Education Association to be here. Miss Walker has been in sunnier climes, to wit, Hawaii, and is unable to arrive here. I will try to present quickly to the committee the general scope and dimensions of the needs for the construction of public-school buildings in the United States at large.

In order to do this it will be useful, I think, to identify three major factors which create a need for school buildings. The first factor is the removal of the deficit commonly called the backlog, which has arisen because of a long period of relative neglect during the depression, during the arsenal of democracy period, during the hot war, and during the World War. There are many reasons why this neglect occurred. Many people think it should not have been allowed to accumulate, but that is past, and the fact is that we have a very substantial deficit now of school buildings.

The evidence of this deficit can readily be seen in almost any part of the country. You see conditions of extreme crowding in many communities. There are many children now who have never known what it is to go to a school for a full day, and if something isn't done rather suddenly we shall have hundreds of thousands graduating from our schools who have never had a full day's schooling in their lives. Because there isn't room for them, they have to go part time.

There are other evidences of crowding which the most casual walk through any one of our communities will reveal. Now, the removal of this deficit as it has accumulated over the past quarter century would call, according to the best information we can get, for about 312,000 classrooms in the next 10 years. At $34,000 a classroom that is $10.6 billion.

Now, the second factor that we have to reckon with is, of course, obsolescence, which is continually going on. If you assume, which is contrary to fact that we have no obsolescence now, and all the buildings where our children are found are safe and sanitary, you will have in the future buildings that will wear out and ought to be replaced. If you take a useful life of a school building at 50 years, which is probably far too long, the obsolescence in the next 10 years will require about 220,000 classrooms, which is $7½ billion at the same rate of construction.

There is, of course, a third factor in our economy and in our educational system which adds to the needs for school buildings, and that is the expanding school population. This expansion in enrollment, in turn, is due to 2 other causes, 1 the dramatic increase in the birthrate which has marked recent years, and the other the general tendency of people to stay in school longer.

We, of course, have had compulsory attendance laws in this country for many years, and though they have not been perfectly enforced they have by and large kept our people in school for the elementary school years. But now the tendency to consider at least a high-school education as a basic minimum for almost any kind of employment is resulting in an expanding enrollment.

Now, if we take this third factor, Mr. Chairman, over the next 10 years and plot it in terms of what we know about children who have already been born and will mostly survive to attend our schools 6 years after birth, and make reasonable assumptions as to the continuation of this birthrate and of the demand for education, and if we assume that people do not withdraw from school earlier than they do now, we have 420,000 classrooms which at the same rate is $14.3 billion.

These three factors, then, the removal of the backlog, or deficit, the removal of obsolescent buildings, and the meeting of enrollments which are expanding because of greater demand for education and more people to be educated, will add up, if my arithmetic is right, to $32.4 billion between now and 1963. I am not, of course, predicting that this is what will be spent to construct public school buildings. This is, I think, a reasonable estimate as to what might be spent.

In concluding I will be happy to answer any questions of policy or program that I can. The estimates that I have been giving to you do not assume any improvement in the basic quality of our schools. We are not putting anything in here for a swimming pool in every school, for any improvements in the general construction, for any more gracious space than we now have, for any more beautiful buildings, and so on. We have assumed merely the continuation of the present conditions, and, of course, these present conditions are infinitely varied.

In many of our communities the schools are very fine buildings. In others they are very poor buildings.

These figures do not contain anything in the way of a dramatic improvement in status. It is merely a question of keeping where we are.

I hope, Mr. Chairman, and members of the committee, that this brief analysis will supply you with the information you desire. Perhaps I ought to add just one other word partly for the advantage of the record or the staff: It happens that in this public school building field we are at the moment in an unusually good position to make a statement. The 81st Congress, I believe, authorized a $3 million study of our school building problems, and this study has been substantially completed. It is on the basis of this study covering every part of the United States that the figures I have just given you rest.

The CHAIRMAN. Thank you very much.

The CHAIRMAN. Mr. Wheaton, professor of city planning, and acting head of the Institute for Urban Studies, University of Pennsylvania.

OPENING STATEMENT OF WILLIAM L. C. WHEATON, PROFESSOR OF CITY PLANNING, AND ACTING HEAD OF THE INSTITUTE FOR URBAN STUDIES, UNIVERSITY OF PENNSYLVANIA

Mr. WHEATON. Mr. Chairman, members of the committee, because of the lateness of the hour, I am going to attempt to abbreviate my written statement and just speak briefly to you on the subject of housing.

During the last 5 years we have been building about 1.2 million units a year. This is a considerable achievement in terms of past housing production, and is pointed to with satisfaction in the Economic Report. I hold that while this is indeed an achievement in which we can take pride, it is nothing with which we should be contented. I have made available to members of the committee copies of an estimate of American housing needs during the next 15 to 20 years. This is a study that I made a year ago on what we ought to be building in the field of housing.

That study suggests that we should be building about 2 million units a year if we are to keep up with the formation of new families, the obsolescence of existing dwellings, and with a 20-year program for replacement of houses that are now substandard, and that will become substandard during that 20 years. The rate of building ought to step up from about 2 million units a year at present rates to about 2½ million units a year by 1970.

There is reproduced in that report comparable estimates of other organizations and agencies, the Twentieth Century Fund, the National Association of Home Builders, the National Association of Real Estate Boards, and Fortune Magazine, and some others. While they vary in their estimates from a million and a half to 2 million, these estimates indicate that our present level of building is not enough to meet our current and our future housing requirements, to create adequate vacancies and to put a little competition into a business which has traditionally lacked competition to a considerable extent.

If we relate this need to gross national product we find that to build 2 million units a year we would have to devote the same proportion of our total product to home building that we devoted during the 20 years following 1915. In other words, this is not an excessive requirement in terms of the allocation of resources. We are falling today somewhat below that level.

Now, we should note also that in the last 20 years we have had a great development of Government aids to housing with which the members of the committee are familiar. Those aid systems now directly aid 40 to 50 percent of new residential construction each year. When I say directly aid, I mean FHA insurance or VA guaranties, and they are backed up, of course, by the Home Loan Bank System, the Federal National Mortgage Association, and other less direct credit aids.

If we look at the income levels of families who are served by this vast program, we find that in general the families who are able to take advantage of these aids are those in the upper half or in the upper 40 percent of the income distribution. There are local variations. We can point to instances in which families below the median income can buy new houses, but in general across the country, it is the upper 40 percent that is being served.

I believe that we can expand the market for housing with these conventional Government aids and with conventional financing in a number of fields, particularly in housing for Negroes. Virtually nothing has been built for Negroes in the North and only a little in the South in recent years. There is an opportunity to expand the market in rental housing. There are opportunities in rural nonfarm housing and in housing for the aged. These, it seems to me, will require only minor perfections of our present direct aids to housing, plus some expansion of the secondary credit activities of the Home

Loan Banking System and the Federal National Mortgage Association.

If we are to expand housing substantially beyond the present levels, we must look to other markets not now being served. These are chiefly the market in the middle income groups and the market in the low income groups. It is a deplorable fact that in America today the average wage-earner who works steadily year-round in a factory, who makes the median income, in most cities cannot afford to buy a new house. If Mr. Average American cannot afford to buy a new house, it seems to me this is a matter that requires national attention.

I believe that a more direct form of Federal credit aid would permit this middle income market to be served by private building rather than by public building. I am strongly in favor of having it served by the conventional processes of mortgage lending and private speculative building, rather than by some vast expansion of the public housing program.

It seems to me that this is a problem of major importance now facing the Congress, and that as long as we have relatively idle or underutilized resources, we should seek to expand housing production, particularly in this middle income field.

Finally, in connection with that——

The CHAIRMAN. Which field did you say, middle income or low income?

Mr. WHEATON. I am speaking about middle income.

The CHAIRMAN. What about the low income?

Mr. WHEATON. I will come to that in a moment. Particularly in this middle income field, let me note that this is a form of public works which can be entirely self-liquidating. If the Federal Government will extend credit aid, these middle income American families are eager to buy homes and will pay the full cost of their homes in the sense of the cost to the Federal Government. I think, again, this can be done through private activity.

Now below the middle-income levels there are about 10 million families who are living in substandard homes and who have low incomes. These are families whose incomes cannot possibly permit them to buy or to rent or to maintain decent private housing. The Congress in 1949 recognized a national responsibility for providing public housing to meet the needs of low-income families. That program got off to a rather slow start and has since been curtailed by congressional action. I strongly urge the reenactment or the reopening of the public housing program now going on on a nominal basis to permit the resumption of that program of providing housing for low-income families.

It seems to me that is the only way that we can meet low-income housing need. When somebody comes up with a better way I will be very glad to support that better way, but in the meantime, I hold with Senator Taft on the early hearings on the 1949 bill, we cannot afford to neglect this problem.

Let me note in passing, too, that the administration has supported and is continuing and now proposes to continue the program of urban redevelopment, which Mr. Zeckendorf is to speak of shortly. That program, in my opinion, is going to be stopped dead in its tracks in the next few years unless a substantial amount of public housing is available in which to house the families displaced by slum clearance and urban redevelopment activities.

The scale of the present redevelopment program has been small, clearing very few slums, because it is new and experimental. It hasn't raised this problem in the forceable way that it will be raised if the program is continued or if it is expanded to about twice its present level, which seems to me to be needed if we are to clear slums as fast as they are being created.

The CHAIRMAN. Do you mean that the slums have actually been gaining on us?

Mr. WHEATON. Gaining at a rate of about 2 to 1. I would say dwellings are becoming obsolescent and substandard at a rate of somewhere between 200,000 and 500,000 units a year. We do not have good figures on that. You have to interpolate from census data. We are clearing at substantially less than a rate of 100,000 a year. Doubling the program would stretch resources of local communities at the present time, so I suggest this is a first step toward meeting this problem.

There is one other subject I want to mention in connection with housing, and that is the program of local community facility-type public works. I am not talking about dams and I am not talking about interstate highways. I am talking about water and sewage facilities and schools and community centers and parks and playgrounds, and the things that have to go with housing.

We have a shelf, which has been adverted to, a reservoir of public works, ostensibly. This is actually so tiny and so picayune in size that it is scarcely worth mentioning. That program, it seems to me, must be expanded very considerably to provide a much more substantial reservoir of public works to go along with housing. I emphasize, to go along with housing, because I do not want to get into the larger subject of highways and other facilities.

Let me note also that the President the other day recommended that we make a study and devote several million dollars of Federal funds to research on the air pollution caused by urban development. No agency of the Federal Government has a research program now going on on the much larger problems of urban development itself, of housing, of the relationship between housing and fiscal policy and of the problems of making the housing industry more widely useful to the American people.

We urgently need a resumption of the research program in housing and urban development authorized by the Housing Act of 1949.

There is also an urgent need for Federal leadership in the field of metropolitan planning. I note that Mr. Zeckendorf is going to avert to that and so I won't say more.

In conclusion, let me say we can improve and expand our present conventionally financed housing industry, in my opinion, particularly in the market for Negro housing, more rental housing, rural nonfarm, farm, and housing for the aged. We need supplementary credit resources through the Home Loan Bank and FNMA to permit that expansion. We need a new housing program for middle-income families, one which will use Federal credit, use private lending institutions and use private building to enable families with stable moderate incomes to buy new houses, perhaps 200,000 to 400,000 units a year. We need a reactivated public housing program at the minimum level prescribed in the Housing Act of 1949, and in my opinion, at a substantially higher level.

We need a greatly enlarged urban redevelopment program and we need a greatly enlarged program of advanced planning of local community facilities. These things, except for the community facilities and the continuation of the urban redevelopment program, are not given appropriate emphasis in the report which is before this committee.

Thank you.

Representative CURTIS. Could I ask one question of Mr. Wheaton or make a comment?

The CHAIRMAN. Yes.

Representative CURTIS. Mr. Wheaton, I was very much interested in your comments as to the demand and need for additional housing in this country and the fact that, in your opinion, even though our constructure and new housing starts are well on the increase, we still are not going to be filling the demand of our society. The reason I say that is we had a previous panel—I forget what day it was—of several prominent economists, and they were raising the question of whether indeed, we weren't going ahead too fast in the housing starts and in the construction field, and they were warning us that we could not count on that aspect of our growing economy as a factor in seeing to it that we did have continued business activity in the country.

Your expression here seems to indicate that you think there is a great future for the building industry, immediate future.

Mr. WHEATON. In my oral statement I did not put in the qualifications which appear in the written statement, Mr. Curtis. The most eminent housing economist in the United States, I suppose, is Miles Colean, and he said in writing in 1947 or 1948, that if we ever built a million and a quarter units a year, that would be followed by an immediate and disastrous depression in the real-estate industry. So deep was his gloom about the future of America. I think that this kind of attitude is typical of people in the housing industry. They got burned badly 20 years ago and they still remember those burns.

My statement in writing was that as long as we maintain a stable and growing economy, the market appears to be there to sustain conventionally financed home construction at 1,200,000 to 1,400,000. The evidence in 1949 and 1950 is that if the growth of the economy ever slackens, this market disappears at a remarkably fast rate. We could have a sharp recession in home building.

I am a little surprised that we did not have it last year when we had a year in which momentarily we did not go forward, but my prognostication is based upon the assumption that the economy can and will continue to grow at 3 or 4 percent per year. Under those circumstances, the rising income of families that we have had in the past suggests that we will have a very steady flow of people in the real-estate market.

I further suggested new or additional programs to expand housing production. The public housing program requires a subsidy, as we all know. I believe that subsidy is small compared to what we are going to spend on highways and some other subjects, but it could do an enormous amount of good. And in the middle-income housing field, I do not think we require a cent's worth of subsidy. We require credit.

Representative CURTIS. Well, the gloom expressed was not expressed by those in the housing industry. The gloom was expressed by men who were looking at the overall economy picture, and as I analyzed it, after questioning them, it seemed to be that they just felt the demand woud not be there; not the financing. Unless I misunderstood what they said, it was their concern that we were overbuilding the demand, and incidentally I might state that they expressed the same feeling about another field of private enterprise, the automobile industry; they thought that that industry was going beyond the demand.

In fact, the discussion involved both those aspects of our economy. But I take it from your expression that you feel that if the housing industry is certainly willing to go ahead with these new starts and feels confident, the general economist should not be too alarmed.

Would you say that is a fair observation?

Mr. WHEATON. Yes; and let me first point out we do not have adequate facts on the housing program. The HHFA research program, authorized in 1949, had a good beginning. Several universities participated in it. It is now terminated. We are now starting a project to find out how deep the housing market is in Philadelphia, but there has not been any decent study of the housing market in any major city that really got the facts out in the last 5 years. This is a deplorable state of ignorance.

Then, second, let's think about some of the sustaining forces in the housing market. Ten percent of our population in the United States is Negro. They have made remarkable advances in recent years in income, education and stability of employment.

I find that in Philadelphia there have in that last 5 years been built 137 houses for sale for more than a quarter of million Negroes. Now there should have been built probably 40,000, 50,000 or 60,000.

Representative CURTIS. I am familiar with the situation in St. Louis. It seems that the Negroes, as a general rule, have been buying older homes and moving into those areas, and incidentally, in St. Louis, at any rate, the homes that they have been moving into have been very fine neighborhoods, and the new homes seem to be being bought by the white population going out.

I wonder if that is true in Philadelphia.

Mr. WHEATON. The same thing is true, and yet the very preliminary canvass we make of the Negro market suggests that there are wonderful opportunities for home building there.

Representative CURTIS. For new construction?

Mr. WHEATON. For new construction, and I am happy to note that the National Association of Home Builders is putting on a major drive to open up this market. I feel the same opportunities exist in rental housing.

One banker friend of mine, has been looking at the situation in rural nonfarm areas. He finds an amazing shortaige of credit and large numbers of people in rural nonfarm areas in a populated State like Pennsylvania, where mortgage credit has not been available for building and where people wanted to build. If that is true in eastern Pennsylvania, it must be much more true in the southern and western parts of our country, which are much less adequately served with credit facilities.

I think that you could find specific areas like this where the potential of the building industry has not been tapped yet. These new markets can fill a market gap which results from the dropoff in the rate of new family formation which will carry on for about the next 5 years. After about 5 years new families will be being formed at such a rapid rate that the building industry will be sorely pressed to catch up with the demands then created.

Representative CURTIS. Thank you. I certainly share your optimism in that statement.

(Mr. Wheaton's prepared and supplemental statements appear at pp. 816, 818, 819.)

The CHAIRMAN. Thank you very much, Mr. Wheaton. We are very glad to have Mr. Zeckendorf, president of Webb & Knapp, with us.

I have never met Mr. Zeckendorf, but I have read about his activities, and it seems to me he has taken as his motto that of Mr. Burnham, a former city planner of Chicago, "Make no little plans, they have no power to disturb the blood."

Mr. Zeckendorf's plans disturb my blood very much, and so I am eager to hear Mr. Zeckendorf.

OPENING STATEMENT OF WILLIAM ZECKENDORF, PRESIDENT OF WEBB & KNAPP, INC.

Mr. ZECKENDORF. Thank you, Mr. Chairman. I have been asked to talk on the subject of urban redevelopment. This problem, which afflicts most of the older cities of the United States, falls into many categories, each of which is related to the particular situation that uniquely affects each community, there being no single state of facts that is identical in any two cities. There are certain common denominators, however, that affect all communities of the aging variety; they are as follows:

(1) Downgrading of central areas due to a so-called trend to decentralization. This is is often aggravated by the physical condition of the buildings in such zones since, in the opinion of the owners, they are not bad enough to tear down and not good enough to justify substantial capital reinvestment for upgrading.

(2) Most of these communities are plagued by parasite-like types of incorporated and unincorporated towns or villages ringing the periphery of the central city. The populations of these centers are the recipients of the benefits of the downtown area through employment, central community urban service facilities, rapid transit, and many other costly benefits paid for by the central community and not reimbursed by the dwellers of the satellite areas.

The CHAIRMAN. Mr. Zeckendorf, I want to say "Amen" to what you just said.

Mr. ZECKENDORF. State and municipal legislatures might well carry out objective studies to determine whether or not sound fiscal and social policy should dictate the reincorporation of such peripheral communities into the whole.

The CHAIRMAN. But, you know, our cities are underrepresented in the State legislatures and are virtual serfs of the States, with the control of the States in the hands of the rural regions, although the population in most of these States is relatively small.

For instance, in the State of Rhode Island, the city of Providence has only 3 Senators out of 43, and Providence, Woonsocket, and Pawtucket, of the majority of the population, have 5.

This is true in New Jersey, it is true in Michigan, it is true in Minnesota, it is conspicuously true in California, and I am glad there is somebody here to speak up for the cities.

Representative CURTIS. You can add Missouri to that, too.

Mr. ZECKENDORF. (3) Growth of urban centers without direction has resulted in two major voids: (*a*) inadequate highway and parking facilities to cope with the automobile; (*b*) lack of overall planning with the power of implementation.

This master planning is impotent unless it can accurately state the case for the individual community. Before it can intelligently plan for anything, the community through self-analysis must discover its potentialities, its possibilities, and its limitations.

To know what it wants to become implies that it is aware of its function in the national orbit. Obviously, Pittsburgh, however ambitious, would not endeavor to become like Los Angeles, nor would Los Angeles wish to emulate New York City, and surely New York City would not try to appear like Denver. Each of these communities has a distinctly separate function in the overall national picture, each having uniquely important contributions to make and a separate and fascinating personality of its own.

All master planning should be done with forward-looking, broad-range perspective, courage and daring, balanced against a knowledge of what financial capacity will permit it to achieve.

The most important single source of civil revenue is real-estate taxation. It therefore must be recognized that the future of any community's real estate is of the utmost importance to it. It is not far from the mark to state that basically every community is in the real-estate business because its ability to meet its obligations and to go forward are related to the soundness of its real estate.

This statement is made, based upon the pure direct economics of the essential part played by real-estate taxation which does not obviate or minimize the sociological results from better or poorer real-estate improvement, as the case may be. Unfortunately, the cost of city maintenance for police, fire, sanitation, health, and general community morals is higher from the slum and downgraded areas, and out of all proportion to the ability of such zones to contribute to the city treasury. These indirect, but equally important, effects are to be weighed in considering this problem along with direct realty taxation.

Every community and owner of real estate in the urban areas should think not of what is being done through Federal legislation to provide incentives looking toward renewing the slum and rundown zones within our cities.

I would like to say two things on this point: (1) That existing Federal aid is ample to spur redevelopment, provided red tape is cut to a minimum; (2) the community should act on its own and not wait for the Federal Government to solve a problem which so intimately affects the city's tax base and therefore its future. The Federal legislation of 1954 is, of course, geared to induce the community to do just this, and I believe this policy will bring private capital into the job.

The writer has devoted some years of study to this subject, and believes he has basic solutions to certain of these major problems.

Amplification of these solutions would take more time than is allowed in this requested 5 minute introductory statement.

The CHAIRMAN. Congressman Curtis.

Representative CURTIS. No questions at this point, Mr. Chairman.

The CHAIRMAN. Congressman Talle.

Representative TALLE. Mr. Chairman, at least two of the gentlemen on the panel mentioned "obsolescence" and it seemed to me that the rate was very high. Was the construction bad at the start, was the maintenance bad, or both, to make this rate of obsolescence so high?

Mr. CARR. You are speaking about my reference to schools?

Representative TALLE. Yes, sir.

Mr. CARR. I thought that to say a school ought to last 50 years before it was worn out would be at the other end of the scale. I did not mean to imply that the buildings had been badly built in the first place, or that the upkeep had been faulty. I was saying, and perhaps I did not make myself clear, that if we assume that buildings will last 50 years in order for them to be worn out or before being replaced, then the figures I gave would be the price of meeting the problem of obsolescence.

Representative TALLE. In other words, you took that as a standard from which to start?

Mr. CARR. I thought, sir, it was a very low standard. That is, I think it is an unusual school that would last 50 years. It probably should, in the interests of educational efficiency and convenience and comfort and the beauty of the community, probably should be replaced in less than 50 years.

I took what I considered to be the outside life of a building of this nature. They get hard wear, too.

Representative TALLE. Yes; that is true. Perhaps I am wrong, but I have a feeling if it is planned properly and constructed properly, a building should last longer than that.

Mr. CARR. It is possible some of our fine new schools being built today will last longer. Who can tell what is around the corner in the ways of lighting, heating, and all of the things that go into the making of schools? I think if you would look at schools built 50 years ago, you would not see too many of them that you would think would be suitable for use today. I do not pose as an expert on this matter of construction, however. I could be wrong.

I would be interested in knowing what Mr. Zeckendorf thinks about the reasonable life of the school building.

Representative TALLE. Yes; I would like to have Mr. Zeckendorf's opinion, too.

Mr. ZECKENDORF. I think it is like automobiles. Every time we build a new one, it looks a little bit better than the one before and the old one, by comparison, looks inferior. I think if we are going to continue to raise our sights and our standards, that what we are satisfied with today we will not be content with tomorrow, and we will have a continually, and I surely hope, an accelerated viewpoint toward obsolescence.

The mere physical wearing out of a building is not the answer. We have changed our idea on lighting, ventilation, on school facilities. We have building in New York that could last as long as the Coliseum. They would not fall down. Yet we tear them down through private capital, recognizing obsolescence, through economic wear-out, sociological neighborhood changes, economic changes. We tear them down and we replace them. And I would say that that probably is the most important single factor in American progress and the virility of the American economic bloodstream, our willingness to declare obsolete and susceptible to demolition and replacement everything that is not within a reasonable standard of the current new advancement in technological construction and standard of living.

Representative TALLE. What would you say would be a fair period of life for a dwelling?

Mr. ZECKENDORF. Well, I am sure that General Washington's Mount Vernon is still a very beautiful house and one that no one would be ashamed to live in today, yet I would say that there is no across-the-board determination of what might be the length of life of a building.

I would say that based upon our experience and the rate of improvement of construction methods and the demand that has been generated in people for improved living conditions, the probabilities are that the housing being built today will be considered obsolete within 30 years. I hope so.

Representative TALLE. It sort of amazes me because my old house out in Iowa is over a hundred years old and I have lived in it for 33 years myself.

Mr. ZECKENDORF. We have to distinguish between the classic house and the mass house, and that is what you are talking about.

Representative TALLE. Yes.

Mr. WHEATON. Mr. Talle, let me point out this. The census statistics show that after you get above 40 years of age in neighborhoods, you get 10 percent substandard; at 50 years, it may be 20; and 60 years it may jump way up to 40 or 50. This operates not necessarily because the structure gets worse and the owner is unwilling to maintain it as a structure, but because the neighborhood becomes obsolete. If I own a piece of property in an old and declining neighborhood and I know that I cannot get more than $40 a month rent for it, I am not going to invest $2,000 or $3,000 to put in new bathrooms and new central heating, because I will never get that money back.

It is an unsound investment because the neighborhood has become obsolete. So you have structures which may be structurally sound but are economically obsolete and, therefore, do not get the maintenance and renewal that a structure has to have.

You have new bathrooms in your house, but there are many neighborhoods in Philadelphia, in any major city of the country, where it is not economically justified for the property owner to invest a lot of money in that structure. He will never get it back, and so the neighborhood becomes obsolete and the structures begin to decline much more rapidly.

Mr. ZECKENDORF. There is more to it than that. The house of today is expected to absorb in its kitchen, for example, an entirely new gadget setup. Its lighting system and electric-power systems will be called on to transmit 10 times the amount of power for all the gadgets that are being used than were originally installed 20 or 30 years ago, and all of these things continue to change, and it is like an autmobile. We found during the war that the 10- and 12-year-old automobiles still ran but we shed them as fast as we could when the new ones became available.

(Mr. Zeckendorf's prepared statement and supplemental material appear at pp. 835, 836, 841, 845.)

Representative TALLE. Now, Mr. Chairman, I would like to ask Dr. Renne some questions about coal.

The CHAIRMAN. Surely.

Representative TALLE. Isn't there something going on at Billings, Mont., with reference to coal that you would like to say a word about?

Mr. RENNE. We have some experimental work going on in the treatment of coal and its byproducts which I think will make coal economically much more competitive and revive an industry that is hit pretty badly in our State.

Mr. ZECKENDORF. Is that soft coal?

Mr. RENNE. Yes; about 11,000 or 12,000 B. t. u.'s a ton. That is pretty soft.

Representative TALLE. Is that lignite?

Mr. RENNE. Yes, lignite.

Representative TALLE. Also there is the western half of North Dakota, and some of that coal is above ground. You must have tremendous reserves.

Mr. RENNE. We have 3 trillion tons of known reserves of lignite underground.

Representative TALLE. Are your scientists endeavoring to find new uses for coal?

Mr. RENNE. Yes, we are studying a new process, and char is the main product to be derived from this new process, which our men tell us will be used in Butte as against the present source of charcoal, which comes from the East. So our market for coal in the general area there will be stepped up considerably, and that is just a development of the last 18 months.

Representative TALLE. Well, now, that kind of research is certainly an indication of progress and is the right way to go about making use of a natural resource, in my opinion.

Mr. RENNE. I would agree with that.

Representative TALLE. I do not think we can force society to burn coal, except in public institutions. If they want to dieselize their transportation, they will do it, as they have done in West Virginia. You cannot very well force them to use coal, so I want to compliment you on that.

Mr. RENNE. Thank you.

Representative TALLE. You and the people of Montana.

Mr. RENNE. Thank you. I will convey your thoughts to the men who are largely responsible.

Representative TALLE. Thank you, Mr. Chairman.

(Whereupon, at 12:22 p. m., a recess was taken to 2:30 p. m.)

AFTERNOON SESSION

The joint committee reconvened at 2:30 p. m., Senator Paul H. Douglas (chairman) presiding.

Present: Senators Douglas and Goldwater, and Representatives Bolling, Kelley, Talle, Curtis, and Patman (vice chairman).

The CHAIRMAN. We will begin the session this afternoon with a statement by Mr. Aandahl, Assistant Secretary of the Department of the Interior.

STATEMENT OF ASSISTANT SECRETARY FRED G. AANDAHL, DEPARTMENT OF THE INTERIOR

Mr. AANDAHL. Mr. Chairman, the President's Economic Report calls for an acceleration of the development of our natural resources. To speed this process, with particular reference to the programs for reclamation and hydroelectric power under the Department of the Interior, the Federal Government has attempted to distinguish as clearly as is possible the proper role for Federal participation, and to encourage the States, local governmental bodies, and private investors to undertake as much resource development as they possibly can.

The Government can contribute in a very substantial degree by undertaking those multiple-purpose projects which may not readily be undertaken by others. Where projects are of great size or complexity, or where they serve numerous national interests, such as flood control, navigation, reclamation, fish and wildlife conservation, recreation, and pollution abatement, as well as hydroelectric power production and municipal water supply, and produce many benefits which are not always accessible against the beneficiaries, there is an excellent opportunity for the Federal Government to supplement the enterprise of others in the work of resources development.

An adequate water resources development program to meet the demands of our national economy is a matter of national concern. It is appropriate that the Federal Government take cognizance of the problems in this field and endeavor to formulate sound national policies in the public interest. As you may know, the President's Cabinet Committee on Water Resources Policy is currently reviewing many aspects of existing policies and programs in the field.

The planning of development of water resources on a river-basin basis with active and cooperative participation by both Federal and non-Federal interests is necessary to assure coordination of construction and operation of related units within a river system, and to promote the maximum economic utilization of the valuable resource with a minimum of interference in the case of conflicting uses.

The policies we have been following in the Department of the Interior are based on the development of the natural resources of the country through the initiative and industry of its citizens with the assistance but without domination of the Federal Government.

The Department of the Interior constructs hydroelectric power plants as part of the reclamation program, markets this power, and also markets power generated at hydroelectric plants constructed by the Corps of Engineers as a part of the national flood control and navigation program.

Over a year ago the President approved a power policy for this Department. The policy recognizes that the Federal Government has a proper but limited role in the power field. The Reclamation Act of 1902 and various other acts of Congress have made Interior the power-producing and power-marketing agency at many Federal plants.

These various laws have established basic policies for the marketing of power, as well as for the planning of facilities for generation and transmission. Primary responsibilities of the Department in the field of water resources are the reclamation of arid lands and the development of natural resources as authorized by Congress. This includes a disposal of electric power which can be economically produced in such developments.

The Department, therefore, actively plans and recommends construction of generating facilities in water projects under its jurisdiction when such facilities are economically justified.

We recognize that the primary responsibility for supplying power needs rests with the local people. We do not oppose the construction of facilities which local interests, either public or private, are willing and able to provide and which are consonant with the best development of the natural resources of the area. The Department will construct and operate transmission lines that are economically feasible and necessary for proper interconnection of Federal plants.

Transmission facilities also will be built and operated to carry power to load centers within economic transmission distances unless other public or private agencies will provide the necessary facilities upon reasonable terms.

We do not favor a general disposition or transfer of title to the project facilities now held by the Federal Government. In two exceptional instances, discussions have been pursued regarding the transfer of ownership of physical facilities to the States concerned. In both cases the States initiated the negotiations but in neither case has the transfer been arranged.

California inquired as to the terms on which the Central Valley project might be transferred to that State. Arizona inquired as to the purchase of the feeder transmission system in that State. In any case, in the event that an equitable arrangement could be agreed upon and the repayment of the Federal investment assured, legislative action by the Congress would be necessary before a property transfer could be made.

Direct Federal participation in water resources development, in keeping with the President's policies, is provided in his recent budget message. It was recommended in the message that the Secretary of the Interior, through the Bureau of Reclamation, be authorized to undertake the construction of two comprehensive river-basin improvements which together will require an investment of over a billion dollars.

These projects will require some years of progressive development before their long-range objectives are reached. They are beyond the capabilities of local initiative, public or private, but are needed in their respective regions for irrigation, power, flood control, and municipal and industrial water supply. These projects, which are familiar to many of you, are the Colorado River storage project, serving the States of Wyoming, Utah, Colorado, Arizona, and New Mexico; and the Fryingpan-Arkansas project, in the State of Colorado.

The Budget for 1956 contemplates initiation of construction on these two projects in the fiscal year 1956 upon their authorization by the Congress. An amount of $7 million is included in the budget as an estimated 1956 supplemental appropriation to initiate these developments. Their construction will continue the pattern of Federal construction of such large-scale projects as the Central Valley project in California, the Columbia Basin project in Washington, and the Missouri Basin project.

In addition to such vast developments, however, the small irrigation project which does not have the ability to show ready repayment by the irrigators alone, but is otherwise economically justified, is equally a part of our balanced program.

Thus, the budget contemplates initiation of 5 small reclamation projects having an estimated total cost of $33 million. These are: Foster Creek Division, Chief Joseph Dam project, Washington; Haystack Equalizing Reservoir, Deschutes project, Oregon; Michaud Flats project, Idaho; Palo Verde project, Arizona-California; and Santa Maria project, California.

The total appropriation estimate for the Bureau of Reclamation in the 1956 budget is $176 million. This finances planning, operation, and continuation of construction on 63 projects in the Western States.

The appropriations for all Interior water and power agencies as submitted for the 1956 fiscal year total $201 million, as compared to $195 million for 1955.

In regard to your question on the sharing of costs of construction and maintenance by the Federal Government, it is to be commented that today certain Federal programs in the field of water resources are entirely reimbursable, others partially reimbursable, and some essentially nonreimbursable. Thus, municipal water supply and hydroelectric power are reimbursable with interest; irrigation is reimbursable but without interest; and flood control, navigation, and certain conservation programs are essentially nonreimbursable in respect to the Federal investment, although frequently there is required the provision of rights-of-way, local maintenance, or other local contributions. These practices are founded on the provisions of existing law.

The President has stated in his budget message that an important policy of this Government is to encourage an increased sharing by State and local governments of our long-range development projects. For example, under legislation passed last year the Markham Ferry project in Oklahoma and the Priest Rapids projects in the State of Washington, both with large power developments, will be built by State or local units with modest Federal contributions for those purposes such as flood control which involve national responsibilities.

The message goes on to say that achievement of the resource development basic to the economic progress and security of the Nation requires encouragement of local public and private initiative and, where Federal participation is necessary, requires emphasis on the partnership aspects of essential cooperative arrangements with State and local governments or with private enterprise.

To the greatest extent possible, the responsibility for resource development, and its cost, should be borne by those who receive the benefits.

The CHAIRMAN. This may be out of your jurisdiction, but would you say the same thing should apply on the Delaware River?

Mr. AANDAHL. I believe I would prefer to not comment on that, Mr. Chairman.

In many instances, private interests or State and local governments can best carry on the needed programs. In other instances Fedeal participation or initiative may be necessary to safeguard the public interest or to accomplish broad national objectives where projects, because of size or complexity, are beyond the means or the needs of local public or private enterprise.

The Federal Government must be willing and ready to share the cost of improvements made for national purposes; but in all cases where the partnership pinciple logically applies, there is automatically acquired a concern for economy and efficiency that is often lacking when no local contribution is required.

In connection with the general question of cost sharing, it is of interest that in order to establish equity between the Federal Government and other interests, the administration repeated in this year's budget message the recommendation for enactment of legislation to provide that the Federal Government make payments to non-Federal owner of water resources projects when Federal hydroelectric developments benefit from these projects.

May I say in conclusion that under our policy we will revive and encourage local responsibility; avoid greater demands for Federal investments than our national income will permit; and continue the Government's proper participation in developing the water resources of the Nation.

(The unread portion of Mr. Aandahl's statement follows:)

1955 appropriations and 1956 estimates of appropriations

[Millions]

	1955	1956
Bonneville Power Administration	$30.3	$23.1
Bureau of Reclamation	162.4	175.9
Southeastern Power Administration	1.2	1.2
Southwestern Power Administration	1.7	1.1
Total	195.6	201.3

Mr. AANDAHL. Mr. Chairman, in respect to the question that you just asked me, may I further comment that at the secretarial level in the Department of the Interior, we are reviewing and studying broad policies and principles that should apply to water-development programs and we may have a secretarial answer to your question, and it is because it is just in the formative position that I hesitate to express an opinion on it.

The CHAIRMAN. Well, I hope that it will be consistent with the policies that you lay down.

Vice Chairman PATMAN. May I ask one question: This reimbursal without interest, the irrigated land; how does that operate?

Mr. AANDAHL. By statute governing the operation of the Bureau of Reclamation. The money that is appropriated for the investment in the irrigation facilities, including the joint cost of a reservoir itself, is interest free and is expected to be repaid by contracts with the water users over a 40-year period.

Now oftentimes the repayment cannot be accomplished in 40 years and power revenues are used to supplement the payment, and sometimes the repayment period has been extended to a considerable number of years beyond the 40-year period.

Vice Chairman PATMAN. The reason I ask that, many of the letters I am receiving now about this road-bond issue pose this question. Why should not the Government get its money for purposes like that up to a limited amount without interest? In other words, suppose you needed $25 billion over a period of years for roadbuilding purposes, transcontinental highways or interstate highways; why not sell $25 billion of the non-interest-bearing bonds to the 12 Federal Reserve banks in proportion to their resources and have them hold these bonds and get repayment, a part each year, from gasoline taxes; in other words, $25 billion in bonds, a billion dollars a year? In other words, there would be no interest. Have you given any consideration to a question like that?

Mr. AANDAHL. No, I have not, but I do feel that the condition of roads throughout the country is such that we should give a sizable amount of Federal encouragement to highway programs.

Vice Chairman PATMAN. That way you would get encouragement and I can see where you would issue interest-bearing bonds, which, of course, is the orthodox method. By the time you pay the bonds, by the time you have paid 100 percent in interest, you still owe the bonds and they do not pay off bonds any more, they just refund them. There is lots of agitation to create more debt paper, especially bond paper, but no agitation to pay it off.

Mr. AANDAHL. I might say that my experience in State government in North Dakota would prompt me to make this observation. I think that highway construction is an endless responsibility. They are going to be constantly needing improvements in our highways.

Vice Chairman PATMAN. That is right.

Mr. AANDAHL. And I think, in the most part, especially during periods of reasonably strong economic prosperity, our highway program should be pretty much on a cash basis. We should be able to collect enough revenue from the highway users and from the other sources of taxation to support our highway building program on a taxation basis.

Now, if we get into a period of depression when construction costs become low, it might be advisable to speed up the program at that time and encounter some degree of indebtedness in doing that.

Mr. ZECKENDORF. Mr. Chairman, I would like to ask a question on the subject.

The CHAIRMAN. May I say this. One of the sore points in the discussion procedure was the degree to which Government witnesses could be questioned, which was discussed at an executive meeting. The decision has been reached that governmental witnesses cannot be questioned by members of the panel.

Mr. ZECKENDORF. This question is not put to the last speaker, it is just a general question on the subject of water.

The CHAIRMAN. Yes.

Mr. ZECKENDORF. So much of the Rocky Mountain area is being used as a watershed for the coastal State of California and Arizona, and it seems to me——

Senator GOLDWATER. Pardon me, Mr. Chairman.

Would you repeat that, please?

Mr. ZECKENDORF. I said that so much of the Rocky Mountain area is being used as a watershed for California——

Senator GOLDWATER. Did you say Arizona, too?

Mr. ZECKENDORF. And partially Arizona.

Senator GOLDWATER. I will get to that later.

The CHAIRMAN. Go ahead, Mr. Zeckendorf.

Mr. ZECKENDORF. That it occurred to me that among the possible peacetime uses of atomic power that perhaps the tremendous surplus heat of atomic power—and this is not meant to be controversial, Senator Goldwater, but simply to be of a little bit of help—might be used to distill ocean water and take the pressure and demand for that tremendous amount of water now going to California off of those areas that are so controversial now, and that seem to cost so very much money to produce and create, and it is conceivable that if such an achievement were possible, that the entire economics and the land economics of the whole world would change. It would be one of the greatest peacetime moves our country could make if it could perfect such a device. A very small part of the money that is now being spent for these reclamation programs and a much smaller than is being used for defense in connection with nuclear weapons, if used for this purpose, might, to an extent, minimize the need for nuclear weapons by creating surpluses all over the world because most of the great world deserts border salt water, and I throw that suggestion in here to the gentleman who are so conversant on this subject and who are facing the problem of water from our mountain lands where, in the last analysis, if we took the pressure off by creating water at sea level, it would change our whole problem in the interior.

The CHAIRMAN. I quite agree with you, if we could get an effective and economical condensation of salt seat water into fresh water, it would probably be one of the greatest developments of modern times.

Mr. ZECKENDORF. And the byproduct residuals of chemicals now in solution in the ocean waters bring untold wealth, too, and with the use of the fantastic heat of atomic power, the waste material that has gone into the Columbia River has raised the temperature of the river by 6°.

The CHAIRMAN. Mr. Olds.

Mr. OLDS. I think I would like to point out that there have been funds appropriated by Congress for the development of processes to desalt sea water. Mr. Aandahl can possibly tell you more about that. There has been considerable progress made in that direction. One process is showing signs of eventually becoming an economic process.

I think the suggestion is valuable, that when we get—as I think we are going to get very soon—economical atomic power, that it will fit into that general program. The Government of France is trying to carry out a variant of this at Abidjan off the western coast of Africa, where they are trying to use the difference in temperature between deep seas, say 1,500 feet down offshore, and the surface water, to develop power for the desalting process and surplus power for use in the region.

I had many conferences with them during the years I was with the Government when they were seeking funds for the carrying on of the experiment, and they felt they had pilot setups which indicated that the process ultimately would become feasible in that part of western Africa where the desert is closely adjacent to the sea. Some of the people I have been working with who are interested in the whole power question have felt that the Government should undertake a much larger expenditure in order perhaps to develop more rapidly this or some other process that would be economical for the conversion of sea water to water that could be used both for city water supply and for irrigation. I think that might be well taken under consideration by this committee in terms of the general economic problem, particularly of areas where water is necessary for the growth of crops, and so forth.

Senator GOLDWATER. I would like to comment.

The CHAIRMAN. Certainly.

Senator GOLDWATER. First, Mr. Zeckendorf, I wondered if I was hearing an old Arizonan right when I heard we might be getting our share of the Colorado. Then I want to comment on the fact that while Mr. Zeckendorf is now a citizen of New York, he is a member of one of Arizona's oldest families, and we are proud of him as is his adopted State of New York, and we hope he comes back home sometime.

Mr. ZECKENDORF. Thank you.

The CHAIRMAN. He happens to have been born in Illinois, so a number of States claim him.

Senator GOLDWATER. My mother shares that honor, too. In the West we are increasingly interested in this process of turning sea water into palatable or irrigationable water. The University of California led off in that, and in 1944 published an interesting discourse on the possibilities of it.

I think the cost is now down below $50 an acre-foot, but we have to get it down someplace between $5 and $12 an acre-foot before it will be feasible. But, Mr. Zeckendorf, I can envision with you the day when water will be piped across this country like gas and oil, and I think it may come sooner than we expect.

Mr. ZECKENDORF. I surely join you in that hope.

Representative CURTIS. I would like to ask Mr. Aandahl a couple of questions about the charts, the 1955 appropriations and the 1956 estimated appropriations.

I know you have it broken down into four items. Do you have similar breakdowns for the obligated but unexpended balances for the same items?

Mr. AANDAHL. I think we can get you that information. I do not have it here.

Representative CURTIS. What I was interested in, of course, is the anticipated expenditures for 1955 and 1956. There have been a lot of questions raised, and properly so, by the economists, of what the expenditures will be, going into the economy in a given year, from our various public-works projects.

Now, maybe you can answer this: Have the ratios that would be anticipated in the expenditures field for 1955 and 1956 increased or decreased over the period of the past few years? Will we be spending about what we have spent before?

Mr. AANDAHL. In the construction program for the Bureau of Reclamation we are experiencing a small but gradual increase in the construction expenditures.

Representative CURTIS. In the construction end?

Mr. AANDAHL. Yes. I might give you the measure of that by appropriations over a period of several years.

Representative CURTIS. Yes; that would be somewhat helpful.

Mr. AANDAHL. For the Bureau of Reclamation, fiscal year 1951, the appropriation was $271,679,000. For the following year, 1952, it was $234,408,000. For 1953, it was $205,847,000. For 1954, it was $143,669,000, and then we have 1955 and 1956 on the supplement to my remarks.

Representative CURTIS. Yes; and they are on the upgrade.

Mr. AANDAHL. They are on the up. The low point was for fiscal 1954, and we are gradually moving up again.

Representative CURTIS. I imagine the unspent balances on those previous obligations are considerably more than the new appropriations. They usually are.

Mr. AANDAHL. That is correct. I think we probably had a maximum of carryover in 1954 when we had the small appropriation.

Representative CURTIS. Yes; so that your actual expenditures probably would be a fairly even curve.

Mr. AANDAHL. Probably not too much of a change there.

Representative CURTIS. Thank you.

Mr. AANDAHL. Of course, there is this circumstance also with respect to the reclamation: We are gradually completing more projects, both irrigation projects and transmission facilities, and the maintenance expense for those facilities is gradually going up, which is a part of the overall appropriation figures that I have given you.

Representative CURTIS. Wait, let me understand that. The maintenance figures are going up. The ones you have mentioned, though, I think, are projects that you referred to in here as being somewhat self-liquidating. Am I right? What projects did you mention where the maintenance was going up? Transmission lines?

Mr. AANDAHL. Yes, and also in the case of reclamation projects that have not been turned over to the local irrigation district for operation and maintenance.

Representative CURTIS. I see.

Mr. AANDAHL. And the Federal expenditure, even though it may be repaid in full, is taken out of the appropriation that is made for the Bureau of Reclamation. The expenditure may be a reimbursable expenditure, but any money that we spend through appropriations for persons employed by the Bureau of Reclamation comes from our appropriated funds.

Representative CURTIS. I see, the money coming back would go into the General Treasury?

Mr. AANDAHL. Some of it goes to the reclamation fund.

The CHAIRMAN. On that very point, is it not true that on these reclamation projects while the amounts are ultimately repaid over a period of 50 years, they do not go into the General Treasury, but go into the reclamation fund, and are therefore used for new reclamation projects, so that, in effect, the rest of the country never gets its money back, and what you have is an accumulating snowball which is devoted to more and more reclamation?

Mr. AANDAHL. It is correct that these revenues build up the reclamation fund.

Representative CURTIS. But to go into a new reclamation project you have to go to Congress to get authorization to use money from the reclamation fund?

Mr. AANDAHL. That is correct, and we also have to have specific appropriations for that purpose.

Representative CURTIS. I see; yes.

The CHAIRMAN. But the rest of the country cannot put its hands on these funds and devote them to any other purpose? They are earmarked.

Representative CURTIS. That is true; but, of course, if Congress is going to go ahead and authorize and appropriate for a new project, it does not make too much difference as far as the taxpayer is concerned whether you take it out of their pockets or whether you take it out of a fund for that purpose.

The CHAIRMAN. But the will of Congress to turn down reclamation projects is weakened because here are these funds that can be used for reclamation projects, and cannot be used for anything else, and so these are the only purposes for which they can be spent. So let us go ahead and appropriate. This is another case of narcoticizing the will to economy on the part of the country.

Senator GOLDWATER. It is pretty much like TVA funds.

The CHAIRMAN. No, in the case of TVA the repayment of capital with interest, and then the funds do go into the Treasury, whereas the irrigation is without interest and the funds do not go into the General Treasury.

Senator GOLDWATER. But they do not have to come to Congress for specific permission to spend their moneys.

The CHAIRMAN. I think the payments made by TVA go into the General Treasury.

Am I wrong on that?

Mr. AANDAHL. I am not too sure about TVA. It is a separate agency which does not come under the Department of the Interior and I am not close to its functioning.

The CHAIRMAN. Mr. Fisher.

Mr. FISHER. I believe you are correct.

Representative CURTIS. Could I ask in regard to the hydroelectric projects that are in the Department of the Interior, do the moneys come back to you or to the General Treasury?

Mr. AANDAHL. They come back either to the reclamation fund or to the General Treasury depending on their source.

Representative CURTIS. The hydroelectric project moneys would come to the reclamation fund, too?

Mr. AANDAHL. Depending on what the project is. We are marketing power from both the Corps of Army Engineer projects and Bureau of Reclamation projects, and the money that we receive in repayment of the investment in the Corps of Engineer projects does not go into the reclamation funds.

The CHAIRMAN. I want to break in here again.

Not only does the Government never get back the money which it originally appropriates for reclamation, except for more reclamation projects, but reclamation in addition takes a large portion of the power revenues for the purpose of reclamation.

Mr. AANDAHL. There isn't any question but what a sizable portion of power revenues are ultimately dedicated as an aid to irrigation.

The CHAIRMAN. Absolutely.

Mr. AANDAHL. And probably that is a wise policy because it means that the people in the area where the powerplant is, and where the reclamation projects are, are carrying the burden of the reclamation project in excess of the ability of the water users to repay it.

The CHAIRMAN. It also means that the consumers of power have to pay a higher price in order to subsidize reclamation projects which, in general, are uneconomical.

Mr. AANDAHL. But they are the people living in the community whose broad economy is strengthened by the reclamation project and not the people of the United States as a whole.

The CHAIRMAN. Well, Mr. Secretary, we could discuss this for a long time.

I merely say that your theories on this point go back to the 18th century. The French Physiocrats who believed the only initiating activities in the world were farming, that the activities of farming alone gave employment to other people.

I would say manufacturing enterprises create production and purchasing power and stimulate demands for other industries and production of other goods. This idea that only farm production creates a demand for other projects, while commonly held, Mr. Secretary, is, to my mind, completely fallacious.

Senator GOLDWATER. Mr. Chairman, I am sincerely glad to hear you say that because while I have heard you say it before, I have also heard it expounded that farming was the only source of income in this country, and that we had better take care of it.

The CHAIRMAN. Well, I have never said that.

Senator GOLDWATER. I have just commented that I never heard you say it, but I am glad to hear you reiterate your stand.

Of course, in reclamation, we look at it as a service to the country, because the time will come when we have 200 million population, and the rich farming States of Illinois and Iowa and the other farming States will not be able to take care of the country, and while we admit that an investment of $400 to $2,000 an acre seems high today, the day will come when that seems a bargain.

The CHAIRMAN. When that days comes, let us consider it, but let us not create land at a cost of $2,000 an acre when the richest land in the country is worth only five to six hundred dollars, and when we are taking out 40 million arable acres, why should we create fertile land out of this arid land? It is just one more means by which the industrial States are exploited, and the powerful semiarid States are subsidized at the expense of the general taxpayer.

Senator GOLDWATER. I am glad to hear the chairman say that the arid States are powerful. It is the first indication I have had that we are.

By the same token, we might take that attitude toward the inland waterways.

The CHAIRMAN. There is a working agreement between the advocates of inland waterways and reclamation. Each scratch each other's back, and you have a political combination of the Mississippi River and of the arid States. They dominate the United States Senate, and both of them get what they want at the expense of the industrial States.

Senator GOLDWATER. Well, we could argue that all day.

The CHAIRMAN. Well, it is true.

Senator GOLDWATER. I disagree with you. I think you could look at it from the national economy standpoint. What is good for one part of the country is good for all of the country.

The CHAIRMAN. But when the kissing takes place the industrial States are never under the mistletoe.

Senator GOLDWATER. I might call the Senator's attention to the great railroad industry that was developed at the expense of the Western

States through land grants. We did not ask that the railroad hub out of Chicago begin with gifts to hundreds of thousands of acres in Arizona.

The CHAIRMAN. This is the first time that I have heard the industrial States gain in such a fashion.

Mr. OLDS. If you consider the economic system as well as the governmental system, the exploitation is not all one way. The exploitation is not altogether by the arid land States as against the urban populations, is it?

The CHAIRMAN. You mean because the bonds of these concerns are owned in the investing centers. As far as public appropriations are concerned, it is all the other way.

Mr. OLDS. There is one thing that I think should be pointed out in connection with this $2,000 an acre question. I cannot say it in terms of any specific projects, but I know in those Mountain States where there are many irrigated acres that are simply parts of larger ranches, the value of the lands that can produce the feed for the livestock, run on the range acres, is such, and adds so to the value of the ranch, that the irrigation investment might well be spread over the total acreage benefited rather than over the specific irrigated cropland.

The CHAIRMAN. It would have the indirect effect of an increase in production.

Representative CURTIS. Mr. Chairman, could I ask a final question of Governor Aandahl?

The CHAIRMAN. Certainly.

Representative CURTIS. In order to get this thing in a proper perspective, my question along the line of fiscal policy, this policy of the reclamation fund and these moneys going back into that is not a changed policy. That has existed for some time.

Mr. AANDAHL. No, that is an established policy, established by Federal statute, and one that has been in existence for a long time.

Representative CURTIS. So there has been no change. That policy has occurred over several administrations?

Mr. AANDAHL. That is correct.

The CHAIRMAN. Let me make it clear that I do not charge this as a unique evil of the present administration.

Representative CURTIS. Mr. Chairman, I am trying to direct this back to a discussion of economics, if I can, and that is what I was trying to do, in order to understand trends, and I think it is important——

The CHAIRMAN. Let the record show that this is a long continuing evil.

Representative CURTIS. I don't know what is an evil and what isn't. I am interested in what has happened in the past to the extent that that can throw light on what is happening right now and what might happen in the future, and that is why my questions to the Secretary were directed along the lines of what our expenditures might be in 1955, whether this seemed to be a constant expenditure.

Incidentally, if that expenditure is going up, it would simply be keeping the same ratio in regard to other public and private expenditures, if it were slightly going up, inasmuch as we are still in a rising economy.

Mr. AANDAHL. I would think so, and then our understanding of it should be further seasoned to the fact that for several years there we made a very sizable cut in appropriations to reclamation.

Representative CURTIS. During the war years.

Mr. AANDAHL. Yes, and during the Korean war period, and we got down to a low of $143 million, and now we are just moving up a little bit, approaching the level that we had been at in the past.

Representative CURTIS. Now, one final general question: I have heard that there is quite a backlog of authorizations in these fields, and also of requested authorizations. Is that a fair statement?

Mr. AANDAHL. I would be inclined to say that there is a limited number of authorizations, and that in the Bureau of Reclamation we have a limited number of plans for further authorizations. In fact, it is my feeling that we should step up our general investigative program to be a little better appraised of the water development programs that might be needed in the future. Construction comes only a long, long time after you begin investigation and study of a possible project development.

Representative CURTIS. Now, the reason I asked that question was in relation to the much broader question that has been posed which is this: In the event of a recession or decline in activity in private enterprise, the Government might move more strongly into the field of public works. I was just interested to know whether there was any planning along that line for that future possibility?

Mr. AANDAHL. We are attempting to do that, but we haven't gotten very far, and we can well use a little strengthening of our investigation funds for that purpose, and I believe the President's budget, as submitted this year, includes an increase in investigation funds for the Bureau of Reclamation over what we had a year ago.

Representative CURTIS. For that kind of thing.

Mr. AANDAHL. For that kind of thing.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Chairman, there are still many distressed areas in this country, in my State, Pennsylvania, for one. There is a great deal of unemployment, and there are other areas of the United States in addition. I have been perplexed at the disinterest that seems to be shown by the Government in this matter of broad public works on a matching basis where the States or local communities would handle the funds and decide what public works should be done in the area. There is a lot of impoverishment in these areas. I know personally that there is, and I repeat I cannot understand why something has not been done about it, except maybe it was an extreme desire to balance the budget.

Of course, any public-works program would be a temporary measure to tide over a period from recession to good business conditions. I was certainly impressed in seeing in U. S. News & World Report, for February 4, of which David Lawrence is the editor, it says that official concern is beginning to be directed at inflational forces. It says inflation will not be a real threat so long as excess capacity exists in big industries, and so long as there is a surplus of workers seeking jobs. That was a startling statement to read coming from that magazine.

Then a thought occurred to me, and I am sure to many of them who read it, are we to think that the budget must be balanced at the price of impoverishment and misery? I cannot believe that that is the purpose, although one is certainly led to think that that is the objective, to keep a surplus of labor in order to keep down inflation and balance the budget.

Now, I would like to have an expression of some of the members of the panel about that. Why haven't we had a public-works program, at least a blueprint on hand so that a public-works program could be put into effect on a matching basis for the areas that want to use it?

The CHAIRMAN. Does anybody want to volunteer a comment on that?

Mr. RENNE. I think one of the major reasons is that our planning has been very piecemeal, both in terms of the scope of our thinking and the agencies responsible for it. There has not been an overall planning agency operating over the years that could do that type of job. It has been out in the different agencies, and I do not think you get the kind of planning you are talking about that way.

Representative KELLEY. But I am thinking in the 1930's we had an overall public works program that was very successful, and it did take care of the unemployment situation to some degree, and I was wondering why in the light of the information that has come before us, a statement like this, why something hadn't been foreseen, and the blueprint made for a broad public-works program, and then put into effect, if it was necessary, as it is necessary now?

Representative TALLE. Mr. Chairman, if I may comment on that, it is clear that the public works program in 1953, as Mr. Kelley mentioned, and the subsequent years, was not adequate because there were over 9 million unemployed in 1939 in spite of all that Government tried to do for over 6 years.

The CHAIRMAN. As compared with 16 million in 1933.

Representative KELLEY. Well, the unemployment is perhaps not generally distributed, but there are certain areas in this country, and mine is one, where there is a great deal of unemployment. There is a great deal of distress and impoverishment as a result of it. I am sure that is not the only area.

With a public works program on a matching basis certainly those local communities could avail themselves of the measure to help themselves, to relieve themselves. It would be only a temporary help, but some measure of that type should have been in effect a long while ago, I believe.

The CHAIRMAN. Mr. Olds.

Mr. OLDS. There is one question raised here that was given a lot of consideration by the President's Water Resources Policy Committee in 1950. It is a matter of great interest to this committee, and it may have been raised before by other economists. That is whether the public works program of the Government should be a compensatory one, that is the investment fluctuated in an effort to deal with depression conditions when they begin to show themselves, or whether it should be a stabilizing factor in the economy by maintaining a fairly stable, fairly large participation by the Federal Government in the general creation of capital working in its own particular field. That would recognize a Federal investment function that would tend to create a greater stability because of its magnitude where there were fluctuations, for instance, as I suggested this morning in the expenditures of utilities for equipment or railroads for equipment, which as they fluctuate up and down have a very material effect on the total economy.

I think the President's Water Resources Policy Commission was of a unanimous opinion that, whereas there could be a shelf of public works that would permit some fluctuation where recession began to appear, nevertheless, the more important function of a public works program was to serve as a stabilizing element in the total expenditure for projects, which would be geared not so much to the fluctuations in the business curve as it would be geared to the requirements of the country in terms of water-resource projects, school projects, housing projects, public roads, etc. Thus you would have a fairly large segment of the total economy, where if you maintained a stability of constant expenditure it would have a very moderating effect on the other factors which come from private sources which tend to create instability.

Representative KELLEY. It wouldn't be necessary to limit it to just those. Suppose a municipality needed besides schools, municipal buildings, courthouses, sewage disposal?

Mr. OLDS. I did not mean to limit it to those; I just cited those as possible things at the Federal level.

Representative KELLEY. They could apply for projects as they needed them. It would help the area. It would necessarily affect the steel industry, and the railroads to a certain degree. It would depend on how big the project was. It would certainly help the economic situation in those areas where it is so severe.

That is my thought and, as I say, I am surprised that something hasn't been done in that direction. I think sometimes that the officials in charge are not aware of the amount of impoverishment there is in certain areas in this country. Maybe that is one answer.

Mr. RENNE. I think that is probably the best answer. I do not think most of us have been sufficiently aware of those areas of impoverishment, because the overall level has been high and relatively speaking highest in the world, and so we haven't been in the position of feeling that we needed to do this so much.

Representative KELLEY. It could be confined to the local areas if they wished to help themselves. The Government would make available the funds on a matching basis. It seems to me that that is one answer to the problem that affects many districts, many areas of the country, and I say mine is one of them.

Mr. ZECKENDORF. I would like to say something, if I may, Mr. Chairman.

The CHAIRMAN. Mr. Zeckendorf.

Mr. ZECKENDORF. In line with my earlier talk, Mr. Kelley, you weren't present, but when you read it you will find when I refer to the subject of urban redevelopment I said I had various solutions to the problems of the cities, which I didn't have time to set forth in that little statement. But one of them is the whole subject of urban redevelopment through the use of power of eminent domain and reconstruction, opening the cities up to provide more modern facilities for traffic and for growth, to get away from the congestion that exists, so that it is possible that local reclamation work can be conceived in communities as and when they need it for purposes such as you speak, and I am sure in your area you must have cities with substandard conditions that require general redevelopment, and such a program as you suggest could create great employment during these periods when you have unemployment to the ultimate long-term benefit of the community, and it can be done on a self-bailing basis without cost to the community, or to the Federal Government, by one single process that I should like to mention, Mr. Chairman, and if you don't mind I will have to leave it at that because I am expected back in New York.

By condemning excess land beyond the requirement for the improvement and preventing a windfall profit to a free rider who happens to be in the way of a civic improvement, it is my belief that a well-conceived urban improvement will create increments in the surrounding areas.

Suppose, for example, you have a slum area and you decide to put a park in the middle of it, instead of just putting a park in the middle of the slum and letting these people running the slum tenements get a free ride on increment, condemn the whole lot of them and put back on the market for private development all of the surplus land around that park—I am oversimplifying this now—and having removed so much slum, what it will have cost you to dedicate the park you will get more than that amount back by the increment that will have arisen through three factors:

One, the existence of the park and the benefit that surrounding properties would get from it; second is the fact that land has greater value if it is assembled than it has in individual units. In other words, a 50-foot plot is worth more than twice the value of a 25-foot lot, and having eliminated an eyesore in the area you encourage private redevelopment.

Now, I do not propose for one minute that you should take something away from one man and give to to another. I am simply talking the negative. Whoever has an asset in that area should be paid all it is worth. I simply do not believe in giving that fellow a present and not being able to have the community to get the bait back, and also you will never get urban redevelopment really off the ground by waiting for the process of attrition to finally get some fellow to get off his seat and help them do something about it. But once you have condemned it, and you put it back in large plots, I assure you that private capital will come in.

This can be true of new streets. For example, in the city of New York after we made the deal for the United Nations we advocated the condemnation of six square block around the United Nations. We said if they condemned 6 blocks and took 2 center blocks, demolished them and made a grand monumental approach to the United Nations, that it was our opinion that the 4 blocks that remained would have at least as much value pro forma as the 6 blocks. The two blocks would have come for nothing.

We told the city if you don't believe that, you think it is too speculative, we will put up a bond and guarantee it, and then someone will pay much more as a result of having done that. There was a case that I speak of where you can by ingenuity and resourcefulness and pro forma thinking get back the cost of redevelopment on an operation bootstrap, so to speak, creating wealth by concept, and in your communities that is possible without having to go into leaf raking, for example.

Representative KELLEY. I question whether that would be effective in my community.

Mr. ZECKENDORF. Perhaps not.

Representative KELLEY. There are no large cities larger than 30,000. It is a very industrial district.

Mr. ZECKENDORF. I would be surprised if it wouldn't be effective.

Representative KELLEY. Pardon me?

Mr. ZECKENDORF. I would be surprised if it wouldn't be helpful.

Representative KELLEY. My question is whether it would be helpful enough.

Mr. ZECKENDORF. Well, I wouldn't know.

Representative KELLEY. Mr. Talle, I believe you have something.

Representative TALLE. Well, I don't want to cut in on your questioning.

Mr. Chairman, I have a report here from the Library of Congress re "The scientific and professional manpower shortage," "The need for a national policy to alleviate manpower wastage," and "Specific scholarship and loan proposals." Without objection I would like to have permission to incorporate it in the record.

(The material referred to is as follows:)

HUMAN RESOURCES AND THEIR RELATION TO A FEDERAL SCHOLARSHIP PROGRAM

I. THE SCIENTIFIC AND PROFESSIONAL MANPOWER SHORTAGE

Since World War II much has been said and written on the subject of human resources and several important studies of our manpower resources have been undertaken by private organizations as well as governmental agencies. Our experience with the lack of a well-defined manpower policy prior to the Second World War has had some influence on the recognition of the problem. The best utilization of our manpower resources is gradually being recognized as one of the most significant factors affecting this country's future welfare and world leadership. As one university president pointed out:

"We can no longer afford to waste or neglect available resources of human skill. It has suddenly become clear that as a Nation we are still too casual, too inexpert, too wasteful, in our attitude toward brains and ability. Because we have never lost a war, because we are almost continental in our extent, because more than any other people we have turned the raw earth into a flood of food and goods, we are in real danger of living in a world of false proportions, and of acquiring the delusion that we can always be adequate to the tasks thrust upon us. Today we must accept new magnitudes and make new comparisons." [1]

We are not developing the Nation's greatest asset, the brains of our citizens. A large number of the people of this country are working at levels below their true potentialities, which is a waste of manpower. It is imperative that we have the "highest possible correlation between talent and national welfare" whether in preparation for defense or for the purposes of peace.

Numerous studies have appraised America's "educated manpower" as the country's most valuable resource. One commission stressed this when it stated:

"Since the whole population profits from the work of its ablest members, it would appear to be good business for the Nation to use its brains well, just as it is good business to use well its forests, it waterpower, and it minerals. It is more than good business; it is a great national concern." [2]

The National Manpower Council in 1952 also emphasized the need for a continued comprehensive research program in the field of human resources. Trained personnel and technological superiority are more vital to the national security

---

than are numbers of population. One educator described it in the following manner:

"In the final analysis there is no substitute for the qualitative development of our best brains. Our foreign and military policy has no better ally than the educational system. In any assessment of American power, higher education has the same stature as our system of food production, our industrial organization, or our system of defense." [3]

Historically, the Manpower Council pointed out, that:

"* * * the concern with human resources centered largely on the span of human life, health, and immigration. Efforts to conserve human resources aimed mainly at the elimination of preventable deaths. Disease and accidents were the specific targets, and improved hygiene, preventive medicine, and industrial and other safety measures were the major means relied upon. Until quite recently, questions of the effective use of the country's human resources, the development of skills and capacities, and the waste of ability received relatively little attention." [4]

Manpower policies in a democratic society, however, have been uncoordinated except in periods of defense mobilization. The development and utilization of our human resources usually comes as a result of many different forces. In fact, the effective development and utilization of our resources of scientific and professional manpower is a continuing important issue concerning public policy. Experts urge that the present world situation "compels consideration not only of current manpower needs but also of long-range policies to provide the country with the highly trained manpower it will require in the future." [5]

The National Manpower Council had this to say concerning the country's future needs for "educated manpower":

"It is safe to assume that, barring a catastrophe which would destroy the bases of Western civilization, the major factors which have been responsible for the very rapid growth of the professions and the sciences in recent years will continue to operate in the future. The rate of progress in science and technology will certainly not be slowed and will probably be accelerated. The gain in productivity, estimated at about 3 percent per year in recent decades, is not likely to be less in the near future. An expanding national income will result in a greater capacity to consume the services of professional personnel. A dynamic economy, high levels of employment, rising living standards, and the aspiration for improved health, education, and social security all point to the need for larger numbers of scientifically and professionally trained workers. In spite of the uncertainties which must qualify any judgment on the future, a long-run view clearly points to a continuing high level of demand for scientific and professional manpower." [6]

It is not possible to estimate the exact demand which might be made for each group of scientific and professional personnel within the overall manpower category for the next 10, 15, or 20 years. A system of "manpower allocation" is held by experts to be impractical when a country is not engaged in an all-out emergency, which is the only time the nation is ready to sacrifice certain objectives in order to survive.

II. THE NEED FOR A NATIONAL POLICY TO ALLEVIATE MANPOWER WASTAGE

In its 1954 report, entitled America's Resources of Specialized Talent, the Commission on Human Resources and Advanced Training held that it would be sound national policy to encourage and help to bring more of the ablest young people into institutions of higher education. It was expressed as follows:

"To make the maximum use of those who are potentially well qualified means to get each into the job which he can do best and in which he can contribute most effectively to the Nation. College training is one means to that end. Getting more of the ablest high-school graduates into college is therefore a major step in preparing them for positions of greater responsibility and usefulness than they would be likely to achieve without college training." [7]

The Commission also believed that there should be no limit placed upon the choice of fields of specialization students could enter.

[5] Ibid., p. 243.
[6] Ibid., p. 244.
[7] Dael Wolfe, op. cit., p. 242.

The Commission emphasized this latter recommendation, as follows:

"Educating the Nation's highest intellectual potential, but letting each student specialize in the field of his choice, is a means of making the best use of America's intellectual resources and of assuring intellectual flexibility to meet whatever conditions the future brings.

* * * * * * *

"The existence of a sizable body of educated workers, flexible enough in skill and interest to move into the fields in which demands and rewards are greatest is a major national asset." [8]

This view has been previously supported by the Vannevar Bush report Science the Endless Frontier (1945), which declared:

"We think as we think because we are not interested in setting up an elect. We think it much the best plan, in this constitutional republic, that opportunity be held out to all kinds and conditions of men whereby they can better themselves. This is the American way; this is the way the United States has become what it is. We think it very important that circumstances be such that there be no ceilings, other than ability itself, to intellectual ambition. We think it very important that every boy and girl shall know that if he shows that he 'has what it takes,' the sky is the limit. * * *

"By proceeding from point to point and taking stock on the way, by giving further opportunity to those who show themselves worthy of further opportunity by giving the most opportunity to those who show themselves continually developing—this is the way we propose. This is the American way: A man works for what he gets." [9]

There are many capable young people who are financially unable to attend college. This group represents a considerable loss to the Nation of more highly trained manpower potential. The President's Scientific Research Board called attention to this in its 1947 report on manpower for research when it stated:

"It has repeatedly been estimated that approximately as many students with high ability drop out of school before reaching college as enter college in any 1 year. Many of these young people take mediocre jobs, and very few of them ever rise high enough in their occupations to put their excellent abilities to use in intellectual or creative work of a high order. While some of these able students drop out because they do not have the ambition to go on with further training, thus pointing toward the need for better guidance in the secondary school, some of the students have to leave college because they cannot afford financially to go on. * * *

"Thus, there is a large group of able students whose talents could be put to much more profitable use by society if society were to invest in education." [10]

Former President Truman in his 1952 budget message to the Congress placed emphasis on this country's wasted manpower when he said:

"At a time like this we cannot afford to waste any resources, yet this pool of inadequately used human resources is being continually enlarged because many young people are denied the opportunity for a proper education."

Of the high-school graduates who are among the top fifth in ability, only 53 percent enter college and 43 percent graduate. Every year this country loses a high proportion of the young people who might become leaders in the professions. Almost 60 percent of the group with the greatest potential fail to complete a college education.

We waste much of our potential talent.

"College graduating classes could be twice as large as they currently are, and with no loss of quality. The potential supply gets drained off, in large and small amounts, all the way through the educational system. Practically all potentially good college students enter, and most of them finish, high school, but after high school the loss is large. Fewer than half of the upper 25 percent of all high-school graduates ever earn college degrees; only 6 out of 10 of the top 5 percent do. Society fails to secure the fullest benefit of many of its brightest youth because they do not secure the education that would enable them to work at the levels for which they are potentially qualified." [11]

[10] President's Scientific Research Board, Science and the Public Policy, vol. 4, p. 124.
[11] Dael Wolfe, op. cit., p. 269.

This Nation's future strength is closely linked with the adequate development of its manpower resources. Again, this was stressed by the Commission on Human Resources and Advanced Training in the following statements:

"A nation with as complex an economy, as important a role in world affairs, and as tangled a web of social, economic, military, and technological problems as confront the United States is peculiarly dependent for its future welfare upon its citizens who are competent to work effectively with ideas. The development of new weapons, the conduct of government and statesmanship, the discovery and development of means to improve health, increase productivity, and add to human welfare, the ability to bring all these forces to the benefit of the less fortunate peoples of the world, and the ability to use them effectively to counteract the influences of totalitarianism all depend primarily upon those of the Nation's workers who labor chiefly with their heads instead of their hands.

* * * * * * *

"The Nation needs to make more effective use of its intellectual resources. * * * Democracy at its best gives each child access to the education and opportunities which will enable him to develop his potentialities. Each can then progress to the highest level which his abilities and interests allow. The United States stands in too vital need of the high abilities of its ablest sons and daughters to adopt any lesser goal." [12]

III. SPECIFIC SCHOLARSHIP AND LOAN PROPOSALS

In the latter part of 1947 the President's Commission on Higher Education made its report to President Truman and among its recommendations it declared that:

"Immediate steps be taken to establish a national program of federally financed scholarships and fellowships as a means of removing further the economic barrier and enabling our most competent and gifted youth to obtain for themselves and for society the maximum benefits to be gained from higher education.

* * * * * * *

"Not only is it important for the welfare of the Nation that adequate low-cost opportunities for higher education be made available to all the people of America, but it is of utmost importance that the Nation's most talented youth be encouraged and given the opportunity to continue their education to the fullest extent possible. For this reason the Commission advocates: (1) That a continuing Federal program for undergraduate scholarships be established beginning with $120 million in 1948–49 and continuing each year for the succeeding 5 years in an amount sufficient to provide scholarships for 20 percent of the nonveteran undergraduate enrollment; (2) that in addition to the existing Federal fellowships programs a new program be established for graduate students through the appropriation of sufficient funds to provide 10,000 grants of $1,500 each in 1948–49, 20,000 grants in 1949–50, and 30,000 grants in 1950–51, 1951–52, and 1952–53; and (3) that before 1953–54 the program of scholarships and fellowships be reexamined with a view to expanding it.

"On the basis of the anticipated enrollment in 1948–49, the granting of scholarships to 20 percent of the nonveteran undergraduate enrollment would provide assistance to some 300,000 students. This would be in addition to the 10,000 fellowships also proposed for the first year of the program." [13]

From the 79th through the 83d Congresses a number of different proposals have been made for Federal grants-in-aid for a scholarship program, and in some cases a loan program. The following selected bills indicate the scope of these proposals:

79th Congress

S. 1782. Mr. Langer; January 31, 1946 (Education and Labor):

Directs the Commissioner of Education to make loans up to $500 to individuals desiring to obtain a college or university education and authorizes $3 billion for a revolving fund. Loans shall be made without security but the borrower shall execute a 1-percent 15-year promissory note payable to the United States.

S. 2499. Messrs. Murray, Morse, and Pepper; July 31, 1946 (Education and Labor).

II. For scholarships and fellowships (scholarships for students in last 2 years of high school and in junior colleges, technical institutes, vocational schools,

---

[12] Ibid., pp. 5–6.

[13] Higher Education in American Democracy, vol. V.

colleges, and universities, and fellowships for students in graduate or professional schools or departments of colleges, universities, and research institutes in the United States or other countries): $70 million for 1948; annual increases of $35 million for 2 years, thereafter annual increases of $30 million; $350 million for 1957, allotments to be based on a State's population within the age range 16 to 24 years, inclusive.

H. R. 5465. Mr. Savage; February 13, 1946 (education):

Provides Federal aid to States in establishing and maintaining a scholarship and fellowship program in colleges and universities. Authorizes for the purpose $35 million for 1946–47; $50 million for 1947–48; $65 million for 1948–49; and $80 million for 1949–50 and for each fiscal year thereafter. In order to secure the benefits of this act a State shall establish a State scholarship and fellowship board which shall submit to the United States Commissioner of Education plans showing the ways in which it proposes to discover and encourage the development of unusual abilities among the youth of the State. Such plans shall provide for expenditure of 25 percent to 50 percent of the funds for students in the first year after high school and 50 percent to 75 percent for students above the first year of college. The average scholarship stipend shall not exceed $30 per month and the average fellowship stipend shall not exceed $50 per month. This act shall be administered by the United States Commissioner of Education under supervision of the Federal Security Administrator.

80th Congress

S. 1131. Messrs. Pepper and Murray; April 18, 1947 (Labor and Public Welfare):

To aid the States in providing education in the 11th grade and above there is authorized: (1) For scholarships: $80 million in the fiscal year 1948, $100 million for 1949, $125 million for 1950, and $150 million for 1951; and (2) for loans, a revolving fund of $250 million. Apportionment shall be on the basis of the number of persons from 14 to 26 years of age in the State and its per capita income compared with the per capita income of the United States. States must provide an equitable apportionment where separate schools are maintained for separate population groups. They shall provide: (1) For certification of persons solely on the basis of ability without reference to race, color, creed, sex, or religion; and (2) that 10 percent shall be expended for scholarships for education in the 11th and 12th grades; 30 percent for high-school graduates, and 20 percent for students above the 16th year of school grade in graduate schools, etc. Scholarships or loans shall not exceed $125 a month for a person without dependents, $150 if 1 dependent, and $175 if 2 or more dependents. No scholarship or loan shall be made to a person while he is receiving education under title II of the Servicemen's Readjustment Act. Federal control over an educational or training institution in which funds are expended under this act is banned.

81st Congress

H. R. 3630. Mr. Lesinski (by request); March 21, 1949 (Education and Labor):

There is authorized, in the form of outright grants or Reconstruction Finance Corporation guaranteed low-interest loans, to assist qualified needy persons from 16 to 25 years of age to continue their education $100 million for the fiscal years ending June 30, 1950 and 1951; $150 million for the years 1952, 1953, and 1954, and $200 million for the years 1955 and thereafter, to be apportioned in the same proportion as the number of persons within the class in each State bears to the total number in all the States. Recipients of assistance shall be named by a State approval board to be set up under the act. The Commissioner of Education shall from time to time publish a list of approved institutions (including industrial and on-the-farm training establishments). Expenses covered include tuition, fees, travel, and subsistence allowance.

S. 3455. Messrs. Murray and Humphrey; July 2, 1952 (Labor and Public Welfare):

Student Aid Act of 1952—Authorizes annual appropriations for Federal scholarships beginning in fiscal 1953 with $32 million and increasing by $32 million each year until in fiscal 1956 the authorization shall be for $128 million, whereafter it shall remain the same unless the Congress change it. Provides that this money shall be used for certificates of scholarship awarded to high school students in the several States for pursuit of higher education, without any discriminations as to sex, creed, race, etc. The State quota of these scholarships shall be determined as follows: One-half of the total number of scholarships shall be allotted among the States in percentages equal to the percentage the State's high school graduates bear to the national total of high school grades for the year; and the remaining one-half shall be allotted in the proportion that the State's population between 19 and 21 bears to the national total population of that age.

The recipients must (1) (a) have a certificate of graduation from a high school of that State or (b) if graduated from an out-of-State high school, have the course of studies recognized as adequate by their own State, (2) must not be eligible for veteran's educational training, (3) must apply in accordance with State rules and (4) must not have had any Federal scholarship under this or any other act vacated except for good cause.

The State commission shall, in accordance with objective tests and other measures prescribed by the Commissioner of Education, make its selection on basis of intellectual capacity and financial need. The scholarship stipend shall be uniform and not in excess of 4 years. The requirements for continuance during this time shall be (1) continued financial need, (2) full-time attendance. (3) no scholarship aid from other sources. The recipient may attend any higher institution within or without the United States.

Each State desiring to participate shall establish a commission on Federal scholarships and submit it to the Commissioner of Education for approval. The payments of scholarships under this act shall be by check payable to the individual recipient transmitted through the administartion of the institution he is attending.

Administration of this act shall be under the Commissioner of Education who in turn shall be responsible to the Federal Security Administrator. He shall consult with all agencies of the Federal Government,with a view to coordinate all Federal scholarships; and shall be assisted by a National Council on Student Aid of 12 members with the Commissioner as Chairman to represent individual, organizational, and professional interests.

Authorizes $10 million for insurance of loans to students in higher institutions of learning. No loan in excess of $600 shall be made to any student in 1 year, nor shall the aggregate unpaid balance exceed $2,400. Reimbursement under the insurance shall not be in excess of 80 percent of the unpaid balance of the loan including interest accrued at the time of default. Eligibility of lenders shall be determined by certification by the State commission: loans shall be insurable whether from funds fully owned or from trust funds of the lenders.

Eligibility of students shall depend on: (1) full-time educational work; (2) the signing of a note or other agreement, payable by installments commencing the fourth year after student ceases to devote full time to study: (3) requires full payment plus interest within 6 years after payments begin; (4) until such date of commencement carries interest at a rate not exceeding the average market rate of Treasury obligations by 1 percent, or after commencement, not exceeding such rate by more than 2 percent; (5) permits acceleration and (6) contains any necessary terms stipulated by the Commissioner.

Certificates shall be issued under this title and upon default, death, or disability of the borrower, prior to any enforcement proceedings, the beneficiary shall inform the Commissioner who shall pay off such insurance and be subrogated to the rights of the insured against any security given for the loan. Premiums and all other funds acquired by the Commissioner under these operations shall be deposited in a revolving fund in the Treasury. Five hundred thousand dollars is authorized for initial establishment of this fund.

83d Congress

H. R. 6079. Mr. Boland; July 2, 1953 (Education and Labor):

Federal Scholarship Act—creates a Federal Scholarship Fund and authorizes therefor $10 million for 1953 and such sums as are necessary for succeeding years to make loans to students selected by State agencies in proportion to number of Members of House of Representatives from States which have accepted provisions of this act. For a student to be eligible for a loan, his State must designate a State Agency, establish certain methods and standards for selection, and make certain deposits into the scholarship fund which amount shall not exceed 10 percent of aggregate amount of advances made to students from that State during preceding calendar year. Sets forth the procedure for application. approval, security, and the making of loans to eligible students. The Commissioner of Education may suspend a loan where he finds that a State has made selections on a discriminatory basis. Provides for loans up to $1,000 a year for the first 4 years in college grade studies, up to $1,500 a year for first 4 years of post college studies, and for repayments of loans to begin the 2d year after advances have ceased. Assures all educational institutions where students attend on loans freedom from interference from Federal or State Governments.

In addition to these congressional proposals for an unrestricted Federal scholarship or loan program, in the present Congress at least one bill has been introduced to provide scholarships for persons of unusual ability in the fields of engineering, physics, chemistry and the related sciences. No action has been taken on these bills in previous Congresses.

The existing scholarship and fellowship programs financed by the Federal Government for education at colleges and universities were established for the benefit of a special group, such as veterans, or for postgraduate work in scientific fields.

Current Federal program in higher education can be classified as follows:

(1) Aid for the education of a special group of individuals, such as veterans;

(2) Aid to individuals for study in special fields, such as military science and medicine;

(3) Educational activities carried out largely for the promotion of some policy of the Government, such as the development of international goodwill, or building up an officer reserve;

(4) Annual grants to particular institutions for specific purposes, such as agricultural education;

(5) Grants and contracts awarded to institutions for research in certain fields, such as the physical sciences.

The Federal Government has a stake in the quality, productivity and efficiency of this Nation's skilled manpower. Can Congress be indifferent to the consequences and meaning of the findings concerning "the nature ad distribution of talent and skill in American society"? What are the steps Congress should take to implement a national policy in this area? What form should they take and where should the emphasis be placed?

The CHAIRMAN. Mr. Talle.

Representative TALLE. Mr. Chairman, I am very much interested in public-works programs. Government could proceed on a program covering a period of years, in good times and in bad times. We might proceed because we wanted to build the country up without regard to depression or inflation or anything else, but generally you hear a good deal more about public works in a time of recession.

Early in this hearing public works were mentioned, and it is one way of alleviating unemployment, but as Dr. Gainsbrugh pointed out at the time, it takes a long while to get started. In other words, a recession comes along, and you want to carry out public works to alleviate unemployment, but you are not ready to go ahead.

If you do not have your gun loaded, you cannot shoot, and therefore I think we should take a look at this problem of having our plans ready so that if we want to use public works as a relief in times of depression and unemployment when we have good times, we should be working on our plans. I should like to ask General Itschner, who certainly is well-informed in this field, how many steps must be taken and how long a time is required to take those steps to get a project ready for construction from the time the project is an idea in somebody's mind until you are ready to do the work, actually using the bulldozers and the other things you must use.

General ITSCHNER. Well, sir, it takes a great many years from the time the project is first conceived by local interests who desire that project until the project is actually under construction. We found recently that we had something like $8.9 billion worth of projects already authorized, which meant that it had been maybe six or so years prior to that time they were conceived, and yet, they were not ready for construction.

It takes on an average of perhaps 2 years to plan a project after the initial funds are made available for planning, and as an average in the first year of construction, we find that we can spend at a normal rate of progress just about 10 percent of the cost of that project. So that means that in our type of program, at least, during the initial year, even after the construction has commenced, we do not have too much effect upon the economy.

It has to go to the second or third year until the project progresses and consumes a large amount of money. So the entire process is a very long one and we are trying now to improve that condition. We feel that it will be improved because in fiscal year 1956 we have in the budget $5 million for planning, as compared to $2½ million in fiscal year 1955.

Representative TALLE. There is an aspect of that which probably is not very well known to the public. Before a project can be undertaken at all by the engineers, there must be authorization in law. Now that, I submit, takes a long time. I know that from experience. From the moment the idea is born something should be done, to the hour when Congress has passed a bill and the President has signed it—that is typically a long time. That is correct; isn't it, General?

General ITSCHNER. That is correct; yes. There were many projects in the 1954 omnibus bill, which is the authorizing bill for our work, for which the reports were prepared as far back as 1946, 1947, and 1948, which means some of the data contained in those reports went back to 1945, so it is a long process.

Representative TALLE. I have several urgent projects in mind. So, if you have a flood-control problem and you have the authorization, you still have not got anywhere, as far as stopping floods is concerned, for you have another big step, and that is to get the money to do what has been permitted by law. Would you like to comment on the problem, General Itschner?

General ITSCHNER. Well, after the authorization, the next step, as you say, is the obtaining of funds by appropriation, and that takes a great length of time, in many cases. The reason is that the backlog of authorized projects is many times the amount of an annual appropriation that we might expect for construction. I did give the figure of $8.9 billion as being the present backlog of authorized projects. Our annual appropriations for new construction has been something on the order of $400 million as a maximum. So that means 22 years of appropriations before we could accomplish the backlog.

We all know that some of those projects never will be built.

Representative TALLE. That is right. Turning back to that first big step, a project is authorized by law. Even if money is appropriated for carrying out that project, isn't there a preliminary step called planning for construction before you actually start the job?

General ITSCHNER. That is correct, in almost all cases. In cases where the project is one which is rather simple to plan, such as a dredging project, the construction funds and the planning funds might be combined in a single annual appropriation, but as a rule, we have 1 or 2 years' planning money first, usually 2, before we ask for construction funds.

Representative TALLE. I think the Office of Army Engineers has worked out a chart showing the different steps that must be taken, and if we had some of those, it would help to clarify that point.

I would enclose them in some letters I write. Thank you, General.

Let me get back to the point that I started with. If we decide to depend on public works for the alleviation of unemployment in a time of distress, then it is not any solution at all, unless we have all of these steps completed and are ready to shoot the gun.

Is that correct, Mr. Chairman?

Representative KELLEY (presiding). I would say so, Mr. Talle. I would agree with that.

Mr. WHEATON. I would just like to say in the fields of housing the comparable times are 3 years for housing and 5 years for redevelopment projects. This means you have to have a program in operation with more than 5 years of programing in the works if you want to have something that can be telescoped at any one time and concentrated to meet local unemployment situations. It is for that reason that I believe that we have to have a large going program and a rather steadily expanding program to meet our actual needs, as well as to create this kind of a reservoir that Mr. Talle is speaking of, which is a reservoir of live, active programs, rather than a reservoir of dead fish.

Mr. CARR. Mr. Chairman, I wonder if I might just follow that up on a closely comparable matter, the building of schools, about which I spoke this morning. We do not have to wait, I am sure nobody intends that we should wait, until people are unemployed to build schools. The reason for building schools is to educate children, primarily, and only incidentally, if it is so at all, to take care of unemployment. From the evidence I presented this morning, I think it is clear enough that we need the schools.

Because we were under a time limit this morning, I did not make the point which I would like to make now. We not only need the schools in many communities and States of this country, but the study to which I referred shows quite clearly that under existing circumstances they cannot be built with State and local funds, because those funds are already committed. Communities have reached the legal limit of their borrowing and of their current revenues for construction purposes.

You asked, Mr. Kelley, why there is so little interest in a program of Federal matching grants for use in local and State public works. I cannot answer the question as to why there is so little, but I would like to express the hope that there will be a great deal of interest in it, particularly from the point of view of schools.

We are all looking forward to the message which President Eisenhower will send to Congress on the construction of schools in the very near future and hoping that it will contain some of these provisions for matching grants to which you referred.

Representative TALLE. It looks as if we are in a pretty bad situation, then, because if the States and local communities have such ceilings and the Federal Government also has a ceiling—its debt limit—we cannot do anything more than we are doing.

Mr. CARR. I still believe in our country and its wealth. We are going to find a way to provide good schools for our children. I just think that Congress is going to do that.

Representative TALLE. Oh, I want education for our children, believe me, I do, but you see what the trouble is: The ceiling will have to be punctured by one or both.

Mr. CARR. I see that it involves some difficult choices.

Representative KELLEY. Senator Goldwater.

Senator GOLDWATER. In regard to what Mr. Carr is talking about, you might be interested in a study my staff has been carrying on, together with Health, Education, and Welfare, regarding available moneys, should the Government take action this year to provide them. We found—in fact, we did not have to look far—2,400 pieces of real estate in this country belonging to the Federal Government or commercially operated projects owned by the Federal Government that would produce $307 million a year on average school tax rates.

The question I have raised to HEW and to the administration is one of the possibility of the national parks, for instance, including in its budget an amount for lieu payments because you cannot tax Federal land. Then in defense areas where large defense plants have been built and immediately taken off the taxrolls and title put in the Government. The suggestion there has been either to return that property to the taxrolls or there, again, to let the Defense Department appropriate lieu amounts.

Now, $307 million is about two-thirds of what the Hill bill is asking. I do not think that is an adequate amount, but it is a large sum of money, and I just mention that to you so that you might pursue that further in your studies. But it has grown in this country to the point that it is dangerous. I do not like to see the Federal Government build schools when the local school districts can build them. But as you say, many of them are now to their bonded limit, and it is impossible for them to build more.

Mr. CARR. Thank you, sir.

Representative KELLEY. Mr. Curtis.

Representative CURTIS. Mr. Chairman, I would just like to comment, too. Of course, I realize, at least I hope I realize this tax problem, particularly with respect to the ability of the State and local governments to tax, but I cannot fail to compare the State and local debt in comparison with the Federal debt. When we talk about debt limitation, I was just looking at this chart very quickly on Government financing, 1954–55, the chart on page 201, total Federal, State, and local debt, and in 1932 the Federal debt was about equal to the State and local debt, about $18 billion apiece. In 1953 the local and State debt has only risen to about $32 billion, which is less than a 100-percent increase, from $18 billion to $32 billion, but the Federal debt has increased from about $18 billion to almost $300 billion, and I am well aware of this problem of local and State taxation. That is why we have this committee studying it, but I am impressed with the fact that somehow or other local and State communities, in my opinion, have not been sizing up to their job.

There has been this great tendency, and perhaps this is a political observation, although I do not mean it to be, a great tendency of going to the Federal Government, which will increase the Federal debt. It is bound to, unless we have the revenue, instead of trying to dig down and solve the thing locally.

Now in schools I recognize that we have got an added job. We do not have it in the environs of St. Louis, Mo., but we certainly do have it in the Ozarks, in Missouri and Arkansas, where the argument is you do not have the wealth in the community to solve that thing. But even in areas like around St. Louis, Mo., where, heaven knows, they have got the wealth, it seems to be an easy thing for people to let the Federal Government tax them, but they are not willing to vote bond issues for local matters when it is actually going to come out of their pockets in the same way. I do not know what the answer is unless people are going to pay a little more interest in their own communities.

Mr. CARR. Well, sir, I certainly agree that every locality should do everything it reasonably can to support its schools just as I agree that every locality should do what it can to build its streets and its roads and should not come flying into Washington every time it does not rain.

Representative CURTIS. Let me ask you this $64 question. Do you think they really have been doing that?

Mr. CARR. I do not think the American people at any level of government—Federal, State, or local—have supported their schools as much as they should.

Representative CURTIS. Of course, we get into this: Those who believe as I do, were very much concerned about keeping education within the control of the local communities and we know, as a matter of fact, that whenever you pay out funds, there is bound to be some restriction on the payment of those funds. That is why so many of us who all recognize the great need for education—I could not be more interested in it, having five children of my own—are deeply concerned about education, and feel it is a dangerous thing to get the money up here at the Federal level because we know that that is bound to bring some sort of control. That is one of our great jobs, I say, to try to get the proper solution to this dilemma.

Mr. CARR. I would not want, Mr. Chairman, to prolong this discussion. We took quite a while on irrigation. But maybe you would let me go into this educational question just a bit more. It is a big question, and I would like to say to Mr. Curtis and Mr. Talle——

Representative KELLEY. I think there is this matter of control. If the Government gets its nose under the tent, nobody knows how far it will go, although there has been great pressure put on the Members of Congress to do something on a Federal level to aid education.

Mr. CARR. Yes, sir; it was on that point that I wanted to speak, and as I was brief this morning, I will try to be brief this afternoon.

I want to say, in the first place, that I expressly do not wish to leave the impression that anybody who is against, or doubts the wisdom of, Federal support for education is thereby unfriendly to education. The gentlemen who have just recently spoken, and you, sir, have raised questions, and I do not interpret these honest questions as being in any sense unfriendly to the schools. I know they are not meant in that sense.

Now we have three questions here. I think I can express a viewpoint on one right after the other in a staccato fashion. First, the statement is made, and we have heard it many times, that if the Federal Government assists the schools, it will control them in some measure.

Representative KELLEY. Some day.

Mr. CARR. Some day. Rebuttal: The Federal Government has been assisting the land-grant colleges of the United States, which are educational institutions, with regular grants every year since the law was signed by Abraham Lincoln. When President Buchanan vetoed that law just before President Lincoln signed it, Mr. Buchanan, whose veto message is interesting, predicted the direst results, because he said the long hand of the Federal Government would be running our land-grant colleges.

Well, we have been giving money to them ever since then, nearly a hundred years, and I appeal to any president of any land-grant college as to whether the long arm of the Federal Government has dictated a single course or a single policy or limited the academic freedom. On the contrary, they have been free. So let's not make too quick a generalization that, under all circumstances, this kind of assistance involves Federal control. I think it would involve control under some circumstances, but I do believe the historical evidence will support me that control is not necessary.

Now, the second point, the question of whether it makes any difference whether money comes from the State or from the locality; they are both finding difficulty meeting their finances; they are both carrying debts. I think it does make a difference. I think the rapidly growing wealth of our country does not exist in the form of real property, and some of the other testimony this morning supports that. Real property limps along behind even when it is fully assessed. The tremendous explosive growth in the production of wealth in this country is such that if you are going to tap the real wealth of the country you cannot do it by taxing real property. You must tax other forms of wealth, particularly income, and if you tax income largely on the State level, you get the moving of industry from one State to another to avoid taxation, and all the other undesirable effects with which you are much more familiar than I am.

The instrument for reaching out to this real wealth is the Federal income-tax system and if we do not use that system to support our schools, you deny the schools a very significant share in the economic lifeblood of the country.

Third, may I just point out to the committee the inevitable results of matching, as applied to other activities than schools. If you have Federal matching for roads and Federal matching for X and Y and Z, but no Federal matching at all for school construction, you can see the inevitable result. The States are going to use their money to match the Federal Government in those areas where the Federal Government has decided to match. I greatly fear that this continued expansion of matching, if the schools are left out, is going to exclude our schools, and worse than that, is going to discriminate against our schools in the competition for economic support which goes on all of the time among all of the objects of government. I hope this has not been too long.

Representative KELLEY. Thank you very much.

Mr. FISHER. Mr. Chairman, I wanted to suggest, particularly in reference to a number of comments made to Mr. Talle, that in my opinion, the outlook for accelerating public works in time of recession or depression is not nearly so bleak as the general run of comments would perhaps lead you to think. I should say, first, that I take my general stand on the year-in-year-out steady pursuit and development of public works—resources, schools, highways, and so on—but then I must add that there still are, in my view, possibilities for acceleration that are not to be overlooked, and if they can be identified with care and if a state of rather total readiness can be created so that they may be engaged in very timely and prompt fashion, then they may serve to exercise quite a leavening effect when a recession comes upon us.

For example, it is perfectly clear that a vast urban renewal scheme or a tremendous multiple-purpose dam, reservoir, and power project, or a large program of school building, which may involve hundreds of structures, take some years to get under way. But I still feel quite strongly that it is possible to identify particular types of work which can be accelerated on as little as a 3-months' basis, provided people are willing and ready. For example, I think in the acceleration of channel dredging or smaller scale farm and forest conservation work this is true. I think that certain local public works, such as street extensions, sewer and water line extensions, the additions to school buildings, can be accelerated in timely fashion. While I would rely mainly upon a steady development of these programs, I think it is important to identify those works which can be accelerated quickly, not only to go as far as is sensible with the blueprints and specifications, but also with the financial preparations, the site acquisitions, and so on.

Every last ounce that can be got from public works to meet a depression situation should be got. I think this is an important point to bring out, lest it be overlooked. I am not sure that this helps very much in the coal areas of Pennsylvania, West Virginia, and Kentucky, where the problem, by and large, I believe, is not a business-cycle matter, but a chronic problem closely connected with the fortunes of the coal industry as it competes with oil and gas.

Representative KELLEY. Mechanization of mines.

Mr. FISHER. That is right. So I would not hold out any kind of temporary spurt in public works as a total solution to that problem. Even so, I think it is incumbent upon everyone to look them over most carefully, to try to see which particular public works might well exert a longtime effect upon the kind of problem that exists in these areas.

Representative TALLE. Mr. Chairman.

Representative KELLEY. Yes, Mr. Talle.

Representative TALLE. I think it would be fair to say, as far as school buildings are concerned, they would not be a very good illustration of something that would be done in time of depression, because there is a time when children must go to school. When a child is 6 years old, it should be in school, maybe at 5. But there are other worthwhile public works that could be carried on. Unfortunately, it takes such a long time to get ready to do them. Perhaps we can improve on that.

Senator GOLDWATER. Mr. Chairman, just to preface a question that I want to throw to the whole panel, and it does not need answering now, but sometime in the future it should have consideration. It has been my privilege to see the President's school plan, and I think it is the most workable, best approach to the school problem that I have seen yet. I know that the country will rally around it when it is presented next week. Mr. Fisher, together with the joint committee staff, I made a study last year of the effect of the public-works approach to the solving of unemployment, to the solving of recession or depression.

Of course, the only period we had to use was the period between 1932, 1933, and 1939, prior to the war, because that is the first time we made a real all-out effort to solve those problems in this country through Government expenditures.

A surprising number of things cropped up. One of them is this, and we keep forgetting this; in that 7-year period—mind you, this is for 7 years, and you won't believe it—but for 7 years our total Federal budget was $51 billion, and out of that $51 billion about twenty-five billion-plus dollars, just a little over 50 percent, went into the public-works approach and also CCC and the other things that we used during that period.

Now, the question that remains in my mind after studying that report is: Did we spend enough money? Did we spend it soon enough—because we still had terrific unemployment in 1939, after spending over 50 percent of the budget for 7 years in this public-works approach. The great question then that comes from all of this is if it was not enough and if it was not soon enough, but particularly if it was not enough, where could we today get 50 percent more in addition to the present Federal budget?

Now, there are a lot of questions in there, and I do not ask that they be answered now. You are interested and concerned with the public-works approach, and I think it is the duty of this committee to consider how much we can actually do with this approach.

I do not think it is right for us to fool the public, if we are fooling them. We may be telling them the truth. I do not think it is fair to say to the American people: Do not fear another depression, because the Federal Government can step right in with public works, if that is not true. If you would like a copy of basic table in that study, I will be very glad to send it to you.

It has left a lot of questions in my mind, and I think it has left a lot of questions in the staff's mind as to just the extent of effectiveness of the public-works program if it is effective.

Representative KELLEY. Would you wish to have Mr. Fisher supply that for the record?

Senator GOLDWATER. Yes; if he wants to and can get it in time. I think I know some of the answers he might give. I have a copy of the table here and I will put it in the record.

Representative KELLEY. Very well.

(The materials referred to are as follows (table supplied by Senator Coldwater for the record) :)

Total Federal Government receipts, expenditures, and budget surplus or deficit—and major direct Government expenditures to aid the economy, fiscal years 1933 through 1939 [1]

[Millions of dollars. On basis of daily Treasury statements (unrevised) adjusted to provide uniform classification of expenditures]

	1933	1934	1935	1936	1937	1938	1939
Total receipts	$2,079.7	$3,115.6	$3,800.5	$4,116.0	$5,028.8	$5,854.7	$5,164.8
Total expenditures excluding public debt retirements	3,863.5	6,011.1	7,009.9	8,665.6	8,177.4	7,238.8	8,707.1
Net surplus or deficit [2]	−1,783.8	−2,895.5	−3,209.4	−4,549.7	−3,148.6	−1,384.2	−3,542.3
Relief and work relief: [3]							
(a) Direct relief: Federal Emergency Relief Administration [4]	336.0	707.8	1,820.1	494.3	[5] 933.0	4.2	1.7
(b) Work relief:							
Civil Works Administration		805.1	11.3	.7	.3	.2	.2
Works Projects Administration and National Youth Administration				1,263.7	1,896.4	1,472.5	2,239.6
Civilian Conservation Corps	14.2	331.9	435.5	486.3	385.8	326.4	290.4
Total relief and work relief	350.2	1,844.9	2,267.0	2,245.0	2,281.6	1,803.2	2,531.9
Public works [6]	442.4	698.0	883.4	729.7	1,023.9	803.5	1,000.5
Aid to agriculture [7]	203.7	775.3	1,071.3	932.7	970.5	853.8	1,228.2
Total major direct Government expenditures to aid the economy	996.3	3,318.2	4,221.7	3,907.4	4,276.0	3,460.5	4,760.6

Total, 1933 through 1939:	
Relief and work relief	$13,323.8
Public works	5,581.4
Aid to agriculture	6,035.5
Total major direct Government expenditures to aid the economy	24,940.7

[1] Source: H. Doc. No. 505, 77th Cong., 2d sess., the Annual Report of the Secretary of the Treasury on the State of Finances, pp. 416, 417, and 476.

[2] Net surplus or deficit is before giving effect to expenditures for retirement of public debt, chargeable to sinking fund, etc.

[3] Does not include total expenditures from emergency appropriations and allocations to other departments and agencies. Such allocations totaled approximately $2 billion for the period 1933-39.

[4] Includes Reconstruction Finance Corporation loans and grants to States, municipalities, etc., for direct relief.

[5] Excess credits (deduct).

[6] Includes Public Roads Administration, forest roads and trails, Public Buildings Administration, Tennessee Valley Authority, reclamation projects, river and harbor work (including flood control), Public Works Administration (including administrative expenses), and U. S. Housing Authority.

[7] Includes agricultural adjustment program, Farm Credit Administration, Federal Farm Mortgage Corporation, Federal intermediate credit banks, Federal land banks, Farm Security Administration, Farm Tenant Act, Rural Electrification Administration, Federal Surplus Commodities Corporation 1938 to 1939, Commodity Credit Corporation, and Department of Agriculture. Department of Agriculture expenditures include aids for the benefit of the general public such as meat inspection and enforcement of the Food and Drug Act.

REPLY TO SENATOR GOLDWATER'S QUESTION REGARDING PUBLIC WORKS DURING THE DEPRESSION OF THE 1930'S

The question which Senator Goldwater raises is intriguing and important, but one which can't be answered definitely. The question is, to what extent can public works be used to combat depression successfully; particularly, was the Government spending for this purpose during the depression of the 1930's helpful in restoring prosperity?

The statistics furnished me by the staff of the Joint Economic Committee show about $25 billion from 1933 through 1939 in major direct Government expenditures to aid the economy. This figure seems to be somewhat misleading since it includes a number of programs which probably would have been undertaken regardless of the depression, at least to a considerable extent. Among such programs were reclamation projects, river and harbor work (including flood control), public buildings, and even TVA and REA. Also, the agricultural adjustment program might have been launched without a catastrophic depression and resulted in substantial expenditures.

Although the point has remained in dispute, my own view is that Federal efforts to stimulate the economy generally by expenditures for relief, work relief, public works, and aids to agriculture during the period 1933 through 1939 were moderately successful. Relief and work-relief programs were expanded rapidly from 1933 to 1935; thereafter larger and more permanent construction projects became relatively more significant.

While the total of major direct Government expenditures to aid the economy increased by nearly 400 percent from 1933 to 1939, the corresponding increase in GNP was only about 50 percent in constant dollars. Industrial production rose nearly 60 percent and gross private domestic investments by nearly 500 percent. Total private construction increased nearly 250 percent; total public construction rose about 130 percent; personal-consumption expenditures went up one-third. Unemployment dropped by slightly more than one-fourth. While the rate of increase of these items was less than that of the major direct Government expenditures, the absolute amounts of increase in GNP, personal-consumption expenditures, and gross private investment were considerably larger than for the Government expenditures.

Those who expected an increase of a few billions of dollars in Government expenditures to convert a severely depressed economy to a highly prosperous one in the space of several years were disappointed. It took the massive defense and war expenditures following 1939 to do that. Nevertheless, there was a definite and fairly steady recovery following 1933, except for the sharp setback in 1938. It seems likely that Government expenditures to aid the economy were of some effect in the recovery, particularly in the maintenance of income and spending and hence on economic activity generally.

In the future, as for the past 15 years, there is a good prospect that major depressions can be avoided. We know more about the timing of monetary measures. Fiscal policy over which Government has some degree of control now has a large potential for business-cycle control. Public works, carefully selected, can help to offset business decline. Large-scale projects, slow in the planning, offer little for mild and short recessions such as those occurring in 1949–50 and 1953–53. Small-scale works such as upstream-flood protection, channel dredging, sewer and water lines, school additions, and forest roads and trails, if planned ahead and with financing and sites already provided for, can help to contain a recession. It is important not to exaggerate the possibilities in acceleration of public works to meet minor business setbacks.

Mr. AANDAHL. Mr. Chairman, I would like to make a further brief statement with respect to power. It throws some light on this question of Federal-local community relationships and it also relates to a question that was raised this morning on power shortage and what might need to be done to meet the power requirements of the American people.

In October 1954, the electric-generating capacity in the United States just went over the 100-million-kilowatt mark.

Representative CURTIS. What date was that, sir?

Mr. AANDAHL. That was in October, 1954. Our best estimates of the nationwide load was 79,400,000 kilowatts in November of 1954, and it was then estimated that the peak load in December would be 84 million. I haven't checked to see just where the actual December figure went to, but I presume it was very close to that amount. That means that in the United States at the present time we have a reserve generating capacity of somewhere between 16 and 19 percent. At the present time about 14 percent of the generating capacity is that which has been built by the Federal Government, and 86 percent has been built and is supplied by local entities, public and private, at the local level.

As far as we are able to determine, that reserve capacity of 16 to 19 percent is ample to safeguard the requirements of the American people and there is strong indication that local entities are ready and willing and eager to supply additional generating capacity as rapidly as it might be needed.

Now in the Pacific Northwest we find power region 7 as set up by the Federal Power Commission, and in that region where Federal power in the Bonneville area is 60 percent of the total power that is used, we have the lowest reserves. I do not mean to make that statement with the assumption that the reserves are the lowest there because the supply is coming in the most part from Federal sources, because we know that there has been defense industry shifted to the area and many other factors there, but it is an area in which the reserve of power, electric power, is the lowest.

A little better than a year ago, the Department of Interior took active steps to encourage a partnership program and that relieved the concern among local entities in the area, that if they went ahead with power installation, it might later be absorbed by the Federal Government. It recognized a responsibility at the local level, and shortly after that, the application of local entities, public and private, to the Federal Power Commission for license to put in hydroelectric developments in the rivers of the area equalled 4,150,000 kilowatts. About half the applications by public power at the local level and the other half by private utilities.

That information means to me that in this field of power, local entities are ready and willing to make the additional installations that are necessary and that the Federal Government, by just following a constructive program as far as water development is concerned with the development of power as it comes in conjunction with irrigation and flood control, can make a helpful contribution to the power needs, but doesn't need to take the responsibility of attempting to supply the full power needs of the area. That is what is involved in the partnership power policy that is being suggested and put into effect at the present time.

General Itschner.

OPENING STATEMENT OF BRIG. GEN. E. C. ITSCHNER, ASSISTANT CHIEF OF ENGINEERS FOR CIVIL WORKS, CORPS OF ENGINEERS, DEPARTMENT OF THE ARMY

General ITSCHNER. Mr. Chairman, I shall abbreviate my remarks. You have the longer printed statement before you.

Vice Chairman PATMAN. Yes; and it will go in the record as it is.

General ITSCHNER. However, I do think it would be well to describe the civil-works activities of the corps in order to provide a background for discussion and to present certain problems which are inherent in a program of this kind.

These works include the improvement of the Nation's rivers, lakes, and harbors for navigation, flood control, shore protection, and for related purposes such as water supply, pollution abatement, preservation of fish and wildlife, and notably for development of hydroelectric power.

At the present time the active authorized program has a total cost of $15.2 billion. Works with a cost of $3.1 billion are complete or essentially complete. Work under construction has a total cost of $5.6 billion and appropriations of about $2.4 billion will be required for completion. And authorized improvements with an estimated cost of $6.5 billion have not been started.

In addition, after review of the entire authorized program, the Corps of Engineers has classed over 400 projects with an estimated cost of $3.6 billion as inactive or deferred for further study.

Work under this program has been accomplished in recent years with annual appropriations of about $330 million for new construction. The President's budget for fiscal year 1956 contemplates construction expenditures of $397 million; an increase of about 20 percent. In addition about $100 million will be provided for maintenance and operation of completed works and for investigations.

During the past year 31 projects with an estimated total cost of $1.2 billion were placed in effective operation, either wholly or in part. These works involve: Provision of over 39 million acre-feet of storage; flood protection of over 4 million acres of land; installation of 803,000 kilowatts of power during the year.

One of the pertinent questions affecting water resources development in this country is in regard to the relative degree of Federal participation in this activity and as to how costs should be shared. We feel that the relative Federal-State-local interest and participation in water-resource development should be generally in accordance with the distribution of benefits and in accord with the character of the benefits.

This will vary according to various phases of water-resource development, and with regional needs. However, where different phases of water-resource development produce essentially the same result, the degree of Federal participation should be generally uniform.

The Federal interest in water-resource development generally will vary across a rather wide "spectrum." At one end would be a major improvement, such as the main protective system for the alluvial valley of the Mississippi, in which there is primary Federal interest and which may properly be undertaken wholly or largely at Federal cost. At the other end of the spectrum is the minor, local flood problem and improvement, where benefits will accrue to readily identifiable local beneficiaries.

Such work probably should be undertaken largely by States or local organizations. Between these extremes are intermediate cases where judgment and equity will indicate a variable sharing of cost depending on whether benefits are general and widespreal, or local and readily identified.

In brief, there should be greater non-Federal participation in water-resource development, but this participation should not be so great as to impede progress at a time when sound conservation and development of our water resources is more essential than ever before.

Another important question affecting this program concerns the procedure for planning for water-resource development. This should be accomplished by river basins or by appropriate related regions. The Federal Government should take the lead in planning, but States should participate actively. On the Federal side this planning should be carried out by the agencies concerned, or by groups of agencies where appropriate. The two interagency surveys of the Arkansas-White-Red River Basins and of the New York-New England area, both of which studies will be completed in the next few months, and in which the States are participating, may well be pioneer experience in such coordinated water-resource planning.

Federal participation in water-resource development is only one of many heavy demands upon the Treasury. Progress insofar as Federal participation is concerned must necessarily recognize budgetary ceilings and limitations. With limited funds, however, we must be selective and proceed first with those improvements most urgently needed and which will bring the greatest economic and social returns to the nation.

Vice Chairman PATMAN. Thank you very much, General. We will not interrogate you now until we hear from the other panel member who has not been heard from.

(General Itschner's prepared statement appears on p. 850.)

Vice Chairman PATMAN. Mr. Charles P. Lawrence, Jr., program analysis officer, Department of Health, Education, and Welfare. Mr. Lawrence.

STATEMENT OF CHARLES B. LAWRENCE, JR., PROGRAM ANALYSIS OFFICER, DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

Mr. LAWRENCE. Mr. Chairman, members of the committee, the Secretary of Health, Education, and Welfare has asked me to thank you for your invitation to appear before your comittee. She has expressed her regret at not being able to be here in person. The Department welcomes this opportunity to discuss with you the importance of public works in the development of the Nation's investments in health, education, and welfare.

These investments are important during peace or war, and in fact, provide a broad base for expansion of economic opportunity. Because of the necessary diversion of resources from civilian to defense requirements during the war years, many deficits have developed in our health and educational facilities to the tremendous task of overcoming those deficits. We must add the equally imposing task of building additional facilities for our rapidly growing population.

With respect to medical care facilities, services for the protection and improvement of the Nation's health require public works of many different types, including hospitals and outpatient departments, nursing homes, clinics for ambulatory patients, diagnostic and treatment centers, rehabilitation centers, and so forth. Huge unsatisfied needs for facilities in all these fields were built up during the war years. The programs of the Public Health Service of the Department of Health, Education, and Welfare have been aiding substantially in meeting the demands for medical care facilities, but many communities are not yet adequately supplied. The Congress in enacting the medical facilities Survey and Construction Act of 1954 at the President's recommendation reoriented the Federal Air Program. State surveys are now being initiated preparatory to the establishment of priorities and of plans for construction that will add to present medical care facilities.

There are now approximately 1,100,000 acceptable hospital beds of all types in the United States; 114,000 of these beds in nearly 2,400 projects have been provided with the aid of the hospital survey and construction program, chiefly in general hospitals.

We still need 838,000 additional hospital beds. Nearly half of these are needed in mental hospitals, and one-third in hospitals offering care for the chronically ill. General hospitals require about 200,000 additional beds.

Present evidence also indicates a need for about 200,000 additional beds in nursing homes, where skilled nursing care under medical supervision can be provided at a lower cost than is possible in hospitals. The demand for nursing-home care is steadily mounting, because of the increasing proportion of elderly people who are subject to more frequent and more prolonged illnesses. It is growing also because of changing conditions of family living, in limited quarters.

The ultimate health objective is to keep well people well. We now have available specialized knowledge and techniques for modern medical practice requiring more complex and expensive facilities which, except to a limited degree, are not generally available outside of major metropolitan centers. There is increasing recognition of the need for diagnostic and treatment centers. A minimum estimate of additional need for care in rehabilitation centers amounts to 12,000 additional patients treated annually.

In addition to the present backlog of unmet requirements, any appraisal of a future program involves an allowance for population growth, and for replacement of old and obsolete facilities. Now, need created by population growth, at a rate of 2.5 persons annually, will amount to 30,000 beds per year. About 22,000 beds each year will also be needed to take care of obsolescence. Our present backlog of needed hospital construction by currently accepted standards, is in the magnitude of $12 billion.

To meet all needs within a 10-year period (including backlog and new requirements) would require a level of construction in a magnitude of $1,700 million annually. The 1954 volume of all hospital construction nationally is $685 million. Of this total, about $135 million was constructed with the aid of Federal funds under the Hospital Survey and Construction Act. Federal funds amount to about one-third of the total aided construction work.

The President's special health message to the Congress on January 31 points to specific areas needing attention at this time and recommends a program for dealing with them.

(The message referred to follows:)

[H. Doc. No. 81, 84th Cong., 1st sess.]

RECOMMENDATIONS RELATIVE TO A HEALTH PROGRAM—MESSAGE FROM THE PRESIDENT OF THE UNITED STATES TRANSMITTING RECOMMENDATIONS RELATIVE TO A HEALTH PROGRAM

To the Congress of the United States:

Because the strength of our Nation is in its people, their good health is a proper national concern; healthy Americans live more rewarding, more productive, and happier lives. Fortunately, the Nation continues its advance in bettering the health of all its people.

Deaths from infectious diseases have diminished. During the past year, important progress has been made in dealing with such diseases as rheumatic fever, high blood pressure, poliomyelitis, and tuberculosis. Intensified research has produced more knowledge than ever before about the scourges of heart disease and cancer.

The 83d Congress, during the last legislative session, supported dramatic new strides in vocational rehabilitation. By 1959, consequently, we should be restoring to useful lives most persons who become disabled and who can be rehabilitated and returned to employment. In human terms, this will be a heartwarming achievement.

The 1954 amendments to the Hospital Survey and Construction Act opened another new chapter in the national drive for better health. Under these amendments, further provision was made to help build health care facilities for the chronically ill; to aid in the construction of nursing and convalescent homes; to provide for more diagnostic and treatment centers for patients who do not need hospital care; and to help make centers available for the rehabilitation of the disabled.

These achievements represent a major gain for the immediate and future welfare of countless Americans—in the health of both mind and body. Recent advances do not, however, represent our full capacity to wage war on illness and disability throughout the land.

THE IMMEDIATE NEEDS

As a Nation, we are doing less than now lies within our power to reduce the impact of disease. Many of our fellow Americans cannot afford to pay the costs of medical care when it is needed, and they are not protected by adequate health insurance. Too frequently the local hospitals, clinics, or nursing homes required for the prevention, diagnosis, and treatment of disease either do not exist or are badly out of date. Finally, there are critical shortages of the trained personnel required to study, prevent, treat, and control disease.

The specific recommendations that follow are designed to meet this threefold deficiency.

MEETING THE COSTS OF MEDICAL CARE

For most Americans, insurance—private, voluntary insurance—provides a sound and effective method of meeting unexpected hazards which may be beyond the capacity of the individual to bear. Risk sharing through group action is in the best tradition of vigorous and imaginative American enterprise.

The Government should cooperate with, and encourage, private carriers in the improvement of health insurance. Moreover, a great many people who are not now covered can be given its protection, particularly in rural areas where group enrollment is at present difficult.

Existing health insurance can also be improved by expanding the scope of the benefits provided. Not all private expenditures for medical care can or should be covered by insurance; nevertheless, many policies offered today are too limited in scope. They are principally for hospitalized illness and for relatively short periods of time.

I recommend, consequently, the establishment of a Federal health reinsurance service to encourage private health insurance organizations in offering broader benefits to insured individuals and families and coverage to more people.

In addition, to improve medical care for the aged, the blind, dependent children, and the permanently and totally disabled who are public assistance recipients, I recommend the authorization of limited Federal grants to match State and local expenditures.

Reinsurance

The purpose of the reinsurance proposal is to furnish a system for broad sharing among health insurance organizations of the risks of experimentation. A system of this sort will give an incentive to the improvement of existing health insurance plans. It will encourage private, voluntary health insurance organizations to provide better protection—particularly against expensive illness—for those who now are insured against some of the financial hazards of illness. Reinsurance will also help to stimulate extension of private voluntary health insurance plans to millions of additional people who do not now have, but who could afford to purchase, health insurance.

The Department of Health, Education, and Welfare has been working with specialists from the insurance industry, with experts from the health professions, and with many other interested citizens, in its effort to perfect a sound reinsurance program—a program which involves no Government subsidy and no Government competition with private insurance carriers. The time has come to put such a program to work for the American people.

I urge the Congress to launch the reinsurance service this year by authorizing a reasonable capital fund and by providing for its use as necessary to reinsure three broad areas for expansion in private voluntary health insurance:

1. Health insurance plans providing protection against the high costs of severe or prolonged illness;
2. Health insurance plans providing coverage for individuals and families in predominantly rural areas;
3. Health insurance plans designed primarily for coverage of individuals and families of average or lower income against medical care costs in the home and physician's office as well as in the hospital.

Medical care for public assistance recipients

Nearly 5 million persons in the United States are now receiving public assistance under State programs aided by Federal grants. Present arrangements for their medical care, however, are far from adequate. Special provision for improving health services for these needy persons must be made.

I recommend to the Congress, therefore, that it authorize separate Federal matching of State and local expenditures for the medical care needed by public assistance recipients. The separate matching should apply to each of the four federally aided categories: the aged, the permanently and totally disabled, the blind, and children deprived of parental care.

STIMULATING THE CONSTRUCTION OF HEALTH FACILITIES

Many communities in the United States today lack the hospitals, clinics, nursing homes, and other modern technical facilities required for the protection of the people's health. In other communities, structures are antiquated or otherwise deficient in construction or equipment.

Present methods of financing are not always satisfactory in meeting this problem. Many sponsors and operators are unable to qualify for grants under the recently extended Hospital Survey and Construction Act. Sponsors of health facilities often find it difficult to obtain private capital for construction.

In other fields, Government-insured loans have consistently helped produce the new construction required in the urgent national interests. The tested procedures developed by such successful Government guaranty programs as these should now be used to stimulate construction of additional health facilities.

I recommend, therefore, that the Congress authorize the Secretary of Health, Education, and Welfare to insure, for a small premium, mortgage loans made by private lending intitutions for the construction of health facilities.

The continuing responsibility of the mortgagor and of the lending institution should be preserved by limiting the insurance to less than the face amount of the loan and by requiring that a mortgage loan, to be eligible for insurance, must be for less than the full value of the property. The authorizing legislation should, of course, include any needed safeguards against the encouragement of substandard or unsound projects.

HEALTH PERSONNEL NEEDS

Whether we look at health problems in terms of services for the community or for the individual—at problems of research, prevention, or treatment of disease—we find that supplies of trained personnel are critically short.

The administration's legislative program for this year therefore contains proposals addressed to crucial areas of personnel shortages. These particular areas, moreover, hold the key to other possible advances and improvements in health programs.

Two proposals are aimed at shortages in nurse personnel: First, I recommend a 5-year program of grants to State vocational-education agencies for training practical nurses. Second, I recommend an expansion of Public Health Service operations to establish traineeships for graduate nurses in specialties such as nursing service administration, teaching, and research.

In addition, my recommendations for the revision of the present public health grant programs include authority for the establishment of traineeships in all public health specialties, including mental health.

PUBLIC HEALTH PROGRAMS

The Public Health Service, the Children's Bureau of the Social Security Administration, and the Food and Drug Administration are skilled and vigilant guardians of our Nation's health. All three of these agencies should be strengthened, and the programs of the Public Health Service and the Children's Bureau for aiding State health activities made more responsive to changes in State and local health needs. To this end, I urge the Congress to take the following steps:

1. Improve present grant-in-aid programs providing services for mothers, for crippled children, and for children requiring special health services. Separate funds should be provided for extension and improvement of these activities and for special projects designed to develop improved medical care techniques both for mothers and for children.

2. Permit greater flexibility in the use by the States of Federal grant funds for public health services. The States could adapt their programs more effectively to their own needs if the separate Public Health Service grants were combined into a single, unified grant-in-aid structure. In addition, separate funds should be provided for extension and improvement of existing public health programs and for special projects looking to the development of improved techniques.

3. Step up research on air pollution. As a result of industrial growth and urban development, the atmosphere over some population centers may be approaching the limit of its ability to absorb air pollutants with safety to health. I am recommending an increased appropriation to the Public Health Service for studies seeking necessary scientific data and more effective methods of control.

4. Provide greater assistance to the States for water pollution control programs. As our population grows, and demands for water increase, and as the use of chemicals expands, our water supply problems become more acute. Intensified research in water pollution problems is needed as well as continuing authority for the Public Health Service to deal with these matters. The present Water Pollution Control Act expires on June 30, 1956. This termination date should be removed and the act should be strengthened.

5. Authorize the Public Health Service to establish traineeships for both graduate and specialized training in public health in order to increase the numbers of trained personnel.

6. Strengthen the Public Health Service commissioned corps by improving its status and its survivor benefits.

MENTAL HEALTH

Care for the mentally ill presents a special set of problems.

Only in the past few decades have we, as a people, begun to regard mental and emotional disorders as capable of specific diagnosis, alleviation, cure, and rehabilitation. We now know that effective preventive and control programs are possible in the field of mental health.

I recommend, therefore, new and intensified measures in our attack on mental illness. These are:

1. Strengthening of present aid to State and community programs for the early detection, control, and alleviation of mental and emotional derangements;

2. Increased budgetary support for training activities which are now authorized, so as to increase the number of qualified personnel available for care of mental patients; and

3. Authorization of a new program of mental health project grants. Such projects would aim at improving the quality of care in mental institutions and

the administration of the institutions themselves. They would also search out ways of reducing the length of stay and the necessity of institutional care in as many cases as possible.

JUVENILE DELINQUENCY

As a vital part of our attack on a serious health and social problem, I also recommend new grants to the States to enable them to strengthen and improve their programs and services for the prevention, diagnosis, and treatment of delinquency in youth. There should be assistance for State planning, for coordination of all State and local agencies concerned with juvenile delinquency, for training of personnel, and for special research and demonstration projects.

INTERNATIONAL ASPECTS OF HEALTH

For half of mankind, disease and disability are a normal condition of life. This incalculable burden not only causes poverty and distress, and impedes economic development, but provides a fertile field for the spread of communism.

The World Health Organization of the United Nations is exerting forceful leadership in a cooperative worldwide movement toward better health. Its program merits adequate and growing financial support on the part of the United States. Our contribution to the World Health Organization should be raised, so that the effort to release men from the bondage of disease through international cooperation may be increased.

These recommendations to the Congress represent a broad and coordinated offensive against many of the problems which must be solved if we are to have better health for a stronger America. All the proposals recognize the primacy of local and State responsibility for the health of the community. They encourage private effort, with private funds. With the cooperation of the States and the medical profession, they can form the basis for better health for all.

DWIGHT D. EISENHOWER.

THE WHITE HOUSE,
January 31, 1955.

With respect to water and water pollution control works, water is a primary natural resource. The changes wrought in our national life would have had important consequences for water uses. Intensified and accelerated industrial growth and further urbanization of an enlarged population have increased the need for water, for water-pollution control, and for reuse of water. Long-term economic growth is dependent on safeguarding the Nation's water resources and facilitating reuse. This department is vitally concerned with water supply and waste-treatment works because of the close relationship between water and health.

While progress has been made in developing municipal water systems, providing sewers, and reducing pollution, we must not lose sight of the fact that the fight against disease arising from insanitary conditions is a continuing one. Our protective pattern must be maintained and enforced. Much work remains to be done. Especially is this true because of the increased production and use of chemicals and the complex wastes which are being discharged into streams.

The primary responsibility for furnishing municipal water supply and sewerage facilities rests with the community, aided and guided by the State health department. The Department of Health, Education, and Welfare, through the Public Health Service, works with the States, with interstate agencies, and with others in developing and implementing pollution-control programs on a watershed basis. State programs are developed and strengthened through Federal support. The Public Health Service activity places emphasis on research, technical consultation, and limited enforcement activities on interstate pollution problems.

Of our 12,000 sewer systems, only slightly over 7,000 have adequate treatment. Of the nearly 100 million persons served by sewers, only some 60 million are served by adequate treatment facilities. In addition, there are some 10,400 industrial plants which are not served by municipal sewers that discharge production wastes into our natural water bodies.

As the Economic Report of the President pointed out last year, an annual expenditure of $1,800 million would be necessary for 5 years to meet the backlog of needs for municipal sewerage and industrial waste facilities, as well as to provide for current population growth. The current rate of expenditure is about $600 million.

In the field of water supply, the Department is also working with State agencies through research programs and by furnishing technical assistance and consultation.

An increasing number of cities each year are experiencing water shortages. The shortages are often deterrents to economic growth. During the past decade municipal water supply capacity for domestic and industrial use has been expanded at the rate of 2 to 3 percent annually. Population growth, increased consumption per capita, and greater industrial requirements have increased the demand for water by 5 percent annually. Current expenditures for water-supply construction are $500 million annually, which is only enough to meet immediate urgent needs. To eliminate the backlog of needs, again assuming a 5-year period, would require an annual expenditure of $1,200 million annually.

The President in his January 31 health message to the Congress urged the amendment of the Water Pollution Control Act of 1948 to provide a continuing legislative base for Federal water pollution control activities. The basic principal of State responsibility would be maintained and strengthened. The recommendations, furthermore, would broaden Federal research activity, technical consultation, and support of State programs by grants-in-aid. Technical assistance would include studies and consultation on fiscal problems and local governments involved in financing the construction of abatement works.

Education facilities: In education, during the war years little was added to our school-plant inventory. Lowered maintenance standards often accelerated deterioration and obsolescence and intensified our problems of classroom deficits, overcrowding multishifting and the use of temporary and sometimes highly unsatisfactory accommodations. Increased enrollment resulting from higher birthrates following World War II, when added to the existing deficits, has created an inescapable demands for school construction. Some assistance in federally affected areas has been given by the Federal Government, but the major effort has been State and local where responsibility traditionally has been placed. The effort has in fact been outstanding.

The financing of school construction has been undertaken largely by State and local governments through bond issues. Despite the new highs in financing volume during 1954, interest rates have been low. This favorable market condition has benefited many school districts and has offset to some extent the rising level of construction costs. Some communities, of course, have been unable to undertake construction because of tax or debt limits, lack of local resources, or other conditions affecting their financial ability. This was specifically pointed out in the Economic Report of the President.

The President has announced that he will shortly send a special message to the Congress dealing specifically with the problem of classroom shortages.

(See p. 852.)

The Economic Report of the President devotes a section to coordination of public works and recommends the establishment of an Office of Coordinator of Public Works Planning within the Executive Office of the President. Continuity in assistance to States and municipalities for advance planning is also recommended. Such measures while helpful in good times, can have special significance if expansion of public works is needed as an economic measure. The concept of continuity in advance planning assistance to the States and localities is important. Under the Hospital Survey and Construction Act, surveys of State needs and the preparation of plans to meet them have been an integral part of the long-range program. As related above, State surveys are now proceeding for new types of facilities under expanded legislative authority.

Vice Chairman PATMAN. Thank you, sir. Senator Goldwater, would you like to ask any questions?

Senator GOLDWATER. No, I have no questions.

Vice Chairman PATMAN. Mr. Curtis, would you like to ask some questions?

Representative CURTIS. I would just like to ask one question of General Itschner. On page 4, you made this statement, General, and I just wanted to understand what you meant:

> In brief there should be greater non-Federal participation in water resource development, but this participation should not be so great as to impede progress at a time when sound conservation and development of our water resources is more essential than ever before.

By that you don't mean to imply that non-Federal participation would not be along the lines of sound conservation and development and yet it reads that way.

General ITSCHNER. It would not if it were in a proper amount depending on the particular case.

Representative CURTIS. Why would the size make a difference? What difference would it make whether there was greater non-Federal participation or less?

General ITSCHNER. I am afraid if the percentage of Federal contribution were much less, many projects would not be constructed. The statement was really aimed at planning for water-resource development. We feel that for certain types of projects there should be no local participation. In other types of projects there should be very substantial local participation.

Representative CURTIS. But you seem to imply in this statement that non-Federal participation, if it were of a certain size, would impede progress as far as sound conservation is concerned.

That is why I am puzzled, that you should feel that way.

General ITSCHNER. We do feel that the actual non-Federal participation in a going project, regardless of magnitude, would, of course, not influence the result.

But if it were planned so that the non-Federal participation were too great in certain types of projects, we believe that those types of projects would not in fact be constructed.

Representative CURTIS. It would be poor planning.

General ITSCHNER. It merely had in mind the planning phases at that time. During the planning phase, if the participation would not interests were too great, we feel certain types of projects would not be constructed.

Representative CURTIS. And, Mr. Chairman, one question of Mr. Lawrence.

You mention this hospital construction needs and what we would have to do over a 10-year period. Even if you fulfill these construction requirements, would we have the medical and nursing staffs available to properly staff those additional hospital beds?

Mr. LAWRENCE. At our present rate of construction, of course, that is not as serious a problem as if we were able to supply all of these needs as the various surveys have indicated. There is a severe shortage, certainly.

Representative CURTIS. The question, of course, would be this: Are we limited really in the amount of money that we are setting aside for construction or is the limitation rather on the nursing and medical staff that will be necessary? There could be a limitation on either side, couldn't there?

Mr. LAWRENCE. I think your question is very pertinent, sir, and it applies not only in this field but in many other fields as well.

Representative CURTIS. In other words, we could get ahead of our construction and not have the personnel to properly handle the facilities?

Mr. LAWRENCE. It is hoped, of course, that attention in this field will be given. It may be noted that about 20 percent of all the Hill-Burton dollars has gone into teaching institutions since the program started in 1946. That is 20 percent of $2 billion. This has been for the purpose of supplying personnel for the hospitals being built. It would have to be assumed that in a public-works program an appropriate amount would go to teaching institutions to help keep the situation of supply and demand for hospital facility personnel in balance.

Vice Chairman PATMAN. Dr. Talle, would you like to ask any questions?

Representative TALLE. Mr. Chairman, I do not want to ask any, but I just want to make a brief statement.

Vice Chairman PATMAN. Certainly, sir.

Representative TALLE. I am reminded of what President Eisenhower said during Education Week. I think the heart of the matter was that we should encourage scientists to do special work in our country, and that relates to this specific point that Dr. Renee mentioned this morning about new use for coal. That is an illustration of what can be done. Finally, I want to thank all of you who have participated in this panel discussion. You have been very helpful to the committee.

Vice CHAIRMAN PATMAN. You bring up an interesting point. Do you think from the Government there should be scholarships to certain deserving students who have demonstrated their ability and intelligence, but who do not have the means to secure a college education?

Representative TALLE. My curbstone answer to that is "Yes." I would favor encouraging that on an individual basis.

Vice Chairman PATMAN. Something along that line.

Representative TALLE. That is right. I would not name specific institutions or colleges.

Vice Chairman PATMAN. That is right.

Representative TALLE. I would let it be on an individual basis.

Vice Chairman PATMAN. Dr. Renne, would you like to comment on that?

Mr. RENNE. Well, the best statistics that are available indicate that about half of those who are competent to carry college work, about half really go to college, but a very sizable proportion, better than one-fourth of the top, in terms of brain power, or I. Q. do not get to college or university, primarily because of financial resources, and it would seem to us that this is one of our most important resources, and if some way could be worked out whereby the individual student who does have the ability could see his way clear financially or be stimulated by the honor which is associated with awards—and, after all, the awards are very limited in terms of numbers—we would not lose this high proportion of human ability which we are now losing.

Vice Chairman PATMAN. In other words, that is a great waste for our Nation.

Mr. RENNE. It seems to me it is.

Vice Chairman PATMAN. One of our greatest, and in a democracy we should certainly encourage things like that.

Mr. RENNE. I would say so.

Representative TALLE. Mr. Chairman, my attention has thus been called to a study prepared for the Committee on the Economic Report by the Legislative Reference Service of the Library of Congress, which I want to say, for myself, is a remarkable agency, a very helpful agency. The title of this study is "Trends in Economic Growth," a comparison of the Western and the Soviet bloc (83d Cong., 2d sess., joint committee print) and I should like to quote a sentence on page 5:

> It is important that the Western countries intensify their efforts in the field of education. The more immediate need is to train adequate numbers of scientists, engineers, and technicians. In the longer run it is essential to keep raising the level of general education.

I feel there is nothing that is really progressive except the human mind and I think the human mind should be trained.

Vice Chairman PATMAN. Thank you, Mr. Talle.

The hour is getting late. Did you want to ask some questions?

Representative CURTIS. I would like to ask a couple of questions of Mr. Olds, if I might.

Vice Chairman PATMAN. Go right ahead.

Representative CURTIS. First I want to apologize for not having been here this morning when Mr. Olds was testifying, but I have read his statement, and first I would like to comment. You are an advocate of public power, I would take it?

Mr. OLDS. I am an advocate of a combination of public and private power, in which there is sufficient public and cooperative competition to supplement the private power and keep private power systems on their toes.

Representative CURTIS. But in the popular concept you would be one who is regarded as a "public power" advocate as opposed to one in popular concept as a "private power" advocate. I interpret that from your statement.

Mr. OLDS. I think that interpretation is generally placed on what I say. I wanted to make it clear, though, that I am not an advocate of all public power.

Representative CURTIS. Now, I was interested in your first sentence where you say:

The Economic Report of the President is completely lacking in recommendations with regard to electric power—

Now, of course, if you are a public power advocate, I could see why you would conclude that. But being a private power advocate, as I am, I think it is full of recommendations.

Now, going on to the rest of your comment—

or recognition of the part played by ample supplies of low-cost electricity in an expanding economy with provision for defense.

Now, I would say, sir, that I think the President's report, talking for myself as a private power advocate, that you and I and the President's report are all concerned about an ample supply of low-cost electricity for an expanding economy and for defense. Our disagreements are not in what you want to achieve. Our disagreements are in how you achieve it.

Throughout your statement you beg the question. You just assume by having the Government do this and that and not have private enterprise that thereby you will get more supplies of low-cost electricity, and it is perfectly all right for you to argue that, but to assume here that those who disagree with your procedures and methods are not equally interested in the objective is what disturbs me.

Do you not think that this objective is in the mind of the President and those who advocate this new power policy which you suggest, incidentally, on the second page where you say that—

the Economic Report apparently takes some pride in the administration's reversal of the power policy of the last 25 years—

I would not say that was just apparent. They do. And there is no hiding of this thing that this is a reversal, and that we think that the procedures before were wrong.

So we should get down to the arguments of the thing and not as to whose motives are the correct ones, because I think our motives are identical. We both want ample supplies of low-cost electricity in an expanding economy, with provisions for defense. Now, will you not grant us that same motive?

Mr. OLDS. I will grant you the motive but not necessarily the wisdom in the choice of means.

Representative CURTIS. Exactly. The argument lies in the wisdom of the means, does it not?

Mr. OLDS. May I answer your question?

Representative CURTIS. Let me ask you that one thing. I want to pin you down.

Mr. OLDS. As far as the President's Economic Report is concerned, there are no recommendations in it whatsoever that apply to power.

You can look at the list of recommendations. I have them here as they have been mimeographed by somebody.

Representative CURTIS. I think one of the basic recommendations lies in this relationship of the Federal Government's position, the local and State governments' position, and the position of private enterprise, and therein lies the solution as to how we think maybe we can get more ample supplies of low-cost electricity and also provide for defense.

Now, you disagree with the means and the wisdom of it, which is perfectly all right. But if we will confine ourselves to that, then I can go on to a discussion of some of the suggestions here.

Mr. OLDS. I just want to point out that as far as the recommendations of the report are concerned, they do not concern themselves with power.

Representative CURTIS. Possibly not in so many words, but there is no question that you derived the proper meaning because you yourself have said the Economic Report "apparently takes some pride in the administration's reversal of the power policy of the last 25 years."

Now, if it does not say anything about it, how could you yourself conclude that there is a reversal of policy?

Mr. OLDS. I had to read between the lines in the report. The report talks about a change in partnership without mentioning the fact that that applies specifically to power.

Representative CURTIS. Well, it applies to many things, and power is one of them. Because it applies to a great many things that have been going on and that, too, is a reversal of policy, I might state.

But let us go on, if we may, to some of the specific points that you bring out. In the next paragraph you state:

> The report fails to recognize that the electric power field is one in which the proved shortsightedness of private monopoly can result in seriously retarding the vigorous economic growth which the report offers as the best way to avoid recessions.

Now, throughout there you have made statements like that. Now, where do you feel that there has been a proved shortsightedness? Who proved it and to whom was it proved?

Mr. OLDS. I am glad you raised the question. The shortness of the statement prevented me from introducing into the statement the proof. I am going to state at least two instances of proof.

In the first place, when the Federal Government, when the Congress was considering the legislation which created the TVA——

Representative CURTIS. That was back in——

Mr. OLDS. 1933.

Representative CURTIS. You mean what finally culminated?

Mr. OLDS. The final discussion. Witnesses appeared on behalf of the Commonwealth and Southern System, which was the system of operating companies down in the States of Tennessee, Alabama, Georgia, and Mississippi——

Representative CURTIS. May we get one thing straight: There was no power provision in the original TVA Act; am I right?

Mr. OLDS. No, sir; I am afraid you are not correct. One of the main purposes of the TVA Act was to provide a basis for the development of hydroelectric resources of the Tennessee Basin, and there are very definite provisions in the act for marketing that power in such a way as to encourage municipal and cooperative distribution of the power.

Representative CURTIS. My understanding was that it was originally to control navigation on a navigable stream and the power was incidental; is that right?

Mr. OLDS. Well, it was called incidental.

Representative CURTIS. That is what we are talking about. It was. Do not just say "called."

Mr. OLDS. The provisions of the TVA Act, the Norris bill, which became the TVA Act, was definitely pointed at the hydroelectric resources and its distribution under conditions which were designed to encourage general economic development in the basin.

Representative CURTIS. But was not the power aspect incidental to the flood control and the navigation features? That is the point, because after all the Federal Government—at that time the theory of constitutional law was based on that.

Mr. OLDS. There was a legal use of that phrase, but the fact is that the law was essentially to provide for the power development of that area.

Representative CURTIS. That is your interpretation.

Vice Chairman PATMAN. Mr. Curtis, would you pardon me just for a brief reference? I might help you on that.

Representative Alman from Alabama was here when I came to Congress in 1928, when I was elected to Congress, and he was working on the Muscle Shoals project and had been for a number of years. That was the beginning of TVA, and a few years preceding that Thomas Edison and Henry Ford and two of the tire manufacturers were on a trip and they went by Muscle Shoals. There is where Henry Ford gave out that statement that is still quoted about the Government should issue noninterest-bearing bonds and develop the electric there and pay it off in the manner that I suggested this morning about the payment of these road bonds. So I think you will find that it started with Muscle Shoals and electricity was one of the main things.

Representative CURTIS. I think that is a very basic source of disagreement in the beginning, but for the sake of Mr. Olds' statement I will grant him that he believes that. I disagree with you. But he certainly can go ahead with his belief. I go along with him. I figure it was incidental and it had to be incidental or there would have been no authority.

Mr. OLDS. I suggest, Mr. Congressman, that you read the debates in Congress at the time the bill was under consideration.

Representative CURTIS. I have, sir. We have both studied it and we disagree. I hope we are both honest people and can have disagreements.

Mr. OLDS. At least the representatives of the power companies there interpreted the bill as proposing to develop the power resources of the Tennessee Basin and in so interpreting it they took the position that that power would not be needed in the Tennessee Valley area.

Mr. Yates, who is now president of the Southern Co. and a partner of the Dixon-Yates contract which some of us have heard about in testifying before the House Military Affairs Committee on the TVA bill, took the position that there was no need for the power development in the Tennessee River as was proposed in the bill.

Representative CURTIS. Wait a second. If we are going to go back to 1934 I am not so much interested in the history. I thought your statement that I was calling to your attention had something to do with present times, not perhaps 1934. The electric-power field was one in which the proved shortsightedness of private monopoly can result—you are referring back to 1934.

Is there anything within the past 10 years that you feel indicates shortsightedness on the part, and, of course, you use the term "private monopoly" throughout your statement as an epithet rather than as a descriptive term, I am afraid. But you mean the private-power companies.

Mr. OLDS. Which are recognized under the law in general as natural monopolies in their fields of distribution.

Representative CURTIS. Natural monopolies developed and operated under the control of the public service commissions of the various States, and in a certain respect there is a type of competition because there are so many of them there in the broad field of private power, many, many different operations under different controls, although in a given area they are, of course, not competing. But referring to the past 10 years, do you feel that our present power companies have had shortsightedness, in view of the figures I have heard here where 86 percent of the power in this country comes from private concerns, and only 14 percent from Government?

Mr. OLDS. Only 14 percent from Federal Government.

Representative CURTIS. I beg your pardon.

Mr. OLDS. But the point I am emphasizing, Mr. Congressman, is the fact that the more important influence in the last 20 or 25 years in the power industry has been the influence of public competition.

Representative CURTIS. That is your feeling.

Mr. OLDS. Just in these terms that you are raising the question. If you will just let me finish my answer, I will try to illustrate.

I would like to point out the fact that although the power companies in the region where the TVA was coming into being indicated that there was no need for the power, the facts are that between 1933 and 1952, the period covered by the activities of the Tennessee Valley Authority, whereas the area served by the Tennessee Valley Authority experienced a growth of about 500 percent in the capacity to meet the power requirements——

Representative CURTIS. Just a moment. We are talking about trends and what happened. I might say to you to illustrate what I do not like in your comment, that on our farm up in Michigan, we had rural electrification in 1928 or 1929 from a private power company. It was just the beginning in those periods of the development of power in this country. Electricity had not been in this country too long, and certainly——

Mr. OLDS. Only since 1882.

Representative CURTIS. Well, that is not long. That is not long in these trends in development of the techniques, and so forth, of that industry. The automobile, I would say, is a very recent industry, and TV is a very recent industry, so in order to be fair in judging these things we have to recognize that there was a normal growth, a tremendous normal growth that was going to go on in that particular field regardless of how it was handled, whether it was private or public or a combination or what, and as students—and I hope we are students here—as students, what we would say would not be to take credit for all of the growth that occurred and say that that was because we did it this way. As students, we should think back if we had done it differently, would we have had the same amount of growth, would we have had more or would we have had less, and if you would discuss it from that standpoint, it would make a lot more sense to me.

Mr. OLDS. I was trying to.

Representative CURTIS. All right.

Mr. OLDS. I suggested that the growth as far as the Tennessee Valley area itself was concerned was 500 percent in that interval.

Representative CURTIS. What do you think it might have been had it been left to the resources of private enterprise and the States and local governments?

Mr. OLDS. The point I am trying to make is not associated with that particular 500 percent, but with the fact that in the 8 States adjoining the Tennessee Valley area the growth was 200 percent, as compared with a growth of 91 percent for the companies outside the influence of the Tennessee Valley Authority.

In other words, you have three growth figures, and I can give you a fourth one. A growth of 500 percent in the area served by the Tennessee Valley Authority. In the same period, a growth of 200 percent in the 8 States related in that general area.

Representative CURTIS. And the growth was what from the original beginning? That becomes important.

Mr. OLDS. I can put the figures in the record.

Representative CURTIS. You see, it has to be in relation to something. Did they both start from the same level?

Mr. OLDS. We are starting from a 100 percent level at the time TVA was created.

Representative CURTIS. In other words, there was the same amount of power in the Tennessee Valley as in the areas immediately outside?

Mr. OLDS. I am talking about rates of growth.

Representative CURTIS. I am, too, and I am talking about whether you start from 5 feet high or 4 feet high.

Mr. OLDS. You start from the level that the private power companies had brought that region to when that was created.

Representative CURTIS. Was that more or less developed at that time?

Mr. OLDS. About proportionately the same.

Representative CURTIS. What was this period of 500 percent growth?

Mr. OLDS. The period from 1933 to 1952, and in that same period——

Representative CURTIS. Is that measured in kilowatt-hours or what?

Mr. OLDS. That is measured in kilowatts of capacity for service. Then as I suggested, the private companies in the area surrounding the TVA had a 200 percent growth as against other private companies of the country having a 91 percent growth. In the New England States where rates were high and it was remote from the influence of TVA competition, the increase was about 75 percent.

Representative CURTIS. And also remote from the coal regions, too.

Mr. OLDS. Yes.

Representative CURTIS. And you would be willing to grant that, I think, 60 percent of TVA power today comes from coal; it has not anything to do with hydroelectric plants?

Mr. OLDS. That is right. New England, however, has abundant hydroelectric resources that because of the general opposition, the kind of development that went forward in the TVA did not occur in New England. There were no Federal hydroelectric projects built in the New England area.

Representative CURTIS. Do you think they lent themselves to the same type of thing?

Mr. OLDS. Yes. The studies made under my direction when I was at the Federal Power Commission indicate that they do lend themselves in certain instances to very excellent power development.

Representative CURTIS. Are there not people who disagree with your conclusions?

Mr. OLDS. I think that the New England Council and the power companies that are members of the New England Council have put forth different figures.

Representative CURTIS. Don't you think they are sincere men, Mr. Olds?

Mr. OLDS. I think they are sincere, but I think they are calculating their figures on a different basis from the calculations used for the purposes of developing the Tennessee Valley. I am citing the figures that the Federal Power Commission in its Bureau of Power, found to be the potentialities of the New England river basins.

Now, I would like to come closer to my own definite personal experience. I had the responsibility in 1939 and 1940 and down into 1941 under Secretary Ickes as Vice Chairman of the National Power Policy Committee for seeing that there was adequate power supply to meet the requirements of the war that was anticipated as a possibility.

Representative CURTIS. You anticipated World War II?

Mr. OLDS. There was an anticipation that we would need to have our defense capacities up to a maximum limit.

Representative CURTIS. When did Secretary Ickes start anticipating World War II?

Mr. OLDS. The Federal Power Commission even before I came to it, after its national power survey called the attention of the administration to the fact that if the world situation developed to the point where there was the threat of war or the possibility of war, the expansion of power capacity——

Representative CURTIS. What year are we talking about?

Mr. OLDS. I am talking about beginning about 1936 or 1937.

Representative CURTIS. That early?

Mr. OLDS. That early. As a result, the War Department, as it was then, before it became the Defense Department, began taking interest, because they were laying plans in terms of munitions production to assure adequate power supplies in case an emergency arose, and even before I came to the Federal Power Commission I was called down to participate in those studies as an adviser of a committee set up representing the different power agencies of the Government to work toward adequate power supply in case it was needed for defense.

Now, I can testify from my own experience to the fact that right down to 1940, the position taken by the private power companies would not have provided adequately for defense power supply.

Representative CURTIS. They did a pretty good job in World War II, though, did they not, the private power companies and local and State agencies did a pretty good job in World War II?

Mr. OLDS. They did a pretty good job after they were stimulated by rather extreme efforts on the part of those of us responsible in the administration for making sure that there were adequate power supplies for war.

Representative CURTIS. Do you mean by "threats" that you would take them over?

Mr. OLDS. No threats were necessary. It was only necessary to overcome their natural, we call it, conservatism, their natural unwillingness to build ahead of what they could immediately see ahead.

Representative CURTIS. They have built ahead, you will agree with that.

Mr. OLDS. The problem was to get them to order approximately the equivalent of 10 million kilowatts for installation over a 3-year period at the time Mr. Kellogg, who was president of the Edison Electric Institute and the power man down here for the power industry during those years, was taking the position that the utiilties had made adequate provision for power to meet any war emergency. Actually, that was not the case.

Representative CURTIS. That was in 1936?

Mr. OLDS. That was in 1940 and 1941. I can cite a statement.

Representative CURTIS. They felt that they had adequate facilities to take care of this increased load.

Vice Chairman PATMAN. Will the gentleman yield for an observation?

Representative CURTIS. Yes.

Vice Chairman PATMAN. We promised to let some of the members of the panel off at 5 o'clock, and it has gone beyond 5. The discussion is very interesting to me. May I suggest this, Mr. Curtis, if Mr. Olds would be willing to it, that you submit questions in writing to him to be answered in this record.

Would that suffice?

Representative CURTIS. I think it would be a very good idea and I do recognize I have been imposing on everyone's time. I have really got my main thesis across and I think we do agree, and that was this: Even though we might disagree on the details which is what we do, both you and I, and I hope everyone in this country, whether we are for public power, as it is so-called, or private power, we are equally interested in trying to get ample supplies of low-cost electricity in an expanding economy with provisions for defense and it is simply that I believe the techniques proposed by the President and this present administration in the long run are going to achieve that better than the techniques that have been used in the past, and there is plenty of room for honest disagreement and discussion.

Mr. OLDS. Plenty of room for honest disagreement, but I would not want to have your remarks leave in my replies the interpretation of the President's report as giving any consideration to the need for power in an expanding economy.

Representative CURTIS. Well, I do not think there is an American alive who does not recognize the need for power in this country, and so many statements have been made by the President and other people in this administration along this line that certainly, Mr. Olds, you have no monopoly on those feelings, and that deep concern, the only thing is, you think it has to be done the way you see it.

We think there is a better way of doing it.

Mr. OLDS. I would say this, Mr. Curtis. Assuming for the moment that each man has the right to choose which means he thinks would accomplish the end, a report on the national economy that practically ignores power, trends in power, throughout its pages, does not indicate a concern for power as an element in economic expansion.

Representative CURTIS. Well, then, I would suggest to you, sir, the recent Atomic Energy Act that was passed in the last Congress as a result of the President's message and his deep concern for power there, because that is a future source, and the amount of money we are spending on it and the attention that the administration has been devoting to it. This whole matter is a good issue for a 1956 campaign, and frankly, I would be very happy to draw it here right down the line. But do not ever worry about the private power people being willing to assume that that is the burden they are carrying.

Do not think we are trying to kid anybody by saying that that is not what we are for, because we are for it, and you, in turn, are for a different program. So let's argue it out, and see who wins.

Mr. OLDS. Mr. Chairman, in connection with your suggestion that I might be putting some additional material in the record——

Vice Chairman PATMAN. Yes, sir; may I say, Mr. Olds, that each one of you, the members of the panel, have the privilege of extending and expanding on your remarks to answer any question that you desire to answer or make any observation that you desire to make, and if you want to answer questions that were not asked directly of you, you are not only privileged to do so, but you are invited to do so.

Mr. OLDS. I wanted to be sure that I could comment on Mr. Aandahl's supplemental presentation. (See p. 814.)

Vice Chairman PATMAN. You are entitled to do that, and if Mr. Curtis wants to submit some questions to you, I am sure we would be glad to have you answer them for this record. For the committee, I want to express our appreciation for you gentlemen coming here and giving us the benefit of your views and your thinking. You are helpful to us. We appreciate it more than we can tell you.

We feel like, really, this is democracy. A lot of people say that it is a republic or a democracy, but, after all, it is a democracy and a republic, in my book, and this is a democracy where people from the outside not connected with Government can come in here and they at least get a good hearing and their views are considered and not only before this committee, but this testimony is gone over by you and by the members of this committee, after all of the corrections are made and the record is finished, it is printed at the Government Printing Office.

Not only will the members of this committee receive a copy, but all Members of the House and Senate will receive a copy, the 531. Not only that, but the different Government departments, not only in the United States, but all over the world, will receive a copy. Not only that, but the Government depositories and the libraries, between 600 and 1,000, they receive copies all over the United States. They are made available for sale at a low price by the Superintendent of

Documents at the Government Printing Office, so there is real distribution of the information that is received here by us and we feel like you make a really great contribution to the success of our country in coming here, and we appreciate it very much.

Senator Goldwater, would you like to say something?

Senator GOLDWATER. Only this, Mr. Chairman: I had quite a long list of questions to ask Mr. Olds myself. I intended to take over when Congressman Curtis quit, and I would like to have permission—in view of the fact that I think Mr. Olds will anticipate the questions—to submit written comments on his presentation this morning. If he cares to comment further on my remarks, he should have that opportunity.

(The following comments were received for the record:)

I would first like to comment on Mr. Olds' statement with a general observation or two. He continually, throughout his statement, refers to investor-owned electric companies as private monopoly. When referring to Government-owned electric utilities he calls them public competition. Mr. Olds knows, or should know, the situation is just the reverse. Monopoly means the power to fluctuate prices at will and restrain trade. Private utilities can do neither. Government utilities do both. Private utilities are controlled by public-regulating agencies but what public regulating agency has any say over Government utilities? Private utilities live under the threat of some form of Government competition and are always subject to competition from private industry which may at will provide its own generating capacity.

The general theme runs throughout Mr. Old's statement that only through Government competition or participation in the electric industry can we be assured of an adequate supply of low cost power. This is far from the fact. In the first place all electric power is cheap in comparison with other commodities and services we purchase. Secondly, the earnings of private utilities are regulated, which means their prices will always be kept well in line. In the third place the private utilities' planning and expansion programs are designed to keep them well ahead of demands upon them. This is true except in rare instances where some unusual load is located in their service area. No one could expect either Government or private utility to carry a million or two kilowatts in reserve so as to be available if the Government just happens to select its service area as the site of a new atomic plant or some other unexpected or unheard-of load. But the private companies have demonstrated by their actions they are ready and able to supply these requirements when such unusual loads are so located and they can supply the requirements as soon as the power consuming industry is ready.

Now, I would like to comment on several of Mr. Olds' statements in the order in which they appear. Mr. Olds refers to the President's power policy as one which would result in a power-short America with rising power costs and the slowing down of automation in industry, on the farm and in the home. He refers to Mr. Gadsby's statement of energy now required per man-hour in industry and predicts that this will increase materially, and so do I. Conversion from hand operation or from partial automation to full automation, however, does not occur overnight; it is a gradual process governed by experimental and development work. Increased uses on the farm and in the home do not occur overnight but are also dependent upon development of appliances and work savers and the promotion of use of these things. The utility companies have highly skilled men watching the trends of increased use in all of these various fields who plan the utilities' expansion program accordingly. It was this private initiative and not big Government paternalism that has made our country what it is today. Private utilities have no difficulty in financing or constructing additional facilities in advance of requirements. There is no reason for us to anticipate that they might run into future difficulties in this connection.

Mr. Olds states that reliance upon private power supply will result in underdevelopment of our hydro, hesitant development of low-cost atomic power, and slower processes in other fields which would restrict American living standards and jeopardize national security. Contrary to Mr. Olds' statement, the President, in his Economic Report for 1955, shows the tremendous increase in activity toward development of hydroelectric facilities on the partnership basis. Of course, there may be some slacking off in development of uneconomical hydro sites that public power enthusiasts hope to get the Government involved in. The utilities have organized into groups to work as partners with the Atomic Energy Commission in developing use of the atom for peaceful purposes. This will expedite work in this field. A sure way of having a slow or hesitant development program would be to maintain a Federal monopoly and depend upon the bureaucrats and uncertain Federal appropriations for this work. When Mr. Olds refers to national security is it his opinion that the Federal Government should construct tremendous power-generating stations and keep them on the shelf for some possible future needs in connection with national defense production? Such a program could be tremendously expensive and wasteful. The present program will keep well ahead of any reasonable foreseen requirements. Of course, if something else unheard and unthought of, such as the atomic-energy program, should come along requiring tremendous supplies of power, it would be necessary to build power-producing facilities along with the new development as was done in connection with atomic energy. In this changing world almost anything can happen, but to all of us, except the unrealistic, impractical dreamer, economics is still a factor. No private industry or government can economically afford to construct and keep idle unlimited facilities because of the fact that at some future time there is a remote possibility that such facilities might be needed during a national emergency. If the facilities are not kept idle they will be in other use and not available when required for this unexpected new defense load. During 1954 the utility industry was carrying 19.8 percent in reserve capacity. With the presently large integrated systems this is a reasonable and adequate margin.

Mr. Olds expresses the prospect of a power shortage in the Pacific Northwest and the Southeast. If those who give lip service to their anxiety over power shortages in those areas where the Government has preempted power supply would discontinue obstructing efforts by others to overcome the possibility of power shortage there would be no danger of it occurring. It is those who think that only the Government should take care of those situations and who fight and retard the efforts of others either through private initiative or the partnership arrangement who will be responsible for these shortages if they occur.

Mr. Olds quotes Westinghouse as an authority on the status of generating capacity on order. I can only tell Mr. Olds that Westinghouse builds the generators. The utilities are well aware of production schedules and of their needs, and schedule their equipment accordingly.

Mr. Olds speaks of the administration's reversal of the power policy of the last 25 years. I hope the power policy of the past 25 years is reversed, and it is high time for it, unless we want complete Government ownership of the electric industry. He refers to the fact that under the partnership arrangement the people would put up the nonreimbursable costs and non-Federal, mainly private interests, the reimbursable. This would leave the inference that the private industries were getting something for nothing. The people have always put up the nonreimbursable part of the investment, and under the partnership arrangement the Government's partner—private industry or some segment of State or local government—would have to put up their share of the cost, so it is no giveaway, as public power advocates would have us believe.

Mr. Olds' statement that public or cooperative competition has proved the most effective supplement to the otherwise largely ineffectual efforts to regulate utilities is an unwarranted and irresponsible slap at our public regulatory agencies. When Mr. Olds states that public power has stimulated neighboring private utilities to greater reductions in rates he apparently ignores the fact that electric rates have been coming down since power became an industry and that the decrease was as rapid prior to the advent of the New Deal power era as it has been since. Reduction in rates has been largely due to improvements in the technology of both producing and distributing power and to increases in use brought about by automation and appliances developed by private industry—not by Federal agencies.

Mr. Olds states that public and cooperative systems cannot hope to take full advantage of river basin or atomic power unless the Government takes a portion of the responsibility. No one has suggested that the Government should not assume a portion of the responsibility—that is the partnership arrangement. The main difference in thinking seems to be there are those who favor the partnership arrangement and those who want the Government to assume sole responsibility. Mr. Olds says that the partnership arrangement means that the people will get less power from water and nuclear power resources at higher costs. I would like to know how he assumes less power. Under the private-enterprise system the people will get all the power they need when they need it. This has been the industry's record, except of course for the additional time always required by any growing and expanding industry to get power to the more remote areas, which in this case was the farms. So far as costs are concerned the only difference between costs of power furnished by private companies and that furnished by Government is due to lower interest rates from the Treasury, tax-free bonds, and dodging taxes that private enterprise has to pay. One thing that public power advocates apparently fail to recognize is that when taxes are dodged it is not the Government, the State or municipality that is getting out of taxes, it is the individual, the business and industries using the power that dodge the taxes. And to me that is rank discrimination between classes of citizens.

Mr. Olds' reference to Tennessee and Washington exceeding the United States average in purchase of appliances for the year 1954 means nothing unless we know where we started from. A great many different things influence the purchase of appliances. For instance, in some sections of the country where there is an abundance of low-cost gas, you will naturally expect most of the water heating, cooking, and house heating to be done by gas. In colder sections of the country, people may want a type of cookstove that can be used for heating the kitchen and wouldn't supplant it with an electric stove if the electric rate were cut in half. Those two areas may have had a smaller saturation in electric appliances than the national average to begin with and that could be a very logical reason for their higher purchases in 1954. With the present low cost of electricity nationally I am convinced that the rate will have little influence on people getting and using an appliance if they want it. In generating and wholesaling power the Federal Government with all of the subsidies included can only beat the private electric companies' cost by a few mills per kilowatt-hour. With the average family it takes about 30 kilowatt-hours a month to run an electric refrigerator. Does anyone think that, with the Government saving 2 or 3 mills per kilowatt-hour, a family would be influenced for or against an electric refrigerator if they wanted it because of a small saving in rates? An electric washer requires about 4 kilowatt-hours a month, a coffeemaker requires about 7 kilowatt-hours a month, an electric blanket requires about 10 kilowatt-hours a month, and I could go on naming appliances. It is ridiculous to me for anyone to contend that a few mills difference in the cost of electricity is going to influence a family as to ownership of these appliances if they want them. About the only place electricity can begin to get expensive to the individual family today is if they want to use it for house heating. And the only sections where the ordinary family can afford to heat a house electrically is where Government is subsidizing their electric supply as it is doing in the TVA area.

Mr. Olds refers to the outstanding Federal contribution toward rural electrification and states that the Government assumes a partnership responsibility for assuring rural electric systems directly or indirectly low-cost wholesale power. I agree that the rural electrification program has been a tremendous success and has brought power to our farm communities much sooner than they would have otherwise gotten it. But the rural electrification program is a partnership arrangement whereby the Federal Government has loaned farm organizations money at a low-interest rate to help them provide their own power facilities. This is not Government monopoly. It is true partnership where the Government has made it possible for these citizens to construct their own rural systems when they probably could not have financed them through private investment firms. Through this partnership arrangement the Government also makes it possible for these systems to produce their own power if they are not able to obtain it from central stations at a reasonable cost, and this is perfectly proper. These systems have as much right to own their own generation as any other private power company. But because of the fact that the Government has been a partner and made it possible for these systems to be constructed puts no obligation on the Federal Government to get into the generating business as a Federal operation to supply them or anyone else with their wholesale power requirements. Besides that the few mills that a Government operation might save them in wholesale power rates is not going to make or break an REA. Some of the REA's paying the highest wholesale price for power are in the best financial condition, and some paying the lowest are in the poorest condition. There is no fixed pattern.

Mr. Olds refers to the hearings held by the Senate Judiciary Antimonopoly Subcommittee as showing that the new power policy would undermine cooperative enterprises. In my opinion this subcommittee's hearings are not at all conclusive. All you have to do is to examine the list and records of those who testified. The hearing was entirely one-sided with witnesses most of whom have a long record as proponents of public power.

Mr. Olds cites the Paley report, Westinghouse, and General Electric as to future industry expectations of power requirements and makes his own predictions for 1990. I will not dispute his 1990 prediction since neither of us will be here to determine who was right or wrong, but it is my best judgment that no matter what those requirements may be, private enterprise will be able and willing to meet them. If not, then I would look with more favor on the Government taking up the slack. But until such time as the Government is needed for this purpose our only sound policy is to rely upon the tried and proven free-enterprise system.

Mr. Olds quotes Representative Jensen in his statement during last year's atomic-energy bill debate and I want to reiterate Mr. Jensen's statement. Certainly "whoever controls power controls industry" but one thing is certain, as long as we rely upon free enterprise for our power supply it will never be under the control of one man or any small group of men. But the minute it goes under Federal control it will be under the control of one man or at best a small group of men. TVA is a good example today. That valley has become dependent largely upon the decisions of three men.

Mr. Olds makes six recommendations which he says should have been included in the Economic Report. It is interesting to note that in all of his recommendations the Federal Government plays the all-powerful predominant role. In other words his is a Government whole hog proposition. I wish to comment on his recommendations in order.

As to No. 1—I favor the development of all of our river-basins projects where the developments are necessary and desirable provided they are economically sound and local interests either State, county, municipal, or private, carry their share of the load in planning, constructing, operating, and financing them.

As to No. 2—I see no reason whatsoever why the Federal Government should develop the Niagara site when it has absolutely no connection with flood control or navigation—is entirely a power development—which private industry is ready and willing to build more expediently. Irrespective of who builds it, I have no illusions of it bringing down what Mr. Olds calls "restrictive high rates" in the Northeast region. In the first place it would hardly be a drop in the bucket when considering the power requirements of that region. If the rates there are high Mr. Olds must know it is due to an unfavorable fuel situation and higher construction costs due to climatic conditions.

As to No. 3—Why should the Federal Government build large-scale atomic powerplants and assume all that financial responsibility when they can use the assistance of private industry both from a standpoint of know-how and financing to get the job done.

I have no quarrel with Mr. Olds' recommendation No. 4. If small-scale atomic powerplants can be developed to assist cooperatives and small-community power systems in obtaining a more favorable power supply, I am all for it.

Mr. Olds wants to place TVA on a sound basis for continuing to assume utility responsibility for the power requirements of its distributors. I certainly agree with that, except I am afraid my definition and Mr. Olds' of "sound" are entirely different. There is no reason why the Government should continue to subsidize the power users in TVA's service area. TVA should be put on a sound basis. It should pay at least the prevailing interest rate to the Federal Treasury. It should pay taxes on the same basis that the private utility company has to pay. And financing, arrangements should be worked out whereby TVA and those dependent upon TVA power no longer have to look to the Federal Treasury. And last, TVA should be forced to include in its rate a sufficient amount of money to refund to the American people their investment in TVA, with interest, in a reasonable period of time.

Under No. 6—Mr. Olds wants Federal transmission facilities to assure public and cooperative systems first call on power generated at Federal projects. Here again Mr. Olds wants to establish two classes of citizens in this country. Although these natural resources and Government developments are supposed to belong to all the people, he wants the benefits to go only to those who are obtaining their power supply from some type of Government operation. I will fight for the right of the municipality or other Government power operation or the cooperatives to get its fair share of power produced at a Federal powerplant, but I do not favor putting the other 80 percent of our citizens who happen to get their power from a private utility company in a second-class category.

Mr. Olds refers to the sensitive response of the private power industry to fear of overbuilding in the face of business recession, tending to accentuate those recessions. I believe I have commented on this sufficiently when I say that plans of the industry, and its history, refute Mr. Olds' statement. Of course, the power companies have to take into consideration economics and cannot launch a large building program on their own just for the purpose of stimulating an economy. They will build what they need when needed to supply the requirements of their customers.

Mr. Olds refers to a statement that if all electric sales in the United States had been billed at TVA rates the consumers in the country would have saved over $2 billion in 1950—which money would be available for purchase of other things. I certainly disagree with this statement. In the first place, anybody with any knowledge of the power business knows that it costs more to do busines in some sections of the country than it does in others, depending upon fuel and other considerations. So the statement is ridiculous on the face of it. But if the Federal Government took over the power business and made TVA rates available over the entire United States thus saving the people some $2 billion on their power bill, they would not have this money available for spending on other commodities. They would have to pay out this money and probably a good deal more in taxes to support such a Federal power subsidy.

The remainder of Mr. Olds' statement does not warrant comment.

Under questioning by Congressman Curtis, Mr. Olds expressed his views on public-private power controversy to the effect that he was not against all private power. In other words, he thought there should be some private industry. I would like Mr. Olds to tell us what public-power developments he ever opposed and what private-power developments he ever supported if there was any question between public and private power involved. Even in his position as Chairman of the Federal Power Commission, which is our highest regulatory agency for the utility industry, supposedly an impartial one, it is my information that Mr. Olds spent a great deal of his time attempting to promote Government power operations of all types, and he has continued to do so since then. He must know that if all of his efforts in this connection are succesful it will be only a matter of a short time before we will have no privately operated power companies.

(Mr. Old's reply to Senator Goldwater's comments appears on p. 808.)

Senator GOLDWATER. Also in closing, I am glad that you recognize this as a republican form of government, because that responsibility is charged to the Federal Government in article 4 of the Constitution, and it does not mention "Democrat."

Vice Chairman PATMAN. Doesn't it say each State shall have a republican form of government, and I believe that the best creed that was ever gotten out was gotten out by a distinguished Republican. He was Speaker of the House of Representatives when I first came here. His name was William Tyler Page.

They offered a reward of $1,000 for the person who would put in 100 words the best and most acceptable creed, and William Tyler Page wrote that of exactly 100 words. He received the award of $1,000, and in that wonderful creed that goes all over the world, you will find the phrase "a democracy in a republic."

Without objection, we will recess until our next meeting, Tuesday, at room 318, Senate Office Building. We have as our panel a number of distinguished people.

(The extended statements of the panel are as follows:)

STATEMENT OF JOSEPH L. FISHER, ASSOCIATE DIRECTOR, RESOURCES FOR THE FUTURE, INC., WASHINGTON, D. C.

I have been asked to comment briefly on the proposals in the field of conservation of resources, as set forth in the January 1955 Economic Report of the President. More particularly, and along with other members of the panel, I have been asked to comment on the two questions: (1) What should be the Nation's public works policy in 1955, especially in the resources field; and (2) what part if any of the cost of construction and maintenance of resource facilities should be share by the Federal Government, and how should these costs be shared? I would like also to blend with my remarks concerning resources conservation and development a number of basic points regarding public works policies in general.

First, I would like to note the high quality of the report and compliment the Council of Economic Advisers and others who aided in preparing it for the emphasis upon economic growth. I hope that this attention to economic growth represents a continuing interest rather than a viewpoint stressed only at this particular time when the general business movement is upward and there seems to be no critical need for policies relating primarily to business-cycle movements—either those suitable for times of recession or those suitable for impending boom and possible collapse.

In my view, the long-run potentials for economic growth, and the policies and actions to realize those potentials, should be a principal subject for concern under the terms of the Employment Act in every Economic Report of the President. Shorter run fluctuations in business are likely to be much more manageable in an environment of steady, long-term economic growth, as the Council of Economic Advisers so well recognizes in this report. Furthermore, the distinction frequently made between economic growth and economic stability is largely a figment of imagination. It is somewhat analogous to the distinction between long- and short-run analysis in economics which is largely an analytical device for gaining understanding of the complicated movement of business. Actually there is a continuous and subtle blending of long- and short-run economic effects following upon new policies and actions. There is similar blending of stabilization and growth.

Economic decisions are always in the present even though the intended economic effects of those decisions may be months or years ahead. Even the decision not to decide, but to postpone, is a present decision. If we are to have a multiple-purpose dam, or a vastly improved interstate highway system, or large numbers of new and expanded school buildings by some date in the future, and that date may be 5 or 10 years ahead, decisions have to be taken in the present. Otherwise, the support which these and similar assets may provide to the total economy in the year 1960 or 1965 simply will not be present. Unless these considerations are kept to the forefront in our thinking, there is always the tendency to defer basic public and private investments in natural resources, highways, and the like. Fiscal or budget policies which make such expenditures the bondservant of short-run considerations, whether they are to create larger deficits or to reduce them, are not in the longer term public interest. In the end such policies will defeat the establishment and continued expansion of the very base of resources and facilities without which growth is severely handicapped and the business cycle becomes much harder to manage.

Therefore, in a general way, the Nation's public works policy in 1955 should be one of proceeding steadily and confidently with investment and investment decisions which will serve to expand basic public works and facilities in the interests of long-term growth. The budget outlook clearly is not so severe, nor the need for balance in conventional terms so impelling, as to indicate any less in spending for natural resources and other public works than the recent 1956 budget envisages. In my view, a good case can be made for somewhat higher expenditures in the resources field than the budget proposes. During the 5 years, 1951 to 1956, as estimated in the budget, the amount spent by the Federal Government for water resources development, to name the natural resource of greatest budget concern, has decreased by roughly 10 percent. Federal water resources expenditures as a percent of total Federal expenditures reached a high of 4.1 percent in 1938; according to the 1956 budget estimates they will be 1.9 percent. As a percent of GNP, estimated Federal water resources expenditures for 1956 are one-fifth to one-quarter less than in 1951. It would seem that Federal Government spending for the development of water resources is not keeping pace either with other items in our Government and national economic accounts or with the opportunities and needs of the times. Yet the economic report states "of all our natural resources, none requires more immediate attention than water."

The way to reconcile emphasis on the need for water development with declining budget allocations is to offer convincing evidence that resources investment funds will be forthcoming from non-Federal sources. This brings up the "partnership" concept. This approach has a genuine appeal. I think it to be excellent and in its general form I endorse it highly. It strikes a good note and one which most Americans will applaud. However, I believe the general idea needs to be thought through more carefully, if it is to be made to work effectively. The biggest single difficulty, as I see it, is to enlist the responsible cooperation of States, localities, and private groups. This means financial responsibility and participation as the acid and final test of genuine partnership. If the partnership idea is to amount to more than it has in the past, if it is to be a genuine thing, then both local and State governments, and in some instances private groups, must participate substantially in investment and repayment.

The 1956 budget proposes $20 million in Federal expenditures for partnership projects under the Corps of Engineers and the Bureau of Reclamation. I hope the amount may be enlarged in future years. It would be advisable to follow the working out of these initial partnership projects with an eye to revealing the strong and weak points and finding out what really can make the idea work. I think it is important not to oversell the partnership idea lest the day come when people realize that more has been held out under the attractive label of partnership than can be delivered. Particularly, I think the Federal Government will have to act sternly in refusing Federal participation except upon terms which require significant State, local, or other participation. There will have to be a tougher resistance to political pressures, in which public agencies and private pressure groups sometimes combine, than has been characteristic of the past. The will of people to raise money at the State and local levels will have to be strengthened, as well as their desire to see through the long repayment periods which may be involved. The partnership program is a hopeful one, it deserves to be nourished and tended carefully; but proclaiming it does not necessarily make it work.

The exact amounts or proportions of the cost of various resource projects which ought to be borne by the Federal Government cannot be set out in doctrinaire fashion. Yet certain general rules would have to be followed so that various State and local governments and private groups would have a feeling of confidence in the program and be able to count on the Federal Government's dealing with them all in similar fashion. This means that suitable criteria have to be worked out to cover the degree of local participation, or its range, for the different categories of projects and programs. Some flexibility would seem to be desirable here so that rules can be tempered to unique situations in such a way that work can get done. The Government has had a good deal of experience in setting up standards for Federal patricipation. For example, the agricultural conservation payment program has long faced the problem of how much aid in various forms to supply farmers so as to encourage and stimulate them to do conservation work on their own.

The resolution of these and related problems lies in large part in the fields of public organization and finance, since if the States and localities are to become partners with the Federal Government they must have the sources from which additional funds can be raised, as well as the will to do it. The Council correctly recomemnds that outmoded State tax rate and debt limits be relaxed.

The possibilities for interstate or regional development corporations for resources development might well be explored. Ways might be found for the chartering of such corporations with power to issue mortgage or revenue bonds and which could also reecive appropriations from State, local, and Federal Governments. An extension of this idea would encourage private participation for certain phases of multiple purpose projects such as electric power production and distribution. I do not think we have begun to exhaust our organizational and administrative resourcefulness along this line. An important consideration is that any development corporation operate over a sufficiently wide geographical area and span of resources so that a truly balanced and integrated development may be achieved.

At another place in the Economic Report the proposal is made that advance planning loans to States and localities should be enlarged and made permanent on a revolving fund basis. This is all to the good and I hope it will be done forthwith. I would suggest careful study be given to an extension of the advance planning approach to embody the idea of planning for total readiness for antirecession public-works activities. Such a readiness would recognize that even with plans and specifications all prepared, there would still be many roadblocks in the way of actually spending money for antirecession public works. Financial arrangements between Federal, State, and local governments would have to be arranged. Appropriations would have to be made, construction organizations perfected, and decisions as to precise time, place, and type of project reached. I would propose careful consideration of an antirecession fund, established by Congress, and with its use limited by Congress to authorized projects. Congress might limit the fund as to total amount, and specify general criteria which should trigger its actual use. It might also lay down general rules regarding the geographical distribution of the spending. The establishment of such a fund would place in the hands of the President the authority to engage in antirecession public-works spending in speedy and timely fashion, but with appropriate safeguards and general directives laid down by the Congress. I am not so much proposing the establishment of such a fund as I am proposing that it be examined with greatest care looking toward the advisability of recommendation at a later date. This is not a new idea, but it is a good one which so far as I know has never been adequately investigated. Perhaps the chief value of such a study would be to point out the severe limitations of antirecession public-works because of timing difficulties. The study should specify the kinds of projects which lend themselves to antirecession use, as well as those that do not. It should also analyze realistically the possible arrangements for sharing the financing among several levels of government.

Finally, I wish to add a point which I think of major importance and which appears to be overlooked in the few paragraphs in the Economic Report which relate to resources development. That is the need for some partnership arrangement, not by which particular projects get parceled out and built by this or that level of government or privately, but by means of which the planning for development of natural resources in the large areas of the country can be done in a cooperative and comprehensive way. Surely this goal cannot be achieved if miscellaneous private companies, localities, and even States, acting separately, pick off such projects as suit their interests and leave the scraps for the National Government. A general guiding plan, or at least a set of development objectives and procedures, is needed. This is especially true in the water and related land development in the large river basins which usually include several States. Such planning should not be in detail, but should block out the main development potentials, consider the several feasible types of development, appraising the benefits and costs of each, provide for wide public consideration, and in short make possible the emergence of general approaches and plans of development which will not permit any particular private concern or public body to undertake a project which will foreclose other projects more clearly in the long run and general interest. I do not feel that this kind of planning should be objectionable It makes sense. If done with care that all concerned have their say, it can provide for a river basin a general framework or skeleton within which the several private and public organizations can more intelligently choose their projects and relate them one to another.

In my opinion we should look beyond the TVA or the interagency river-basin committees to find new patterns for cooperative planning of this character. Which group actually builds and owns a particular structure seems to me of far less importance to the nation than that our river valleys are developed intelligently, comprehensively, and economically. During these few years we are committing ourselves to the structures and programs which will fix the general character of river-basin development in this country for perhaps a century or longer, just as the location of our main railroads in the 19th century set a pattern of location of people and industry which continues to this day. Cooperative planning of the type I have suggested, it seems to me, is the way to assure an intelligent arrangement of investments by public and private bodies and that the long-range national interest will be enhanced.

Statement of Leland Olds

ECONOMIC REPORT OF THE PRESIDENT FAILS TO RECOGNIZE IMPORTANCE OF ELECTRIC POWER TO THE ECONOMY

The Economic Report of the President is completely lacking in recommendations with regard to electric power or recognition of the part played by ample supplies of low-cost electricity in an expanding economy with provisions for defense.

The report fails to recognize that the electric-power field is one in which the proved shortsightedness of private monopoly can result in seriously retarding the vigorous economic growth which the report offers as the best way to avoid recessions.

The President's power policy if carried out in terms suggested by his report, would result in a power-short America measured by the requirements of an expanding economy, which will call for supplies of electricity multiplying at least 3 times over within 15 years and 10 times over by the beginning of the last decade of this electric-power century. It would result in an America hampered by rising power costs. It would mean a slowing down of automation in industry, on the farm, and in the home, which will enable us to couple rising living standards with reductions in the working week to 35, 30, and ultimately 25 hours.

And there is a direct tie between adequate power and employment because, as President Gadsby, of the Utah Power & Light Co., points out, electric energy now required per man-hour in industry is equivalent to 154 unseen workers under the direction of each visible worker, with the prospect that the number of invisible helpers will rise to 250 for each worker on the production line.

The President's power policy, as set forth in the Economic Report, by favoring private monopoly in the business of power supply, will result in underdevelopment of our hydro, hesitant development of low-cost atomic power, slower progress toward all-electric homes, cramped expansion of farm electrification, and a general restriction on improvement in American living standards.

In terms of national security, this may prove serious, for although the Office of Defense Mobilization and the Department of the Interior disagree on the adequacy of planned capacity to 1957, both agree that the prospect of power shortage in the Pacific Northwest and the Southeast is serious.

In this connection, we may note the effort of Westinghouse Electric Co. to spur timely orders for new generators. Westinghouse shows that although 9.3 million kilowatts of new generating capacity will be required for installation in 1956, only 5.1 million had been ordered as of September 21, 1954. According to their statement: "It is too late to furnish the 4.2 million kilowatt deficiency on a 30-month production schedule. Practically no commitments have been made for 1958 and 1959."

With what seems a careful avoidance of the mention of electric power, the Economic Report apparently takes some pride in the administration's reversal of the power policy of the last 25 years. Advocating expansion of investment in conserving and utilizing soil, water, mineral, and other resources, the President indicates that "to speed this process, the Federal Government has attempted to distinguish as clearly as possible the field of Federal enterprise from the field of private or local enterprise." He applies this to water resources by setting forth the administration's so-called partnership policy under which, broadly speaking, the people would put up the nonreimbursable investment and non-Federal interests, mainly private, the reimbursable.

This means in the main a shift of Federal partnership in the field of electric power from partnership with local community public or cooperative electric systems, to partnership with private monopoly. It will ultimately destroy the type of public or cooperative competition which has proved the most effective supplement to the otherwise largely ineffectual efforts to regulate utilities in the public interest.

The type of public or cooperative competition provided by Federal power legislation, including the Tennessee Valley Authority, Rural Electrification, Bonneville Power Administration, Reclamation, and Flood Control Acts, has stimulated neighboring private power companies to greater reductions in rates and greater expansion in business than has occurred where this influence is lacking.

The power policy set forth in the President's Economic Report purports to be based on the premise that power supply is a local responsibility. This is technologically inaccurate. Today low-cost power is power from integrated regional systems and, where the Federal Government abdicates responsibility, most public and cooperative systems are thrown upon the mercy of their private competitors or must depend on relatively high-cost, small local generating stations.

Except in rare instances, public and cooperative systems cannot hope to take full advantage of river basin or atomic power unless the Federal Government takes a portion of the responsibility for wholesale power supply. The shift in partnership described in the President's Report will mean that the people of the country will get less power from their water and nuclear power resources, at higher cost.

Table 1 and table 4 in the report suggest that the authors fail to be influenced by their own proof of the relationship between dynamic power policy and an expanding economy. Table 1 shows expansion of electric power production outdistancing all other growth factors between both 1939 and 1946 and the present.

Table 4 shows some rapidly growing commodities and services to illustrate the widening economic horizons of consumers, with the comment that "one of the marvels of our generation has been the growth of consumer capital." The significant fact is that 8 of the 15 rapidly growing commodities shown are electric appliances and a ninth involves electric freezing.

The influence of Federal power policy, as embodied in the TVA and the Bonneville Administration, in producing this result is apparent in the annual statistics of electric appliance sales, published in the January 1955 issue of Electrical Merchandising, a trade journal. These statistics show that in 1954 sales of electric appliances, the States of Tennessee and Washington exceeded the United States average per 1,000 residential customers for 10 of the 13 appliances covered. Both also equaled the national average in 2 of the 3 remaining appliances.

The administration should reread the subtitle under which this table appears. It reads: "Lessons from the Past and Guides to the Future."

The President's report stresses the importance of assisting new and small businesses, stating that our economy is strong and progressive because it contains, in addition to its 5 million farm enterprises, 4 million independent centers of business decision. My comment is that the Federal rural electrification program has probably been the outstanding Federal contribution to the strengthening of small business enterprise and that it is an integral part of the larger Federal power program, in which the Government assumes a partnership responsibility for assuring rural electric systems, directly or indirectly, low-cost wholesale power supply.

The report specifically claims credit for ending Federal power responsibility for power supply, which has played an important part in this boost to America's premier small businesses.

The President finds the history of our country and the Western World demonstrating "that economic progress depends fundamentally on the enterprise and initiative of millions of people seeking to better themselves." No clearer illustration of this could be cited than the economic progress of the country's farms which has come through the enterprise of millions of farmers in organizing and managing their nearly 1,000 rural electric cooperative systems, raising the percentage of electrified farms from 11 percent in 1936 to over 92 percent last year.

Yet the testimony before the Senate Judiciary Antimonopoly Subcommittee shows that the new power policy, set forth in the President's report, is making it possible for private power monopoly, which contended that area-wide rural electrification was not feasible, to undermine these very vital cooperative enterprises.

Low-cost electric power in abundance is an important key to an expanding economy. So said the Paley Commission. And the expansion in power demand is always exceeding private company expectations. So says Westinghouse. General Electric says industry expectations of 1 trillion kilowatt-hours in 1970 are now advanced to 1965, and the Paley Commission estimates of 1,400 billion in 1975 are advanced to 1970. GE says that the upward trend of total residential use will pass industrial use by 1973 and that prophets look for an overall requirement of 5 trillion kilowatt-hours in the year 2000. I predict it will be reached by 1990.

To meet this challenge of the electrical age, with all that it will require in hydro, conventional fuels and nuclear energy, will require expansion of Federal, State and local public, private, and cooperative generating capacity, all working together and all stimulating each other by the special brand of competition deriving from the freedom of all communities to choose whichever form of ownership best meets their needs. Without Federal participation in the wholesale field, making possible public and cooperative competition, private monopoly will dominate and will prove a restrictive influence on expansion. And we must not forget the wider implications, stated by Representative Jensen, of Iowa, in last year's atomic energy bill debate. Warning of possible Federal monopoly, in words even more applicable to private monopoly, Mr. Jensen said:

"Mr. Chairman, the man who controls the electric energy of any nation, especially in a nation that is dependent on electric energy as we, controls that nation. Any one of you Members of the House, or any other American could control America lock, stock, and barrel today if he or she had control of the electric energy of America. Let us not forget that."

The recommendations of the Economic Report should have included, as a part of the public works program: (1) The undertaking of new Federal multipurpose river-basin projects, including Federal development of power, in the Columbia, Colorado, Central Valley (Calif.), Missouri, Arkansas-White, Alabama-Coosa, Chattahoochee, Roanoke, Connecticut, Merrimac, St. John, and Kennebec River Basins; (2) assurance of public development of the Niagara-St. Lawrence power resources, under conditions that will bring down the restrictive high rates still prevailing in the northeastern region; (3) legislative and administrative action to initiate the immediate construction of large-scale Federal atomic powerplants in addition to licensed private construction; (4) active pressing of a cooperative program for development of economically feasible small-scale atomic powerplants adaptable to the needs of small community power systems; (5) placing of the TVA on a sound basis for continuing to assume utility responsibility for the power requirements of its distributors; and (6) provision for such Federal transmission facilities as prove necessary to assure public and cooperative systems first call on power generated at Federal projects.

We can interpret the contrasting power policies, one leaning toward private monopoly, the other toward public competition, including Federal investment in some generation and transmission, rather specifically in terms of immediate effects on employment.

In the first place, the sensitive response of the private power industry to fear of overbuilding in the face of business recession tends to accentuate those recessions, as well as to cramp later recovery when power supply becomes tight. Thus, the September 20, 1954, issue of Electrical World forecasts capital expenditures by all agencies for electric generating capacity falling from a high of $2,088 million in 1953 to an estimated $1,475 million in 1957, or by more than $600 million. Already by its January 24, 1955, issue this journal reports actual investment in generation for 1954 at less than the prediction of 4 months earlier and drops its 1955 estimates by nearly 10 percent. This recalls the Westinghouse figures for generators on order, to which I have already referred.

Such reductions in new investment have far-reaching effects on business and employment, as well as reducing the power supply available for future expansion. The Federal program I am recommending can help to remedy this situation.

In the second place, reductions in electric rates, due to an effective competitive power program, will mean hundreds of millions of dollars savings in electricity costs which will be available for consumer expenditures on such soft goods as textiles and shoes which need such a spur to absorb unemployed workers in a number of depressed areas. Figures prepared by the Federal Power Commission for a former Member of Congress in 1952 showed possible savings of over $2 billion in 1950 if all electric sales in the United States had been billed at rates prevailing in the TVA area. Of course, if all rates had been so reduced, the result would have been big boosts in sales of electricity and appliances, so that actually power revenues would not have been reduced by anything like this amount. In other words the savings would have been distributed among the soft goods and electrical appliance industries.

In the third place, if the expansion of power requirements is not cramped by the proposed change in Federal power policy, it will mean a tremendous boost in employment in the depressed coal-mining areas. The forecast for 1970, even assuming reasonable expansion in hydro capacity and atomic power, will require approximately double the 117 million tons burned to produce coal's share of electric generation in 1954. This assumes coal continuing to provide 65 percent of the total thermal generation, although as the last half of the century unfolds, the share carried by oil and gas is due to decrease. With the requirements for cement mills, the steel industry, the coke, gas, and chemical industry, rail transportation, other industries and retail sales, this would call for bituminous coal production in excess of the present Bureau of Mines' estimates of full-time production of existing mines, with this year's work forces.

When the country reaches the 5 trillion kilowatt-hour mark suggested by General Electric, even with more than half of the electric energy produced by hydro or atomic power, the power industry alone is likely to call for from 5 to 8 times as much coal as was used for the generation of electricity in 1954, or considerably more than total production in that year.

These are samples of the effect of a dynamic power program in stimulating vigorous expansion in the availability of low-cost electric energy. With such a program, a factor of prime importance in the expansion of the economy, maintenance of full employment, rising living standards and increasing leisure, which should characterize the progress of American civilization, will be assured.

58422—55——52

(The following statement was received for the record from Mr. Olds:)

COMMENT ON THE STATEMENT OF SENATOR GOLDWATER COMMENTING ON MY STATEMENT WITH REGARD TO THE TREATMENT OF ELECTRIC POWER IN THE PRESIDENT'S ECONOMIC REPORT

I am glad to find Senator Goldwater accepting my thesis that one of the limitations on monopoly in the power business is competition or the threat of competition. His statement that private utilities "are always subject to competition from private industry which may at will provide its own generating capacity" is particularly significant. The corresponding competition, protecting small residential, farm, and commercial consumers against the exactions of private monopoly, is found in the opportunity to use their municipalities or cooperatives to provide their power supply. The availability of power supply from Federal projects, under the preference provisions established by Congress, has proved an important factor in maintaining the same competitive right for small consumers that Senator Goldwater acknowledges are available to large industries.

This brings me directly to the point of difference between the point of view which Senator Goldwater is expounding and that set forth in my statement to the Joint Committee on the Economic Report. It involves the question whether public utility regulation, unsupported by actual or potential public competition, provides an effective check on the evils of monopoly in one of our most vital public service industries. It may be noted that the private power companies over the years have sought to use regulation as a protective front against public competition, while at the same time using every device to render it impotent. Thus, nearly 20 years ago, the Federal Trade Commission, in its "Summary Report on Utility Corporations, No. 73-A," said:

"An important part of the industry's propaganda against municipal or Government ownership has been a sedulous cultivation of the idea in the public mind that the existing regulatory mechanism was both sufficient and efficient as a middle course between the two extremes of private and public monopoly" (p. 1).

Later, summarizing the results of its exhaustive investigation, extending over a number of years, this same Commission said:

"From the foregoing it appears that comparatively few States have adopted any thoroughgoing policy or system of utility regulation. Those which have done so have encountered insuperable difficulties growing out of constitutional limitations, economic developments, and the attitude of the industry and the courts" (Ibid., p. 28).

The fundamental weakness of regulation in dealing with what are termed natural monopolies is due to its static approach to determination of reasonable rates. It consists largely in determinations as to whether the profits on last year's limited business are more or less than a fair return on some rate base. Where there is no competition, regulation lacks cost standards as a basis for rates. In general it must assume that the actual costs shown on the books of the companies are reasonable and cannot base rate orders on the important fact that unit costs of electric service come down very rapidly when a dynamic sales policy causes rapid increase in average sales.

Leverett S. Lyon, when vice president of the Brookings Institution, stated the problem of regulation very clearly at a 1937 symposium of the American Society of Civil Engineers on power costs. Lyon attributed the introduction of the TVA "yardstick" policy to the lack of any satisfactory cost basis for fixing rates under regulation. After paying tribute to the competitive system as a means of assuring the lowest possible costs, he asserted that in the field of power, because it was a natural monopoly, the competitive method of price determination will not apply. He pointed out that since monopoly cannot be trusted to create prices in the public interest, social regulation of rates has been established in every State. He continued:

"Since the commissions which have been given this responsibility have no competitive tests, they have groped none too happily in an effort to relate costs to prices."

"It is the raising of such issues of costs as these," he concluded, "which has introduced the now much discussed 'yardstick' as a proposed method of determining what prices should be."

At the same meeting Prof. B. Alden Thresher, of the Massachusetts Institute of Technology, definitely related the direction taken in the broadening of Federal power policy to the inadequacy of regulation. He suggested that the accepted scheme of regulation in the United States is, by its very nature, static and ill-adapted to the economic and technical changes characteristic of the power industry. He said:

"It is more accurate, therefore, to regard the Federal power program, whatever its merits or defects, as a response to a long-standing maladjustment * * *. The machinery of State regulation is often said to have 'broken down.' More strictly speaking, it has always lagged behind the situation with which it strove to grapple * * *."

There is perhaps no more enlightening discussion of the issue which I raised in my statement on the President's Economic Report than that found in an editorial in the Electrical World, trade journal of the power industry, in the issue of June 25, 1943, in which the editor suggested that the electrical industry must substitute the concept of competition for the outlook of monopoly, if the opportunity of private enterprise in the business is to be preserved. He said:

"In a competitive business, there is the same eagerness to secure a fair return on invested capital, but the approach is different. Return in competitive business comes from expansion of sales—from volume. * * *

"In a competitive business one does not start with a rate that will produce a return and struggle to build business at that price. Just the opposite; one sets a goal and then finds out what price is necessary to reach that figure. The costs are adjusted to make the price bring a return on the estimated volume.

"*What is the difference? Just this, that growth under the monopolistic concept is necessarily slower than under the competitive concept. Rates in one case are protective of investment, while in the other, they are volume creative.* * * *" [Italic added.]

I have supplied the emphasis to bring out that the industry trade journal, more than 10 years ago, suggested the very basis for my criticism of the President's Economic Report, insofar as that report attempts to justify the reversal of the power policy of the last 25 years which Senator Goldwater welcomes. For, as the President's Water Resources Policy Commission said in its 1950 report, A Water Policy for the American People, this trade journal editorial "is a precise statement of the changes in management outlook which Federal power policy is designed to foster. It is not so much excessive profits as it is a short-sighted sales policy which is responsible for high electric rates" (p. 229).

As the editor of the trade journal suggests, it is high monopoly rates under regulation that retard growth and so result in shortages, not measured in demand actually exceeding supply but measured in failure of demand to realize the full possibilities of desirable economic expansion. New England power company experience is a good example. As I pointed out to Representative Curtis in the course of the panel discussion, while generating capacity of private power companies in the general TVA area increased by 200 percent, the corresponding growth for New England companies amounted to only 75 percent.

There are many examples of the effectiveness of public competition in bringing reductions in rates charged by privately owned utilities which regulation failed to accomplish. A simple illustration is found in Illinois where, with an active State public service commission, the residential bill for 250 kilowatt-hours a month use charged by the Central Illinois Light Co. rises in direct proportion to the distance of the area served from the Springfield area, where the private company competes with the Springfield municipally owned system. The Federal Power Commission's typical electric bills report for 1954 shows this private company charging $5.22 in the competitive Springfield area, $5.78 some 60 miles away in the Peoria area, and finally $7 some 100 miles beyond Peoria in the DeKalb area, all for the same service.

A similar illustration on a much broader scale, is found in a map of the United States, contained in the Federal Power Commission typical bills report, showing the average bills for 250 kilowatt-hours of residential use of electricity in the several States. In general, the map shows clearly that the bills become higher and higher as the distances from the influence of the TVA system in the Southeast and the Bonneville system in the Pacific Northwest increase. Thus, moving northeastward from the TVA, the bills are $4.92 in Tennessee, $6.47 in Kentucky, $7.23 in West Virginia, $7.34 in Pennsylvania, $7.81 in New York, and between $8 and $8.85 in all the New England States except Connecticut. Similarly, moving northwestward from the same starting point, the bills are $4.92 for Tennessee, $6.59 for Illinois, $7.97 for Iowa, $7.74 for Minnesota and $8.46 and $8.28 for South Dakota and North Dakota, respectively.

Maps issued by the Director of Information of the Tennessee Valley Authority tell the same story by showing for 1932 and 1952, in concentric areas surrounding the TVA area, the average typical bills for 100 kilowatt-hours monthly residential use of electricity. These maps show that before TVA, the level of rates decreased slightly from a high of $5.26 in Tennessee to $4.97 in the first band, $4.73 in the second band, $5.07 in the third, and then down to $4.90 in the fourth. After 20 years of TVA influence, the trend had been reversed so that, beginning with $2.50 in the TVA market area, the average rises to $3.24 in the first band, $3.61 in the second, $3.83 in the third, and $4.12 in the most remote band.

As a final illustration, I would call attention to the way in which an official plan for public competition supplemented regulation in New York, bringing about a reduction of rates in New York City which the public service commission of that State ordered but was restrained by the courts from enforcing. In 1933, the major company serving New York City was ordered to reduce rates by what was at that time the most effective regulatory body in the country. The company took the commission into the courts and early in 1935 won a decision reversing the commission's order. But, within about 2 months, the company "voluntarily" reduced its rates. The explanation is that, while the case was pending in the courts, the mayor of New York City, Fiorello LaGuardia, supported by the Federal administration in Washington, had come forward with a well-worked-out plan to construct a 100,000-kilowatt municipal yardstick plant and had shown what such a plant could charge. It may be noted that within a year the company boasted that the rate reduction had proved good business.

Similarly, upstate New York private power companies during the same period reduced their almost prohibitive charges for rural electric service, maintained under regulation, when the farmers in Seneca County launched a drive to establish a rural electric cooperative to bring electricity to their farms at reasonable rates.

This analysis, amplifying my statement that public and cooperative competition has proved the most effective supplement to the otherwise largely ineffectual efforts to regulate utilities, should be sufficient answer to Senator Goldwater's reference to that statement as "an unwarranted and irresponsible slap at our public regulatory agencies." In general, I have attempted to show that the ineffectiveness of regulation is inherent in the process rather than in human failure on the part of public-service commissioners, many of whom I have known and respected.

But, since he has raised the point, I must note that regulation is also rendered ineffectual through the influence of private power companies in politics, reaching to decisions as to appointments of members of the commissions and, shall I say, reappointments. I could cite a number of concrete illustrations involving different States, but believe Senator Goldwater would probably be more interested in an instance out of Arizona regulatory history.

It is generally recognized that one of the handicaps under which State regulatory bodies labor is lack of funds to maintain the technical staffs required to meet the batteries of experts mobilized by the companies in rate cases. This led Congress, when it rewrote the Federal Power Act in 1935, not only to provide for cooperation between the Federal Power Commission and State commissions where there was concurrent jurisdiction but also to authorize the Federal agency to loan experts to State commissions on a reimbursable basis.

During the administrations of Gov. Sidney P. Osborn, every effort was made to have the State of Arizona avail itself of this cooperation provided by Congress. In response to the adoption by the State legislature of a Senate memorial and the request of Governor Osborn, transmitted through Senators Hayden and McFarland and Representative Murdock, the Federal Power Commission made a power survey of the State. Then in January 1943 in his annual message Governor Osborn expressed the hope that the legislature would immediately enact the necessary appropriation to secure experts from the Federal Power Commission to assist the State commission in preparing a rate case.

The initial request for such assistance was made in February of that year, but it was not until October 1945 that the Arizona Legislature appropriated $50,000 for that purpose. The Federal Power Commission immediately announced it would make personnel available about January 1, but the whole matter was held up for a year by court action involving the appropriation, affording time in which, through changes in membership and otherwise, to alter the decision of the State commission to go forward with the plan. In December 1946, following final action of the United States Supreme Court denying certiorari in the main suit to block use of the appropriation, on the specific request of the Arizona

State commission, a Federal Power Commission staff expert went to Phoenix to confer on further steps, but one of the commissioners actively pushing an effective rate case was about to be replaced and the other was quickly placed in the minority, so that the Governor's program was never carried out.

It is significant, however, that quickly following the appropriation by the State legislature and the Federal Power Commission's announcement that it would make personnel available to the Arizona commission, on a reimbursable basis January 1, 1946, the Central Arizona Power & Light Co., largest utility in the State, announced on January 20, 1946, an electric rate reduction of $648,000, and on April 1, 1946, a gas rate reduction of $380,000.

Subsequently, the new majority of the State commission charged that our attempt to respond under the Federal Power Act to the successive requests of the legislature, the Governor, and the Public Service Commission of the State of Arizona represented an attempt to usurp State jurisdiction. But Governor Osborn had at least the satisfaction of knowing that the possibility of such investigation, like potential public competition, brought customers of Central Arizona Power & Light rate reductions amounting to more than $1 million annually.

Senator Goldwater apparently misses the point of my effort to relate power policy to economic growth, including progress of automation leading to higher living standards and more leisure. To make my point clear, I will refer to authoritative reports indicating that New England manufacturers have adjusted their operations to high electric rates by restricting their use of electricity. Now, as high use of electricity per man-hour means higher productivity, a better competitive position, and higher standards of living, the high-rate policies of New England power companies are restricting the expansion of both industry and power in the region. And, as I have shown in my original statement to the committee, the same applies to use of appliances in the region's homes. In other words, power shortage appears in New England, not as failure to meet peak loads but as failure to develop the peak loads which would be possible with lower electric rates.

Thus, the report on the New England economy, submitted to the President of the United States in 1951 by the Council of Economic Advisers, points out that "manufacturers in New England have responded to the higher level of rates by holding down consumption." It says further:

"In view of the higher rates and lower consumption per establishment, New England manufacturers have adapted their products and processes to minimize the importance of power costs. In this respect the high costs of power have been a restrictive influence limiting the range of industries in which New England can compete. * * * Any policies which could reduce energy costs significantly would tend to broaden New England's industrial opportunities."

Similarly, a 1952 report prepared for the Boston Federal Reserve Bank by Arthur D. Little, Inc., research-engineering-investigation firm, contains numerous references to the influence of high power costs on the region. Among other things, it points out that "lower power costs should correspond with an increase in productivity per man, and this, in turn, would lead to a higher standard of living."

With final reference to the influence of power policy on economic expansion, I will quote from the foreword of Resources for Freedom (vol. III), by the President's Materials Policy Commission. After emphasizing the strong interrelationships among energy resources, the Commission says:

"Equally important, it (the Commission) wishes to stress the basic importance of ample, low-cost energy, along with technology, as the foundation on which industrial growth is built and a prime essential in supporting national security."

I turn now to Senator Goldwater's apparent misunderstanding of my reference to the underdevelopment of our hydroelectric power which will result from the President's power policy hinted at in the economic report. What I am referring to is the technical fact that determination of the best possible development of given waterpower resources is in terms of assumptions, including the rate of return required. The effect of assuming a high rate of return is, in general, to reduce the size of the works which appear to offer the greatest economic justification.

In other words, privately financed projects tend to be smaller projects, with less storage and, consequently, less contribution to downstream power development. The administration-favored Idaho Power Co. substitute for the proposed Federal high Hells Canyon project is a case in point. If the Federal Power Commission finally licenses the power company substitute, the people will have lost forever some 400,000 kilowatts of hydroelectric capacity which the Federal project, as part of the Columbia Basin control plan, would provide. The Montana Power Co.'s selection of the Buffalo Rapids project in another part of the Columbia Basin is another case in point. Construction of this project would prevent future construction of the proposed larger Federal Paradise project.

In 1949, in replying to a request from Senator Saltonstall of Massachusetts, the Federal Power Commission explained the wide difference between its estimate of over 3 million kilowatts of undeveloped hydro in New England rivers and private company estimates of about 500,000 kilowatts as in part due to the different assumptions involved in planning public and private developments. Just in terms of fixed charges it is my understanding that the New England-New York Inter-Agency Committee, which will report this summer on the possibilities of resource development in the river basins of that region, figures that projects would be economically justified for public construction which, with private fixed charges, show only a 0.7 to 1.0 benefit-cost ratio.

Let us turn next to the conclusion which both Senator Goldwater and Assistant Secretary of Interior Aandahl would have drawn, that Federal abdication in the field of waterpower development has led to a tremendous increase in activity toward development of hydro under the President's partnership program. To correct the picture, I need only point out that the bulk of this activity is in the Pacific Northwest and that most of it involves no more than the staking out of claims, through applications to the Federal Power Commission for preliminary permits. As yet, there have been no new starts to meet the threatened power shortage in the region as there would have been if the orderly Federal program had proceeded.

Furthermore, the fact that public power agencies have filed declarations covering about half the capacity involved in this activity in the region is not due, as Secretary Aandahl implies, to a release of local desire to construct these very large projects, but to a determination to keep the sites from falling into the hands of private power monopoly.

The people of the Pacific Northwest, who are behind these public applications, would much prefer their construction by the Federal Government as parts of the comprehensive development of the entire basin. They are convinced that this would provide greater assurance of full economic development of the region. But they also know that five privately owned power companies have joined to form the Pacific Northwest Co., with openly avowed intent to take advantage of the President's new "partnership" policy. And they know that the charter of this new company is broad enough to enable it not only to develop Columbia Basin power but also to purchase or lease Federal hydroelectric projects and transmission systems. They have been placed in the position of having to act as best they can to ward off ultimate private monopoly control of the country's greatest power stream, with its potential of more than 30 million kilowatts if federally developed.

And at this point it should be remarked that Senator Goldwater confuses the partnership issue when he refers to the present administration's partnership arrangement as the alternative of Government assumption of full responsibility. Actually, the issue is between two kinds of partnership: The first, which Congress has consistently incorporated in all Federal power legislation since the Reclamation Act of 1906, makes the Federal Government, as one source of power supply from Federal projects, the partner of distributors of electricity, with a preference for communities that have chosen public or cooperative ownership of their power systems. The second—the new administration approach—would make the Federal Government, as constructor of water-resources projects involving potential hydroelectric power, partner with non-Federal agencies (mainly private) which would own the project power works and market the power.

Due to the very nature of the power industry, this would mean that power from the new partnership river basin projects would be available to communities exercising the very important American right to choose public or cooperative ownership only through the tollgates of private monopolies. And the whole history of the past generation indicates that this would immediately eliminate the competitive influence which has kept down the rates that such systems have had to pay private power companies for their power supply. This can be graphically illustrated by a map showing by States the average charge to rural electric cooperatives for purchased power.

If Senator Goldwater will examine the reports of the Federal Trade Commission, to which I have already referred, he will find that the organizers of the Insull-dominated drive to eliminate municipal electric competition in the

1920's sought to accomplish this, in part, by causing municipal electric systems to pay higher prices for power supply purchased from private power systems. This is why it is so important to recognize that the right of American communities to choose public or cooperative distribution of electricity includes the right to secure the approval of Congress for projects which will assure them low-cost wholesale power supply, without being accused of advocating Federal power monopoly.

This approach has been recognized as sound by conservationists from the very start of the movement and was embodied in the original Federal Water Power Act of 1920. The legislative history of this act shows that Congress deliberately accorded to the Federal Government itself the first right to develop any waterpower resource, followed by a second preference to States and municipalities. This accords naturally with the requirement that any project must be best adapted to a comprehensive plan for development of the river for all purposes. Thus the preference in connection with the marketing of power from Federal projects is carried into the very authorization of the projects themselves. It is a preference for public development.

In this connection I am glad to find Senator Goldwater endorsing the rural-electric program. And I am sure he recognizes how closely it is related to the Federal power program of which the TVA was the pioneer, and that the partnership which he sees in the REA program involves providing not only low-cost financing but also low-cost power, to assure the financial feasibility of areawide rural service. This is particularly true where the number of farms per mile of line is relatively low. In other words, both phases of the bona fide Federal partnership are necessary to get away from the cream-skimming rural-electric program of the private-power companies which inevitably leaves many farms without electricity and all the other elements of civilized living which it brings.

As already indicated, the very possibility of Federal power supply, as an alternative, has been invaluable to rural electric cooperatives in securing low-cost power from private systems.

In my comments so far I have tried to suggest some facts about the power industry which may help to clarify thinking on the basic issues raised by Senator Goldwater's comments on my original statement. There are a number of other points where he challenges my interpretation of figures and trends on which I should comment, very briefly.

Thus, the 19.8 percent margin of reserve power capacity, which Senator Goldwater and Assistant Secretary Aandahl both cite, reflects a period in which the Office of Defense Mobilization has been very generous to private power companies in providing them with what amounts to free capital through "quick amortization" tax savings, at the expense of the American people. The falling off in proposed new investment in additional generating capacity, to which I referred in my original statement, may well reflect a reductiton in this type of subsidy and could quickly reduce this reserve margin. In this connection, Senator Goldwater's suggestion that we wait until 1990, to determine whether private enterprise will meet the challenge of projected load growth, begs the questiton. For failure will be reflected in a slowing down of load growth and, consequently, of expansioen in the country's economy rather than in a last-minute enforced curtailment when supply fails to meet a jump in demand. We cannot afford to wait for this to happen.

Senator Goldwater minimizes generally the contributions which low-cost Federal power supply can make toward reductitons in electric rates and, specifically, the importance to ratepayers of public development of Niagara power. This actually serves to underscore the point which I am making, that it is the marketing of such power in accordance with the congressionally established policy of preference to public and cooperative electric systems, rather than the mere saving in generating costs, which assures the public lower electric rates. In other words, it is the competitive factor that is important.

This brings me to a final point. The American system of power supply has always been a mixed system, including both public and private, and more recently cooperative, conduct of the power business. The competitive influence of either actual or potential public ownership on a local basis has always been present. Thus, as far back as 1882, considered the birth year of central station electricity, there were already 4 publicly owned electric systems in existence in this country and the number of public systems increased by 1923 to more than 3,000.

A reading of the record of the Federal Trade Commission investigation of electric utilities reveals the extent to which private power companies, organized into the Insull-dominated National Electric Light Association, felt the pressure of this public competition and sought to eliminate it. Public power systems at Jamestown, N. Y., Cleveland, Ohio, Springfield, Ill., Hannibal, Mo., Kansas City, Kans., Rochester, Minn., Los Angeles, Calif., and Seattle and Tacoma, Wash., to mention a few, were already providing important rate and service yardsticks before the TVA started to do business. And the very successful Ontario Hydroelectric Power Commission, distributing through municipal systems and rural districts, just across the border in Canada, was proving a constant source of embarrassment, as well as a spur, to private power enterprise in the United States.

As the 1920's developed, however, the industry had reached a point where some Federal participation in providing wholesale power supply became necessary if this 100-percent American combination was to continue. It became necessary (1) because local public power had not proved adequate to stimulate areawide electrification of the Nation's farms and (2) because the industry had progressed technologically beyond the point where small, isolated generating stations were competitive. Furthermore, with the arrival of the 1930's, another need for Federal public power had developed, related to the Government's interest in large expansion of the production of electrometals and electrochemicals, coupled with its further interest in fostering competition in these fields. The larger entrance of the Federal Government into the power field was thus directly related to healthy expansion of the economy and the national security.

It is the American combination of public, private, and cooperative power, with the resulting specialized form of competition adapted to the nature of the industry, which has been responsible for the great progress of this country in the field of power and the contribution of the industry to our expanding economy.

This statement provides a general background for the recommendations in my original statement to the committee. It also serves as my comment on the supplemental statement of Assistant Secretary of the Interior Aandahl which made some of the points contained in Senator Goldwater's statement.

LELAND OLDS.

STATEMENT OF ROLAND R. RENNE, PRESIDENT OF MONTANA STATE COLLEGE

WATER RESOURCES

The President's report concludes that it is desirable to expand investment in facilities for conserving and bringing into economic usage, more of our sol, water, mineral, and other resources. I am in full agreement with this conclusion. The report also concludes that of all our natural resources, none requires more immediate attention than water, and effective conservation, control, and utilization of the Nation's water resources requires energetic implementing of sound policies. I can find no fault with this point.

The report then expresses full approval of the present partnership policy of the Government of developing water resources whereby State and local governments and private interests "are encouraged to provide all physical facilities they can, leaving for Federal execution only those parts of water-development projects which serve national purposes, or which because of great size, or complexity, are beyond the capability of others." The report argues that this approach will accelerate the development of water resources, but will not involve the Federal Government in huge expenditures for operations.

This statement of policy sounds perfectly logical and in principle is basically sound, yet its execution may very easily result in serious damage to the public welfare and to the ultimate growth and progress of our country. The first and probably most important question raised by this policy is whether private development or partnership development result in less than maximum use of a particular resource situation. In the case of water resources, good reservoir and dam sites are definitely limited. Moreover, the structures to be placed upon such sites are of a very permanent nature. Once construction is completed it is difficult and usually impossible to build onto the first structure, or to modify the original structure to any great extent. It is highly important, therefore, that the first structure be one which will make maximum utilization of the site and the water resource. The Nation cannot afford less than the maximum development and use of its water resources in the light of the limited number of good development sites available and the projected future population and demand.

Private development or partnership development in which the Federal Government is cast in a residual role of undertaking only those projects that State and local governments or private interests do not care to or cannot undertake, is certain to result in less than maximum development and use of water resources in many instances. Private interests are ordinarily concerned primarily with immediate needs and with only a part of the total services the water resources may be able to provide. The interests of State and local governments are frequently such that only a part of the total services are of major concern. The Federal Government is the only agency clothed with responsibility for, and concerned with, maximum development of the resource in the interests of the welfare of all the people. It cannot perform this function effectively in a residual capacity, but only in a leading role.

The second question raised by the partnership policy concerns fiscal policy of the Government. The desire to avoid heavy Federal expenditures and to achieve a balanced budget is understandable, but we should not abandon sound water resources development policy simply because traditional budget procedures may result in a bookkeeping deficit. Federal expenditures for construction of water-development projects should be distinguished from Federal expenditures of the usual operation type. Water resources development project outlays which expand the capacity of these resources to support the needs of a growing population, should be set up in an investment account as distinguished from the regular operating budget. Establishment of an Office of Coordinator of Public Works Planning within the Executive Office of the President, as recommended in the report, is highly desirable.

The Nation's public-works policy in 1955 insofar as water resources are concerned, should be one of expanding development over and above the rate in 1954 or 1953. Major multiple-purpose projects in strategic areas should receive careful consideration. Where only strictly local interests are concerned, private interests and local and State governments should be encouraged and assisted by technical and planning staffs of Federal agencies to undertake development. Most projects, however, which will achieve the maximum use of water resources for irrigation and reclamation, river and harbor improvement, and power development, will necessitate use of Federal funds.

In the case of conservation treatment of watershed lands, the head of the Federal agency responsible for the conservation treatment function should execute repayment contracts with organizations representing the primary beneficiaries. These contracts should provide for payment of an annual amount sufficient to cover that part of the annual operation and maintenance costs allocated to conservation treatment, the cost of replacements allocated to conservation treatment, and repayment without interest for a period of not more than 50 years, beginning the first year after the initiation of such conservation treatment of so much of the capital investment allocated to conservation treatment as the agency head annually determines after consideration of ability of the beneficiaries to pay in relation to their net income derived from the project or activity during the preceding year, and to current agriculture production and marketing conditions.

Where flood control services are provided by a given project, agreements should be executed with one or more States or local governments, to provide for payments sufficient to cover that part of the annual operation and maintenance costs allocated to flood control, the cost of replacements allocated to flood control, and repayment without interest and within 50 years, of the capital investment allocated to flood control to a degree corresponding with the production of primary benefits and secondary regional benefits. All remaining flood control costs should be borne by the United States.

Local contributions should be secured to reimburse the United States for any navigation benefits conferred specially upon local interests, otherwise, all navigation costs should be borne by the United States until and unless Congress prescribes a general reimbursement standard after further consideration of charges for transportation by all means, including transportation by water.

The investment of the Federal Government in irrigation projects should be recovered by the head of the responsible Federal agency executing contracts with organizations representing primary beneficiaries, such contracts to provide for payment of an annual amount sufficient to cover that part of the annual operation and maintenance costs allocated to irrigation, the cost of replacements allocated to irrigation, and repayment without interest for a period of not to exceed 50 years from the date of delivery of water for an irrigation area of so much of the capital investment allocated to irrigation as the agency head annually determines after consideration of the ability of the beneficiaries to pay in relation to their net income derived from the project or activity during the prior year, and to current agricultural production and marketing conditions. Similar repayment procedures should be worked out for drainage services.

STATEMENT OF PROF. WILLIAM L. C. WHEATON, UNIVERSITY OF PENNSYLVANIA

During the last 5 years we have built nearly 6 million homes in the United States, a record far above that of any previous 5-year period. Residential construction has averaged between $11 and $12 billions per year, accounting for over half of all private construction, and from 35 percent to 45 percent of all construction activity. This is a record of which we can feel proud, but with which we cannot be content.

While we have been building 1,200,000 homes a year we have not begun to meet our housing needs. Recent building has kept up with the needs for new family formation. It has not been high enough to permit replacement of substandard homes, variously estimated at from 7 to 15 million units. It has not been enough to replace units which are becoming substandard each year. It has not been enough to provide for adequate vacancies to permit reasonable choice in the market or to create competitive conditions.

I have estimated that we need to build 2 million units a year during the next 5 years, with larger amounts in future 5-year periods. By 1965–70 we should be building 2.4 million homes a year. If we were to build at these rates, we would still have 5 million American families living in substandard units in 1970. This study, which is available to members of the committee, also reproduces studies made by other organizations which place total housing requirements at levels substantially above those now being achieved.

These general levels of residential construction are also consistent with the growth of our economy. The proportion of our national product going into housing has declined in recent years to a level below the 1919–35 average. We could devote a slightly declining proportion of gross national product to residential construction and still meet the required construction volumes under circumstances of moderate growth. I submit that a healthy housing economy is not only a result of, but also a cause of, a healthy national economy. In this connection we need to define policies which will contribute to stability and growth. The Housing and Home Finance Agency has never engaged in any research program attempting to analyze the requirements for a stable building industry. Today it lacks the resources and the authority to do so. Its research program has been terminated.

Our present systems of governmental aid to housing have accounted for 40 percent to 50 percent of new residential construction. These are chiefly the FHA program of mortgage insurance and the VA loan-guaranty program. They have been backed up by important credit aids of the Home Loan Bank System and the Federal National Mortgage Association. These programs have cost the Federal Government substantially nothing. They have directly aided nearly half of all building, and indirectly aided probably two-thirds of all building.

If we look further into the housing market, we find that these programs chiefly aid those families who comprise the upper 40 percent of the income distribution. In some areas as many as half of the population appear to be able to afford new homes, but generally the picture is less favorable. Only about a third to two-fifths are really in the market. This fact is emphasized when we realize that only a quarter of eligible veterans have been able to take advantage of the very favorable credit terms offered them. I presume that millions of the remaining three-quarters would like to buy a house but cannot afford to do so.

My analysis suggests that the present volume of home building can be increased slightly with present credit conditions and assuming that we can maintain full employment and a steadily expanding economy. Any decline in incomes would sharply curtail the number of potential home purchasers and might result in a serious decline in building. The present market can be expanded particularly among Negroes who have been most seriously neglected. The next largest opportunity for expansion appears to be in the field of rental housing. A third important area is the rural nonfarm housing market, with farm housing and housing for the aged as other fields for action. These 5 might account for 200,000 units a year and permit construction of 1,400,000 units in good years, or roughly the 1950 level.

If we are to expand into these market areas, we will need some minor revisions of present legislation, a substantial expansion of the activities of the Home Loan Bank System, and of the Federal National Mortgage Association. The last two in particular may also be essential to a stabilization of residential construction volume and the flow of mortgage credit. So much for what we might call conventionally financed housing.

Beyond this we are confronted with a need on the part of families who have steady jobs, earn average wages, are sound risks, and are the backbone of America, but who cannot afford a new home. In Philadelphia the average family earns about $3,700. The home this family can afford must be priced at no more than about $7,400. The lowest priced home on the market today is a little under $10,000. This situation is fairly widespread. It means that Mr. Average American Citizen is not a new-home buyer. I suggest that we should be building about 200,000 to 400,000 homes a year for such families. In my opinion, this need should not be met by public housing but can be met through the normal private channels of home building and home mortgage lending, if we will make Federal credit available for mortgage loans at lower interest rates and for such families. I believe that safeguards can be developed to assure that such a program would not compete with private lending.

I appreciate that some may not look favorably upon this suggestion. On the other hand we are spending billions for highways, and hundreds of millions for other programs, and we are reported to be considering other types of public works expenditures. Housing for millions of American middle-income families constitutes the only completely self-liquidating public-works program that I know of. These families can pay for housing at interest rates that would cost the Government nothing. This is a subject that deserves most careful investigation before we consider other types of employment-creating activity.

Below these middle-income levels there are about 10 to 15 million families who cannot afford new housing and who now occupy substandard homes, who live in slums, urban or rural. Under the Housing Act of 1949 the Congress launched a program to provide public housing for these families through a combination of Federal and local subsidies. The families themselves can and do pay for about half of the housing cost; subsidies make up the balance. That program was well conceived. No better way of meeting this need has yet been devised. Until a better method has been devised we urgently need a resumption of the public-housing program, now substantially stopped. In my opinion it is factually inaccurate and morally deceptive to claim, as some have claimed, that private builders can meet low-income housing needs. They never have, they cannot today, and they will not in the foreseeable future. In any event I would urge a reactivation of the public-housing program as authorized in the 1949 act. This would permit construction of up to 200,000 units a year of public housing.

Finally, let me note that the Government is pushing ahead with the urban-redevelopment program to clear and rebuild slums. This program will shortly be stopped dead in its tracks if public housing is not provided to rehouse the displaced families. Rehabilitation poses the same problems. The present urban-redevelopment program has proven to be a workable and practical method for clearing slums. The size of the present program, however, is too small. We are not clearing slums as fast as they are being created. The program should be doubled in scale.

I would like to mention one other related subject briefly. Any housing development necessitates community facilities: streets, water, sewers, schools, playgrounds, community centers. American communities are hard pressed to supply these, as you know. A community facility public-works program is also our largest potential reservoir of employment-creating works in the event of critical unemployment. The Congress has long recognized this need in the authorization for a shelf of public works. The shelf exists today, but it is pitifully small. Its total size provides less than 3 months of employment at the current rate of public-works expenditures. We need a shelf of works which would provide for at least 2 years of employment at present levels. The local public-works reserve should be built up to about $20 billions, roughly 10 times the present level. We should also consider the feasibility of a Federal guaranty of local bonds to acquire in advance sites for community facilities.

In conclusion let me note that there are urgent needs for research in housing and community development not now being met at all. We desperately need some Federal leadership incentives for metropolitan city planning. We need much more vigorous coordination of Federal-housing and public-works activities. We need five major programs to sustain and expand housing production:

1. Improvement in present programs, particularly directed toward expanding the market among Negroes, for rental housing, and in rural nonfarm areas, and through larger and more stable secondary market and credit facilities.
2. A new program of aid to private housing for middle-income families.
3. A reactivated public-housing program.
4. A greatly enlarged urban-redevelopment program.
5. A greatly enlarged shelf of local community facility-type public works.

(Supplementary statement on statistical needs submitted by Mr. Wheaton is as follows:)

OUR STATISTICAL NEEDS IN THE HOUSING FIELD

Considering the importance of housing in our economy, we are woefully lacking in our statistical resources for evaluating our position, measuring our progress, and planning our future course of action.

Today our principal statistical tools are a census once every 10 years, rather imperfect annual statistics on household formation, and, at long last, quite adequate monthly information on the volume of new home building. We also have reasonably adequate data on activity in the mortgage market and are, of course, well supplied with figures on the activities of the Federal Government in the housing field—FHA, VA, FNMA, HLBB, PHA, URA, CFA. It is largely with this assortment of facts and figures that the builders, the lenders, the city officials, the market researchers, the Federal agencies, and the Congress must make their respective judgments about the current and the future housing situation.

The paucity of our statistical material in the housing field is due in part at least to the mistaken attitude of some businessmen and some legislators that statistics were not essential to the understanding of the housing situation, or for that matter any other segment of our economic life. This point of view was fostered in part by the desire to see Federal expenditures reduced by the elimination of dispensable functions and services.

Fortunately, there has been a marked shift in the businessmen's attitude about the essentiality of statistics during the past year. Powerful industry groups have gone on record as favoring an expansion of the Federal Government statistical program in the housing and construction fields. As a result, the President's budget for fiscal year 1956 calls for: a badly needed intercensal housing survey to update the 1950 census of housing, a survey of expenditure for residential maintenance and repair—the so-called fix-up market—vacancy data on a limited scale, an updating of the 1949 study of the size of builders' operations, and the procurement of information on the characteristics of recently completed homes.

If the entire program is approved by the Congress, it will shed badly needed light upon where we stand in the housing field. As far as meeting our basic requirements, however, the proposed program leaves many serious gaps. If industry and Government are to do an intelligent job in housing, we must have on a current basis data not only on new houses built, but also on the impact upon the supply of conversions and demolitions. In other words, we should know rather than guess what the net change in the housing inventory at least year by year, but preferably monthly or quarterly.

It is well known that housing demand is profoundly affected by the rate at which new families are being formed, as well as by the extent to which existing families shift from place to place. Today our figures on family formation, migration, and mobility are little more than rudimentary. While the Bureau of the Census issues annual figures on the number of households in existence, it cautions against attaching any statistical significance to the indicated annual increment. Good usable data on the annual volume of family and household formation are absolutely indispensable to an intelligent evaluation of the housing situation. Equally important are data that would illuminate the question of the magnitude of the demand generated by migration and mobility.

We need more adequate vacancy data than are to be provided in the proposed statistical program for 1956. We also need come facts on the prices at which both new and used houses are being sold. We need better data on building costs and on the profits and losses of builders. There is much to be done in developing the statistical base which would enable us better to understand the role of FHA and VA in the mortgage picture.

It would be hoping for too much to look for the adoption of a complete housing statistics program in the forthcoming fiscal year. It is important, however, that all who have an interest in the housing situation in this country keep it clearly in mind that the proposed statistical program for 1956 is just a beginning. We must ever broaden our horizons until we have illuminated the entire housing scene with the facts and figures that will show us without question what our goals should be and how rapidly we are moving toward them.

(The following is also made a part of Mr. Wheaton's statement:)

AMERICAN HOUSING NEEDS, 1955–70—A PRELIMINARY ESTIMATE—BY WILLIAM L. C. WHEATON, UNIVERSITY OF PENNSYLVANIA

ACKNOWLEDGMENTS

The author wishes to acknowledge the assistance provided by the Housing and Home Finance Agency, Office of the Administrator, Federal Housing Administration and Public Housing Administration; the Bureau of the Census, the 20th Century Fund, the American Federation of Labor, the Congress of Industrial Organizations, the National Association of Real Estate Boards, and the National Association of Home Builders in supplying data for this study. He is especially indebted to several of the directors of research of these organizations for critical comments and suggestions. The conclusions are, of course, those of the author.

Estimates of housing need have been prepared by a large number of organizations and individuals in recent years. During the debates which preceded the adoption of the Housing Act of 1949, leaders of the home-building industry or their spokesmen generally adopted the view that the sustained construction of more than 900,000 dwellings a year was impossible or in any event undesirable. A number of estimates in the range of 600,000–900,000 units per year were proposed to congressional committees considering housing policy.[1] The subsequent achievements of the industry in producing nearly twice the volume suggested by these leaders is evidence of the inadequacy of their estimates.

In 1944 the National Housing Agency estimated postwar housing needs at 1,200,000 units per year. This estimate, called fantastic by some business leaders at the time, has proved to be much closer to subsequently attained levels.[2] On the other hand, even this estimate appears to have understated the potentials of the economy, for it assumed that a very large share of the estimated needs could be met only by the replacement of existing housing. Later and higher estimates by the Housing and Home Finance Agency are based upon similar assumptions.[3]

Perhaps the dominent characteristic of these estimates is their pessimism concerning the economic future of the country. This was most succintly stated by 1 distinguished housing expert in a report prepared for an industry group which suggested that production levels of more than 900,000 units a year would be undesirable because they could not be sustained for more than a short period of time. This expert predicted that the construction of 1.5 million homes would produce immense and immediate instability.[4] These dire consequences have not appeared in the boom-building years 1950–53.

If business leaders and official agencies have underestimated our capacity to produce and consume housing, other estimates of higher requirements have failed to be realized. Thus the National Housing Conference and the American Federation of Labor estimates of the same period, calling for the construction of 1,800,000 units or more per year, assumed very high levels of replacement of existing units, and substantial programs of slum clearance and public housing.[5]

[5] Estimates by 14 organizations and persons are summarized in U. S. Congress, 80th Cong., 1st sess., hearings of the Joint Committee on Housing, September 10–19, 1947, pp. 49–55.

Although the Congress authorized these programs, the authorizations were subsequently reduced and have never been carried forward at the levels intended. It is now evident that all of these estimates have underestimated the market demand for new housing under conditions of full employment and high output, and have overestimated the willingness or capacity of the country to replace substandard housing through slum clearance and public housing programs.[6]

ASSUMPTIONS OF THIS STUDY

The major weaknesses of many earlier studies derive from the assumptions, stated and unstated, which underlay them. They have assumed a stable or declining national output while the postwar economy has been characterized by steadily rising employment and productivity. They were based upon population forecasts which have proved to be consistently below subsequent population growth. Estimates of family formation, too, have been substantially below ultimate levels. In their analysis of the housing market itself many of these studies have apparently underestimated the willingness of families to purchase homes, the influence of liberalized federally aided credit upon the market, and the vast extent of suburban building.

The assumptions upon which this study is based are:

1. Continued expansion of our economy, at a steady rate, full employment and continuing increases in productivity.
2. Expenditures for national defense no greater than those of 1953–54.
3. Continued high increases in population and family formation in keeping with a prosperous economy.
4. An active desire on the part of the American people for higher standards of living, including higher housing standards but not at the expense of other essential expenditures.
5. Extension and expansion of Federal and local aids to housing to assist in achieving these goals.

These assumptions will be adhered to in the estimates of this study. It is further assumed that housing will be utilized to the fullest extent possible to stabilize economic trends and to assure continued economic expansion, in short, that housing production will be maintained or increased in the event of marked downturns in economic activity.

FACTORS AFFECTING HOUSING REQUIREMENTS

Future housing requirements are a function of population growth, family formation, migration, losses of housing units, obsolescence and deterioration, undoubling of families, and vacancy and occupancy rates. These factors are influenced to a considerable extent by changing housing standards, changing market preferences, by general economic conditions, and by market demands in the light of available credit. The most important of the above-named factors are discussed in the following sections and are summarized in table 1.

Family formation

Estimates of family formation have been developed from marriage rates, less allowances for divorce, death, and other dissolutions. When so developed the estimates considerably understate housing requirements. While most, but not all, marriages result in additional requirements for separate housing accommodations, few dissolutions of families result in reduced housing requirements. The widow, widower, or divorced person with children will usually give up separate housing accommodations only under strong economic compulsion. An increasing number of aged persons appear to prefer to maintain separate accommodations after the death of the spouse, and this is particularly true where the accommodation is suited to the need of aged persons. Old-age and survivors insurance, private pension plans, aid for dependent children, and veterans' benefits for widows and orphans, are steadily raising the ability of these classes of families to maintain separate households.

TABLE 1.—*Factors affecting nonfarm housing requirements per decade* [1]

[Millions of dwellings]

RECURRING REQUIREMENTS PER DECADE

Units required for—	Low	Medium	High
Additional household formation	6.0	[2] 8.0	10.0
Internal migration of families	3.0	5.0	7.5
Replacement of annual losses	1.1	1.3	1.6
Replacement of dwellings becoming obsolete or substandard	2.8	3.8	4.8
Total recurrent	12.9	18.1	23.9

NONRECURRENT REQUIREMENTS

Units required for—	Low	Medium	High
Replacement of dwellings substandard in 1950	6.8	8.3	10.2
Undoubling of families doubled in 1950	1.0	1.2	1.5
Undoubling of single persons	.2	.8	1.2
Overcrowded families in 1950	.5	1.0	1.6
Adequate available vacancies, 1950	1.1	1.6	2.2
Total nonrecurrent	9.6	12.9	16.7

[1] See text for basis. Low may be low estimate or early in the 1955–65 period. High may be high estimate or late in 1955–70 period.
[2] United States Census Series P20, No. 42, 1952, high. The census low of 2.75 could arise only under conditions of disastrous economic depression.

Current estimates of future family formation range from as low as 275,000 per year for the remaining years of this decade to the 2 million per year estimate of the National Association of Home Builders for the later years of the next decade.[7] The marriage rate has fluctuated from under 1 million to over 2.2 million in the last 20 years. The range of net new social family formation shown is from 6 million to 10 million per decade. This does not include single person families which are discussed below in connection with undoubling. If these were to be included in the estimate, the high estimate should be increased.

Migration

The migration of people from one area to another may result in increased housing requirements where in-migration is not balanced by out-migration. Those moving into the country from other countries, and those moving from areas of stable or declining population to areas of rapidly growing population, create such needs.[8] From 25 to 30 million persons move annually, and about a third of these, 8 to 10 millions, move across county lines. There is a steady movement of persons into the country, and of the rural or farm population to urban areas. Of the 10 million persons who moved across county lines in 1950, 9 million were members of families who presumably created demands for about 3 million dwellings.[9] Since a considerable part of this movement is to urban communities in the South and West where it results in net in-migration, it must be presumed that at least between 10 and 25 percent of this movement creates new housing requirements.

Replacement of current losses

The National Housing Agency and the Housing and Home Finance Agency estimate that 40,000 homes are lost each year as a result of fire, windstorm, and other types of demolition. To these annual losses there is usually added 300,000 temporary war and veterans' units required to be removed during the current decade if only by their physical deterioration. Thus it is customary to estimate 70,000 units per year as current losses requiring replacement.

These estimates require radical revision if only in the light of current urban highway construction. A modern superhighway built through developed areas will require clearance of from 250 to as high as 1,000 homes per lineal mile. If each metropolitan area built only 1 mile each year, and if the demolition

[7] Cf. U. S. Census Series P20, No. 42, 1952; NAHB Correlator, February 1954, pp. 4, 5. The National Association of Real Estate Boards estimates these at 700,000 per year currently. Cf. address of Charles B. Shattuck, president, 46th annual convention, November 10, 1953.
[8] Cf. E. E. Ashley, Mobility and Migration as Factors in Housing Demand, Housing Research, October 1953.
[9] U. S. Census Series P20, No. 39, 1952.

requirements in the 5 largest cities were at the upper limit and all others at the lower limit suggested above, the total would exceed 40,000 homes per year.

In some of our largest cities, demolitions resulting from highway construction have greatly exceeded demolitions from all other causes throughout the postwar period. With urgent highway needs measured in tens of thousands of miles, and current Federal aid programs including approximately 30,000 miles, it is clear that losses from this source alone will be exceedingly high for the next 2 decades. For current purposes it is assumed that losses from all causes will be 1,100,000 per decade in the 1950's and 1,600,000 during the 1960's, equivalent to previous estimates of loss plus 1 mile per metropolitan area in the former period and 2 miles per area in the latter.

Other losses not accounted for here include abandonments and conversions to nonresidential use. One expert estimates that the latter alone exceed all extra units gained by conversion. One group of Government officials concerned with housing statistics has reached the tentative conclusion that 200,000 units are lost each year through demolition, abandonment, and conversion, and that 100,000 are gained each year through conversion, for a net loss of 100,000 units. This estimate accords with the estimate above.

Obsolescence and deterioration

More than 6 million of our present housing units were built before the beginning of this century, and will be 60 or more years old by the end of this decade. Many of these are now dilapidated and should be replaced immediately, but many of them are merely old, obsolete, and now deteriorating at a rate reflecting their age. Some 1,400,000 of these units, now standard but becoming 75 years of age or older by 1960, should be replaced during the next decade.

With our present housing stock of over 50 million homes, it will be necessary to replace 500,000 units per year in order to replace homes at 100 years of age. Many hundreds of thousands of fine old homes will doubtless continue to be well maintained, and will retain historical, architectural, and other qualities worth preserving. But the speculative homes of the Gothic period and millions of drab shacks built since 1900 lack these fine qualities. Their useful life as structures, and the useful life of the neighborhoods they comprise, will be long past at 60 years. Applying this standard would necessitate the replacement of 2.8 million homes during the 1960's and 4.8 million in the succeeding decade.[10]

Substandard housing in 1950

Housing standards are not fixed and invariable. A wide range of judgment is involved in determinations of substandardness. What is standard for a primitive economy (mud huts) will be substandard for a more advanced economy. Standards are therefore in part determined by resources. In a society of abundant resources and high output, standards should rise steadily. There is no apparent reason why all American families should not have good homes within the next generation. This was particularly apparent during the 1930's when idle labor and unused materials led to the adoption of Federal aids to housing. The Congress has subsequently adopted a national goal of a "decent home in a suitable living environment for every American family."

Table 2 reveals the most serious inadequacies of our housing supply in 1950. For many years official agencies have used the standards of structural soundness and lack of plumbing facilities as measures of substandardness. Opinion has varied as to whether farm or country homes which lacked running water should be considered substandard. Under the assumptions of this study, of a rising standard of housing, all dwellings, rural and urban, should have interior plumbing.

According to the most recent census of housing, 10 million nonfarm dwelling units were dilapidated or lacked running water. This number includes farm residences in standard metropolitan areas. In addition to these dilapidated or substandard structures, 1.9 million other units were located in blocks containing more than 50-percent substandard units. These units contain structural and plumbing deficiencies not sufficiently serious to be recorded by the census, but their environmental substandardness is clear. They would almost certainly be razed in any slum-clearance program.[11]

---

[10] The NAREB estimate of demolition requirements is 300,000-400,000 per year. Cf. Shattuck, op. cit.

[11] Slum-clearance projects to date involve clearance of 20 percent of standard units and 80 percent substandard units. The proportion in the blocks mentioned above is 28–72 percent.

4.9 million farm homes below par

Only 23 percent of our farm-housing units meet these urban standards. Thus by census criteria and urban standards, 4.9 million farm homes are substandard. The Department of Agriculture surveys of farm housing suggest, however, that by farm standards, only 3.4 million farm homes are substandard, 2 million of which contain serious deficiencies requiring replacement, the remaining 1.4 million being remediable.[12]

TABLE 2.—*Substandard dwellings requiring replacement or rehabilitation, 1950*

[In thousands]

	Substandard	Requiring replacement	Requiring rehabilitation
Urban housing:[1]			
Dilapidated	2,217	2,217	
Lacking plumbing or running water	4,721	2,725	1,996
In substandard blocks[2]	1,993	1,993	
Total urban	8,931	6,935	1,996
Rural nonfarm housing:[3]			
Dilapidated	1,131	1,131	
Lacking running water	1,841	614	1,227
Total rural nonfarm	2,972	1,745	1,227
Nonfarm total	11,903	8,680	3,223
Farm housing:[4]			
Serious deficiencies	2,024	1,524	[5](500)
Other deficiencies	1,405		1,405
Total farm	3,429	1,524	1,405
All housing	15,332	10,204	[5] 4,628

[1] All housing in standard metropolitan areas.
[2] Additional dwellings in blocks more than 50 percent substandard.
[3] Nonfarm dwellings outside standard metropolitan areas.
[4] Deficiencies based on U. S. Department of Agriculture data.
[5] 500,000 dwellings abandoned and not replaced.

Not all substandard dwellings need be demolished and replaced. A basically sound structure, lacking running water or a toilet, may be brought up to standard by relatively minor repairs and the installation of plumbing facilities if the structure is located in a sound neighborhood. On the other hand, where the structure is located in a slum, the installation of plumbing or heating facilities may be economically unsound. The rents required to finance the improvements may exceed the levels which renters are prepared to pay in slum areas. While precise data are lacking on the location and character of all housing units which are substandard because of plumbing deficiencies, data are available on 2.7 million urban units in substandard areas. It is reasonable to assume that these must be replaced. The remaining 1.9 million are in relatively scattered locations and may be brought up to standard. It is further assumed that two-thirds of the rural nonfarm units which are substandard because of plumbing deficiencies may be rehabilitated. One-third would then require replacement.

Of the 3.4 million substandard farm units, 2 million with serious deficiencies are beyond repair, but 0.5 million of these may be abandoned, leaving a 1.5 million replacement goal.[13] It is assumed that all of the remaining substandard units can be rehabilitated. Thus, of the 15.3 million substandard units in 1950, a total of 10.2 million must be replaced, 4.6 million must be rehabilitated, and 0.5 million abandoned.

Undoubling

In recent years the number of doubled-up families has been reduced steadily. Nevertheless over 1.7 million social families were still without separate housing

[12] This report draws upon tabulations of Census and Agriculture Department data prepared for a new edition of America's Needs and Resources, by J. Frederick Dewhurst and Associates, Twentieth Century Fund, to be published in fall, 1954.
[13] Census figures suggest 3.2 substandard farm units, of which 2.4 are dilapidated.

accommodations in 1950. An unknown proportion of the doubled families and single persons prefer to share housing accommodations with others for health or other reasons. For many, however, doubling up continues because of economic necessity or housing shortage. Under conditions of sustained prosperity and more adequate social security and old-age allowances, the number of doubled families should be reduced steadily. It may be assumed that under these conditions upwards of two-thirds of these families might prefer separate accommodations.

Single person families

In addition to these families, there were in 1950 some 10 million adult single persons not in families, of whom about one-third occupied separate households. This number may be expected to increase sharply with sustained prosperity. An important future influence upon single person families is the growing number of aged persons able to maintain separate accommodations. If one-tenth of these persons, those with incomes of over $3,500 per year, were to establish separate households a million additional housing units would be required. Thus the combined undoubling of families and single persons during the next decade might vary from 1.2 million (two-thirds of married doubled, no single) to 2.7 million (all married doubled and one-tenth of single).

Overcrowding

In 1950 over 6.6 million families (census households) were living in dwelling units which provided more than 1 person per room.[14] More than 2.5 million families were seriously overcrowded with more than 1.5 persons per room.

During the postwar years, several million young couples purchased small two-bedroom houses with floor areas far below those considered acceptable in prewar years. The continued high rate of births and the steady rise in the number of second, third, and fourth children born suggests that a larger proportion of these owners of too-small houses already are seriously overcrowded and that this number will increase.

Because of the overlap between families overcrowded and families living in substandard homes, only a quarter of the number of overcrowded homes are shown with other measures of need in the summary table. The range of estimates is from one-fourth of units containing more than 1.5 persons per room to one-fifth of units containing over 1 person per room. Under the assumptions of this study, a rising standard of housing should not require 5-person families to live in 2-bedroom homes. The estimates therefore leave three-fourths of the undoubling problem for future decades.

Vacancies

The number of vacancies required to permit freedom of choice in the market and to allow for mobility has been variously estimated at from 3 percent to 6 percent of supply. The number of available vacancies in recent years has been only about one-fourth of the nominally vacant units, a large proportion of which are dilapidated, seasonal, or not on the market. To achieve an available vacancy rate of 3 percent it might be necessary to have at least a total of 6 percent vacancies. A further consideration is raised by our annual volume of family movements, involving nearly 28 million persons including about 3 million families in 1950–51.[15]

PROGRAMING HOUSING NEEDS

The total housing requirements shown in table 1 suggest that we must build from 1.3 to 2.4 million units per year to meet our growing housing needs and must in addition replace accumulated deficiencies of the past of from 9 to 16 million units. Clearly all of these needs cannot be met at once, nor would it be economically wise to do so. Some of these needs tend to overlap, i. e., new family formation and undoubling, replacement of substandard houses and provision of homes for overcrowded families. Some orderly basis is required for estimating the changing volume of current housing requirements and for scheduling the replacement of existing substandard units. The first of these requirements will be served by the measure of household formation.

---

[14] U. S. Census, Housing Census, vol. I.
[15] A 5-percent rate is considered desirable by the realtors; cf. Shattuck, op. cit.

Household formation

Census projections of household formation involve circular reasoning to some extent since household formation is in some degree dependent upon the volume of residential construction and remodeling. Nevertheless census definitions of households have been sufficiently loose to reflect the improvised housing conditions which families desiring separate accommodations have adopted in the past. Thus the room or rooms with an electric hotplate and a shared bath, occupied by a man and wife, are a household to the census taker. These conditions reflect an active desire for separate dwelling accommodations whether or not that goal has been reached in some more refined sense. The census household thus reflects in part the housing shortage.

Household size has declined steadily for the last generation. The decline was approximately the same in periods of prosperity and depression as is shown in table 3. This decline in average household size reflects both the smaller size of families containing two or more persons, and the larger number of single person families who desire and can afford to maintain separate housing accommodations. It is a measure also of rising standards of housing space and privacy. Continued declines in household size would reflect continued increases in housing standards in this sense.

TABLE 3.—*Population and average household size, 1930–70*

Year	Population (millions) [1]	Average household size [2]
1930	122.7	4.01
1940	131.6	3.67
1950	151.6	3.39
1955	164.8	[3] 3.35
1960	174.4	[3] 3.1
1965	189.9	[3] 2.95
1970	204.4	[3] 2.80

[1] U. S. Census. Series P.—25 No. 78, 1953.
[2] U. S. Census. P-20 No. 41, 1952; and P-20 No. 35, 1951.
[3] Straight line projection of 1930–50.

The total future population of the United States is also shown in table 3. This is the most recent high estimate of the United States Bureau of the Census, and is thus consistent with assumptions of sustained prosperity. It should be noted that census estimates for the last 20 years have generally underestimated future population growth. Absolute and specific birthrates and marriage rates have been higher, and death rates have been lower than those used in even the so-called high projections. Under conditions of sustained economic growth, these estimates may well prove below actual growth.

Total population and average household size have been used to project housing requirements by 5-year periods from 1955 to 1970 in table 4. Using this method, it is first necessary to reduce the total population by the number of persons not in households. An arbitrary percentage, approximately that of 1950, has been used as a constant. A 20 percent increase in this constant would reduce annual construction requirements by 4 percent in 1960. The resulting population in households is divided by a straight-line projection of the 1930–50 trend in number of persons per household. The result is increased by 4 percent to allow for necessary vacancies.

The method suggests the number of housing units which will be required at different future dates and the annual volumes of construction required during successive 5-year periods to achieve this stock. The population used is total population, farm and nonfarm. The housing units shown as required would be necessary to accommodate future population growth, future reductions in family size, increases in the number of single persons desiring separate accommodations, and reductions in the number of nonfamily households. The measure accounts for the undoubling of families now doubled. Finally, as used here, the measure assumes the same rate of progress in the relation between population and housing that obtained during the last 20 years.

The table indicates that we will require approximately 1.43 million new units per year from 1955 to 1960, 1.65 million new units per year from 1960 to 1965, and 1.74 million new units per year from 1965 to 1970 to house our growing population adequately. It should be noted that this measure produces results which are below the medium estimates of need in table 1. The method is used, nevertheless, because it suggests time periods within which houses are needed.

TABLE 4.—*Estimated changes in population, household size, number of households and dwellings required, 1955–70*

	1955	1960	1965	1970
Population (millions)	164.8	174.4	189.9	204.4
Less population not in households [1]	4.9	5.2	5.7	6.1
Population in households (millions)	159.9	169.2	184.2	198.3
Average household size [2]	3.35	[3] 3.1	2.95	2.80
Number of households (millions)	47.70	54.58	62.44	70.82
Plus vacancies, 4 percent (millions)	1.90	2.18	2.50	2.83
Total dwellings required (millions)	49.60	56.76	64.94	73.65
Additional dwellings required during preceding period (millions)		7.16	8.28	8.71
Average annual construction required during preceding period [4]		1.43	1.65	1.74

[1] Assumed 3 percent.
[2] Table 3.
[3] A lower rate of reduction in average household size would be:

Average size	3.15	3.0	2.90
Number of households	53.71	61.40	68.38
Total dwellings	55.86	63.86	71.11
Additional dwellings	5.44	8.00	7.25
Annual construction	1.09	1.60	1.46

[4] See text for explanation of relationship between family and household size. These estimates include needs arising from new family formation, undoubling, required vacancies, changes in family size, and increases in number of persons or families using separate housing accommodations.

Replacement rates

In addition to these requirements for new population and new families, the Nation must replace the 10.2 million substandard units requiring replacement shown in table 2. If these units were to be replaced in the period 1955–65 we would have to build nearly 2.5 million homes in each of these years. This could not be accomplished in the immediate future without inflationary pressures, unless other construction drops seriously and unless there is a substantial drop in armament production. From a purely housing standpoint, it would be undesirable to attempt any such volume of replacement until new homes are available to accommodate those displaced from substandard homes.

For these reasons it would appear to be both economically and socially desirable to spread the replacement task over a 20-year period. If this were done, the volume of current construction would have to be increased steadily and rapidly, but within magnitudes which could be readily achieved by the building industry. Such a program would permit relocation to proceed in a more orderly and humane fashion, and would be more nearly in keeping with the capacity of our cities to plan for slum clearance and redevelopment.

Finally, if the replacement job is scheduled over a 20-year period, the annual volume of new building for replacement will be stabilized over a 30-year period. For by 1975, when the job of replacing our 1950 substandard homes is completed, we will have to continue replacement construction at the rate of 500,000 units per year merely to replace dwellings then becoming 70 years old. Indeed a stepup of replacement construction to a level of over 600,000 units per year would be necessary to cover the 1950–70 backlog of deteriorated dwellings during the succeeding 20 years.

TABLE 5.—*Additional dwellings needed, 1955–70*

[In millions]

	1955–60	1960–65	1965–70
For additional households and vacancies	1.43	1.65	1.74
For replacement of 1,900 substandard dwellings	.50	.50	.50
For annual losses	.10	.13	.16
Total additional construction requirements	2.03	2.28	2.40

Construction program

Requirements for additional residential construction for new household formation, and for replacement of units substandard in 1950, are set forth in table 5. Additional housing needs are those shown in table 4, ranging from 1.43 million in 1955–60 to 1.74 million in 1865–70. Replacement of the 10 million 1950 substandard units is spread over 20 years at 500,000 per year. To these must be added replacement of current losses here scheduled at 100,000 to 160,000 per year or somewhat below the estimates shown in table 1.

The resulting new construction requirements are 2.03 million per year for the period 1955–60, 2.28 million for the period 1960–65 and 2.40 million for 1965–70. In periods after 1970 the new construction rate should be above 2.60 millions.

Some part of these requirements could be met, of course, by the conversion of existing larger homes and apartments into smaller apartment units. When conversions are made without structural and plumbing changes, they usually produce substandard or nearly substandard units. When accompanied by structural changes and the installation of needed plumbing facilities, satisfactory housing can be provided.

The total number of such potential conversions is substantial, but proportionately small. There were only 3.3 million units in the United States in 1950 with 8 rooms or more. Most units which were suitable for conversion must have been converted during the acute housing shortages of the war and postwar years. Many others are poorly located for rental use or are in areas zoned for single-family use only, or are dilapidated. If 25 percent of these 3.3 million units are still not converted and are legally, economically, and structurally convertible, and if half of them are converted during the next 10 years, this would reduce new construction requirements by only 40,000 units per year. The smaller size of houses built since 1920 makes improbable any large volume of conversions in the future.

Rehabilitation

In addition to new construction requirements, we have an estimated 4.6 million units which were substandard in 1950 and were presumed suitable for rehabilitation. If 400,000 of these units were rehabilitated each year for the next 5 years and 600,000 per year were rehabilitated thereafter, the 1950 backlog of substandard rehabilitation units could be eliminated by 1965. By that time the large volume of obsolete dwellings becoming 60 years of age should provide opportunities for sustaining this level of rehabilitation activity.

Data from the 1950 census indicate that only 500,000 of the nonfarm units which were substandard for lack of plumbing facilities are occupied by families with incomes of more than $4,000. These should provide a ready market for modernization. An additional 500,000 units occupied by families with incomes of $3,000 to $4,000 may also be rehabilitated if sufficiently liberal credit is available for these purposes.

The remaining 2.2 million nonfarm units, occupied by low-income families, of which 1.6 million have incomes of less than $2,000 per year, may present greater difficulties as will the modernization of 1.4 million farm homes. Only an aggressive campaign is likely to achieve the schedule set forth above.

Schedules for slum clearance or perpetuation

The construction program outlined above requires that new housing construction be increased by 80 percent over the 1951–53 levels and by 40 percent over the 1950 level. Any lesser volume of construction means that our slums and substandard housing will continue to accumulate and will never be reduced or eliminated. The consequences of different levels of construction and rehabilitation are summarized in table 6. If new construction continues at slightly above the 1951–53 average, and if in addition we can rehabilitate 400,000 to 600,000 units per year, the number of substandard units in use will increase by 2 million in the next 15 years. This means that substantially all of the 15 million units which were substandard in 1950 would still be occupied by American families in 1970.

At construction levels of 1.4 to 1.6 million units per year, approximately the 1950 rate, slight progress is made in reducing the number of substandard units capable of rehabilitation.. No elimination of the 10 million units classified for replacement appears possible. At 1.6 to 1.8 million new units per year, all of these 10 million units must be continued in use until 1965 and 1 million of these can be replaced by 1970.

Only if new construction is raised to 2 million units a year is real progress possible toward the elimination of units substandard in 1950. At the construction and rehabilitation rates shown in table 5 some 5 million of the present substandard units can be eliminated by 1960, but in 1970 some 5 million will still be required in use. Table 6 suggests that 2 million new units per year are essential for even slow progress toward the goal of a decent home for every family. Any lesser level perpetuates the slums.

COMPARISON OF NEED ESTIMATES

The estimates of housing need prepared by six national organizations or agencies in recent years range from 1.4 million units per year to 2.4 million units per year. The standards, methods of estimation and programs of these studies vary widely. Some include farm-housing, others deal only with nonfarm housing, some cover only the period to 1960, others project needs through 1975. Table 7 presents these estimates on a comparable basis, utilizing the standards adopted by each organization. The table shows a remarkable degree of agreement as to the inadequacy of present construction levels. Current needs for new construction are 1.4 million nonfarm units per year or 27 percent above present levels in all estimates.[16] Most of the estimates place current total requirements at or above 2 million units per year. A similar degree of agreement appears in the three estimates with respect to long-range requirements for new family formation. Here the range is from 1.8 to 2 million units per year.

ECONOMIC FEASIBILITY

The levels of residential construction proposed by this report are well within the limits of economic feasibility as measured by past output. In 1925 the Nation applied 6.5 percent of its gross national product to nonfarm residential construction, and in 1950, 4.4 percent of our national product was devoted to housing. These were boom years. Housing investments in other years are shown in table 8 as a percentage of national product. Over an entire building cycle, 1919–35, the average was 3.9 percent. This may be assumed to be a reasonable normal ratio of housing investment, one which can be increased substantially in favorable years.

With the sustained economic growth assumed in this report, national income should increase steadily. If this increase is continued at substantially less than the rates of recent years, our gross national product should reach the levels shown in table 9. The annual rate of growth here used declines from 3.6 percent per year to 2.1 percent per year over the period in the low estimate and is stable at 3.5 percent per year in the moderate estimate. This latter rate of growth corresponds to that used by the President's Materials Policy Commission in its projection of future economic growth.[17]

It is assumed that prices will be stable over this period, and that the average dwelling unit cost can be held to $8,000 or less. This assumes that building volume will include a relatively high proportion of low and moderate cost units. These assumptions are substantially below current average house prices. Building costs used in production analysis are well below home prices used in consumer cost analysis. Farm construction is excluded from table 8 but is included in table 9. Modernization expenditures are therefore excluded from the latter table.

Even at relatively slow rates of growth, housing goals can be achieved at the 1919–35 ratio of residential investment and at substantially below the 1950 rate. At the rates of economic growth of the last 2 decades, the expenditures for housing would be reduced to 3.2 percent. In short, if we continue to spend no more of our income than we have in the past, and if our economy continues to grow at a steady rate, we can afford to build from 2 million to 2.4 million homes per year in the next 15 years. Under favorable circumstances, lower ratios of expenditure will produce even more housing than these estimates require.

---

[16] The Fortune estimate includes maximum demands (not needs) as shown in the table. Its estimated minimum demand of 1.1, 1.6, and 1.8 million units in successive 5-year periods relates to market demand rather than replacement and new need.

[2] 200,000 dwellings per year added for farm housing. This is the low estimate of farm housing needs prepared by the Housing and Home Finance Agency, cf. note 4.
[3] Fortune, February 1954, pp. 103–104. This estimate is for market demand. A lower estimate is also presented. See text note.
[4] How Big Is the Housing Job? Washington, 1951, p. 13. The adjustment for farm housing is based upon p. 14.
[5] National Association of Home Builders Correlator, February 1954, pp. 4–6. The statement does not explicitly refer to farm and nonfarm housing, but is based upon nonfarm data. This estimate excludes 750,000 dwellings for rehabilitation in lieu of replacement dwellings which are included in other estimates. Thus comparative figures might better be 2, 2.5 for nonfarm construction. The report calls for 2 million new or "new condition" dwellings per year.
[6] After 1970, estimate is for 2 million per year for additional new dwellings. No estimate of rehabilitation or replacement after 1965.
[7] Speech of Charles B. Shattuck, president, National Association of Real Estate Boards, New York Times Nov. 11, 1953, p. 48. The text indicates that the reference is to housing demand, not need. It is estimated that there is demand for 1.1 to 1.4 million dwellings. The figure quoted above is therefore the high demand.
[8] Farm housing included. Rehabilitation of 0.4 to 0.8 million dwellings excluded since these do not add to supply.
[9] Manuscript of forthcoming edition of America's Needs and Resources, J. Frederick Dewhurst and Associates, Twentieth Century Fund, to be published in the fall of 1954.
[10] Resources for Freedom, Washington, 1952, vol. I and vol. II. This estimate is the volume required for the entire period 1950–75. The estimate is presumably lower in the early years and higher in the later years

MARKETING 2 MILLION HOMES A YEAR

The marketing of 2 million homes a year will present real challenges to the housing industry and to Government. Data are lacking on many of the most important variables which will affect the willingness of people to buy or rent new homes. These include changes in the distribution of incomes, mobility, the income and price elasticity of demand for housing, and the extent of the required or desired movements to suburban areas.

Intensive research on housing markets is necessary if we are to achieve our housing goals in an orderly way. Despite these limitations in our knowledge concerning the housing market, some broad relationships may be outlined with respect to the immediate future.

TABLE 8.—*Gross national product and new residential construction, selected years*

[Billions of dollars]

Year	Gross national product	New nonfarm residential construction	Percent
1919–35 average [1]	$73.3	$2.9	3.9
1939 [2]	187.9	7.1	3.8
1940 [2]	205.7	7.6	3.7
1950 [2]	320.1	14.1	4.4
1951 [2]	343.6	11.5	3.3

[1] American Housing, Twentieth Century Fund, appendix C, table 13.
[2] Economic Report of the President, 1954, table G-2. Prices are in 1953 dollars.

There appears to be a wide measure of agreement that approximately 1 million to 1.2 million homes can be sold or rented under economic conditions similar to those of 1953 and with the then available FHA and VA credit aids. Leaders of the National Association of Home Builders, the National Association of Real Estate Boards and other trade organizations have expressed such judgments repeatedly during the past year.[18] These estimates accord with projections in the forthcoming Twentieth Century Fund study.

Table 10 shows the income distribution of families of 2 or more persons in 1949–51 and also shows 42 million families distributed in proportion to 1951. The startling increase in incomes between 1949 and 1951 with its consequences for future housing markets are apparent. The number of families with incomes over $4,000 increased from 10.7 million in 1949 to 16.8 million in 1951. This should indicate at least 20 million such families before 1960, which might sustain a market of 1 million homes a year. In addition there are demands created by single persons, undoubling and mobility.

Importance of full employment

Table 10 also emphasizes the direct relationship between full employment and housing markets. Any slackening in employment or economic growth tending to recreate the income distribution of 1949 would sharply reduce the possibilities for sustaining large volumes of new home sales and rentals. It would normally result in price declines, decreases in construction and increases in vacancies which would defer or prevent the development of an adequate housing supply and the replacement of substandard housing.

TABLE.—*Projections of gross national product and new residential construction, 1955–70*

Period	Average projected gross national product (billions)		Number of new dwellings (millions)	Gross cost [3] (billions)	Percent of gross national product	
	Low [1]	Moderate [2]			Low	Moderate
1955–59	$416	$431	2.03	$16.1	3.9	3.8
1960–64	472	508	2.28	18.2	3.9	3.6
1965–69	534	604	2.40	19.2	3.6	3.2

[1] Gross national product increased from $390 billion in 1955 by a constant amount of $12 billion—or at a rate declining from 3.6 percent to 2.1 percent per year.
[2] Rate assumed by the Paley Commission. Gross national product increased by 3.5 percent per year (the 1925–50 rate).
[3] Assumed cost per dwelling is $8,000.

[2] HHFA Annual Report, 1952, p. 300.
[3] Computed from idem.
[4] Data adjusted to fit class interval.

Current marketing practices are revealed by table 11 which shows the distribution of incomes of families of two or more persons in 1951 in contrast to the incomes of buyers of new FHA-insured homes.[19] The table indicates that substantially no homes were sold to families in income groups comprising 30 percent of all families and that only a third of FHA buyers were in income groups representing over half of the market. This is not fully representative of all new residential construction since it appears that non-FHA homes include more higher-priced homes, and more lower-priced homes, although most of the latter may not meet FHA standards and many of them may be substandard when built. In addition, a very large proportion of FHA homes in the lower price brackets are purchased by families who will spend more than 20 percent of their income for housing. Indeed, some of these families are spending nearly 50 percent of their incomes for housing. Of the FHA buyers with incomes between $200 and $250 per month, 97 percent were spending more than 20 percent of their income for housing. A safe rule would be that families should not spend more than 20 percent of their incomes for housing and most families above the lowest income groups spend substantially less than this ratio. The average

[19] Data are sec. 203 homes. Similar income data are not available for other titles. The price distribution of all FHA new units is wider than that here used.

FHA sale requires 19.7 percent or less of the purchaser's income for all housing expenses.[20]

High ratio of housing expense risky

These FHA-insured sales are not necessarily unsound since they apply to few families numerically (less than 30,000 units below $3,600 income levels in 1952) and many of these families are clearly living from accumulated funds or are families whose homes are being purchased for them by others. It would be socially unwise and economically disastrous, however, if any substantial proportion of our families began to purchase or rent homes which required such high expenditures for housing as to prevent normal expenditures for food, clothing, medical expenses, and other necessities.

If purchases involving more than 20 percent of income for housing are excluded from the FHA experience table, the results would be more representative of the sales and rental possibilities of enlarged private housing production under present Government-aid systems. This distribution is shown in the third column of table 11. Limitations of the data are described above. This column suggests that 80 percent of new private construction is produced for income groups representing half of the market.

If actual ratios of income to housing expense were to be utilized, these conclusions would be even more apparent. In addition it should be noted that national housing market data tend to set low-priced homes of the South and West against relatively higher incomes of the North and East. When new house prices are compared with family incomes on a city basis, we rarely find situations in which homes are offered at prices within the means of more than 40 percent of the families; and these are in the main already well housed and not in the market in any urgent sense for a new home.

Finally, many families in these middle and lower income groups cannot use the lowest priced houses produced because such homes are universally 2-bedroom homes and most of our families have more than 1 child. The disparity between incomes and housing prices is thus widened further by the factors of location and family size.

A second approach to the problem of marketing a high volume of new homes is summarized in table 12. The method here used is a modification of the method developed by the National Housing Agency in its 1944 projection of housing needs. Basically, it involves a filtration of the 1950 supply, elimination of losses due to clearance and demolition, and the addition of new units during the 1950–54 period. The result is subtracted from a future distribution based upon current or past experience. Limitations in available data and in the number of market factors which can be treated in the model suggest that this method can be used only to identify broad magnitudes and relationships and should not be used to forecast actual market trends.

Market for high-priced houses will decline

The method does suggest these important conclusions:

1. The current excessive production in higher priced houses, i. e., those priced to sell or rent at monthly costs of $75 or more, will materially narrow the market for such homes in future years. To the extent that these homes filter down to lower prices, they may create a surplus under unfavorable conditions. This could result in excessive filtration of higher priced units and marketing problems for new homes.

2. There is a very large market for homes at prices and rents ranging from $60 per month downward, a market which could account for over 3 million units in the next 5 years. This is the market now not served by either private or public housing. In northern cities, it consists roughly of homes in the range of $40 to $60 monthly, and in southern areas, $25 to $50 monthly.

[20] FHA data on monthly housing expenses and income-expense ratios have been used throughout this report. These data have been criticized as understating housing expense. Despite this weakness, these data are among the best and most consistent in the field, and the only adequate source on this subject. Wider publication of local data by FHA would be a distinct service.

TABLE 12.—*Projections of nonfarm housing needed by price class with low filtration and clearance rates and high construction volume, 1955–60* [1]

[In millions]

Rent or monthly housing cost	Dwellings needed with 1949 income distribution of 1960 families [2]	Dwellings needed with 1951 income distribution of 1960 families [3]
0 to $20	2.3	1.5
$20 to $30	1.8	1.1
$30 to $40	1.6	.9
$40 to $50	1.8	1.0
$50 to $60	.9	.9
$60 to $75	−[4] .2	.6
$75 to $100	−[4] 1.6 ([5] 1.2)	.6 ([5] 3.4)
$100 and over	2.2 (−.6)	2.2 (−.6)
Total	8.8	8.8

[1] See text note for results of alternative assumptions regarding filtration. Other assumptions, demolition of 2.5 million substandard dwellings, 5% filtration, moderate current losses, 6 million dwellings built 1950–54 and 8.8 million dwellings required 1955–59.
[2] The 1960 families distributed by classes of rents and prices paid in 1950.
[3] The 1960 families distributed by classes of rents and prices paid in 1950 and adjusted upward for changes in income between 1949 and 1951.
[4] Negative quantities imply surpluses in the classes indicated. This presumes rapid filtration, price declines, and reduction of building in these price classes and the price classes immediately above.
[5] Under alternative assumptions regarding filtration. See text note.

TABLE 13.—*Increases in mortgage holdings, 1950–53; new residential construction and projections, 1954–58*

	1950 [1]	1952 [1]	1953 [2]	FHA estimate [3] 1954–58	FHA estimate additional funds available [4]
Increases in mortgage holdings (billions)	$7.5	$6.9	$7.1	$5.5	$3.5
New dwellings built (millions)	1.4	1.1	1.1	1.0	(450)
Average requirement	$5,400	$6,300	$6,500	$5,500	($7,800)

[1] HHFA, Housing Statistics, January 1953, p. 23.
[2] FHA Prospective Level of Residential Construction and Availability of Mortgage Money, 1954–58, table 6.
[3] Ibid, table 5. Estimate is for average year in this period.
[4] Computed from ibid. tables 5 and 6. Assumed average mortgage amount is the marginal rate assumed by FHA table.

3. Unless full employment and a steady rate of economic growth are maintained, there will appear positive surpluses in some price ranges, accompanied by softening of markets which will jeopardize all private housing production. On the other hand, a maintenance of full employment conditions could produce substantially greater markets than those shown in the table. Housing markets are highly sensitive to changes in family incomes.

4. There remains a large need for housing for low-income families, a need which is increased by 50 percent under less than full-employment income distributions. This need is at price and rent levels far below any which private construction can approach.

5. Other models of future income distributions suggest that very high levels of housing production could be maintained in all price classes if rates of redistribution of income comparable to those which occurred in 1949–51 could be repeated.

6. A stable demand for about 400,000 units of higher-priced homes appears in all estimates based upon this method. If the method overstates needs in the

higher price groups, this demand will appear in the price groups of $70 to $100 per month, just below the levels shown in the table.[21]

Must serve middle- and lower-income groups

These conclusions support the views widely recognized by industry leaders that future construction must serve the broad middle- and lower-income groups if it is to be maintained at high levels. Under favorable economic conditions, there appears to be a sustained demand for no more than 1 million dwellings a year in the price classes now produced by industry with current Federal aids. In addition, there appears to be a need for approximately 500,000 units a year in price classes below the levels now served by the industry with present credit aids, and for 200,000 to 300,000 units per year for families requiring public housing. These nonfarm needs are supplemented by farm needs of unknown price distribution of 200,000 to 300,000 units per year.

FINANCING 2 MILLION HOMES PER YEAR

Both the construction and the marketing of new residential construction will depend upon the availability of an adequate supply of construction and mortgage funds on terms which will meet the needs of the industry and of consumers. The Federal Housing Administration prepared an estimate for the President's Advisory Committee on Government Housing Policies and Programs of the probable mortgage fund requirements for the period 1954–58, and probable volume of savings available for mortgage lending.[22]

These estimates are extremely conservative. They assume construction of only a million new units per year[23] and a decline in the total volume of mortgage lending,[24] even under assumed conditions of prosperity in the rest of the economy. Selected measures from this report are presented in table 13. The average mortgage requirement is not to be interpreted as a function of prices alone. It is a product of the aggregate volume of new savings, repayments on existing mortgages, the volume and amount of mortgage loans on new and existing housing, and prices on new and existing homes.

The same study estimates that $9 billion annually will be available for new mortgage loans of which $5.5 billion will be utilized by the low level of construction assumed. This would leave unutilized $3.5 billion. In the last column of table 13 these funds have been applied to FHA's estimate of the average mortgage amount for new homes during the period. At this amount, funds would be available to finance an additional 450,000 units per year, or a total of 1,450,000 units per year.

The FHA estimate of new savings is probably low and the implication of its assumed low volume of construction is that mortgage interest rates will decline sharply and that funds will be readily available. If these estimates of available funds prove correct, full utilization of such funds would tend to hold interest rates at higher levels. Thus even if savings available for mortgage loans (but a small part of total savings) were assumed to average somewhat higher than the FHA estimate, such funds would probably not be available freely and on favorable terms at construction volumes exceeding 1.5 million new units per year under current institutional arrangements for savings and mortgage lending.

More mortgage funds needed

These considerations suggest that under conditions of prosperity, ample mortgage funds may be available on favorable terms through existing channels for 1.2 to 1.4 million units a year. Additional flows of money will probably be required to meet housing goals of 1.2 million nonfarm units a year in the next few years, and in part to meet farm goals.

---

[21] The method assumes that all units in the existing supply will filter by 5 percent. In fact filtration rates will vary widely by location and price class, and recently built homes may not filter (i. e., suffer price or rent reductions) at all during the first 5 years of occupancy. If this is assumed to be true, construction requirements in the highest class interval above are sharply reduced and those in the next classes are correspondingly increased. This would indicate a negative demand (−0.6) in the class over $100 under the first assumption, and a substantial demand (1.2) in the $75 to $100 class. Under the second assumption, demand in the over $100 category would be the same (−0.6) and in the $75 to $100 class would jump to 3.4 millions, or nearly 700,000 units a year.

[22] Prospective Level of Residential Construction and Availability of Mortgage Money, 1945–58, Federal Housing Administration, 1953. These estimates and the following text deal with nonfarm financing.

[23] Ibid., pp. 4, 12, and 13.

[24] Ibid., table 5.

The prospective large volume of savings, increases in corporate savings to meet corporate investment requirements, and reductions in defense financing requirements suggest that ample funds will be available in fields which have not financed housing construction in recent years. These include particularly institutional savings which have been utilized for corporate investments and institutional and personal savings which have been going into Government bonds. The fuller utilization of these savings channels may be expected to provide funds on terms acceptable to the housing market. If funds are to be diverted directly from other sources, the implied increases in interest rate would make impossible the marketing of larger volumes of new construction.

These conclusions are consistent with the marketing requirements suggested in the preceding section. A substantial market appears to exist in the higher income levels for new homes at rents and monthly prices corresponding to the present output of the industry. If larger volumes are to be produced, they must be produced at prices and on terms which will be available to income groups substantially below those now in the market for new homes. If such terms are available, and only if such terms are available, it will be possible to obtain the goal of a decent home in a suitable living environment for every American family.

(William L. C. Wheaton received his A. B. from Princeton University, his Ph. D. from the University of Chicago. He has worked in municipal, county, State, and Federal agencies and served as special assistant to the Administrator of the former National Housing Agency and the present Housing and Home Finance Agency. He was formerly chairman of the department of regional planning at Harvard University. He is now professor of city planning in the department of land and city planning of the University of Pennsylvania. A consulting city planner and a member of the American Institute of Planners, Dr. Wheaton is also a vice president of the National Housing Conference.)

Statement by William Zeckendorf, President of Webb & Knapp, Inc.

This problem, which afflicts most of the older cities of the United States, falls into many categories, each of which is related to the particular situation that uniquely affects each community, there being no single state of facts that is identical in any two cities. There are certain common denominators, however, that affect all communities of the aging variety; they are as follows:

(1) Downgrading of central areas due to a so-called trend to decentralization. This is often aggravated by the physical condition of the buildings in such zones since, in the opinion of the owners, they are not bad enough to tear down and not good enough to justify substantial capital reinvestment for upgrading.

(2) Most of these communities are plagued by parasitelike types of incorporated and unincorporated towns or villages ringing the periphery of the central city. The populations of these centers are the recipients of the benefits of the downtown area through employment, central community urban service facilities, rapid transit, and many other costly benefits paid for by the central community and not reimbursed by the dwellers of the satellite areas. State and municipal legislatures might well carry out objective studies to determine whether or not sound fiscal and social policy should dictate the reincorporation of such peripheral communities into the whole.

(3) Growth of urban centers without direction has resulted in two major voids: (*a*) Inadequate highway and parking facilities to cope with the automobile; (*b*) lack of overall planning with the power of implementation.

This master planning is important unless it can accurately state the case for the individual community. Before it can intelligently plan for anything, the community through self-analysis must discover its potentialities, its possibilities, and its limitations. To know what it wants to become implies that it is aware of its function in the national orbit. Obviously, Pittsburgh, however ambitious, would not endeavor to become like Los Angeles, nor would Los Angeles wish to emulate New York City, and surely New York City would not try to appear like Denver. Each of these communities has a distinctly separate function in the overall national picture, each having uniquely important contributions to make and a separate and fascinating personality of its own. All master planning should be done with forward-looking, broad-range perspective, courage, and daring, balanced against a knowledge of what financial capacity will permit it to achieve.

The most important single source of civic revenue is real-estate taxation. It therefore must be recognized that the future of any community's real estate is of the utmost importance to it. It is not far from the mark to state that basically every community is in the real-estate business because its ability to meet its obligations and to go forward are related to the soundness of its real estate.

This statement is made, based upon the pure direct economics of the essential part played by real-estate taxation which does not obviate or minimize the sociological results from better or poorer real-estate improvement as the case may be. Unfortunately, the cost of city maintenance for police, fire, sanitation, health, and general community morals is higher from the slum and downgraded areas, and out of all proportion to the ability of such zones to contribute to the city treasury. These indirect but equally important effects are to be weighed in considering this problem along with direct realty taxation.

Every community and owner of real estate in the urban areas should take note of what is being done through Federal legislation to provide incentives looking toward renewing the slum and rundown zones within our cities. I would like to say 2 things on this point: (1) that existing Federal aid is ample to spur redevelopment, provided redtape is cut to a minimum; (2) the community should act on its own and not wait for the Federal Government to solve a problem which so intimately affects the city's tax base and therefore its future. The Federal legislation of 1954 is, of course, geared to induce the community to do just this, and I believe this policy will bring private capital into the job.

The writer has devoted some years of study to this subject, and believes he has basic solutions to certain of these major problems. Amplification of these solutions would take more time than is allowed in this requested 5-minute-introductory statement.

(The following materials were subsequently supplied for the record:)

NEW CITIES FOR OLD

[From the Atlantic Monthly]

By William Zeckendorf

How can we keep cities that represent the toil and sweat and invested labor and invested capital of generations from becoming ghost towns? It is wonderful to talk about going out into the country—as I see some of you have done here—to build a perfect city on a plateau; I don't say that that is easy, but I do say that it is much more of a challenge for somebody to tell you, "Here is a city in which there are $5 billion or more invested. Try to save it from disintegration and economic blight, which cannot miss if you do not do something about the core which you are permitting to rot; never mind doing something gaily and theoretically about the periphery."

We are all building these wonderful means of ingress to and egress from the central and urban areas, which simply means that we are developing easier and easier means of escape. They are roads from, not to, because people come to the town for reasons of necessity and leave it as fast as they can. That is the really greatest challenge that we've got in this country. People speak of inflation and of the results that will follow inflation, of economic and social waste and the fact that we are going to pass on to generations to come the errors of our ways through high debt, inflated money, dislocated economy. That is nothing compared with what is going on by attrition; attrition in the sense that the cities of the country are being permitted to die on the vine; cities that have been built and paid for, cities against which billions of dollars of municipal bonds have been levied in good faith and bought by citizens who have saved their life's labors to invest in these municipal securities and mortgage bonds, and indirectly through the life-insurance companies which reinvest their savings to make these cities go. If this attrition continues, these savings are going to be wiped out.

Inflation has almost no greater threat than the threat that has taken place in cities like Boston, one of the worst examples I know. Our firm is so concerned about Boston that it would not buy any real estate here. It is no joke. We believe that Boston, with its tax rate what it is, and justified because of the expense in comparison with the potential revenue, is going to go broke.

You have already put through a semiconfiscation of private property by your levied tax. Your tax rate is such and your assessment rate is such in the city of

Boston that you have practically confiscated the assets already. It is not something that you have to wait around for. And the first depression will find half the city on the town tax roll, because only the high occupancy, the extraordinary high rents due to a scarcity resulting from an unusual situation, make it possible to run these properties and pay the taxes and operating charges with some modest return on the investment. You have a town here that is completely dislocated, where your people work in one community and spend their money in another community that pays nothing to the town in which their labors are expended. There are other cities in this same dilemma. But Boston is an outstanding example.

I want to talk about the possible cure. That is more important. The cure, in my opinion, is really the greatest challenge to the imagination, much more challenging than going out in a pasture and building a city, and much more satisfying from a constructive and a creative standpoint than abandoning the core to eventual ruin—anybody can do that if given enough boondoggling subsidy. But it takes real thinking, real energy, courage, and imagination to work within the confines of an existing problem. As a matter of fact, you will find in your experience, as you go into architectural life, that the greatest results you can get in ingenuity are those which are dictated in alterations where the restrictions of existing conditions force you to do things that you would never do if you had a completely free hand. Working within limitations will often produce more striking results, because of the provocative problems that arise, than if you have no limitations.

Let me give you three examples of constructive developments which our firm has put through in the heart of New York City. The first begins on the day a broker called and offered us at a price of $700,000 the old riding academy at 66th Street running through to 67th Street just west of Central Park West, a piece of property consisting of some 40,000 square feet. We turned down the offer with the comment that it was impossible at that price—we could not afford to build apartments in that area at that square-foot figure—to which the broker responded that the buildings themselves were very valuable. We pointed out that we would pay more for the property demolished than with the buildings on it, as they had outlived their usefulness, and let it go at that.

Some weeks later I happened to be driving through 66th Street, and what follows illustrates the old adage that it is better to be lucky than smart. Because of a traffic jam my car was stalled in front of the academy. I decided that as long as I was there I might as well take a look at the property. I noted that the main building—the riding arena—was 92 by 200 with a great high vaulted ceiling and no interior columns. I said to myself, here is a perfect place for a television studio. Upon my return to the office I called the broker and we bought the property at his price, $700,000 with 20 percent cash, balance on purchase money mortgage.

We circularized all the radio companies immediately, offering the property for television purposes, and to our dismay received letters from all declining the proposal. This put us in the horse business. We bought 150 horses and went into the market to buy hay and sell manure, running a regular monthly loss of $3,500 to $4,500. This went on for almost a year, when one day the phone rang and a rather uncertain voice announced that he was Mr. E. J. Noble. Knowing by reputation that he was the owner of the American Broadcasting Co., I promptly told him that I had never heard of him. He said, "Some time ago you suggested that we buy your barn for a TV station. Perhaps we'd better have a look at it."

To make a long story short, we leased the academy to him and subsequently sold it to him at a profit of $600,000. He converted it into the most modern TV station in the United States. Some months late when we were lunching together at "21" he said he was going to invite me to become a director of ABC. He asked me if I knew why, and when I replied that I did not he said, "Because you're the first man to make money out of TV."

We had a much longer struggle in the transaction which we recently consummated in the 34th Street midtown shopping center of Manhattan. There we found an unusual situation in that Macy's, which is the largest department store in the world, doing an annual business of up to $200 million is separated from its chief competitor, Gimbel Bros., by a single block running from the south side of 34th Street to the north side of 33d Street. It seemed to us that if a large assemblage of smaller properties within this block could be engineered we could redevelop the property in the form of an arcade or through-street merchandising so that the customers of both great merchants, as they passed back and forth from 33d to 34th Street, could do window shopping or comparative shopping on their way.

Such assemblage, however, held many obstacles because of the existing leases. There were a variety of buildings, including a firehouse, a hotel, and a theater, all of which would have to be removed. In order to acquire the firehouse, Webb & Knapp had to persuade the city that it was in the interest of efficiency and that it would ease traffic if the patrol at 29th Street was combined with the one at 33d Street in a new station at 31st Street. We offered to build a new firehouse 75 feet wide in accordance with the specification of the city and exchange it on an even basis for the 50-year-old, 50-foot firehouse standing on 33d Street. The city agreed.

We have just signed leases with the F. W. Woolworth Co. for a new building that will occupy part of the site of the old firehouse, the Herald Square Hotel, and the Savoy Theater, and which will be the largest store in the Woolworth chain throughout the United States. This new Woolworth's will serve as an arcade; it will syphon off customers. Thus there will be a steady current instead of the logjam which exists between Macy's and Gimbel's; all will receive the benefit of greater customer circulation. Incidentally, it has taken us nearly 10 years to clear the block.

Our most challenging project in Manhattan involved the land that is now called the United Nations zone. This area runs north from 42d Street to approximately 48th Street, and east from First Avenue to the East River. It is a rectangular section of about 500 feet east and west, and about 2,000 feet north and south—roughly a million square feet.

At the time that we first heard or thought of it, the property easterly from First Avenue from 42d to 49th was called the slaughterhouse district of New York, and was occupied by the abattoirs of the Swift and Wilson companies. They had been there since the 1870's or 1880's. Prior to that time it was a pesthole, and when it came to granting a privilege to slaughter cattle on Manhattan, it was decided that the best place for it was that pesthole area to the east. The slaughterhouses were built there then. They were the best that were built at the time, and probably for slaughterhouses they were pretty good looking. But as time went on, the Grand Central zone came into concept, the subsurface rapid transit was developed, and the Grand Central Station was conceived. That 42d Street zone became probably the most intensive and the most interesting new development of any urban area in the United States. It was a great tribute to the planning and the foresight of the people who recognized its possibilities. I don't know of anything more important in long-term thinking than what was done at this place in the first decade of the century.

When the old steam railroad line was submerged under Park Avenue, which was a slum area, and air rights were built over the railroad tracks, there took place one of the most magnificent pieces of urban redevelopment ever seen. And it was so important and so virile that it overcame everything in its way—except the slaughterhouses. Its zone of influence moved easterly about as far as Second Avenue. It couldn't take in any more than that because the physical stench of the slaughterhouses prevented it. But those slaughterhouses remained there while they built apartment houses that rented in the 1920's for $500 and more a room, almost within niblick shot of the slaughterhouses.

But nobody did anything about the slaughterhouses. They stayed there indefinitely. I recall when I first went into the real-estate business as a broker that they said of the slaughterhouses, "They will never be sold," because nobody could ever get a franchise to build a thing like that in Manhattan again anywhere, even though from time to time the properties were offered to us for sale. They never could be delivered, and every time somebody talked of it, it became a joke.

In the early part of 1946 when a broker called up and said he wished to offer the slaughterhouses I asked him to see one of my associates. This had been going on in my own experience for over 20 years. He came and went, and a few minutes later the man to whom I had assigned him came in, and I said, "What did that fellow want?'

"Oh," he said, "the old chestnut, slaughterhouses."

"I presume you gave him the usual brushoff."

And he said, "Yes, sure, nothing to it. By the way, he said he was related to the Swifts."

"What?"

"Yes."

"Are you sure? Let's get him back here," I said.

So we got the broker back, and I said, "What makes you think you can deliver these slaughterhouses?"

"Well," he said, "my daughter is the sole heir to the Swift fortune and I think I can do it."

I said, "Sit down." Which he did. I said, "What do you want for them?"

He said, "Swift and Wilson have agreed that they want $17 a square foot, take one, take all. They have pooled their properties."

"Are you sure you can deliver?"

His reply was "Yes."

"What is the best price?" I asked.

"Seventeen dollars."

"Are you aware of the fact that the properties on the other side of First Avenue, running up and down and westerly all the way over to Second Avenue, are selling for $5 a square foot and less?"

He said, "I know it's a ridiculous price but that is what they want."

"Will you take back an offer of a lesser amount?"

"No," he said, "I've got to keep on offering it until I get a buyer."

I asked, "Have you offered it anywhere else?"

He replied, "No."

"Well," I said, "I'll talk about it with my associates if you'll wait a few minutes."

So I went inside and talked with my partners.

"Here is the greatest opportunity that I have ever seen in my life," I said, "and I never expect to see one like it again. This is the situation. Regardless of whether the properties are selling for $5 per foot, $1 per foot, half a dollar a foot, $3 a foot, around this area that they want $17 per foot for, that has nothing to do with it. The only reason they are selling for $4 a foot or $5 a foot is because the slaughterhouses are here. If you can think in pro forma terms of X, the slaughterhouses, there is no excuse for the $5 land and there is no excuse for the $17 land. The whole thing is worth $50. Actually, by eliminating the abomination, you can pull the whole thing up by its own bootstraps."

A very simple rule of real-estate economics. It was so centrally located, so beautifully located, with the site and size and dimensions of the property such that there were limitless potentials. Regardless of whether you could see them all the way through to the end at first view, you knew that they were there. "Therefore," I said, "I advocate buying the property for $17 a foot." Which we did. We also bought the $5 land. We bought some land for less, some for as little as $1 a foot.

There was one fellow, an Italian, who had put his life saving into a purchase for $10,000 of the only outstanding property on the east side of First Avenue that did not belong to the slaughterhouses. That was the northeast corner of 42d Street. Fifty by one hundred—$10,000. That is $2 per foot. We sent the broker over to buy that property, and his wife said she wouldn't sell it for less than $12,000. He came back and said, "Wife wants thirteen!" I said, "Buy it." This little dialogue went on between the broker and wife until finally we paid her $100,000. And that piece of real estate today would be worth a minimum of $500,000. A minimum! It would be a bargain at that price.

And it all happened the moment we said, there are no slaughterhouses. Just say it. Wipe them out with a piece of rubber. Here is the new concept of this development—this Grand Central zone at the East River point. Seventeen dollars a foot was meaningless. So was anything else. When you have a plot that size, located that way in an urban area, the values are almost infinite, limited only by your imagination, your courage, your ideas and your ability to execute them.

We had a concept for the development of what is now the United Nations area which was very much publicized. That concept arose after much study in which Mrs. Zeckendorf was a great aid because her thinking from a woman's viewpoint was of enormous help in projecting the residential phase of this development, which started commercial at the south and wound up residential at the north end at Beekman Place. We developed this plan, and the plan came into model form and was given a lot of publicity. On December 6, 1946, I read in the paper that the United Nations were going to Philadelphia because they were unwilling to go to the Flushing Meadows that New York offered them, they were rejected in the Westchester-Greenwich area where they wished to go, and the Russians had said that no "first class" diplomat would go to San Francisco. That morning I told Mrs. Zeckendorf that I was going to put those birds on the platform. And she said, "What birds on what platform?" And I said, "Those U. N. birds on the platform on the East River."

I called the mayor that day and he said, "What's your idea?"

I said, "I hereby offer you—" I said, "Do you want to keep those fellows in New York?"

And he said, "Yes, I'd give anything to do that."

"Well," I said, "put this down. I'll offer you 17 acres of land on the East River from 42d Street north at any price the United Nations wish to pay. That will be their new home."

Now, the important thing about this whole thing is the value of the visualization of a concept. Thanks to Life magazine, a few other magazines, and a lot of newspapers, a great deal of publicity was given to the design that we had for the redevelopment of the area, so that when they brought around the Site Committee of the United Nations, no two of whom spoke the same language—and they were all ready to build a Tower of Babel—they were shown first the property and then the visualization of the plan. They saw this development along the East River and they recognized that it could look like what they had always dreamed of for the United Nations. I am sure that if they had just been shown those red brick slaughterhouses with no concept, they never could have understood what we were talking about. But they did understand it because they saw it in print. And within 8 days, notwithstanding the 18 months of previous searching, Mr. Rockefeller, who recognized its potential, offered the money to buy it for the United Nations. The United Nations approved the site, and 8 days later it was a fait accompli.

When it came to the development of an approach to the United Nations—a monumental boulevard that was going to be grand enough, beautiful enough, functional enough, as would be warranted by such a basic conception—we proposed a minimum concept for redevelopment. We said that as a minimum the city should do the following: it should use its power of eminent domain, its right to redevelop communal area, and it should resell the surrounding zones so that the benefits of automatically increased valuation would go to the community and not to the guys who did nothing to get it. That may sound communistic or socialistic. But I cannot see any reason why the people who own those cold-water tenements in the area of the United Nations should be permitted to get a free ride or to hold up indefinitely, at their own will and whimsey, the redevelopment of an area that should be rededicated.

We presented that idea to the city fathers. "Condemn the north side of 46th Street to the south side of 49th Street from First Avenue to Third Avenue," we said. That area would involve 6 square blocks: the north side of 46th to the south side of 47th, the north side of 47th to the south side of 48th, and on up to 49th; 3 blocks north, 2 blocks east and west, from First Avenue to Second, Second Avenue to Third. Those blocks are precise, gridiron blocks, 200 feet north and south each, roughly 800 feet east and west, and the intervening streets are 60 feet.

We said, "Take the 2 central blocks, the ones from the north side of 47th to the south side of 48th from First Avenue to Second Avenue, from Second Avenue to Third Avenue, which means a strip 200 feet long and 1,600 feet wide plus the intervening street beds of 60 feet each, the street bed of 48th and the street bed of 47th. You have 120 feet of street bed, 200 feet of block, or 320 feet north and south by 1,600 feet east and west. Redesign that for a great boulevard: 320 feet is 230 percent of New York's widest street, Park Avenue, which is 140 feet. Let that be a great boulevard for pedestrians and for the well-designed traffic, with subsurface traffic and subsurface parking. And then you will wind up with these 4 blocks which you also condemned, from the north side of 46th to the south side of 47th, and the north side of 48th to the south side of 49th. Then take those 4 blocks, rezone them, dictate what may and may not be built, and say that they shall now go up at auction to the highest bidder, providing they are built that way. To assure you, the city, that you will take no loss for your speculation in having bought 6 blocks, but that you will get the 2 central blocks, plus the streets that you are going to use for this great boulevard, absolutely for nothing, we will guarantee to make a bid ourselves for a minimum figure which will equal 120 percent of the assessed valuation of all 6 blocks, land and buildings. That 120 percent is what we shall pay for the 4 blocks, so that you get the 2 blocks for free."

I also proposed that the 4 blocks should have levied against them a land assessment which would equal the full tax assessment of all the land, of all the buildings, of all 6 blocks, and that any improvements on top of that should be levied at the regular rate of assessment. The pro forma value of those 4 blocks fronting on that communal way and their plotage assembly value, which has been achieved by a single condemnation, is so vast as to make it a good real-estate investment for hard money, not boondoggling money. Here is a case where two-thirds is greater than three-thirds. Here is a case exactly like the situation with the slaughterhouses at $17 a foot against $5 surrounding land value. It is a subtle redevelopment by a new concept, and the center of New York could have been vastly improved at no one's expense, not even at the expense of the fellows who were condemned, because they would have gotten more than they ever dreamed of getting at 120 percent of assessed value. The city fathers made one of the greatest mistakes of their lives when they turned us down, but we are still hopeful they will come to their senses and reverse their decision before the opportunity is wholly lost.

Again it comes back to concepts. I don't believe that cities are lost unless we are prepared to abandon them. The present tendency indicates that we are ready to abandon them. I deplore that. I think that if any great challenge exists in this country for the architects and designers, the real-estate economists and builders, the urban redevelopers and the city planners, it is the saving of a city.

I am not against decentralization. I think every new means of transportation that comes along in the progress of mechanized development causes farther and farther flung communities. I believe those communities have to go out to meet the problem that arises from the new mode of transportation. But I do not believe it is necessary to have cities die on the vine and rot at the core. I think they can be things of beauty, light, and economic functionalism; but they have got to be attacked by a combination of three kinds of thinkers: The real-estate economist, the designer and engineer, and the city planner and civic thinker.

Baked Buildings

(By William Zeckendorf)

I should like to explore the relation between real-estate economics and architecture. I hope the time is coming when we shall have a much closer harmony between the arts and the engineering on the one side and the economics of real estate on the other.

On the one hand, we have people who build buildings. The so-called builders are interested in three phases of their activity: First, to buy a piece of land as inexpensively as possible; second, to conceive and execute a building as cheaply as possible—and I do not mean that in the flattering sense of the word; and third, to borrow the maximum that they can borrow, and subsequently either retain or sell the property. If they retain it, they retain it until it falls in by its own failure, from economic pressure; or else they sell it to someone who thinks he can make it work out. And, on the other hand, we have the aesthetic people of the architectural and engineering life, who are capable of thinking in very broad terms and producing things of importance—real contributions to art—but who fail to understand the down-to-earth essentials of real-estate economics.

I think it is just as fundamental for an architect to have a working knowledge of economics as it is to have an understanding of the classical, the traditional, and the modern concepts of art and architecture. Whatever education in the field of engineering is given him, until he understands the economic function and the size of buildings, I say he is no architect, he's an academician. On the other hand, to permit builders to go on, with no consideration except price, to erect whatever their fancy dictates, without regard to what they do to the neighbor who lives next door, brings about a potential form of iconoclasm which is injurious to the entire neighborhood and seriously impairs the general economic structure of the community in which they build.

It is a curious thing that in the great depression of the thirties, it was the buildings that were mortgaged for the greatest amount by the most speculatively minded builders, who were interested chiefly in borrowing the maximum and building for the least cost, and whose costs of operation were the highest, and whose vulnerability was the most pronounced—those buildings were the first to fall. As they fell into the hands of creditors, they undermined the sounder and more conservative investments, because when something goes through the bankruptcy court, there is no bottom. The receiver rents for what he can get; he rents at whatever price he has to take to fill his vacancies because he is not interested in any other way; and the more conservative man who borrowed a smaller amount and built more wisely finds himself in competition with a mortgage that has been wiped out. As a result, his equity is wiped out too because his rents are undermined when he has to compete with bankruptcy renting.

This is a hard-boiled approach, but it brings home the extent to which even the toughest investor who is not interested in the esthetic side, who is not interested in anything relating to beauty or functionalism, but who thinks only in terms of the conservative—how very much concerned this investor is with the general subject of having buildings built by builders who are interested in something that is functional, beautiful, and soundly economic, and designed by architects who understand the investor's problem and who, therefore, do not design buildings that are art for art's sake or merely expedient.

That is why I should like to see architectural schools make as part of their "must" courses the subject of basic real-estate economics and construction. If that is done, these schools will send out men who will develop this country on a basis that we will be proud of. We may well be entering upon a golden era of construction, when the merger of the real-estate builder-economist and the artist and designer can be so skillfully integrated that we shall bring forth residential, industrial, and commercial architecture which will stand the two important tests of time: economic soundness and beauty and functionalism. If we continue as we have been going, letting the devil take the hindmost—the builder builds for as little as he can and borrows as much as he can and runs, and the architect follows him—then the rebel who would design only things of great beauty can find no clients or only a few clients who are as crazy as he is because they do not understand. In that case, I say, we still have to wait for our golden era. But it is not necessary to wait. Not at all.

Let us analyze for a moment the reasons why all this confusion comes about—why it is that we do not have architecture that is both beautiful and functional, and why we do not have buildings that are economically sound in every sense of the word. I should pause here to make it very clear that there are exceptions to what I have said on this subject. There are many instances of buildings which combine beauty, functionalism, and economic soundness. But wherever you find them the percentage in proportion to the total number of buildings erected is infinitesimal. Therefore, I do not address myself to the few but to the many.

Let us talk first about the builder. You go to him, a speculative builder—speculative builders build about 90 to 95 percent of all the things that are built in this country for rent—and you say, "Why do you dare to build that terrible-looking 6-story apartment house that looks as though it came out of an oven, baked, according to a stenciled plan?"

He will say, "Well, maybe I like that and maybe I don't. Maybe I would like to build something more beautiful and maybe I wouldn't. But that's not my business. My business is to build within the framework, concept, and spirit of the FHA."

Well, I do not have to spell that out, but I shall do so for the record in a very simple way. It means designing as cheaply as possible, borrowing as much as possible, building as inexpensively as you can and never mind the rest.

The builder says, "I'm not going to take a chance and build something more beautiful than that, something revolutionary. Maybe I do like a more modern design. But when I take that into a lending institution and they say to me, 'What is this plan here? We've never seen that before. We'll discount that by 25 percent in the amount of a loan you've asked for'—well, that puts me out of business. I'm not that kind of a builder." And he speaks for 95 percent of the boys. "I have to borrow from the man who will lend me the maximum that is permissible, and that man is the fellow who will lend me on exactly what every predecessor building of the same character looked like and was all the way back. Don't blame me. Blame the fellow I borrow from. Someday I'll build something more beautiful. I'd like it perhaps. But I cannot borrow and I'm no contributor to the general welfare of the community. If I want to give charity, I'll find my own way to give it. But not in my business."

I am oversimplifying this, of course. But basically the fundamental philosophy of the speculative builder is exactly what I've said. You try to find out who this guy is who finances him, who limits his horizon, his vision, and his potential.

Who is he? He is the insurance companies, the big ones and the small ones; he is the savings banks, the building and loan companies—the impersonalized corporations that people visualize when they see a great tall building with a beacon on the top of it. But basically, those beacons are supported by a little group of self-perpetuating trustees, mainly of the same social strata, and you go talk to them. You say to a typical one, "What is the idea of financing these baked buildings that look like everything that was ever built before? What is the idea of perpetuating these monstrosities?"

The trustee will say, "Who are you?"

"Well, I'm just a fellow who wants to know what is going on; why you do it. You are in control of the purse strings. You're the fellow who calls the tune and the other fellow dances because it is your money that makes these buildings go. And if you say X song, they will dance X dance, over and over again until they're dizzy. How come? Why have you made so little contribution to the furtherance of thinking in design and execution?"

Now here is the answer you'll get from the typical trustee. He will say to you, "I am a manufacturer; I'm a chemist; I'm a banker; I'm a retired industrialist; I'm a professor, or I'm something—something completely unrelated to the subject specifically involved, the subject of lending money. I'm a trustee of this institution or that institution." He will say to you, "I'm interested in beauty. Come to my home and I'll show you beauty. But when it comes to lending, I want to bake them."

"Why do you want to bake them?"

"I want to bake them because I know that they've been baked for 25 years and they've never failed. The six-story flat is a good thing. You know I don't work here. I come here without pay. I do not even get a director's fee for attending a meeting. I'm only here because I think it's my duty to run this institution."

Of course he doesn't add that he enjoys being in association with a lot of other fellows like him who finally got up there, or that he is filling his father's seat in the chair that his father and his father before him filled. But he says, "I'm here and I am going to make sure that this institution doesn't go broke. I know there's one thing certain," he says; "I never can be criticized for doing what has been done before, I can't be criticized for doing something new, something that was never done before—it might succeed; but the Lord won't spare me if it doesn't—and I am not going to take that chance."

That is the attitude of perhaps 80 to 90 percent of the trustees of the eleemosynary and mutual institutions that are financing the vast bulk of the construction in this country. Add to that the FHA and its own completely unimaginative and limited scope in thinking and design, which is understandable because they are trying to protect themselves by the most minute specifications against the chicanery of the builder who is only interested in borrowing the most and building for the least. There you have the double hazard, these two, the builder and the banker, on their high stools. And right between them our architecture and design fall flat.

There are exceptions. There are provocative thinkers among the boards of trustees, and every once in a while you will see a great new thing come out which finally brings us a notch forward and lifts us up because the power of emulation is something that is always with us. But it comes from such a minute number of those who are in control of the purse strings, and is given to that very small percentage of those who would build and who are interested in doing something more progressive and more important, that progress is painfully slow. We are now building new slums for old slums, anachronistic conditions following upon the horrors of years before, so that notwithstanding the billions of dollars that are at our disposal we are still building approximately the same thing that we have had in the years gone by.

There is a great and important lesson to be learned from this. And that is, to find out how we can change it. I'm an optimist, perhaps too much of an optimist. I have no doubt that we will pull out of this trough. I have no doubt that this country will take the lead, and I believe that our time will be looked back upon as the beginning of the greatest renaissance in design and construction that has ever been known. To crystallize your thinking and to try to dramatize how sluggishly, how slowly, how foolishly we are traveling down that path which has got all its ways greased and ready for a 50,000 miles a minute move if we can ever organize ourselves to think straight. I draw your attention to the fact that this building industry and the real estate business are the largest businesses, in terms of dollars employed, of any business in the world. You can talk about automobiles or chemicals or merchandising or anything you want. I say there is more money invested in real estate than in anything else.

You can tell the difference between a 1951 hand iron and a 1949. The difference between a 1951 automobile and a 1929 automobile makes you turn around and look at the one of 1929. You don't look at the 1951 one. Why? Why is that true of hand irons? Why is it true of automobiles? Why is it true of new products that were invented and never dreamed of before, whether they be radios or television sets or anything else? Every product you can name is the result of research and design, and research in the laboratory of the great companies of America. All the products of Johns Manville, Libby Owens, the metal companies, the air-conditioning concerns, are available to real estate and construction, but the building industry is the only one where the signs of progress are slight and the finished products are cheap in the least flattering sense, less functional yet more costly. Why is it we have not been able to bring housing down in cost? Today a Ford is more beautiful, faster, more functional, much more pleasant to ride in than a Simplex-Crane was in 1915—the Simplex-Crane that was the most expensive car built at that time. The automobile industry gives us a better car today than the best car of 1915 and for much less money.

You cannot say that about our business. Our business costs more than ever, notwithstanding that it is the heir—and incidentally the heir without pay—of all of the products of the laboratory. Can we blame the architect? Can we blame the builders? Can we blame the financiers? I do not know. Perhaps they are all to blame. Perhaps none. All I can say is that we are reaching the point very rapidly where it is almost impossible to build a building which will pay at all without some form of subsidy. And the FHA is a form of subsidy. And the FHA has accounted for perhaps 80 percent of the construction in the United States for the past 12 years.

What an indictment of an art, of an industry, and of a phase of finance! There is an answer because there must be. We at Webb & Knapp have tried to seek that answer by developing what we call the department of architectural research. Headed by a brilliant young architect, I. M. Pei, this department works hand in hand with a very active economic-minded organization of real-estate people who are not subsidized by anybody.

Pei and I got together to discuss a program and develop some sort of order of priorities for the more important challenges that exist in the real-estate industry and the architectural profession. It was obvious to me that the scope, however wide, pointed definitely to the multiple-dwelling housing as the first job to tackle. The reason for this was the obvious wastefulness resulting from shortsighted thinking on the part of planners and builders through the all too rapid obsolescence of apartment houses. I knew from firsthand experience that buildings 25 to 30 years of age were considered old while at the same time they were structurally sound and had a physical life of centuries—that the only serious deterioration that takes place in fireproof buildings is in mechanical equipment such as elevators and plumbing. With the small return available from this kind of construction, it was apparent that the income was rarely adequate to write off the structure by conventional depreciation methods and yet leave a satisfactory return on the investment.

Buildings seems to wear out for two reasons, both cyclical in character. The first reason was economic and the other sociological. As to the former, the good flush times resulting from economic booms made it desirable to have large luxury-type suites. The undercycle known as depression required the antithesis. Thus in the thirties the owners of buildings found themselves unable to meet the new demand and the would-be tenants could not afford to take the large, luxurious apartments even at drastically reduced rents, for the simple reason of the high cost of maintenance. The other cycle, the sociological one, occurs in every city all over the country irrespective of economic conditions. It is the usual trend of American residences to move from class character to mass character as the "class" moves steadily farther and farther out, partly for snobbish reasons but partly for the sound reason that the encroachment of the commercial aspects of the city on high-grade residences takes place everywhere as cities grow.

This sociological cycle calls for a change in layout and type of building. But our planning is so rigid, so inflexible, that it cannot adjust itself. If you could change the walls around, have greater latitude in expanding or contracting space by adding acoustical wall panels—which are better than walls a foot thick—your building would keep abreast of the market. Families could take more space in good times, less in bad.

Another thing we have to consider is extracting the utmost from the construction dollar by bringing together the thinking of the structural, mechanical, air-conditioning construction engineers with the thinking of the architect before the design is fixed, before the building is baked.

Well, I talked it over with Pei and gave him a rough idea in the form of a sketch of a building with a core for utilities and arms reaching out with apartments on them. He embodied these concepts into a spiral building which we called the Helix.

The result briefly is this. He gets his construction savings through a central mechanical core in which all the utilities, air conditioning, all the pipes for water and heat and electricity, and the elevators are located. All kitchens and bathrooms back up on this core and tap into it.

Structurally speaking, the circle enables you to use radial reinforced concrete wall, structural walls, as against the forest of girders in the conventional system. You can standardize wall panels, kitchen and bathroom units. On the periphery of the circle you can provide private terraces, 8 x 35 feet, giving every apartment a taste of the outdoors. You get better living space for smaller capital investment and have a building which is more likely to stay 100 percent occupied over a long term. That, I think, meets the problem.

Webb & Knapp believe that Mr. Pei's Helix, which is the first fruit of our laboratory, may be a forerunner of a complete change in philosophy toward design of multiple-dwelling construction And for that reason, and without concerning ourselves with FHA construction thinking, or stuffed-shirt banking thinking, or conventional architectural thinking, or art for art's sake thinking, we are going to try this one out ourselves and take the risk that it is a good idea. Having looked the country over from one end to the other to find the most appropriate site for this new design, we have bought the top of Nob Hill and shall locate the Helix at the very apex of San Francisco. If we are fortunate, it will be a reality in 1953–54.

We want to prove that research, an intelligent economic approach, and modern assembly methods can produce in the housing industry miracles of progress comparable to those in any other industry in the world. And we seek this development through reaching out for a relationship of the closest possible character between ourselves, who are real-estate men, builders, and real-estate economists, and you who are architects and designers. And we have no doubt that we are on the right road.

Cities Versus Suburbs—A Struggle for Survival

(By William Zeckendorf)

The idea of decentralization is not original with our generation. Nations, cities, all communities work on the same principle. New York, which started at the Battery and once had its northerly boundary at Wall Street, decentralized; they thought they were decentralizing enormously when they got as far north as Chambers Street and a little later, as far as the Bowery—that was the open country. Today, of course, we know the Bowery as in a sense an outmoded, abandoned area. With the advent of rapid transit the city decentralized still further, but that did not mean the destruction of the city. It merely meant that the city was growing, and enjoying the benefits of greater population and better communications.

Distance is not space but time. A man who had to walk 10 miles to go to work took more time than a man who today flies from New York to Chicago on a job. Naturally, as new means of transportation and better roads are developed, more remote places continually become accessible. The whole principle of real-estate economics changes.

Today, however, a new and vicious development has arisen in cities throughout the United States, which makes decentralization feared as the death knell of the central core area. This fear will continue at least as long as we have the present inept laws bearing on municipalities and satellite towns.

Satellite towns, which are the product of decentralization, are parasites. The high cost of maintenance of the central core that supports the whole metropolitan area is borne by the city, but the revenues and benefits go to the towns at the periphery—each having its own political setup, its own separate fire department, police department, water supply, its own mayor, its own councilmen; all a duplication of the cost of the city's core. Every satellite town saps off the buying power, the taxing power, and the vital factors that make for a cohesive, comprehensive, healthy city. This is just as though the United States suddenly lost the taxing power of California and New York through their setting up independent operation, but continued with the central bureaucracy and cost of maintenance of the Army and Navy, and so on. It wouldn't take very long for the United States to go broke on such a basis, and as long as this sort of thing can be done by the satellite towns around the mother city, we are jeopardizing the entire fiscal and political future of our great municipalities.

What I conceive as the answer would consist of a change in the basic law, providing that municipalities have the right of unilateral incorporation or of involuntary incorporation of the communities that live on them at the periphery. The satellite communities should be forced into the large city and taxed to make them a contributing part of the whole community.

The test as to whether a community is an independent community is simple and obvious, and if it fails to meet the test, then it should be incorporated into the large city. Otherwise, the township should retain its independence. This test should be: "Can this community survive financially, socially, and economically without the benefits from the large city?" Take employment, for example. Does the bulk of employment or earning power and other benefits come from the mother city or is the town a self-reliant, independent community? If the former is the case (which it happens to be in 90 percent of the satellite towns in the immediate vicinity of large cities), then the city should have the right to incorporate the town.

The net result would be beneficial. We could have integrated roads and highways. We could eliminate duplication of Government officials and bring about a vast reduction in repetitive bureaucratic setups. There could be a single taxing power, and there could be truly comprehensive zoning and planning so that the entire area becomes one interrelated unit. As long as we continue growing in the present unrelated pattern where each community imposes its own zoning and controls its own street system, and where it will do its own taxing and waste its own money and disregard what happens to the central core, just so long we shall have more and more confiscatory taxes by the central city, and less and less control of central city politics by the general citizenry, who will have abandoned the mother city to ward politics of the lowest order. The eventual result will be financial catastrophe.

There are many horrible examples of what we are speaking about, and perhaps the saddest of all is Boston. The present tax load on Boston real estate is as great in proportion to its sound value as the average tax plus first mortgage charges on the average city throughout the United States. One might say that already the city of Boston has gone a long way down the road toward confiscation of the real property asset, including the complete subordination of institutional first mortgages. This is merely symptomatic of the inevitable termination of decentralized communities each playing its own game, siphoning off the strength of the central core. There are 43 independent cities and towns in the metropolitan Boston area. Boston's tax rate compared with tax rates in some of the surrounding "bedroom towns," whose residents make their living in Boston, gives some indication of the burden on the taxpayers in the mother city. These are the 1951 tax rates per $1,000 of assessed valuation:

Boston	$62.80	Medford	$49.40
Arlington	54.20	Milton	41.40
Belmont	38.00	Newton	38.40
Brookline	38.90	Winchester	40.00

Another flagrant illustration of how termite communities feed on a great city can be seen in New York Harbor. On the Jersey shore of the Hudson River, along a 10-mile stretch running from Bayonne to Edgewater, there are piers vital to the welfare of the harbor generally. Yet they are situated in a series of townships notorious for their bureaucratic wastefulness. In communities such as Jersey City the tax rate raises the cost of pier occupancy beyond the ability of private ownership to pay taxes and maintain the piers and still to rent to shipping concerns at rates competitive with those in other ports. In Hoboken, for instance, a pier owned by our company has an assessed value of $622,000 and a tax rate of 8.3 calling for annual taxes of more than $50,000. This figure represents approximately 75 percent of the total rental revenues. Because of lack of earning power the value of the pier has been depressed to a point where we would gladly sell the property for 25 percent of its reproduction value and less than half of the city's assessment. The diversion of shipping from New York Harbor which is now taking place can be attributed to a large extent to waterfront costs, including pier rentals.

Many factors are involved in decentralization. The obvious one is ease of transportation, but among others which have a potent force is sociological and economic change. There is snob appeal: the desire of the rich or the newly rich or the aspiring rich to disassociate themselves from those in a more modest economic or intellectual category. The established families tend to hold themselves above the Johnny-come-latelies. The Johnny-come-latelies soon reach the same category as their former "superiors," when their income improves and their education or their children's education brings them up to acceptable country-club standards. Fortunately the tracks can be crossed either way, and the cross-currents soon get mixed after the third generation. As the less desirable encroach on the established communities of the right people, the right people move farther out, discovering new fields and following the social leader. They leave in their wake a void which is rapidly filled by those aspiring to the higher level, who in turn follow their leader, abandoning what was once the best location in the community close to the central core ("best" because it was originally selected by the settlers for reasons of convenience) to the poorest economic and sociological level. The result is that we have some of the worst slums within the shadow of city hall all over the United States. This pattern is to be found in almost every community over a hundred years old.

These city-hall slums offer a wonderful opportunity for real-estate speculation and a challenge to the entrepreneur because large-scale redevelopment at a great profit can be achieved in the central area. But one of the worst tendencies in redevelopment throughout the United States is to demolish slums close to the central core after condemnation, and then to replace them with low-cost housing. The downtown area of the cities in the United States should not be used for housing but should be devoted to high tax producing sites, to give the cities the greatest long-term tax benefits.

Now a city can maintain its beauty and functionalism only by determining what it is best qualified to offer to the general economy. Where does it stand in the national orbit? New York is an excellent example of a city that has gone a long way toward achieving the greatest development consistent with its abilities.

First, it is a great port. Being a port, it must have great distribution and collective transportation power. It must be able to take in the imports and distribute them through the country and collect the products from the factories and farms of the Nation so that they can reach the distant cities of the world by water-borne traffic. New York has made the most of the Hudson River. It has the greatest network of railroads in the world. Back in the middle of the 19th century it recognized the necessity of tapping the western development and was the first to go in for an integrated group of canals to the Middle West.

Before decentralization of manufacturing took place it was a great location for manufacture, for the processing of the world's raw materials and the distribution of the commodities which came to its door. With the decentralization of heavy industry and a great deal of light industry, New York changed its pattern accordingly, and rapidly became not only the distributive point but also the merchandising point, leaving it to the rapidly growing industrial areas of the Nation to do the manufacturing. New York enlarged the concept of the idea-exchange market, financial center, executive center, cultural, advertising, and style center, and took comfort in the fact that in spite of the loss of heavy industry and some light industry through decentralization, it could well make on the bananas what it was losing on the peanuts. The city realized that as fast as manufacturing would be decentralized, just as fast would it be imperative to centralize the market place, the idea center, and the world of finance which, in turn, would make possible the further development of the decentralized areas.

Boston, on the other hand, failed to accommodate itself to change. Boston held on to its old spinning mills, and its weaving and its water power, and had the rug pulled out from under while it tried to retain plants that long since were outmoded by competition which it could no longer meet. New York has been the most rapidly changing of all the cities. It has proved the wisdom of abandoning heavy industry in favor of office buildings. There is no city in the whole Nation that has strength and solvency of office-building investments comparable to that of the city of New York. New York gets the highest rent, has always enjoyed the highest occupancy, and has always had the finest corporate representation. When the world capital, the United Nations, was seeking a home, it was New York that reached out and grabbed it, recognizing the importance to the city of this international forum. The United Nations, seeking a city that best suited its character and function, realized that New York was its proper home for a long-term future; and so, finally, New York in addition to all the other things has now become the capital of the world.

Other cities have a similar opportunity to develop within the scope of their potential—Houston, for example, or Buffalo. Many of them are achieving their destinies, some unconsciously; but the moment they start to try to be or to look like New York they are going to fail. The city of San Francisco has a distinctive personality. The same thing is true of Los Angeles, of Atlanta, and of many other cities throughout the country. They must find what they can best do most profitably in the large sense, and then readapt themselves according to this realization.

Incorporation of the communities that live off the mother city is by far the most important single remedial step that can be taken to stop the breakdown of cities which we are currently pleased to call decentralization. Cities, meantime, must make themselves more attractive; they must reattract people to the central core. Let's say a city has analyzed its potentials. It should then take stock of what it has to offer the people who live in it and around it, and go all out to satisfy their fundamental demands.

In too many cities—especially in the manufacturing and industrial cities—there is an element of grimness, a lack of balance between work and play, which drives people out. The automobile enables people to escape, and they are no longer trapped within a narrow radius as they were before the automobile was invented.

Take the city of Buffalo as illustrative of this point. Basically Buffalo is a vibrant city, strong and virile, with a tremendous growth potential, a great urge to expand. The city is strong industrially. It has a reasonable diversification, although not as much as I like to see. If there were more interests owned locally or more interest taken locally in the home industries, probably less of the city's earnings would be siphoned off and spent elsewhere. But Buffalo is most deficient, as I see it, in this respect: it has not devoted much of its time or thinking to the lighter side of life for the people who are its industrial employees.

Well, what to do about it? We have the trend toward shorter hours and more leisure time. I urge upon the many cities across the country in which this situation exists that they take a well-located site and, making the most of the desire to eliminate blight, replace it with a development just as important as housing: namely, a play area—a place for fun. Each city must find the best place for its center of fun and entertainment, and since most have their share of substandard properties close to the central core, the selection should not be difficult. Watch the way Pittsburgh is developing its new recreation park, once a railroad yard, at the meeting of the rivers.

I visualize these fun centers as consisting of a tremendous dancehall, bowling alleys, skating rinks, merry-go-rounds for the children, a swimming pool for the children and one for the adults too—in short, a happy, functionally designed center for dancing and exercise and entertainment. In addition to lifting the morale of the people, such a place would give balance to the labor of the men who make the basis for the city's economy. And they would say, "Let's go to town. Let's have some fun tonight." People would feel that their city is a great place to live in, not a great place to get away from.

Curiously enough, such a center would pay for itself. There is no type of investment well conceived and well located and well executed which will pay as high a return in relation to the invested capital as this sort of thing. If your city is one that people want to come to, one of the great and important problems of your economy can be substantially solved simply through the attraction of more and better labor. And you can reattract to the central area a large part of the buying power that is now being lost to the nontaxpaying satellite communities.

Atlanta, like Buffalo, is virile and dynamic, and is growing out of its breeches. It is a great distributing city—possibly the greatest for its size in the United States except for cities that are seaports. It is blessed with a geographical position beyond the pull of such cities as Chicago, Washington, Philadelphia, New Orleans. Atlanta has no important nearby competition that is going to bypass it and leave it dying on the vine. Geography makes Atlanta's position safe if its potential is fully exploited.

Atlanta is a great retail market as well as a secondary wholesale market. The position of the city with respect to the many communities within its radius is strong and growing stronger. It can draw as a magnet from farther and farther points, thanks not the least to its merchants, who know how to offer people things that they come for. The city is well located from the standpoint of proximity to good labor and raw materials. Since these advantages are correlated with a well-integrated transportation system—air, rail, and highway—the city should continue to grow with a strong, diversified industrial expansion in balance with the distributing, light manufacturing, and retail end. The city has everything except water shipping and makes up for that with railways.

But the same thing applies to Atlanta as applies to Buffalo. All work and no play makes Jack a dull boy. Atlanta, in my opinion, has not devoted enough time and thought and investment of capital to entertainment and play. It should wipe out the blighted central area and, as part of the park system, plan a center of fun. Atlanta should also have cultural and theatrical facilities worthy of its potential, and it should have convention and auditorium facilities that can handle the people whom it will continue to attract and reattract.

This brings us to the heart of the matter—the problem of overall planning. I am a great believer in planning but a great disbeliever in spot planning. Planning means the cooperation of the private developer and municipal authority. Cooperation furnishes the key. I am not in favor of any city authority going into private real-estate business. Planning alone by planners without hard-boiled knowledge of real-estate economics means boondoggling and bankruptcy. On the other hand, I would not permit two or three holdouts in an area to stymie a great development would be in everyone's interest. We need a marriage between Government and private capital on a practical, workable basis for the redevelopment of our cities.

What is the city's role in development? First, to analyze itself to discover the things it can do and the things it can't do, and then to implement its potentials through a master plan. This master plan may be a somewhat idealized conception, but it can be a vastly important one as a standard to live up to and as a guide.

The city should then enforce its plan through those powers which in its position of arbiter are proper to it: (1) the right to zone; (2) the right to condemn: (3) the setting up of a revolving fund for the purpose of buying and selling land, not in the speculative sense but to achieve the best in its redevelopment program.

Most people know about number one. The city says: If we are going in for office buildings, for example, let's place the highest type here, the second-type there; light industry and semi-heavy and heavy industry would be here and over there, where they logically go with utilities and functions allied to them. If we are going in for theaters, let them have a logical relationship to the things that are connected with them—the hotels, dining places, cabarets, and perhaps opera, music, ballet, and allied arts, and schools of all kinds in these several fields. The city must rigidly restrict the different sections again encroachment by an irrational type of building. Second-rate retail stores with neon signs and cheap buildings should not sit next to residential property; residences should be kept to appropriate areas, and industrial activity should not encroach on residential or office space areas. Each has to have its place in the scheme. Leave it to the ingenuity and individuality of the man to plan his own buildings; but in order to protect the community, give him limitations as to where he may build what he wants to build.

The right to condemn is a most important municipal function. The city should continue to deliver the communal developments such as parks, streets, and highways; but, in my opinion, it should be much more generous in its use of eminent domain for redevelopment purposes and it should also try to make a profit. This may be heresy, but I am against the windfall profit for the fellow who had nothing to do with the creation of increment through a communal development. If the city, in other words, decides it is going to build a park, it should condemn an area around the park and should realize on the increased value of the land around the park through the resale to private developers.

In this way it will be possible for the city to redevelop itself and get its money back for the communal project. Furthermore, the city can create increment merely by virtue of assemblage. If a block consisting of 10 separate 25-foot holdings is assembled, it is a simple principle of reale-state economics that the whole is worth more than the 10 individual parts. Appreciation of real-estate values in urban areas takes place through assemblage. That costs nobody anything. It is purely the constructive result emanating from the greater functional utility of larger areas. By this means the city can recapture the greater part, if not all, of the cost of areas it wants redeveloped, directly from the properties that realize the benefit reflected in increased value.

The actual redevelopment work would, of course, be left in the hands of private enterprise. To have private capital develop or redevelop the urban areas is vital and essential. I do not believe a bureaucratic, citywide, statewide, or national planning or executive commission could possibly accomplish the actual work. It has to be done under the hard, cold analysis that venture capital will give everything that it goes into. Success of individual enterprise is the only true test.

One more point—in some ways the most important of all. The question of master planning and supervision of design can almost never be carried too far so long as it is in intelligent, imaginative, and honorable hands. The relationship between city authorities and private enterprise, therefore, in meeting the great challenge of our cities should be one of mutual openmindedness. Pride of authorship should be forgotten in the interests of all, and the planning authorities should encourage the submission of plans by creative private enterprise, thus insuring that no bets are overlooked, that their own planning ideas are compared with those of private enterprise, and that all men in the community are making their best contribution toward a living community.

STATEMENT OF BRIG. GEN. E. C. ITSCHNER, ASSISTANT CHIEF OF ENGINEERS FOR CIVIL WORKS, CORPS OF ENGINEERS, DEPARTMENT OF THE ARMY

It is my purpose in this statement to describe briefly the civil-works activities of the Corps of Engineers in order to provide a background for discussion, and to present certain problems which are inherent in a program of this kind.

The civil functions of the Department of the Army which are administered by the Corps of Engineers are a part of the overall Federal activity in water resource development. These under existing law include the improvement of the Nation's rivers, lakes, and harbors for navigation, flood control, and shore protection, and for related purposes such as water supply, pollution abatement, preservation of fish and wildlife, and notably for development of hydroelectric power.

When the Federal Government first began to participate in work of this kind, early in the 1800's, the program was limited to navigation improvements of moderate cost. In more recent years the civil-works activity has been broadened by congressional authority, particularly since the first general Flood Control Act of 1936. At the present time the active authorized program has a total cost of $15.2 billion. Works with a cost of $3.1 billion are complete or essentially complete. Work under construction has a total cost of $5.6 billion and appropriations of about $2.4 billion will be required for completion. And authorized improvements with an estimated cost of $6.5 billion have not been started.

In addition, after review of the entire authorized program the Corps of Engineers has classed over 400 projects with an estimated cost of $3.6 billion as inactive or deferred for further study.

Work under this program has been accomplished in recent years with annual appropriations of about $330 million for new construction. The President's budget for fiscal year 1956 contemplates construction expenditures of $397 million—an increase of about 20 percent. In addition, about $100 million will be provided for maintenance and operation of completed works and for investigations.

During the past year 31 projects with an estimated total cost of $1.2 billion were placed in effective operation, either wholly or in part. These works involve:

Provision of over 39 million acre-feet of storage.

Flood protection of over 4 million acres of land.

Installation of 803,000 kilowatts of power during the year.

The projects in the program range from the large project for flood protection and navigation in the alluvial valley of the Mississippi River to small channel and harbor improvements. It includes large multiple-use projects in the Columbia and Missouri River Basins; reservoirs for flood control and water supply in Texas; flood protection for the densely populated Los Angeles area; the complex project for water control in central and southern Florida; improvements of all of our major ports; and work on the harbors and connecting channels of the Great Lakes.

It is inevitable that a major program of this kind, which affects basic natural resources such as water, land, and power, and many diverse interests, will generate difficult problems. And conflicts of interest often result from impingement of one national program on another. Such differences are healthful so long as they arise in good faith and lead to a thorough exploration of all aspects of the situation. These matters are now being explored by the Hoover Commission and by the President's Cabinet Committee on Water Resource Policy. The Federal agencies themselves took the initiative last year in strengthening the machinery for interagency coordination.

One of the most pertinent questions affecting the civil-works program and water resource development in this country is in regard to the relative degree of Federal and non-Federal participation in this activity; and as to how costs should be shared. We feel that the relative Federal-State-local interest and participation in water resource development should be generally in accordance with the distribution of benefits and in accord with the character of the benefits. This will vary according to various phases of water resource development, and with regional needs. However, where different phases of water resource development produces essentially the same result, the degree of Federal participation should be generally uniform.

The Federal interest in water resource development generally will vary across a rather wide "spectrum." At one end would be a major improvement, such as the main protective system for the alluvial valley of the Mississippi, in which there is primary Federal interest and which may properly be undertaken wholly or largely at Federal cost. At the other end of the spectrum is the minor, local flood problem and improvement, where benefits will accrue to readily identifiable local beneficiaries. Such work probably should be undertaken largely by States or local organizations. Between these extremes are intermediate cases where judgment and equity will indicate a variable sharing of cost depending on whether benefits are general and widespread, or local and readily identified.

In brief, there should be greater non-Federal participation in water resource development, but this participation should not be so great as to impede progress at a time when sound conservation and development of our water resources is more essential than ever before.

Another important question affecting this program concerns the procedure for planning for water resource development. This should be accomplished by river basins or by appropriate related regions. The Federal Government should take the lead in planning, but States should participate actively. On the Federal side this planning should be carried out by the agencies concerned, or by groups of agencies where appropriate. The two interagency surveys of the Arkansas-White-Red River Basins and of the New York-New England area, in which the States are participating, may well be pioneer experience in such coordinated water resource planning.

Federal participation in water resource development is only one of many heavy demands upon the Treasury. Progress insofar as Federal participation is concerned must necessarily recognize budgetary ceilings and limitations. With limited funds, however, we must be selective and proceed first with those improvements most urgently needed and which will bring the greatest economic and social returns to the Nation.

(The following letter was subsequently received for the record:)

CHESTNUT HILL, PHILADELPHIA 18, PA., *January 31, 1955.*

Hon. PAUL H. DOUGLAS,
Chairman, Joint Committee on the Economic Report,
United States Senate, Washington 25, D. C.

DEAR SENATOR DOUGLAS: Would you be good enough to have the following read into the record of the hearing of February 3, 1955, on public works policies:

As President Hoover gave me the credit for drafting and sponsoring the Federal Employment Stabilization Act of 1931, I would like to support the proposal before the committee to create the coordinating body on public works planning, as proposed in the President's message.

The Federal Employment Stabilization Board, set up in 1931, had the same purpose and was based on the same theory. It came too late to have any effect in mitigating the then existing depression. Its functions were taken over by a number of emergency agencies set up by President Roosevelt. These extemporized agencies initiated large quantities of public works of many kinds, some more effective in relieving unemployment and stabilizing industries than others.

If the coordinating agency now proposed had been in existence several years before the depression of the thirties, the severity of the depression would have been mitigated and the work done under this economic theory would have been more effective, better planned, and better coordinated.

The President's proposal to place the new body in close connection with the budget is correct. It is apparently proposed to include State and municipal public works in the general stabilization scheme. This is important and, experience proves, very difficult. Municipalities have a way of borrowing, when their credit permits, and constructing their maximum during boom periods and periods of economic growth and upswing.

The only way that this can be controlled, that I know of, is by the device contained in a recent amendment to the Constitution of the Commonwealth of Pennsylvania, applying to the city of Philadelphia. This amendment is now operative in Philadelphia and is working well. It provides that the borrowing power of the city shall be based, not upon the real estate valuation of the preceding year, but of the preceding 10 years. Thus when the city is growing in valuation the curve of its borrowing capacity does not rise as rapidly as the curve of its growth. Conversely, when valuations begin to go down, or are stationary, and growth is slowing down or stopping temporarily, there is a period in which the borrowing power is still rising from the accumulated effects of the increased valuations of the preceding 9 years.

My suggestion is that, after the coordinating body is created, it studies this amendment and method of applying an economic theory to borrowing power and see how far it can be promoted in cities and States.

One of the authorities on this subject is Prof. Karl Scholz, professor of economics of the University of Pennsylvania.

The man who carried this through the legislature was the then speaker of the house, Representative Charles C. Smith, of Philadelphia.

The person who has to put this theory into practical effect is Edward Hopkinson, Jr., chairman of the City Planning Commission of Philadelphia.

I was the initiator and promoter as chairman of the committee of the Philadelphia Committee on Public Affairs.

If desired, I could appear in support of the President's message and this application of it.

Sincerely yours,

OTTO T. MALLERY.

(The following message on Federal cooperation with States in regard to building additional classrooms was sent to the Congress subsequent to the hearing on public facilities.)

[H. Doc. No. 84, 84th Cong., 1st sess.]

FEDERAL COOPERATION WITH STATES IN REGARD TO BUILDING ADDITIONAL CLASSROOMS—MESSAGE FROM THE PRESIDENT OF THE UNITED STATES PROPOSING A PLAN OF FEDERAL COOPERATION WITH THE STATES IN REGARD TO BUILDING ADDITIONAL CLASSROOMS FOR SCHOOLCHILDREN

To the Congress of the United States:

For the consideration of the Congress, I herewith propose a plan of Federal cooperation with the States, designed to give our schoolchildren as quickly as possible the classrooms they must have.

Because of the magnitude of the job, but more fundamentally because of the undeniable importance of free education to a free way of life, the means we take to provide our children with proper classrooms must be weighed most carefully. The phrase "free education" is a deliberate choice. For unless education continues to be free—free in its response to local community needs, free from any suggestion of political domination, and free from impediments to the pursuit of knowledge by teachers and students—it will cease to serve the purposes of free men.

STATE AND LOCAL RESPONSIBILITY FOR EDUCATION

A distinguishing characteristic of our Nation, and a great strength, is the development of our institutions within the concept of individual worth and dignity. Our schools are among the guardians of that principle. Consequently, and deliberately, their control and support throughout our history have been, and are, a State and local responsibility.

The American idea of universal public education was conceived as necessary in a society dedicated to the principles of individual freedom, equality, and self-government. A necessary corollary is that public schools must always reflect the character and aspirations of the people of the community.

Thus was established a fundamental element of the American public school system—local direction by boards of education responsible immediately to the parents of children and the other citizens of the community. Diffusion of authority among tens of thousands of school districts is a safeguard against centralized control and abuse of the educational system that must be maintained. We believe that to take away the responsibility of communities and States in educating our children is to undermine not only a basic element of our freedom but a basic right of our citizens.

The legislative proposals submitted to the last Congress were offered by the administration in the earnest conviction that education must always be close to the people: in the belief that a careful reassessment by the people themselves of the problems of education is necessary; and with a realization of the growing financial difficulties that school districts face. To encourage a nationwide examination of our schools, the 83d Congress authorized funds for conferences on education in the 48 States and the Territories and for a White House conference to be held in November of this year.

THE CURRENT PROBLEM

These are the facts of the classroom shortage:

The latest information submitted by the States to the Office of Education indicates that there is a deficit of more than 300,000 classrooms, a legacy, in part, of the years of war and defense mobilization when construction had to be curtailed. In addition, to keep up with mounting enrollments, the Nation must build at least 50,000 new elementary and high-school classrooms yearly. It must also replace the thousands of classrooms which become unsafe or otherwise unusable each year.

During the current school year, about 60,000 new classrooms are being built. Capital outlays for public-school construction will reach an all-time high of $2 billion this year. During the last 5 years, new construction, costing over $7 billion, has provided new classrooms for 6,750,000 pupils in our public schools. During that time more than 5½ million additional children enrolled in school. Thus the rate of construction has more than kept pace with mounting enrollment. But it has only slightly reduced the total classroom deficit.

As a consequence, millions of children still attend schools which are unsafe or which permit learning only part time or under conditions of serious overcrowding. To build satisfactory classrooms for all our children, the current rate of school building must be multiplied sharply and this increase must be sustained.

Fundamentally, the remedy lies with the States and their communities. But the present shortage requires immediate and effective action that will produce more rapid results. Unless the Federal Government steps forward to join with the States and communities, this emergency situation will continue.

Therefore, for the purpose of meeting the emergency only and pending the results of the nationwide conferences, I propose a broad effort to widen the accepted channels of financing school construction and to increase materially the flow of private lending through them, without interference with the responsibility of State and local school systems. Over the next 3 years, this proposed effort envisages a total of $7 billion put to work building badly needed new schools, in addition to construction expenditures outside these proposals.

THE RECOMMENDATIONS

1. Bond purchases by the Federal Government

The first recommendation is directed at action, effective as rapidly as school districts can offer bonds to the public for sale.

I recommend that legislation be enacted authorizing the Federal Government, cooperating with the several States, to purchase school bonds issued by local communities which are handicapped in selling bonds at a reasonable interest rate. This proposal is sound educationally and economically. It will help build schools.

To carry out this proposal, I recommend that the Congress authorize the appropriation of $750 million for use over the next 3 years.

2. State school-building agencies

Many school districts cannot borrow to build schools because of restrictive debt limits. They need some other form of financing. Therefore, the second proposal is designed to facilitate immediate construction of schools without local borrowing by the school district.

To expand school construction, several States have already created special statewide school-building agencies. These can borrow advantageously, since they represent the combined credit of many communities. After building schools, the agency rents them to school districts. The local community under its lease gets a new school without borrowing.

I now propose the wider adoption of this tested method of accelerating school construction. Under this proposal the Federal Government would share with the States in establishing and maintaining for State school-building agencies an initial reserve fund equal to 1 year's payment on principal and interest.

The State school-building agency, working in cooperation with the State educational officials, would issue its bonds through the customary investment channels, then build schools for lease to local school districts. Rentals would be sufficient to cover the payments on principal and interest of the bonds outstanding; a payment to a supplemental reserve fund; and a proportionate share of the administrative expenses of the State school-building agency. In time, the payments to the reserve fund would permit repayment of the initial Federal and State advances. When all its financial obligations to the agency are met, the local school district takes title to its building.

I recommend that the Congress authorize the necessary Federal participation to put this plan into effect so that State building agencies may be in a position to issue bonds in the next 3 years which will build $6 billion worth of new schools.

3. Grants for school districts with proved need and lack of local income

My first message to the Congress on the state of the Union stated the view that "the firm conditions of Federal aid must be proved need and proved lack of local income." In my judgment, any sound program of grants must adhere to this principle. Some school districts meet the conditions. In them the amount of taxable property and local income is so low as to make it impossible for the district either to repay borrowed money or rent a satisfactory school building.

I now propose a program of grants-in-aid directed clearly and specifically at the urgent situations in which the Federal Government can justifiably share direct construction costs without undermining State and local responsibility. Under this proposal the Federal Government would share with the States part of the cost of building schools in districts where one of the following conditions is met:

(*a*) The school district, if it has not reached its legal bonding limit, cannot sell its bonds to the Federal Government under proposal 1 because it cannot pay interest and principal charges on the total construction costs.

(*b*) The school district, if it has reached its legal bonding limit, is unable to pay the rent needed to obtain a school from a State agency on a lease-purchase basis, as described in proposal 2.

The State would certify the school district's inability to finance the total construction cost through borrowing or a rental arrangement. It would also certify that the new school is needed to relieve extreme overcrowding, double shifts, or hazardous or unhealthful conditions.

The Federal and State aid would be in an amount sufficient for a school district to qualify under either proposal 1 or proposal 2 for financing the remainder of the building costs. The requirement that Federal funds be matched with State-appropriated funds is an essential safeguard to preservation of the proper spheres of local, State, and Federal responsibility in the field of public education.

By authorizing this program of joint Federal-State aid to supplement the financing plans set forth in proposals 1 and 2, a workable way will be provided for every community in the Nation to construct classrooms for its children. I recommend that the Congress authorize the appropriation of $200 million for a 3-year program.

4. Grants for administrative costs of State programs

In addition to immediate school construction, the Nation needs to plan sound long-term financing of the public schools free from obsolete restrictions. Our State conferences on education will help accomplish this. Out of these meetings of parents, teachers, and public-spirited citizens can come lasting solutions to such underlying problems as more efficient school districting and the modification of unduly restrictive local debt limits.

The Federal Government, having helped sponsor the State conferences on education, should now move to help the States in carrying out such recommendations as may be made. I propose, therefore, that the Federal Government furnish one-half of the administrative costs of State programs which are designed to overcome obstacles to local financing or to provide additional State aid to local school districts.

For this purpose, I recommend a total authorization of $20 million with an appropriation of $5 million for the first year of a 3-year period.

This program is sound and equitable. It accelerates construction of classrooms within the traditional framework of local responsibility for our schools. It does not preclude other proposals for long-range solutions which undoubtedly will grow out of the State conferences and the White House Conference on Education.

CONCLUSION

The best possible education for all our young people is a fixed objective of the American Nation. The four-point program, herein outlined, would help provide proper physical housing for the achievement of this objective. But the finest buildings, of themselves, are no assurance that the pupils who use them are each day better fitted to shoulder the responsibilities, to meet the opportunities, to enjoy the rewards that one day will be their lot as American citizens.

Good teaching and good teachers made even the one-room crossroads schools of the 19th century a rich source of the knowledge and enthusiasm and patriotism, joined with spiritual wisdom, that mark a vigorously dynamic people. Today, the professional quality of American teaching is better than ever. But too many teachers are underpaid and overworked and, in consequence, too few young men and women join their ranks. Here is a shortage, less obvious but ultimately more dangerous, than the classroom shortage.

The conferences now underway and the massive school-building program here proposed will, I believe, arouse the American people to a community effort for schools and a community concern for education, unparalleled in our history. Taken together, they will serve to advance the teaching profession to the position it should enjoy.

Federal aid in a form that tends to lead to Federal control of our schools could cripple education for freedom. In no form can it ever approach the mighty effectiveness of an aroused people. But Federal leadership can stir America to national action.

Then the Nation's objective of the best possible education for all our young people will be achieved.

DWIGHT D. EISENHOWER.

THE WHITE HOUSE, *February 8, 1955.*

(Whereupon, at 5:20 p. m., Thursday, February 3, 1955, the committee adjourned to Tuesday, February 8, 1955.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

TUESDAY, FEBRUARY 8, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Senators Flanders and Goldwater, and Representatives Bolling, Kelley, and Talle.

The CHAIRMAN. Before the panel starts, Senator Flanders would like to make a brief statement.

Senator FLANDERS. Mr. Chairman, I would like to call attention to a remarkable series of events. There is a joint committee print on trends in economic growth giving a comparison of the Western Powers and the Soviet bloc, with particular attention to the failure of the Soviet bloc in agricultural production. The study was released a week ago Friday. Last Friday a rather embarrassed young man from the Soviet Embassy came to the committee offices and got some copies of this document, which is entitled "Trends in Economic Growth." This morning we find that Malenkov has resigned, largely on account of the failure of the agricultural program.

I think it is evident, Mr. Chairman, that the work of our committee and our staff has resulted in a major change in the rule of the whole Soviet Government, and I wish the record to show it.

There is one other point, and that is——

Representative TALLE. Will the Senator yield? Inasmuch as the Senator from Vermont is a fine Latin scholar, we might say this is a case of post hoc ergo propter hoc.

Senator FLANDERS. Well, I do not want to diminish in any way my conviction of the result of the activities of this committee, and so I regretfully refuse to accept the Latin maxim which the Senator has proposed.

For the benefit of others who did not have Latin in high school as I did, I would say that Representative Talle is trying to say that this is a case in which, because a thing occurred afterward it must have been the cause, but I indignantly refute or refuse to agree with the implications of my friend, the Representative from Iowa.

Representative TALLE. I share the Senator's point of view, in fact.

Senator FLANDERS. Thank you.

Now the second point is, Mr. Chairman, I think it might be well to introduce into the record the message of the White House on the recommendations for developing foreign economic policy of the United States, and I ask that it be included in the record.

The CHAIRMAN. That will be done, and the chairman will reserve the right to file certain declarations of the Democratic Party dating back to the year 1801 on the subject of foreign policy, too.

(The mesage referred to is as follows:)

FOREIGN ECONOMIC POLICY OF THE UNITED STATES—MESSAGE FROM THE PRESIDENT OF THE UNITED STATES (H. DOC. NO. 63)

To the Congress of the United States:

For the consideration of the Congress, I submit my recommendations for further developing the foreign economic policy of the United States. Although largely based upon my special message to the Congress of March 30, 1954, these proposals are the product of fresh review.

The Nation's enlightened self-interest and sense of responsibility as a leader among the free nations require a foreign economic program that will stimulate economic growth in the free world through enlarging opportunities for the fuller operation of the forces of free enterprise and competitive markets. Our own self-interest requires such a program because (1) economic strength among our allies is essential to our security; (2) economic growth in underdeveloped areas is necessary to lessen international instability growing out of the vulnerability of such areas to Communist penetration and subversion; and (3) an increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people.

In the worldwide struggle between the forces of freedom and those of communism, we have wisely recognized that the security of each nation in the free world is dependent upon the security of all other nations in the free world. The measure of that security in turn is dependent upon the economic strength of all free nations, for without economic strength they cannot support the military establishments that are necessary to deter Communist armed aggression. Economic strength is indispensable, as well, in securing themselves against internal Communist subversion.

For every country in the free world economic strength is dependent upon high levels of economic activity internally and high levels of international trade. No nation can be economically self-sufficient. Nations must buy from other nations, and in order to pay for what they buy they must sell. It is essential for the security of the United States and the rest of the free world that the United States take the leadership in promoting the achievement of those high levels of trade that will bring to all the economic strength upon which the freedom and security of all depends. Those high levels of trade can be promoted by the specific measures with respect to trade barriers recommended in this message, by the greater flow of capital among nations of the free world, by convertibility of currencies, by an expanded interchange of technical counsel, and by an increase in international travel.

From the military standpoint, our national strength has been augmented by the overall military alliance of the nations constituting the free world. This free world alliance will be most firmly cemented when its association is based on flourishing mutual trade as well as common ideals, interests, and aspirations. Mutually advantageous trade relationships are not only profitable but they are also more binding and more enduring than costly grants and other forms of aid.

Today numerous uneconomic, man-made barriers to mutually advantageous trade and the flow of investment are preventing the nations of the free world from achieving their full economic potential. International trade and investment are not making their full contribution to production, employment, and income. Over a large area of the world currencies are not yet convertible.

We and our friends abroad must together undertake the lowering of the unjustifiable barriers to trade and investment, and we must do it on a mutual basis so that the benefits may be shared by all.

Such action will add strength to our own domestic economy and help assure a rising standard of living among our people by opening new markets for our farms and factories and mines.

The program that I am here recommending is moderate, gradual, and reciprocal. Radical or sudden tariff reductions would not be to the interest of the United States and would not accomplish the goal we seek. A moderate program, however, can add immeasurably to the security and well-being of the United States and the rest of the free world.

TRADE AGREEMENT AUTHORITY

I request a 3-year extension of Presidential authority to negotiate tariff reductions with other nations on a gradual, selective, and reciprocal basis. This authority would permit negotiations for reductions in those barriers that now limit the markets for our goods throughout the world. I shall ask all nations with whom we trade to take similar steps in their relations with each other.

The 3-year extension of the Trade Agreements Act should authorize, subject to the present peril and escape clause provisions:

1. Reduction, through multilateral and reciprocal negotiations, of tariff rates on selected commodities by not more than 5 percent per year for 3 years;
2. Reduction, through multilateral and reciprocal negotiations, of any tariff rates in excess of 50 percent to that level over a 3-year period; and
3. Reduction, by not more than one-half over a 3-year period, of tariff rates in effect on January 1, 1945, on articles which are not now being imported or which are being imported only in negligible quantities.

THE GENERAL AGREEMENT ON TARIFFS AND TRADE

For approximately 7 years the United States has cooperated with all the major trading nations of the free world in an effort to reduce trade barriers. The instrument of cooperation is the General Agreement on Tariffs and Trade. Through this agreement the United States has sought to carry out the provisions and purposes of the Trade Agreements Act.

The United States and 33 other trading countries are now reviewing the provisions of the agreement for the purpose of making it a simpler and more effective instrument for the development of a sound system of world trade. When the current negotiations on the revision of the organizational provisions of the General Agreement are satisfactorily completed, the results will be submitted to the Congress for its approval.

CUSTOMS ADMINISTRATION AND PROCEDURE

Considerable progress has been made in freeing imports from unnecessary customs administrative burdens. Still more, however, needs to be done in the three areas I mentioned in my message last year: (1) the simplification of commodity definitions, classification and rate structures; (2) improvement in standards for the valuation of imports; and (3) further improvement of procedures for customs administration.

An important step toward simplification of the tariff structure was taken by the Congress last year with the passage of the Customs Simplification Act which directs the Tariff Commission to study the difficulties of commodity classification of imports. The interim report of the Tariff Commission to be made by next March 15 should help enable the Congress to determine whether further legislative steps should then be taken or should await submission of the final report.

The uncertainties and confusion arising from the complex system of valuation on imported articles cause unwarranted delays in the determination of customs duties. I urge the Congress to give favorable consideration to legislation for remedying this situation.

The improvement of customs administration requires continuous effort, as the Congress recognized by enacting the Customs Simplification Acts of 1953 and 1954. The Treasury Department in its annual report to the Congress will review the remaining reasons for delay or difficulty in processing imported articles through customs and will propose still further technical amendments to simplify customs procedures.

UNITED STATES INVESTMENT ABROAD

The whole free world needs capital; America is its largest source. In that light, the flow of capital abroad from our country must be stimulated and in such a manner that it results in investment largely by individuals or private enterprises rather than by Government.

An increased flow of United States private investment funds abroad, especially to the underdeveloped areas, could contribute much to the expansion of two-way international trade. The underdeveloped countries would thus be enabled more easily to acquire the capital equipment so badly needed by them to achieve sound economic growth and higher living standards. This would do much to offset the false but alluring promises of the Communists.

To facilitate the investment of capital abroad I recommend enactment of legislation providing for taxation of business income from foreign subsidiaries or branches at a rate 14 percentage points lower than the corporate rate on domestic income, and a deferral of tax on income of foreign branches until it is removed from the country where it is earned.

I propose also to explore the further use of tax treaties with the possible recognition of tax concessions made to foreign capital by other countries. Under proper safeguards, credit could be given for foreign income taxes which are waived for an initial limited period, as we now grant credit for taxes which are imposed. This would give maximum effectiveness to foreign tax laws designed to encourage new enterprises.

As a further step to stimulate investment abroad, I recommend approval by the Congress at the appropriate time of membership in the proposed International Finance Corporation, which will be affiliated with the International Bank for Reconstruction and Development. This Corporation will be designed to increase private investment in less developed countries by making loans without Government guaranties. Although the Corporation will not purchase stock, it will provide venture capital through investing in debentures and similar obligations. Its operation will cover a field not dealt with by an existing institution.

The executive branch will continue through our diplomatic representatives abroad to encourage a climate favorable to the private enterprise concept in investment.

We shall continue to seek other new ways to enlarge the outward flow of capital.

It must be recognized, however, that when American private capital moves abroad it properly expects to bring home its fair reward. This can only be accomplished in the last analysis by our willingness to purchase more goods and services from abroad in order to provide the dollars for these growing remittances. This fact is a further compelling reason for a fair and forward-looking trade policy on our part.

TECHNICAL COOPERATION

The United States has a vast store of practical and scientific know-how that is needed in the underdeveloped areas of the world. The United States has a responsibility to make it available. Its flow for peaceful purposes must remain unfettered.

United States participation in technical cooperation programs should be carried forward. These programs should be concerned with know-how rather than large funds. In my budget message next week, I shall recommend that the Congress make available the funds required to support the multilateral technical cooperation programs of the United Nations. The bilateral programs of the United States should be pressed vigorously.

INTERNATIONAL TRAVEL

The United States remains committed to the objective of freedom of travel throughout the world. Encouragement given to travel abroad is extremely important both for its cultural and social importance in the free world, and for its economic benefits. Travel abroad by Americans provides an important source of dollars for many countries. The executive branch shall continue to look for ways of facilitating international travel and shall continue to cooperate with private travel agencies.

One legislative action that would be beneficial in this field is the increase of the present duty-free allowances for tourists from $500 to $1,000 exercisable every 6 months. I recommend the passage of such legislation.

TRADE FAIRS

International trade fairs have been of major importance to foreign countries for many years, and most of the trading nations have strengthened the promotional aspects of their industrial displays in many fairs with a central exhibit designed to emphasize the industrial progress and achievement of the Nation.

Soviet and satellite exhibits, for example, have been costly, well planned, and housed in expensive structures designed to convey the impression that the U. S. S. R. is producing on a large scale for peace and is creating a paradise for workers.

The United States, which has a larger volume of international trade than any other nation, until recently has been conspicuous by its absence at these trade fairs. American visitors and participants have pointed out the failure of their Government to tell adequately the story of our free-enterprise system and to provide effective international trade promotion cooperation.

As a result, I have undertaken an international trade fair program under the direction of the Department of Commerce. Since the inauguration of this program in August, participation has been authorized in 11 fairs to be held before June 30. Sixteen additional fairs are being considered for exhibition purposes in the latter part of the year. The first fair in which the United States presented a central exhibit is that at Bangkok, which opened December 7, 1954. At it our exhibit was awarded first prize. Over 100 American companies supplied items for inclusion in it.

I shall ask the Congress for funds to continue this program.

CONVERTIBILITY

Convertibility of currencies is required for the development of a steadily rising volume of world trade and investment. The achievement of convertibility has not been possible in the postwar period due to dislocations caused by the war, inflation, and other domestic economic difficulties in many countries, which have contributed to an imbalance in international trade and payments. However, steady progress, particularly by Western European countries, is being made toward our mutual objective of restoring currency convertibility. The foreign economic program proposed here will make an important contribution to the achievement of convertibility.

AGRICULTURE

No single group within America has a greater stake in a healthy and expanding foreign trade than the farmers. One-fourth to one-third of some major crops, such as wheat, cotton, and tobacco, must find markets abroad in order to maintain farm income at high levels.

If they are to be successful, programs designated to promote the prosperity of agriculture should be consistent with our foreign economic program. We must take due account of the effect of any agricultural program on our foreign economic relations to assure that it contributes to the development of healthy, expanding foreign markets over the years.

CONCLUSION

The series of recommendations I have just made are all components of an integrated program, pointing in a single direction. Each contributes to the whole. Each advances our national security by bringing added strength and self-sufficiency to our allies. Each contributes to our economic growth and a rising standard of living among our people.

DWIGHT D. EISENHOWER.

THE WHITE HOUSE, *January 10, 1955.*

Senator FLANDERS. Is this a case of post hoc ergo propter hoc?

The CHAIRMAN. There is a certain capacity of the human mind to absorb, even after 150 years of density.

Senator FLANDERS. I think this might be continued indefinitely, Mr. Chairman, and I leave you with such honors as there are.

The CHAIRMAN. I did not start it, but I felt I was compelled to make an observation because I have been greatly amused at the way in which it is said that the Republican administration has discovered the idea of freer trade. We welcome their conversion and we appreciate their help, but I think we should realize who bore the heat and burden of the day when to advocate freer trade was extremely unpopular.

Senator FLANDERS. Mr. Chairman, since this matter is being continued, I would suggest that it was President McKinley who initiated the move toward the reciprocal trade treaties.

The CHAIRMAN. I believe that was done the day before he was assassinated.

Senator FLANDERS. It was not a Republican who assassinated him.

Mr. TAFT. On the contrary, it was Mr. McKinley, as chairman of the Ways and Means Committee, who first introduced them in 1890, and the Wilson committee that repealed them in 1903.

The CHAIRMAN. I always thought of the McKinley tariff, as well as the Dinkler tariff as being a high tariff. We could continue this for some time and we are very glad, indeed, to have this alliance. We appreciate it very, very much, but they should not regard themselves as pioneers. They should take their place, rather, as contrite signers who now have given evidence of a change of heart and who are duly welcomed into the fellowship of enlightened persons. We will now proceed in the order in which the members of the panel are listed. In preceding sessions we have taken up each question in turn, but this morning we are going to ask the members of the panel to make a satement and then call on each in turn, but I think members of the committee should have the right to question each man after the conclusion of the statement, rather than postpone questions until the end.

We will now hear from Mr. Harlan Cleveland, who is executive editor of the Reporter magazine.

Mr. Cleveland.

STATEMENT OF HARLAN CLEVELAND, EXECUTIVE EDITOR, THE REPORTER MAGAZINE

Mr. CLEVELAND. Mr. Chairman, my name is Harlan Cleveland, executive editor of the Reporter magazine. I was formerly Assistant Director (for Europe) of the Mutual Security Agency, and Deputy Assistant Administrator of the Economic Cooperation Administration.

This year the President's Economic Report polishes off our foreign economic policy in a little more than 3 pages—reading time 5 minutes.

It is true that foreign trade and investment are only a tiny segment of the entire American economy. Our exports amount to barely 3 percent of our national product, private investment to about one-third of 1 percent. And these percentages are constantly diminishing, since the amounts they represent remain fairly constant while the rest of our economy—domestic production and employment—is growing steadily.

Since 1947 we have added more than 50 percent to our gross national product, from $232 billion to $357 billion, but we still export only about $12 billion or $13 billion worth of goods a year, and private investment is still averaging out at less than a billion dollars a year—a little more in 1954, but much less in 1953.

The importance of foreign economic matters cannot, of course, be measured in mere numbers of any kind. In its simplest terms, the central objective of our foreign economic policy is—and should be—to promote rapid, constant, and balanced economic growth in the free world. The purpose of this economic growth, in turn, is to provide greater elbow room for other forms of human progress.

Our problem now is what it has always been: How to further these purposes without saddling the United States taxpayer with a large and disturbingly perennial bill for foreign charities. The administration's program, as set forth in the Economic Report and the President's message of January 10, is at best a weak flank attack on this central problem.

Take trade policy. If the administration gets its heart's desire this year, Congress will extend the Trade Agreements Act for 3 years. The President will be allowed to gut any tariff rate by one-twentieth a year for 3 years and set at 50 percent any duty that is now above this level.

The CHAIRMAN. I notice the verb as printed is "gut," but as read is "cut." Which verb do you wish to use?

Mr. CLEVELAND. "Cut." I think it might even be "shave."

Congress may also chop a small clearing in the jungle of customs procedures and definitions, and let tourists bring in $1,000 instead of $500 worth of perfumes and knickknacks.

These then are the bold steps that the administration, guided by what its economic advisers call broad vision, describes as "freeing the channels of trade." If the plumbing in your house is clogged up, it is no doubt possible to make some progress by attacking the problem with a bottle washer. But some real plumbers' tools would be better.

The protectionists will, of course, raise a great hue and cry about this program, feeble as it is. But there is certainly very little danger that, even if enacted, it will have much effect on the flow of imports into the United States. For the administration also wants to retain the escape-clause and peril-point provisions of the Trade Agreements Act.

(As now written, this act tells the Tariff Commission to set for each product a rate of duty below which concessions should not be made in trade treaties, for fear of injury to domestic producers. This is the peril-point provision. The Tariff Commission is also supposed to advise the President when a tariff concession already made is causing serious injury to American producers; if the President takes the advice, as he did in the Swiss watch case last year, he can cancel the concession under the escape clause that must be written into every one of our trade treaties.)

The Committee for Economic Development has pointed out that with the single exception of the trade pact with Venezuela, no major cuts in United States tariffs have been made while the peril-point provision has been in effect. The escape clause exists, as Clair Wilcox has put it, to intimidate the American negotiators. It means that even such offers as we can make in these negotiations have a large and well-publicized string attached to them.

What foreign producer in his right mind will invest heavily in restyling and advertising his product for the American market, knowing that any successes he may have in our market will automatically increase the likelihood of the escape clause being used to put him out of business?

Looked at from abroad, our trade policy is an enigma of uncertainty. What the foreign producer wants most of all from us—far more than he wants any kind of charity—is at least a minimum of predictability. From this standpoint, there is a great deal of food for thought in the idea advanced by former Ambassador William Draper in an article he wrote for the Reporter: to declare a 10-year moratorium on any increase in tariffs. But an easier approach to the problem of predictability would be to eliminate the escape clause entirely.

I would like to suggest, Mr. Chairman, three general points that might be taken into account by the joint committee, which has the responsibility to stand back and look at foreign economic policies and United States economic policies as a whole.

One is that it seems clear from our past experience that we never will achieve important reductions in our tariffs until the Government sets up some system of aid to the fields of labor and industry which freer trade hinders. This is a complex subject. But some combination of unemployment compensation, small-business loans and technical aid, all administered as a single program in localities that become depressed areas as a result of foreign competition, is essential if the political pressure from the injured businessmen and workers is not going to keep our tariff wall inviolate forever.

As the CED's tariff study says, direct assistance for readjustment "is preferable to continued tariff protection because it aims at facilitating competitive adjustments rather than at giving permanent protection against import competition."

Point No. 2: The reciprocity idea in the present trade-agreements program is now badly out of date. It is often vastly more important to the United States, in dealing with another country, to promote economic recovery or land reforms or the building up of new industries, than it is to increase the market for United States exports as such.

When we limit ourselves to trading one tariff concession against another, we spoil the chance to use our tariff concessions to get concessions in other fields that will advance our foreign policy. In other words, since our economic interests are not usually the most compelling, the tariff should be viewed not merely as a commercial or economic instrument, but as an instrument of our whole foreign policy.

The third point is this: The whole of our foreign economic policy has limped along much too long as a year-to-year program, subect to change with very little notice. For steadiness and predictability, the laws that govern trade and investment should not come up for review every year. One year, or even 3 years, is too short a period for our basic trade law.

One year is impossibly short for the technical assistance program, and anything less than 5 years is ridiculous for any form of investment program. The Government's foreign economic agency, which has run through 6 sets of initials in 8 years, should be made a permanent part of the Federal establishment. We are part of the world for good, and it is high time we stopped pretending each year that our current attempt to strengthen the free world will be our last.

Let me mention two other subjects—travel and investment. If we cannot do much about trade, maybe we can encourage more foreign travel.

The CHAIRMAN. Do you give up on trade?

Mr. CLEVELAND. I do not give up on trade, but it appears to me the administration has given up, and it is their report we are commenting on. I hope the Congress will not give up.

Travel is now very big business. Worldwide, it adds up to more money than the world trade in wheat. American travelers alone are putting into foreign hands some $1.2 billion a year—the equivalent of one-tenth of all our merchandise exports, more than the net outflow of United States private investment.

Big as it is, international travel can get much bigger. Americans travel mostly to the places that are easiest to reach: Canada, Mexico, Europe. But, whole segments of the globe are largely untouched by organized tourism: Africa, the Middle East, South Asia, and the Pacific; some parts of Latin America.

Even in Europe, most countries have hardly scratched the surface of their potential earnings in this field. Given our restrictive trade practices, international travel may show the greatest proportional rise of any element in our foreign economic relations. Unlike trade and investment, tourism is already growing at a rate which matches our rate of domestic economic growth.

What does it take to cash in on this potential? The answer is simple—foreign governments have to persuade tourists to visit their countries by promotion and advertising in the United States. The promotion has to be done mostly by governments because the people who benefit from tourist spending are the little businesses, from shops to restaurants to taxi drivers, who cannot very well finance a great promotional effort themselves, but who can pay taxes to a government for the purpose. The airlines, steamship lines, and a few big hotels can carry a part of the load, but the major share of the task is bound to fall on governments.

With rising incomes and more leisure time, a growing number of Americans can be sold on travel. During the past few years, intensive promotion of travel to certain areas has ben fabulously successful—when it has been done on a large enough scale. National and State tourist offices which have bet on their own tourist attractions, like England, Hawaii, Nassau, Bermuda, Florida, southern California, and New York State, have quickly taxed their capacity to handle the Americans who respond.

In this whole picture, the administration's lone proposal to let tourists bring in $500 more in foreign goods is a helpful, but minor, item. The most important thing the United States Government can do is to help persuade other governments to step up their promotion in this country and strengthen their tourist offices here. There is a technical assistance function, too; some governments want to tap the American tourist flow, but need help in learning how best to tackle the large and mysterious American market.

Now there is a small office in the Department of Commerce that is supposed to handle these functions. The Randall Commission, you know, was quite enthusiastic about the potential of travel, but a diligent search of the President's budget fails to turn up any provision at all for the promotion of international travel or the continuance of the Department of Commerce's interest in the subject.

Was it forgotten, or doesn't the administration believe itself when it says, in the President's message of January 10, that—

> encouragement given to travel abroad is extremely important both for its culture and social importance in the free world, and for its economic benefits?

Presumably the administration would not object if Congress were to take the initiative, as it did last year in the Javits amendment to the mutual security appropriation, to provide the executive branch with funds to carry out its expressed intentions. A $100,000 spent by the

Department of Commerce could be multiplied a hundred times in the effect on the travel item in our balance of payments.

The crisis in the Far East has revived the whole question of a more vigorous investment policy for the underdeveloped areas. On this subject again, the President's Economic Report is eloquent about the reasons for action. But the proposals for action are sparse and, with one exception, shopworn.

Every year for half a decade or more, Congress has asked what can be done about getting more American investors to put their money into foreign economic development. Every year Congress has had to listen to a lot of trumped-up optimism. Every year the witnesses for the executive branch try to skirt their way around the obvious fact that private foreign investment is small, and is not getting any larger. Speaking from red-faced experience, I can testify that it's most embarrassing for these unfortunate representatives of the executive department to have to admit, year after year, that foreign countries are actually paying to the United States on past investments half again as much as Americans are currently investing abroad.

Year after year, the executive branch suggests that Congress do something about inducing private investors to help cover our trade deficit by planting more of their dollars overseas. And Congress dutifully responds with exhortations and guarantees, which so far have had extraordinarily little effect in the real world of investment decisions. This year the administration is proposing again that something be done about giving private investors a break on taxes. The new gimmicks may help some, but in my opinion they offer no solution.

The only solution is simple and drastic: to have a deep recession in the United States. The main reason private investors don't send their money abroad is that the United States provides such a good market for investment right here at home. And judging from the Council's rosy optimism about the future of our domestic economy, there seems, happily, little hope that United States prosperity will be removed as the main obstacle to more private investment overseas.

So we are thrown back on one form or another of public investment—that is if we really believe, as the President says, that "A great challenge of our time is to find constructive ways of aiding the economically underdeveloped countries in different parts of the world."

We already have the International Bank, which is doing that part of the public investment job that a bank can do very well, especially in Latin America. The Export-Import Bank, which should be doing part of the job too, has never really succeeded in cutting loose from its narrow original purpose, which was to lubricate United States trade rather than to invest in other countries' growth. Last year, like the private investors, the Eximbank took in more money than it loaned out—$276 million disbursed, $343 million received in repayments.

The administration has made one excellent proposal this year for breaking out of the eternal circle of rosy predictions and disappointing facts. At the proper time, says the Economic Report, Congress will be asked to contribute to the capital of an International Finance Corporation. This proposal, which has been kicking around since Nelson Rockefeller's Board proposed it in 1950, encountered the unrelieved hostility of the United States Treasury until a few months ago, when it was revived on the occasion of the Caracas conference.

By investing in private equities, helping get new private industries on their feet, and then selling off its holdings locally, such a corporation can promote industrial development and help create a capital market at the same time. This kind of partnership makes a lot of sense. Even in those underdeveloped areas where there is some local capital for development (as in countries getting oil royalties) it is essential to create channels for capitalism. An International Finance Corporation can help prove to prospective local investors that it is at least as profitable—and certainly more important—to invest in their own country's growth as in real estate on the Riviera or a casino on the Las Vegas strip.

In this public investment field, the need for something more than meer words is dramatized right now by the crisis in the Far East. Suppose, just for the sake of supposing that somehow or other we do get a cease-fire in the Formosa Strait. We shall then still be left with our main task in Asia; to help the non-Communist nations prove that government based more or less on consent is not only better for their people but also more efficient in the long run than the Communist model of police and promises. In this task, investment by the United States is only one of several essential elements. But taken together with the technical knowledge and the spirit of vigorous enterprise that American investment (public as well as private) can bring into Asia, it is certainly one of the major factors in the equation of Asia's future.

In mobilizing public investment funds, and applying them in Asia, we can take account of four new facts

1. Red China's development program has a major defect—the Communists have not yet figured out how to make farmers produce more food through police control. Collectivising the farmers according to Stalin's old methods will bring on an internal crisis much faster in China, which starts with a food deficit, than it did in Russia and the Eastern European satellites, which started with a sizable food surplus

2. India's 5-year plan is working well. Its emphasis on agricultural output, its realistic targets for industrial development, the wide participation in village community projects, all this has established a pattern by which United States aid can be applied in support of a truly Asian program.

3. Japan needs both markets for her industrial goods, and sources of food and raw materials. The United States is not a stable market for Japan—not just because of our trade policy, but also because only a minor segment of what the Japanese have to sell is truly competitive with United States production. There are good political objections to more Japanese trade with the Communists, but that trade wouldn't solve Japan's problem even if it were encouraged. Communist China would willingly take most of what Japan has to sell, but the Chinese cannot offer much in return besides limited amounts of coal and unlimited amounts of those curious commodities like hog bristles and tung oil which have always bulked so large in Chinese export statistics. Therefore the economic development of south and southeast Asia is essential to solving both sides of Japan's trade problem, by stepping up the production of primary goods and providing rising incomes to buy Japan's finished products. There is, indeed, only one other solution: an expensive Marshall plan for Japan.

4. The Colombo plan, which is already well established as a regional system of technical aid, could easily be expanded to provide sponsorship for a more flexible regional investment program as well. The application of United States funds through a regional bank would probably be more acceptable to most Asians—because the Colombo plan is in some senses their own club—than a bilateral United States program of investment, which would always be subject to the interpretation that we were engaged in a disguised form of colonial imperialism. A regional program would secure the advantages of the multilateral approach, without getting involved with the Soviet Union and other countries that are either uninterested in Asia or actively hostile to successful economic development there.

These new conditions suggest that the administration needs a new look at the public investment phase of its foreign economic policy right away, this year. For while we are debating how to turn the tide in Asia, that tide is still running fast. Time is not on our side side unless we employ it for constructive purposes. Or, as Ralph Waldo Emerson put it:

> Economy does not consist in saving the coal, but in using the time while it burns.

The CHAIRMAN. Thank you very much.

Any questions of Mr. Cleveland?

Mr. Talle.

Representative TALLE. No, thank you, Mr. Chairman.

The CHAIRMAN. Senator Flanders.

Senator FLANDERS. Not at this point.

The CHAIRMAN. The next member of the panel is Mr. O. R. Strackbein, chairman of the Nationwide Committee of Industry, Agriculture, and Labor on Import-Export Policy.

Mr. Strackbein.

OPENING STATEMENT OF O. R. STRACKBEIN, CHAIRMAN, THE NATION-WIDE COMMITTEE OF INDUSTRY, AGRICULTURE, AND LABOR ON IMPORT-EXPORT POLICY

Mr. STRACKBEIN. Mr. Chairman, members of the committee, the President in his special message to Congress on January 10, 1955, stated:

> The Nation's enlightened self-interest and sense of responsibility as a leader among the free nations require a foreign-economic program that will stimulate economic growth in the free world through enlarging opportunities for the fuller operation of the forces of free enterprise and competitive markets.

He added that—

> our own self-interest requires such a program because (1) economic strength among our allies is essential to our security; (2) economic growth in underdeveloped areas is necessary to lessen internatonal instability growing out of the vulnerability of such areas to Communist penetration and subversion; and (3) an increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people.

Thereafter the message contained, among other things, specific legislative recommendation that had 5 days earlier made their appearance in H. R. 1, or the trade agreements extension bill of 1955, introduced by Mr. Jere Cooper, Democrat, of Tennessee, chairman of the House Committee on Ways and Means.

The statements above quoted, taken from the President's message, are acceptable as generalities, but the extent to which the attainment of the stated goals or objectives rests upon the provisions of H. R. 1, it is based upon certain false assumptions and erroneous deductions from past achievements and failures. The message, to repeat a part of it, says:

An increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people.

Of course, it would not necessarily do anything of the kind. Increasing world production and trade could just as easily take place at our expense and to our detriment.

The sublime or naive faith in foreign trade as the great cure-all for the world's economic ills or as a sure road to the peace of the world, reflected in the message, is a curse and an affliction. It has prevented a clear-headed assessment of the facts for too many years and has reached the ridiculous stage. It is like a spell or a hypnosis under which the victim merely repeats uncritically what the hypnotist says. Or, differently stated, it ranks as a nostrum with the notion that if 1 spoonful of medicine is good, 2 spoonfuls are twice as good.

Trade is not and never was a good thing in and of itself. It can be evil and harmful, as the trade in opium. It may be thoroughly immoral as is prostitution. The slave trade was lucrative, but does that mean it was good? The trade in ivory created exchange and added to the income of the people who engaged in it, but was it in the national interest of the African tribes where it was carried on?

The halo must be torn from international trade before we can reason soberly about it.

Am I then saying that the President is naive or that those who participated in shaping the part of the message relating to trade are naive or unthinking?

The fact is, a whole people can be blind, and a whole national leadership can be led along by a false idea until it explodes in their face. We do not have to strain our memories for examples.

One notion held not so many years ago was that Russia would quickly crumble under the Hitler onslaught. The fallacy of that judgment was amply demonstrated by events. Another notion was that the German people would throw up their arms and surrender once the war went against them. That also was a false estimate, but very widely accepted. There are enough of such false notions and fads floating around us in other fields, such as medicine, diet, child psychology, etc., to give us pause. Ordinarily, it is necessary only to wait a few years for the upset or for knowledge to catch up. In the field of trade we cling to a used-up idea because we do not seem to know how, when, or where to stop.

It is understandable why certain export interests wish to perpetuate the idea that increased trade, meaning, of course, increased exports, is an unmixed blessing. On the other hand, the support of this idea by economists and private organizations of voters who cut across the economic spectrum merely suggests a bankruptcy of ideas. This in turn may be the result of immersion in a constant flow of inspired comment that in itself has taken on the dangerous aspect of unreflecting acceptances of what is fed to it.

After 20 years of tariff reductions, carried out in 29 bilateral agreements, followed by 3 multilateral agreements; after a reduction of

75 percent in the protection afforded by our tariff and after witnessing the great number of nontariff restrictions on trade imposed by other countries, it is about time that we turned away from this broken-down vehicle to carry us to the promised land. Many of these nontariff restrictions were justified and justifiable and were symptomatic of the economic disruption of war, but that does not change the fact of their existence or obliterate their cause.

The CHAIRMAN. Mr. Strackbein, do I understand the meaning of what you are saying is that while some European countries have agreed to reduce tariff rates that they have imposed quotas upon imports which have had the effect of restricting our exports to these countries?

Mr. STRACKBEIN. That is correct, import quotas and import licenses, and exchange control.

The CHAIRMAN. Do you regard these as a violation of the meaning or purport of the reciprocal trade agreements which they signed?

Mr. STRACKBEIN. I would not say so across the board at all. As I say here some of them may be justified. Some of them may be used in the guise of protection and in that way have violated or undone, let us say, the concessions that they had previously granted.

The CHAIRMAN. So you would say that the effect has been that we have not reaped the advantage in exports which we might have expected from a reciprocal reduction of tariff duties?

Mr. STRACKBEIN. I do not even want to go that far, Senator, because I think that our exports were limited by certain other factors, by the amount of our own imports, and by the amount of our foreign aid.

Now, if those countries had not put on those limitations their currency reserves would probably have dwindled much further even than they did, so I am not accusing the countries of bad faith.

I say the situation was inherent in the postwar conditions of the world.

We would do far better to study the great shifts that have taken place in the basic foundations of trade in the past 15 years, the distortions in the world economy caused by the great upheavals of World War II, and the effects of the political and military realinements of the world. We should ponder the meaning of a policy that would subordinate the strongest economy in the world to the vicissitudes of a necessarily shifting diplomacy in an unsettled world.

We have in the past 10 years contributed heavily to the righting of the war-upset world; we have greatly liberalized our trade; we have greatly increased our imports. They are more than half again as high per capita in physical volume as in 1938–39.

Our diplomacy has been profoundly at fault in not saying these things to the world about our trade. On the contrary, our diplomats and various officials traveling about overseas have aided and abetted the idea that it was our stiff-necked policy about tariffs and trade that caused and sustained the dollar gap. They converted the protests of other countries thus incited into instruments of political pressure on the homefront in behalf of more tariff cuts. Only very recently has there been some evidence of a change.

We have actually reached the point in our tariff reductions where a halt is urgent. I don't say a stop, but a halt. We have cut to the quick and in some instances well into the living nerves of many of our producers. However, no great reversal is involved; no general rise in tariff rates.

Our producers who are asked to absorb the foreign competition uncovered by 20 years of tariff cutting are entitled to a remedy against errors of judgment committed in the wholesale approach to tariff cuts or against adverse changes in competitive conditions. There is no demand for undoing such good as may have come from the liberalized trade policy; only for a means of rooting out the evils. This remedy is not in hand. An escape clause that is more responsive to the needs of the case than the present one is called for.

All the minimizing of the losses caused or threatened by lower tariffs, so eagerly practiced by those interested in import profits or export markets or in upholding an intellectual position, cannot overcome the very widespread and legitimate concern of the exposed industries and their workers. Final success in this campaign of belittlement would in any case succeed in depriving the very propagators of any real reason for advocating their own program.

In a nutshell, the trade-agreements program has run out of magic. Its constant elevation to the position of arbiter of world economic questions is not justified. As a measure that may be looked to for the attainment and maintenance of full domestic employment, the further general lowering of tariffs would bring us greater liabilities than assets.

Now, I say the further general lowering. There is much more employment at stake, directly and indirectly, in the industries and agricultural pursuits that are vulnerable to import competition than exists in manufacturing or producing for export.

The fact that some of these producers are already highly protected by import quotas, such as wheat, wheat flour, and cotton, does not remove them from the list of exposed producers or from the list of beneficiaries of protection. That these groups themselves, cotton, wheat, and wheat flour, heavily support freer trade for others is only a measure of the high degree of inconsistency of which man is capable.

As for investment in foreign countries as a means of developing and strengthening them, the idea has some merit, but again it is not foreign investment, as such, that is important. The kind of investment and the conditions under which it is made are more important. Investment in economically unsound projects will not only not accomplish what is sought, but will go sour. The same may be said of investment where expropriation, nationalization, or refusal to allow profit transfers may sooner or later confront the investors.

Inasmuch as tax incentives would tend to overcome the prudence and caution that should be exercised in such investments, their long-term value may be questioned. Also as inducements to industry to seek low-wage areas for location of new plants, tax incentives on foreign investments might do more harm than good. If our capital cannot find foreign outlets that are sound enough or free enough from State control or confiscation to make them attractive without special tax incentives, it certainly is not clear that the granting of such incentives would remove their obstacles to investment, but they might cause the taking of unjustifiable risk.

From present trends of world population it does not appear that our point 4, and similar elements of assistance, will accomplish much more than to demonstrate the continuing validity of the Malthusian theory of population.

Thank you very much.

The CHAIRMAN. Thank you very much, Mr. Strackbein.

Inasmuch as I think that Mr. Strackbein perhaps is the only opponent of the proposal for continuation of reciprocal-trade agreements—we have allowed him to take more time than would normally be the case, some 15 minutes.

Mr. STRACKBEIN. I thought I was going over.

The CHAIRMAN. That was quite all right. We thought we should lean over backward in being fair.

(Mr. Strackbein's prepared statement appears at p. 974.)

The CHAIRMAN. Mr. Taft.

OPENING STATEMENT OF CHARLES P. TAFT, PRESIDENT, COMMITTEE FOR A NATIONAL TRADE POLICY

Mr. TAFT. I apologize for not having a prepared statement, Mr. Chairman. I finished testifying before the Ways and Means Committee at 20 minutes past 7 last evening.

I am very glad to be here with this panel. I feel like the man that put his mule in the Hambletonian trotting race and said he was very glad to have him run with those thoroughbreds.

I might say that Mr. Cleveland enjoys the responsibility of being a newspaper editor, and is not in charge of getting two committees of Congress behind a measure that is controversial. When he suggested that there is no general rise in tariffs at present, I am sure he hasn't observed the number of escape-clause actions that are pending or the number of bills introduced for raising individual tariffs.

Apart from that, I will leave for the committee a statement I presented yesterday to the Committee on Ways and Means which deals with some of the arguments Mr. Strackbein has given you.

(The statement referred to appears at p. 976.)

Mr. TAFT. Now for some general comments on the subjects listed for discussion. I want to start by saying that on the general problem of the relationship of our tariff policy to defense, we face the difficulty today of not knowing exactly what a mobilization base is in an era of atomic warfare. If we have a strike which wipes out a considerable part of our industrial areas, or if we have simply the kind of saturation bombing which devastated Germany, then it is most important that we retain flexibility and adaptability in the use of our resources, particularly our skills.

The strategic bombing survey after World War II certainly demonstrate that that is what kept Germany going despite the destruction of her physical resources. Now, under those circumstances the most important thing, it seems to me, is not to use tariffs to protect every individual pocket of defense essential skills but rather to expose our economy to the competition that sharpens our ingenuity and our enterprise. This is what is generally described as the "free-enterprise system." And it applies to foreign competition as well as domestic competition.

When you say that you want the information program to tell the Communists and uncommitted peoples about the material progress in our economy, that seems to me to be an unsound approach. They are not interested in the number of ice boxes and telephones and automobiles we have, but they might be interested in the general ideas of competition, the effort to excel, the necessity of calculated risk taking, the benefits of ingenuity, the kind of hard work and integrity that goes with our operations in an atmosphere of free choices. That, it seems to me, should be the base of the information program and I would say that our foreign-trade program, which is good in itself, quite contrary to Mr. Strackbein's suggestion, can be used to spread these kinds of ideas.

As far as the investment program abroad is concerned, I think the greatest interference with it is the lack of incentive for investing abroad. This incentive is far greater at the moment than it has been. The spread between stocks and bonds of approximately 2.8 points as it has been in the past offers no incentive for putting any money any place else. Now that it has been cut down to about 1.4 points it changes the situation for an investor, even an institutional investor, and he may be looking, therefore, for the possibilities of greater increased profits now.

The proposals for special tax treatments of income from foreign investments may therefore have considerable more effect than it did a year ago, before the stock market moved so far. It is very difficult today to buy income at the same rate you could have 12 months ago. So it does seem to me both factors result in increasing the incentive for investment abroad. It is also important to train people in the understanding of the foreign investment problem.

I think the most distinctive comment of those who have testified against H. R. 1 is that they either do not have or don't listen to people skilled in foreign trade. Mr. Percy of Bell & Howell, who came before that committee, and who made a most extraordinary statement, and I have a copy of that for this committee also, was one of the first men to testify before that committee in many years who is under a protected system and is up against extremely difficult foreign competition, but who nevertheless has stood out in favor of a reduction in trade barriers. One of the reasons why he is able to do that is that he has a most competent adviser and director of his foreign-trade activities.

We have not brought up a generation which knows how to manage foreign business under today's circumstances.

I visited, for instance, Mr. Paul Armstrong, the head of Sunkist. I have heard many objections from those who ship fruit abroad. Mr. Armstrong sends oranges. He shipped oranges and lemons to Holland, and he had to get paid for them. He took 30 percent of his pay in notes given by American citizens—this is Holland, mind you—notes given by American citizens for Israel bonds, which he then was able to sell to a bank in New York.

That kind of ingenuity and understanding of foreign trade is what we have in general lacked. If you get that then you get investment, and increased foreign investments, it is good. It is not as concentrated in a few areas as it has been in the past, and it will certainly increase in the future.

When you come to the specific measures that are proposed to help produce increased trade and investment, these must obviously be tailored to the practicalities of politics in the Congress. I would agree that predictability in our policies is the most important element to be secured. This comes about both through the improvement of customs regulations, which is at least under way, and also through the passage of a bill, almost any bill, which represents progress by an administration which is headed by a Republican President. If that is done, and it goes in for 3 years as expected, that helps increase predictability. It helps to reduce the number of escape-clause proceedings, because when it is not expected that these actions will be successful, they will not be tried since they do cost money for those who go into them.

Now, as far as help for those injured as a result of increased imports, and the numbers injured are limited, this is something in which the Government can be of assistance. If the Small Business Administration works on the question of towns which may be shut down because of the closing down of a plant, that would be helpful. But imports don't always cause the trouble. Take the Sanford Carpet Co. case, which is not a case of import competition, that closed because people don't want to buy Axminister rugs. Besides, it is an old plant, and they are moving to New England.

Contrary to what the New York Times said yesterday——

Senator FLANDERS. May I say——

Mr. TAFT. I haven't finished.

Quite contrary to what the New York Times said yesterday that New England is suffering from leukemia, the carpet plant in Thompsonville is moving to Connecticut. Someone just bought a plant in Cincinnati and is moving that to New England. Actually, New England lost 40,000 jobs in textiles and gained 400,000 jobs in other industries over the past 10 to 15 years.

That doesn't get in the newspapers. The textile plant closing does.

So it is this kind of readjustment that is going on, and in which the Small Business Administration could be of great help in finding diversified industries to come in. A Government agency has greater scope than a local committee could have.

Finally, as to travel, I would say that goes right along with ideas. It seems to me there could be started a program which would go particularly to the service clubs, for instance, which cover a wide range of small business in many towns, urging them to see to it that every person who is a member of their club, or that they know of who goes abroad, promises to assign at least 2 days in every month to talking to people of his own general situation in the foreign country about the values that exist in the United States and finding out about their values which, in turn, we might get some benefit from. Under those circumstances, it seems to me that the portion on foreign trade of the President's Economic Report is certainly a step in the right direction. It may not go very far, but a step in that direction which, if firmly nailed down, would certainly represent very great progress at the present stage.

The CHAIRMAN. Thank you very much, Mr. Taft.

Any questions of Mr. Taft?

Mr. Bolling?

Mr. Kelley?

Representative KELLEY. Yes.

I note you said the A. F. of L. or the CIO are proponents of H. R. 1. You didn't mention that the United Mine Workers are opposed to it. They are primarily opposed on account of residual oil coming in from South America, which is increasing the loss in coal, which means

20,000 or 30,000 miners have been displaced. When you multiply that by 4 to a family—miners' families are larger than that—you have 100,000 people affected.

I direct this question to you, sir: Don't you believe that an amendment to the escape clause might bring some help to the coal industry in the point that the Tariff Commission's recommendations would be mandatory?

That is an isolated case, I admit, but the promiscuous dumping of residual oil has injured the coal industry. I know that a great deal of imports go to the oilfields of South America, particularly Venezuela, but I see no reason why the coal miners and the coal industry itself should suffer because of that.

Mr. TAFT. Mr. Kelley, I have supplied you with a copy of my statement before the Ways and Means Committee. I think in view of your question, I had better read the answer to it, which appears on page 9 in my statement:

> The coal problem, like that of the wool-textile business, is the problem of a sick industry. Let us by all means do all we can to help each cure itself. But let us have all the facts, not the selected ones which coal spokesmen and their auxiliaries bring to this committee.
>
> Let me give you a few basic ones.
>
> 1947 was the alltime peak production year for bituminous coal. Since 1947, through 1953, bituminous coal demand has decreased by 155 million tons.
>
> What was the composition of this decline in demand? Bituminous lost:
>
> 1. 82 million tons in railroads, largely to diesel oils, which are domestically refined.
> 2. 38 million tons in space heating to natural gas and light fuels.
> 3. 35 million tons in exports, kept out by currency restrictions, not tariffs.
> 4. 29 million tons to other industries.
>
> Coal consumption in public utilities increased 26 million tons. There have also been minor gains in other categories. Compared to this coal loss of 155 million tons in 6 years, heavy residual fuel oil consumption increased by only 11 million tons equivalent over the same period. Six million tons of this was in public utilities where coal consumption increased by 26 million tons.
>
> Residual oil in not "dumped." Over a period of 7 or 8 years, except for 20 months' total, the barge-delivered price of heavy fuel oil in New York Harbor area was higher on an equivalent basis than barge-delivered coal. The prices fluctuated independently. The coal people have never made any request to the Government under the Antidumping Act.
>
> There is no evidence that shutting out residual oil helps coal. In the first 10 months of 1954, use of residual oil by public utilities reporting to the Federal Power Commission dropped 21.4 percent from the prior year, coal increased 1 percent—more than accounted for by new facilities—and natural gas increased 13.6 percent.
>
> Shutting out residual oil definitely hurts American manufacturers in 30 States employing 30,000 people in manufacturing for export to Venezuela. They send $170 million of goods paid for by the 80 percent of Venezuela residual oil imports that would be excluded by the proposed 5 percent quota.

Some of the bills propose 10 percent.

> So far as national defense is concerned, existing mines by going to a full week without overtime could add 150 to 200 million tons of coal a year.

That would run them 'way over the estimates of the Defense Department as to needs in wartime.

> With all the shifts that have taken place to oil and gas, even with our present industrial capacity, 400 million tons of bituminous in 1954, plus 70 million tons, is ample for war needs. According to the latest Bureau of Mines data, current capacity in the bituminous industry actually is 670 million tons.
>
> The real employment problem in coal mining is the turn to strip mining, which accounts for fully 25 percent of total bituminous production. This is a technological change opposed as vigorously by the United Mine Workers as is the

importation of residual oil, but with less publicity. This is because strip mining employs many fewer people, and has no place for most of the skills of deep miners. In fact, of the 142,000 out of work since 1947, the loss of 85,000 can be attributed to improvements in technology and productivity. How much of this is better machinery in deep mines, and how much strip mining, is a question the coal people had better answer to this committee. At least, it is not imports of residual oil.

And I have just been arbitrator in southern Kentucky where the percentage in strip mining has increased from 10 percent to 40 percent.

In addition, I found out last week that the mines in southern Kentucky and Tennessee, on the Southern Railroad at least, had no competition from residual oil since the last reduction in freight rates down there.

They sell to Georgia Power, and they have moved back from residual oil to coal.

Representative KELLEY. Of course, I don't say they have lost it all.

Mr. TAFT. It is only the equivalent of 11 million tons of coal since 1947, which was the year of peak coal production.

Representative KELLEY. The point is that it is increasing.

Mr. TAFT. No, sir; as I gave you the figures for the 10 months of last year, residual went down on the east coast, and it was replaced by natural gas.

Representative KELLEY. Do you mean to tell me that the amount of residual oil coming into our seaboard is less?

Mr. TAFT. I can only refer you to what I just read to you which are our statistics which we got from a thoroughly reliable source.

Just a minute. In the first 10 months of 1954, imports are down a million tons of residual fuel oil, and I have given you the figures there at the bottom of page 10, on the reporting of the first 10 months of 1954 to the Federal Power Commission. I think the coal people just haven't given you the facts, Mr. Kelley, with all respect.

Representative KELLEY. I cannot pretend that they don't know the facts. They must know after being concerned with this matter for a long time. From my own personal experience in the industry I know that they have lost business due to the residual oil coming into the United States.

The CHAIRMAN. Mr. Flanders?

Senator FLANDERS. I will pass on to the next witness. I am going to concentrate my fire on a professional economist who is also an old friend.

The CHAIRMAN. Mr. Talle.

Representative TALLE. No; thank you, Mr. Chairman.

The CHAIRMAN. Mr. Thorp, who was former Assistant Secretary of State for Economic Affairs and now Director of the Merrill Center for Economics.

OPENING STATEMENT OF WILLARD L. THORP, DIRECTOR, MERRILL CENTER FOR ECONOMICS, AMHERST COLLEGE

Mr. THORP. The Economic Report states flatly that—

the foreign economic policies of the United States can be a powerful instrument for strengthening the security of our Nation and the free world.

It emphasizes their relationship to overall foreign policy in saying that—

our trade and investment policies affect our ability to increase the solidarity of the free world.

It recognizes their economic significance when it says:

> Such actions will not only help to increase world production and trade, they also will help to assure a rising standard of living for our own people.

With this evaluation of the importance of "strengthening our economic ties with other countries", I am in complete agreement. Unfortunately, the specific program laid out falls far short of the challenge of these statements of high purpose. Although the Council and the President are pointing this powerful instrument in the right direction they propose to touch the accelerator ever so gently, and always to keep one foot poised over the brake.

First are the proposals dealing with trade barriers. Authority would be given to negotiate further trade agreements on a reciprocal basis, reducing present rates on individual commodities by not more than 5 percent per year in each of 3 years. Disregarding the fact that the machinery can hardly be put in motion to use the first of the 5 percent, a 15 percent reduction from present levels is little indeed, from 50 percent to 42½ percent or from 20 to 17 percent. The authority to bring rates above 50 percent down to that level is fine but it will leave so much protection that I doubt if this will have much significance except to those who calculated unweighted averages of rates, and the same goes for the cases of negligible imports. I fear that the proposals will mean relatively little effective reduction in tariff rates.

Other difficulties which handicap the importer are also given little relief. I heartily applaud the suggested changes in customs procedures, for these have been a large but little appreciated obstacle to imports. However, we are still to operate under the escape clause, which is a continual threat to any importer who endeavors to expand his market in the United States. Since this procedure was intended to prevent or correct mistakes made by our trade-agreement negotiators, I would suggest that there be some time limit set, so that if a lowered rate has not caused injury for, let us say, 3 years, it can no longer be challenged. Under its present form the escape clause stands as a permanent threat to the development of new trade channels.

One other type of uncertainty is that once again it is proposed to set our trade policy for only 3 years ahead. Why must we keep on this business of going over and over the same ground every year or 2 or 3? Since 1934, the Trade Agreements Act has been renewed again and again. The same witnesses have presented the same arguments again and again. The Congress can always enact amendments to permanent legislation, so why must the world be led to believe that we cannot determine the outlines of commercial policy for more than 1 to 3 years ahead?

The basic economic problems in the area of trade is still that of bringing the relationship between the dollar area and the rest of the world into balance on an economic basis. We still are providing substantial foreign aid in the form of grants and extraordinary expenditures abroad; foreign countries are still trying to hold down their purchases of American goods by quota restrictions; and the lack of general currency convertibility still interferes with the most efficient distribution of economic goods. I am a believer in growth and expansion. I should like to see our program for "freeing the channels of trade" one which would move much more vigorously toward breaking down these barriers to economic progress.

I have the same feeling that the proposals for fostering foreign investment do not match up to the scale and urgency of the problem. I have done my part in the past to try to improve the climate for private investment abroad, and I am convinced that the greatest obstacle today is the basic tension in international affairs.

The CHAIRMAN. Do you mean the fear that if appreciable investments are made abroad either the Communists will take over or there will be a domestic program of nationalization?

Mr. THORP. That is correct. We already have the proposed tax incentive in operation in the Western Hemisphere, and I doubt if the wider geographical extension will have much impact on private investment in Africa or Asia, except as it enriches all those who have already made investments there.

The CHAIRMAN. May I interrupt for a moment. I have always understood that the investments of the oil companies in the Near East were perhaps the most profitable investments in the world because, as I understand it, the production costs are low and they sell their oil in Western Europe at the Galveston price plus shipping costs from Galveston to Europe. The result is that under this world basing system they have a highly inflated price accompanied with low costs, and, therefore, have a tremendous differential.

Am I substantially correct in that?

Mr. THORP. I cannot testify with authority on that. The investments have been tremendous, and I suppose whether or not this will result in high profits in the end turns around the length of time——

The CHAIRMAN. High annual profits?

Mr. THORP. I would feel quite sure that under circumstances of full production and the existing price structure that oil is very profitable.

The CHAIRMAN. Is it not true that the European price which is charged is the Galveston price plus the cost of shipping from Galveston to European ports, even though the oil comes from the Near East?

Mr. THORP. I believe there is such a world basing-point operation; yes.

The CHAIRMAN. And, therefore, a 14-percent reduction would give a tremendous increase in income to those who are already making large annual profits; isn't that correct?

Mr. THORP. Yes; that is the point I was suggesting in my comment here.

Perhaps more help will come from the International Finance Corporation. But all these proposals are of limited effectiveness in the face of the requirements of economic development. I hope that still other steps are implied in the sentence in the report: "The program of technical and other assistance to economically underdeveloped countries should be strengthened." Economic development is a slow and difficult process, requiring assistance in various forms. I should like to feel that the United States was prepared to give strong support in practical ways to countries which could present reasonable programs for their development. We must keep in mind that many developmental steps may have to be taken before private investment can play its full part.

Foreign economic policies can be a powerful instrument, but they must take the form of actions. If we talk of individual enterprise, competition, and open markets, or if we urge other countries to bring their trade into balance by increasing exports, we can hardly be convincing if we ourselves act by closing markets and increasing protection. I am happy that the Economic Report is liberal in its approach. It faces in the right direction, but I regret that the motion which it promises is only at a snail's pace.

The CHAIRMAN. Mr. Flanders.

Senator FLANDERS. Mr. Chairman, I have often been puzzled by trying to make out in these hearings what was on the questioner's mind, what his own position was, and trying to figure that out from the questions he asked.

I therefore ask the privilege of stating my position to start with so that there will be no doubt about it. Let me say, in the first place, that as a matter of principle with me, as a Republican, if I cannot clearly follow an administration line I should let the responsible officers of the administration know before I make any public pronouncement on the subject. I have done that on this question of trade policy. I sent to the White House fully a month ago a statement of my belief on this trade policy. At one of these afternoon parties which are so prevalent in Washington, two young men came up to me and said they had this statement under consideration and were shortly going to come up to my office and set me right. The two bright young men have not come up.

The emergency of this public hearing has arisen, so I have to proceed without the benefit of the criticism of the administration.

Let me say briefly, Mr. Thorp, that my questioning will be from this standpoint. I believe that standards must be set up for the administration of the so-called reciprocal—which, by the way, have ceased to reciprocate—trade policies, that instead of being a flat overall action we must divide the whole field of tariff revision into categories, and my brief sent to the White House related to these categories. I want, first, to mention a couple of them and ask you what your judgment is on them.

The 2 cases I will mention were cases in which I had protested to the President. One was one way, in increasing the tariff; the other was the other way, in lowering a tariff. The protest against lowering of the tariff was on clothespins, spring clothespins.

The CHAIRMAN. That happen to be made in Vermont.

Senator FLANDERS. They certainly are, and I do not deny that fact, and I want it entered into the record.

The CHAIRMAN. Good.

Mr. TAFT. Are they used only in the spring, or do they cover the whole year?

Senator FLANDERS. They have nothing to do with the clear, cold water which springs from the mountains of Vermont, nor do they relate to the seasons of the year.

My objection to lowering the tariff on spring clothespins was on what seems to me a broad policy which should be followed in regard to minor industries whose contribution to international trade is so minute as to be practically invisible. My point was that the massive machinery of stimulating foreign trade should just pass by those minor industries because there were social implications involved which were important for these small areas as a whole, for small businesses in the villages, etc., and why drag them into the maelstrom of international trade?

Now, I would like, Mr. Thorp, to ask what your opinion is on my judgment in that respect?

Mr. THORP. I am not quite clear on one question, Senator. It really isn't the product, I take it, that you are judging on. It is being a minor item as against some complicated product. It is rather that you would like to define protection by size and geographical location; is that it?

Senator FLANDERS. Well, geographical location, in part, but the fact that in dollar volume it is inconsiderable. In importance to a given locality, it is considerable.

I might say it is not only Vermont, it is also Maine, it is also Indiana, and one other State which I forget.

Mr. THORP. Well, first, as to the dollar volume, the characteristic of our gross national product is that it is made up of a lot of items, a very large number of which are, if one looks at them separately, small. I would have great difficulty in trying to make a list of non-small products. One can see the automobile, for example. But it would seem to me that to try to define a policy in terms of size of industry gets one into difficulty.

One might try to deal with this problem in terms of scale production on the grounds that the large-scale industries are the ones in which we are without question the most efficient, and the small-scale industry which often is in a sense almost a handicraft industry may be the one in which the cost abroad provides the foreign country with the opportunity of getting a comparative advantage.

However, I think that the gains that I would hope to achieve in balancing out trade might nevertheless be over a large number of smaller industries.

The CHAIRMAN. May I be permitted to reply to the Senator from Vermont with the type of literary allusion which he likes so well?

Senator FLANDERS. If it is pertinent.

THE CHAIRMAN. I remember that in Washington Irving's story of Rip Van Winkle, when Rip Van Winkle was addicted to the bottle he would excuse his successive drinks by saying he wouldn't count that one since it was only a small nip, but these cumulatively operated to produce a very bad set of habits.

I would suggest that the Senator from Vermont realize that the whole is made up of a series of small parts.

Senator FLANDERS. The whole is made up of a series of small parts, but the total may be a change in the character of village life and small community life in the country.

I am not making a special plea for some clothespin manufacturers in Vermont, though I will admit that my thoughts on this subject was instigated by the Vermont situation.

Well, I have made that point about the standards; it seems to me that should be considered in not an overall broad policy but one in which we set up categories.

Now, that is one on which I protested to the President about his decision.

Mr. THORP. May I just make one added point?

Senator FLANDERS. Yes.

Mr. THORP. It would seem to me if one takes as a basic proposition that one should protect operations of this sort, there are other threats also. Probably one ought to try to limit invention and the development of substitute commodities, and a whole series of other threats. Competition and progress are cruel things. There is no question about this for the people who lose out in competition. This is true in the economic world, just as it is in the political world.

It would seem to me that if one adopts a policy of somehow preserving a particular kind of enterprise, one has to go much beyond the possible threat of import.

Senator FLANDERS. You now, sir, are speaking to my third question, and I will bear in mind what you have just answered.

Mr. THORP. If I may just illustrate, I would have thought the clothespin people would have been very much concerned about the spin-dry washing machines, and this is where protection should have taken place.

Senator FLANDERS. Yes, they ought to have gone into spin-dry washing-machine business, there is no doubt about it.

I may say, however, that one of the factors mentioned in the President's decision was that they were already having competition from the plastic spring clothespins, and that was argued as a reason for reducing the tariff on the imported clothespins.

Mr. TAFT. Wasn't it a question of not raising the tariff, Senator?

Senator FLANDERS. It was a question, let me say, which I did not support. It was a question of setting a quota, and I was against that. I was against setting the quota. I did protest, and would continue to protest on the preceding lowering of the tariffs, particularly when 5 percent of the tariff rate was given by negotiation with Mexico, and Mexico afterward repudiated the new agreement, but still the new 5 percent remained.

We could go into all the complications of the thing, but I think the principle is what I am talking about.

But the decision which involved the plastic clothespins was simply to the effect that if an industry is having trouble let us give them more. That is the way I interpret that decision.

Mr. THORP. May I express the way in which I interpret it?

Senator FLANDERS. Yes.

Mr. THORP. If an industry is being injured, and there is very clear indication that injury is coming from domestic competition, then there is question as to how much one should attribute the injury to the reduced tariff. This is a question of attributing the injury.

Senator FLANDERS. Well, the increased imports attribute the injury.

Now, the next point is one on which I protested to the President on an exactly opposite line on the basis of my analysis of what the standards of protection should be. That was when he raised the tariff on watches. The principle to my mind, which I set forth in my memorandum, was that any industry which through its own lack of initiative, through its own lack of willingness to engage in competition, had found itself in trouble, was not entitled to additional protection to protect its own inefficiency.

Now, 45 years ago I was very familiar with the watch industry in an era which is still represented by this old Waltham Riverside watch. I defy any country in the world to have competed with the Waltham watch of that day. The productive methods were magnificent, and I do not see how the Swiss or anybody else could have matched that competition. But the Swiss came along with smaller watches, and still smaller ones, and got down to the miniature watch of today, which is a marvelous thing in its timekeeping ability and inconceivably small movement. There is where they forced the pace with the American watchmakers.

There was no ingenuity, there was no sense of competition in the American watchmakers at all.

So a second principle which I set forth in my memorandum was that tariffs should not be used to protect an inefficient industry. So you see I am on both sides of the fence, but on principle.

There were other things in this memorandum which I will not go into at this time. One of the suggestions made in it, however, I think it is still pertinent, and that is the greatest contribution that can be made to the health and prosperity of the industry of Europe, is an extension of Benelux to cover the whole western continent of Europe, so that they have their own mass production market. Now, that is worth 10 times for them anything that we can do for them by the way of tariff reductions. And that idea, by the way, was first put forth to my knowledge by Ortega y Gasset in his book, The Revolt of the Masses. I forget how long ago that was. I think the book is at least 15 years old. It is the way for Europe to save itself, and if not save itself to increase in prosperity.

They need a mass market, and it is right there on the European Continent for their getting.

Now, my third question, Mr. Thorp, and that will be my last one at this time: It seems to me that we get in these presentations reference to—I hate to use the word "doctrinaire" because that has come to have unfavorable connotations—free trade. But I use it because I don't have any other word to take its place. Most of the proposals go back to a doctrinaire position.

I wish you could give us the limit to which we are approaching in these things. If ultimate complete world free trade is the limit, what would you assume to be the nature of the industries and operations which would result for the United States as we approach that limit, if that is the limit?

Mr. THORP. That is a fascinating question, and I am not at all sure as to the exact answer.

Senator FLANDERS. It is a practical question.

Mr. THORP. Obviously there are a certain number of industries which cannot easily be internationalized, because of transportation costs——

Senator FLANDERS. Dry cleaning establishments, barber shops?

Mr. THORP. Yes, housing, construction, and so forth. There are many things where transportation is high. Then there are other industries which have to adapt themselves rather rapidly to shifts in American tastes, and are peculiar to American tastes. We now have forms of styling which change rapidly enough so that there are whole areas in the garment trades, for instance, which probably couldn't be taken over from abroad.

On the other hand, there are, of course, many raw materials which we know as we expand we will have to bring in from foreign countries. I would expect that foreign trade never would become a major percentage in American operations. We would not reach the kinds of percentages that have been reached in Denmark or in France or in smaller countries.

Actually, it has been quite interesting to see that our imports have been declining in percentage, that even though the tariff rates have been declining our imports have not held pace with our national income.

I would have to say I think as a first reaction, and maybe some of my brethren have thought about this more than others, that I would not expect in a free trade world a major reorientation in American industry. I would think there would be undoubtedly some industries which would not be able to meet foreign competition. Obviously, the things in which we are most skillful, the application of capital, the production of complicated machinery, are the things in which we would stand out. A handicraft product like a power generator might be done in one of the other countries, whereas electric refrigerators might be something in which we would provide the supply all through the world.

But I cannot feel that there would be major changes that would create a great volume of trade. The American economy will be one in which 90 percent, shall we say, of our goods and services will be produced within the United States.

Senator FLANDERS. You have an optimistic viewpoint. I may say that mine is not quite so hopeful.

I see a tendency to concentrate on the advantages of mass production, which would include such things as automobiles and household equipment, and also in agriculture, both in the intensive agriculture for feeding ourselves, and the extensive agriculture for the great products which move in world markets. However, that depends on our finding some way in reaching a free market pricing system. We still have a barrier to get over in our price support on those world products.

I do not see that we are necessarily hurting the rest of the world if we decide that we had better look at our final point and see where we are going. As far as Western Europe is concerned, that necessity for developing their own mass market is a way out for them, and I was glad to hear Mr. Cleveland make just a casual reference to Japan and eastern, southern, and southeastern Asia, because the way out for Japan she already saw before the Second World War. Japan went at it the wrong way. That was the greater Asian co-prosperity sphere where you will remember started them off on a war. It should not have started them off on the war, it should have started them off on commercial and trade negotiations because there is that whole area where she is fitted to supply the manufactured goods, and they in turn fitted to supply her the food and the raw materials.

So we don't have to look solely or even, I think, properly to our selves as carrying the whole responsibility for the prosperity of Europe or of Asia. It lies largely in their own hands. Our responsibility in Asia lies in doing what we can to restore free trade, normal trade arrangements, and that, of course, is a problem.

But I have talked more than you have. I do commend to you a thought on the question of just what we are heading into as we approach what seems to be the end of our series, which is world free trade.

Mr. TAFT. Mr. Chairman, may I comment on the Senator's question?

The CHAIRMAN. Yes, indeed.

Mr. TAFT. We have attempted to make an estimate, which my distinguished colleagues here will know is very inaccurate, but at least it is an attempt. If the present proposals were put into effect completely, and at once, which is not proposed or thought of by anybody, we estimate that it would represent roughly one-seventh of the way toward total free trade. Now, that is not proposed. The powers lapse if they are not exercised in each of the 3 years, and it isn't proposed to make it across the board anyhow.

I should also comment that as far as the supporters of my committee are concerned, they extend far beyond the mass producers. We made up a list at the request of the Ways and Means Committee of the industries that are represented by our supporters, and it covers a perfectly extraordinary range of small business as well as large.

On the other side, it is not at all just small producers who are opposing any changes. The major opposition is coming from part of the electrical industry and from the chemical industry, which are anything but small, and, the height of the tariffs involved in chemicals, may offer some explanation.

On two pages here of my statement which I submitted to the Ways and Means Committee yesterday, page 8 and page 9, there are two tables of chemical tariffs which I think will startle you as far as the height of the duties is concerned.

One other comment which the Senator made, Mr. Chairman, and I would like to put a rather factual statement in the record on that, if I may: This has to do with the question of reciprocity. Since 1945 there has been what amounts to a universal tariff truce throughout the world; there have been none of the outbursts of tariff wars that sporadically used to rock the world's trade in the interwar period. More than 50 items have been reduced or prevented from increasing. It is fashionable to say that other countries' tariffs don't really matter because they have put on exchange controls and quantitative restrictions. This is a substantial overstatement of the case because Canada and Cuba don't use these devices and Switzerland hardly uses them at all, and they are three of our biggest customers.

On quantitative restrictions, in 1946, I would say that a hundred percent of our foreign trade was covered by quantitative restrictions in other countries by reason of balance of payments considerations. Since that time, there has been an extraordinary change in this picture. It has come about slowly, but certainly, especially in the last 2 years; it has taken large steps.

The trend began with Canada. In 1948, the Canadians dropped the quantitative restrictions they had been using to ration their scarce dollars and invited United States goods to come in without license.

The next major steps took place in 1951 and 1952, when Belgium first began to relax its import restrictions against dollar goods on a broad scale; today the Belgians have just about wiped out the extensive system of restrictions they had 4 years ago.

In 1952, the dismantling process moved a great deal faster. The United Kingdom paced the process when in the fall of 1953 it authorized unlimited imports of wood, wheat, and grains, then followed up by freezing copper, lead, zinc, and many chemicals from import restrictions. In 1954, the United Kingdom went so much further in the process that by the end of the year 50 percent of its trade with the United States was free of restrictions.

In Germany, Holland, Italy, Greece, and other Western European countries, very much the same prcess has been taking place.

So I think it should no longer be said that the trend is entirely in that direction. It is quite in the opposite direction, and we now have more quotas in effect than we have had at any time since 1946.

The CHAIRMAN. Would you say that France has been the conspicuous exception to the general pattern?

Mr. TAFT. Yes; but even France, in reducing their exchange and quantitative restrictions, compensated for them with special taxes which accomplished the same purpose. But they have now finally agreed to remove these taxes because of pressure from OEEC and GATT, according to the New York Times. So France is being pushed further. They have been the bad boy, without any question, on this general subject, but even they are improving.

The CHAIRMAN. Mr. Bolling.

Representative BOLLING. Mr. Chairman, I would like to ask some questions along a somewhat new line, at least from what I have heard. There has been a great deal said, particularly in the last year and a half or 2 years, when at least in a portion of that time there was recession in this country—there has been a great deal of discussion of the techniques and the rightness of the basic policy of this country with regard to trade with the Soviet bloc, the Iron Curtain countries, and there have been at least some who have had the suspicion that some of heavy industry in this country, in a natural and reasonable desire to find additional markets, were moving in the position held by some producers in the 1930's in regard to trade with our potential enemies.

I found myself relatively unpopular in almost any circle when I voiced the belief that there was no occasion in any history that any totalitarian country's attitude toward another country or the world was in any way modified by trade. I would like to get Mr. Thorp's opinion on that—in any modified by trade out of the purely expedient material advantage that might or might not be obtained from that trade.

In other words, there was no softening of attitude because of trade. I would like to get Mr. Thorp's comment on that thesis.

Mr. THORP. I think it would be very difficult to demonstrate that any attitude had ever been affected by trade with a totalitarian country. On the other hand, it is very clear that they themselves regard trade as a very important instrument to total policy.

You just have to recall the treatment of Yugoslavia, for example, when Tito defected, and the immediate embargo against Yugoslav trade; or the case of Australia, when some Russian representative or his wife refused to go back to Russia and there was an argument about whether the Australians were preventing him from returning. This was a question about freedom of diplomats, and Russia announced that because of the behavior of Australia in this particular respect, they would withdraw from the Australian wool market. You get this very real identification.

Now, I think it is probably fair to say that in the same way they would use the problem of purchasing, both in terms of things that they might need and also in terms of what possible political effect or atmospheric effect, shall we say, might be created by that.

Representative BOLLING. Mr. Thorp, at that point might I ask this: Do you think that what we did in the way of trade with an Iron Curtain country, whether it were gifts of food or actual trade, do you feel that our efforts, our generosity, would ever be transmitted to the people of the Iron Curtain countries and thus ever have a political effect in the Iron Curtain countries?

Mr. THORP. Well, now you have got a number of different situations there. I am sure that in East Germany, for instance, the people were aware of the fact that they were getting certain food from the Western countries at the time that we were distributing food through Berlin. The people knew that and I am sure it had some real effect on the situation.

As to what effect the attitude of people in one of these countries may have on Government policy, that is another question. I think one may take the position that as of several years ago there had to be modifications in policy because of rising discontent on the part of people. There is no question but what the agricultural area is one in which the reaction of the citizens in these countries doesn't meet what the Government would like, and the Government is having to adjust itself to peasant resistance. And I would think, therefore, that there is some impact on the people, but how much this translates itself up to the governments in these countries is very hard to say.

Representative BOLLING. Now, Mr. Thorp, I would like one more refinement on that. Would there be any more impact on the people if the items in question were so-called producers goods, as opposed to consumer goods?

Mr. THORP. I suppose this depends on whether these items came in and were fairly anonymous and word did not get around about them.

Representative BOLLING. East Berlin, where the food undoubtedly apparently had an impact, was an area that was most vulnerable to our information program. It was certainly a very specific item that inevitably got to an individual or was not distributed at all.

What I am getting at is the obvious: Must we not in our trade with Iron Curtain countries have very specific practical reasons for engaging in that trade, and not operate on the general thesis, which one hears a great deal of these days, that trade in itself will have the effect of breaking down tensions?

Mr. THORP. Yes, I have never had great enthusiasm for that. I think trade has some impact, because it necessarily does bring some people into contact with each other. It means some people have to come out or some people have to go into the country to do it. Also in some cases the items may create a respect for the source of those items, but I think I would agree with what I suspect is your chief point; namely, that in developing trade with these countries, one should consider what one is going to get, what items one is going to get, as well as the items that one is going to ship to them.

My feeling has been that, by and large, in Europe, the European countries who have been most interested in expanding trade have been negotiating pretty carefully to get the things they need—timber, coarse grains, and things of that sort.

The CHAIRMAN. Mr. Viner.

Mr. VINER. It seems to me fairly obvious that one has to consider the question of freer trade as an instrument of foreign policy with respect to aggressive powers in terms of the historical circumstances and the powers you have in mind.

To me, it seems foolish to think that we could woo the Russians or convert them to a respectable foreign or domestic policy by whatever trade policies we adopted. But I do think an important East-West cold war issue is involved in our trade policy, and that is that insofar as restrictions of the Western World's trade with the Soviet can weaken the Soviet world, our tariff policy stands as a barrier to use of that strategic instrument. The major burden of such restrictions would not fall on us—we never have been important traders with the Soviet countries—but they would fall on certain Western European countries in particular. If we do not offer them outlets, if we do not offer them substitute markets for the markets of the East, which are their historical and traditional markets, they may be forced, phychologically, politically, economically, physically, to come to terms in trade with Russia. I would also say that with respect to Japan we ought to bear that issue in mind.

As to whether trade in itself is a peace-making thing, I think it is debatable whether it has made more for peace or for war. It depends on what kind of trade policies prevail. Trade based on discriminatory and restrictive policies is probably more enmity creating than friendship creating. I would like, however, to give two illustrations where countries became extremely aggressive who might not have done so if the Western World, including the United States, had had more liberal trade policies. One of those was Hohenzollern, Germany, before 1914, which saw the world expanding in an imperialistic way, closing colonies to German trade, and creating a situation where it felt it could not avoid colonial encirclement. The second was Japan in the 1930's. Even in our period of more liberal trade policy it was being pushed out of our market and out of the markets of the British Empire everywhere. It was facing restrictions everywhere and experiencing a rising population, and rightly or wrongly, it saw no escape by peaceful means in a world in which countries would not trade liberally with it.

The CHAIRMAN. Are you suggesting, Mr. Viner, the same point that I think Mr. Taft emphasized in his testimony yesterday before the House Ways and Means Committee, that if we close our markets to Japanese exports, we inevitably throw them back on trade with Communist China?

Mr. VINER. Either trade with Communist China or some hopeless collapse. I see no possible economic future for Japan, not only if we do not open our own market to them more freely, but also if we do not foster a situation, in general, in which they have good prospects for making a living out of an economy which must in large part depend upon foreign trade.

Representative BOLLING. Mr. Chairman, I have to leave in a minute and I would like to make this very clear with what Dr. Viner has said with regard to Western Europe and Japan, I am in entire agreement.

I would like to have the opportunity at another time to discuss the other final statement he made, because my own feeling offhand would be that the trade was rather more the excuse than the core reason with regard to Germany in World War I, and Japan in the thirties, but I heartily agree with the first two points, the positive points that are made.

Mr. VINER. You may be right, but I know the politicians used the argument with their people. They may have been military aggressors, but this is what persuaded the people, and it comes to the same thing in the end. They needed public support, and they needed this argument which served their purpose, even though it may have been used insincerely by their leaders. As to whether they use it sincerely or insincerely, I reserve judgment.

Mr. TAFT. I would only note the relevance of this to foreign investment. For instance, you may have read the article in the New Yorker about Afghanistan, where we have a point 4 program, but we also have some American foreign investment. The Russians have now come in, and the Czechs, and are putting in quite a number of plants, in addition to which they are taking over in payment for those plants the so-called Persian lamb, or karakul, which comes from Afghanistan, and may therefore acquire economic control through that kind of foreign investment and this could become very dangerous.

Now they are pretty smart people. Maybe they are just trading with us, I do not know about that, but at least that is something that ought to be considered along with current trade.

Mr. CLEVELAND. On the question of Japan, it is my view that both the possibilities of Japanese trade with the United States and the possibilities of Japanese trade with the Soviet bloc, particularly Communist China, are overrated.

In the case of Communist China, the Chinese are already having difficulty finding enough Chinese products to exchange with Russia for what the Russians are sending them. Apart from coal, where the Chinese might be able to develop some surplus for Japan, Japan is likely to have to take the usual run of hog bristles and tung oil, and other items that have always bulked so large in Chinese export statistics.

As far as the United States is concerned, if there were really free trade between the United States and Japan, I will bet we would find that the area of comparative advantage isn't very large on any but the very high-labor-content commodities. That, I think, leads inevitably to the conclusion that the economic development of the rest of Asia—with rising incomes providing a market for industrial exports from Japan and more efficient production of primary goods providing some of the raw materials, some of the coal and some of the food that the Japanese need—is necessary to the Japanese problem. An Asian development program is necessary anyhow on political and other grounds in the development of our foreign policy in Asia.

The CHAIRMAN. Mr. Strackbein.

Mr. STRACKBEIN. May I comment on the Japanese situation?

The CHAIRMAN. Surely.

Mr. STRACKBEIN. Mention has been made here of the cutting off trade with Japan. Of course, that is not encouraged at all. I think that the members of this committee must know that under the unconditional most-favored-nation clause, Japan has received all of the benefits of any tariff reductions that we have made since 1934 in trade agreements. Now, not all concessions have applied to Japan because not all applied to goods coming from Japan, but where they did apply to goods coming from Japan, Japan got the benefits without ever entering into a trade agreement with the United States and without giving any concessions in return.

So it is not a question of our restricting our trade with Japan. The real question is if we make further duty reductions on our imports from Japan, to what extent our own domestic industry would stand the increased competition. Another question is, as you say, or as some have said, How much will it actually increase the shipments from Japan to the United States?

One of the great blows against Japan and Japanese exports to the United States was the development of synthetic textiles in the United States. Silk was the great staple product of Japan and much of it was sold in the United States. They do not have that any more, or at least only in very reduced quantities. So how far we can go to substitute for that by permitting toys and tuna, and knickknacks of one kind or another to come in here at lower rates is a highly debatable question.

I would not look at the reduced trade barriers against Japanese goods to lead to as great a volume as some people might think. I think at the same time it could do a great deal of damage because the competition from Japan is the most difficult that we face, and that is true in textiles, cotton textiles, and others, woolen textiles, even the synthetics. So my view is if we must have a trade agreement with Japan, and recognizing the difficult international situation, that we should have made a bilateral agreement instead of going through GATT.

In that case we could have made it possible to live with the competition by putting on import quotas, liberal, if you please, but nonetheless limiting the damage instead of having an open end to the competition which becomes upsetting to our own producers.

Mr. THORP. Mr. Chairman, may I just make a footnote on this statement of Mr. Strackbein's, because I think he has given a slightly wrong impression. While it is true that the previous trade agreement negotiations are, under our principles, generalized through the most-favored-nations clause, the fact is that the negotiators of trade agreements with other countries have not negotiated with respect to the main items of importance in trade with Japan.

What one does in negotiating with a country is to negotiate on the chief trading items with that country. This has meant in many cases that there have been differentiations made within a single product, by price level or something of that sort, so that a tariff cut is applied to the quality of that product which might come from some other country, but not from Japan, and so the actual fact is that as of the moment there has been reserved, one might say, until the day when negotiations took place with Japan, the items which promise to be most important in our trade with Japan.

The CHAIRMAN. What would those be, Mr. Thorp?

Mr. THORP. Well, this is a long list of items that has been put out. There have been public hearings on it. I can't offhand define what it is.

Mr. TAFT. It was published in advertisements in the New York Times and Journal of Commerce last week, and Washington Post and Times Herald.

The CHAIRMAN. I regret to say I do not always read the advertising pages.

Mr. TAFT. It was a full page: You could not have missed it, Senator. May I add, in addition to what Mr. Thorp has said, the classification operation in the Customs Bureau of the Treasury Department has been rather carefully used to exclude Japan from benefits of trade agreements that may have been negotiated.

Mr. STRACKBEIN. Well, that is certainly not true universally. In the case of tuna, trade agreements were made with Iceland, and there were included certain items of tuna, and that benefit did go to Japan. It was not possible in these broad trade negotiations to cut Japan out by value brackets or other devices.

Mr. THORP. Not completely, but to a large extent.

Mr. TAFT. They tried.

(Mr. Thorp's prepared statement appears at p. 984.)

The CHAIRMAN. Mr. Upgren.

OPENING STATEMENT OF ARTHUR UPGREN, DEAN, AMOS TUCK SCHOOL OF BUSINESS ADMINISTRATION, DARTMOUTH COLLEGE

Mr. UPGREN. I have prepared a rather longer paper, so I will try to keep my testimony short and stay inside the limit, but I would like to speak to three points:

First of all, the methods we have for strengthening the Allies, and how we have used them. Second, the problem of the standard of living and jobs at home, as opposed to the question of security. And, thirdly, a guide that we might have for agriculture, which the President noted in his message was a very special problem.

First, with respect to aiding the free world, we have had some five general methods. Of the five, I think the tariff reduction has not been better than fourth in importance and probably could not be better than fourth in the immediate future.

The first and greatest method of helping the world, of course, is to keep the domestic economy strong because that pulls in the imports regardless of whether they are dutiable or free and, of course, it is to that which this committee has dedicated its major effort.

The second way in which we have assisted the world is by giving aid, which the Department of Commerce said a week or two ago has added up to $50 billion since the end of the war. That would be an average of five and a half billion dollars a year, and I suspect we have given aid in that manner rather than by tariff reduction because of our huge, powerful fiscal budget. We are able to raise the money to give that aid, and to assess the burden on Americans as fairly as the Ways and Means Committee can manage to do that, whereas in the case of tariffs, we are unable yet to find a device to assess the very localized burden on our people.

The third most important way of assisting the world is in terms of trade. American industry produces more and more goods without as much a rise in prices as the rest of the world which has really supplied us with a lesser increased flow of goods at a much more greatly increased price.

Then comes our fourth way, tariff reduction, and I think, because we have had so many rather doctrinaire questions, we might digress briefly to point out that the barrier to a great inflow in imports is largely the $160 billion investment of American plant in new industry.

With that huge investment American industry would generally meet the price conditions which would be imposed by tariff reduction. What I am saying here is that the proposal of trade, not aid about a year or two ago, could not have accomplished but a very small amount of the achievement that was dramatized by the visit of two members of the British Cabinet. This was important, but we should not try to persuade the American people that we can do so much more than is possible.

The reason is that our industry is generally profitable. It will meet the price conditions imposed by reductions of tariffs. We discovered this working in the Trade Agreement Section of the State Department 20 years ago, and it is the price effects that industry is concerned with because it does have this huge investment which will keep most of its output coming forth to meet the competition of any inflow of European imports.

The CHAIRMAN. That would help the consumer, would it not?

Mr. UPGREN. Yes, it might help the consumer in terms of a lower price, but it wouldn't be the method necessarily of strengthening our allies. That is entirely correct.

The fourth method of assisting the world—by reducing tariffs—would be very slow, though there might be certain price gains. There could be adverse effects from this lowering of price such as the slowdown of that very, very important factor in maintaining a high level of prosperity, which is a sustained flow of American investment in new plant and equipment. I would assume that one of the very great benefits secured a year ago from the abandonment of the excess-profits tax was the maintenance of total construction at the very high rates which were maintained during this past year, thus giving the consumer a gain in that direction to offset a gain he might not have gotten by the failure to lower that tax, or to lower the tariff to use the other case.

The conduct of foreign trade does not increase jobs, as Dr. Goldweisser on many occasions would emphasize. Rather, it makes better jobs, and there we have a key to the last point about which I would like to talk briefly, and that is the rule that might guide agriculture in its own self-interest.

I think of that because I lived in the Midwest until 2 years ago. In the Midwest our agriculture has made a very marked shift from cereal farming of 50 years ago over to production of meat and all products of livestock. That has been a remarkable shift efficiently accomplished and it reflects the high-income position of the American people. Agriculture, therefore, is interested in a high rate of marketing of livestock and its products, or in other words, meat, dairy products, and all that, with the result that the importance of cereals is very greatly reduced.

Now the sale of such products is much greater when the American family income is high. I can recall estimates—I confess I am not up to date here—that families some years ago who had a $65 or $70 weekly income consumed two-thirds more meat than a family with a $40 or $45 weekly income. Then it becomes in the interests of agriculture, which now has a production of 55 percent livestock and its products—and in the States of Indiana, Wisconsin, Iowa, the proportion is over 70 percent—to encourage high consumer income.

Here we might suggest that agriculture reverse its position against the lowering of tariffs. By favoring tariff reduction agriculture would constantly put the pressure on those industries which are paying low wages and, therefore, which provide somewhat poorer customers for agricultural products.

Now the clue to this, I think, will also answer some of the questions which have been raised, and that is how do you create a high wage industry. The high wage industry generally, I think, is created by the use of large amounts of capital and machinery. Larger amount of capital and machinery increases the productivity and results in a higher wage.

For example, the utility and the oil industry—and I guess the chemical industry, and the steel industries—do have very high investment per worker and high wages. Workers in these industries provide excellent markets for agriculture. Other industries, not to make any invidious comparisons, have lower wage rates and agriculture might very greatly gain markets here if income were higher.

The CHAIRMAN. Those happen generally to be the protected industries, too, do they not?

Mr. UPGREN. I think that is right.

The CHAIRMAN. I notice the industries in the past which have had high tariff rates tend to be low-wage industries.

Mr. UPGREN. That is right.

Mr. STRACKBEIN. Mr. Chairman, don't you think the differential in wage rates in the United States is more regional than it is among industries? I had occasion for a period of several years to observe the wage rates in different parts of the country. That was under the Walsh-Healey Act. The highest wage-paying section of this country was Washington and Oregon. Now that very fact may upset many classical economic theories, but it is nonetheless a fact. The lowest rates were in Southeastern United States. Fairly high rates prevailed throughout New England, in Massachusetts, coming down through New York, Pennsylvania, and then Ohio.

The wages were lower in the Southwest, lower Middle West, and southern California. From San Francisco up, they were higher. I do not think you can equate that with whether the industries there located were protected or unprotected.

The CHAIRMAN. There are undoubtedly regional differences, but I think it is also true that woolen, cotton, jute, hemp, most of which have had high tariff rates, have been low wage industries; in fact, low wage industries all over the world.

Mr. STRACKBEIN. Another differential was in the size. In almost all cases, the large companies paid high rates, the medium sized companies middle rates, and the small companies low rates. I do not think you can equate that either with whether industries are protected or unprotected. So there are many causes of wage differentials in this country operating aside from whether industries are protected or not.

The CHAIRMAN. Of course, I would not maintain that this is the only or perhaps the chief reason. I would simply suggest that it is the position the proponents of high tariffs take when they say it is necessary to protect the American wage scale, and yet the industries which have the greatest amount of protection happen to be low-wage industries. That fact sticks out like a sore thumb.

Mr. STRACKBEIN. I wonder if an examination has been made of that thesis in the postwar years.

The CHAIRMAN. Well, my information doesn't go much beyond 1940. I will say I would be surprised if there were a great change.

Mr. STRACKBEIN. I think you would find it very interesting to see what changes have been taking place in that case.

(Mr. Upgren's prepared statement appears at p. 986.)

The CHAIRMAN. Mr. Viner.

OPENING STATEMENT OF JACOB VINER, PROFESSOR OF ECONOMICS, PRINCETON UNIVERSITY

Mr. VINER. Mr. Chairman and members, I support heartily the general principles stated by the President with respect to the economic foreign policy of the United States in his economic report, and in his message to Congress of January 10. I, in general, support also most of his specific recommendations. I would have preferred, however, a closer match between the vigorously expressed and highly persuasive exposition of the general policy and the meager, hesitant, and partial program proposed for carrying out this general policy.

It is in the interest of the prosperity and the security of the United States that the economies of our allies, friends, and potential friends abroad shall experience steady and significant growth from year to year. More liberal access to the American market for their commodities and services can be a major factor in promoting this result.

American prosperity would be promoted by a more liberal commercial policy on our part. It is in our own economic interest that we shall move steadily toward the objective that we obtain from abroad in exchange for exports of our own commodities and services such desirable commodities and services as cannot be produced here, under normal conditions and in normal years, at as low or nearly as low a cost as the cost to us of buying such or equivalent commodities abroad.

In the past 20 years there have been substantial reductins in our tariff rates and, because of inflation, there has been also a substantial reduction of the ad valorem equivalents of the specific duties of our tariff. The cuts that have been made in our tariff, however, have been in large part those that could be made without appreciably reducing the control of our protected industries over the domestic market. To a large extent the reductions in our tariff which would really lower the effective margin of tariff protection remain to be made. The percentage of imports of dutiable goods to total domestic production of such goods in the United States is probably less today than it was in 1934, when the process of tariff reduction began. This decline in the relative importance of imports is due to many factors, of which failure to make genuine and important reductions in the effective level of our tariff protection is only one. This decline serves, nevertheless, to support the verdict that much of the tariff-liberalization of the past two decades was make-believe.

Even deep cuts in tariff rates may have only token effects on the volume of trade if the foreign producers and the American importers of the commodities in question cannot be reasonably confident that these cuts are made with serious intent to encourage imports and will not be withdrawn as soon as it becomes evident that they are having their supposedly intended effect. In many cases successful entrance into the American market requires redesign of products, adjustment and expansion of production facilities, establishment in the United States of warehousing and distribution facilities, expensive sales effort to win market acceptance for the products. Sober foreign businessmen will often rightly conclude that the risk that the tariff will be raised on their products as soon as it becomes clear that there is an American market for them is too great to justify the investment necessary to find out whether they can sell their products here.

In the light of these considerations, the proposed limitation to 3 years as the period of authorization of reductions of duty by executive action, the limitation, with respect to most dutiable items, of reductions not to exceed 5 percent per annum, the continued subjection of the reduced duties to the hazard of cancellation of the reductions under the escape clause, these make the program as a whole a very insubstantial and timid contribution to the goal of a more liberal commercial policy for the United States.

Whatever may be said in favor of tariffs on imports, there is nothing which can be said in support of import restrictions being given the form of making the importing process unnecessarily costly in legal and clerical expenses, in deliberately manufactured risks for the importers, uncertainties, and delays, through archaic administrative procedures which burden the American Government, the foreign exporters, the American importers, and the American consumer. The delay in instituting a thoroughgoing reform of our customs administration which has already occurred is inexcusable. What has recently been accomplished in this direction is good as far as it goes, but goes only a small distance toward removing abuses whose nature has been evident for many years. There has been more than ample time for exploration and for resolution of the technical questions to which revision gives rise. The time for real remedial action is long overdue.

The CHAIRMAN. Mr. Viner, would you say that the chief difficulty in this connection is the uncertainty and the varying standards which are applied in the determination of what the price of a commodity is?

Mr. VINER. I think that is probably the most important single one. If one looks, however, at the record of the items which cause procedural difficulty to the importers and make litigation a normal part of our importing procedure on a wholesale scale, without parallel at any time or anywhere in the world elsewhere, it is, I think, not so much the valuation procedures but rather the classification procedures. These give customs officials too much leeway because of the vagueness, the uncertainty, and the great detail, the fineness, of the classification of commodities for duty purposes. Fitting a commodity into its class is difficult for the most accomplishel person. When the final decisions are made, very often after a prolonged legal procedure, going through three legal stages, the final decision sometimes reveals that the judges themselves are often amused at the arbitrary and trivial considerations which decide the issue—whether, for instance, once actual case—an imitation bird in a cage was a toy, or a musical instrument, or a manufacture of feathers and brass, and, if so, whether the important constituent was feathers or brass. This sort of thing has occurred in thousands of cases.

Moreover, the backlog of delay is always tremendous. There is a backlog of tens of thousands of cases in a normal year.

The CHAIRMAN. What would you suggest in the way of simplification?

Mr. VINER. Well, if there were not a very wide range of duties in our tariffs, which would be practicable if none or few of our duties were at very high levels, there would be so little point in having one duty, say, at 8½ percent, and another at 9¼ percent, that it would be easy to put hundreds of commodities in one duty class, and then the classification decision would shrink in importance and difficulty and uncertainty. One of the things that has been missed in all of the able and conscientious work that has been done over 20 years, trying to prepare the way for tariff liberalization, is the failure to realize that as tariff levels fall by negotiation, or through inflation, that provides an opportunity for lumping many items into one group, without appreciably changing the duties applicable to any item. Classification could thus become relatively unimportant, for both the customs staff for whom it is a headache, and for the importers, for whom it is also a headache.

If we followed a general policy of reducing the range of duties by reducing the maximum rates, we could then move without much resistance, and without important adverse effect on anyone, toward reducing the number of rate classes. This would not reduce the number of dutiable items, but only the number of rate classes. You could have a great number of commodities, for example, in the 15 percent ad valorem class bracket.

The CHAIRMAN. Do you think this could be reached by the present proposal?

Mr. VINER. As I understand the present proposal, it is a proposal for further study. I was with the Tariff Commission back in 1917. I think they knew enough then to know how to produce within 6 months an adequate program of simplified classification procedures, although I am not denying that it would give rise to some technical difficulties. I think they knew enough 2 years ago, and 4 years ago. A proposal for still further studies and for waiting for the results of such studies, amounts chiefly to a proposal to postpone at this legislative session any real action.

The CHAIRMAN. Would you recommend the amendment of the present bill which would give to the President and the Tariff Commission the power for this broader classification which you suggest?

Mr. VINER. Well, in some respects I am a conservative, and I am conservative about excessive tampering with the tariff-rate structure, where it is not clear that it is being done with the sanction of Congress. If you gave complete discretion, it would be possible by a change in classification to change rates from 80 percent to 5 percent, or vice versa. Therefore, I would recommend, and it would suffice for a great deal of simplification, that wherever the Tariff Commission would find that a change in classification would not change the rate by more than a specified moderate amount, it could be done by executive action.

The CHAIRMAN. Let me see if I understand your proposal. You would say that the rates could not be decreased below a given point?

Mr. VINER. By mere change of classification, so that if important reduction—or increase—in rates, would not be made possible without

Congress knowing in advance that it is giving the power and the administration knows that it is carrying out a mandate of Congress.

The CHAIRMAN. But rates could be reduced down to that point?

Mr. VINER. Yes.

The CHAIRMAN. Do you have in mind a figure of "X" percent?

Mr. VINER. I would say 5 percent ought to be readily acceptable. I mean 5 percentage points, or 5 percent of the value of the commodity.

Mr. TAFT. Mr. Chairman, may I complete the record on this? The bill on tariff simplification submitted by the President last year provided for the setting up of a reduced number of classifications. Within each classification it was provided that the total revenue derived from that classification should remain at the same amount. This automatically required that certain tariffs might be raised and certain others might be lowered in order to arrive at a standard for that classification. It did not provide for a further reference to Congress.

Mr. Byrnes, who introduced the bill in the House last year, was unwilling to accept it in that form, and it was introduced with those provisions but with the further provisions that when the President arrived at these conclusions after a Tariff Commission study, it should sit in the two Houses for 30 or 60 days, whatever it was, subject to a congressional veto. This bill, however, when it came to the Senate—it was passed in that form, roughly, in the House—when it came to the Senate, it was revised so that the study itself should come to the Congress, and that is the form in which it was passed. This problem becomes so serious, and increasingly serious, because of the number of new products. First, the total categories, I think, are about 8,000 in the present Tariff Act of 1930. And in the chemical industry alone there are 7,500 new products since the period of the last tariff act. And when you take all of the other categories, you get innumerable products that cannot be squeezed into anything that you have got as it stands now, and then the discretion to which Professor Viner has referred in the Bureau of Customs that lets them take almost any infinitesimal part and apply the highest rate applicable, just gets things into a terrible jam, just as he has described.

Mr. STRACKBEIN. Mr. Chairman, may I make a comment on this customs simplification? This is only a guess, I would admit, but I would say that 95 percent of our imports come through in routine fashion without any difficulty.

Mr. VINER. That is quite possibly so. I think the same sort of thing can be said about our import duties; a very large part of our imports come in free of duty. Nobody says that it is the free duty list that keeps the imports out. It is the customs administrative procedures on dutiable items and the higher duties that keep products out.

I am interested in the imports which do not come in because of the trade barriers and not in the ones which do come in. When you appeal to the ones that do come in you are just begging the question.

On the proposal of last year, I must say I did not like it because it would involve automatically the increase of some duties. Also, figuring the total receipts from a class of duties means that you are forecasting the effect of change in duties on the volume of imports or the effect of change in business conditions on the volume of imports.

I have great skepticism about the capacity of anybody, even my fellow economists, to forecast such things with any degree of accuracy. Moreover, the total revenue collected is largely irrevelant. But my chief objection is that you could not carry out last year's proposal consistently with our agreements with other countries. We have pledged ourselves to certain specific rates on certain designated commodities. Because we have decided to change our customs administration, we cannot now tell them that unfortunately the duty which was formerly 12 percent on their item is now to be 15 percent, when we have agreed to keep it at 12.

Mr. TAFT. May I add just one comment on what professor said as to the relationship of the free list by value to the rest.

The implication would be that the more you reduce the tariff the higher the proportion of the free-list value. It is the exact opposite. The highest percentage of free tariff was after the passage of the Smoot-Hawley Act, and it has gone down ever since.

Mr. VINER. If we let in all of the products we have no interest in producing here and imposed a 5,000 percent ad valorem tax on the items we do wish to produce, the amount of duties received would be zero.

Mr. STRACKBEIN. We hear a lot of discussion on this point. I would like to see what items are being excluded other than by quarantine.

Mr. TAFT. If he will look at page 8 of my statement he will see a great number of them. Here is a list of chemical incomes in 1952 in thousands of dollars, and the tariff rate next to them. There are 3 out of this list of 15 or 20, one is $104,000, one $81,000, and then one $15,000, and one $12,000, and there are half of them that don't come in at all, over rates that vary from 50 percent to 250 percent.

Mr. STRACKBEIN. That is not responsive to the question, Mr. Chairman.

Mr. TAFT. It is what you asked for.

Mr. STRACKBEIN. No, I said give some examples of items excluded because of custom administration, not because of the height of the tariff rates.

Mr. VINER. I think the only procedure by which you could get reliable results on that would be to get the expert buyers for the important importing stores, Sears, Roebuck, and so on, and let them tell you why certain things cannot profitably be introduced in the United States. I know over the years in talking to such people that they could literally accumulate these items by the list of hundreds up to the thousands, items which they have explored. There is in the first place the uncertainty as to what the duty would be; in the second place, the fact that the product in question may be experimental. They would first have to know at what price they could lay it down and, secondly, whether the American public would respond. They do experiment, and they do decide in the negative after experimenting, time after time; they are experimenting steadily, and you can go to Macy's, go to Marshall Fields, go to Sears, Roebuck, and talk to the appropriate people. They will give you the list of these items if you ask them to.

Mr. THORP. I can also testify to the fact that while I was in the State Department I knew of a number of cases which people told me about where a new commodity coming in, not specified in the Tariff Act, would come in under the basket clause, the nonspecified level of tariff rate, which is usually very high. This would mean that its competitive item which was specified in the tariff rate at a lower tariff would continue to have the market and the new item, not having been specified, would be kept out. This is, of course, customs administration in the sense that it relates to the character of the classification procedure which automatically places high tariffs on unspecified and new items.

Mr. VINER. That is right.

Mr. STRACKBEIN. My only point is in place of citing these horrible examples that we have some factual data. As it is we are merely tossing words back and forth, and we have no real factual data, and I think we should have it instead of generalizing.

Mr. KALIJARVI. I think a dramatic instance of this was withholding of appraisal on rayon faille for 8 or 10 months and that represented an embargo of about $10 million on fiber that would have normally come into the United States.

The CHAIRMAN. Mr. Viner.

Mr. VINER. Our treatment of agricultural imports is entangled with the special measures which we have taken to promote the prosperity of our domestic agriculture. It would admittedly be inconsistent and impracticable to allow foreign agricultural products to enter freely into the American market while domestic agricultural products are supported at higher than world-market prices. But whatever our policy should be with respect to the income levels of the persons and resources engaged in agriculture, we should carry it out by measures which retain in American agriculture only those amounts of human and other productive resources which without subsidy can earn in free competition the economic equivalent of what corresponding American productive resources earn in American industry at large.

It is our restrictions on agricultural imports which press most severely on the underdeveloped countries and on our neighbors to the north. It is our agricultural program, with its quotas on imports, its subsidies to exports, and its governmental trading, which conflicts most obviously and most importantly with our declared objectives of free private enterprise operating in free competitive markets and of the confinement of restrictions on foreign trade to nondiscriminatory and moderate import duties. When agricultural policy comes to be considered and, I hope, to be reformed, it is urgent that one of the major objectives shall be such a revision of that policy as to make if consistent, in its foreign economic policy aspects, with all the principles of liberalized foreign trade to which we so repeatedly declare our adherence.

The CHAIRMAN. Thank you very much.

(Mr. Viner's prepared statement appears at p. 991.)

(Whereupon, at 12:35 p. m., a recess was taken until 2 p. m. of the same day.)

AFTERNOON SESSION

The committee reconvened at 2:45 p. m., Senator Paul H. Douglas, chairman, presiding.

Present: Senator Douglas, chairman, Senator Sparkman, and Representatives Kelley and Talle.

The CHAIRMAN. We thank you, gentlemen, for coming back this afternoon. Mr. Kalijarvi.

OPENING STATEMENT OF THORSTEN V. KALIJARVI, DEPUTY ASSISTANT SECRETARY OF STATE FOR ECONOMIC AFFAIRS

Mr. KALIJARVI. Mr. Chairman, you raised the question as to the items contemplated for negotiation with respect to the Japanese agreement. I have here the TAC report on those, and perhaps it might be useful for the record if they were inserted at this point.

The CHAIRMAN. We wish you would.

(The information referred to is as follows:)

[Department of State Publication 5653, Commercial Policy Series 145]

THE GENERAL AGREEMENT ON TARIFFS AND TRADE

NEGOTIATIONS UNDER THE TRADE AGREEMENT ACT OF 1934 AS AMENDED AND EXTENDED

NOTICE OF UNITED STATES INTENTION TO NEGOTIATE

LIST OF PRODUCTS TO BE CONSIDERED

NOTICE OF PUBLIC HEARINGS

Prepared by the Interdepartmental Trade Agreement Organization consisting of the Departments of State, Treasury, Defense, Agriculture, Commerce, Labor, Interior, the United States Tariff Commission, and the Foreign Operations Administration, November 1954

UNITED STATES INTENTION TO UNDERTAKE TRADE-AGREEMENT NEGOTIATIONS

The Interdepartment Committee on Trade Agreements today issued formal notice of the intention of the United States Government to participate, under the authority of the Trade Agreements Act of 1934, as amended and extended, in reciprocal tariff negotiations involving Japan. The President has given high priority to expansion of Japan's trading opportunities because of Japan's vital importance to free-world mutual security.

Today's announcement, including the listing of products and the scheduling of hearings, formally opens United States preparations for participation in an international tariff-negotiating conference to be convened next February in Geneva, Switzerland, under the sponsorship of the countries associated in the General Agreement on Tariffs and Trade. The purpose of this conference will be tariff negotiations looking to Japan's full accession to the general agreement, thus enlarging her trade possibilities with other countries as well as with the United States.

To aid in the development of positions which the United States should adopt in the proposed tariff negotiations, and in accordance with established procedures, a list is also published today of the products on which the United States may consider offering concessions. Hearings are also scheduled and opportunity is provided for submission of briefs for the purpose of obtaining views and information from interested persons on all phases of these negotiations, including views for or against concessions which the United States might seek or offer on particular products.

Attached to the committee's notice of intention to negotiate is a list of products on which modifications may be considered during the negotiations. Listing of an item is for the purpose of gathering information on the possibility of a concession: it does not necessarily mean that a concession will be offered on the product. No tariff concession can be made by the United States on any product not included in this or a subsequent published list.

As indicated in the announcement, the United States also proposes to take advantage of the occasion of these tariff negotiations to carry out four renegotiations arising out of various United States actions. In two cases, there was enacted legislation calling for modification of certain trade-agreement obligations by an upward adjustment of import duties for commodities affected by exceptional developments. The laws in question are Public Law 689 on fish sticks and Public Law 479 on certain rubber-soled shoes. The third case relates to the escape-clause action taken by the United States in which it modified the concession on dried figs. No change is contemplated in the present tariff treatment of figs, but under the agreement the escape-clause action permits other countries to seek compensatory adjustments either by new concessions on our part or by withdrawal of concessions by affected countries. In the fourth case, when Uruguay became a party to the agreement last December, the United States did not find it possible to proclaim certain concessions that had been negotiated on meat products.

The majority of the listed articles are included for the purpose of giving consideration to concessions in negotiations directly between the United States and Japan. There are, however, many articles which are of primary interest to other countries. For these articles consideration will be given to possible concessions under circumstances where these other countries are also negotiating with Japan under the general agreement and where a concession by the United States would broaden the overall results of the multilateral negotiations through the triangular exchange of benefits.

In addition, because of the extensive and time-consuming nature of the procedures for getting information on possible concessions, there are a relatively few articles of interest primarily to countries which may decide to negotiate with Japan though they have not yet done so. As a general rule no concessions would be made on such products if the country having a primary interest does not complete its negotiations with Japan.

The Interdepartmental Trade Agreements Committee's notice and the list are attached to this release.

As required by law, the Committee for Reciprocity Information also gave notice that it will receive views of interested persons concerning any aspect of the proposed negotiations. The members of the Committee for Reciprocity Information and the Committee on Trade Agreements are the same. They include a member of the United States Tariff Commission and representatives designated by the Secretaries of State, the Treasury, Defense, Agriculture, Commerce, Labor, and Interior, and the director of the Foreign Operations Administration.

Domestic producers, importers, and other interested persons are invited to present views and all possible information regarding products on the published list, including information relative to section 2 of the Trade Agreements Extension Act of 1954. This section provides that no action should be taken to decrease the duty on any article where the President finds that such reduction would threaten domestic production needed for projected national defense requirements. Consideration will be given to submissions concerning wages in the exporting country in accordance with the President's message of March 30. All views and information will be carefully considered in arriving at a decision as to whether or not a concession should be offered by the United States on each product.

There is no limitation on the products on which the United States may request concessions, and domestic producers or exporters interested in developing markets in Japan are invited to present suggestions to the Committee for Reciprocity Information as to concessions which should be sought. The Department of Commerce also furnishes the Interdepartmental Committee on Trade Agreements with studies of the trade in and other facts regarding articles exported from the United States on which the United States might consider seeking concessions in the negotiations.

Hearings before the Committee for Reciprocity Information will open on December 13, 1954. Applications for oral presentation of views and information should be presented to the committee not later than 12 noon, December 3. Persons desiring to be heard should also submit written briefs or statements to the Committee for Reciprocity Information by 12 noon, December 6, 1954. Only those persons will be heard who presented written briefs or statements and filed applications to be heard by the date indicated. Persons who do not desire to be heard may present written statements until noon, December 27, 1954. Details concerning the submission of briefs and applications to be heard are contained in the committee's notice attached to this release.

The United States Tariff Commission also announced today that it would open public hearings on December 13, to receive views and information useful in preparing its "peril-point" report to the President, as required by section 3 (a) of the

Trade Agreements Extension Act of 1951, on the extent to which United States concessions on particular products may be made in the negotiations without causing or threatening serious injury to a domestic industry producing like or directly competitive products.

Views and information received by the Tariff Commission in its hearings referred to above will be made available to the Committee for Reciprocity Information for consideration by the Interdepartmental Committee on Trade Agreements. Persons whose interests relate only to import products included in the list published today, and who have appeared before the Tariff Commission need not—but may if they wish—appear also before the Committee for Reciprocity Information.

However, persons wishing to present material on United States import concessions other than the material they have presented to the Tariff Commission should file written statements or briefs with the Committee for Reciprocity Information, or may, if they wish request appearance before that committee. Persons wishing to suggest additional items on which United States import concessions may be considered, and which do not appear in a published list, should present their views to the Committee for Reciprocity Information.

Copies of the notice of the Tariff Commission may be obtained from the Commission.

INTERDEPARTMENTAL COMMITTEE ON TRADE AGREEMENTS

I. Trade-agreement negotiations under the General Agreement on Tariffs and Trade relating to Japan.
II. Possible adjustment in preferential rates on Cuban products.

Pursuant to section 4 of the Trade Agreements Act, approved June 12, 1934, as amended (48 Stat. 945, ch. 474; 65 Stat. 73, ch. 141) and to paragraph 4 of Executive Order 10082 of October 5, 1949 (3 CFR, 1949 supp., p. 126), notice is hereby given by the Interdepartmental Committee on Trade Agreements of intention to participate in trade-agreement negotiations, on a reciprocal basis, looking to Japan's accession to the General Agreement on Tariffs and Trade, as a means of improving Japan's trading prospects in the free world. With a view to the further expansion of such trading prospects, the United States is also considering, in addition to negotiations directly with Japan, participating in limited negotiations with other contracting parties to the general agreement that will also be negotiating with Japan, in order to broaden the overall results of the negotiations.

There is annexed hereto a list of articles imported into the United States to be considered for possible modification of duties and other import restrictions, imposition of additional import restrictions, or specific continuance of existing customs or excise treatment in the trade agreement negotiations of which notice is given above. In addition to articles of primary interest to Japan, there are also being listed some articles of interest to certain contracting parties as well as to Japan, and a few articles which are believed to be of primary interest to other contracting parties that may be negotiating with Japan, some of which articles are closely related to articles of primary interest to Japan.

Notice is also given of intention to negotiate settlement of several outstanding problems arising out of various actions by the United States. Negotiations are contemplated looking to such modification of trade agreement obligations as may be necessary in view of the enactment of Public Law 479 of the 83d Congress relating to certain rubber-soled shoes and Public Law 689 of the 83d Congress relating to certain prepared fish. In addition the United States modified its concession on figs, fresh, dried, or in brine, as a result of an escape clause action. Finally, the United States did not find it possible to carry out obligations negotiated with Uruguay with respect to certain meat products. Among the possible outcomes of these negotiations might be a granting of such concessions on some items in the annexed list as may be necessary to compensate for the above actions of the United States.

The articles proposed for consideration in the negotiations are identified in the annexed list by specifying the numbers of the paragraphs in tariff schedules of title I and title II of the Tariff Act of 1930, as amended, in which they are provided for together with the language used in such tariff paragraphs to provide for such articles, except that where necessary the statutory language has been modified by the omission of words or the addition of new language in order to narrow the scope of the original language. Where no qualifying language is used with regard to the type, grade, or value of any listed article, all types, grades, and values of the article covered by the language used are included.

In the case of each article in the list with respect to which the corresponding product of Cuba is now entitled to preferential treatment, the negotiations referred to will involve the elimination, reduction, or continuation of the prefernce, perhaps in some cases with an adjustment or specification of the rate applicable to the product of Cuba.

No article will be considered in the negotiatiosn for possible modification of duties or other import restrictions, imposition of additional import restrictions, or specific continuance of existing customs or exercise treatment unless it is included, specifically or by reference, in the annexed list or unless it is subsequently included in a supplementary public list. Only duties on the articles listed imposed under the paragraphs of the Tariff Act of 1930 specified with regard to such articles and import taxes imposed on such articles under the Internal Revenue Code will be considered for a possible decrease, but additional or separate ordinary duties or import taxes on such articles imposed under any other provisions of law may be bound against increase as an assurance that the concession under the listed paragraph will not be nullified. In addition, any action which might be taken with respect to basic duties on products may involve action with respect to compensating duties imposed on manufactues containing such products. In the event that an article which as of January 1, 1954, was regarded as classifiable under a description included in the list is excluded therefrom by judicial decision or otherwise prior to the conclusion of the trade-agreement negotiations, the list will nevertheless be considered as including such article.

Persons interested in exports may present their views regarding any tariff or other concessions that might be requested from Japan. Any other matters appropriate to be considered in connection with the negotiations proposed above may also be presented. Public hearings in connection with the "peril point" investigation of the United States Tariff Commission in connection with the articles included in the annexed list, pursuant to section 3 of the Trade Agreements Extension Act of 1951, as amended, are the subject of an announcement of the date issued by that Commission.

Pursuant to section 4 of the Trade Agreements Act, as amended, and paragraph 5 of Executive Order 10082 of October 5, 1949, information and views as to any aspect of the proposals announced in this notice may be submitted to the Committee for Reciprocity Information in accordance with the announcement of this date issued by that Committee.

By direction of the Interdepartmental Committee on Trade Agreements this 13th day of November, 1954.

CARL D. CORSE,
Chairman, Interdepartmental Committee on Trade Agreements.

LIST OF ARTICLES IMPORTED INTO THE UNITED STATES PROPOSED FOR CONSIDERATION IN TRADE AGREEMENT NEGOTIATIONS WITH JAPAN AND OTHER COUNTRIES

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST

SCHEDULE 1. CHEMICALS, OILS, AND PAINTS

Par.		
5	Ajinomoto and other monosodium glutamate preparations	
27 (a) (1) (5)	Acetanilide not suitable for medicinal use,	
	alphanaphthol,	aminobenzoic acid,
	aminonaphthol,	aminophenetole,
	aminophenol,	aminosalicylic acid
	aminoanthraquinone,	aniline oil,
	aniline salt,	anthraquinone,
	arsanilic acid,	
	benzaldehyde not suitable for medicinal use,	
	benzal chloride,	benzanthrone,
	benzidine,	benzidine sulfate,
	benzoic acid not suitable for medicinal use,	
	benzoquinone,	benzoyl chloride,
	benzyl chloride,	benzylethylaniline,
	beta-naphthol not suitable for medicinal use,	

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 1. CHEMICALS, OILS, AND PAINTS—continued

Par.

bromobenzene, chlorobenzene,
chlorophthalic acid, cinnamic acid,
cumidine, dehydrothiotoluidine,
diaminostilbene, dianisidine,
dichlorophthalic acid, dimethyl aniline,
dimethylaminophenol,
dimethylphenylbenzylammonium hydroxide,
dimethylphenylenediamine,
dinitrobenzene, dinitrochlorobenzene,
dinitronaphthalene, dinitrophenol,
dinitrotoluene, dihydroxynaphthalene,
diphenylamine, hydroxyphenylarsinic acid,
metanilic acid, methylanthraquinone,
naphthylamine, naphthylenediamine,
nitroaniline, nitroanthraquinone,
nitrobenzaldehyde, nitrobenzene,
nitronaphthalene, nitrophenol,
nitrophenylenediamine,
nitrosodimethylaniline,
nitrotoluene, nitrotoluylenediamine,
phenylenediamine, phenylhydrazine,
phenylnaphthylamine, phenylglycine,
phenylglycineortho-carboxylic acid,
phthalic acid, phthalimide,
quinaldine, quinoline,
resorcinol not suitable for medicinal use,
salicylic acid and its salts not suitable
for medicinal use sulfanilic acid,
thiocarbanilide, thiosalicylic acid,
tetrachlorophthalic acid,
tetramethyldiaminobenzophenone,
tetramethyldiaminodiphenylmethane,
toluene sulfochloride, toluene sulfonamide,
tribromophenol, toluidine,
tolidine. tolylenediamine,
xylidine,
carbazole having a purity of 65% or more; all the foregoing products (not including phthalic anhydride, anthracene, or naphthalene) whether obtained, derived, or manufactured from coal tar or other source.

27 (a) (3) (5) All products (except products chiefly used as assistants in preparing or finishing textiles and except azo salts, fast color bases, fast color salts, and Naphthol AS and its derivatives), by whatever name known, which are similar to any of the products provided for in paragraph 27 or 1651, Tariff Act of 1930, and which are obtained, derived, or manufactured in whole or in part from any of the products provided for in either of said paragraphs.

27 (a) (4) (5) All mixtures including solutions, consisting in whole or in part of any of the products provided for in subdivision (1), (2), or (3) of paragraph 27 (a), Tariff Act of 1930 (except sheep dip and medicinal soaps, and except products chiefly used as assistants in preparing or finishing textiles).

41 Agar agar.

47 Licorice, extracts of, in pastes, rolls, or other forms.

51 Camphor, natural (crude and refined) and synthetic.

51 Menthol.

58 Oils, distilled or essential, not mixed or compounded with or containing alcohol:
Sandalwood.

60 Safrol, not mixed or compounded, not containing more than 10 per centum of alcohol, not marketable as cosmetics, perfumery, or toilet preparations, and not specially provided for.

66 Pigments, whether dry, mixed, or ground in or mixed with water, oil, or solutions other than oil, not specially provided for:
Vandyke brown and Cassel earth.

58422—55——58

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 1. CHEMICALS, OILS, AND PAINTS—continued

Par.	
67	Barytes ore, crude or unmanufactured, or ground or otherwise manufactured.
83	Potato starch.
84	Dextrine, not otherwise provided for (not including dextrine made from potato starch or potato flour), burnt starch or British gum, dextrine substitutes, and soluble or chemically treated starch.
87	Cerium nitrate, cerium fluoride, and other salts of cerium not specially provided for.

SCHEDULE 2. EARTHS, EARTHENWARE, AND GLASSWARE

204	Dead burned and grain magnesite, and periclase, not suitable for manufacture into oxychloride cements.
206	Pumice stone, wholly or partly manufactured.
210	Rockingham earthenware.
211	Earthenware and crockery ware composed of a nonvitrified absorbent body, including white granite and semiporcelain earthenware, and cream-colored ware, terra cotta, and stoneware, including all articles wholly or in chief value of such ware; any of the foregoing which are tableware, kitchenware, or table or kitchen utensils, however provided for in paragraph 211, Tariff Act of 1930.
211	Articles, other than tableware, kitchenware, or table or kitchen utensils, however provided for in paragraph 211, Tariff Act of 1930, if valued under $10 per dozen.
212	China, porcelain, and other vitrified wares, including chemical stoneware (but not including chemical porcelain ware, sanitary ware and fittings and parts therefor, or electrical porcelain ware), composed of a vitrified nonabsorbent body which when broken shows a vitrified or vitreous, or semivitrified or semivitreous fracture, and all bisque and parian wares, including clock cases with or without movements, plaques, pill tiles, ornaments, charms, vases, statues, statuettes, mugs, cups, steins, lamps, and all other articles composed wholly or in chief value of such ware; all the foregoing, however provided for in paragraph 212, Tariff Act of 1930, not containing 25 per centum or more of calcined bone.
213	Graphite or plumbago, crude or refined: Amorphous (except artificial).
218 (c)	Illuminating articles of every description, finished or unfinished, wholly or in chief value of glass, for use in connection with artificial illumination: Chimneys, globes, and shades, and parts thereof, wholly or in chief value of glass.
218 (f)	Table and kitchen articles and utensils, and all articles of every description not specially provided for, composed wholly or in chief value of glass, blown or partly blown in the mold or otherwise, or colored, cut, engraved, etched, frosted, gilded, ground (except such grinding as is necessary for fitting stoppers or for purposes other than ornamentation), painted, printed in any manner, sand-blasted, silvered, stained, or decorated or ornamented in any manner, whether filled or unfilled, or whether their contents be dutiable or free: Christmas tree ornaments valued under $7.50 per gross; Other articles or utensils valued not over $1.66⅔ each (except articles or utensils commercially known as bubble glass, if produced otherwise than by automatic machine but not cut or engraved and valued at $1 or more each, and except Christmas tree ornaments).
225	Spectacles, eyeglasses, and goggles, and frames for the same, and parts thereof, finished or unfinished, valued at not over $2.50 per dozen.
226	Lenses of glass or pebble, molded or pressed, or ground and polished to a spherical, cylindrical, or prismatic form, and ground and polished plano or coquille glasses, wholly or partly manufactured; all the foregoing (except lighthouse lenses and except eyeglass and

Par.	
	spectacle lenses with edges unground and valued at $10 or more per dozen pairs).
228 (a)	Spectographs, spectrometers, spectroscopes, refractometers, saccharimeters, colorimeters, cathetometers, interferometers, haemacytometers, polarimeters, polariscopes, photometers, opthalmoscopes, slit lamps, corneal microscopes, optical measuring or optical testing instruments, testing or recording instruments for ophthalmological purposes, frames and mountings therefor, and parts of any of the foregoing, finished or unfinished.
228 (a)	Prism-binoculars, having a magnification of 5 diameters or less, and valued at not over $12 each; frames and mountings therefor, and parts of any of the foregoing; all the foregoing, finished or unfinished.
228 (b)	Opera or field glasses (not prism-binoculars), frames and mountings therefor, and parts of any of the foregoing; all the foregoing, finished or unfinished, not specially provided for (except opera or field glasses valued over $1 each).
228 (b) and 1551	Photographic lenses, frames and mountings therefor, and parts of any of the foregoing; all the foregoing, finished or unfinished, not specially provided for (including cameras and parts of cameras of which a photographic lens is the component of chief value).
228 (b)	Telescopes, valued not over $2 each; frames and mountings therefor; parts of any of the foregoing, suitable in type and not excessive in quantity for use with, and imported in the same shipment with, telescopes valued not over $2 each; frames and mountings for, and parts of telescopes and of frames and mountings therefor, imported separately; all the foregoing, finished or unfinished, not specially provided for.
228 (b)	Azimuth mirrors, parabolic or mangin mirrors for searchlight reflectors, mirrors for optical, dental, or surgical purposes, projection lenses, sextants, octants, microscopes, all optical instruments (not including photographic lenses, opera or field glasses, and telescopes), frames and mountings therefore, and parts of any of the foregoing; all the foregoing, finished or unfinished, not specially provided for.
229	Incandescent electric-light bulbs and lamps, with or without metal or other filaments.
230 (b)	Glass mirrors (except framed or cased mirrors in chief value of platinum, gold, or silver), not specially provided for, not exceeding in size 144 square inches, with or without frames or cases.
233	All articles composed wholly or in chief value of agate or other semiprecious stone (not including rock crystal), except such as are cut into shapes and forms fitting them expressly for use in the construction of jewelry, not specially provided for.

SCHEDULE 3. METALS AND MANUFACTURES OF

301	Iron in pigs and iron kentledge, whether or not containing vanadium, tungsten, molybdenum, or chromium in quantities specified in paragraph 301, Tariff Act of 1930.
302 (c)	Tungsten ore or concentrates.
302 (d)	Ferromanganese containing 4 per centum or more carbon.
302 (n)	Titanium.
312	Sheet piling.
329	Chains of iron or steel, used for the transmission of power, of not more than 2-inch pitch and containing more than three parts per pitch, and parts thereof, finished or unfinished; and all other chains used for the transmission of power, and parts thereof.
331	Upholsterers' nails and thumb tacks, of two or more pieces of iron or steel, finished or unfinished.
343	Needle cases or needle books furnished with assortments of needles or combinations of needles and other articles.
343	Needles for knitting machines of every description, not specially provided for.

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 3. METALS AND MANUFACTURES OF—continued

Par.	
354	Cuticle knives, corn knives, nail files, tweezers, manicure or pedicure nippers, and parts thereof, finished or unfinished, by whatever name known.
359	Surgical instruments, and parts thereof (except hypodermic and other needles, but including hypodermic syringes and forceps), composed wholly or in part of iron, steel, copper, brass, nickel, aluminum, or other metal (but not in chief value of glass), finished or unfinished.
359	Dental instruments, and parts thereof, wholly or in part of iron, steel, copper, brass, nickel, aluminum, or other metal, finished or unfinished: Dental burrs.
359	Surgical instruments and parts thereof and dental instruments and parts thereof, any of the foregoing in part of iron, steel, copper, brass, nickel, aluminum, or other metal and in chief value of glass, finished or unfinished.
364	Bicycle, velocipede, and similar bells, finished or unfinished, and parts thereof.
365	Shotguns, valued over $25 each.
365	Barrels for shotguns, further advanced in manufacture than rough bored only; stocks for shotguns, wholly or partly manufactured; parts of shotguns, and fittings for shotgun stocks or barrels, finished or unfinished; and shotgun barrels, in single tubes, forged, rough bored.
366	Pistols and revolvers, automatic, single-shot, magazine, or revolving, valued not over $8 each.
372	Sewing machines, not specially provided for, valued over $10 but not over $75 each.
372	Parts of sewing machines, not specially provided for, wholly or in chief value of metal or porcelain.
372	Printing machinery; and parts of printing machinery, not specially provided for, wholly or in chief value of metal or porcelain: Duplicating machines (not including printing presses), and parts thereof
372	Knitting machines (except full-fashioned hosiery and circular knitting machines), finished or unfinished, not specially provided for, and parts thereof, not specially provided for, wholly or in chief value of metal or porcelain.
382 (a)	Aluminum foil less than 6/1000 of one inch in thickness.
397	Articles or wares, not specially provided for, not plated with platinum (unless in chief value of platinum), gold, or silver, or colored with gold lacquer, whether partly or wholly manufactured: Composed wholly or in chief value of lead. Composed wholly or in chief value of base metal other than iron or steel: Screws, commonly called wood screws, having shanks not exceeding 12/100 inch in diameter; and screws other than those commonly called wood screws, having shanks or threads not exceeding 24/100 inch in diameter. Composed wholly or in chief value of platinum.

SCHEDULE 4. WOOD AND MANUFACTURES OF

404	Japanese white oak and Japanese maple: In the form of sawed boards, planks, deals, and all other forms not further manufactured than sawed, and flooring.
409	Split bamboo.
409	All articles not specially provided for, wholly or partly manufactured of rattan, bamboo, osier or willow (except tennis-racket frames, valued at $1.75 or more each).
410	Toothpicks of wood or other vegetable substance.
411	Porch and window blinds, baskets, bags, chair seats, curtains, shades, or screens, any of the foregoing wholly or in chief value of bamboo, wood, straw, papier-mache, palm leaf, or compositions of wood, not specially provided for (except baskets and bags wholly or in chief value of straw or willow or osier).

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 4. WOOD AND MANUFACTURES OF—continued

Par.	
412	Bentwood furniture, wholly or partly finished, and parts thereof.
412	Folding rules, wholly or in chief value of wood, and not specially provided for.
412	Manufactures of wood or bark, or of which wood or bark is the component material of chief value, not specially provided for: Brush backs.

SCHEDULE 5. SUGAR, MOLASSES, AND MANUFACTURES OF

505	Levulose.

SCHEDULE 7. AGRICULTURAL PRODUCTS AND PROVISIONS

703	Hams and shoulders, prepared or preserved: If cooked and packed in air-tight containers, but not made into sausage.
710	Cheese, made from sheep's milk, in original loaves, not suitable for grating.
712	Birds, prepared or preserved in any manner and not specially provided for (except chickens, prepared by removal of the feathers, heads, and all or part of the viscera, with or without removal of the feet, but not cooked or divided into portions).
713	Eggs of poultry (except of chickens), in the shell.
713	Dried egg albumen, whether or not sugar or other material is added.
717 (b)	Fish, fresh or frozen (whether or not packed in ice), filleted, skinned, boned, sliced, or divided into portions, not specially provided for: Swordfish.
717 (c)	Fish, dried and unsalted (except cod, haddock, hake, pollock, and cusk, and except shark fins).
718 (a)	Fish, prepared or preserved in any manner, when packed in oil or in oil and other substances: Tuna.
718 (b)	Fish, prepared or preserved in any manner, when packed in air-tight containers weighing with their contents not more than 15 pounds each (except fish packed in oil or in oil and other substances): Tuna.
721 (a)	Crab meat, fresh or frozen (whether or not packed in ice), or prepared or preserved in any manner, including crab paste and crab sauce.
721 (b)	Clams other than razor clams, and clams in combination with other substances (except clam chowder), packed in air-tight containers.
721 (e)	Oysters, oyster juice, or either in combination with other substances, packed in air-tight containers.
727	Broken rice, which will pass readily through a metal sieve perforated with round holes five and one-half sixty-fourths of 1 inch in diameter.
730	Soy bean oil cake and soy bean oil-cake meal.
730	Vegetable oil cake and oil-cake meal, not specially provided for: Coconut or copra. Linseed.
736	Berries, edible (except blueberries), prepared or preserved (not including berries in brine, dried, desiccated, evaporated, or frozen), and not specially provided for.
738	Cider.
743	Oranges, Mandarin, packed in air-tight containers.
748	Plums, prunes, and prunelles, green, ripe, or in brine.
753	Lily bulbs.
760	Walnuts of all kinds, shelled, or blanched, roasted, prepared, or preserved, including walnut paste.
761	Cashew nuts, shelled (including blanched) or unshelled.
763	Grass seeds and other forage crop seeds: Clover, not specially provided for.
764	Tree and shrub seeds.
768	Mushrooms, dried.

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 7. AGRICULTURAL PRODUCTS AND PROVISIONS—continued

Par.	
775	Vegetables (including horseradish), if cut, sliced, or otherwise reduced in size, or if reduced to flour, or if parched or roasted, or if packed in oil, or prepared or preserved in any other way and not specially provided for (not including dehydrated onions in any form or vegetables pickled, or packed in salt or in brine).
775	Soybeans, prepared or preserved in any manner.
775	Pastes, balls, puddings, hash (except corned beef hash), and all similar forms, composed of vegetables, or of vegetables and meat or fish, or both, not specially provided for.
776	Chicory, crude (except endive), or ground or otherwise prepared.
779	Rice straw, and rice fiber.
781	Curry and curry powder.

SCHEDULE 8. SPIRITS, WINES, AND OTHER BEVERAGES

804	Rice wine or sake.

SCHEDULE 9. COTTON MANUFACTURES

904(a) (b)(c) (d)	Cotton cloth, however provided for in paragraph 904, Tariff Act of 1930 (not incduding tire fabric or fabric for use in pneumatic tires).
905	Cloth, in chief value of cotton, containing silk, or rayon or other synthetic textile.
909	Pile fabrics (not including pile ribbons), cut or uncut, whether or not the pile covers the entire surface, wholly or in chief value of cotton, if velveteens.
910	Table damask, wholly or in chief value of cotton, and all articles, finished or unfinished, made or cut from such table damask.
911 (a)	Blankets or blanket cloth, napped or unnapped, wholly or in chief value of cotton, whether in the piece or otherwise, if Jacquard-figured.
911(a)	Quilts or bedspreads, wholly or in chief value of cotton, whether in the piece or otherwise, not Jacquard-figured, if block-printed by hand.
911(a)	Towels, other than pile fabrics, wholly or in chief value of cotton, whether in the piece or otherwise, and whether or not Jacquard-figured.
911(b)	Sheets and pillow cases, wholly or in chief value of cotton.
911(b)	Table and bureau covers, centerpieces, runners, scarfs, napkins, and doilies, made of plain-woven cotton cloth, and not specially provided for.
912	Boot, shoe, or corset lacings, wholly or in chief value of cotton or other vegetable fiber.
915	Gloves and mittens, finished or unfinished, wholly or in chief value of cotton or other vegetable fiber, made of fabric knit on a warp-knitting or other machine.
917	Underwear, outerwear, and articles of all kinds, knit or crocheted, finished or unfinished, wholly or in chief value of cotton or other vegetable fiber, and not specially provided for (except knit underwear valued over $1.75 per pound, and crocheted underwear).
919	Clothing and articles of wearing apparel of every description, manufactured wholly or in part, wholly or in chief value of cotton, and not specially provided for (except coats valued $4 or more each; vests valued $2 or more each; dressing gowns, including bath robes and beach robes, valued $2.50 or more each; underwear valued 75 cents or more per separate piece; and except pajamas valued $1.50 or more per suit).
921	Rag rugs, wholly or in chief value of cotton, of the type commonly known as "hit-and-miss": chenille rugs, wholly or in chief value of cotton; and all other floor coverings, including carpets, carpeting, mats, and rugs, wholly or in chief value of cotton (except cut-pile and hand-hooked floor coverings and imitation oriental rugs).

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 9. COTTON MANUFACTURES—continued

Par.	
922	Rags, including wiping rags, wholly or in chief value of cotton, except rags chiefly used in paper-making.
923	Manufactures, wholly or in chief value of cotton, not specially provided for (except articles of pile construction other than terry-woven towels, and except bougies, catheters, drains, explorateurs, instillateurs, probes, sondes, and other urological instruments, yarns containing wool, molded cotton and rubber packing, and printers' rubberized blanketing).

SCHEDULE 10. FLAX, HEMP, JUTE, AND MANUFACTURES OF

1001	Flax, hackled, including "dressed line".
1001	Flax, not hackled.
1003	Jute yarns or roving, single; and jute sliver.
1006	Gill nettings, nets, webs, and seines, and other nets for fishing, wholly or in chief value of flax, hemp, or ramie, and not specially provided for.
1015	Fabrics with fast edges, not exceeding 12 inches in width, and articles made therefrom:
	Webbing wholly or in chief value of jute.
1019	Bagging for cotton, gunny cloth, and similar fabrics, suitable for covering cotton, composed of single yarns made of jute, jute butts, or other vegetable fiber, not bleached, dyed, colored, stained, painted, or printed, not exceeding 16 threads to the square inch, counting the warp and filling, and weighing not less than 15 ounces nor more than 32 ounces per square yard.
1021	Common China, Japan, and India straw matting, and floor coverings made therefrom.
1021	Floor coverings not specially provided for:
	Grass or rice straw.
1022	Pile mats and floor coverings, wholly or in chief value of cocoa fiber.

SCHEDULE 11. WOOL AND MANUFACTURES OF

1101(a) (b)	Hair of the camel, however provided for in paragraph 1101, Tariff Act of 1930.
1111	Blankets, and similar articles (including carriage and automobile robes and steamer rugs), made as units or in the piece, finished or unfinished, wholly or in chief value of wool, not exceeding 3 yards in length.
1114(b)	Hose and half-hose, finished or unfinished, wholly or in chief value of wool.
1114(d)	Outerwear and articles of all kinds, knit or crocheted, finished or unfinished, wholly or in chief value of wool, and not specially provided for:
	Hats, bonnets, caps, berets, and similar articles (except infants' headwear), valued over $2 per pound.
	Other (except infants' headwear and other infants' outerwear).
1117(c)	Floor coverings, including mats and druggets, wholly or in chief value of wool, not specially provided for, valued over 40 cents per square foot (except such floor coverings wholly or in chief value of hair of the alpaca, guanaco, huarizo, llama, misti, suri, or a combination of the hair of two or more of these species, or wholly or in chief value of hair of the Angora goat).
1117(c)	Floor coverings, including mats and druggets, wholly or in chief value of wool, not specially provided for:
	Wholly or in chief value of hair of the Angora goat.

SCHEDULE 12. SILK MANUFACTURES

1201	Silk partially manufactured, including total or partial degumming other than in the reeling process, from raw silk, waste silk, or cocoons, and silk noils exceeding 2 inches in length; all the foregoing, if not twisted or spun.

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 12. SILK MANUFACTURES—continued

Par.	
1202	Spun silk or schappe silk yarn, or yarn of silk and rayon or other synthetic textile, and roving, whether or not bleached, dyed, colored, or plied.
1205	Woven fabrics in the piece, wholly or in chief value of silk, however provided for in paragraph 1205, Tariff Act of 1930 (except fabrics with fibers wholly of silk, not bleached, colored, dyed, or printed, if Jacquard-figured; with fibers chiefly but not wholly of silk, not bleached, colored, dyed, or printed, if Jacquard-figured, or bleached, colored, dyed, or printed, whether or not Jacquard-figured; and except silk bolting cloth).
1208	Gloves and mittens, knit or crocheted, finished or unfinished, wholly or in chief value of silk.

SCHEDULE 13. MANUFACTURES OF RAYON OR OTHER SYNTHETIC TEXTILE

1301	Yarns of rayon or other synthetic textile, singles or plied, not specially provided for (except single yarns weighing 150 deniers or more per length of 450 meters), and regardless of the number of turns twist per inch.
1302	Filaments of rayon or other synthetic textile, not exceeding 30 inches in length, other than waste, whether known as cut fiber, staple fiber, or by any other name.
1309	Gloves and mittens, knit or crocheted, finished or unfinished, wholly or in chief value of rayon or other synthetic textile, valued under $1.50 per dozen pairs.

SCHEDULE 14. PAPERS AND BOOKS

1403	Masks composed of paper, pulp, or papier-mache, not specially provided for.
1404	Papers commonly or commercially known as stereotype paper, copying paper, or bibulous paper, not specially provided for, colored or uncolored, white or printed, whether in sheets or any other form, and weighing less than 10 pounds to the ream.
1405	Bags and other articles, except printed matter, composed wholly or in chief value of any of the papers provided for in any of the provisions of paragraph 1405, Tariff Act of 1930, preceding the provision for bags, and not specially provided for (not including boxes of paper or papier-mache or wood covered or lined with any such paper).
1405	Sensitized paper to be used in photography.
1409	Hanging paper, printed, lithographed, dyed, or colored.
1409	Papers, not specially provided for (except stencil paper, unmounted, and except strawboard and straw paper, under 0.012 but not under 0.008 inch thick).
1410	Books, unbound or bound (except those bound wholly or in part in leather), and sheets or printed pages of books bound wholly or in part in leather, not specially provided for, if of bona fide foreign authorship: Prayer books and sheets or printed pages of prayer books.
1410	Blank books and slate books: Diaries, notebooks, and address books.

SCHEDULE 15. SUNDRIES

1502	Baseballs, and balls wholly or in chief value of rubber (except golf and lawn-tennis balls), finished or unfinished, primarily designed for use in physical exercise (whether or not such exercise involves the element of sport), all the foregoing, not specially provided for.
1502	Tennis rackets.
1503	Beads of ivory; hollow or filled imitation pearl beads of all kinds and shapes, of whatever material composed; imitation solid pearl beads; and iridescent imitation solid pearl beads.

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 15. SUNDRIES—continued

Par.	
1504 (a)	Braids, plaits, laces, and willow sheets or squares, composed wholly or in chief value of straw, chip, paper, grass, palm leaf, willow, osier, rattan, real horsehair, cuba bark, or manila hemp, and braids and plaits, wholly or in chief value of ramie, all the foregoing suitable for making or ornamenting hats, bonnets, or hoods, whether or not bleached, dyed, colored, or stained, and whether or not containing a substantial part of rayon or other synthetic textile (but not wholly or in chief value thereof), *except* any of the foregoing (other than willow sheets or squares) not containing a substantial part of rayon or other synthetic textile and not bleached, dyed, colored, or stained.
1504 (b) (1) (2)	Hats, bonnets, and hoods, wholly or in chief value of chip, paper, grass, palm leaf, willow, osier, rattan, real horsehair, cuba bark, or manila hemp, whether wholly or partly manufactured, not blocked, trimmed, or sewed, whether or not bleached, dyed, colored, or stained (not including any of the foregoing known as harvest hats and valued under $3 per dozen, or hats and hoods, not bleached, colored, dyed, or stained, wholly or in chief value of fiber of the *carludovica palmata*, commercially known as toquilla fiber or straw).
1504 (b) (2) (4)	Hats, bonnets, and hoods, whether wholly or partly manufactured: Wholly or in chief value of straw or ramie, bleached, dyed, colored, or stained, but not blocked, trimmed, or sewed; or wholly or in chief value of straw, if sewed (whether or not blocked, trimmed, bleached, dyed, colored, or stained).
1504 (b) (3)	Hats, bonnets, and hoods, composed wholly or in chief value of straw, chip, paper, grass, palm leaf, willow, osier, rattan, real horsehair, cuba bark, ramie, or manila hemp, whether wholly or partly manufactured, blocked or trimmed (whether or not bleached, dyed, colored, or stained).
1506	Toilet brushes (not including tooth brushes), the handles or backs of which are composed wholly or in chief value of any product provided for in paragraph 31, Tariff Act of 1930.
1506	Handles and backs for tooth brushes and other toilet brushes, composed wholly or in chief value of any product provided for in paragraph 31, Tariff Act of 1930.
1506	Hair pencils in quills or otherwise.
1506	Brushes, not specially provided for (except paint brushes).
1510	Buttons not specially provided for (except horn and composition horn buttons, buttons wholly or in chief value of any compound of casein and valued over 60 cents per gross, buttons wholly or in chief value of glass, buttons commonly known as Roman pearl, fancy buttons with a fish-scale or similar to fish-scale finish, buttons wholly or in chief value of wood, and buttons wholly or in part of textile material).
1511	Cork tile in the rough or wholly or partly finished.
1513	Dolls wholly or in chief value of china, porcelain, parian, bisque, earthenware, or stoneware, or wholly or in chief value of any product provided for in paragraph 31, Tariff Act of 1930, and parts of dolls (including clothing), and doll heads, however provided for in paragraph 1513, Tariff Act of 1930 (except dolls and doll clothing composed in any part, however small, of any of the laces, fabrics, embroideries, or other materials or articles provided for in paragraph 1529 (a), Tariff Act of 1930).
1513	Toys, and parts of toys (not including dolls or parts of dolls) composed wholly or in chief value of any product provided for in paragraph 31, Tariff Act of 1930.
1513	Toy games, toy containers, toy favors, toy souvenirs, of whatever materials composed; toy balloons; and toy books without reading matter (not counting as reading matter any printing on removable pages), other than letters, numerals, or descriptive words, bound or unbound, and parts thereof.
1513	Toys, not specially provided for: Wholly or in chief value of china, porcelain, parian, bisque, earthenware, or stoneware.

TARIFF ACT OF 1930, TITLE I—DUTIABLE LIST—Continued

SCHEDULE 15. SUNDRIES—continued

Par.	
	Wholly or in chief value of rubber.
	Toys having a spring mechanism (except figures or images of animate objects, wholly or in chief value of metal).
	Stuffed animal figures not having a spring mechanism.
1513	Parts of toys, not specially provided for.
1515	Bombs, rockets, Roman candles, and fireworks of all descriptions, not specially provided for (not including firecrackers).
1516	Matches, friction or lucifer, of all descriptions, in boxes containing not over 100 matches per box.
1518	Artificial or ornamental fruits, vegetables, grasses, grains, leaves, flowers, stems, or parts thereof, composed wholly or in chief value of yarns, threads, filaments, tinsel wire, lamé, bullions, metal threads, beads, bugles, spangles, or rayon or other synthetic textile, or composed wholly or in chief value of other materials (except feathers) and not specially provided for: and boas, boutonnieres, wreaths, and all articles not specially provided for, composed wholly or in chief value of any of the foregoing fruits, vegetables, grasses, grains, leaves, flowers, stems, or parts.
1523	Hair press cloth, not specially provided for.
1526 (a)	Hats, caps, bonnets, and hoods, trimmed or untrimmed, including bodies, hoods, plateaux, forms, or shapes, for such hats or bonnets, composed wholly or in chief value of fur of the rabbit, beaver, or other animals, and valued over $24 but not over $48 per dozen.
1527 (a) (2)	Jewelry, commonly or commercially so known, finished or unfinished (including parts thereof), of whatever material composed (except jewelry and parts thereof composed wholly or in chief value of gold or platinum, or of which the metal part is wholly or in chief value of gold or platinum); all the foregoing valued over 20 cents but not over $5 per dozen pieces.

Paragraph	
1527 (c) (2)	Articles valued above 20 cents per dozen pieces, designed to be worn on apparel or carried on or about or attached to the person, such as and including cardcases, chains, cigar cases, cigar cutters, cigar holders, cigar lighters, cigarette cases, cigarette holders, coin holders, combs, match boxes, mesh bags and purses, millinery, military and hair ornaments, pins, powder cases, stamp cases, vanity cases, watch bracelets and like articles; all the foregoing and parts thereof, finished or unfinished, composed wholly or in chief value of metal other than gold or platinum (whether or not enameled, washed, covered, or plated, including rolled gold plate), or (if not composed in chief value of metal and if not dutiable under clause 1 of paragraph 1527 (c), Tariff Act of 1930) set with and in chief value of precious or semiprecious stones, pearls, cameos, coral, amber, imitation precious or semiprecious stones, or imitation pearls (except cigar and cigarette lighters and parts thereof, buckles, collar, cuff, and dress buttons, ladies' handbags set with and in chief value of rhinestones, mesh bags and parts thereof, all the foregoing valued above 20 cents and not above $5 per dozen pieces or parts; and except all articles and parts, other than cigar and cigarette lighters and parts, valued above $5 per dozen pieces or parts).
1528	Diamonds, rubies, and sapphires, cut but not set, and suitable for use in the manufacture of jewelry.
1528	Pearls and parts thereof, drilled or undrilled, but not set or strung (except temporarily), if cultured or cultivated; imitation half pearls, and hollow or filled imitation pearls of all shapes, without hole or with hole partly through only; imitation solid pearls and iridescent imitation solid pearls, unpierced, pierced or partially pierced, loose, or mounted, of whatever shape, color, or design.
1529 (a)	Laces, lace fabrics, and lace articles, made wholly by hand and containing no machine-made material or article provided for in paragraph 1529 (a), Tariff Act of 1930, all the foregoing not wholly or in chief value of vegetable fiber other than cotton, if over 2 inches

Par.

wide and valued not over $50 per pound, or if not over 2 inches wide, regardless of value.

1529 (a) Fabrics and articles (not wearing apparel), in part but not wholly of handmade lace and containing no machine-made material or article provided for in paragraph 1529 (a), Tariff Act of 1930, if all or part of the lace is over 2 inches wide and the fabrics or articles are valued not over $50 per pound, or if none of the lace is over 2 inches wide, regardless of the value of the fabrics or articles.

1529 (a) Fabrics and articles embroidered (whether or not the embroidery is on a scalloped edge), tamboured, appliqued, ornamented with beads, bugles, or spangles, or from which threads have been omitted, drawn, punched, or cut, and with threads introduced after weaving to finish or ornament the openwork, not including one row of straight hemstitching adjoining the hem; all the foregoing, and fabrics and articles wholly or in part thereof (not including fabrics and articles in any part of lace), however described in paragraph 1529 (a), Tariff Act of 1930; any of the foregoing if wholly or in chief value of cotton and included in subdivision [6] of paragraph 1529 (a) of "United States Import Duties (1952)" (but not including wearing apparel), or if included in subdivision [9] of paragraph 1529 (a) of said "United States Import Duties" (except gloves and mittens included in such subdivision [9] wholly or in chief value of wool and except other wearing apparel included in such subdivision [9] wholly or in chief value of cotton or other vegetable fiber or wholly or in chief value of rayon or other synthetic textile).

1529 (a) Bureau and table covers, centerpieces, doilies, napkins, runners, and scarfs, made of plain-woven cotton cloth, block-printed by hand, and in part of fringe.

1529 (a) Quilts or bedspreads, wholly or in chief value of cotton, in the piece or otherwise, block-printed by hand, and in part of fringe.

1530 (b) Upper leather made from calf or kip skins, rough, partly finished, or finished, but not cut or partly or wholly manufactured into uppers, vamps, or any forms or shapes suitable for conversion into boots, shoes, or footwear.

1530 (e) Boots, shoes, or other footwear, made wholly or in chief value of leather, not specially provided for:
- Slippers (for housewear).

1530 (e) Boots, shoes, or other footwear (including athletic or sporting boots and shoes), the uppers of which are composed wholly or in chief value of wool, cotton, ramie, animal hair, fiber, rayon or other synthetic textile, silk, or substitutes for any of the foregoing:
- With soles wholly or in chief value of leather.
- With soles wholly or in chief value of india rubber or substitutes for rubber.[1]
- With soles wholly or in chief value of other materials (except boots, shoes, or other footwear with uppers wholly or in chief value of vegetable fiber other than cotton, or with uppers and soles both in chief value of wool felt, and except alpargatas with uppers wholly or in chief value of cotton).

1531 Bags, baskets, belts, satchels, cardcases, pocketbooks, jewel boxes, portfolios, and other boxes and cases, not jewelry, wholly or in chief value of leather or parchment, and manufactures of leather, rawhide, or parchment, or of which leather, rawhide, or parchment is the component material of chief value, not specially provided for (except straps and strops):
- Belts and buckles designed to be worn on the person.
- Coin purses, change purses, billfolds, bill cases, bill rolls, bill purses, bank-note cases, currency cases, money cases, cardcases, license cases, pass cases, passport cases, letter cases,

[1] Listed subject to amendment of paragraph 1530 (e), Tariff Act of 1930, by Public Law 479, 83d Congress, approved July 8, 1954.

	and similar flat leather goods, not wholly or in chief value of reptile leather.
	Women's and children's hand bags or pocketbooks, not wholly or in chief value of reptile leather.
	Leads, leashes, collars, muzzles, and similar dog equipment.
	Wearing apparel (other than belts and buckles).
	Bags, baskets, belts, satchels, pocketbooks, jewel boxes, portfolios, and boxes and cases, not jewelry (except articles named in any of the above subdivisions, whether or not wholly or in chief value of reptile leather).
1531	Articles provided for in paragraph 1531, Tariff Act of 1930, if wholly or in chief value of reptile leather and permanently fitted and furnished with traveling, bottle, drinking, dining or luncheon, sewing, manicure, or similar sets.
1532 (b)	Gloves, wholly or in chief value of leather made from horsehides or cowhides (except calfskins), whether wholly or partly manufactured.
1535	Artificial flies, snelled hooks, leaders or casts, finished or unfinished; fishing rods, and parts thereof, finished or unfinished, not specially provided for: fish hooks, artificial baits, and all other fishing tackle and parts thereof, fly books, fly boxes, fishing baskets or creels, finished or unfinished, not specially provided for, except fishing lines, fishing nets, and seines (and not including fishing reels and parts thereof).
1536	Candles.
1536	Manufactures of amber or bladders or of which these substances or either of them is the component material of chief value, not specially provided for.
1537 (a)	Manufactures of bone, chip, grass, sea grass, horn, straw, weeds, or whalebone, or of which these substances or any of them is the component material of chief value, not specially provided for.
1537 (a)	Manufactures of chip roping.
1537 (b)	Manufactures of india rubber or gutta-percha, or of which these substances or either of them is the component material of chief value, not specially provided for (including boots, shoes, or other footwear, wholly or in chief value of india rubber), *except* the following:
	Bougies, catheters, drains, sondes, and other urological instruments; gloves; gaskets, packing, and valves; golf-ball centers or cores, wound or unwound; nursing nipples or pacifiers; tires wholly or in chief value of india rubber; heels and soles for footwear wholly or in chief value of india rubber; hose and tubing; and other articles (not including automobile, bicycle, or motorcycle tires), wholly or in chief value of gutta-percha only.
1537 (c)	Combs of whatever material composed, not specially provided for:
	Combs composed wholly of rubber or compounds of cellulose.
1541 (a)	Musical instruments and parts thereof, not specially provided for:
	Stringed instruments (not including pianos) and parts thereof (not including bows).
1541 (c)	Carillons containing not over 34 bells, and parts thereof.
1549 (a)	Pencils of paper, wood, or other material not metal, filled with lead or other material, and pencils of lead, not specially provided for.
1549 (a)	Pencils stamped with names other than the manufacturers' or the manufacturers' trade name or trade-mark.
1549 (a)	Pencil point protectors, and clips, whether separate or attached to pencils.
1550 (c)	Mechanical pencils.
1551	Photographic cameras and parts thereof, not specially provided for (except motion-picture cameras and parts thereof and cameras, other than fixed-focus, valued $10 or over but not over $50 each).
1551	Photographic dry plates, not specially provided for.
1552	Pouches for chewing or smoking tobacco, finished or partly finished (except pouches wholly or in chief value of leather).

Par.	
1553	All thermostatic bottles, carafes, jars, jugs, and other thermostatic containers, or blanks and pistons of such articles, of whatever material composed, constructed with a vacuous or partially vacuous insulation space to maintain the temperature of the contents, whether imported, finished or unfinished, with or without a jacket or casing of metal or other material, and parts of any of the foregoing.
1554	Walking canes, finished or unfinished.
1554	Handles and sticks for umbrellas, parasols, sunshades, and walking canes, wholly or in chief value of wood and valued under $2.50 per dozen or wholly or in chief value of compounds of cellulose.
1558	Raw or unmanufactured articles not enumerated or provided for: Frogs (not including live frogs) and frog legs.
1558	Articles manufactured, in whole or in part, not specially provided for: Coconut shell char.

TARIFF ACT OF 1930, TITLE II—FREE LIST

1656	Coir yarn.
1677	Fish imported to be used for purposes other than human consumption: Goldfish.
1686	Gums and resins: Kadaya. Natural gums, natural gum resins, and natural resins, not specially provided for: Talka.
1688	Hair of horse, cattle, and other animals, cleaned or uncleaned, drawn or undrawn, but unmanufactured, not specially provided for: Goat and kid hair (except dressed soft hair).
1703	Joss stick or joss light.
1705	Kelp.
1731	Oils, distilled or essential, not mixed or compounded with or containing alcohol: Camphor.
1754	Santonin, and salts of.
1756	Tuna fish, fresh or frozen, whether or not packed in ice, and whether or not whole.
1761	Shellfish, fresh or frozen (whether or not packed in ice), or prepared or preserved in any manner (not including pastes and sauces) and not specially provided for (except shrimps, prawns, lobsters, crabs, clams, quahaugs, unfrozen fresh scallops, fresh or frozen oysters other than seed oysters, and abalone).
1762	Silk cocoons and silk waste.
1763	Silk, raw, in skeins reeled from the cocoon, or rereeled, but not wound, doubled, twisted, or advanced in manufacture in any way.
1768 (2)	Spices and spice seed: Cardamom.
1796	Wax, vegetable, not specially provided for: Japan.
1803 (1)	Sawed lumber and timber, not further manufactured than planed, and tongued and grooved, not specially provided for: Japanese white oak, Japanese maple, and teak.

COMMITTEE FOR RECIPROCITY INFORMATION

I. Trade-Agreement Negotiations under the General Agreement on Tariffs and Trade relating to Japan;
II. Possible Adjustment in Preferential Rates on Cuban Products.

Submission of Information to the Committee for Reciprocity Information:
Closing date for application to be head, December 3, 1954.
Closing date for submission of briefs, December 6, 1954.
Public hearings open, December 13, 1954.

The Interdepartmental Committee on Trade Agreements has issued on this day a notice of intention to participate in trade-agreement negotiations, on a reciprocal basis, looking to Japan's accession to the General Agreement on Tariffs and Trade, as a means of improving Japan's trading prospects in the free world. With a view to the further expansion of such trading prospects, the United States is also considering, in addition to negotiations directly with Japan, participating in limited negotiations with other contracting parties to the General Agreement that will also be negotiating with Japan, in order to broaden the overall results of the negotiations.

Annexed to the notice of the Interdepartmental Committee on Trade Agreements, is a list of articles imported into the United States to be considered for possible concessions in the negotiations. The Committee for Reciprocity Information hereby gives notice that all applications for oral presentation of views in regard to the proposed negotiations, which must indicate the product or products on which the individuals or groups desire to be heard, and an estimate of the time required for such presentation, shall be submitted to the Committee for Reciprocity Information not later than 12:00 noon, December 3, 1954, and all information and views in writing of persons who desire to be heard in regard to the foregoing proposals shall be submitted to the Committee for Reciprocity Information not later than 12:00 noon, December 6, 1954. Written statements of persons who do not desire to be heard shall be submitted not later than 12:00 noon, December 27, 1954. Such communications shall be addressed to "Committee for Reciprocity Information, Tariff Commission Building, Washington 25, D. C." Fifteen copies of written statements, either typed, printed, or duplicated shall be submitted, of which one copy shall be sworn to.

Written statements submitted to the Committee, except information and business data proffered in confidence, shall be open to inspection by interested persons. Information and business data proffered in confidence shall be submitted on separate pages clearly marked "For official use only of Committee for Reciprocity Information."

Public hearings will be held before the Committee for Reciprocity Information, at which oral statements will be heard. The first hearing will be at 2 p. m. on December 13, 1954, in the Hearing Room in the Tariff Commission Building, 7th and E Streets, N. W., Washington 25, D. C. Witnesses who make application to be heard will be advised regarding the time and place of their individual appearances. Appearances at hearings before the Committee may be made only by or on behalf of those persons who have filed written statements and who have within the time prescribed made written application for oral presentation of views. Statements made at the public hearings shall be under oath.

Persons or groups interested in import products may present to the Committee their views concerning possible tariff concessions by the United States on any product, whether or not included in the list annexed to the notice of intention to negotiate. However, as indicated in the notice of intention to negotiate, no tariff reduction or specific continuance of customs or excise treatment will be considered on any product which is not included in the list annexed to the public notice by the Interdepartmental Committee on Trade Agreements, unless it is subsequently included in a supplementary public list.

The United States Tariff Commission has today announced public hearings on the import items appearing in the list annexed to the notice of intention to negotiate to run concurrently with the hearings of the Committee for Reciprocity Information. Oral testimony and written information submitted to the Tariff Commission will be made available to and will be considered by the Interdepartmental Committee on Trade Agreements. Consequently, those whose interests relate only to import products included in the foregoing list, and who appear before the Tariff Commission, need not, but may if they wish, appear also before the Committee for Reciprocity Information.

Persons interested in exports may present their views regarding any tariff or other concessions that might be requested from Japan. Any other matters appropriate to be considered in connection with the proposed negotiations may also be presented.

Copies of the list atached to the notice of intention to negotiate may be obtained from the Committee for Reciprocity Information at the address designated above and may be inspected at the field offices of the Department of Commerce.

By direction of the Committee for Reciprocity Information this 13th day of November 1954.

EDWARD YARDLEY,
Secretary, Committee for Reciprocity Information.

Mr. KALIJARVI. The basic aim of our foreign policy is to improve the security and well-being of the United States. This objective is generally accepted and understood. What is less widely understood is the fact that our international economic policies are a major instrument for achieving this objective.

The President clearly outlined the objectives of his foreign economic policy in his message to Congress on the program, and Mr. Strackbein read the section I have here and which I will not repeat.

As these objectives are attained they will aid and expand the economy of the United States as well as those of other countries. Thus the objectives of the Full Employment Act will be served, for the program is designed to—

> promote maximum employment, production, and purchasing power * * * in a manner calculated to promote and foster free competitive enterprise.

The principal trade measures in the President's program are the 3-year extension of the Trade Agreements Act, the revision of the General Agreement on Tariffs and Trade with submission to the Congress of the organizational provisions of the new agreement, multilateral trade negotiations with Japan, customs simplification, clarification of customs evaluation, increased tourism, support for trade fairs, and a liberalization of the administration of the Buy American Act.

Chief measures pertaining to investments are the so-called 14 points tax advantage on investments abroad, the deferral of tax on income of foreign branches until such income is withdrawn from the country in which it is earned, tax treaties, the International Finance Corporation, the encouragement of measures by other countries to attract private United States capital, and increased Export-Import Bank loans.

Other parts of the program include foreign economic aid, technical assistance, and the use of agricultural surpluses to expand consumption abroad and to promote economic development.

The President has referred to this program as "moderate" and "minimum." In his letter of transmittal of the report here under consideration, he says:

> Measures by ourselves and other nations to reduce existing barriers to international trade, payments, and investment will make the free world stronger and aid our own economic growth.

This seems axiomatic to most of those who deal with foreign economic policies. Unfortunately it is not always so clear to those not so occupied. There is a ready acceptance of the need for the many political and military arrangements that we have with other countries, such as NATO. But the reasons why the Schuman plan, for example, should have active United States support are not as widely recognized. And when it comes to trade liberalization and the free flow of capital the connection with our broad foreign policy objectives seems remote indeed to some. But alliances of the free world either reflect a mutuality of interests shared by the peoples of the countries involved or they are doomed to a destiny of frustration.

Specifically, when fears, doubts, and disputes over economic matters develop between countries, they undermine intergovernmental confidence creating an atmosphere inimical to political and ideological loyalties among peoples. Thus if the United States is to exercise political leadership in the world, it cannot escape the companion role of economic leadership. That means that it must pursue economic foreign policies that will produce the results it seeks; namely, growth, stability, trust, and confidence among the nations of the free world.

Wise and constructive policies today are more imperative than ever. Not only are they calculated to create confidence among our allies in the cold war and to make new ones for us. But, they are of direct immediate benefit to us in the sense of the Full Employment Act. Let us note for a moment what is involved from the standpoint of our own economy.

In 1953, when the gross national product was $365 billion, exports including military aid came to $21 billion, or almost 6 percent of the GNP. This compared with gross receipts from farming of 8.5 percent; nonfarm residential construction of a little over 3 percent; business expenditures for capital equipment of a little over 6.5 percent; and consumer purchases of durable goods of a little over 8 percent. About 4⅓ million jobs are attributable to work generated by our exports and handling of imports. About 10 percent of our agricultural income is derived from exports. In recent years the production of 30 to 50 million acres of our cropland has been devoted to foreign consumers.

In the most recent market year 1953–54, wheat, cotton, and tobacco farmers shipped from 19 to 26 percent of their production overseas while ricegrowers exported almost one-half their harvest.

The CHAIRMAN. In the case of the first three crops, that is a very appreciable reduction, is it not, in recent years?

Mr. TAFT. Rice has gone up, however, way up.

Mr. KALIJARVI. Last year 10 percent or more of the output of machine tools, tinplate, steel rails, refrigerators, motor trucks were sold abroad. These are only a few statistics. The short-run effect of United States economic aid is to increase United States exports, e. g. every Eximbank loan and guaranty promotes the export of a United States commodity. The long-run purpose of technical and economic aid is to raise the productivity and purchasing power of foreign recipients. The result over time is (*a*) to enlarge markets for our exports, and (*b*) to promote the expanded output of basic materials we need to procure from abroad.

The CHAIRMAN. It is the contention of Senator Malone of Nevada that in aiding foreign countries to produce more more effectively we are breeding rivals for ourselves. What would you say to that contention?

Mr. KALIJARVI. I think if the assistance were indiscriminate and if it were over a period of time, without regard to our own interest, that probably will hold true.

The CHAIRMAN. He argues if you increase productivity per man or per unit of capital, that that increases the ability of foreign countries to undersell American products, and hence contributes to unemployment here.

I wondered what you would say to that.

Mr. KALIJARVI. I do not think those consequences necessarily follow from the original hypothesis.

The CHAIRMAN. I would like to have you clear that up. I have tried to explain that to Senator Malone on numerous occasions, but I have been unsuccessful. I wondered if you couldn't make a more successful venture.

Mr. KALIJARVI. I would like to assure the Senator that we have been before Senator Malone on many occasions and we have been equally unsuccessful.

The CHAIRMAN. Well, I wonder if you might suggest a facet of thought which I might use.

Mr. KALIJARVI. For once I am completely at a loss, Senator.

The short-run effect of private foreign investment is to increase the export of United States commodities, since United States direct investment is generally tied to United States goods. The long-run effect of private foreign investment is to increase production and income abroad, with the result of expanding markets for United States goods and increasing the output of scarce basic materials on which United States economic growth depends.

When we look abroad, the significance of the President's program is equally forcefully borne in upon us.

The CHAIRMAN. I do not wish to score points off you, but I gave vent this morning to my irritation of having this program referred to as the President's program. It is true it is in the immediate foreground the President's program, and I know you should not be requested to make any comment about this, but, again, for the sake of the record, I would like to say this has been the program of the Democratic Party ever since 1801, under Thomas Jefferson, and we are delighted to find that at long last, after 51 or 52 or 53 years, it has gradually penetrated then into the ranks of the Republican Party.

Mr. TAFT. Senator, you remember there was more joy over one lamb who was lost.

The CHAIRMAN. Over one Senator who repented. We are delighted to have him, but we do not want to have the record stand that this is the unique contribution of the Republican National Party in the present national administration. They are in this as in other matters merely adopting the policies which we Democrats have been advocating for a long time, only they have to go through a rigamarole to pretend it is their theory they first created, or that there are differences, which in reality are nonexistent, which are played up in their program. You are not expected to comment on this, but I would like to keep the record straight on this matter.

Mr. THORP. There may be some difference in timidity.

The CHAIRMAN. We are much more determined in this matter than our Republican friends and we only hope that they will maintain courage throughout this session and will not bolt and run as they did in the last session.

Senator SPARKMAN. Mr. Chairman, I was about to offer the suggestion that our greatest concern right now was whether or not this would continue to be the President's program beyond March 31. I believe it was about that time it died last year.

Mr. TAFT. Senator, I am sure this won't be true in the Senate, but over in the House what worries us is southern Democrats bringing in bills to prevent any reduction in the tariff on cotton and some bills on residual oil and even some bills on other items.

The CHAIRMAN. The Democratic Party has never been completely virtuous on this point. Virtue is relative, however, and I think it was Winfield Scott Hancock, in the campaign of 1880, who said that the tariff is a local issue, but generally our localities have been low-tariff areas.

Senator SPARKMAN. Mr. Chairman, I would be willing to predict that every one of those fellows that has introduced a bill to cover some particular local commodity will be supported. This program will be supported vigorously. Of course, one reason they offer those bills is because there is no adequate overall program.

Mr. STRACKBEIN. Mr. Chairman, I would like to comment on this southern attitude. I would call it the great enlightenment. They are just now beginning to face a situation that other parts of the country have been facing for many generations and are beginning to learn what we have been talking about all of this time.

Mr. KALIJARVI. Mr. Chairman, I am delighted to hear among the panel a program on which there is practically complete unanimity.

When we look abroad, the significance of the President's program is equally forcefully borne in upon us. The United States occupies a position of economic leadership regardless of its wishes. The question is whether it uses this position for good or for harm—that is, to build or to undermine the strength and cohesiveness of the free world. It hardly seems possible that United States economic policies could operate merely as a neutral force.

The predominance of the United States in the world economy is well known. Accordingly, the course of economic conditions in the United States and the policies we pursue in the international economic field assume tremendous importance in terms of our relations with our allies.

In 1949 we had a slight recession here—a drop in our national income of 3.4 percent. During this mild adjustment Western Europe's exports to the United States dropped almost 22 percent. Chile's sales to us dropped 36 percent and Australia's 34 percent, partly as a result of the United States economic situation.

In 1954–55 a slight economic adjustment——

The CHAIRMAN. At this point, the chairman interjects the word "recession."

Mr. KALIJARVI. In the United States brought about a drop of $1 billion in the amount of goods we imported. This adjustment in the United States did not, however, have an appreciable effect on Western Europe, proving that that area had recovered its economic strength sufficiently not to "catch pneumonia when the United States catches a cold." In fact, European imports from the United States were sustained throughout this period and there is evidence to indicate that this was a factor toward stabilizing the growth in world trade and production.

This dependence is dramatic in the case of many underdeveloped countries whose foreign exchange earnings are highly concentrated in a few primary materials. For example, 60 percent of Brazil's income from exports is derived from coffee; in Chile, 51 percent is derived from copper; Columbia, 78 percent from coffee; Cuba, 82 percent from sugar; Venezuela, 97 percent from petroleum; Egypt, 89 percent from cotton; Indonesia, 95 percent from tin and rubber; Ceylon, 78 percent from tea and rubber; Iraq, 80 percent from petroleum; Pakistan, 87 percent from cotton and jute.

Access to foreign markets is also far more vital for some highly developed countries than it is for the United States. Though large in absolute terms, United States exports constitute only about 6 percent of the national income. The United Kingdom's exports amount to 21 percent of the national income; Canada's, 26 percent; Denmark's, 27 percent; the Netherlands', 46 percent; New Zealand's, 37 percent; Australia's, 21 percent.

Since most of these countries are tied to us by way of defense arrangements, we cannot be indifferent to their economic interests and problems. Therefore, the President's program takes them into account.

But the interests of the United States are even broader. The United States has an affirmative interest in the economic well-being of the free world and the President's program asserts it as something good in itself. Even if there were no Communist threat, it is in our interests to promote economic development in the underdeveloped areas and to raise the level of production and trade in the world. In this way we improve our own well-being.

Our conception of the proper role of Government in economic affairs is much more narrow than that of most other countries. In peacetime we tend to think primarily in terms of private action rather than in terms of governmental capabilities. For us the major normal function of Government in the economic sphere is to provide an environment in which private enterprise can flourish free from artificial restraints.

This basic creed we carry over into our economic relations with other countries. Our principal specific objectives relate to the removal of artificial restraints on the movement of goods, services, and capital, whether publicly or privately imposed. We seek to reduce tariffs, eliminate quotas, get rid of cartels, do away with exchange restrictions, and remove restraints on foreign investment.

We feel that the Government should interfere as little as possible with the free market, it should act as the promoter and guardian of conditions under which the market can operate most effectively.

The CHAIRMAN. Senator Sparkman.

Senator SPARKMAN. Dr. Kalijarvi, back on page 7, you gave the percentage of the income from exports of the various foreign countries. Then in the next paragraph you gave some other figures, and I notice one relates to the percentage of income from exports, the other the percentage of national income.

They are not analagous at all, are they?

Mr. KALIJARVI. No.

Senator SPARKMAN. They are not intended to be?

Mr. KALIJARVI. No.

Senator SPARKMAN. I first thought they were, and I see now they are not.

Mr. KALIJARVI. They were selected because they highlighted the point I wanted to make.

Senator SPARKMAN. By the way, I notice you say "Venezuela, 97 percent from petroleum." What year was that?

Mr. KALIJARVI. 1953.

Senator SPARKMAN. I wonder if that has been changed by the heavy exports they have made of iron ore. I think it has started.

Mr. TAFT. The value isn't nearly as high, in relation to oil.

Senator SPARKMAN. I realize that, but 97 percent is the figure that impressed me.

Mr. TAFT. The shipments did not begin in large quantities until 1953, but I don't think it has been changed too much even in 1954.

Mr. KALIJARVI. If you wish, I will follow it up.

Senator SPARKMAN. No, I was just curious how it might be changed with that. Of course, I suppose any country that has to depend so largely on one commodity for its income from exports is in not the most comfortable position.

Mr. KALIPARVI. It certainly is not.

Senator SPARKMAN. Are any of our programs aimed at a greater variety of products that they might export?

Mr. KALIJARVI. There is all kinds of incentive, as far as lies within our capabilities for countries that have possibilities of diversification.

For instance we have definitely interested ourselves in Indonesia in diversification of production from their tin and rubber operations, and in other countries.

Senator SPARKMAN. I was surprised to learn from your paper that 95 percent of the income from exports of Indonesia was made up of those two items.

Mr. KALIJARVI. And we run into a great many problems, as Mr. Thorp certainly knows, where the countries are very much concerned in terms of the rise and drop in price and how they can dispose of their products. Indonesia, for example, with the drop in prices of rubber, is looking for a means of disposing of it. That sort of thing was a basis for a good deal of the thought in the international commodity discussions we had. The answer to your question is "Yes."

Senator SPARKMAN. Taking Indonesia, since we are talking about that, as an example; doesn't it have a good many natural resources?

Mr. KALIJARVI. Oh, yes.

Senator SPARKMAN. Isn't it fairly rich in natural resources?

Mr. KALIJARVI. Yes, but not developed.

Senator SPARKMAN. But not developed. And it is that kind of challenge that serves as an incentive for our developing a technical aid program.

Mr. KALIJARVI. It certainly does.

Senator SPARKMAN. And you feel, as we talk about a trade program, a technical aid program would be supplemental to it?

Mr. KALIJARVI. Decidedly.

Senator SPARKMAN. I believe that is all.

Mr. STRACKBEIN. Mr. Chairman.

The CHAIRMAN. Mr. Strackbein.

Mr. STRACKBEIN. I just wanted to make this comment about heavy percentages of exports in particular commodities from particular countries. It seems to me that is exactly the kind of pattern that free trade would lead to throughout the world. Sixty percent of the Brazilian exports consist of coffee. Brazil is exceedingly adept at producing coffee.

The CHAIRMAN. Would you suggest that we produce coffee?

Mr. STRACKBEIN. No, I would suggest that we maintain our economy on a diversified basis and not expose it to such an extent to specialization.

Senator SPARKMAN. Don't you think ease of access serves as an incentive to diversification? That is true of farms and it might be carried on to nations.

Mr. STRACKBEIN. If we had free trade, it is just this kind of undiversified production you would expect in the world.

Mr. TAFT. Mr. Chairman, may I suggest that the problem comes first in inducing domestic capital and then capital from outside to go into the new investments that are successful. There is a very interesting piece in Barron's Weekly for January 31 on the efforts of the Rockefeller International Basic Economy Corp., operating in Latin America.

They have attempted and insisted on local capital and turned it over to the local operators when they get to the point that they can get out. But they have made a number of failures because they pick the wrong thing. The first most successful one, according to this article, is an operation in partnership with Foremost Dairies in distributing pasteurized milk and ice cream and cottage cheese, and the next one was in setting up supermarkets. I don't think anybody looking at it from the outside would think that is the sort of thing that would work, but apparently it does work, and now they have local capital going in and stimulating diversification.

I suggest if such things are not done to stimulate diversification, they will continue with 1 or 2 things they have. In Indonesia, I think the psychological state of mind is important, because apparently there is a disposition to reject anything which depend on skills developed by the Dutch prior to their independence.

That makes it difficult in Indonesia.

Mr. STRACKBEIN. One of the problems in the negotiations leading to GATT gives an indication of how we will have problems in diversification. The underdeveloped countries said they needed protection to start new industries and, as a matter of fact, the charter for the International Trade Organization recognized that, and so does the General Agreement on Tariffs and Trade for that matter. So, again, as long as you do not give protection, you do not get away from this one-crop, one-commodity situation in those countries. They cannot pull themselves up by their bootstraps.

Mr. KALIJARVI. Mr. Chairman, that makes a nice philosophical argument, but I think if we look at our own country there is the most eloquent factual denial of that thesis.

The CHAIRMAN. Because of the national market, do you mean?

Mr. KALIJARVI. Yes, the greatest market in the world.

Mr. STRACKBEIN. This country has been built up on the protection system.

The CHAIRMAN. I must put in a word in support of Mr. Strackbein. The thesis he espoused is the one of Alexander Hamilton and Thomas Clay, the necessity for building up home industries. But it never worked.

Senator FLANDERS. I recollect the campaign in which Benjamin Harrison beat Grover Cleveland. I think that was 1888, as I remember, and I remember the torchlight processions, and they wore oilcloth garments to preserve their clothes from the drippings of the torches they carried.

The CHAIRMAN. That started with the Wide Awakes in 1860.

Senator FLANDERS. Well, your memory goes back further, and I remember they chanted as they marched along the street, "Tin, Tin, American, Grover's out and Benjamin's in," and, as a matter of fact, the American tin industry did start with that protective tariff.

I cannot think offhand of another infant industry that did start in such a way.

Mr. TAFT. The chemical industry in 1918.

Senator FLANDERS. That may be so.

Any other comments?

The CHAIRMAN. Yes; I was not present in the campaign of 1888, although my first visit to Washington was paid in the administration of Benjamin Harrison at an early age, but I wonder if the Senator's memory is correct that it was tin that was being protected?

Senator FLANDERS. It was tinplate which we had previously had to get from Wales.

Now, there is one other point I wish to make, and I hope it is constructive, following up the suggestion that the greatest benefit to Western Europe would come from a customs union of their own; we have had the customs union of the States, which as just mentioned, has worked out very well, even if it is exceedingly painful at times. New England can testify to that, and don't think that any customs adjustment can be made without great pain. It cannot. We endured the pain because we are all one country.

I expected a satisfied smile, Senator Sparkman, to spread over your countenance.

Senator SPARKMAN. It always does when you philosophize.

Senator FLANDERS. Now, here is one great customs union covering Western Europe. There is an opportunity for another great customs union extending from Japan clear around to India, probably stopping short of India because they wish to develop themselves industrially.

Now, there are three great customs unions, which within those unions, not setting up too great barriers against the rest of the world, could generate and maintain each for his own conditions a high degree of prosperity, and it seems to me that the development of those three unions is on the whole far more realistic and far more hopeful and far more practical than trying to put us all into one big union. There will be less of these exceedingly painful readjustments that have to be made.

I am through with that dissertation, Mr. Chairman.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. Mr. Chairman, I would like to renew the conversation I had with Mr. Taft this morning about residual oil and the coal industry.

I see him smiling. Unfortunately for renewing the discussion I have to go to the floor again.

I would like to have permission, if I may, to set forth a statement of the industry, and of the United Mine Workers, and their position in that. There is quite a difference in the opinion as set forth by Mr. Taft and that of the industry.

(See statement, p. 1005.)

The CHAIRMAN. Very well.

Mr. TAFT. I may say I got most of my facts, or a good many of them, out of Mr. Pickett's brief.

Representative KELLEY. You mean you took what you saw in Mr. Pickett's brief to get an argument out of it, to set up a defense?

Mr. TAFT. Mr. Chairman, I referred to one new enterprise in foreign investment. I think perhaps there should be in the record also a second one. From February 28 to March 3 there will be in New Orleans a meeting sponsored by the city of New Orleans and by Time-Life International of representatives of quite a number of Latin-American countries with various kinds of proposals for investment which have been circulated before that time to various bankers and other persons who might invest in Latin America. It is contemplated that there will then be direct discussions or even negotiations over the carrying out of those proposals.

I have a press release of December 11 on this which happened to come to my desk. I think it might be worthwhile to have it in the record as representing a new type of approach which might be very helpful.

(The press release referred to follows:)

INTER-AMERICAN INVESTMENT CONFERENCE, NEW ORLEANS, LA., FEBRUARY 28, MARCH 1, 2, 3

In a private-enterprise sequel to the recent intergovernmental conference at Rio de Janeiro, leading industrialists and businessmen of the United States and Latin America will meet in New Orleans February 28 through March 3, 1955, to explore the role of private initiatives and finance in United States-Latin American economic relations.

Organized under the auspicies of private business, the New Orleans meeting, to be known as the Inter-American Investment Conference, will bring together representative industrial and financial leaders of both continents for a 4-day examination of present opportunities for productive capital investment in the swiftly growing nations of Latin America.

The New Orleans conference was announced today by Rudolf S. Hecht, chairman of the board, International House, New Orleans, and Edgar R. Baker, managing director, Time-Life International. The city of New Orleans and Time-Life International are serving jointly as sponsors and hosts for the conference.

Widespread interest in the conference has been shown by leading business and industrial organizations both in the United States and Latin America.

In this country, the Chamber of Commerce of the United States, the National Association of Manufacturers, the Investment Bankers Association of America, and the United States Inter-American Council are serving as cooperating organizations.

Some 50 business organizations in 16 Latin American countries are cooperating actively in organizing Latin American representation at the conference. (See list attached.)

The Organization of American States, representing all of the Latin American nations, and the International Development Advisory Board, a private citizen group appointed by the President to advise on certain aspects of United States foreign economic policy, are also cooperating with the sponsors of the conference.

In announcing the conference, Mr. Hecht recalled that President Eisenhower, in a letter to Eric Johnston, chairman of the International Development Advisory Board, last July had expressed personal approval of a meeting of the kind to be held in New Orleans. At that time, the President wrote:

"The suggestion of the International Development Advisory Board that representatives of private business, industry, and finance in the United States and Latin America take the initiative in organizing a privately sponsored conference to promote economic progress in Latin America through increased private capital investment is a good one. As you well know, private investment has been the major stimulus for economic development in this hemisphere. An increased flow could contribute significantly not only to the development of the countries in which made, but also to the economic progress of the United States.

"The administration looks with favor upon positive, forward-looking steps of this kind by private enterprise. We also urge appropriate action on the part of our Government to encourage the outflow of private American investment and on the part of foreign nations to encourage its inflow."

Mr. Hecht said the primary purpose of the Conference is to stimulate greater participation of United States capital in productive enterprise in the Latin American countries.

"The sponsors of this meeting believe," said Mr. Hecht, "that private capital, with its managerial and technical skills, is going to be the most effective long-range answer to Latin America's need for development funds.

"We are convinced that if the private-enterprise system is to prevail in the nations of the Western hemisphere, main reliance for the development of economic potentials must be placed upon the forces of private initiative. These forces will respond in both continents if they are properly encouraged to do so.

"While we recognize existing barriers and uncertainties, and urge continued intergovernmental action to remove them, we feel that a meeting jointly sponsored by United States and Latin American business and industrial interests will help to dispel apprehensions, increase mutual confidence, and spotlight the immense and varied opportunities which exist today for safe and sane investment in the Latin American republics.

"We are confident that much can be accomplished right now through a frank and full exchange of views between entrepreneurs of both continents who speak the langauge of business whether they speak it in Spanish, English, or Portuguese."

Mr. Hecht said that while the Conference is a private-enterprise undertaking, the Government of the United States, as well as the Governments of many Latin American countries have indicated interest. It is expected that official observers and technical advisers will attend the meeting.

Mr. Baker recalled the emphasis placed on private capital during the recent inter-American economic discussions at Rio de Janeiro. "The New Orleans meeting," he said, "will constitute a serious effort on the part of private enterprise in the United States and Latin America to find practical answers to some of the problems which have slowed up the flow of United States private capital to our Latin American neighbors. While the idea of the New Orleans Conference was conceived weeks before the Rio meeting, it comes as a logical next step in our joint efforts to develop stronger economic relations in this hemisphere. It might be regarded, in fact, as private industry's answer to the challenge inherent in Latin America's need for financial assistance for development.

"In helping to organize the New Orleans Meeting," Mr. Baker added, "we have been astonished by the intense interest shown by the business communities of all the Latin American countries. Their enthusiasm and willingness to help make the Conference a success have greatly exceeded our expectations."

The Conference will be conducted both as an assembly and as a workshop. Speakers will include men of international reputation in the field of business and industry. Panel discussions on major questions will offer all in attendance an opportunity of personal participation in the discussions. In addition, the program will provide ample time for direct personal discussions between individual Latin American and United States participants.

In order to assure consideration of practical measures rather than generalities, definite preliminary steps are being taken by the cooperating organizations in Latin America to send business representatives to the Conference prepared to put forward specific investment proposals. The Laten American cooperating organizations are asking their respective members to prepare outline data regarding specific investment proposals which they would like to discuss with United States capital interests. On the basis of this information, the Conference management will extend special invitations to United States business concerns which might be expected to have an interest in the specific proposals put forward by Latin American participants.

While no assurance can be given with respect to United States acceptance of proposals offered by the Latin American representatives, every facility for discussion and negotiation will be offered during the Conference.

A portion of the Conference period will also be reserved for "country" meetings at which the representatives of the business communities of each of the Latin American countries will be available for direct discussion with United States participants interested in the investment picture in a particular country.

The CHAIRMAN. Thank you very much.

Mr. Talle.

Representative TALLE. No questions, thank you.

The CHAIRMAN. Mr. Knowles, who is Acting Deputy Director of the Bureau of Foreign Commerce.

Mr. KALIJARVI. Mr. Chairman, before you call on Mr. Knowles, may I insert in the record at this point a statement prepared in the Department as a result of some of the things we have received as a result of this program? This statement is called "Relaxation of Restrictions Against Dollar Imports."

Even we were surprised with what we came up with as a consequence of our study. There are some 12 pages with a graph at the end.

(See p. 995.)

With your permission, we would like to insert it.

The CHAIRMAN. Yes.

(Mr. Karijarvi's prepared statement appears at p. 992.)

The CHAIRMAN. Mr. Knowles.

OPENING STATEMENT OF NATHANIEL KNOWLES, JR., ACTING DEPUTY DIRECTOR, BUREAU OF FOREIGN COMMERCE, DEPARTMENT OF COMMERCE

Mr. KNOWLES. Mr. Chairman, members of the committee, in view of the many quotations entered into the record by the several panelists, I would like to abbreviate my paper and just call attention to a few of the highlights, but I would like my whole paper in the record.

The CHAIRMAN. You may so proceed.

Mr. KNOWLES. As a representative of the Department of Commerce, I can perhaps make some contribution to today's discussion by indicating the present and past relationships of United States foreign trade to various elements of our national economy.

One way to measure the importance of foreign trade to our economy is to express it as a percentage of our gross national product and to compare that percentage with the similar percentage for other important components. Attached to my statement is a table showing such percentages for a selected number of years, starting with 1929 and ending with an estimated figure for 1954. These percentages, of course, are based on the current prices for each year.

In the year just past, that is 1954, our merchandise exports were about 4.2 percent of the estimated total gross national product of $357 billion. This figure, which includes military aid exports, compares with 5 percent in 1929 when there was no military program. Excluding the military program, the 1954 estimated figure of 3.5 percent was slightly higher than in 1953, and moved upward contrary to most other trends in the national economy. Our merchandise imports in 1954 declined slightly from 1953, and were about 2.9 percent of the gross national product.

I would like to point out in these figures that the 3.5 percent excluding military represents a very much smaller proportion of our gross national product than it did in 1929. These figures may not appear impressive when compared with similar relationships in some of the important trading countries of Europe whose exports reach 25 percent or more of their gross national product. Such a comparison, however, ignores a very important difference between our economy and those of European countries. No one factor makes an overwhelming contribution to our total economic picture. The strength of our economy results from its diversity. Even cash receipts from farming were only 8.5 percent of the gross national product in 1954. Thus, this important component which has commanded so much attention of the Government of the United States made only about twice as much a contribution to our economy as did the exports of merchandise.

Another very important component of the gross national product which is frequently consulted to determine whether our economy is functioning properly is residential nonfarm construction. This housing component was about 3.8 percent of the gross national product in 1954. Even in 1954 when housing construction moved upward contrary to most business trends, it was lower than the exports of goods and services. Other new construction representing about 4 percent of the gross national product in 1954 was also exceeded by merchandise exports.

The foreign trade contributions to our total economy also compared favorably with such investment components of our gross national product as business purchases of capital equipment which represented 6.2 percent of the gross national product in 1954 and consumer purchases of durable goods which were about 8.1 percent.

For your convenience, I am leaving a table entitled "Selected Elements—Percentage of Gross National Product" which gives additional details.

The significance of exports and imports is reinforced by a consideration of their relationships to some of our most important and progressive industries.

During the 3 years 1949–51 nearly one-half of our exports came from industries which sold more than 10 percent of their production abroad. One-third of our exports were accounted for by products which rely upon foreign markets for more than 25 percent of their sales.

Export markets are of central importance for some of our major agricultural products such as cotton, wheat, rice, and tobacco. In the crop year 1952–53 we exported 24 percent of our wheat and 20 percent of our cotton despite the fact that this was a year of comparatively low exports. In the preceding 5 years we exported, on the average, about one-third of these crops. In 1953 we also exported 56 percent of our rice, 22 percent of our tobacco, 61 percent of our inedible tallow, and 18 percent of our lard.

The critical importance to our economy of the imports of many raw materials and foodstuffs which we do not produce at all or where our production does not come even close to meeting our needs has been well known for many years.

About 58 percent of our commodity imports are essential for consumption or for the operation of our economy, given the present industrial and technological pattern of production. Of these, one-third, or 20 percent of total imports, cannot be produced at all in the United States. Another one-third are not available domestically in sufficient quantity.

The remaining one-third, of which coffee, tea, and cocoa are typical examples, have become an accepted part of our daily consumption and we are anxious to obtain them in exchange for our produce.

The other 42 percent of the total are imported even though they could be produced here because foreign countries are able to deliver at lower costs, or because they are sufficiently different from domestic products to stimulate demand.

The level of our imports governs the level of our exports, since they provide the dollar exchange for the purchase of exports. As our grant aid to the rest of the world is reduced and ultimately eliminated, we must increase our imports unless we are willing to see our exports decrease.

American investments abroad tend to create markets for our finished product as well as raw material sources of supply.

It is almost a truism that our best customers are the more highly developed countries. The import demands of countries with low standards of living while frequently large in relation to their domestic production are small in absolute terms. As our investments abroad contribute to the economic development of other countries and increase the standards of living in those countries, new demands are created, some of which will be translated into increased exports from the United States. This is in addition to the capital-goods requirements necessary to translate the money investment into plant and equipment.

Moreover, a very large part of our investments abroad has gone into the development of raw materials which we must increasingly import from abroad as our economy expands and our known domestic sources of supply prove inadequate.

I want to emphasize the role of both exports and imports in generating employment, wages, and profits in the United States.

Let me just underscore it by pointing out that some 70 percent of our exports consist of manufactured goods shipped in substantially the forms in which they are finally utilized abroad. The great bulk of the end-use value of these goods is thus contributed by American labor, capital, and management.

Our imports, in contrast to our exports, consist preponderantly of raw materials and crude foodstuffs requiring extensive further processing before entering into consumption channels here. For at least 80 percent of the goods we import, a very large part of their end-use value is added by American industry after they are purchased from abroad. The activities contributing to this added value represent jobs and profits for United States workers and employers, just as surely as do those involved in the production of our exports. Less than one-fifth of our imports enter the country as substantially finished products, and even these contribute significantly to employment and earnings in our distributive and service industries.

Thank you, sir.

The CHAIRMAN. Thank you.

(Mr. Knowles' prepared statement appears at p. 1002.)

The CHAIRMAN. I would like to throw out a couple of general questions for discussion which have been touched upon but not discussed in detail. The first is the question: What changes, if any, should we make in the present law relating to the escape clause, to the peril points, and to the "Buy American" provision, from a foreign-aid angle?

Mr. VINER. I would like to suggest as a reasonable compromise between leaving the escape clause and "Buy American" legislation as it is and wholly repealing it, which I consider impractical and perhaps not desirable on principle—and the percentages I give I think are reasonable, but I suggest them merely as a basis of consideration.

I would suggest that commodities be ineligible for the application of the escape clause, first, in case the reduced rates of duty on them are now in excess of 20 percent on the principle that if they already have 20 percent or more protection they need not and they are not entitled to have still additional protection.

Mr. TAFT. That is the equivalent ad valorem?

Mr. VINER. Yes.

Secondly, any commodity of which in the preceding calendar year the imports did not exceed 10 percent of American production. That industry is unlikely to be in distress or in imminent distress because of the volume of importation and, therefore, until the imports exceed 10 percent it would not be eligible for the application of the escape-clause provision.

Third, any commodity whose domestic production has increased by over 5 percent in the preceding calendar year is not to be entitled to additional protection.

Senator FLANDERS. Is that increase in volume or value? I am just thinking that inflation might keep everything in there.

Mr. VINER. I would prefer, as more rational, increase in volume.

Mr. TAFT. That is 5 percent.

Mr. VINER. Five percent increase in domestic production in the prior year.

For "Buy American," I would limit the preference which the buying officers of the Government are permitted to exercise to 10 percent after duty.

Mr. TAFT. It is now 6 to 10.

Mr. VINER. I would make the statutory maximum 10, to go with the other provisions.

Second, I would make any commodities ineligible for governmental preference in purchasing on which the duty is in excess of 20 percent, because the Government preference is in addition to the duty.

Third, I would make commodities ineligible whose import in the preceding calendar year did not exceed 10 percent of American production.

Senator FLANDERS. You said that before.

Mr. VINER. No; these are limitations for "Buy American." However, for these provisions with respect to "Buy American," I would make this qualification: I would make these limitations not apply to commodities which receive certification from the security agency or the defense authorities, that it is important that they be obtained from domestic sources.

Senator FLANDERS. May I make an inquiry with regard to that 10 percent limitation on "Buy American"?

Supposing there comes a time when an industry is suffering from unemployment, and it might well be that such an industry suffering from unemployment still was in the field in which the import was less than 10 percent. Wouldn't you find it politically difficult, as I think I would find it humanly difficult, to say that we would nevertheless buy from abroad at a time when there was unemployment in that industry, simply because there was the 10 percent criterion applied?

Mr. VINER. Senator Flanders, my definition of a statesman is a politician who does difficult things. I would not make the tariff, the "Buy American" provision, and the escape clause our machinery to deal with cyclical changes or regional depressions. I do not say that these things are not to be given very serious consideration, too, and that Congress should not deal with them.

But in the same way as with distressed areas, I would not try to deal with them by manipulating the tariff. That would mix up different things. It would increase the vested interest in tariff protection which I would try to avoid. I would be happy if there were serious study of the experience of other countries, particularly England, with respect to the so-called distressed areas and the careful working out of provisions whereby the Federal Government does assume some responsibility to relieve special stresses not due to demerit on the part of regions or of the employees of particular industries, but without regard to whether the impact that is hurting them is technological change, changes of fashion or taste, or foreign competion.

The CHAIRMAN. What would you suggest as specific measures?

Mr. VINER. I have not given too much thought to it because I think fruitful thought cannot be given to it without investigation of the administrative difficulties which I am not qualified to discuss. With respect to agriculture, I think the distortions of our agricultural policy have been due in part to genuine and deserved sympathy with respect to distressed areas and the population in those areas. I would have dealt with those areas either by the encouragement of new industries to enter such areas or the encouragement of the movement of people, particularly young people, out of such areas, so that there would be gradual adaptation to the situation.

Government preference in its purchasing to areas in need of employment, I would be in favor of, if workable provisions can be designed. I would watch out that Federal minimum wage legislation, and so on, be not so rigid that it itself becomes a factor in throwing a distressed area into still more distress by imposing on that area a level of wages which that area is no longer able to yield. But these are just my casual suggestions.

What I would advocate is a Washington investigation by a competent staff to find out what is in principle desirable, and in practice workable.

Senator FLANDERS. Mr. Chairman, I am wondering if I do not have in my old friend, Dr. Viner, a recruit for the idea of establishing criteria instead of making across-the-board changes of one sort or another in that tariff. It seems to me that the establishment of criteria is the direction in which we should be moving.

Mr. VINER. Well, if we would agree on a definition of the term "criteria"——

Mr. FLANDERS. We couldn't do that this afternoon.

Mr. VINER. No. I would be in hearty agreement with that proposition. But I would include as criteria those already included in practice. After all, nobody is seriously proposing across-the-board elimination of tariffs. I haven't heard a word in all of the discussion here, or in discussion elsewhere, against the selective approach. The word "selective" is a key word. In other words, every reduction in some way or another should receive careful consideration in the light of all of the surrounding circumstances.

On the other hand, I would include in the criteria limits beyond which it is unreasonable to provide protection. I have suggested limits beyond which you should not increase the existing protection. I would approve of the proposal that there be executive authority to reduce any duty which is now, ad valorem or its equivalent, in excess of 50 percent. I regard that as a limited proposal. I would be happy if it were made 30 percent. But I would limit the extent of protection you give on any item to some maximum rate, because one of the things I would like to emphasize is that when you impose a duty of 50 percent on a commodity you are not taking something good out of an unlimited supply that costs nobody anything and giving it out of your kindness to a deserving beneficiary. You are imposing a burden on some other Americans. Somebody pays that 50 percent. It may be the consumer, or the processor, or it may be the Government, but somebody is paying for it. If you impose a duty and that keeps out an import, somebody in the United States pays a price that has been increased by that action. It is unfortunate that the unfavorable effects of a reduction in tariff can be seen and felt quite readily, whereas the benefits are not immediately recognizable, and cannot be demonstrated as a problem in arithmetic can, although they are real and can often be tenfold the costs or burdens.

When I start working out my definition of the appropriate criteria, I am afraid it will turn into an essay. It would attempt to take account of the cost of protection and not merely of the benefits some persons receive from it.

Senator FLANDERS. I think we agree on that.

Mr. VINER. I think, Senator, we have agreed before without too much strain on either side.

The CHAIRMAN. Does anyone else want to discuss these two topics of what should be done about the escape clause, the "Buy American," or adjustments for regions severely hit?

Mr. THORP. I would like to develop one point Mr. Viner raised, and that is the extent to which these policies may be used for quite different objectives, and the difficulty if this is in terms of cyclical fluctuations or agricultural policy or what not, and just speak of the one that is the fashion, that all this is in relation to defense. As a person very much concerned with being adequately defended I would like to protest strongly on the use of the tariff as a device for assuring me proper national defense.

This is a very clumsy and inaccurate instrument. To take the case Senator Flanders mentioned this morning as to the watch industry, it may be that preservation of some of the skills in our watch industry are important to our national defense. We raise the tariff. We don't know whether this will give us too much or too little. I don't know whether this amount of tariff increase is providing me with the defense I am alleged to need from this industry. It seems to me that if the problem is national defense we should know what we need and that should be arranged directly as a burden on us under our defense budget, and not dealt with in this very ineffective and inexact method of trying to say that some particular tariff will provide just what is needed for national defense.

The CHAIRMAN. Would you propose that we buy specific items which at some future time may be needed for national defense and stockpiling them then?

Mr. THORP. That is one way of dealing with it. I think this can be done by stockpiling. It can be done by direct contract with industries. It might even be better for the Government to purchase a certain number of watches, and if they cannot be stockpiled give them away or even destroy them, although this is a very extreme process.

I think by proper contracting or subsidies, it should be possible to keep this industry active and the skills there without the loss of value. I hesitate to have the prices of all watches bought by all people having to carry this extra burden.

Senator FLANDERS. Mr. Chairman, it is a skill rather than a product which is in question in regard to watchmaking, and you cannot stockpile—well, maybe you can stockpile a skill. I never thought that subject through.

The CHAIRMAN. Stockpiling the products of skill?

Senator FLANDERS. It is not the products.

It is largely in instrument making. I, myself, think in that particular case, the case was not too strong, but there are such things, for instance, lens grinding, I think, is a very important case of a requirement for defense, the skill of the lens grinder.

Mr. THORP. I am granting that, Senator. I merely am saying if we need that, I want somebody to say how much we need, and to assure us of having that, rather than using this uncertain method of tariff protection.

Senator FLANDERS. In the extreme form, which perhaps I either have misunderstood or you may regret, you suggested that we might have people preserving the skill by grinding lenses which we afterwards threw away.

Mr. THORP. Well, that was just for making the extreme case clear. I don't think we need to do it that way.

Mr. UPGREN. Mr. Chairman, I was just going to comment that 20 years ago the Hutchins committee looked into it, and there was widespread recommendation of subsidy and contract, but it seems to me you build up a tighter interest with that arrangement, and while tariffs are subject to change once the vested interest is built up the record of subsidies is just as smelly as the record at an earlier date, perhaps, of tariffs.

Mr. VINER. I would question the history of that. There is no durable vested interest in congressional appropriations, and no recipients in the American history of congressional appropriations for subsidies have ever been able to be certain they would get them 5 years later.

Shipping subsidies are a case in point.

The CHAIRMAN. Having been successful in knocking out the subsidy to the American merchant marine at one session of Congress I bear the mark of their successful comeback. The ship operators of the country are very powerful fellows.

Senator FLANDERS. They are not powerful enough to keep the shipyards going.

Mr. STRACKBEIN. Mr. Chairman, may I comment on the escape clause?

It seems a shame to disturb all this harmony.

The CHAIRMAN. We invited you to stir up the lions.

Mr. STRACKBEIN. The escape clause is a subject to which I have paid a good deal of attention over a period of years. It was first introduced into the trade agreements, I think in a trade agreement with Mexico in 1943. I think it made its appearance in a somewhat different form earlier than that, but in any case it was introduced and was explained as providing a remedy against the mistakes that might be made by the Department of State negotiators in reducing the tariffs in conferences with other countries.

It was admitted that when thousands of items came up for reduction in duty that even though hearings had been held before the Committee for Reciprocity Information that actually adequate data could not be obtained in so short a time. So they said "We are not allwise, we admit we can make mistakes, but you have a remedy."

Now, we have found that when steps are taken to apply the remedy, less than 10 percent of the cases actually result in the proclamation of a remedy, and certainly the suggestion now that no remedy be applied unless the rate of duty is 20 percent or less in ad valorem equivalent seems to me to be completely and wholly unrealistic with respect to the different levels of import competition faced by particular products.

I could cite you an example in pottery. Pottery comes in from Japan and competes with our own pottery. The Tariff Commission found that the difference in the cost of production was 284 percent. Now, that may or may not be accurate. The fact is that the prices were extremely low compared with prices from other countries.

Now, to say that no escape-clause remedy should be applied unless the duty is 20 percent, or less, seems to me to overlook completely the difference in the competitive level of various countries in shipping to this country, and the same with respect to the condition that no escape-clause remedy be given unless imports are 10 percent or more of the domestic consumption.

Again, there is no magic in this 10 percent. Why not 5 percent? Why not 20 percent? There is no possible defense for establishing one particular percentage point as being the dividing line. It has no relation at all to the amount of damage that may be done by imports.

The CHAIRMAN. It has been my own feeling, Mr. Strackbein, that after a movement such as reciprocal trade gets under way that the opponents do not so much attack the principle as try to limit its application. Groups which you honestly represent are never really reconciled to Mr. Hull's program, and sought at every turn to limit it. So these devices of the escape clause, the peril points, and so on, were inserted. But the cumulative effect of these has been to greatly, in my judgment, reduce the possibility of expanding imports and, hence, of expanding exports, and has therefore restricted the volume of international trade.

Mr. STRACKBEIN. I want to comment on that. It has been said, and repeated many times, that the mere existence of the peril-point legislation and the mere existence of the escape-clause legislation was a deterrent to any increase in imports or was a deterrent in any case to the flow of imports; that other countries, producers in other countries, hesitated to put on a real sales campaign in this country because if they succeeded then the peril point or the escape clause would be invoked.

Now, I can give you examples from the record of instances where there have been escape-clause applications made and hearings held, not only once, but twice, and where in the face of that fact imports have not only increased but have doubled, and in some cases more than that. So the mere existence of the escape clause certainly cannot be held as a deterrent to imports.

The CHAIRMAN. Well, a partial deterrent.

Mr. THORP. Mr. Chairman, it is worthy of note, that if an escape-clause action is threatened, the importer rushes to get as much of the article into the country as possible before the action is taken.

Mr. STRACKBEIN. The increase in imports I mentioned took place during the nine months allowed for the decision. You can see no change in the upward trend in the imports of tunafish, as one example, bicycles as another, and groundfish fillets, and I think there are some others.

Mr. TAFT. There ought to be some distinctions made here, Mr. Chairman, because certainly you can't make general statements about some of the different categories. If you are talking about various kinds of the raw or semi-processed materials, then the question as to whether they increase or do not increase when they are being sold to manufacturers is one kind of a question.

When you are talking about a manufactured product, a consumer product which is to go to a consumer, then you are dealing with something completely different. It is in the latter category that the fears of spending considerable money to prepare the public for the sale of the new imported product are so great that they do not start, whereas if it is a raw material for chemical manufacture, or something which is semiprocessed, again going to a major manufacturer, that is something entirely different. That goes into channels that are used to handling that kind of thing and it, therefore, is not nearly as much restricted as it would be if you are talking about an end product which is going to the consumers. Now, then, also in this connection, I think that the objective of what Dr. Viner is saying ought to be very clear. The problem we are discussing essentially is whether or not an industry is injured if its proportion of the market decreases. That is, if its own production increases absolutely even though the foreign importer increases his percentage share of the market.

Now the Tariff Commission at no time has held that to be damage, although producers have constantly filed escape-clause proceedings on the theory that it was damage.

There are a number of samples of this. Tableware is one, for instance, china, and other things of that sort, which is one of the items always looking for higher tariffs.

There, the imports over a 5-year period, 1948 to 1953, went up from $7 million to $11 million. At the same time domestic production went up from $10 million to $15 million. Now, are the domestic producers damaged? I say the Tariff Commission has never held that they are, and it certainly seems to me they are not. This is what Dr. Viner is feeling for when he tries to get some limitation below which you cannot file any escape-clause proceeding.

Senator FLANDERS. Is that for fine china?

Mr. TAFT. Fine china and other types of tableware.

Senator FLANDERS. As far as I know, it is only within the past few years that we have had any clay sources, any sources of the proper clay for that.

Mr. TAFT. I am not sure of that because the Rockwood Pottery has been going since the seventies or eighties.

Senator FLANDERS. Is that the fine pottery?

Mr. TAFT. It is of the Wedgwood type and draws from the clays in the mountains of Georgia.

Senator FLANDERS. I am thinking of the porcelains.

Isn't that comparatively recent?

Mr. TAFT. Lenox China goes back very far.

Senator FLANDERS. I do know in Europe the supply of that clay is so limited that Swedish or Danish and much of the French china is made from clay dug in Devonshire in England.

Mr. TAFT. That may well be. I will just give one more sample of this situation, the bicycle case, which the Tariff Commission turned down about 2 years ago, I think and which is now before the Commission again. The figures here are something like this: For balloon tire bicycles which we see usually ridden by young boys, production in 1937 was 1,200,000 units. They reached a peak in 1946 and 1947 because of the shortage of manufacture during the war. Production dropped to 1,400,000 units in 1949, a normal year, and in 1953 they reached 2 million. On the other hand, we started importing lightweight bicycles from Britain, the kind with gears, and so on. My boy in 1947 bought one over my protest because it cost more than a domestic bike. In 1949, with the devaluation, the price came down relatively in the United States, and imports are now about 500,000 units.

The American industry reached a peak of—I forget the exact amount, but I think it is 180,000 in 1953 of this type of bicycle.

Now in 1954, the situation is different, I agree with that, but I am telling you what the prior escape-clause proceeding was, and the Tariff Commission found there was no basis for it again, on the ground that they had increased absolutely in their production even though the importers had been able to sell a lot more of a new kind of product that the American public liked. I can't see that there is any damage to the American producer in that kind of situation.

Senator FLANDERS. Mr. Chairman, bicycles come in my list of categories, in the list in which no greater tariff protection is warranted, simply because American bicycle manufacturers were asleep at the switch.

No child who knew the difference between an American bicycle and an English bicycle would buy an American one, if his father would let him buy an English one. We were asleep at the switch completely.

Mr. STRACKBEIN. Mr. Chairman, before we get too far from this subject, I want to answer the point that Mr. Taft made; namely, that if the product was a consumer item, then the existence of the escape clause did act as a deterrent. I want to point out that canned tuna fish is a consumer item. It is bought by housewives from the shelves of grocery stores.

Mr. TAFT. Made out of imported tuna fish?

Mr. STRACKBEIN. Yes. And the imports, in spite of the Tariff Commission escape-clause hearings and in spite of a bill in the Congress to levy a tariff on fresh and frozen tuna, has gone up. The imports of canned tuna have gone right up undeterred by the existence of the escape clause, the peril point or anything else.

The bicycle is another consumer item. The imports there have gone up even though the Tariff Commission at this time has before it the second application of the manufacturers under the escape clause. So to say that the mere presence of the escape clause is so offensive that it should be wiped off the statute books simply does not make sense. Let's turn it around. Supposing we did not have an escape clause. Are not American producers deterred from expanding their plants or from making plans about increasing their production, and so on, when they do not know what kind of import competition will strike them?

The CHAIRMAN. Well, isn't that something that everyone faces in a competitive market? If you believe in the competitive system, to what degree can you gauarantee in perpetuity a given physical volume or a given share of the market to any one concern?

Mr. STRACKBEIN. But there is competition and competition. We have tried to wipe out unfair competition within our own ranks. We have put a minimum-wage law into effect so sweatshop products cannot move in interstate commerce. We have done a lot of things to make for fairness of competition. The question is: what kind of competition? If the competition is on a roughly equal basis, we should meet it and welcome it, but when goods come in at prices we can't touch, that is something else.

The CHAIRMAN. You mean because of extremely low-wage scales?

Mr. STRACKBEIN. That is right. We say that our protection under the escape clause should not be taken away or nullified by Executive action or by administration that is not under the control of the Congress.

Senator FLANDERS. I would like to get into the record, Mr. Chairman, the best explanation that these eminent panelists can give of the doctrine of relative advantage. Does that mean anything to any of you? Did you ever hear of the doctrine of relative advantage?

Mr. VINER. I have made my living out of it for a good many years.

Senator FLANDERS. I hope, Dr. Viner, that you are not in the position of the doctor whose son took over while he took a vacation and cured his best patient. In other words, you do not feel if you revealed it here so even I could understand it, that you would lose your source of income?

Mr. VINER. No. And if there is any difficulty in my making it clear, I will assume the blame for myself, and I will not assign it to anyone else. I will try to put it in a way, perhaps, a little bit different from the usual way.

Senator FLANDERS. I am serious in this. I think it should be in the record. I have always classed Mr. Hull as a doctrinaire freetrader and have felt that his point of view has permeated this whole great undertaking in procedure and I have assumed that in the creed of the doctrinaire freetrader this question of relative advantage loomed large and that there was some way in which it worked out, so that the high-labor-cost producer, the general high-cost producer, and the extreme low-cost producer over in another country would, supposing there were only those two areas in the whole world, would somehow be able to divide the trade between them to the advantage of both.

Is that a fair statement of the doctrine of relative advantage?

Mr. VINER. Yes. I would say if there were three countries, the problem gets complicated.

Senator FLANDERS. Let's assume just two, Japan and the United States.

Mr. VINER. Yes. The way I would like to put it is who is entitled to control the manner of use of American productive resources? Shall it be an entrepreneur who, paying standard American wages, cannot produce a product costing no more than it is worth. If that is so, we should get it from abroad. Whenever you have an industry living on 50 percent protection year after year, it probably has not been paying more than the standard American wages—the historical fact is that it has probably been paying less—and yet it has been taking from the consumer two prices: first, the world price and, second, the additional price that the tariff makes possible. In other words, that industry has not had a legitimate claim to use the labor and the other resources that this country has available.

Now I am considering the position of the labor in that industry. The labor in it has at some stage or other been enticed into it wrongly. It belonged somewhere else. Let's assume it is receiving the American standard of wages without giving the American people a full equivalent in return. It may be that it has been trapped into it. The persons who are caught in it, with skills that they acquired painfully, we ought to treat very gently and sympathetically. But we ought to avoid drawing in new labor resources to that industry. We ought to avoid training youngsters for that industry, in which they will make their living partly out of earned wages and partly in getting a supplement from a handout forced on the consumer for their benefit.

With respect to low wages abroad we profit from the low wages paid abroad if that results in a low cost to us of the product. But in many cases the low wages abroad are a reflection, and an inadequate reflection, of the inefficiencies of the labor, the unsuitability or scarcity of raw materials, the unfavorable climate, the low quality of business enterprise, so that while they may pay miserably low wages, they can't produce the goods at as low prices as we can. What wages are paid abroad should not be any concern of ours, except possibly a humanitarian one. But you are not helping a country paying low wages by saying to it: "Because your people are inefficient and have poor natural resources, therefore we are going to keep you from making even the miserable living you are making now, by preventing you from exporting your products here, by raising our tariff."

Senator FLANDERS. Let's not get humanitarian aspects into this thing. Let's stick to economics. Here we have this country, high labor rates, large cost of production, high prices, as a result.

Over here is Japan with low labor rates, perhaps in other respects inefficient production, but when our goods on the whole reach the shores of Japan, she cannot pay for them. When her goods reach our shores competing with what we make, we can pay for them. How is the balance struck so that both Japan and we have something to do that we are adapted to doing and exist in the world together to our mutual advantage?

I think this gets back to the question I raised this morning as to what the end point of free trade is, what does it lead us into, what does it lead Japan into, but I am not sure.

I have not quite yet pinned this down to the doctrine of relative advantage, but if you want to yield to Mr. Taft there, or if you want to proceed, the chairman can decide. I have great respect for both of you. In fact, I do not know of a better presentation of a difficult case than Mr. Taft made this morning.

Mr. TAFT. Thank you, sir.

Mr. VINER. I do not agree that it was a difficult case. It was by far the easier of the two cases presented here today, although I think it was very ably presented by Mr. Taft. It is Mr. Stockbein's case which is the difficult one to argue.

Mr. TAFT. Mr. Chairman, I think this point the Senator has raised is a very important one. I was in Europe in 1948 and met the Premier of Maastricht, and I was then in the City Council of Cincinnati, and I told him about the machine which we use which is now generally used, a planer, which levels the black-top on a street. It is a perfectly huge machine and quite expensive, but it nevertheless makes a surface quite different from anything else. Now, he would be delighted to have it, no tariff, no trade restriction would stop him from getting it; he just does not have enough money to pay for it. If you are going to sell, abroad, you have to adapt your products to their needs abroad and what they can pay.

If the man making that product wishes to sell it in Maastricht, they will have to develop a cheaper model which is within the financial capacities of Maastricht to buy, and this is not just a question of the taste and likings and packaging and everything else that goes with selling something to somebody else.

Americans have not always paid enough attention to that kind of item. If that sort of intelligence is applied to foreign trade, then I think the objection which the Senator makes, in a great many instances, might be eliminated.

Mr. CLEVELAND. Could I come back to the problem of readjustment assistance raised by Dr. Viner, because it strikes me if something could really be done along the lines suggested, it would make unnecessary the other suggestion he was making for a rather complex compromise on the escape clause. It is perfectly clear not only politically, but as a matter of right, humanitarian values, and so on, that there has to be some escape hatch of some sort from the difficulties into which individual domestic industries that aren't able to meet foreign competition are put by a reduction of tariffs. But at the moment we are escaping by a hatch that really has a very bad effect on our foreign policy; that is, through a tariff rise or a failure to reduce the tariff.

It is important on this subject to make a distinction that I do not think was fully made by Mr. Upgren when he spoke of subsidies. I think what Mr. Viner talked of is not really what you could call a subsidy. At least it is not a subsidy to enable an inefficient business to remain in business.

I take it he means, assistance of various kinds, unemployment compensation, small-business lending, perhaps some technical assistance, the creation of all sorts and kinds of climate for readjustment that will enable the resources to move out of the inefficient industries and into something else. I would like to make one suggested amendment or an addition to what Dr. Viner suggested.

We are inclined, I think, to consider this too much as a Federal problem—because the tariff is a Federal problem. It seems to me, as a matter of administration, that this is basically and primarily a regional and local problem. It is an appropriate kind of problem for State governments and even lower levels of government to be involved with. The Federal Government can come in with Federal aid, probably more appropriately than it can by trying to declare a Federal depressed area in a locality that might be only two counties big.

With this in mind, it does seem to me that the Congress ought to search for ways of setting up a coordinated system for readjustment assistance, placing that responsibility in some coordinator's hands, perhaps, on the executive side, operating it primarily as Federal aid to local and State levels of government. This could be part of a larger policy decision that would eliminate the other escape hatch so that you substitute one escape hatch for the other. Morally as well as politically, it seems to me, working along this line would make sense, rather than compromising on the escape clause. Setting up a readjustment assistance arrangement gives you the handle to eliminate the escape clause over the same period of time, and perhaps even in the same legislation.

Mr. TAFT. Mr. Chairman, I was just going to say that in the pamphlet which I have submitted to the committee, which contains the proposals presented by the Committee for a National Trade Policy to the Randall Commission a year ago with a supplement on some new items that came up later, there are some eight pages which outline exactly this sort of program.

Most of it has been incorporated in several bills, one of them by Mr. Harrison Williams in the House, and another one by Congressman Eberharter. I think perhaps this pamphlet might well be in the record, if that is satisfactory.

The CHAIRMAN. Good.

(The pamphlet referred to is as follows:)

RECOMMENDATIONS FOR UNITED STATES POLICY ON WORLD TRADE

Committee for a National Trade Policy, Washington, D. C.

INTRODUCTION

To Members and Friends of the Committee:

For the convenience of its members and others interested in the subject of world trade, the Committee for a National Trade Policy is republishing in a single pamphlet its recommendations for the formulation of United States foreign trade policy.

On October 29, 1953, I presented testimony before the President's Commission on Foreign Economic Policy (the Randall Commission) on behalf of the Committee for a National Trade Policy. In December 1953, this testimony was supplemented by the submission of a series of concrete proposals to the Randall Commission. These two submissions to the Randall Commission represent a statement of the views of this committee on United States policy on world trade. They are reprinted in the following pages.

Subsequently, on January 23, 1954, the Randall Commission made its report to the President and the Congress. After a thorough review by the several departments of the Government, the President presented his program on foreign economic policy to the Congress on March 30, 1954. With minor exceptions, the 83d Congress did not act on the President's program because of a crowded legislative calendar and for other reasons.

The existence of the Committee for a National Trade Policy dates from September 1953 and coincided with its first expression of views to the Randall Commission. When the Randall Commission issued its report, we endorsed its recommendations on tariffs and trade. Upon the presentation to the Congress of the President's message of March 30, 1954, the committee endorsed his program, which was based on the findings of the Randall Commission, and worked actively thereafter for its wide dissemination and understanding among the business community. The committee has also actively concerned itself with a wide variety of issues of both a legislative as well as administrative nature in the area of trade policy which have arisen over the past 12 months.

In the process of dealing with foreign-trade policy issues over the past year, the committee has concerned itself with matters that were not included in its original statement of policy of a year ago. Brief statements on supplementary subjects with which the committee has dealt and which can be expected to be of importance in 1955 are to be found immediately after the text of the committee's proposals.

Our fundamental policy position remains the same: We repeat our warm approval and support for the President's enlightened program; 1955 is the crucial year (the 84th Congress will, we hope, take affirmative action on this program). Eventually, as circumstances require, the committee may wish to advocate certain of its own proposals going beyond that program. We will continue in the months ahead to deal with issues of American trade policy as they arise and to make recommendations and proposals on specific problems when the occasion warrants it.

JOHN S. COLEMAN, *Chairman.*

STATEMENT BEFORE THE COMMISSION ON FOREIGN ECONOMIC POLICY, OCTOBER 1953

My name is John S. Coleman. I appear here today in my capacity as chairman of the board of directors of the Committee for a National Trade Policy.

Our committee is drawn from all sections of the United States. Most of our members are heads of industrial enterprises, although we have representatives from other sectors of the economy. I will file with the Commission a full list of the directors, officers, and members of the committee.

The Committee for a National Trade Policy was created to promote public understanding of the issues which our country faces today in its trade relations with the rest of the world. The committee was founded in the belief that American leadership in the expansion of international trade and the reduction of trade barriers is essential to the prosperity and security of the United States.

This Commission will no doubt hear witnesses with arguments as why our national interest requires us to reduce our trade barriers. Other witnesses may advance arguments as to why our trade barriers must be maintained to protect particular interests. We can contribute little to the decision of your Commission by rehearsing all of these arguments again.

Our own views are, however, quite clear. We believe that as a matter of principle when the national interest conflicts with local or special interests, the national interest must prevail.

Our country today is the leader of the free world. The value of our total production is nearly equal to that of all of our allies. Because of this fact, every decision with respect to our economic policy will have an important consequence for our friends abroad.

DOLLAR SHORTAGE

In the period since the war we have fully recognized this fact. Our allies in the free world are not able to earn all the dollars they need to maintain the stability of their economies and to build their defenses to the level that our combined security requires. We have met the problem of a dollar shortage by an elaborate and costly system of foreign aid.

But while we have been supplying dollars through foreign aid we have been restricting the dollar earnings of our allies by a variety of trade barriers. This, I submit, not only violates the economic logic which has been an essential element in Ameica's growth, but is contrary to the basic American principle that work is better than charity—both for the giver and for the recipient.

I don't want to misstate or overstate our position. Let me make it quite clear.

We do not think a reduction of United States trade barriers is the cure for all the world's ills.

More specifically we do not favor free trade beginning tomorrow morning or even next year.

We do not even believe that a reduction of our trade barriers and an expansion of our imports would be a complete substitute for foreign assistance during the present period when we are building up the military strength of our allies.

And we do not consider that injury which may be done to investors, labor, and farmers by a reduction of trade barriers should be ignored.

We make these points for the purpose of clarity, not to minimize the value of a liberal trade policy. Certainly when American taxpayers are faced with a tax burden which weakens economic incentives, measures which will enable us to meet our responsibilities of leadership while permitting us to reduce taxes, have a virtue which is apparent to all. A reduction of trade barriers can go a long way toward elminating the dollar gap, which is one of the greatest impediments to our common strength and prosperity.

Some people are now saying that the problem of the dollar gap has disappeared. They point to the fact that our nonmilitary exports are hardly greater than our imports. Such a contention ignores several important considerations.

1. One should not exclude military exports from the computation merely because we are financing them by foreign aid, out of the pockets of the American taxpayers. If our allies could earn more dollars, they would be able to pay for a larger share of these military goods.

2. The dollar gap cannot be accurately reflected by statistics of actual imports and exports. At the present time, foreign purchases of American goods are in most places subject to tight governmental restriction. If foreign producers could earn more dollars, foreign governments would not have to suppress the demand for our goods.

3. Temporary factors tend to distort the present position. The dollar problem of our allies is easier today because the United States Government is spending vast amounts of money to build airbases and to support its Armed Forces in many parts of the world.

4. It is a mistake to regard present levels of trade as stationary or permanent. What we seek is a high level of trade. The present reduction in the dollar gap has occurred partly through a reduction of our exports. To accept this way of closing it as a permanent policy would involve an immense cost to our economy. We need only look at the effects of the recent cuts in the export of agricultural commodities to see how serious that policy would be.

I think, therefore, that we are deceiving ourselves and that we would be deceiving the American people who pay the taxes if we were to conclude that the dollar shortage was ended and that such a persistent problem has been completely solved.

Our committee is for reducing the burden of the American taxpayer without jeopardizing our security. This burden can and must be reduced by permitting foreign producers to trade in our markets.

Since the war, the free world has gained a measure of economic health but it is still convalescing. It will never attain the economic strength which our security requires so long as it is strangled in a web of trade restrictions. American policy must, we believe, seek to restore greater freedom in the movement of goods, to bring about general convertibility of currencies, to eliminate the need for Government licenses and quotas and the other paraphernalia of trade restriction. Until those objectives are accomplished the Western alliance will be strained by what is in fact economic warfare between its several parts. Because the dollar shortage has been temporarily relieved, we are not content to say that we have reached our goal. This is at best a halfway house. I think that we would mislead the American people if we told them otherwise.

AMERICAN GENIUS FOR CHANGE

The American genius has been a persistent discontent with the status quo. We lead the world today because we have constantly raised our standard of living, have constantly sought new economic opportunities, have broken the barriers of limited objectives. In 1783 the farmer who brought cordwood from Connecticut into New York was stopped at the New York border and made to pay a tariff duty. One of the most important provisions of our Constitution prohibited the States from interfering in the free flow of goods by such measures. Under our Constitution, we have built a market within our vast domestic territories; through the development of that market we have erected a prosperity unequaled in human achievement. For Americans to be satisfied with the present level of trade, either within our own market or in the rest of the world, is to do violence to our national instincts.

As a businessman nurtured in the American business tradition, I resent attempts to limit the horizons of American enterprise. We face each day the challenges of competition from our domestic rivals, and I would fear for the day when American business is unwilling to accept the challenges of competition from abroad.

The advocates of protection say that it is all very well for certain sectors of American industry to take a bold position about foreign competition. The industries which take this position, it is said, are not in danger from foregn producers. The protectonists say also that it is one thing to meet competition from American producers and quite a different thing to face competition from abroad where the standard of living and the wage scale differ from our own.

These arguments, I think, magnify the problem out of all proportion. In the United States we have found that in most cases we can meet competition by increasing the productivity of labor and the efficiency of management. We have pretty well destroyed the old myth that the company which pays low wages is necessarily the company which succeeds. In many industries, in fact, the company that pays the highest wages is the lowest-cost producer.

I think that most American industries have the resourcefulness and the imagination to meet the challenge of foreign competition if they are required to do so. But in those cases where American industry cannot produce a better product at a competitive price, then I think we harm only ourselves if we deprive the American people of the right to choose the foreign product.

If the market for his product is threatened, an American businessman can generally adapt himself to the situation in one of a number of ways. He can get his costs down and meet the competition; he can expand his other products; he can develop new ones. The whole history of American enterprise is a history of ingenuity and flexibility in adjusting to new circumstances and meeting new situations. The kind of adjustment a business has to make when barriers are reduced is no different from the kind it has to make when the competitor introduces a technological improvement that lowers costs or when he brings out an improved model or a new product.

I was brought up in a West Virginia town in which one of the principal activities was the manufacture of buggy whips. Now that community employs 4 or 5 times as many people. Today they don't make buggy whips, but deep freezers, and they are prospering.

At one time workers smashed up new machines that they feared would put them out of work and employers conspired to suppress new inventions.

But today labor and management take improvements in their stride. Indeed, the development of new ideas is the vital force of the American economy.

I do not believe that American business is a hothouse plant which cannot be exposed to the rigors of an international climate. In my opinion, one of the faults of the trade-agreements program as it was conducted in the past was that it always stopped short of allowing American industry to meet serious foreign competition. American business is a lot tougher than many people seem to think and it doesn't need that kind of featherbedding.

READJUSTMENT ASSISTANCE

Having said all this, however, I do not want to suggest that while tariffs are being reduced there may not be some dislocations in certain limited sectors of industry. And I think that when such dislocations come about as a result of an overriding national policy the Government should take appropriate steps to cushion the transition. To say that such changes may produce dislocations does not mean, however, that the changes should never be made. That would attribute a rigidity to our system which it does not have. The point I am making is that while we must not try to prevent these changes, we must find some form of governmental action to mitigate their effects.

I shall not attempt at this point to spell out a detailed system for dealing with the problems of injury and dislocation. This is a question which I am confident your Commission will consider. It may be that the Committee for a National Trade Policy will wish to submit more detailed views at a later time.

Let me say, however, that our committee is more confident than many people seem to be about the administrative possibilities of dealing with the problem of dislocation resulting from tariff reductions. The administrative techniques that we have developed in this country in the past few decades have enabled our Government to tackle the most difficult economic problems. We have had experience in the determination of damage resulting from complex economic factors, in the retraining and movement of labor, and in the relief of temporary community distress. But whatever program we may devise for meeting the problem of dislocation, there is one point that should be emphasized. Any system of compensation should be of limited duration and it should be undertaken only in relation to a specific plan of readjustment. To those who may oppose any compensation on the ground that it is a subsidy, we say this: It is better to subsidize the readjustment of an enterprise during a limited period of transition and be done with the problem once and for all than to use a tariff to subsidize that enterprise forever because it cannot meet competition.

The Committee for a National Trade Policy wishes finally to make one earnest plea to this Commission. What the present time requires is not the reshuffling of all the shopworn arguments about trade policy, with an attempt to fit them together in some variant pattern. What is needed is a forthright acknowledgment that a policy which may have been appropriate for the United States in 1900 is not necessarily appropriate in 1953. Conditions have changed, the perils that beset us have changed, the world position of our country has changed.

This Commission, as I understand it, was created to take a fresh look at our trade policy—to consider that policy in relation to the realities of today. I know of no greater responsibility than that which this Commission bears. The world awaits your report with eagerness and hope.

I trust, therefore, that the findings and recommendations of this Commission will strike a note of confidence in the American businessman, the American farmer, the American worker. I trust that this Commission's report will be an expression of faith. Ours is a great country because it is an adventurous country. That, I hope, will be your guiding principle and you have our earnest wishes for the success of your endeavors.

PROPOSALS FOR UNITED STATES POLICY ON WORLD TRADE, DECEMBER 1953

1. In order to increase predictability in matters of trade, the President should be authorized to extend existing trade agreements and to negotiate new ones having an assured duration of at least 5 years.

2. The statutory provisions and administrative regulations governing the valuation of imported goods should be revised to allow simpler and more easily computed assessments of duties by customs authorities.

3. The present complicated system of classifying imported goods to determine the applicable duty should be substantially revised and simplified.

4. Discrimination against foreign goods by Government procurement agencies should be reduced by administrative action under existing authority and Congress should consider eliminating preferences by the repeal of Buy American legislation.

5. The reduction of trade restrictions should be based on an assessment of the total national interest, and reductions should not be precluded merely by reason of the single test of cause or threatened serious injury to particular private interests, as existing legislation requires.

6. Where special measures are required in the interest of defense or national security, efforts should be made, wherever possible, to use means other than trade restrictions to protect these interests.

7. In negotiating trade agreements, the President should be authorized to accept as reciprocal concessions from other countries not only the reductions of foreign tariff duties but other economic measures that will promote higher levels of economic activity, international trade, and international investment.

8. Additional authority should be provided for the progressive reduction of trade restrictions, where such reductions are found to be in the national interest. This additional authority would permit further reductions with respect to particular items where such action is found to be to the net national advantage, but would not require a reduction across the board.

9. Assistance should be provided to enterprises, communities, and employees affected by reductions in import restrictions where it is needed to help them adjust to dislocations. Such assistance should be provided so far as possible through or in cooperation with local and State agencies.

The Committee for a National Trade Policy recognizes that separate recommendations concerning trade restrictions applicable to agricultural products need to be developed, and that such recommendations will inevitably involve questions relating to domestic agricultural policy. The committee is continuing to study suggestions for dealing specifically with these problems.

DISCUSSION OF THE PROPOSALS

1. In order to increase predictability in matters of trade, the President should be authorized to extend existing trade agreements and to negotiate new ones having an assured duration of at least 5 years

By the provisions of existing trade agreements, the United States reserves the right to withdraw the tariff concessions after 6 months' notice in some cases and 60 days in most. Furthermore, most past tariff reductions are now subject to the escape-clause provisions of the Reciprocal Trade Agreements Act which require the withdrawal of concessions if imports increase sufficiently to threaten substantial competition. As a result of these provisions, the continuance of reductions in United States trade barriers is unpredictable.

The committee cannot emphasize too strongly the importance of predictability in trade policy. To permit orderly adjustments of production, the domestic producer should know the amount of protection he can expect. Similarly, the foreign producer should be in a position to know the trade barriers he will face in undertaking to enter, or expand, his operations in the American market.

Under present agreements, American producers have sometimes avoided facing the problems of readjustment following tariff reductions; they have tended to rely instead on the possibility of nullifying those reductions through the escape clause, or when the Reciprocal Trade Agreements Act is again before Congress for extension. At the same time, foreign producers have been unable to predict with any certainty the character of the trade restrictions that will be in effect beyond a year or two in the future.

The foreign producer is willing and, in fact, is able to undertake the investment in time and money required to enter the American market only when he has some assurance as to the extent of the barriers which imports will encounter over a period of time. At present, he must approach the market in jeopardy that once he establishes a good position, increasing pressure from American competitors will soon bring about action to raise trade restrictions against him.

2. The statutory provisions and administrative regulations governing the valuation of imported goods should be revised to allow simpler and more easily computed assessments of duties by customs authorities

The so-called first Jenkins bill, which was enacted last spring, has carried into effect many of the reforms of administrative customs procedures which those concerned with foreign trade have urged for years. But it did not deal with the great uncertainties which now exist in valuing imports for the purpose of assessing customs duties. Today, foreign producers and American importers are faced with a valuation procedure which rests on a complicated and ambiguous formula. As a result, thousands of appeals are brought before the customs court, and are not decided for years. The valuation provisions were removed before the bill passed the Congress. They were then reintroduced in the form of the so-called second Jenkins bill, which will be before the Congress in 1954.

3. The present complicated system of classifying imported goods to determine the applicable duty should be substantially revised and simplified

The American tariff schedule is exceedingly complex, with more than 3,000 separately described products or classes of products, many of which are quite similar. Since widely differing rates may be applied to an imported article depending upon the particular class in which it is placed, a tremendous amount of uncertainty with respect to rates—and therefore with respect to the prices at which imported goods can be offered for sale—is bound to survive until the number of classifications is very much reduced and until there is much greater standardization of the rates of duty.

At present, for example, the collector in 1 port of entry may place a particular article under 1 tariff classification or subclassification and assess the applicable rates, while the collector in another port will place the same kind of article in another classification bearing another rate. This causes confusion and interferes with the most economic routing of traffic.

The President could employ the power to negotiate reductions in trade restrictions in a manner that would tend to equalize tariff rates within classifications and thus to eliminate some of the multiplicity of classifications and subclassifications which now complicate tariff administration.

Present procedures also result in some cases in the application of high and seemingly irrelevant rates. For example, under paragraph 1529 of the Tariff Act of 1930, articles consisting in part of lace, braids, fringe, etc., are subject to the 90-percent duty that applies to lace and braid. Tuxedo trousers with a braid stripe and bridge-table covers with braided loops at the corners have been subjected under this provision to a 90-percent rate. Such results could be avoided without subjecting the entire classification structure to review.

The broader problem of the general uncertainty created by the multiplicity and diversity of classifications is one which will require major action by Congress. The simplification of the system should be accomplished by providing the President with authority under principles specified in the legislation. The Congress should not undertake to consider classifications product by product.

4. Discrimination against foreign goods by Government procurement agencies should be reduced by administrative action under existing authority and Congress should consider eliminating preferences by the repeal of buy American legislation

Many Federal laws require Government procurement agencies to give preference in their purchasing to goods produced in the United States. They also impose similar requirements in purchasing by non-Federal agencies which receive funds from the Federal Government. Such discrimination applies also to purchases of materials used by private suppliers in producing goods for the Federal Government. There are also a number of State and municipal measures requiring discrimination against imported goods.

The basic Federal legislation ,the Buy American Act, was passed in March 1933 at the depth of the depression, as an artificial stimulus to employment. Under this act, as amended, goods produced or mined outside of the United States, and even goods manufactured in the United States from materials produced or mined outside of the United States, may be acquired for public use only under specified conditions. Two of these conditions are that the cost of the domestically produced commodity is unreasonable and that the head of the agency concerned determines in a particular case that exercise of the discrimination is inconsistent with the public interest.

Goods produced in the United States from domestic materials are generally regarded as unreasonable in cost only if their price is more than 25 percent higher than the landed duty-paid price of other goods. This criterion of unreasonableness was determined by administrative decision. It can and should be relaxed by administrative decision, as the first step in the gradual elimination of the extra discrimination involved in Federal procurement legislation.

At the same time, heads of Federal agencies procuring goods, in applying the criterion of consistency with the public interest, should be instructed to use a comprehensive definition of the net national interest.

Finally, consideration should be given to the repeal of all provisions of Federal legislation which require Federal procurement agencies, or non-Federal agencies receiving United States funds, to discriminate automatically against foreign goods in their purchasing activities.

5. The reduction of trade restrictions should be based on an assessment of the total national interest, and reductions should not be precluded merely because of the single test of "caused or threatened serious injury" to particular private interests, as existing legislation requires

The test of national interest which the committee proposes would require that before a trade restriction was reduced there be a determination that such reduction would contribute to the net interest of the Nation. In making a determination with respect to national interest, possible injury to the domestic economy as well as all other effects of the reduction would be taken into account. The difference between such a test and the present one would be that injury to a particular interest would not be the controlling factor in making a reduction or in reversing the previous reduction of a restriction.

The committee believes that "caused or threatened serious injury" is an inadequate criterion for determining reductions in trade barriers. As it has been applied, the doctrine has tended to prevent or vitiate trade-barrier reductions which would result in an adequate increase of imports. If the trade-agreements program continues to be administered so as to preclude action which may result in substantially increased imports, it can contribute little to further the expansion of international trade.

Moreover, the committee believes that the concept of threatened serious injury is bound to result in a trade program based on an exaggerated fear of dislocations and on an underestimate of the ability of American producers to deal with such dislocations as might occur.

Little or no dislocation may occur in cases where total demand for the product is growing rapidly or in cases where the product is one for which the market expands substantially when added competition brings about a reduction of price.

In some cases, however, a reduction of trade barriers would probably result in a loss of sales and profits for the American producer. In the opinion of the committee these dislocations would be small in relation to the overall national advantage, even if the liberalization of our trade policy is vigorously pursued. These dislocations would, moreover, be temporary, whereas the national advantage can be permanent.

6. Where special measures are required in the interest of defense or national security, efforts should be made, wherever possible, to use means other than trade restrictions to protect these interests

Domestic industries faced with the possibility of foreign competition as a result of a reduction in trade restrictions have contended with extraordinary regularity that such reductions threaten the national security. Each industry has tended to regard itself as vital to our defense even where its claimed connection with defense was extremely tenuous.

The committee recognizes that certain industries are truly vital to United States defense. It believes, however, that as a general principle the maintenance of trade restrictions is uneconomic and is an undesirable way of protecting our security interests in most of those industries.

The committee recommends that before entering into any trade agreement the President obtain the advice of the National Security Council with respect to the importance to our security of the industries which will be affected by such agreement. To the extent that the maintenance of facilities for the production of defense articles is involved, alternative means of assuring the availability of that production should be explored. It is probable that in the case of most articles in which there is a real security interest, the essential production capacity could be maintained by standby orders and exploration contracts. The committee believes that this technique for maintaining essential production facilities is generally preferable to the maintenance of trade restrictions to protect industries which are otherwise unable to compete with foreign producers.

7. In negotiating trade agreements, the President should be authorized to accept as reciprocal concessions from other countries not only the reduction of foreign tariff duties but other economic measures that will promote higher levels of economic activity, international trade, and international investment

Under existing trade-agreements legislation, representatives of the United States Government have sought in the negotiation of trade agreements to obtain only the reduction of traditional trade barriers imposed by foreign governments on imports of American products. The committee believes that the United States Government should utilize more fully the bargaining power which it may obtain from its authority to reduce barriers. The President should be authorized to request and accept in exchange for the reduction of trade restrictions not only the reduction of foreign tariffs but other economic measures. In other words, he should be permitted to employ the trade-agreement mechanism as a broad instrument of natonal policy.

The precise concessions which the President could accept might include appropriate measures to bring about a favorable climate for United States investments in the foreign country with whom negotiations are conducted. They might include measures in the direction of convertibility of foreign currency or measures in furtherance of European economic integration.

By expanding the President's power to make reductions in United States trade restrictions and by expanding the scope of reciprocal concessions which the President might accept in exchange, the committee hopes that trade-agreements negotiations could be a powerful instrument in bringing about the improvement of the economic climate for international trade. The committee recommends, however, that the most favored nation principle be retained.

8. Additional authority should be provided for the progressive reduction of trade restrictions, where such reductions are found to be in the national interest. This additional authority would permit further reductions with respect to particular items where such action is found to be to the net national advantage, but would not require a reduction across the board

The committee believes that the President should be given additional authority to reduce trade barriers, and that, in exercising his authority, he should be required to examine the products that would be affected before determining that a particular reduction of restrictions would contribute to the net interest of the United States.

Other than the test of national interests in any particular case, this new authority should be subject to only two principal kinds of limitation—a limit on the aggregate amount by which the trade barriers on any product may be reduced, and a limit on the amount of such reduction which may take effect during any one year. The principle of progressive reduction should apply whether the barrier is in the form of a tariff or other trade restriction. It would be premature to recommend at this time precisely what these limits should be. Acceptance of the principle is the first essential.

The committee recommends against putting any time limit on the period during which the President can exercise such new authority. The authority should continue until the Congress takes the initiative to repeal or modify it.

The committee believes that if the reduction in any one year is limited and the total authorized reductions can take place only progressively over a period of years, both domestic and foreign producers would be in a position to make long-range plans, and would benefit from a program which would avoid the necessity of immediately facing the full effect of the total authorized reductions.

In the last few years the practice of bringing the trade-agreements legislation before the Congress for renewal every year or two has not only made the trade policy of the United States unpredictable for American as well as foreign producers, but it has also prevented the orderly reduction of trade restrictions required for the development of a systematic, long-term policy.

Reductions must be phased with a view to minimizing dislocations in particular industries or particular geographical regions. They must also be timed to assure that they provide the President with the maximum of bargaining power in obtaining reciprocal advantages. If, as the leading political and economic power in the world, we are to exercise our power wisely, the President must be able to time his tactical and strategic moves in relation to developments in other areas of policy. For reasons quite unrelated to trade considerations, he may find it advisable to undertake trade-agreement negotiations with country A this year but postpone negotiations with country B until the following year. If the President knows that his power to negotiate will expire at the end of the first or even the second year, he will be unable to exercise a free judgment with respect to timing.

9. *Assistance should be provided to enterprises, communities, and employees affected by reductions in import restrictions where it is needed to help them adjust to dislocations. Such assistance should be provided so far as possible through or in cooperation with local and State agencies*

In contrast to proposals for a straight indemnification against injury, the committee's proposal places emphasis on forms of assistance that will promote a more economic and efficient use of resources and that will permit the avoidance of injury where possible.

The committee believes that the real economic cost to the country involved in any dislocations caused by gradual reduction of trade restrictions will be less than the costs of continuing protection at present levels. It also believes that the costs of any assistance required in adjusting to such dislocations will be more than compensated for by saving in Government expenditures and increased revenues that will result from the favorable effects of a higher level of United States foreign trade.

Trade restrictions are a form of concealed subsidy. Furthermore, they tend to be a permanent subsidy, and in many, if not most cases, trade restrictions serve to protect production that cannot compete because it is inefficient or uneconomic. The committee, therefore, prefers a program of assistance which is temporary in character and limited in cost. Such a program has the advantage of shifting resources to more economic uses and, at the same time, permitting an expansion of international trade.

(a) *Extent of dislocation.*—The extent of the dislocation which would accompany even the total elimination of tariffs has often been exaggerated. It would depend not only upon the timing and amount of the reductions, but also upon the level and direction of economic activity during the period of reduction. While no exact estimate can be made, it is possible to make an outside estimate of the order of magnitude of the gross job displacement. According to the most careful available estimate, the increase in imports that would result from a complete abolition of tariffs and quotas—a course not advocated by the Committee—might be as little as $1.2 billion or as much as 2.6 billion. These figures rest on the assumption that the absence of barriers is assured for only 5 years. If we suppose thatthe domestic sales of products which compete with imports decline by an amount equal to this estimated increase of imports, we will be able to measure the maximum direct adverse effects on employment of trade barrier reductions.

In the year 1952, the gross value added per man in the private employment for the national economy as a whole averaged $5,593.[1] If this average figure of $5,593 is applied to the domestic products affected by increased foreign competition, the $1.2 to $2.6 billion of estimated sales of imported goods are equivalent to the production of between 215,000 and 465,000 workers. This is only between one-third and two-thirds of 1 percent of our total 1952 labor force and it would be spread over the period during which imports rose.

We believe this range of figures not only indicates the maximum direct adverse effects on employment of a total elimination of tariffs and quotas for a temorary period, but can be regarded as a generously estimated maximum for the direct adverse effects of a more permanent but only partial reduction of all import barriers, as proposed by the Committee.

Moreover, the Committee's proposal envisages gradual reductions, not a cut in restrictions across the board or in one step. If trade restrictions were reduced progressively over a 5-year period, the range of the estimate of maximum direct adverse effects on employment amounts, on an annual basis, to between 43,000 and 93,000 workers.

It is necessary to remember that this set of maximum estimates leaves out of account the offsetting favorable effects of a liberalization of trades restrictions and therefore greatly exaggerates the net effects upon employment. These estimates do not take into account any expansion of the total market for the affected product, although increased imports would tend, in the case of many products, to bring lower prices and a larger market. Furthermore, they do not take into account any expansion of employment opportunities that would result from an increase in United States exports as a consequence of increased earnings of dollars by other countries, or from a decrease of taxes consequent upon a reduction of foreign aid programs. These and other indirect consequences of a reduction in United States import restrictions would necessarily limit the net adverse effects on job opportunities to a number much smaller than those indicated as a maximum.

(*b*) *Vitality of the United States economy.*—Those who strongly emphasize the adverse effect on employment which would result from liberalization of our trade policy greatly underestimate the vitality of our economy. The American economy successfully meets every year a much larger problem than is involved in finding jobs for workers who would be adversely affected by increased imports. American business and labor are accustomed to meet dislocations every day because we have a dynamic economy. The American market is constantly shifting in response to changes in consumers taste, the movements of population, the development or employment of new materials, and the exhaustion of raw material sources. American industry time and time again has demonstrated its resourcefulness and ability to adapt to such changes. Each year our production must expand enough to provide employment for the equivalent of at least 1.9 million workers. Of this number, at least 1.2 are workers made available by the annual increase in our productivity while 700,000 are net additions to the labor force. Even the maximum range of annual gross job displacement over 5 years would represent only a 2 to 5 percent addition to the expansion normally required. As we have already indicated, the net adverse effect would be far smaller.

(*c*) *Experience in adjusting to local economic dislocation.*—If an enterprise or industry affected by increased imports is located in a large urban area where there are alternative job opportunities the problem of adjustment should be relatively simple. In such a case, the adjustment of production for even a moderately large enterprise, while difficult for the management and owners, should create no serious problems for the employees or the community. Where, however, the enterprise is the dominant factor in the economy of a small community, a substantial readjustment of production may create a problem for the employees and community as well as for the management and owners.

[1] According to figures in the Survey of Current Business for July 1953, private employment in 1952 was 56.7 million and gross value added in private employment was $317.1 billion, which averages out to $5,593 per man in private employment.

We have had valuable experience in this country in dealing with the problems of dislocation resulting from shifts of population and production. Forty-one of our States have established economic devolopment commissions or similar bodies which are equipped to assist in easing the adverse effect of economic dislocation. The activities of the Michigan Economic Development Commission in the case of Iron Mountain provide a good example of this type of action.

Iron Mountain is a community of 10,000 located in the upper peninsula of Michigan. It was originally established in the latter part of the 19th century as a mining town in connection with the exploitation of iron ore deposits. In the first 40 years of the community's existence the principal economic activities were mining and logging. As the ore deposits were depleted and the mines were gradually shut down, the community found itself almost wholly dependent upon a Ford Motor Co. plant, which employed at one time as many as 7,500 workers to manufacture wooden automobile bodies. Beginning in the latter '40's, however, there was a change in the preferences of the public. Metal came more and more to supplant wood in station wagon construction. Employment began to decline, and in 1951 the plant was closed. The 1,200 men employed at that time were thrown out of work, leaving the community in a critical economic position.

In the past 2 years the combined efforts of the State development commission and local business men have brought the community three new industries. Within the next year, local payrolls of these three industries are expected substantially to exceed the single major payroll on which the community was long dependent. The community will, in fact, be stronger because it will have a more diversified economy. This adjustment was made without help from the Federal Government.

The case of Iron Mountain has been described to indicate the extent to which problems of dislocation can be handled by State and local authorities without the need for intervention by the Federal Government or for Federal financial assistance. The Committee recognizes, however, that in some cases Federal intervention and assistance may be necessary. When necessary it should be provided, and a Federal agency should be designated to administer the program, through or in cooperation with public and private State or local agencies.

(*d*) *Suggested program for adjustment assistance.*—(1) Assistance to enterprises: There is much to be gained by being generous in providing assistance which would increase economic mobility and bring about a more economic use of resources, whether of managerial ability, materials or manpower. The initiative for proposing specific plans of adjustment, however, should be left to enterprises which consider that they will be adversely affected by specific reductions of trade restrictions.

Any enterprise should be permitted to submit an adjustment plan and be eligible for assistance if it receives a substantial portion—perhaps 20 percent—of its gross reecipts from products that compete directly with goods on which import restrictions are to be reduced. The enterprise should be permitted to propose a plan as soon as the reduction of applicable trade restrictions has been announced; it should not be required to wait until it has incurred actual injury. On the other hand, it should not be eligible for assistance unless its own plan is submitted within 2 years after the effective date of the reduction in the applicable trade restriction and unless the plan can be carried out within 3 years from the time of approval.

A plan might provide for the modernization of plant and production facilities in order to reduce costs, for the movement of production to more favorable producing areas, for the development and production of new or modified products, or for a combination of these and other solutions.

When assistance, whether financial or other, is not available from other sources, it should be made available to permit the enterprise to carry out a feasible plan of adjustment. This assistance might take several forms. The Federal Government might make loans to enterprises, directly or through local agencies, for a part of the cost, at low rates of interest and for a sufficiently long term to permit easy amortization. Accelerated depreciation might be provided under the Federal tax laws similar to that provided for the construction of defense facilities. Procedures now exist for channeling defense orders into areas where unemployment is present, and might be adapted to plants undergoing adjustment.

To be eligible for assistance, an enterprise should submit a concrete plan which is found to be feasible by the designated Federal agency, and such plan should have the approval of the state development commission, or comparable agency, of the State in which the enterprise is located or the State to which it proposes to move.

In addition to assistance which may be provided pursuant to a plan of adjustment, the Committee recommends that, by amendment of the tax laws, more generous "carryback" provisions be made applicable to enterprises affected by a reduction of trade restrictions. It is proposed that an enterprise which produces items competing with those on which a trade restriction is reduced be permitted for a period of 5 years after the effective date of such restriction. to "carry back" operating or liquidating losses for a period of 5 years prior to the year in which the loss was suffered, provided that the enterprise demonstrates that the losses are a result of increased imports of competing products.

(2) Assistance to employees: As a condition of approval, a plan of adjustment for an enterprise should contain reasonable provisions for protecting the interests of its employees. To the extent possible, the applicant enterprise should undertake as a part of the plan to provide for retraining of workers to adapt them to any new types of production that may be contemplated. Where the plan proposes a diminution in the number of employees, the enterprise should give workers an adequate period of notice so as to permit them to find new employment.

The Federal Government should assist those employees for whom continued employment is not provided under a plan of adjustment. This assistance could take a variety of forms. The Federal Government could finance retraining, preferably through State or local agencies. It might extend the applicable period of unemployment insurance benefits for such workers up to perhaps 90 days beyond the normal period. In the case of older workers, the date of eligibility for old-age and survivors insurance could be accelerated. Where affected employees cannot find jobs locally, the Federal Government could lend them money, at low rates of interest, to facilitate movement to other localities. If employees of an enterprise are not adequately provided for under a plan of adjustment, they should be eligible for assistance if they have been engaged for a reasonable period—perhaps 1 year—in employment which has been adversely affected by the reduction of import restrictions.

(3) Assistance to communities: Where an affected enterprise or industry is the principal economic support of a community, assistance should be provided for the protection of that community, where local and State facilities are inadequate. To the extent that the needed assistance is financial in character, it should be provided through State and local agencies on the basis of matching funds. The Federal Government might also facilitate the work of State economic development commissions by establishing a central clearinghouse to provide information regarding the industrial advantages offered by various distressed communities, and to provide State and local agencies with information as to the success of various techniques for achieving diversification.

Mention should also be made of the development credit corporations which have been created in the New England States. The banks and insurance companies in those areas have furnished capital, more or less in proportion to their own capital and surplus, to these credit corporations, which in turn can then make loans available for warranted development risks beyond the amounts the individual participants could advance. The existence of institutions of this sort makes it possible to visualize utilizing them as instruments to increase diversification of employment opportunities even before trade restrictions have been reduced.

Careful study needs to be given to the adequacy of credit resources available for the development of new industries, to directing publicly financed projects toward these communities when other conditions are suitable, and to such interim measures as the channeling of defense orders and Federal procurement.

(4) Financing the assistance program: It is impossible to estimate with precision the long run financial cost or the immediate cash outlays that would be required to carry out the program of assistance herein proposed. The long run cost would be less than the cash outlays, of course, because a large part of the assistance would take the form of repayable loans. Both would depend in part on the extent and phasing of trade liberalization actions and the general state of business activity.

The committee does not exclude the possible need for appropriations to finance assistance, but it believes that such a program could be financed partially, and perhaps entirely, from additional Government revenues directly related to the reduction of trade restrictions. These will also be savings in Government expenditures as a result of the relaxation or repeal of "Buy American" preferences, from reductions in foreign aid made possible by increased imports, and from reductions in farm price-support operations made possible by increased exports of agricultural products.

Customs revenues can be expected to increase for a number of reasons. Where nontariff restrictions, such as quotas and "Buy American" preferences, are reduced and tariff rates remain unchanged, customs revenues must rise. Customs revenues will rise also in cases where tariff duties are reduced, but the market for the imported product increases to a greater degree. Other factors will also enhance the possibility of greater revenues; for example, the growth of dutiable imports that tends to accompany the normal growth of the economy.

Where the reduction of a trade restriction does not increase imports sufficiently to produce additional revenue, it is unlikely that much adjustment assistance would be necessary.

CONCLUSION

The Committee for a National Trade Policy believes that the concrete program it has outlined would contribute materially to the objective of expanding international trade and demonstrating the responsibility of the United States as the leader of the free world coalition. The only appropriate test of a new trade policy is the test of our total national interest.

SUPPLEMENTARY STATEMENTS OF POLICY, DECEMBER 1954

1. General agreement on tariffs and trade

GATT has been the instrument through which the United States has sought to put into effect the reciprocal trade agreements program in the postwar period. There are many advantages that can accrue to the United States from continued participation in a stronger and more effective GATT.

(*a*) The multilateral negotiation of the reciprocal tarff concessions in GATT makes certain that for every concession we grant on a particular commodity to a given country, we get reciprocal concessions from all our other trading partners as well. This expands the markets for American exports.

(*b*) Universal agreement on the part of the member countries to the principles of GATT gives continuity and stability to the commercial policies of individual countries and promotes the increased flow of mutually beneficially international trade.

(*c*) By providing the machinery for consultation and review of tariff problems, the chance is reduced that a country will take unexpected and hasty action in raising a trade barrier.

The general agreement has two aspects: the tariff schedules and the articles of agreement which embody the general principles of international trade to which the contracting parties are committed. Since the GATT is still a provisional instrument, an organizational protocol will be renegotiated at the ninth session of GATT which will provide for a permanent organizational structure. This protocol should be approved by the Congress to eliminate any doubts that now surround United States participation in GATT. In the main, subscription by the United States to the articles of agreement of GATT requires no such ratification but where a conflict with domestic legislation exists, the pertinent article of GATT should be renegotiated. It is important that Japan's accession to GATT be completed through the medium of a multilateral trade agreement to which Japan is a party.

2. East-West trade

While it may not be desirable to restrict trade in nonstrategic goods between the East and West, we must recognize that it is part of Soviet strategy to encourage increased dependence on the part of the free world on Soviet markets and sources of supply. The need for increased economic cohesiveness among the nations of the free world presents a fundamental challenge to American trade policy. The only good way to assure such unity is by increasing the flow of mutually beneficial trade between the countries of the free world.

3. Agricultural import restrictions

American agriculture enjoys an overwhelming net stake in exports. Our domestic price support schemes for certain agricultural staples require the restriction of imports, not to protect the American farmer against competition but rather to protect the United States Treasury and the taxpayer. The imposition of excessive import quotas, however, may invite retaliation from those countries that are the principal markets for American farm exports. Import quotas on agricultural products should be imposed only to the extent that they are needed to restrict the inflow of excessive imports, that is, imports that are being attracted to domestic markets because of the operation of domestic price-support schemes for agriculural commodities. Quotas should be reviewed periodically and modified when necessary or desirable in the light of changed conditions.

4. Antidumping Act.

The administration of the Antidumping Act should serve to protect American producers against serious injury from dumping practices and should not act as a deterrent against legitimate imports. The act should be revised to provide for a simpler method of determining the fair value of an import and consideration should be given to defining a statutory deadline for the time consumed in such determination. Consideration should also be given to revising the statute to permit the continuance of imports pending an investigation of suspected dumping. The criteria for serious injury should be clarified and findings of such injury by the Tariff Commission should be subject to Presidential review.

COMMITTEE FOR A NATIONAL TRADE POLICY

BOARD OF DIRECTORS

John S. Coleman, chairman; president, Burroughs Corp., Detroit, Mich.
William L. Batt, secretary, Philadelphia, Pa.
George L. Bell, management consultant, Washington, D. C.
Harry A. Bullis, vice chairman; chairman, General Mills, Inc., Minneapolis, Minn.
John F. Fennelly, Glore Forgan & Co., Chicago, Ill.
Edward Littlejohn, Burroughs Corp., Detroit, Mich.
Thomas B. McCabe, president, the Scott Paper Co., Chester, Pa.
John J. McCloy, chairman, the Chase National Bank, New York, N. Y.
John A. McCone, president, Joshua Hendy Corp., San Marina, Calif.
Charles H. Percy, vice chairman; president, Bell & Howell Co., Chicago, Ill.
B. E. Richmond, general manager, Richmond-Chase Co., San Jose, Calif.
Morris S. Rosenthal, New York, N. Y.
James S. Schramm, executive vice chairman; executive vice president, J. S. Schramm Co., Burlington, Iowa
Russell G. Smith, executive vice president, Bank of America, San Francisco, Calif.
Ralph I. Straus, vice chairman and treasurer; director, R. H. Macy & Co., Inc., New York, N. Y.
Charles P. Taft, president, Headley, Sibbald & Taft, Cincinnati, Ohio.
Brayton Wilbur, president, Wilbur-Ellis Co., San Francisco, Calif.
J. D. Zellerbach, president, Crown-Zellerbach Corp., San Francisco, Calif.

BOARD OF ADVISERS

Herbert F. Boettler, president, Bankers Association for Foreign Trade, St. Louis, Mo.
Richard L. Bowditch, chairman of the board, C. H. Sprague & Son Co., Boston, Mass.
E. Lamar Buckner, president, United States Junior Chamber of Commerce, Tulsa, Okla.
Dean Meribeth Cameron, American Association of University Women, South Hadley, Mass.
C. Emanuel Carlson, director, Baptist Joint Commission on Public Affairs, Washington, D. C.
Mrs. Theodore S. Chapman, president, General Federation of Women's Clubs, Washington, D. C.
William L. Clayton, Houston, Tex.
Howard S. Cullman, chairman, the Port of New York Authority, New York, N. Y.
S. A. Dodge, president, Lions International, Detroit, Mich.
Dain J. Domich, Sacramento, Calif.
Mrs. Irving Engel, president, National Council of Jewish Women, Inc., New York, N. Y.
W. J. Gilstrap, vice president and manager, foreign department, Wells Fargo Bank & Union Trust Co., San Francisco, Calif.
Joseph C. Grew, Washington, D. C.
Cordell Hull, Washington, D. C.

Miss Helen G. Irwin, National Federation of Business and Professional Women's Clubs, Des Moines, Iowa.
Allan B. Kline, past president, American Farm Bureau Federation, Chicago, Ill.
Murray D. Lincoln, president, Cooperative League of the United States, Columbus, Ohio.
Stuart F. Louchheim, Philadelphia, Pa.
A. E. Lyon, executive secretary, Railway Labor Executives' Association, Washington, D. C.
Mrs. Edith W. Macy, president, YWCA National Board, New York, N. Y.
Henry J. Mahady, Latrobe, Pa.
George Meany, president, American Federation of Labor, Washington, D. C.
Donald M. Miller, president, National Council of American Importers, New York, N. Y.
Herschel D. Newson, master, the National Grange, Washington, D. C.
James G. Patton, president, National Farmers Union, Denver, Colo.
Everett D. Reese, president, Park National Bank, Newark, Ohio.
Walter Reuther, president, Congress of Industrial Organizations, Washington, D. C.
Wayne E. Richards, Arkansas City, Kans.
H. Christian Sonne, chairman, National Planning Association, Washington, D. C.
Michael Straight, American Veterans Committee, Washington, D. C.
Walter White, secretary, National Association for the Advancement of Colored People, New York, N. Y.
Rufus Wilson, national commander, AMVETS, Washington, D. C.
Mrs. James Wyker, president, United Church Women, Columbia, Mo.

The CHAIRMAN. Bills have also been introduced by Senators Humphrey and Kennedy.

Mr. TAFT. I would only say as to those bills, the ones last year proposed to increase the absolute amount of unemployment compensation. This seems to me a mistake, because then you have people drawing different rates of unemployment compensation. We prefer a simple extension of the period of compensation so that retraining over a longer period will take place. This seems a sounder approach, to me.

The CHAIRMAN. You would suggest an additional 13 weeks?

Mr. TAFT. We suggested about 90 days.

The CHAIRMAN. It is about the same.

Mr. TAFT. Yes.

Mr. STRACKBEIN. Mr. Chairman, there seems to be an assumption that everybody is in favor of such a program.

Mr. TAFT. No, 16 out of 17 members of the Randall Commisison refused to go along with it, to our disappointment.

Senator FLANDERS. I am faced with the problem of determining how I shall vote on the trade legislation which shall be presented to us, and I can tell you where I am at the present time.

The CHAIRMAN. Well, it isn't necessary, unless you wish to bare your soul.

Senator FLANDERS. No. I am perfectly willing to bare my soul and also my burden of responsibility. At the present time I am concerned about the end of this series of terms which is leading toward free trade on the free trade doctrine basis which, I believe, is the basis of it all, and which stems from Mr. Hull.

The CHAIRMAN. Mr. Flanders, I respect and revere you. We love you. We have great affection for you.

Senator FLANDERS. I accept part of that.

The CHAIRMAN. But I would say you are suffering from a complex developed in youth hearing too many protectionist speakers.

Mr. TAFT. May I say, Mr. Chairman, that Senator Flanders testified for me when I was putting on the State Department case 10 years ago.

Senator FLANDERS. My conversion to these reactionary doctrines, if such they be, are recent, because I started my economic reading with John Stewart Mill. I did not start with Adam Smith, unfortunately. I only started with John Stewart Mill, and went through 2 or 3 other perfectly respectable writers and joined up with Charley Taft. I am not quite so sure as I was. I do want to see where we are going and what Dr. Viner had to say about the division of the world's activity between the United States and Japan, or if we wish to say the United States, Japan, and China, supposing China is ever admitted into the fellowship of nations, it seems to me is something that must give us, lead us to some thought, because the best that I have been able to see as the end toward which we are moving is that this country will retain certain extractive industries, retain its agriculture, and also mass production, and that most everything else will go to the low labor-cost countries.

Now I may be right or wrong, but sincerely, that is the only picture that I can see, and a possible alternative, I have also brought up, seems to me to lie not so much in the tariff policy area as in the area of these various agreement areas, such as Western Europe, on its own behalf, eastern and southern Asia, on its own behalf, and our own country, on its own behalf.

Now that does not mean that there would be no commerce between these 3 separate groups, but the commerce between these 3 separate groups could most evidently be to the advantage of all. It would not be a case of either exploiting the other in any way, and so my advice to statesmanship, which I am assuming at this point lies outside the Halls of the Senate and the House, is that every effort be made to develop these three areas which are practically free of any trade restraint.

That, sir, is my statement of the position in which I find myself as of 4:27 p. m.—I do not know what the date is.

Mr. CLEVELAND. Speaking from several years of experience in trying to persuade the Europeans to set up the kind of economic union you are talking about, could I just say this: The thing that was continually thrown in our teeth was United States trade policy. If, in trying to follow the very excellent line you are suggesting on the establishment of a customs union and economic integration in Europe, it were possible for United States representatives to bargain with some real liberalization of United States trade policy, it would be a whole lot easier. The answer is not more protection and more unification of Europe. The practical situation is, I think, that we won't get the more unification of Europe unless we have a more liberal trade policy.

Senator FLANDERS. In other words, they are not willing to move to their own advantage in their own territory and we have to subsidize them in some way to persuade them to move for their own good; is that what you are saying?

Mr. CLEVELAND. They have the same difficulties seeing what their own advantage is as we do on our trade policies.

Senator FLANDERS. Of course, the question is whether we see real or imagined difficulties. I think the difficulties are real for reasons which I have given, and I see no reason why those abroad cannot take a leaf out of the American book, which is to have a large domestic trade area without tariffs.

Mr. CLEVELAND. But they do not think we believe in competition.

Senator FLANDERS. Well, let them come over here and see how Senator Sparkman's area competed with New England for the textile industry. If they do not believe we have competition, they do not know anything.

Mr. STRACKBEIN. Mr. Chairman, I would like to address myself briefly to one of the observations that has been made here this afternoon and which comes up time and again in any discussion of this kind, and that is to the effect that the consumer pays the tariff. Now, generalizations of that kind can be made in an area where there is no proof and they can be repeated time without end because nobody can prove it one way or the other.

That is just like the question of whether the income tax is paid by the consumer or not. The situation may be that in a seller's market when we have a shortage economy that the consumer pays the tariff; that is to say, inasmuch as the demand is greater than the supply, the imports, even though imports can be brought in at lower prices, do not reduce the price.

We have had much evidence of that in the postwar years. While imports were entering at lower prices as shown by the invoices, they nonetheless reached the consumers at the same price level as domestic products. That was in a seller's market. So at exactly the time when imports coming in at lower prices would be very welcome in their function of reducing prices, they do not have that effect.

Now the time that they do have that effect is in a buyer's or a surplus market, that is precisely the time when the domestic producers are least able to stand the competition and when it leads to deflationary pressure.

Mr. TAFT. Mr. Chairman, I would like to come back to Senator Flanders' point. It seems to me, I may be wrong, that his thinking is based primarily on the distinction drawn between the so-called big mass production industry and smaller industry which is assumed to have a higher proportion of labor costs in its production.

I am convinced this is not an accurate description of American industry. I think, for instance, of a small plant that I saw in a northwestern Ohio county seat that did not have a population over three or four thousand. This plant belonged to the Sylvania Co., which is also in Salem, Mass. This was a factory in which they make television tubes. I saw a room which I suppose is about the width of this hearing room, with a series of tables across it, and a rather large group, I would say probably 75 or 100 women working.

It was a production line. The items that go in the heart of the tube started with some raw materials at the end of the table at one end and it went across that table and around across the next table, and all the way down to the other end and came out with the piece with a large degree of handwork, but a very carefully worked-out in-line production.

Now you can call it mass production if you want, but it is something very different from a perfectly huge mile-long plant that starts with some steel and ends up with an automobile.

Senator FLANDERS. May I interrupt here. I use the term mass production because that is something that everybody hears and, the term is familiar. I have never been satisfied with it. The real term, as a manufacture I will say is continuous production.

Mr. TAFT. In-line production.

Senator FLANDERS. Continuous production which, instead of making a batch of this and a batch of this and a batch of this, you are working all of the time at the same spot on a product which flows through. Continuous production is the term for economists to talk about, and not mass production.

Mr. TAFT. And I also saw another example in another Ohio county seat in a firm which is the best-known firm in making heavy-duty cabin cruisers. I do not mean the flossy ones you see in the advertisements. I mean the kind that a fellow would buy who wants to get a cabin cruiser that he knows will go to England if it has to. That was in Port Clinton, in a plant not more than twice the size of this room, and yet they had these great, big cabin cruisers moving around at stages.

They weren't continuously moving but they moved around in stages for different operations to be put on them. That is a small concern by any definition, by volume, by dollar production, or whatever you want.

It is a small concern, but it uses these American ideas. Now I emphasize that because I want to offer for the record here the first part—it is only preliminary—it is the only one out yet—of a study being made by Fred Harbison and Eugene W. Burgess, at the University of Chicago Industrial Relations Center of Management Practices in Western Europe. I will just give you a summary of it and, then perhaps this might be introduced in the record.

The study showed the number of persons in management is small, about half that in the United States, on the average. Decision-making is highly centralized. The burden of routine duties by individuals is extremely heavy. European companies have few, if any, people in market research, advertising, sales promotion, production engineering, training, labor relations, and research in general.

They have a shortage of qualified personnel. The top man intentionally makes him indispensable and he does not delegate authority. The company often, in France and Italy, at least, is in the family. So you get nepotism. There is no future for those at the bottom. You can go to foreman and no further. The educational system abroad produces imagination engineers but not practical production men and it does not produce many compared to the United States.

If we talk about a shortage, then what we have is a flood compared to what they have got. What our better management produces is better planning, constant improvement in product, and better personnel, better morale and labor relations and, therefore, continued higher productivity on the same machines and with 40 hours against 50 hours.

That element, I think, is the only possible explanation of why we can export $12 billion in competition with anybody.

(The pamphlet referred to is as follows:)

MODERN MANAGEMENT IN WESTERN EUROPE, No. 48

(F. H. Harbison and Eugene W. Burgess)

ABSTRACT

American management of business enterprise is compared with that in France, Belgium, and Italy. By comparison, business management in Europe is undermanned, and decision-making highly centralized. Access to the managerial class is rigorously restricted by family or by education. European businessmen strive to control rather than to build organization. Their class consciousness largely explains the class consciousness of workers. Management's concern for security forces other classes to safeguard their own, making business enterprise static. But certain businesses are now becoming more dynamic.

It is generally agreed that the private-enterprise system as it exists today in the United States is more "dynamic" than the capitalism which prevails in many countries of western Europe. The contrast is both strikingly illustrated and partially explained when one compares the nature of entrepreneurship on the two continents. For it is entrepreneurship or, more precisely, business management, public or private, which initiates ventures, employs workers, organizes and directs production, develops markets, and thus contributes to the building of a nation's economy.[1] Indeed, in looking closely at management we find very important clues for understanding some of the basic social, political, and economic problems of modern Europe. The nature and status of managerial systems aid in explaining the political orientation of labor organizations, the persistence of cartels and other restrictive institutions, the lower productivity of European enterprise in comparison with its Amercan counterpart, and the current tenuous postion of capitalism in many European countries.

In this article we compare the American type of management with our conception of typical management in France, Belgium, and Italy, justifying impressionistic analysis based upon visits to both American and European firms as a temporary substitute, in the absence of objective empirical studies of entrepreneurship on the two continents. In so doing, we are aware of the dangers of constructing stereotypes of business management which may obscure significant differences not only between countries but also within them. Yet stereotypes not only serve to distinguish the differences both between and within countries but also give a reference point for measuring significant changes in progress.[2] Thus stereotypes are used here as a starting point for further research rather than as a faithful characterization of any enterprise system.

MANAGEMENT ON TWO CONTINENTS—A COMPARISON

The "typical" American management and its counterpart in France, Italy, and Belgium can best be compared by reference to the organizational development of the enterprise, the means of access to managerial positions, and the goals of management. This comparison is made in terms of the American system of values, which should explain what might to some seem biased statements.

In the European firm the number of persons in management is relatively small, decision-making is highly centralized, and the burden of routine administrative duties borne by individual executives is extremely heavy. The managerial force in the European firm is probably less than half that in an

[1] We use the term "management" in the same sense in which many other writers use the term "enterpreneurship." Following James H. Strauss, the firm rather than the individual is regarded as the entrepreneur, the firm being the innovator, the supplier of capital, and the manager and coordinator of activities through the medium of the individuals who have decision-making responsibilities. (See James H. Strauss, The Entrepreneur: The Firm, Journal of Political Economy, LII (1944), 120.)

[2] The impressions set forth in this article are based upon many years of acquaintance with American business concerns and three trips by each author to western Europe. During 9 weeks in France, Belgium, Holland, Luxembourg, Germany, and Italy, we made a pilot study of managerial problems and management development. This study, undertaken by the University of Chicago's Industrial Relations Center under a grant from the Ford Foundation, involved interviews with approximately 85 persons in or serving business concerns, mostly in the ranks of top management in European enterprises. This project is part of a program of research on the utilization of human resources in selected countries, both developed and underdeveloped, throughout the world, by a team of specialists from Harvard, Massachusetts Institute of Technology, the University of California (Berkeley), and the University of Chicago.

American firm of comparable size and technology. Whereas the American firm generally has large numbers of people engaged in activities such as market research, advertising, sales promotion, production engineering, training, industrial relations, and research, the comparable European firm customarily has only skeleton forces in most of these areas and often no specialized personnel in the others. Staff services to the line organization are rare, and even the key executives appear to have few assistants. The European executive must work harder than his American counterpart because he must personally supervise a great many of the functions of the enterprise.

For this undermanning in management there are perhaps several explanations. Many functions, such as sales and industrial relations, are performed for the firm by sales organizations, cartels, or trade associations. Others do not appear sufficiently important to the European businessman to require specialized managerial talent. Also, there is a shortage of capable people who can be "trusted" to fill managerial positions. Finally, some top managers in Europe take obvious pride in their ability to run a business "economically" with a small managerial force.

By American standards, the organizational structure of even the largest and most progressive European enterprises is haphazard. Organizational charts are rare, and where they exist, they are often kept secret. Jobs in the managerial hierarchy are seldom defined, described, or alined. The organization tends to be built around personalities, among whom the division of responsibility is not clear. As one managing director said, "the goal of most of our executives is to make themselves as indispensable as possible."

This organizational structure, which appears so nebulous to an American, is attributable in some cases to family ownership and management. In France and Italy, for example, it is often impossible to distinguish between the objectives of the family and the objectives of the firm. As David Landes points out in a penetrating study of French business enterprise, the business is not an end in itself, nor is its purpose to be found in any such independent ideal as production or service. It exists by and for the family, and the honor, the reputation and wealth of the one are the honor, wealth, and reputation of the other.[8]

Under these circumstances, managerial organization is of necessity geared as much to personalities as to functions.

Many European enterprises are, of course, directed by professional managers rather than by family dynasties. In some cases there is a dual authority shared by a technical managing director and an economic managing director, each reporting on an equal and independent basis to a board of directors. Yet, whether the firm is run by members of the family or by a professional group, the managing directors of the typical European enterprise hold the reins in a tight grasp. Whereas the chief executive of a large American corporation is supposed to devote his major energies to building an organization and integrating the many functions of the enterprise, his European counterpart is more likely himself to be the boss of most of his departments. The European executive finds it difficult to delegate responsibility to subordinates. In the first place, he does not have enough people to whom he can delegate authority. Second, he feels that he cannot trust many of the subordinates he has. In France, Italy, and Belgium managing directors repeatedly explained: "We have no confidence in our subordinates"; "The people in lower management won't assume responsibility; they aren't well enough trained; they lack experience; they're too young; and some of them are even members of leftwing unions." The head of a multiplant manufacturing company would not even permit his factory managers to hire their personal secretaries until after he had himself passed upon their qualifications and potential loyalty to the organization.

Undermanning and overcentralization management naturally discourage the growth and expansion of the enterprise. "Why should I try to expand my market," said one harassed owner of a business, "when I have to spend 14 hours a day controlling the business I have now." Obviously opportunities for younger executives are limited, incentives to assume responsibility are stifled, and taking initiative is not attractive. While the typical business organizaton may be well designed to preserve the status quo, it is peculiarly ill-adapted to dynamic growth.

[8] Business and the Businessman in France, in E. M. Earle (ed.), Modern France (Princeton, N. J.: Princeton University Press, 1951).

Access to managerial positions is rigidly restricted. In the United States many people, including workers and union leaders, aspire to enter management, whereas in Europe only a select few ever have access to it. It is commonly understood in Europe that people get into management by virtue of being sons or heirs of existing owners, by marrying into the families of the owners dynasties, by using the leverage of a financial interest, or by acquiring a degree from a university or technical institution of higher learning. While this also happens in the United States, it is not so common a course as it is abroad. The European does not expect to work his way up into management from the ranks of the worker.

An aggressive and competent worker may become a foreman, but in Europe foremen are not members of management. Indeed, the European foreman is more comparable to the lead man or strawboss in America, a member of the working class and identified as such. He generally belongs to unions and is often active in protest movements ideologically hostile to the managerial class. Foremanship is not an avenue to upper management, as it so frequently is in the United States. It is rather the highest status to which a worker—without education or family connections—may hope to rise.

But an even more fundamental contrast lies in the educational prerequisites for entry into the managerial class. In the United States, a qualified person can get into management without a degree, in Europe this is much more difficult. Yet in America about five times as many people (proportionate to population) go to colleges and universities and get degrees than is the case in most European countries. Also, in the United States a very substantial proportion of persons in institutions of higher learning come from families with relatively little educational background, whereas the students in comparable institutions in Europe come predominantly from families already in the educated class. Thus in Europe business recruits its managerial personnel almost exclusively from the educated, whose numbers are already quite limited; in the United States business recruits its managers from the uneducated as well as from the educated even though the latter are proportionately much more numerous.

Thus the managerial group in France, Belgium, and Italy is a small and distinct elite. Since entry into the elite is restricted, management is decidedly class-conscious. Once admitted to the management class, either by education or through family connections, a person customarily acquires permanent tenure in the hierarchy. Moreover, once a member of management in a particular company, a man is likely to remain there throughout his entire career. It is unethical for one company to raid and woo executive personnel from another. A person who leaves the company where he has tenure as a member of management to accept a position in another firm may be branded as a disloyal and unscrupulous opportunist. For this reason vacancies are not likely to occur frequently, and members of management jealously safeguard their positions. The lack of horizontal mobility within the managerial class results in an inbreeding within business enterprises which hampers the spread of new ideas and new technology from firm to firm.

Finally, from a qualitative standpoint, the system of higher education through which one must pass to gain access to management is not well adapted to developing the kind of leaders which a more dynamic system would require. In the first place, in countries such as France and Italy the curriculums turn young people to careers in government, the armed forces, the professions, or the arts (which are looked upon as higher-status fields than business management) rather than in management leadership. In the second place, theory rather than applied practice is given predominant emphasis in university training, even of engineers. For example, in the engineering universities, there is great emphasis on higher mathematics and engineering design and relatively little on industrial engineering or on the application of engineering principles to factory operations. Courses in such subjects as management organization and administration, marketing, human relations, economics, and labor problems are rarely included. Without question, the typical graduate from the École Polytechnique in France is a brilliant and hard-working fellow who has successfully survived a system of competition which gets more and more rigorous as he advances through his training. He often turns out to be an imaginative engineer. Yet, by the same token, he may be a complete misfit in a job calling for sophistication in organization and management.

It follows that there is a wide gulf between the theoretical training provided by the universities and technological institutes and the practical world of business management. The educational institutions concentrate on the training of technicians, but they make no attempt to develop administrators or to teach skill in managing people, reflecting the European notion that management is a craft which must be handed down from one generation to another and which can be learned only by long years of apprenticeship in the enterprise. Yet the young technical graduate of high intellect and good character will consider it beneath his dignity to leave the office and get his hands dirty in the shop. His university degree is his membership card in the managerial elite, setting him apart from the working classes which he may be called upon to govern. With this status and this attitude, he is not likely to develop either interest or skill in administration.

The typical American businessman and his counterpart in France, Italy, and Belgium have different values and strive for different goals. In the United States, the businessman feels a compulsion to build an organization, to expand production and sales, and to make even more profits, while the European is more concerned with holding on to the organization he has, with retaining his share of the existing market, and with insuring financial and institutional security.

Management on both continents is interested in greater productivity. However, American management usually thinks of greater productivity as increased output and consequent lower unit cost, whereas European management normally struggles to reduce unit cost while rigidly limiting output. The latter emphasizes such things as savings in materials, elimination of waste, and improvement of quality, whereas comparable American plants would aim at increasing production. This is a logical consequence of the European businessman's assumption that the total size and composition of the market are unchangeable. The same assumption explains in part why the European manufacturer favors high unit profits on a small volume to large volume with small unit returns.

Another goal of European management, apparently, is to keep free of debt and to avoid reliance on outside credit. In countries where the interest rate is 2 to 3 times that in the United States and where bankruptcy is looked upon as a catastrophe rather than a convenient means of reorganization, this is understandable. Yet this concern makes the European businessman a caretaker rather than a risk taker. As Landes observes, the French family firm is "as solid as the rock precisely because it is almost drowned in its own liquidity."[4] In Europe the concern of the entrepreneur is to survive a recession rather than to seek opportunities which involve risks as well as chances for gain.

In Italy, France, and Belgium, the successful management of an enterprise is not an end in itself. The European businessman may strive for and even enjoy leisure. His interests are apt to be broader than those of our modern tycoons. The captains of industry in Europe are certainly as brilliant as, and if anything, more broadly cultured than the American, and if they are relatively poor organization builders, it is because they lack the American compulsion to organize.

The security-conscious attitude of European management is a consequence not merely of cultural milieu, but rather of the chaotic economic environment. In the last two decades Europe has been ravaged by wars; factories and even entire industries have been demolished, fortunes have disappeared, and whole populations uprooted. Successive waves of inflation have destroyed capital investments, and unstable currencies, coupled with fluctuating foreign-exchange rates, are problems which the European businessman must face almost every day. The typical American businessman, if thrust into this sort of economic environment, might also soon lose his opportunity-mindedness and learn to play safe, and he should be cautious in criticizing European management for its lack of aggressiveness, its tendency to look back to "the old days," and its openly expressed lack of confidence in the future. However, even if currencies were stabilized, if trade barriers were eliminated, and if the ideal of the common European market were realized, the typical management in France, Italy, and Belgium would probably continue to value security because of the differences in mobility and in institutional organization described above.

MANAGEMENT AND LABOR

In Europe the social distance between management personnel and workers is much greater than it is in the United States as, to repeat, are the differences in education and income. Consequently, development of understanding between workers and management, which is a problem even in America, is far more diffi-

[4] Op. cit., p. 339.

cult in France, Italy, and Belgium. Management-labor communication tends to be from the top down and to be dictatorial. This does not make it easy for management to enlist loyalty and interest on the part of workers in the enterprise, nor does it lead to participation among workers in lowering costs and in improving efficiency. Workers in European plants seldom "talk back" to their bosses. Upward communication is neither expected nor encouraged.

The more enlightened employees in Italy, France, and Belgium have a sense of responsibility toward their workers and express it in such things as company housing, day nurseries, medical services, clubs, and recreational programs, and other services. Such employers, particularly those in small cities and towns, also recognize the necessity of providing steady employment for workers and their families. Indeed, they may be willing to sustain considerable financial loss to keep their people employed, knowing that displaced workers may be dependent ultimately upon their charity. The socially conscious employer is a benevolent industrial lord who takes care of the people in his domain partly because of humanitarian motives and partly because of fear of uprising by the masses. At the other extreme are the owners and employers who recognize no responsibility to workers, to the community, or to society as a whole, who live according to a doctrine of "sauve qui peut." They look upon labor as an economic commodity, while they live in constant fear of political agitation for basic changes in ownership and management.

In these countries, the paternalistic employer appears to develop in the working forces a feeling of gratitude and dependence mingled with resentment. Socially irresponsible management creates active opposition and outright hatred. The result is an almost universal distrust of management by the working classes. The overt respect which the individual worker shows his boss in the factory in no way conceals his resentment of the authority of the employer over his life and his underlying lack of respect for the capitalistic system. It is with good reason, then, that many European businessmen are so fearful of their workers that they shudder at the thought of building any kind of genuine two-way communication with them.

Certainly we would not argue that management provides the sole explanation for the class-conscious and often revolutionary orientation of European labor movements. The laboring masses may join unions for many reasons, including protest against the government, a landed aristocracy, or simply the status quo. Yet the only logical response to the typical kind of management which exists in Europe is class-conscious unionism. In France and Italy the effective labor movements have been at various times and under various conditions reformist, syndicalist, and revolutionary. Today they happen to be Communist-dominated. The Socialist and Catholic unions in Belgium, though currently more right-wing than those in the other two countries, are certainly not supporters of the existing capitalistic order. But, if the ranks of management are closed to members of the working classes and if business enterprise in collusion with government builds systems of protection to safeguard its vested interests, what could be more logical than for labor organizations to oppose the employer class politically? The character of protest movements in all societies is largely determined by the orientation, status, objectives, and practices of the elite toward which the protest is directed. If this proposition is so, then the orientation, status, and tactics of management in Europe help to explain why most labor organizations in Europe are political enemies of the employer class, whereas unions in America are for practical purposes committed to working within the framework of a private-enterprise system.

The preoccupation of management in Europe with security rather than with growth and expansion explains the dependence on cartels to share markets and on informal understandings to control competition. It accounts for the reliance of European industrialists on trade associations to come to terms with their labor unions. It explains, in part, the pressure from business for tariffs and import quotas for protection from foreign competition. In Belgium, France, and Italy management typically stands for planned protection of enterprise. Now, obviously, many American businessmen stand for some of these things. They have advocated protective tariffs, bargained with unions on an industrywide basis, entered into collusive agreements with competitors, and sought all kinds of favors from government. However, they depend on such measures much less than the Europeans, and the proportion of rugged individualists who advocate and actually succeed in upsetting such arrangements is far greater. In America the prevailing opinion among businessmen is against most of these restrictions, whereas in Europe it is one of uncritical conformity to, if not open defense of, them.

Management, of course, is not the only class that wants protection. The laboring classes are, if anything, even more anxious for guaranties of security. In the three European countries, the social-security systems are far more comprehensive and considerably more costly than those in the United States: their cost ranges from 30 to 40 percent of pay rolls, or about 6 to 7 times that of ours. Also, the right of employers to discharge or to lay off workers is much more closely circumscribed by unions and by legislation than in the United States. So labor in Europe is less mobile, both because of restrictions and because of customs, than in this country.

The employers logically point out that these protective measures for workers result in high labor costs and unwarranted rigidity in the labor force, and act as a brake on expansion of enterprise. In short, management is prone to cite restrictions on employment and overemphasis on social security as primary reasons for Europe's failure to build more dynamic economies. Yet the lack of labor mobility has its counterpart in lack of mobility within the ranks of management. Labor's restrictions on employment tenure are matched by management's protection of the tenure of its own members, and overemphasis on social security goes hand in hand with formal and informal agreements among manufacturers to limit output and to share markets. To be sure, all these protectionist measures are manifestations of a society in which all classes want security above other things. Yet security-consciousness motivates employers as well as workers. Therefore, business management must be held responsible, at least in part, for the overriding desire of the working masses to put their immediate security ahead of economic progress.

MANAGEMENT AND PRODUCTIVITY

It is generally agreed that manufacturing firms in Europe are less productive than those in the United States. A main reason, of course, is that there is more machinery in American plants, since capital is more plentiful. Yet even in firms with comparable technology many more workers seem to be required in Europe than in America. In part, the explanation may be that labor is relatively cheap and that employers are not free to discharge surplus workers. But a possible interpretation is that the European firm has an overdeveloped labor force largely because of the underdevelopment of its management. Here we find a basic explanation for the fact that labor costs in Europe are high, even though wages are pitifully low.

Because of the difficulty of developing qualified and trustworthy people within the middle-management ranks, European management tends to use incentive systems of one sort or another as substitutes for effective supervision. Such a policy seldom works, even in the United States where the rapport between workers and managers is reasonably good. It is likely to be even less successful in Europe, where workers are more apathetic, more fearful of losing their jobs, and more distrustful of their employers. It is thus unrealistic to expect that the productivity of European business enterprises will automatically be increased if capital can be found to purchase equipment and engineers employed to develop new processes and new incentive systems. The typical business enterprise in the three countries studied is, from an organizational standpoint, poorly equipped to direct and manage its human resources effectively.

Many influential intellectuals as well as people at large are naturally becoming more and more critical of capitalistic systems under which the holders of economic power fail to exercise dynamic and progressive leadership. Significantly, in Europe business enterprise is neither glorified nor publicized as it is in the United States. Instead, management lives in an atmosphere of suspicious toleration rather than widespread respect. The reasons for this are not hard to find. First, management is typically security conscious and static, and therefore it is not identified by other groups as a creative force for bringing about a higher standard of living for all. Second, the fact that management is an elite into which entry is restricted arouses the jealousy and antagonism of other classes. Third, although economically powerful, the managerial class is numerically very small, and this makes its position politicaly precarious in any democratic society.

DYNAMIC FORCES IN EUROPEAN ENTERPRISE

Fortunatey, however, the economies of France, Belgium, and Italy are by no means static, and among their business leaders are some imaginative innovators. Indeed, there may be ground for belief that the ingrown and stagnant type of business enterprise described above is becoming obsolete under the pressure of new economic and political forces at work in Western Europe.

The more progressive businessmen in France, Italy, and Belgium have correctly diagnosed the problems of undermanning and overexclusiveness in managerial organization. They are convinced of the need for the reform of higher education as it relates to training of future leaders. They also advocate the lowering of trade barriers and the economic integration of Europe. In this respect the progressive European businessman is perhaps more honest and perceptive in criticism of himself and of his system than the American. In each country one finds a handful of very progressive business enterprises which may be the potential carriers of new techniques, new concepts, new outlooks in human relations, and new schemes of building managerial organizations. La Compagnie Télémécanique Électrique in France is an outstanding example. This company was founded in 1925 by four workers who had creative ideas both in technology and in industrial democracy. Now an organization of over 2,300 workers, Télémécanique manufactures circuit breakers and similar electrical equipment, which it markets not only throughout Europe but in the United States as well. It has well-developed research, marketing, quality control, planning, and personnel staffs effectively integrated with line operations. It has successfully timed the introduction of laborsaving machinery to coincide with expansion in output and thus has never faced the problem of layoff of workers. Workers are paid on a monthly salary basis, with production bonuses adding currently about 65 percent to base salaries. There are not time clocks in the plants; toolrooms and stockrooms are not guarded; and the workers have direct access to managerial personnel for developing improvements in methods and procedures of work. The plants are up to date in production methods, equipment, layout, lighting, air conditioning, and employee services of every kind. Communications and rapport between management and workers are comparable with the very best in the United States. Located in Nanterre, a suburb of Paris which has been dominated by Communist unions and political control, the vast majority of workers at Télémécanique consistently vote for "right wing" representatives in plant elections for the works council.

Another example is Necchi, of Pavia, Italy, a manufacturer of sewing machines. Only a few years ago this company developed a machine of exceptionally high quality for home use, which is now underselling other internationally known machines, not only in Europe but in the United States. This plant is ultramodern in design, layout, and machinery. Its managerial organization is equal to that of most comparable American companies. Its workers are paid wages nearly twice as high as those prevailing in related industries in Italy. As the general production manager of this company pointed out, "the techniques of mass production are well known to most European engineers. The greatest difficulty in our country is to build the kind of organization which is needed to utilize them." Necchi appears to have mastered this problem. A great deal of attention and planning is given to the development of executives with administrative skills, and conscious attempts are being made to draw from the ranks at least some of the new blood needed for the expanding managerial ranks.

In both Télémécanique and Necchi we see the fullest development of managerial organizations which are pioneering in production and marketing and in the broad area of effective management-labor relations as well. These companies exhibit dynamic management in countries in which customs, tradition, and class distinctions provide the most hostile kind of environment for innovation. They provide concrete evidence that a well-managed European manufacturing enterprise can successfully compete, even in the American market, with the best American firms and at the same time raise the standard of living of its working forces. But as yet it is too early to know if these innovators will establish new patterns of management or will simply persist as anomalies in their respective economies.

Another straw in the wind is the concern of progressive businessmen with education for management. In all three countries "advanced management-training programs" are being started on an experimental basis. In France, teams composed of businessmen, educators, labor leaders, and Government representatives are studying American experience in education in industrial relations, business administration, and engineering, with a view to recommending reforms in the French system of higher education. There is widespread interest in all three countries in the establishment of business-management institutes for junior executives. The advocates of these programs appear unanimous in stressing administration, marketing, and human relations rather than the purely technical aspects of production management. This new interest appears to have been stimulated by the productivity and technical assistance programs which the United States has been developing in cooperation with the productivity centers in the European countries. To be sure, the prerequisite of long-range fundamental improvement in the system of developing people for managerial positions is a basic change in the curriculums of universities and higher technological institutes, through which practically all new entrants to the managerial class must pass. As a prominent French managing director remarked, a revolution is needed in the whole system of higher education. There are businessmen and educators in Europe who would like to lead such a revolution.

Many people in France, Belgium, and Italy feel that the economic integration of Western Europe will be a force making for greater dynamism in business enterprise. Indeed, Jean Monet, the spiritual father of the present European Iron and Steel Community, is widely reported as believing that fundamental reforms in the French entrepreneurial system can be brought about only by the external pressure of free competition with enterprise in other countries. If the new Coal and Steel Community succeeds in its objective of creating a single competitive market for steel and coal in Western Europe, one may expect far-reaching changes in outlook and organizational development in the basic industries, not only in France but in the other member countries as well. For, theoretically, at least, the success of the individual companies will rest much more upon managerial efficiency than upon the tariffs and artificial protections previously relied upon. Here, of course, the crucial question is whether the Steel and Coal Community will actually succeed in creating a free market or whether it will succumb to vested interests which could turn the whole venture into an international superbody for protectionistic and restrictive measures.

Finally, in Europe it is possible that a more dynamic type of management may be developed in publicly owned and operated industry. Here there is real opportunity for building a management profession as distinct from a class-conscious elite. Already, many of the younger and progressive members of the managerial class are being attracted to public enterprises despite the comparatively low salaries which are offered. As a French productivity expert remarked, "Our goal cannot be to build a free-enterprise system which will be only 'second best' to that in the United States. We have the opportunity to make significant innovations in the successful operation of public enterprises and in the planned integration of economic activity in Europe." In this development two questions are crucial: First, will public management be reasonably free from political control which might interfere with its effective development? Second, will it attempt to recruit some of its new blood from the ranks, or will it follow the example of private enterprise in drawing its managerial personnel almost exclusively from the educated elite?

In conclusion, there is evidence that dynamic changes may be taking place in the static enterprise systems of France, Belgium, and Italy. It is these changes, rather than the traditional stereotypes of management, which demand thoughtful consideration and future systematic study.

So I see no reason whatever to look forward even under free trade to any change in the general component of our industrial production because these principles are applied to small companies as well as to big companies. If they don't get all of their investigation through their own company they may have either a trade association or a relationship to a university, so they get it somehow. They know they have to have it where their competitors abroad may not. May I add just one further fact that I think ought to be in the record?

The assumption of our friends on the high tariff side is always that you can determine what the relative costs of production are at home and abroad. Nothing has been said on that, but I think there ought to be something said on it. One of the more recent efforts to find this out is the report prepared for the electrical manufacturing industry by the National Industrial Conference Board in 1953, an organization which I think is generally respected in this area. It certainly made a report which has no political implications, no pressures from anybody. I don't think it was entirely satisfactory to the Westinghouse Co., because they employed Glenn Saxon of Yale, to make a commentary on it.

But on the question as to whether you can find out what comparative costs are, I want to give you just three quotations. On page 136 the study stated:

Internationally comparable labor-cost figures in the electrical-equipment industry are virtually nonexistent for the countries under study in the report.

On the same page, it said:

No information at all exists concerning two factors which have an important direct influence on labor costs. These are quality or style differences of certain products and mechanical equipment per production worker which is of primary importance in any competitive analysis of output per worker.

That is the end of that quote.

On page 40 is this conclusion:

Data are not available from regularly published sources that permit a comparison of the cost of production in the United States and abroad.

Now, this is nothing new. Mr. Robert O'Brien, of the Tariff Commission, said this many times to Congress. What the conference board study did attempt to do was to meet this problem, one by an indirect method of measurement which was by the extrapolation over almost a 10-year period, I think, of costs in order to try to get comparable years, and in the second case by individual case studies which were based on only six cases which themselves showed on conclusive results, and, finally, by reliance on an engineering opinion by general effectiveness of production which was not sufficiently described to permit any clear judgment to be made.

Senator FLANDERS. Mr. Chairman, I wonder whether the real test does not come in the price delivered at the American customshouse?

Mr. STRACKBEIN. Mr. Flanders, that is exactly what I was going to say.

Costs abroad are not the thing that counts. It is the price at which the goods are laid down at the customshouse in the United States. And that is not a mystery. That is what it shows in the invoice.

Mr. TAFT. If I may comment on that, the difficulty with that test is that it does not take account of volume. If they supply one-half percent of our domestic market, their price may be one figure, but if it is to be 10 percent of the market they usually cannot arrive at the same price.

Mr. THORP. I assume Senator Flanders will continue to contemplate this problem.

Senator FLANDERS. I will.

Mr. THORP. I merely wanted to suggest that in the contemplation you keep in mind what I know you are thoroughly familiar with, that is, the balancing process of payments, so that whatever may develop in trade with temporary inequalities will tend to balance out.

Therefore, what does happen over time in the adjustments of trade should be that we will send to other areas the goods which we can, relatively speaking, produce most efficiently and buy those from them which they can produce, relatively speaking, most efficiently, and which come in most cheaply to us.

Senator FLANDERS. And would you want to add there, and no more? That isn't exactly what I mean. There are things that we need, and will have to buy.

58422—55——62

Mr. THORP. Which we need and will have to buy because we cannot produce them ourselves efficiently.

Senator FLANDERS. Yes; and for those we must export enough to bring those things in.

Go on with your statement. I might agree with you.

Mr. THORP. All I am saying is that there are other things which one wouldn't say we must buy, because we can produce them ourselves, but we produce them relatively speaking so inefficiently that it is cheaper for us to make the things which we can make more efficiently, send them abroad, exchange them for others, and this is the basis on which it seems to me trade will develop when there are not arbitrary restrictions.

Now, I don't understand why you would admit that there would be great benefits within these three areas, and yet generalizing beyond them to a world basis somehow does not produce still further benefit.

Senator FLANDERS. The one thing of the mass market that we have is something that others ought to have in order to raise the standard of living. That is the basis of it.

Mr. THORP. But it becomes a still greater market——

Senator FLANDERS. If they can get into ours.

Mr. THORP. And we can get into theirs. This is a two-way operation, and I am not thinking of a flow of imports which is not equated with a flow of exports.

Senator FLANDERS. That comes back to the question of the relative advantage on which I am still hazy.

Mr. STRACKBEIN. Mr. Flanders, may I make a comment on that?

Let Brazil grow coffee, there is no question there. Now, we come up to where they have a comparative advantage in producing something else. But, finally, we come to an area where what they want to ship us we produce very well ourselves. We don't have to buy that. That is where the great conflict—where the great difficulty comes in, where there is no particular advantage in buying their goods.

Senator FLANDERS. I think perhaps the case is clearer for Japan and China. It is your case, but I think it is clearer for Japan and China.

Mr. TAFT. May I suggest, Senator, that what you are proposing, however, involves the substitution of judgment of somebody in the Government, or in the Legislature, for the judgment of the market place.

Senator FLANDERS. The judgment of the market is that we should get our textiles in Japan.

Mr. TAFT. I don't agree. Let me give you the figures on cotton textiles. They say, themselves, they are the most efficient producers in the world of the great middle range, and the imports of cotton textiles are one-half of 1 percent of the total American production, and yet it is that that they are screaming about. Exports of cotton textiles are 6 percent of domestic production.

Senator FLANDERS. I do not know what the duty is on that.

Mr. TAFT. Not much.

Mr. STRACKBEIN. I would like to interject this: So long as the competitive advantage of imports rests on the fact that lower wages are paid in other countries, then we say we are entitled to protection because we have in this country minimum wage laws, obligatory collective bargaining; we have price supports for agriculture, we have social security, and a lot of interferences with the free market, and in fact we have created more and more of those in the past 20 years.

Now, on the foreign-trade side, we are moving toward laissez-faire. It doesn't add up.

To say that the consumer is entitled to low prices, or to cheap products regardless of the source of cheapness, is the same as saying that if we can get goods produced by slave labor then the consumer should be all the more happy. We cannot accept this concept. Our producers are burdened with cost-raising obligations imposed by law.

If we could be assured of what is roughly compensatory protection, we would feel better about it. There are burdens upon us which as producers we cannot shift. We have placed those burdens there by law. On the seaward side, on the other hand, we have taken away the protection and exposed our producers to a kind of competition that is not burdened by those same costs.

Mr. TAFT. Mr. Chairman, I would only remark that the total social-security payments in Europe relative to the base wage is higher than in the United States.

Mr. VINER. I think there is one thing that needs to be said as to the criterion of when is an American industry efficient. I think occasionally the standards of efficiency applied by the apostles of high protection have been the Chinese or Japanese ones; not the American one.

Senator FLANDERS. No, no.

Mr. VINER. The American standard of efficiency requires that the industry be required to produce an article at a cost no higher than the world price and to pay a wage no lower than the American standard. If any company can produce on that basis it will not have any difficulty with foreign competition.

Mr. STRACKBEIN. I am glad to have that definition.

Would you restate it for the record?

Mr. VINER. It is in the record. I would not care to try to restate it.

Senator FLANDERS. I think you have something we can all agree on.

Mr. VINER. If Mr. Strackbein agrees, the amount of print destroyed will be tremendous.

Mr. STRACKBEIN. I want to be sure of what you said. You said if the American producer cannot produce and sell at the world price, then he is inefficient.

Mr. VINER. I say that if he cannot sell at the world price, and—not "but"—pay the American standard wages, he has not attained the American standard of efficiency, and does not have valid claims to the direction of American productive resources. The only way he gets control over productive resources is to get a subsidy out of higher prices paid by the consumer. The consumer is in my picture. He is still a citizen of the United States.

Senator FLANDERS. I still want to know how many American industries there are who can do that and what is the end product of this process.

Mr. VINER. I fear that the amount of change that complete free trade would make in the American economy is not very large. I fear that the amount of gain the American economy can make out of free trade has fairly narrow limits. I "fear" it only in this sense: The amount of good we can do to the rest of the world through free trade is limited, and the amount of good we can get for ourselves from that avenue, as against the benefits we can get from other avenues of good government, is also limited.

The CHAIRMAN. I do not want to prolong the discussion, but Senator Flanders in recent months has had concern about the ultimate consequences of the free-trade movement, or low-tariff movement. I have been trying to understand the objections of the protectionists, and, as I see their objections, they center on a point which has always troubled me; namely, suppose you have in oriental countries western machinery and western techniques, but a very low standard of real wages due to a general condition of agriculture, so that the labor costs in money terms per unit of output are extremely low, even though the output of physical product in terms of labor is relatively high. Those goods undersell American goods and come in.

The former answer we had for this, and which I used to give, was that this would result in an inflow of imports and a balance of trade which would turn against us. And would result in a flow of gold out. This would raise the prices in these countries and a lowering of prices in our country, so you would get an adjustment of the relative advantages.

Senator FLANDERS. I am assuming that is out the window. I understand relative advantages on that basis, but I am assuming it is gone.

The CHAIRMAN. I had not thought that the gold movements had completely disappeared as a factor or that foreign exchange was unconnected with it, but if this analysis or anything like it is to hold it requires a very real fall in the price level of the country which is importing goods with low unit labor costs, and that is very severe medicine for a country to take.

Mr. VINER. Or a fall in its exchange rate so that the Japanese yen becomes more expensive to us in terms of dollars. The Japanese are not going to give the goods to us cheap merely because they can; they will get the best price for them they can, and if we buy unlimited quantities of manufactured products from them they will get the best American prices they can. They will acquire dollars which by assumption they have no use for, and the result is that they will mark down the dollars on their exchange market, and these Japanese products will become expensive to us in dollars and, therefore, will stop coming in.

Senator FLANDERS. Now, I can understand the doctrine of relative advantage provided this area you have just opened up still holds, but it is a rather dangerous foggy ground to advance into, and is something which is not presented to us in connection with these things we are doing.

The CHAIRMAN. I would like to ask the gentlemen here whether this ultimate balance of which they speak can be obtained purely by changes in exchange rates or will it also carry with it changes in general price levels?

Mr. Viner. Well, Mr. Chairman, as you know, a country in our days without the gold standard can, within limits, do what it likes with its currency, and if you mean does it require changes in yen prices, that is up to the Japanese monetary and credit system.

Does it mean changes in the dollar equivalent of their yen prices? I say yes, it does, and must, and will mean that, and you cannot think it out any other way. Either they are willing to accumulate dollars indefinitely with no prospect of using them, or they are willing to use them to buy American goods, or they mark down the dollars in their market in terms of yen, or they raise the yen prices of their export commodities, but one or more of those four things are the only possible things.

The CHAIRMAN. Would you say these price changes are confined to import and export commodities, or will they affect the general price level of all consumer products?

Mr. VINER. The yen becomes dear, and the dollar becomes cheap, and no change in price levels need occur in dollars. What happens to yen prices in Japan depends on Japanese monetary and credit policies. I would forget about comparison between yen prices and dollar prices except in relation to what happens to the exchange rate.

Mr. TAFT. One of the two smaller aluminum companies which has been in favor of an increase in the tariff up until fairly recently, is now satisfied that the Canadian costs of producing aluminum have moved up enough so they aren't in favor of an increase in the tariff any more.

Now, that assume that there has been some change in costs in Canada, presumably in wages, because they must be using the same kind of power and other costs in it, and I do not see that it has had any effect on the exchange rates.

Mr. VINER. Yes, it has. Not very much, but to the extent of two or thee percent, the United States dollar was been at a discount as compared with the Canadian dollar.

Mr. TAFT. And this is the reason why.

Mr. VINER. In any case, the American manufacturer now has 2 or 3 percent more protection against Canadian competition than he did when there was no exchange premium on the Canadian dollars as compared to the American dollar.

Mr. TAFT. I think this is relative to the problem you are raising. This has gradually straightened itself out between ourselves and Canada.

The CHAIRMAN. If you can assure us that these price changes will take place in changes in exchange rates without affecting the general price level appreciably, then you have removed, to my mind, what is the most solid argument for protection against low tariffs.

Mr. VINER. Mr. Chairman, I think we have it within our power to make our price level in general whatever we want it to be, regardless of our foreign-trade policy, and that power rests largely in your hands.

The CHAIRMAN. You would say stabilize the domestic-price level?

Mr. VINER. If that is your aim. To me it is a respectable aim. I might not be a hundred percent rigid on it.

Senator FLANDERS. You are not a hundred percent respectable.

Mr. VINER. Rigid, I said.

The CHAIRMAN. In other words, you would say let the exchange rates fluctuate and adopt your monetary policy on the basis of stable prices, or whatever you choose.

Mr. VINER. As a matter of fact, we cannot set an exchange rate with any other country except by treaty. It is a two-party proposition. We go on on a pattern here which lets the exchanges be what they may in terms of dollars. It is not the only possible pattern, but on that pattern the exchange rates will change. If they are managed abroad, the changes will be manipulated ones. If it is a free exchange market abroad, the exchange rates will move as the market determines. But they will change in either case.

The CHAIRMAN. It is now 5 o'clock.

Mr. STRACKBEIN. I would like to give my definition of an efficient industry, as contrary to Dr. Viner's.

Mr. VINER. I thought you accepted mine.

Mr. STRACKBEIN. I would say that an American industry is efficient, it is economic, it is entitled to remain in business if it can pay the prevailing wage, sell the product at a price that the consumer is willing and able to pay, have some reserve for research and development, and a reasonable profit. That industry, I say, is efficient regardless of the price in other countries where lower wages prevail, regardless of their ability to lay down the product at lower prices in this country. I say the criterion should be in this country to take account of the burdens borne by the domestic producers and not ask these producers to compete in a world market or on a world-price basis, because the other producers in other countries are not bearing the same burdens. They are not producing under the same conditions. It isn't fair.

Now if our producers could disregard the minimum-wage laws, and when they got in a difficult situation could say to their employees, "I am sorry, we are going to reduce our wages by 10 or 15 percent," then they would be in a competitive market or a free situation, but we do not have that. If they could say we have a shortage of labor, we will have unrestricted immigration so we can have a more adequate labor supply, then again they would be operating in a free market, but that is not the way they are operating.

Senator FLANDERS. Mr. Chairman, I would like to ask that Mr. Taft's statement before the House committee be put into the record, and I also wish we might get into the record in some way perhaps a staff statement on the present state of the balance of trade, the overall imports, exports, visible, invisible, and where we are at the present time.

I would like that summarized.

(Mr. Taft's statement appears at p. 976.)

(The following was subsequently supplied for the record by the committee staff:)

Balance of payments of the United States, annual and by quarters, 1953 and 1st 3 quarters, 1954

[Millions of dollars]

Item	1953					1954		
	Year	Quarters				Quarters		
		I	II	III	IV	I	II	III
Exports of goods and services, total	21,265	5,387	5,732	4,916	5,230	4,767	5,691	4,807
Military transfers under aid programs, net, total	4,281	1,280	1,383	815	803	826	996	700

Source: U. S. Department of Commerce Survey of Current Business, July, September, and December, 1954.

The CHAIRMAN. I want to thank you gentlemen very much for coming.

(The prepared statements of the panel are as follows:)

STATEMENT OF O. R. STRACKBEIN, CHAIRMAN, THE NATIONWIDE COMMITTEE OF INDUSTRY, AGRICULTURE, AND LABOR ON IMPORT-EXPORT POLICY

The President in his special message to Congress on January 10, 1955, stated:

"The Nation's enlightened self-interest annd sense of responsibility as a leader among the free nations require a foreign economic program that will stimulate economic growth in the free world through enlarging opportunities for the fuller operation of the forces of free enterprise and competitive markets."

He added that "our own self-interest requires such a program because (1) economic strength among our allies is essential to our security; (2) economic growth in underdeveloped areas is necessary to lessen international instability growing out of the vulnerability of such areas to Communist penetration and subversion; and (3) an increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people."

Thereafter the message contained, among other things, specific legislative recommendations that had 5 days earlier made their appearance in H. R. 1 or the trade agreements extension bill of 1955, introduced by Mr. Jere Cooper, Democrat of Tennessee, chairman of the House Committee on Ways and Means.

The statements above quoted, taken from the President's message, are acceptable as generalities, but the extent to which the attainment of the stated goals or objectives rests upon the provisions of H. R. 1; it is based upon certain false assumptions and erroneous deductions from past achievements and failures. The message, to repeat a part of it, says:

"An increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people."

Of course, it would not necessarily do anything of the kind. "Increasing world production and trade" could just as easily take place at our expense and to our detriment.

The sublime or naive faith in foreign trade as the great cure-all for the world's economic ills or as a sure road to the peace of the world, reflected in the message, is a curse and an affliction. It has prevented a clearheaded assessment of the facts for too many years and has reached the ridiculous stage. It is like a spell or a hypnosis under which the victim merely repeats uncritically what the hypnotist says. Or, differently stated, it ranks as a nostrum with the notion that if one spoonful of medicine is good, two spoonfuls are twice as good.

Trade is not and never was a good thing in and of itself. It can be evil and harmful, as the trade in opium. It may be thoroughly immoral as is prostitution. The slave trade was lucrative, but does that mean it was good? The trade in ivory created exchange and added to the income of the people who engaged in it, but was it in the "national interest" of the African tribes where it was carried on?

The halo must be torn from international trade before we can reason soberly about it.

Am I then saying that the President is naive or that those who participated in shaping the part of the message relating to trade are naive or unthinking?

The fact is a whole people can be blind, and a whole national leadership can be led along by a false idea until it explodes in their face. We do not have to strain our memories for examples.

One notion held not so many years ago was that Russia would quickly crumble under the Hitler onslaught. The fallacy of that judgment was amply demonstrated by events. Another notion was that the German people would throw up their arms and surrender once the war went against them. That also was a false estimate, but very widely accepted. There are enough of such false notions and fads floating around us in other fields, such as medicine, diet, child psychology, etc., to give us pause. Ordinarily, it is necessary only to wait a few years for the upset or for knowledge to catch up. In the field of trade we cling to a used-up idea because we do not seem to know how, when, or where to stop.

It is understandable why certain export interests wish to perpetuate the idea that increased trade, meaning, of course, increased exports, is an unmixed blessing. On the other hand, the support of this idea by economists and private organizations of voters who cut across the economic spectrum merely suggests a bankruptcy of ideas. This in turn may be the result of immersion in a constant flow of inspired comment that in itself has taken on the dangerous aspect of unreflecting acceptances of what is fed to it.

After 20 years of tariff reductions, carried out in 29 bilateral agreements; followed by 3 multilateral agreements; after a reduction of 75 percent in the protection afforded by our tariff and after witnessing the great number of nontariff restrictions on trade imposed by other countries, it is about time that we turned away from this broken-down vehicle to carry us to the promised land. Many of these nontariff restrictions were justified and justifiable and were symptomatic of the economic disruption of war; but that does not change the fact of their existence or obliterate their cause.

We would do far better to study the great shifts that have taken place in the basic foundations of trade in the past 15 years; the distortions in the world economy caused by the great upheavals of World War II and the effects of the political and military realinements of the world. We should ponder the meaning of a policy that would subordinate the strongest economy in the world to the vicissitudes of a necessarily shifting diplomacy in an unsettled world.

We have in the past 10 years contributed heavily to the righting of the war-upset world. We have greatly liberalized our trade. We have greatly increased our imports. They are more than half again as high per capita in physical volume as in 1938–39.

Our diplomacy has been profoundly at fault in not saying these things to the world about our trade. On the contrary, our diplomats and various officials traveling about overseas have aided and abetted the idea that it was our stiff-necked policy about tariffs and trade that caused and sustained the dollar gap. They converted the protests of other countries thus incited into instruments of political pressure on the home front in behalf of more tariff cuts. Only very recently has there been some evidence of a change.

We have actually reached the point in our tariff reductions where a halt is urgent. We have cut to the quick and in some instances well into the living nerves of many of our producers. However, no great reversal is involved; no general rise in tariff rates.

Our producers who are asked to absorb the foreign competition uncovered by 20 years of tariff cutting are entitled to a remedy against errors of judgment committed in the wholesale approach to tariffs cuts or against adverse changes in competitive conditions. There is no demand for undoing such good as may have come from the liberalized trade policy; only for a means of rooting out the evils. This remedy is not in hand. An escape clause that is more responsive to the needs of the case than the present one is called for.

All the minimizing of the losses caused or threatened by lower tariffs, so eagerly practiced by those interested in import profits or export markets or in upholding an intellectual position cannot overcome the very widespread and legitimate concern of the exposed industries and their workers. Final success in this campaign of belittlement would in any case succeed in depriving the very propagators of any real reason for advocating their own program.

In a nutshell, the trade-agreements program has run out of magic. Its constant elevation to the position of arbiter of world economic questions is not justified. As a measure that may be looked to for the attainment and maintenance of full domestic employment, the further general lowering of tariffs would bring us greater liabilities than assests. There is much more employment at stake, directly and indirectly, in the industries and agricultural pursuits that are vulnerable to import competition than exists in manufacturing or producing for export.

The fact that some of these producers are already highly protected by import quotas, such as wheat, wheat flour, and cotton, does not remove them from the list of exposed producers or from the list of beneficiaries of protection. That these groups themselves cotton, wheat, and wheat flour heavily support freer trade for others is only a measure of the high degree of inconsistency of which man is capable.

As for investment in foreign countries as a means of developing and strengthening them, the idea has some merit: but again it is not foreign investment as such that is important. The kind of investment and the conditions under which it is made are more important. Investment in economically unsound projects will not only not accomplish what is sought, but will go sour. The same may be said of investment where expropriation, nationalization, or refusal to allow profit transfers may sooner or later confront the investors.

Inasmuch as tax incentives would tend to overcome the prudence and caution that should be exercised in such investments, their long-term value may be questioned. Also as inducements to industry to seek low-wage areas for location of new plants, tax incentives on foreign investments might do more harm than good. If our capital cannot find foreign outlets that are sound enough or free enough from State control or confiscation to make them attractive without special tax incentives, it certainly is not clear that the granting of such incentives would remove their obstacles to investment; but they might cause the taking of unjustifiable risk.

From present trends of world population it does not appear that our point 4 and similar elements of assistance will accomplish much more than to demonstrate the continuing validity of the Malthusian theory of population.

STATEMENT BY CHARLES P. TAFT, PRESIDENT, COMMITTEE FOR A NATIONAL TRADE POLICY, INC., BEFORE THE HOUSE COMMITTEE ON WAYS AND MEANS

There has been a simple pattern in the testimony on H. R. 1 over the past 10 days. Those who have testified in support of H. R. 1 have included spokesmen for practically every large organization whose primary concern is with the national interest. The bill has also been supported by many individuals representing many industries or groups of industries. On the other hand, almost all of the testimony in opposition to the bill has come from groups which were worried about some particular product or some particular segment of their industry.

There have been allegations of specific injury calling for protection. There have also been broader-based attacks on the bill. Take the question of defense. The people in one fragment of the chemical industry, part of the watch industry, some segments of the petroleum industry, and some of the electrical industry have told you that more tariff reductions will hurt our defense production facilities. But Secretary Dulles and Secretary Wilson, who worry about our defenses on a full-time basis, have said that we need H. R. 1 to keep our defenses strong.

Consider the question of employment. The glass workers, pottery workers, fishermen, mine workers, and hat workers, have told you in effect that they are afraid some of them may lose their jobs if this bill is passed. But the national organizations of the CIO and the A. F. of L. and the railway clerks say that this bill will help American labor and will increase job opportunities. And the Secretary of Labor agrees with them.

Very much the same pattern has held in the testimony of business and other groups. Representatives from a score or so of different industries have testified that H. R. 1 is bad for their business. But broadly based business groups, like the United States Chamber of Commerce, the CED, and the Committee for a National Trade Policy and the groups that represent just people, like the League of Women Voters, say that this bill is good for the national economy.

This distinction occasions no surprise to anybody. It is the same distinction that existed 10 years ago, in 1945, when the only previous debate on increased authority for the reciprocal trade-agreements program took place. Then, as now, the pottery industry, the glass industry, the organic chemical group, the glove industry, the hatters, and others told you that the trade-agreements program would destroy them. Then, as now, the administration and the broad national groups representing labor, industry, and the consumer, denied it, and opposed the position of these industries. Then, as now, I stood here before this committee and urged the continuation and expansion of the reciprocal trade-agreements program. Many of you gentlemen behind the bench today were present then to hear both sides of the issue.

The plain fact is that few industries which have to face foreign competition like the idea. Except for the once rare but now more numerous business statesmen like John Coleman, Charles H. Percy, and Clarence Randall, not many are ready to agree that the foreign competition they face in this market may be good for them. Yet when they get off to one side, away from the worries and strains of their own particular businesses, and think of themselves as part of the whole American economy, most of them are driven to this only possible answer—that more foreign trade is good for this Nation, good for its foreign policy, good for its defense, good for its jobs, and good for its consumers.

This is one basic fact we should not lose sight of. Most Americans, including most businessmen, are for the continued gradual reduction of our tariffs. There have been Gallup polls, polls by the League of Women Voters, polls by Congressmen of their constituents, and other straw votes. The Gallup polls, like the others, show more Republicans for reducing the tariff than for raising it. I think it is fair to say that of those Americans who express an opinion there are twice as many for the continuation of the program as are against it. In the Congressional Record for August 4, 1953, Senator, then Congressman, George Bender of Ohio reported on a poll made of every elected Republican precinct committee man and woman in Ohio. In response to the question "Do you approve of the reciprocal trade-agreements program?" 3,330 said "yes" and only 1,970 said "no." The most extraordinary poll, because it came last year in New England, which used to be the stronghold of protectionism, was the poll by the New England Council. The poll showed that 63.5 percent of the 800 businessmen polled were in favor of lower tariffs.

Though the leaders on both sides of this issue have not changed much since 1945, except perhaps for a little graying at the temples, the world in which we live has changed a great deal. Time has proved that we who spoke on our side of the debate in 1945 were better prophets than those who opposed us. Although our imports of goods, so greatly feared then as now, have increased from $3.9 billions in 1944 to $10.9 billions in 1953, our gross national product has in the same period increased from $211 billions to $364.8 billions and our employment to record figures. Our exports have risen again well above the wartime lend-lease levels to $15.6 billions in 1953 and contributed substantially to our high employment and prosperity. If the reciprocal trade-agreements program has hurt us, it has been a hurt very well concealed.

THE OPPOSITION RECORD

I don't for a moment want to leave the impression that some of the industries that have spread their complaints before you over the past 10 days don't have problems. Of course they have problems. In some cases the problems may not be quite as serious as they would have you believe. For sick industries, some of them have displayed an enormous amount of vitality, tenacity, and financial resources, in attempting to defeat H. R. 1.

To be sure. some of these industries, like the chemical, electrical, and cotton textile goods producers, may be confusing sickness with growing pains. The spectacle of these enormous, vital industries threatened by a trickle of foreign imports is a picture which defies belief.

They are still as much prophets of gloom today when they talk about tariff and the effects of its possible reduction, as they were in 1945.

In 1945 Mr. Rose of the American Tariff League described the bill for new authority, a possible 50-percent cut from then existing tariff levels as involving "the possible breakdown of the American market, American price structure, American wage level, and American living standards by opening the gates of this country to widespread competition with the products of other countries 'with the things we grow or make in this country.' "

On November 5, 1953, in a statement to the Business Advisory Council, Edgar Queeny of Monsanto wrote just what he and his associates have told you here: "Should not the United States freeze present duties until their full effect in a surplus economy can be observed? For, even at their present level, our adverse balance during the first 6 months of 1953 indicates that before too long we may again see apple selling by the unemployed during this Republican administration, too."

This is the official position of the opponents of H. R. 1 in 1955 as it was in 1953 and 1945. On January 26 Mr. Anthony of the American Tariff League said here that the President's program includes the ingredients of general economic distress which could help set off a downward trend in the national level of prosperity.

These people, for all their extraordinary business record since 1945 and their optimism in their annual statements to stockholders, are professional pessimists when they talk to Congress about tariffs.

Mr. Calvin Campbell of Dow, about the same time as Mr. Queeny's statement of 1953, said in a speech to the American Tariff League: "We know that in *isolated* instances we excel in technology or other advantages to a degree sufficient to offset the wage differential." [My italic.]

THE CHEMICALS INDUSTRY

Now really! Would you believe that with such a poor opinion of the strength of our economy and of their own industry the chemical industry would put into new plant in 1954 $1.2 billion and project $1.5 billion for 1955? But they did, and it is better evidence of their real judgment than what they feel and say here about the tariff and its effects. They produce annually $20 billion of goods and chemical exports, for the first 9 months of 1954 were running at the annual rate of $894 million excluding special military items, against only $242 million of imports. They have grown 10 percent a year for 25 years, and developed more than 7,500 new products in that period.

Mr. Campbell and Mr. Queeny and Mr. Lehner are more concerned about synthetic organics. Very well. The total production in this category was about $4 billion, of which $300 million was exported in 1953 against only $50 million imported. Mr. Lehner admitted to you that in the "coal-tar chemical" category of synthetic organics, where, incidentally, exports still exceed imports, no more than $10 million in 1953 was "competitive" under Tariff Commission determination. A recent check of Tariff Commission data shows that the accurate figure for "competitive" coal-tar chemical imports was only $5.8 million in that year.

This is a price question, not one of taking away business. Here is what a purchasing agent of one of the smaller chemical companies told his own industry a few weeks ago:

"The howls against chemical imports are even more ridiculous than those of the sick coal industry against imported crude oil. Imported oil is a tiny fraction of the problem, but it makes the best headlines. What the coal industry really wants is a return to steam locomotives, no gas pipelines, lower wages, and subsidized exports. It has done a notoriously poor job of uniting to find new uses for coal and it seems determined not to face the future problem of atomic energy. The healthy chemical industry should devote less energy to fighting a few imports and more toward new production techniques or superior competitive products where imports are a threat. And, to give due credit, ultimately American manufacturers do meet the threat by lowering their prices, revealing their excessive profit margins and claiming that they were about to do so anyway. (Just between us purchasing agents most of us know why the prices come down.)

"Incidentally, some of those who rail against imports of chemicals have been remarkably avid in importing new chemical ideas from abroad, to the certain detriment of less alert competitors. Synthetic detergents came out of Germany two decades ago. Thorazine originated in France. Versatile polyurethane is a powerful newcomer from Germany which promises to make deep inroads into the foam-rubber business. My own company has felt the competition of Reserpine, an importation from India. Instead of yelling to Congress about how our business has been hurt by this 'foreigner' we are rushing development of new specialties of our own which we believe will be even more effective. Like the rest of our industry we are constantly searching around the world for new ideas to relieve the ills of mankind. That's competition and that's progress and the beneficiary is the American citizen's comfort and his pocketbook.

"It is to your own self-interest on three counts to keep international competition active. First, as purchasing agent for your own company, your job should be to lower your company's costs in any legitimate way you can while insisting on the triple standard of quality, service, and price. If you haven't the courage to combat the arguments of the 'one standard all American price' boys, you will do your management a favor by resigning and letting your secretary copy prices from vendors' catalogs and the Oil, Paint and Drug Reporter. Your self-interest also requires that you keep American competition alive as protection against foreign monopoly, and most experienced purchasing agents don't need to be told how to distribute your purchases to keep them all bidding."

THE ELECTRICAL INDUSTRY

I don't need to add much about the electrical industry. Its production reached $17 billion in 1953 and it exported $800 million in that year. Imports were a little over $50 million or one-third of 1 percent.

As to electrical equipment for powerplants, the domestic industry still retains considerably over 98 percent of the American market. Phil Reed told this committee last week he was particularly concerned about sales of foreign equipment to the United States Government, and pointed out the very great difficulty the American industry had in competing with foreign producers.

It seems to me there is one extremely significant aspect of this situation which has not been emphasized. That is the matter of economy to the United States Government which merely having foreign bidders in the picture appears to afford. In the case of the 8 large generators for the Dalles Dam the General Electric bid was over $1½ million below that of the nearest foreign bidder—English Electric. In the case of generators for Chief Joseph Dam, after the first bids were thrown out, Westinghouse secured the contract with a reduction of $716,000 from its original bid price, or a reduction of about 14 percent.

One is forced to wonder whether it is not the pressure on profits which causes leaders of the heavy electrical equipment industry to testify against foreign competition rather than pressure on costs. These two cases make one believe that United States industry can in fact compete on this kind of equipment if it is forced to. In any case, as was admitted by Messrs. Reed and Price, this is not a tariff problem. Tariffs on heavy electrical equipment are only 15 percent ad valorem and H. R. 1 would, at the maximum, bring a reduction in duty of 2.25 percentage points in 3 years.

FREE ENTERPRISE AND COMPETITION

Do these men really understand what free enterprise means as an American institution? It means competition. It certainly does not mean a domestic monopoly of the American market. Of course we believe in policing our domestic competition here, but since when have we ceased to compete domestically in standards of pay? Wages are low elsewhere because they can't produce as efficiently or at as low costs. We stay ahead on know-how and ingenuity with high wages. Do you remember your Kipling? Hear the skipper of the *Mary Gloster:*

> "They copied all they could follow,
> But they couldn't copy my mind,
> And I left 'em sweating and stealing
> A year and a half behind."

Americans worry about foreign cartels. Cartels are not progressive. The cartel mind tries to eliminate risk taking, which is an essential part of the free-enterprise system. Is there not perhaps a little of the cartel psychology involved in an unwillingness to meet competitive pricing?

Free enterprise depends on free choices and flexibility and mobility not on fixing the pattern forever. Robert Calkins, president of the Brookings Institution, put it right 2 weeks ago. "No settling down to established practice is in sight. Instead wave after wave of technological innovation is in prospect." The president of the Methods Engineering Council of Pittsburgh said the same thing 2 days later and applied it to the tariff. While conceding that tariff protection is sometimes necessary on a temporary basis, he maintained that "a tariff which permits a company to do business without the necessity for improving its methods is a dangerous expedient."

Free enterprise depends on integrity, too. That is not promoted by phony statistics to prove that Great Britain, for instance, is a high tariff country. The United Kingdom imposes its tobacco and gasoline taxes at the time of import of the raw materials or finished product. This is not a protective device or trade restriction at all, but a revenue-producing measure, such as the United States taxes tobacco and gasoline for revenue. If you take these taxes out, the United Kingdom tariff average, even on the American Tariff League basis, is 4.6 percent lower than ours at 5.6 percent.

HOW HIGH IS OUR TARIFF?

Calling our tariffs "low" depends upon ignoring what is kept out by the tariff. Below there is a table showing the rates on some important chemicals with their 1952 import figures in dollars, which indicate how prohibitive rates keep out imports.

TABLE I

Tariff par.	Tariff schedule and commodity (commodity description abbreviated)	Value of United States imports, 1952	Rate in effect on Jan. 1, 1953, or ad valorem equivalent thereof
	SCHEDULE 1. CHEMICALS, OILS, AND PAINTS	*Thousands of dollars*	*Percent*
24	Chemical compounds, n. e. s.:		
	20 percent or less alcohol	2	67.0
	20 to 50 percent alcohol	(1)	103.7
	Ethers and esters, 20 to 50 percent alcohol	(1)	100.6
	Medicinal preparations, etc., over 50 percent alcohol	5	83.9
	Flavoring extracts, etc., except from Cuba:		
	20 percent or less alcohol	3	50.3
	20 to 50 percent alcohol	12	50.4
	Over 50 percent alcohol	(1)	73.3
26	Diethylbarbituric acid, salts, etc	(1)	250.0
28 (a)	Benzyl acetate, etc., and other synthetic odoriferous or aromatic chemicals, n. e. s.[2]	104	55.8
	Synthetic tanning materials [2]	6	68.9
	Coal-tar medicinals: 2-benzyl-4, etc., except from Cuba [2]	81	45.1
	Photographic chemicals (coal-tar) [2]	3	50.8
	Ink powders [2]	2	51.4
	Alizarin, natural; indigo, natural, etc., color acids, n. e. s.[2]	15	49.3
	All other finished coal-tar products, n. e. s.[2]	6	51.1
31 (a)	Cellulose acetate waste	(1)	163.6
49	Magnesium oxide	(1)	67.3
75	Spirit varnishes, less than 5 percent methyl alcohol	1	50.4
81	Sodium nitrite	1	87.6

[1] Indicates imports of less than $500.
[2] Values and equivalent ad valorem rates are in terms of American selling price or United States value.

Calling us low in relation to Canada is shown up in another chemical table where in all but one case entry to Canada is free while our tariff is the equivalent of 40 percent ad valorem.

TABLE II

Product	Manufacturing investment in Canada [1]	Duty	
		Canada	United States
Ethylene glycol (antifreeze)	[2] $25,000,000	Free	(3 cents per pound plus 15 percent ad valorem) about 40 percent ad valorem.
Polyethylene (resin)	13,000,000	do	(4 cents per pound plus 30 percent ad valorem) about 40 percent ad valorem.
Magnesium metal	10,000,000	20 percent	(20 cents per pound) about 73 percent ad valorem.
Phthalic anhydride	6,000,000	Free	(3½ cents plus 20 percent ad valorem) about 40 percent ad valorem.

PROBLEM AREAS

Many industries do have problems. I don't know that hand-blown glass should be put down so much as an industry. Is it not rather an art? As such it competes not on price but on prestige and taste. The tariff can't help it much; it would take an embargo. Are we going to embargo prestige and taste and art that belongs to foreigners?

Nobody could deny that the hat industry has been plagued by the insistence of American men and women on going bareheaded. Do we therefore put an excise tax on bare heads?

COAL

The coal problem, like that of the wool-textile business, is the problem of a sick industry. Let us by all means do all we can to help each cure itself. But let us have all the facts, not the selected ones which coal spokesmen and their auxiliaries bring to this committee.

Let me give you a few basic ones.

Nineteen hundred and forty-seven was the all-time peak production year for bituminous coal. Since 1947, through 1953, bituminous coal demand has decreased by 155 million tons.

What was the composition of this decline in demand? Bituminous lost: (1) 82 million tons in railroads, largely to diesel oils, which are domestically refined; (2) 38 million tons in space heating to natural gas and light fuels; (3) 35 million tons in exports, kept out by currency restrictions, not tariffs; and (4) 29 million tons to other industries.

Coal consumption in public utilities increased 26 million tons. There have also been minor gains in other categories. Compared to this coal loss of 155 million tons in 6 years, heavy residual fuel oil consumption increased by only 11 million tons equivalent over the same period. Six million tons of this was in public utilities where coal consumpton increased by 26 million tons.

Residual oil is not "dumped." Over a period of 7 or 8 years, except for 20 months total, the barge-delivered price of heavy fuel oil in New York harbor area was higher on an equivalent basis than barge-delivered coal. The prices fluctuated independently. The coal people have never made any request to the Government under the Antidumping Act.

There is no evidence that shutting out residual oil helps coal. In the first 10 months of 1954, use of residual oil by public utilities reporting to the Federal Power Commission dropped 21.4 percent from the prior year, coal increased 1 percent (more than accounted for by new facilities), and natural gas increased 13.6 percent.

Shutting out residual oil definitely hurts American manufacturers in 30 States employing 30,000 people in manufacturing for export to Venezuela. They send $170 million of goods paid for by the 80 percent of Venezuela residual oil imports that would be excluded by the proposed 5-percent quota.

So far as national defense is concerned, existing mines by going to a full week without overtime could add 150 to 200 million tons of coal a year. With all the shifts that have taken place to oil and gas, even with our present industrial capacity, 400 million tons of bituminous in 1954 plus 70 million tons is ample for war needs. According to the latest Bureau of Mines data, current capacity in the bituminous industry actually is 670 million tons.

The real employment problem in coal mining is the turn to strip mining, which accounts for fully 25 percent of total bituminous production. This is a technological change opposed as vigorously by the United Mine Workers as is the importation of residual oil, but with less publicity. This is because strip mining employs many fewer people, and has no place for most of the skills of deep miners. In fact, of the 142,000 out of work since 1947, the loss of 85,000 can be attributed to improvements in technology and productivity. How much of this is better machinery in deep mines and how much strip mining, is a question the coal people had better answer to this committee. At least it is not imports of residual oil.

In addition I found out last week that the mines in southern Kentucky and Tennessee, on the Southern Railroad at least, had no competition from residual oil since the last reduction in freight rates down there.

TEXTILES

The other industry that is often called sick is textiles. This is another case where we need to look at the facts. There is not one textile industry but many, and only a few are sick. Woolens and worsteds and carpets have been sick. Cottons and synthetics have not. We export 6 percent of our production of cotton textiles and import the equivalent of one-half of 1 percent. In cottons, the great middle area has no important competition. Only in very high-grade specialties and in the very cheap lines has there been any particular effects from imports.

For support of this last statement I quote Matthew J. Cuffe, president of the Textile Export Association, in a speech to the American Cotton Manufacturers Institute at New Orleans on April 23, 1954. In the so-called middle ground, he said, United States cotton textiles cannot be surpassed in price or quality.

"There are no mills in the world which can produce denim, percales, chambrays, vat-dyed twills and drills, corduroys, sheets, towels, and other items at prices equal to ours when quality factors are taken into consideration."

The best labor union economist in the business told me the same thing a year ago. Our cotton-textile industry is the most efficient and most innovating in the world. Any temporary advantage in wages abroad will not upset the industry.

The synthetic textiles are even better off.

As to most countries trying to send staple textiles here, their textile industries have been built up as part of a colonial system and they are not efficient. The number of European textile workers has shrunk greatly and is still shrinking. A United Nations report published in Geneva on Monday a week ago confirmed this. The director of the study also confirmed my main point to this committee that the capacity of economic systems to change is one of the main determinants of their capacity to grow. Protecting the status quo by using tariffs is stagnation and death, not American growth and success.

Wool textiles are in a different status. They have been badly organized. They were many old inefficient mills which had to be reorganized. Synthetics hit them hard. From 1947 to 1953 there was a decline in sales of men's woolen suits of 7 million units. High protected wool prices, fluctuating widely, aggravated a bad situation. The rash of mergers in the last year has helped; the last and one of the most important of these was announced last Friday. The conclusion from all this is that the manufacture of woolen textiles must be done in integrated companies which can adjust flexibly to consumer tastes and demand. They are now moving fast in that direction and the prospects are good.

I would agree that reductions in these tariffs should be approached cautiously, but the approach should favor efficient operations. This is exactly what H. R. 1 would do.

HIGH PRODUCTIVITY VERSUS LOW WAGES

Since they cannot demonstrate actual injury, the opponents of the bill shift to arguments about the threat of injury in the future. At the center of their position is the age-old slave-wage argument. You all know that one too well for me to add anything. But let me say a word, anyhow.

There are a few cases in which foreign industry, operating with cheaper labor costs, has managed to overcome all of its other obstacles and has undersold its American competitors in this country. In the few cases in which this has happened it has represented a real triumph of man over his environment. For the European competitor of the American manufacturer starts with close to three strikes against him. In many European industries cheap labor is not cheap at all, once the manufacturer calculates his costs on a unit basis; it costs very little by the hour, but often costs a great deal by the piece. In every industry, the European pays 2 or 3 times more for his capital than his American competitor. In every industry, his power costs are higher; in most industries, his raw-material costs are higher, too. Almost universally, he does business on a scale so small that he cannot begin to equal the economies of his American competitor. And, finally, he often operates in an environment saddled with the restrictions of cartels, where the incentive to cut costs is weak and diffused. His wage costs are multiplied by fringe benefits, too. With these handicaps, the European who can match our prices in our market is a man to be admired.

In any case, for every case in which a European industry can match our price here, there are a dozen which run the other way. Scores of American industries, big and little, have been able to outsell Europeans in their own home territory and in third-country markets. Our export figures already referred to are a conclusive demonstration of the position of American industry abroad. The fact that foreign countries have had to ration the dollars which their citizens use to buy our goods only emphasizes how much our goods are demanded and bought.

THE CONCEPT OF RECIPROCITY

Ten years ago and again in 1948, when I appeared before this same committee, there was a great deal of discussion as to whether this reciprocal-trade program was really reciprocal. There is even more discussion of that point today.

As far as I am concerned, I think that the record of the last 10 years bears out the most optimistic expectations as to the response of other countries to a reciprocal-trade program. Look at the facts.

Ever since 1945, there has been what amounts to a universal tariff truce throughout the world; there have been none of the outbursts of tariff wars that sporadically used to rock the world's trade between the two great wars. More than that: well over 50,000 items in the tariff laws in more than 40 countries have been reduced or prevented from increasing under this program.

It has become fashionable to say that other countries' tariffs don't really matter; that quantitative restrictions and exchange controls have taken their place. This is a substantial overstatement of the case, of course, since some of our biggest customers, such as Canada and Cuba, do not use quantitative restrictions and others, such as Switzerland, use them sparingly.

But let us have a close look at the picture on quantitative restrictions. In 1946, practically every nation on the globe except the United States was maintaining extremely tight quantitative restrictions on its imports. Most of them had no choice; they had to use their scarce dollars to buy American cotton, wheat, oil, and machinery, even if it meant denying their citizens other American products they also wanted.

Since 1946, there has been an extraordinary change in this picture; the change has come about by little unspectacular steps, by slow and cautious measures, but its total impact has been little less than revolutionary. Whereas close to 100 percent of our exports in 1946 were subject to quotas and import-licensing restrictions, I would judge that half our exports—perhaps even more—are now free of such restrictions.

The trend began with Canada. In 1948, the Canadians dropped the quantitative restrictions they had been using to ration their scarce dollars and invited United States goods to come in without license.

The next major step took place in 1951 and 1952, when Belgium first began to relax its import restrictions against dollar goods on a broad scale; today the Belgians have just about wiped out the extensive system of restrictions they had 4 years ago.

In 1952, the dismantling process moved a great deal faster. The United Kingdom paced the process when in the fall of 1953 it authorized unlimited imports of wood, wheat and grains, then followed up by freeing copper, lead, zinc, and many chemicals from import restrictions. In 1954, the United Kingdom went so much further in the process that by the end of the year 50 percent of its trade with the United States was free of restrictions.

In Germany, Holland, Italy, Greece, and other Western European countries, very much the same process has been taking place.

Now, I am not sure how one goes about measuring reciprocity precisely in the trade-agreements program. But this much is clear: other countries have made substantial reductions in their tariffs in return for the tariff reductions we have made. More recently, they have taken major steps in scrapping the system of quota restrictions which existed at the time we entered into our agreements with them. On our side, to the contrary, the trend has been the other way; we have more quota restrictions on imports in effect today than at any time since the end of World War II. If these trends continue, the case of unreciprocated concessions may more frequently be made by other nations than by us.

DEFENSE ARGUMENT FOR PROTECTION

Although our committee fully supports the necessity for such protection of defense industries as may be really required, I have not said much so far about the relation of this problem to the trade-agreements program. A few additional words do need to be said. First, the Symington amendment to the present act remains in force, stipulating that no duty should be reduced if the President finds that such reduction would threaten domestic production needed for projected national defense requirements. That places the responsibility for taking into account national security considerations exactly where it belongs—with the President, his National Security Council, and his Department of Defense, which are primarily and directly concerned with these matters.

But beyond that, nobody is really sure what the right defense-mobilization base may be for an era of thermonuclear warfare. It is not clear to me, and I do not apologize for my ignorance, whether we are better off relying on plants concentrated in the industrial areas of the United States, or on plants scattered throughout the free world to supply the needs of ourselves and our allies if we are to meet this strange new type of warfare. I am not even sure whether a mobilization base will be a meaningful concept any more in such a war, or whether we shall simply have to make do with the materials at hand after one great initial strike.

However, if we can afford to think of a mobilization base in conventional terms, then the question is whether the trade-agreements program helps or hinders the development of such a base. On that score, this committee has heard a succession of claims from sections of one industry or another that its particular plant and its particular set of skills are crucial to the conduct of warfare and that foreign competition is squeezing out its plant and its skills.

The one major mistake this Nation could make in mobilizing itself for modern warfare—conventional or otherwise—is to compartmentalize its skills. If another war should ever occur, even the most optimistic of us will have to assume that our plants and industries will be cruelly bombed. Crucial plants may be razed; transportation facilities disrupted.

The experience of Germany in World War II, as disclosed by the strategic bombing survey, taught us one major lesson in the conduct of that kind of warfare. Nations can get on with next to nothing in resources, provided they have versatility and flexibility in their industry; they can substitute and make do so long as the general level of their industrial skills and engineering and executive abilities is high.

This is the antithesis of the pattern into which we would be pushed if we were to succumb to the pressure of protecting every little pocket of specialized industry, every little branch of specialized skills. The one thing we cannot afford to do is to allow the extraordinary talent in our chemical industry, our electrical industry, and our machine-tool industry to grow soft under easy competition. On the contrary, every American skill should be constantly exposed to the best competition the world can bring to bear against it. Every stimulus should be encouraged to find new ways in American industry of making better products at lower costs. I am confident that American industry, by and large, will meet most of the challenges thrown in its way by foreign competition. Whether it meets the challenge or not in each individual test, America's knowledge and strength will be enhanced in the process of trying. If we insulate ourselves from the impact of foreign competition, the smugness and dry rot of protected industry will sap our strength without our even being aware of the process.

While I am on the subject of America's defense, let me say a word about Japan. I cannot for the life of me understand the callousness with which some of us approach the problems of trading with Japan. A few days ago, the American Congress gave the President the power to go to war if necessary in order to protect our outposts in Formosa. We look on the maintenance of this island—rightly, I think—as so important to our future that we are willing to risk our national life to retain it.

But there are more ways than one of losing an island. If Japan goes over to the other side—or if Japan decides that she has to play economic ball with both sides of the Iron Curtain in order to live—we will have lost an outpost more important than Formosa. Yet there are those who urge that this risk ought to be taken in order to preserve America's knit-glove industry and the handkerchief lines in our textile mills. I do not think that our knit-glove industry or our handkerchief lines will disappear in the face of Japanese competition, but, even if they did disappear, the plain fact is that it would be far better to lose them than to lose Japan.

Statement by Willard L. Thorp, Director of the Merrill Center for Economics, and Former Assistant Secretary of State for Economic Affairs

The Economic Report states flatly that "the foreign economic policies of the United States can be a powerful instrument for strengthening the security of our Nation and the free world." It emphasizes their relationship to overall foreign policy in saying that "our trade and investment policies affect our ability to increase the solidarity of the free world." It recognizes their economic significance when it says, "Such actions will not only help to increase world production and trade; they also will help to assure a rising standard of living for our own people."

With this evaluation of the importance of "strengthening our economic ties with other countries" I am in complete agreement. Unfortunately, the specific program laid out falls far short of the challenge of these statements of high purpose. Although the Council and the President are pointing this "powerful instrument" in the right direction, they propose to touch the accelerator ever so gently, and always to keep one foot poised over the brake.

First are the proposals dealing with trade barriers. Authority would be given to negotiate further trade agreements on a reciprocal basis, reducing present rates on individual commodities by not more than 5 percent per year in each of 3 years. Disregarding the fact that the machinery can hardly be put in motion to use the first of the 5 percents, a 15-percent reduction from present levels is little indeed, from 50 to 42½ percent or from 20 to 17 percent. The authority to bring rates above 50 percent down to that level is fine but it will leave so much protection that I doubt if this will have much significance except to those who calculate unweighted averages of rates, and the same goes for the cases of negligible imports. I fear that the proposals will mean relatively little effective reduction in tariff rates.

Other difficulties which handicap the importer are also given little relief. I heartily applaud the suggested changes in customs procedures, for these have been a large but little appreciated obstacle to imports. However, we are still to operate under the escape clause, which is a continual threat to any importer who endeavors to expand his market in the United States. Since this procedure was intended to prevent or correct mistakes made by our trade-agreement negotiators, I would suggest that there be some time-limit set, so that if a lowered rate has not caused injury for, let us say, 3 years, it can no longer be challenged. Under its present form, the escape clause stands as a permanent threat to the development of new trade channels.

One other type of uncertainty is that once again it is proposed to set our trade policy for only 3 years ahead. Why must we keep on this business of going over and over the same ground every year or 2 or 3? Since 1934, the Trade Agreements Act has been renewed again and again. The same witnesses have presented the same arguments again and again. The Congress can always enact amendments to permanent legislation, so why must the world be led to believe that we cannot determine the outlines of commercial policy for more than 1 to 3 years ahead?

The basic economic problem in the area of trade is still that of bringing the relationship between the dollar area and the rest of the world into balance on an economic basis. We still are providing substantial foreign aid in the form of grants and extraordinary expenditures abroad; foreign countries are still trying to hold down their purchases of American goods by quota restrictions; and the lack of general currency convertibility still interferes with the most efficient distribution of economic goods. I am a believer in growth and expansion. I should like to see our program for "freeing the channels of trade" one which would move much more vigorously toward breaking down these barriers to economic progress.

I have the same feeling that the proposals for fostering foreign investment do not match up to the scale and urgency of the problem. I have done my part in the past to try to improve the climate for private investment abroad, and I am convinced that the greatest obstacle today is the basic tension in international affairs. We already have the proposed tax incentive in operation in the Western Hemisphere, and I doubt if the wider geographical extension will have much impact on private investment in Africa or Asia, except as it enriches all those who have already made investments there. Perhaps more help will come from the International Finance Corporation. But all these proposals are of limited effectiveness in the face of the requirements of economic development. I hope that still other steps are implied in the sentence in the report: "The program of technical and other assistance to economically underdeveloped countries should be strengthened." Economic development is a slow and difficult process, requiring assistance in various forms. I should like to feel that the United States was prepared to give strong support in practical ways to countries which could present reasonable programs for their development. We must keep in mind that many developmental steps may have to be taken before private investment can play its full part.

Foreign economic policies can be a powerful instrument, but they must take the form of actions. If we talk of individual enterprise, competition, and open markets, or if we urge other countries to bring their trade into balance by increasing exports, we can hardly be convincing if we ourselves act by closing markets and increasing protection. I am happy that the Economic Report is liberal in its approach. It faces in the right direction, but I regret that the motion which it promises is only at a snail's pace.

STATEMENT OF ARTHUR R. UPGREN, DEAN, AMOS TUCK SCHOOL OF BUSINESS ADMINISTRATION, DARTMOUTH COLLEGE, HANOVER, N. H.

INTRODUCTORY NOTE

This statement has been prepared to cover two quite unrelated aspects of the foreign economic policies of the United States. It deals (1) with the place of foreign trade policy and tariff reduction as a part of total foreign economic policy, and (2) with the interest of United States agriculture in our foreign trade. This statement does not completely express my views with respect to the total foreign aid program. Rather it emphasizes that part of our foreign policy which is of more importance in achieving the international economic objectives of the United States than can be achieved by the recent overemphasis upon tariff reduction alone.

The second part of this statement gives a picture of the true interests of United States agriculture with respect to policies of tariff reduction and import restriction as a part of the price-support program.

PART I

THE CHOICES IN INTERNATIONAL ECONOMIC POLICIES AVAILABLE TO THE UNITED STATES

The choices the people of the United States and their representatives in Congress have in selecting appropriate foreign economic policies to further the international objectives of the United States, can in very large part be seen by a quick review of the policies which have been used since the end of the war. A recent report from the Department of Commerce said that the total amount of economic aid granted since the end of the war had now passed $50 billion.

Obviously what has been or what could hypothetically have been accomplished by tariff reduction is extremely small in comparison with the effect of such a large total amount of foreign aid. The other policies employed by the United States to achieve its international objectives have been of much greater importance than tariff reduction. This statement does not mean that tariff reduction is not important. It is, as evidenced by the extraordinarily heavy emphasis that has been placed upon it. And yet had that policy been employed to the full in the past 8 years, it could probably have had no more than average effectiveness, in comparison with 4 or 5 other policies we have also used in assisting the rest of the world in this period of reconstruction and development.

It is always fitting to emphasize that the most important form of international assistance the United States can render is to keep a strong, highly efficient, and high-producing, domestic economy within the United States. Thus great strength in the domestic economy at home is the greatest factor in giving an economic outlet to the rest of the world. The people of the United States want to keep busy with high productive employment. Doing that is the most important single way in which we can likewise give to the rest of the world with which we freely trade that assistance it too wants in achieving high, productive employment.

A major share of the total imports of the United States come to us quite free of duty. Since there are no duties, obviously the tariff does not obstruct the importation of such goods. The amount wanted here depends upon the levels of purchasing power and industrial production we have at home. If the industrial sector of the economy is operating at high levels, then that sector "chews up" very large amounts of imported raw materials and semifinished products of all kinds. In fact, this assistance is so important as to have led to the observation that through a high producing economy in the United States we have an automatic means of sharing the fruits of our productivity with other countries, particularly the raw material and crude food producing areas of the world. What happens is that as our economy operates at a higher domestic level, incomes are enlarged and all goods, whether produced at home or whether imported, meet a greatly enlarged demand. Since most imported raw materials, crude foodstuffs, and even semifinished materials (refined copper, newsprint, etc.) are produced under conditions of very inelastic supply, an enlarged demand within the United States increases the price of such commodities more than in proportion to the enlargement of purchasing power. Thus by improvement in price, the rest of the world gains very greatly. One need only mention the enormous gain in dollar funds which has flowed in this way to the producers of coffee in Latin America and to newsprint in Canada in recent years.

In contrast, the major share of the exports of the United States are finished manufactures. These are produced under conditions of extremely elastic supply. Consequently as the world gains a greater benefit in dollars by the methods indicated, that flow of dollars now possessed by the rest of the world purchases increasingly larger quantities of goods from the total output of the United States.

Thus not only does a high-level domestic economy render the greatest possible amount of assistance to the rest of the world, but it also provides an automatic mechanism for an increasing flow outward of dollars in payment for the larger values attached to the goods which we import to sustain the domestic economy, to the extent so far as it is sustained by such imports of raw materials, crude foodstuffs and semifinished goods.

The second way in which we have assisted the rest of the world in the past 15 or 18 years is through the improved terms of trade (relative) we offer to the rest of the world. In other words, we are selling much more in goods than the world sell us and we are charging, relatively, much lower (less increased) prices as well.

We can calculate the magnitude of this American contribution to the world from the following short table giving our terms of trade in the base years of 1936–38 and in 1954:

	Indexes of price levels	Indexes of quantities
Exports:		
1936–38 average	100	100
1954	202	252
Imports:		
1936–38 average	100	100
1954	283	148

Here we observe that the prices we paid in 1954 for our imports rose 81 percentage points more than the prices we charged for our exports; the index of import prices rose to 283 while the index of our export prices rose only to 202. Thus the world gained a substantial price advantage in its trade with us between 1938 and 1954.

Turning to the "quantity indexes" in the second column, we observe that the index of goods we exported rose to 252 percent of the base years, 1936–38, whereas the amount of goods we imported rose only to 148 percent of the base years. Translated into dollars, the 1954 terms of trade gained other countries from $2½ billion to $4 billion a year more for their exports than in 1936–38. However, since American industry is unusually productive, other industrialized countries do not share proportionately in the benefits of improved terms of trade unless there is effective "triangular trade." In other words, since we tend to import principally raw materials, European countries capture their share of dollars largely by selling their goods to the raw-material nations to which is flowing the larger amount of dollars we are supplying.

Next we can point out that the grants-in-aid and various forms of assistance granted in dollars have amounted to roundly an annual average of $5 billion since the end of the war. Here reference is made to the first forms of postwar aid including the establishment of the International Monetary Fund, the International Bank for Reconstruction and Developmet, loans to Britain, France, China, etc., and more recently aid extended under the Marshall plan, the Mutual Security Administration, and the Foreign Operations Administration.

The fourth method of extending aid has been, of course, lowered tariffs. It is difficult to estimate the assistance given to the rest of the world as the result of our lowered tariffs. It is certain, however, that the amount of such assistance probably would not put tariff reduction in a better place than fourth place as a "policy means" of economic assistance to the rest of the world.

In fact, we have the very well-known recent estimates by Dr. Howard S. Piquet that complete elimination of tariffs by the United States might in 3 to 5 years increase our imports by amounts placed between $1,300 million and $2,600 million. I think his estimates are unduly large because the greatest factor which would prevent any substantial large inflow of imports as a result of complete elimination of our tariffs is the monumental $160 billion investment of American industry in new plant, equipment, and other production facilities since the end of the war. The fact that this large investment is dedicated to new and more efficient production, combined with the fact that most industry is operating at a profit, precludes in any short run a substantial enlargement of imports. American industry can and will face the competition.

I first learned this lesson 20 years ago during a year of work with the Trade Agreements Division of the State Department. It was then the position of many representatives of industry that their concern with lowering tariffs was not a resulting large inflow of imports. In fact, their concern was far greater with the "price effect" which would ensue from reduced tariffs. At that time the price effects might even have destroyed profitability and it might injure profitability today. It might also adversely affect rates of new business investment.

The reasoning here follows: If a tariff is reduced, an American manufacturing industry which is thereby affected, does not resign the domestic markets to foreign producers. Far from that. Rather the domestic industry is faced, in its determination to retain the major share of domestic markets, with the necessity of lowering prices to meet the new price situation created by tariff reduction. Since American industry today is generally and widely profitable, it can make such reductions without being thrust into a position of suffering deficits in income statements, though profitability may be reduced. Further, inasmuch as the domestic industry has a substantial new, greatly enlarged investment in plant, it can afford to continue to operate so long as some recovery is made on this investment over and above all out-of-pocket costs. Only very slowly at best would foreigners win a larger portion of the market, and domestic producers might lose some of their profitability.

It is sometimes said that lowered tariffs would mostly benefit the handicraft industries of the countries of western Europe. But this will hardly prove that there will be a greatly increased volume of imports subsequent to our reduction of tariffs upon such goods. The point is that the goods are produced by "handicraft" industries. Europe has such completely full employment today, that there are no more "hands" left (supplies of labor) to increase the output of such handicraft industries. To be sure, there would be a general gain from some increase in the purchase of goods of these types imported from abroad but it would not be large, nor would it be desirable from the point of view of the European countries themselves. Somehow, someway, what is needed there is a broad integration of their present smaller markets so that new modern, known, improved techniques of production can be employed widely in, not handicraft, but in machine industries. The encouragement of handicraft industries may assist somewhat in winning a larger dollar supply out of our markets, but it will not greatly assist in winning a higher standard of living for the countries of Western Europe. Higher standards of living are not won by great expansion of handicraft industries. Rather such an expansion would subtract from the kind of economic development which is wanted in Western Europe for the greatest improvement of Western Europe's own standard of living.

A final, or at least fifth way, in which we have assisted the rest of the world is through private foreign investment. Unfortunately, because of widespread feelings of political insecurity in many parts of the world, American capital has not been prepared to flow into investment in other countries in large amount. Here we may think of $1 billion as probably representing the maximum which has been used to assist in foreign countries in recent years in this way.

Now a rough summary of the ways in which we have actually assisted the rest of the world may be helpful:

1. The greatest method of assistance has been the high productive levels of the domestic economy of the United States. Here the amount of aid we have given is perhaps not measurable but it can be pointed out that import levels of $2,050 million in 1935 and of $2,300 million in 1939 (depression years) have grown to more than $10 billion in each of the past 2 years of high domestic prosperity.

2. The gain to the rest of the world from financial assistance of all kinds has in the postwar period averaged roundly $5 billion annually. It has totaled $50 billion.

3. The third means whereby the world has greatly benefited from the United States has been as the result of the fact that we have sold larger quantities of goods than the rest of the world has sold to us and we have charged for these exports of ours a very substantially smaller increase in prices than the rest of the world has charged us for imports we have received from them. In fact, the gain in "terms of trade" has been more than enough to equal the total level of our imports in any pre-World War II years back to 1929.

4. We have assisted the world by steady reduction in tariffs. On all goods subject to tariffs, our latest effective dutiable level recently has been about 12.4

percent compared to a level of 48 percent in 1930 after the passage of the Smoot-Hawley Tariff Act. We have steadily lowered tariffs and the reduction in our "effective tariffs" has gone beyond "formal" tariff reductions. This has been the result of the fact that for all "specific" duties, the "effective" rate of tariff declines as there is a price advance for the goods which are subject to such specific duties. Suppose, for example, a duty of 50 cents is charged on a pound of cotton fabric of some type which at the time that specific (not ad valorem) tariff is levied, sells at $1 a pound. The ad valorem "equivalent" of such a specific tariff is 50 percent. If, however, the price of such a quantity of cotton textiles rises to $2 a pound, the duty is reduced from a 50 percent ad valorem equivalent to a 25 percent ad valorem equivalent, even though there was no change in the rate of the specific duty being levied.

A total amount of estimated annual gain to the rest of the world in trade with us which would come from a complete abandonment of our tariffs may be expected to be below a $2 billion figure. Such estimated gain would not be achieved at once but only over a considerable period of time. Thus, the slogan of "trade, not aid" is one that, if it can be won at all in its full meaning, can only be won after time. It could not have achieved the objectives its leading proponents claimed for it in recent years, especially early in 1953.

All available foreign economic policies must be considered and various choices made if we are to achieve our important and substantial foreign economic purposes. Maximum attention has been given to the subject of lowered tariffs. Adequate analysis has not been given to show the limitations of this policy to assist the rest of the world in the immediate future. These limitations are very great indeed. Certainly people should not be under the impression that we could have provided by tariff reduction anything but a small proportion of the assistance we have wanted to give to the rest of the world. A tariff reduction policy is desirable over future years, because it will promote greater efficiency in United States industry or the abandonment of domestic markets by our least efficient producers to goods which can be more efficiently produced abroad.

For Europe to win the larger amount of dollars which would give adequate supplies of dollars to the countries of Western Europe, requires even more that trade restrictions in Western Europe be greatly reduced and that techniques of production be greatly advanced in accordance with available knowledge of improved and more efficient means to produce. Thus it is mostly for Europe to solve Europe's own demands for increased economic welfare. Only a very minor proportion can be solved by tariff policy on the part of the United States.

PART II

THE INTEREST OF AMERICAN FARMERS IN AMERICAN TARIFF POLICY

American farmers have hugely increased their efficiency, productivity, per-man output, and per-man-hour output in recent years. Since the end of the Second World War there are 25 million more of us in the United States. Despite that large increase in our numbers, we are all fed 13 percent better than only 10 years ago. This represents a remarkable increase in total production and in efficiency of American farmers.

The Department of Agriculture estimates that total output of American farms has increased 75 percent in the past 4 decades with 5 million fewer workers in agriculture. In the same 40-year period agricultural output per man has increased 175 percent. In the last 15 years per-man-hour has increased 91 percent. No important industry of such size has had an increase in productivity and output of so great a magnitude.

American farmers should ask that industry secure like efficiency in order that this large increased volume of farm output may continue to be profitably marketed.

What are the interests of American farmers in American industry and through that, in American tariff policy which can affect American industry?

Substantially more than half of our total agricultural or farm output consists of livestock and all its products. The share of these products in total farm production is probably about 60 percent today. In the Corn Belt States, the share of total farm output represented by livestock and its products is in excess of 70 percent. In Minnesota it is 74 percent, possibly higher in Iowa.

The interests of farmers, therefore, in industry can be simply defined: American agriculture is interested that industry shall produce most efficiently, paying the highest possible wages in order that farmers may have profitable outlets for the products of the farm.

As American agriculture has shifted from a preponderance of cereal production to a preponderance of production of livestock and its products, American farmers can be said, briefly, to be interested that American industry shall pay sufficiently high wages to make meat-eaters of the workers who produce our industrial output. Meat eating, or in more general terms, the consumption of all forms of livestock products, requires that industry must be productive and pay high wages and that there be an efficient agriculture. These requirements are generally met in the United States but American farmers should in their own proper interest be more insistent that American industry as a whole improve materially upon its present performance. Cereal consumption in a substantial degree is a feature of low-wage countries with inefficient agricultures.

Consequently, American agriculture has the primary interest that industry shall be efficient and produce high wages. What has American tariff policy to do with all this?

In the United States, without making invidious comparisons, we have high-wage industries and low-wage industries. Out of the high-wage industries come the wage payments which sustain families in a high-quantity, high-quality, food consumption, mainly of meat or livestock products. Out of low-wage workers' families comes a low-purchasing-power ability for these more desirable and of course, more expensive farm products.

Consequently American agriculture has the interest that it should support all economic policies which would increase the total efficiency of industry. One way in which this could be done is by reduced tariffs.

But can a guide be furnished for the way in which tariffs should be reduced? The guide would be to make an array schedule of the wages paid by the different industries in the United States. The rank order would be from those paying the highest wages, namely all the building trades and the coal-mining industry, for example, when the latter enjoys full employment. Next perhaps would be the automobile industry, for example, in which the weekly wages last year were in excess of $92. The average weekly wage for workers in all durable industries in December 1954, was $80.15. In the nondurable goods industries, the average weekly gross earnings were $66.47. The average weekly wage for all workers engaged in manufacturing was midway between these 2 figures—$74.12. With wages for coal miners averaging more than $80 a week; with building construction workers averaging more than $95 a week; with wages of railroad workers averaging $78 a week, there naturally must be as many groups whose workers earn substantially less than average earnings ($74 for all factory workers in 1954).

Many studies in the past show the high and very increased consumption of meat, milk, dairy products, cheese, butter, and other poultry, dairy, and livestock products which prevails in families where the breadwinner (a misnomer today) receives a high weekly wage. In contrast, the consumption of these products is necessarily low for those families whose breadwinner is earning low wages as the result of employment in those industries which, unavoidably and despite their best efforts, have a lower productivity and therefore can only pay lower wages.

Clearly the interest of agriculture is to maximize the number of workers in industries of average or better-than-average wages. A persistent lowering of tariffs upon the imported goods so that they may slowly displace the goods of our lower wage industries will gradually mean that our future industrial expansion will come from the higher wage industries. New workers will be attracted to the employment opportunities available in such industries and will be dissuaded from entering the fields which will be slowly declining as a result of the exercise of this type of tariff-reducing policy.

To the extent that our total imports can be enlarged our total exports will be enlarged. Our exports are preponderantly the products of industries which are the high-wage industries. Thus there is the double gain by this method of tariff reduction that we expand employment in the more profitable industries and the higher wage industries and we discourage new employment in the less profitable, declining, and lower wage industries.

The key to the level of wages is not easily found. One extremely important factor, however, is the total investment per worker.

Such investment ranges from roundly $50,000 per worker in the utility industry, down through from $35,000 to $25,000 per worker in the petroleum industry, on through $20,000 to $15,000 in the chemical industry, to the national average of perhaps $10,000 investment per worker in all manufacturing industries. Other industries are to be found where the investment is perhaps unavoidably smaller than in the industries we have named. In consequence wages are lower too.

A third great advantage in the creation of high-wage, high-meat-consuming families is to be gained by a policy which encourages industries which have a high capital investment. That high capital investment naturally if the industry is expanded, will be further enlarged. Thus the construction trades and machine-making trades will increase their numbers of high-wage-earning workers.

It is extremely interesting to observe that American agriculture itself is an industry of very high investment per worker. For all American agriculture the total gross investment today is more than $22,500 per worker. Taking the farms which produce the major share of the total supply of farm products marketed commercially, there is a per-farm investment which will range very substantially upward from $25,000 per worker through $50,000 per worker and on up. This standard of investment per worker in farming compares favorably with the extremely higher investment level industries. Thus agriculture is already practising the policy it would preach for others.

In turn, other countries which are somewhat long on labor supplies and, somewhat short on capital supplies could, as a result, specialize in the industries in which they have for these reasons a greater advantage. We in turn in the United States could continue our specialization in the industries in which we have the greater advantage.

Such a policy would in no way discourage growth industries, or the growth in all more efficient industries. These growth industries and growing industries are needed for the very substantially increased volume of employment which will be wanted soon as the very greatly increased numbers of young since 1940 move forward to the thresholds of their future employment. Industries which are growth industries or which are growing rapidly are almost certain to be large-capital-using industries. It is their capital investment which makes not only an important contribution to total production in the United States but which makes a most important contribution to the number of workers in the high-wage-earning categories which further supply the high demand for farm production of today.

American farmers could secure a great gain from this guide to trade policy which calls for reducing tariffs upon the products of those industries unable, because of an inherent inability to use large amounts of capital per worker, to pay the high wages which create the demand to absorb the livestock products which make up the major share of farm output in the United States today.

Statement of Jacob Viner, Professor of Economics, Princeton University

I support heartily the general principles stated by the President with respect to the economic foreign policy of the United States in his Economic Report, and in his message to Congress of January 10. I in general support also most of his specific recommendations. I would have preferred, however, a closer match between the vigorously expressed and highly persuasive exposition of the general policy and the meager, hesitant, and partial program proposed for carrying out this general policy.

It is in the interest of the prosperity and the security of the United States that the economies of our allies, friends, and potential friends abroad shall experience steady and significant growth from year to year. More liberal access to the American market for their commodities and services can be a major factor in promoting this result.

American prosperity would be promoted by a more liberal commercial policy on our part. It is in our own economic interest that we shall move steadily toward the objective that we obtain from abroad in exchange for exports of our own commodities and services such desirable commodities and services as cannot be produced here, under normal conditions and in normal years, at as low or nearly as low a cost as the cost to us of buying such or equivalent commodities abroad.

In the past 20 years, there have been substantial reductions in our tariff rates and, because of inflation, there has been also a substantial reduction of the ad valorem equivalents of the specific duties of our tariff. The cuts that have been made in our tariff, however, have been in large part those that could be made without appreciably reducing the control of our protected industries over the domestic market. To a large extent the reductions in our tariff which would really lower the effective margin of tariff protection remain to be made. The percentage of imports of dutiable goods to total domestic production of such goods in the United States is probably less today than it was in 1934, when the process of tariff reduction began. This decline in the relative importance of imports is due to many factors, of which failure to make genuine and important reductions in the effective level of our tariff protection is only one. This decline serves, nevertheless, to support the verdict that much of the tariff liberalization of the past two decades was make-believe.

Even deep cuts in tariff rates may have only token effects on the volume of trade if the foreign producers and the American importers of the commodities in question cannot be reasonably confident that these cuts are made with serious intent to encourage imports and will not be withdrawn as soon as it becomes evident that they are having their supposedly intended effect. In many cases successful entrance into the American market requires redesign of products, adjustment, and expansion of production facilities, establishment in the United States of warehousing and distribution facilities, expensive sales effort to win market acceptance for the products. Sober, foreign businessmen will often rightly conclude that the risk that the tariff will be raised on their products as soon as it becames clear that there is an American market for them is too great to justify the investment necessary to find out whether they can sell their products here.

In the light of these considerations, the proposed limitation to 3 years as the period of authorization of reductions of duty by executive action, the limitation, with respect to most dutiable items, of reductions not to exceed 5 percent per annum, the continued subjection of the reduced duties to the hazard of cancellation of the reductions under the escape clause, these make the program as a whole a very insubstantial and timid contribution to the goal of a more liberal commercial policy for the United States.

Whatever may be said in favor of tariffs on imports, there is nothing which can be said in support of import restrictions being given the form of making the importing process unnecessarily costly in legal and clerical expenses, in deliberately manufactured risks for the importers, uncertainties and delays, through archaic administrative procedures which burden the American Government, the foreign exporters, the American importers, and the American consumer. The delay in instituting a thoroughgoing reform of our customs administration which has already occurred is inexcusable. What has recently been accomplished in this direction is good as far as it goes, but goes only a small distance toward removing abuses whose nature has been evident for many years. There has been more than ample time for exploration and for resolution of the technical questions to which revision gives rise. The time for real remedial action is long overdue.

Our treatment of agricultural imports is entangled with the special measures which we have taken to promote the prosperity of our domestic agriculture. It would admittedly be inconsistent and impracticable to allow foreign agricultural products to enter freely into the American market while domestic agricultural products are supported at higher than world-market prices. But whatever our policy should be with respect to the income levels of the persons and resources engaged in agriculture, we should carry it out by measures which retain in American agriculture only those amounts of human and other productive resources which, without subsidy, can earn in free competition the economic equivalent of what corresponding American productive resources earn in American industry at large.

It is our restrictions on agricultural imports which press most severely on the underdeveloped countries and on our neighbors to the north. It is our agricultural program, with its quotas on imports, its subsidies to exports, and its governmental trading, which conflicts most obviously and most importantly with our declared objectives of free private enterprise operating in free competitive markets and of the confinement of restrictions on foreign trade to nondiscriminatory and moderate import duties. When agricultural policy comes to be considered and, I hope, to be reformed, it is urgent that one of the major objectives shall be such a revision of that policy as to make it consistent, in its foreign economic policy aspects, with all the principles of liberalized foreign trade to which we so repeatedly declare our adherence.

STATEMENT OF THORSTEN V. KALIJARVI, DEPUTY ASSISTANT SECRETARY FOR ECONOMIC AFFAIRS, DEPARTMENT OF STATE

The basic aim of our foreign policy is to improve the security and well-being of the United States. This objective is generally accepted and understood. What is less widely understood is the fact that our international economic policies are a major instrument for achieving this objective.

The President clearly outlined the objectives of his foreign economic policy in his message to Congress on the program. He stated:

"The Nation's enlightened self-interest and sense of responsibility as a leader among the free nations require a foreign economic program that will stimulate economic growth in the free world through enlarging opportunities for the fuller operation of the forces of free enterprise and competitive markets. Our own self-interest requires such a program because (1) economic strength among our allies is essential to our security; (2) economic growth in underdeveloped areas is necessary to lessen international instability growing out of the vulnerability of such areas to Communist penetration and subversion; and (3) an increasing volume of world production and trade will help assure our own economic growth and a rising standard of living among our own people."

As these objecitves are attained they will aid and expand the economy of the United States as well as those of other countries. Thus the objectives of the Full Employment Act will be served, for the program is designed to "promote maximum employment, production, and purchasing power * * * in a manner calculated to promote and foster free competitive enterprise."

The principal trade measures in the President's program are the 3-year extension of the Trade Agreements Act, the revision of the General Agreement on Tariffs and Trade with submission to the Congress of the organizational provisions of the new agreement, multilateral trade negotiations with Japan, customs simplification, clarification of customs evaluation, increased tourism, support for trade fairs, and a liberalization of the administration of the Buy American Act. Chief measures pertaining to investments are the so-called 14 points tax advantage on investments abroad, the deferral of tax on income of foreign branches until such income is withdrawn from the country in which it is earned, tax treaties, the International Finance Corporation, the encouragement of measures by other countries to attract private United States capital, and increased Export-Import Bank loans. Other parts of the program include foreign economic aid, technical assistance, and the use of agricultural surpluses to expand consumption abroad and to promote economic development.

The President has referred to this program as "moderate" and "minimum." In his letter of transmittal of the report here under consideration, he says:

"Measures by ourselves and other nations to reduce existing barriers to international trade, payments, and investment will make the free world stronger and aid our own economic growth."

This seems axiomatic to most of those who deal with foreign economic policies. Unfortunately it is not always so clear to those not so occupied. There is a ready acceptance of the need for the many political and military arrangements that we have with other countries, such as NATO. But the reasons why the Schuman plan, for example, should have active United States support are not as widely recognized. And when it comes to trade liberalization and the free flow of capital the connection with our broad foreign policy objectives seems remote indeed to some. But alliances of the free world either reflect a mutuality of interests shared by the peoples of the countries involved or they are doomed to a destiny of frustration. Specifically, when fears, doubts, and disputes over economic matters develop between countries, they undermine intergovernmental confidence creating an atmosphere inimical to political and ideological loyalties among peoples. Thus if the United States is to exercise political leadership in the world, it cannot escape the companion role of economic leadership. That means that it must pursue economic foreign policies that will produce the results it seeks, namely growth, stability, trust, and cofidence among the nations of the free world.

Wise and constructive policies today are more imperative than ever. Not only are they calculated to create confidence among our allies in the cold war and to make new ones for us. But, they are of direct immediate benefit to us in the sense of the Full Employment Act. Let us note for a moment what is involved from the standpoint of our own economy.

In 1953 when the gross national product was $365 billion, exports including military aid came to $21 billion, or almost 6 percent of the GNP. This compared with gross receipts from farming of 8.5 percent; nonform residential construction of a little over 3 percent; business expenditures for capital equipment of a little over 6.5 percent; and consumer purchases of durable goods of a little over 8 percent. About 4⅓ million jobs are attributable to work generated by our exports and handling of imports. About 10 percent of our agricultural income is derived from exports. In recent years the production of 30 to 50 million acres of our cropland has been devoted to foreign consumers. In the most recent market year, 1953–54, wheat, cotton, and tobacco farmers shipped from 19 to 26 percent of their production overseas, while rice growers exported almost one-half their harvest.

We are programing a disposal of $453 million worth of surplus agricultural commodities abroad in fiscal 1955. In recent years, manufacturers of tractors, construction and mining equipment, oilfield machinery, textile machinery, and lubricating oil made 20 percent or more of their sales in export markets. Last year 10 percent or more of the output of machine tools, tinplate, steel rails, refrigerators, motortrucks were sold abroad. These are only a few statistics. The short-run effect of United States economic aid is to increase United States exports, e. g., every Export-Import Bank loan and guaranty promotes the export of a United States commodity. The long-run purpose of technical and economic aid is to raise the productivity and purchasing power of foreign recipients. The result over time is (*a*) to enlarge markets for our exports, and (*b*) to promote the expanded output of basic materials we need to procure from abroad.

The short-run effect of private foreign investment is to increase the export of United States commodities, since United States direct investment is generally tied to United States goods. The long-run effect of private foreign investment is to increase production and income abroad, with the result of expanding markets for United States goods and increasing the output of scarce basic materials on which United States economic growth depends.

When we look abroad, the significance of the President's program is equally forcefully borne in upon us. The United States occupies a position of economic leadership regardless of its wishes. The question is whether it uses this position for good or for harm—that is, to build or to undermine the strength and cohesiveness of the free world. It hardly seems possible that United States economic policies could operate merely as a neutral force.

The predominance of the United States in the world economy is well known. Accordingly, the course of economic conditions in the United States and the policies we pursue in the international economic field assume tremendous importance in terms of our relations with our allies.

In 1949 we had a slight recession here—a drop in our national income of 3.4 percent. During this mild adjustment Western Europe's exports to the United States dropped almost 22 percent. Chile's sales to us dropped 36 percent, and Australia's 34 percent, partly as a result of the United States economic situation.

In 1953–54 a slight economic adjustment in the United States brought about a drop of $1 billion in the amount of goods we imported. This adjustment in the United States did not, however, have an appreciable effect on Western Europe, proving that that area had recovered its economic strength sufficiently not to "catch pneumonia when the United States catches a cold." In fact, European imports from the United States were sustained throughout this period, and there is evidence to indicate that this was a factor toward stabilizing the growth in world trade and production.

This dependence is dramatic in the case of many underdeveloped countries whose foreign exchange earnings are highly concentrated in a few primary materials. For example, 60 percent of Brazil's income from exports is derived from coffee; in Chile, 51 percent is derived from copper; Colombia, 78 percent from coffee; Cuba, 82 percent from sugar; Venezuela, 97 percent from petroleum; Egypt, 89 percent from cotton; Indonesia, 95 percent from tin and rubber; Ceylon, 78 percent from tea and rubber; Iraq, 80 percent from petroleum; Pakistan, 87 percent from cotton and jute.

Access to foreign markets is also far more vital for some highly developed countries than it is for the United States. Though large in absolute terms, United States exports constitute only about 6 percent of the national income. The United Kingdom's exports amount to 21 percent of the national income; Canada's, 26 percent; Denmark's, 27 percent; the Netherlands', 46 percent; New Zealand's, 37 percent; Australia's, 21 percent.

Since most of these countries are tied to us by way of defense arrangements, we cannot be indifferent to their economic interests and problems. Therefore, the President's program takes them into account.

But the interests of the United States are even broader. The United States has an affirmative interest in the economic well-being of the free world and the President's program asserts it as something good in itself. Even if there were no Communist threat, it is in our interests to promote economic development in the underdeveloped areas and to raise the level of production and trade in the world. In this way we improve our own well-being.

Our conception of the proper role of Government in economic affairs is much more narrow than that of most other countries. In peacetime we tend to think primarily in terms of private action rather than in terms of governmental capabilities. For us the major normal function of Government in the economic sphere is to provide an environment in which private enterprise can flourish free from artificial restraints. This basic creed we carry over into our economic relations with other countries. Our principal specific objectives relate to the removal of artificial restraints on the movement of goods, services, and capital, whether publicly or privately imposed. We seek to reduce tariffs, eliminate quotas, get rid of cartels, do away with exchange restrictions, and remove restraints on foreign investment. We feel that the Government should interfere as little as possible with the free market but should act as the promoter and guardian of conditions under which the market can operate most effectively.

Additional Statement by Thorsten V. Kalijarvi

RELAXATION OF RESTRICTIONS AGAINST DOLLAR IMPORTS

The purpose of this paper is to indicate the progress that has been made in eliminating restrictions against dollar imports by those countries with which the United States has trade agreements. The paper is divided into 2 parts, 1 a listing of the overall liberalization that has taken place and the second section dealing with specific cases of restrictions which have been rectified through utilization of trade-agreement mechanisms.

1. Restrictions on imports for balance-of-payments reasons

During the post-World War II period many countries have had to take severe measures to help pull their economies out of the difficulties created by the war. Faced with limited supplies of dollars with which to pay for the goods they wished to buy from the United States, they have had to ration their funds through the use of import restrictions on dollar goods. The United States, recognizing the difficult economic situation created by the war, has attempted to minimize the damage to its commerce which has unavoidably resulted from these rationing measures. It has tried to insure that the restrictions would be relaxed as soon as improvement in the financial positions of the importing countries permitted. Consultations have been held with many countries in the General Agreement on Tariffs and Trade, the International Monetary Fund, the Organization for European Economic Cooperation, and in bilateral talks concerning dollar import restrictions.

The results of these efforts by the United States has led to progressive elimination of restrictions against dollar goods. The 1954 Annual Report of the International Monetary Fund states: "There was a general trend toward the removal of barriers on trade and payments, and restrictive practices have been considerably reduced and modified."

A quantitative estimate of the extent of liberalization throughout the world is extremely difficult to develop. However, for Western Europe there has been a significant relaxation of restrictions on dollar imports since the beginning of 1953. In that year only three countries in Western Europe—Belgium, Switzerland, and the United Kingdom—had any degree of freedom with respect to goods imported from the dollar area without any limitation by licensing authorities. By the beginning of 1955, 7 additional countries had liberalized imports from the dollar area, with the overall percentage of liberalization for these 10 countries amounting to almost 60 percent based on statistics for imports on private account in 1953. The attached chart shows the extent of progress in freeing dollar imports from restrictions by these 10 OEEC countries. It should also be noted that the extent that restrictions against dollar imports have been relaxed would reflect even greater progress if account were taken of the more liberal treatment that is being afforded such imports by licensing authorities.

The following brief summary reflects the actions taken by the major trading countries of the free world to liberalize imports from the dollar area. These countries which are not included have not relaxed their restrictions during the past year.

I. WESTERN EUROPE[1]

Belgium, Netherlands, and Luxembourg.—A common free list for imports from the dollar area generally similar to that for the OEEC countries was made effective on June 1, 1954. Licenses for the items on this free list are automatically granted. Included among the freed products are such agricultural commodities as wheat, barley, corn. flour, fats, raw tallow, tobacco, raw cotton, figs, almonds, nuts, apricots and phosphate fertilizer; such raw materials as many chemicals, copper, and petroleum oils; and such manufactured products as iron and steel sections, engines of various types, calculating machines, generators and electric motors, certain parts and components for motor vehicles and tractors, aircraft, locomotives, passenger coaches, motorcycles, dolls, and toys. The liberalization percentage totals 86 percent.

Denmark.—The first major step in freeing dollar imports was taken in December 1954. Import licenses will be issued automatically for such goods on the dollar free list as raw tobacco, cotton, asphalt, lumber, paper, many chemicals, medicinal articles, optical glassware, various tools and instruments, sewing machines, agricultural machinery, textiles, printing, packing and other machines, machine tools, and telephone and telegraph equipment. By this action, a liberalization percentage of 38 percent was achieved. The Danish Government has indicated that the dollar free list will be expanded as soon as conditions permit but, in the interim, a liberal policy will be followed in granting licenses for dollar goods.

Germany.—The issuance of a dollar free list covering 2,000 items in February 1954 was followed in November 1954 by the addition to this list of about 1,800 more items. Items on the dollar free list are automatically issued import licenses. Items included in the first line were mainly raw materials such as cotton, wool, nonferrous ores, ferro-alloys, crude oil, and a number of chemical raw materials. In addition there were such categories of semifinished and finished goods as machine tools, machinery, electro-technical goods, precision instruments, and glass and ceramics. The second list included petroleum lubricating oil, paper, washing machines, some types of refrigerators, electrical sound equipment, certain types of leather, and vulcanized fibers. As in the original list, however, there were no food or agricultural items in this second list. The restrictive policy towards imports of United States coal was relaxed in December 1954 when it was announced that licenses would be issued for the importation of DM40 million of United States coal provided payment was in a nonconvertible currency. The liberalization percentage amounts to about 70 percent.

Greece.—Except for a limited number of specified goods, there are no quantitative restrictions on imports. The liberalization percentage totals 90 percent.

Iceland.—Iceland has a free list for which import licenses are not required. Included among the items on the free list are cereals, flours, raw coffee, fruit juices, certain oils, raw cotton, hemp, certain metallurgy products, non-ferrous metals, refined petroleum, aviation gas, certain lubricants, certain textiles and miscellaneous manufactured goods. The liberalization percentage totals 33 percent.

Italy.—Extended its free list on goods from the dollar area which do not require import licenses on August 10, 1954, so as to raise the liberalization percentage from 10 percent to 24 percent. Included in this new list of liberalized products are such items as vegetable waxes, coal, crude petroleum oils for refining, certain minerals, rags, waste, synthetic and artificial rubber, wood pulp, cast iron, iron and nonferrous ores, iron, steel and cast iron scrap, crude copper and copper alloys and scrap, carbon black, and certain other chemicals and pharmaceuticals.

Norway.—While requiring import licenses for all goods from the dollar area, the Government adopted a new policy in March 1954 of granting licenses for imports of "essential" goods without regard to the previous requirement that there be at least a 10 percent price advantage over non-dollar goods. "Essential" commodities include petroleum, raw tobacco and cotton, soybeans, semifabricated iron and steel, certain chemicals, and agricultural and other machinery.

---

[1] As used in this section the phrase "liberalization percentage" reflects the percentage of private imports from the United States and Canada in the base period of 1953 of the commodities that can be imported without obtaining the prior approval of the licensing authorities.

Sweden.—On October 1, 1954, Sweden established a dollar free list which released a wide range of commodities of dollar area origin from import license requirements. At the same time, the Government announced that licenses for the importation of other goods from the dollar area which were on the OEEC free list would be granted in greater quantities. The dollar free list includes a great majority of the commodities on which Sweden granted tariff concessions to the United States under the GATT. The list covers such items as manufactures of iron and metal, almost all chemical products, hides and skins, rubber products, wood goods, all paper other than newsprint, textile raw materials, yarn, cord fabrics, shoes, hats, stone, clay and glass products, iron and steel products, machines, apparatus and instruments except cameras, projectors and musical instruments, equipment for railways, streetcars, motorcycles and bicycles, dried fruits and raisins, rice, canned fish, canned fruits and juices, handbags, fishing tackle, tobacco pipes, fountain pens, and many other consumer goods. The liberalization percentage totals 40 percent.

Switzerland.—There is no discrimination against imports from the dollar area. Import licenses are not required except for a small list of items. The liberalization percentage amounts to 98 percent.

United Kingdom.—In the past 2 years the Government has taken extensive steps in returning to private trade the importation of many commodities. For the most part this action was followed by the establishment of international commodity markets and the freeing of imports from the dollar area. Included were such commodities as nickel, copper, lead, zinc, raw cotton, and wheat. In June 1954 imports of oil seeds, oils, and fats were allowed freely from the dollar area under open individual licenses and restrictions were eased on the importation of dollar machinery. Further relaxation of restrictions occurred in December 1954 when the quota for imports of passenger automobiles from the United States was increased from approximately 240 cars annually to 500 and the quota for hardwood imports was raised. The liberalization percentage amounts to almost 50 percent.

II. AFRICA

Union of South Africa.—Since January 1, 1954, the import control system has been nondiscriminatory in character insofar as source of imports is concerned. In October 1954 the Government announced that it was proceeding with the gradual relaxation of import controls and hoped to remove the controls entirely in the not too distant future, depending upon the rate of improvement in the balance of payments. In 1955 the Government announced that the requirements of the manufacturing industries for raw materials would be almost fully met; the importation of industrial machinery would be on an even more liberal basis than in 1954; quotas for agricultural machinery and implements would be increased; consumer goods imports would be increased and the list of totally prohibited items would be decreased. Further, import permits would no longer be required for textile piece goods, tea, coffee, raw cotton, raw wool, and certain types of stationery.

Ethiopia.—As of the end of 1953, imports from the dollar area were placed on the same basis as imports from other currency areas, thereby abolishing the discrimination which existed against dollar imports. Further, during the past year, exchange was freely granted for the import of all goods from any source.

Federation of Rhodesia and Nyasaland.—On July 1, 1954, restrictions on imports from the dollar area were eased. Many items previously subject to quota limitations were added to the unrestricted list, i. e., the list of items not under currency quotas but still requiring import licenses which are issued subject only to scrutiny. Such items include animal feeding stuffs, condensed milk, dried milk, edible nuts excluding groundnuts, hand tools, outboard motors over 20 horsepower, filter plants and filters for the purification and softening of water, lifts, hydraulic or electric, and gates, air conditioning machinery, insecticides, medicinal drugs and chemicals, disinfectants, veneers and sensitized paper. Further, there were significant dollar allocations for such goods as wheat, agricultural, mining, and industrial machinery, steel, electrical goods and spares, commercial vehicles, special tires and tubes, plywood, and office equipment.

Libya.—In November 1954, the Government announced the relaxation of restrictions on dollar imports considered necessary to the Libyan economy. Such goods include agricultural and industrial equipment and seeds, essential foodstuffs such as wheat and barley, secondhand clothes, medicines and drugs, essential household appliances such as refrigerators and sewing machines, commercial vehicles and spare parts for automobiles, and other machines, construction equipment, newspapers, magazines, and periodicals.

III. THE FAR EAST

India.—Restrictions, which had held dollar purchases to the barest minimum for the past several years, have been reduced for 1955. Liberalization has taken the form of increased quotas and the possibility of importers utilizing a portion of their soft-currency licenses for dollar imports.

Pakistan.—A new import policy for the first half of 1955 was announced which would maintain import licensing requirements but would be for the most part nondiscriminatory with respect to imports from the dollar area. Further, the list of importable items was increased from less than 200 items to over 300 and includes essential consumer goods. In addition, there was an increase in the established quotas for dollar-area imports.

New Zealand.—The restrictions on dollar imports have recently been relaxed by providing for substantial increases in the list of goods which can be imported freely from all sources. In addition, exchange allocations for dollar imports have been increased.

Thailand.—Practically all imports now require licenses, but this action was taken to discourage speculative imports. However, there is no discrimination as to source of supply. Licenses are automatically granted for "essential" goods and imports of "semiessential" goods are permitted up to the highest value of imports during any of the 5 preceding years. While some "luxury" goods are prohibited, licenses are issued for others.

IV. WESTERN HEMISPHERE

Canada, Costa Rica, Cuba, Dominican Republic, Ecuador, El Salvador, Guatemala, Haiti, Honduras, Nicaragua, Panama, Peru, and Venezuela have only nominal restrictions, if any, on dollar imports.

2. *Specific cases where the United States has succeeded in having restrictions against dollar goods eliminated*

(*a*) *Token imports*.—The United States has been pressing foreign governments which are maintaining balance-of-payments import restrictions to permit the entry of limited quantities of American products in order to permit American traders and their products to retain a foothold in markets established before financial difficulties necessitated rationing of dollars. The United States has been able to make representations on this subject to the major trading countries of the world because of the provisions contained in the General Agreement on Tariffs and Trade which require countries imposing balance-of-payments restrictions "not to apply restrictions so as to prevent unreasonably the importation of any description of goods in minimum commercial quantities, the exclusion of which would impair regular channels of trade, or restrictions which would prevent the importation of commercial samples or prevent compliance with patent, trade mark, copyright or similar procedures * * *."

Token import arrangements have been in effect in the United Kingdom for some years. Other contracting parties have different arrangements which give effect to this requirement. Discussions have been held with Australia, Pakistan, Sweden, New Zealand, and Chile for the establishment of similar arrangements.

(*b*) *United Kingdom purchase of apples*.—The United Kingdom in 1951 was making arrangements for the purchase of apples in a manner which would have discriminated in favor of Canada and against the United States. The United States, in consultations with Canada and the United Kingdom, argued, on the basis of the general agreement, that the British could not apply import restrictions in a way which would discriminate between two hard-currency countries. The resulting arrangement provided for equal treatment of the two countries.

(*c*) *Discriminatory Haitian price regulations affecting United States cigarettes*.—A government tobacco monopoly in Haiti increased the retail price at which imported American cigarettes could be sold but did not increase the retail price at which domestically manufactured cigarettes could be sold, which resulted in discrimination against American cigarettes that might have decreased considerably the market for imported American cigarettes in that country. This Government through the American Embassy called attention to paragraphs 1 and 4 of article III of GATT. The discrimination has since been ended.

(*d*) *Cuban lumber tax*.—Cuba levied a 9 percent sales tax on imports of lumber and exempted domestic lumber from the tax. Attention was called by this

Government through our Embassy to the first two paragraphs of article III, and as a result the tax was made nondiscriminatory by applying it also to domestic lumber.

(*e*) *Cuban import tax.*—Cuba proposed to levy an 8-percent tax on imported food products, with no tax on domestic products. Attention was called by this Government through our Embassy to the first two paragraphs of article III of GATT, and the proposal was never put into effect.

(*f*) *Cuban periodicals tax.*—Cuba levied a 9-percent sales tax on imported newspapers and magazines, exempting domestic newspapers and magazines from the tax. Attention was called by this Government through our Embassy to article III of GATT, and as a result imported newspapers and magazines were also exempted from the tax.

(*g*) *Haitian import surtax.*—Haiti increased the 3-percent customs import surtax to rates varying from 3½ to 4½ percent on a relatively long list of products. This Government, through the Embassy, pointed out that any such increase on products listed in the Haitian schedule of GATT would be in contravention of the provision in article II. The foreign government took immediate steps to end the contravention by making sure that the increase did not apply to scheduled products.

(*h*) *Cuban import quotas.*—Cuba refused to allow two large shipments of potatoes from the United States to enter the country. This Government, through the American Embassy, called attention to the provision of article XI of GATT, which states that no prohibitions shall be instituted or maintained by any contracting party on the importation of any products of any other contracting party, except as specified. The two shipments, which might have spoiled, with considerable loss to the exporter, were as a result of this protest later allowed to enter.

(*i*) *Cuban textile embargo.*—Cuba placed in effect import restrictions on textiles that amounted to a virtual embargo. Hundreds of thousands of dollars worth of shipments of textiles and related producted from the United States were held on the docks or in customs warehouses in Cuba. When the government in question failed to remove the restrictions, the United States Government brought the matter before the contracting parties to GATT, which were then in regular session at Geneva, claiming that the restrictions were in violation of article XI of GATT and invoking article XXIII of GATT to the effect that the restrictions nullified substantial concessions which Cuba had granted the United States in schedule IX and other provisions of the general agreement. The contracting parties discussed the matter, and the Cuban Government promptly took steps to relieve the situation.

(*j*) *Dominican import restrictions.*—The Dominican Republic banned the importation of ice-cream mix, which came principally from the United States. The American Embassy at the request of this Government discussed the matter with officials of that government, pointing out that such a restriction was in contravention of article II of GATT. The restriction was promptly removed.

(*k*) *Dominican auto import restrictions.*—The Dominican Republic published a resolution prohibiting the importation of automobiles valued at more than $1,250, except under special permit, which was at first not being granted. The American Embassy at the request of this Government called the attention of that Government to the provisions of article XI and later reported to the Department of State that the importation of cars valued at more than the figure mentioned was being regulary permitted.

(*l*) *United Kingdom tobacco-mixing requirement.*—In 1950–51, the United States was successful in securing modification of a British requirement that to the amount of 5 percent of the total Oriental tobacco bemixed wih Virginia tobacco. On the basis of the obligation in article III of the general agreement, the British agreed to permit again the manufacture of pure Virginia cigarettes, as desired by the United States tobacco industry.

(*m*) *Brazilian coffee-export restrictions.*—The United States Embassy in Rio de Janeiro made representations to the Government of Brazil in 1951 concerning the appications of monthly export quotas on coffee. The United States protest held that the Brazilian action was in violation of article XI of the general agreement. The system of export quotas was subsequently altered and the basis for the complaint removed.

(*n*) *Discrimination against American petroleum interests.*—Denmark in late 1953 tried to pressure American petroleum companies in that country to purchase some of their petroleum requirements from Soviet bloc sources. The United States Embassy intervened to protest against this discrimination. In doing so it refuted an attempted balance-of-payments justification presented by the Danish Government. The Embassy based its arguments on the principle embodied in article XII of the general agreement, that is, that Denmark's financial position, as measured by the criteria of article XII, did not permit such onerous restrictions. Denmark dropped its request of the American oil companies.

(*o*) *French export quotas on raw Angora wool.*—The United States protested in February 1954 to the French against the application by France of export quotas on raw Angora wool. The complaint held that the quotas were inconsistent with article XI of the general agreement. This case is presently under consideration.

(*p*) *Brazilian marking requirements.*—In July 1952 the United States protested to Brazil that a relaxation with respect to imports from Chile of a requirement that bags be marked in indelible ink should be extended to imports from the United States. The basis for the United States protest was article IX of the general agreement which requires most-favored-nation treatment with respect to marking requirements. The Brazilian Government then instructed its customs officers to extend to the United States on a most-favored-nation basis the treatment which applied to Chile.

(*q*) *Peruvian discrimination against United States cosmetics.*—The United States protested in 1951 and 1952 against the imposition by Peru of internal taxes which discriminated against imports of cosmetic goods from the United States. The United States based its protest on article III of the general agreement, which prevents internal taxes from being imposed on imports in a more burdensome manner than on like domestic products. Subsequently, Peru took steps toward removing the discrimination.

(*r*) *United Kingdom purchase tax.*—The United Kingdom imposed a purchase tax on imported goods which were comparable in price and quality to domestically produced goods which were generally exempt from the tax. The issue was raised at a session of the contracting parties as a violation of article III. At the seventh session (in late 1952), the United Kingdom announced the removal of the discrimination between imported and domestic goods.

(*s*) *French 0.4 percent tax.*—The United States at the session held in the fall of 1953 challenged as inconsistent with the general agreement a tax imposed by France on all imports and exports amounting to four-tenths of 1 percent by value. The United States held that the tax nullified or impaired tariff concessions made by France under the agreement. France agreed that the tax did infringe the provisions of the agreement and expected that it would not be continued in the new budget. This tax has now been abolished.

(*t*) *Peruvian automobile import tax.*—At the time Peru was negotiating for accession to GATT, it developed that Peru contemplated imposition of a charge on imports of certain classes of automobiles which the United States regarded would have violated the general agreement. On the basis of our explanation of the problem to Peru, it was decided to convert the import charge into an internal tax which would apply to any domestically produced automobiles as well as to imported cars.

(*u*) *French West African preferences.*—In 1951, France announced its intention of increasing most-favored-nation duties on some 40 items when imported into French West Africa from foreign countries, while leaving imports from France free of duty. France recognized that such action would require compensation, but on the basis of United States protests, based in part on France's obligation not to increase preference margins over the preference in a base period, France withdrew the request late in 1952. At the time, it was stated that the request might be renewed later, but to date the question has not been brought up again. A considerable amount of United States trade (amounting to $3.5 million in 1 year) thus still enjoys lower rates when imported into French West Africa than would otherwise be the case.

(*v*) *Restrictions and discriminations against American motion pictures.*—i. Austrian import restrictions: In 1953 the United States protested, on the basis of article XI (which contains a general prohibition against import restrictions), import restrictions against American motion pictures. Discussions have not been concluded in this case.

ii. Belgian restrictions: In 1951, when Belgium made known that it was imposing restrictions for balance-of-payments reasons and was giving motion-picture distributors 3 days to make counterproposals, the American Embassy in Brussels interceded on behalf of the American movie industry. It brought to the attention of the Belgians the obligation in the general agreement for consultations in regard to the imposition of balance-of-payments restrictions. The result was that these restrictions were postponed, and much milder restrictions were later imposed after consultation with the industry.

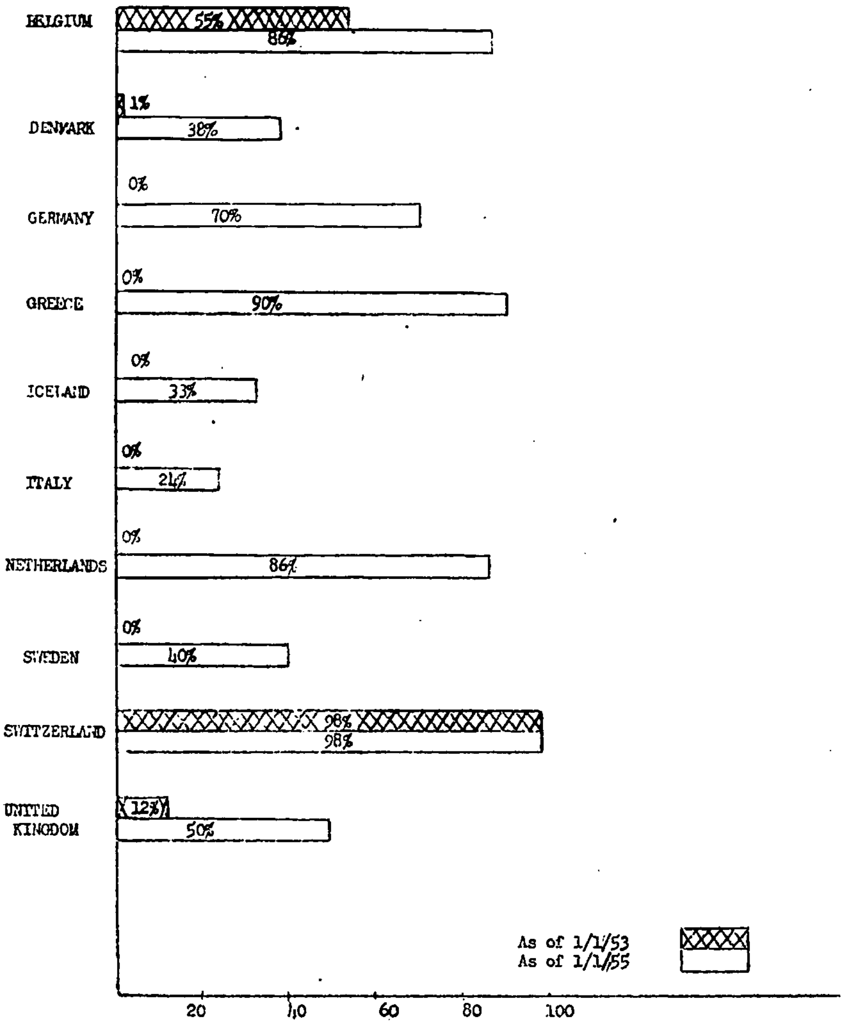
The American Embassy in Brussels in 1951 had the occasion to notify the Belgian Government that the general agreement required Belgium to give public notification of restrictions without regard to whether they were temporary, a reason the Belgians advanced for not giving publicity to the measure. Following United States representations in this case the imposition of the restrictions was postponed, and more satisfactory arrangements were worked out following discussions.

iii. Brazilian regulations: In January 1952, the United States invoked article II, paragraphs 1, 2, and 4, of the general agreement against a new decree and a draft bill which were judged to have a more burdensome effect on American motion pictures than measures in effect on the date of the general agreement (October 1947). The measures required importers to acquire domestic newsreels and shorts to the extent of 10 percent of the footage imported in a previous year. The draft bill was supplanted by another which did not contain the objectionable provision. The decree was later nullified by the Ministry of Justice on the grounds that it was a violation of the general agreement.

The American Embassy in Rio de Janeiro has been instructed to bring to the attention of the Brazilian Government the fact that a draft bill submitted to the Brazilian Congress would violate article III, paragraph 2 (by imposing a discriminatory internal tax), would violate article VII, paragraph 1 (by imposing a fee in excess of the cost of services rendered in connection with the importation), and would impair tariff concessions granted on motion pictures. No further progress has been reported on the draft bill.

In November 1952 the United States invoked article XI, paragraph 1 of the general agreement in protest against a Brazilian decree which called for an import limitation of one print per film. The application of the decree was postponed, and, while the question has not been finally disposed of, restrictions provided by the decree have not been made effective.

(*iv*) *Norwegian internal taxes.*—The United States invoked article III on April 28, 1950, against a 1949 regulation exempting from taxation the revenue derived by theaters from exhibition of Norwegian newsreels but not foreign newsreels. On August 1, 1950, foreign newsreels were also exempted from the admission tax and placed on the same footing as Norwegian newsreels in response to the Embassy's representation.



STATEMENT OF NATHANIEL KNOWLES, JR., ACTING DEPUTY DIRECTOR, BUREAU OF FOREIGN COMMERCE, DEPARTMENT OF COMMERCE

In presenting his foreign-economic program to the Congress the President stated: "For every country in the free world, economic strength is dependent upon high levels of economic activity internally and high levels of international trade. No nation can be economically self-sufficient. Nations must buy from other nations, and in order to pay for what they buy they must sell. It is essential for the security of the United States and the rest of the free world that the United States take the leadership in promoting the achievement of those high levels of trade that will bring to all the economic strength upon which the freedom and security of all depends."

Stated in its broadest terms the objective of the President's proposals is to increase our foreign trade and foreign investments. Each part of the program is designed either to remove or reduce a barrier to the flow of goods, services, and capital, or to provide some positive incentive to increasing that flow. The program recognizes the need for a gradual and moderate approach to the problem. The necessity to protect American labor and industry from unfair foreign competition and undue hardship is of paramount importance. The use of the peril-point and the escape-clause provisions will be fully utilized to assure adequate protection.

As a representative of the Commerce Department, I can perhaps make some contribution to today's discussion by indicating the present and past relationships of United States foreign trade to various elements of our national economy. We Americans are blessed with a wealth of resources and with large and expanding domestic markets. Our growing economy presents ever-increasing opportunities for investment at home. For these reasons, we often forget our important stake in the development of foreign sources of supply, particularly for raw materials, foreign markets for our products, and opportunities for overseas investment.

One way to measure the importance of foreign trade to our economy is to express it as a percentage of our gross national product and to compare that percentage with the similar percentage for other important components.

In the year just past our merchandise exports were about 4.2 percent of the estimated total gross national product of $357 billion. This figure, which includes military-aid exports, compares with 5 percent in 1929 when there was no military program. Excluding the military program, the 1954 estimated figure of 3.5 percent was slightly higher than in 1953 and moved upward contrary to most other trends in the national economy. Our merchandise imports in 1954 declined slightly from 1953 and were about 2.9 percent of the gross national product.

These figures may not appear impressive when compared with similar relationships in some of the important trading countries of Europe whose exports reach 25 percent or more of their gross national product. Such a comparison, however, ignores a very important difference between our economy and those of European countries. No one factor makes an overwhelming contribution to our total economic picture. The strength of our economy results from its diversity. Even cash receipts from farming were only 8.5 percent of the gross national product in 1954. Thus, this important component which has commanded so much attention of the Government of the United States made only about twice as much a contribution to our economy as did the exports of merchandise.

Another very important component of the gross national product which is frequently consulted to determine whether our economy is functioning properly is residential nonfarm construction. This housing component was about 3.8 percent of the gross national product in 1954. Even in 1954 when housing construction moved upward contrary to most business trends, it was lower than the exports of goods and services. Other new construction representing about 4 percent of the gross national product in 1954 was also exceeded by merchandise exports.

The foreign-trade contributions to our total economy also compared favorably with such investment components of our gross national product as business purchases of capital equipment which represented 6.2 percent of the gross national product in 1954 and consumer purchases of durable goods which were about 8.1 percent.

For your convenience, I am leaving a table entitled "Selected Elements—Percentage of Gross National Product" which gives additional details.

The significance of exports and imports is reinforced by a consideration of their relationships to some of our most important and progressive industries.

During the 3 years 1949–51 nearly one-half of our exports came from industries which sold more than 10 percent of their production abroad. One-third of our exports were accounted for by products which rely upon foreign markets for more than 25 percent of their sales.

Export markets are of central importance for some of our major agricultural products such as cotton, wheat, rice, and tobacco. In the crop year 1952–53, we exported 24 percent of our wheat and 20 percent of our cotton despite the fact that this was a year of comparatively low exports. In the preceding 5 years, we exported, on the average, about one-third of these crops. In 1953, we also exported 56 percent of our rice, 22 percent of our tobacco, 61 percent of our inedible tallow, and 18 percent of our lard.

The critical importance to our economy of the imports of many raw materials and foodstuffs which we do not produce at all or where our production does not come even close to meeting our needs has been well known for many years.

About 58 percent of our commodity imports are essential for consumption or for the operation of our economy, given the present industrial and technological pattern of production. Of these, one-third or 20 percent of total imports, cannot be produced at all in the United States. Another one-third are not available domestically in sufficient quantity.

The remainging one-third, of which coffee, tea, and cocoa are typical examples, have become an accepted part of our daily consumption and we are anxious to obtain them in exchange for our produce.

The other 42 percent of the total are imported even though they could be produced here because foreign countries are able to deliver at lower costs, or because they are sufficiently different from domestic products to stimulate demand.

The level of our imports governs the level of our exports since they provide the dollar exchange for the purchase of exports. As our grant aid to the rest of the world is reduced and ultimately eliminated, we must increase our imports unless we are willing to see our exports decrease.

American investments abroad tend to create markets for our finished product as well as raw-material sources of supply.

It is almost a truism that our best customers are the more highly developed countries. The import demands of countries with low standards of living while frequently large in relation to their domestic production are small in absolute terms. As our investments abroad contribute to the economic development of other countries and increase the standards of living in those countries, new demands are created some of which will be translated into increased exports from the United States. This is in addition to the capital goods requirements necessary to translate the money investment into plant and equipment.

Moreover, a very large part of our investments abroad has gone into the development of raw materials which we must increasingly import from abroad as our economy expands and our known domestic sources of supply prove inadequate.

I want to emphasize the role of both exports and imports in generating employment, wages, and profits in the United States.

Let me just underscore it by pointing out that some 70 percent of our exports consist of manufactured goods shipped in substantially the forms in which they are finally utilized abroad. The great bulk of the end-use value of these goods is thus contributed by American labor, capital, and management.

Our imports, in contrast to our exports, consist preponderantly of raw materials and crude foodstuffs requiring extensive further processing before entering into consumption channels here. For at least 80 percent of the goods we import, a very large part of their end-use value is added by American industry after they are purchased from abroad. The activities contributing to this added value represent jobs and profits for United States workers and employers, just as surely as do those involved in the production of our exports. Less than one-fifth of our imports enter the country as substantially finished products, and even these contribute significantly to employment and earnings in our distributive and service industries.

Selected elements—Percentage of gross national product

	1929	1933	1937	1947	1950	1953	1954[1]
Merchandise exports:							
Including military aid	----	----	----	----	3.6	4.3	4.2
Excluding military aid	5.0	3.0	3.6	6.6	3.5	3.4	3.5
Total of exports of goods and services:							
Including military aid	----	----	----	----	5.1	5.8	5.7
Excluding military aid	6.7	4.3	5.1	8.5	4.9	4.7	4.9
Merchandise imports	4.2	2.7	3.4	2.5	3.1	3.0	2.9
Total imports of goods and services	5.7	3.7	4.7	3.5	4.2	4.5	4.5
Residential nonfarm construction	3.4	.9	2.1	2.7	4.4	3.3	3.8
Other construction	4.9	1.8	2.8	3.3	3.5	3.7	4.0
Business purchases of capital equipment	5.7	2.9	5.6	7.2	7.4	6.7	6.2
Federal purchases of goods and services for national security	1.2	3.6	5.1	5.7	6.5	14.3	12.2
Other Federal purchases of goods and services				1.6	1.4	2.3	1.9
State and local government purchases of goods and services	6.9	10.7	7.9	5.5	7.0	6.9	7.7
Consumer purchases of durable goods	8.8	6.2	7.6	8.9	10.0	8.1	8.1
Consumer purchases of apparel	9.0	8.2	7.5	8.1	6.5	5.4	5.5
Cash receipts from farming	10.8	9.6	10.1	12.9	10.0	8.6	8.5

[1] Preliminary estimates.

(The following was subsequently received for the record:)

STATEMENT OF HON. AUGUSTINE B. KELLEY REGARDING TESTIMONY OF CHARLES P. TAFT

When Mr. Charles P. Taft, president of the Committee for a National Trade Policy, testified before this committee, he took it upon himself to act as the champion for the entire foreign trade program, and in doing so belittled the effects which the importation of goods in competition with domestic industry and labor was having upon our national economy.

Mr. Taft, in his appearance before the committee as president of the Committee for a National Trade Policy, although he did not mention it, was not entirely unselfish in his presentation. Mr. Taft, if he is not now, has been in the past, registered as the agent for a foreign government representing the Government of Venezuela and the Venezuelan Chamber of Commerce. Therefore, when, in Mr. Taft's statement, he devotes some very specific, pointed remarks to the efforts of the coal industry to obtain relief from the damaging imports of foreign oil which have greatly reduced coal's market on the east coast, he joins in a very well organized and highly financed campaign being conducted by some of the richest and most powerful oil companies, to destroy vital segments of our industry.

Mr. Taft, as well as other spokesmen for the major oil companies, seven of whom control the entire world petroleum market, attempt to belittle, discredit and destroy an industry that supplies the Nation's biggest source of energy that keeps the electric power and steel industries operating, and which is the keystone of the prosperity of the railroad, chemical, and other related industries.

The coal industry, in an appearance before the House Ways and Means Committee which is now considering proposed extension of the Reciprocal Trade Agreements Act, and before this Joint Committee on the Economic Report, testified that the coal industry must have a quota limitation on residual fuel oil imports if it is to remain competitive in the large east coast energy market. The coal industry has not asked for absolute elimination of the imports of foreign oil. The request has been modest and only asks that the House committee write into the trade-agreements bill, and that Congress vote it, an amendment limiting foreign oil imports, including residual oil imports, to 10 percent of the domestic demand for petroleum products in the corresponding quarter of the previous year. Such a formula would mean only that the level of imports that would be permitted would be the same as the level of imports which prevailed during the postwar period from 1946 to 1951.

I support that request as reasonable, so do a growing number of my colleagues.

The reaction of the oil industry spokesmen, including Mr. Taft, has been one of hysterical denunciation of the coal industry. In addition, the oil industry spokesmen and Mr. Taft have made statements and quoted figures, in attempts to disparage the coal industry's contention, which are deliberately misleading.

In his statement before this committee, Mr. Taft asked for all the facts, "not the selected ones which coal spokesmen and their auxiliaries bring to this committee." Then Mr. Taft cited "facts" of his own which add up to half-truths and untruths.

Mr. Taft asks for facts. Well, let us have the facts about the amount of coal displaced by oil imports. Coal producers and coal shippers, shipping to industries and public utilities on the east coast, know the reason for the discontinuance of these shipments to their East customers. As an example, a coal producer or shipper has an order with an industry for a certain tonnage of coal. He is notified that shipments must be discontinued. He is given the reason; if not, he requests it. Now, by simple addition, the total number of tons of coal displaced, added up, totals approximately 47 million tons per year. It is just as simple as that, and it is accurate.

The coal industry does not need the juggling of figures as to railroads and natural gas and light fuels, and the tonnage lost to other industries. (I don't know what "other industries" mean, nor do I know what he means by "light fuels.") But the facts are as I have stated above about the loss of tonnage.

Does Mr. Taft think for one moment the amount of residual oil being shipped to the United States is not displacing coal at all? What is being done with it? What is the purpose of shipping it then?

He said that heavy residual fuel oil consumption increased by only 11 million tons coal equivalent in the United States between 1947 and 1953. Actually, the increase of foreign residual fuel oil (including that refined from foreign crudes) increased from 17 million tons coal equivalent in 1946 to 47 million tons coal equivalent in 1954, or an increase of 30 million tons.

The fact is that foreign fuel oil represents a type of competition without end or limit, with the capacity—through dump pricing and shifting the cost to other oil products—to drive coal completely off the east coast. Foreign oil has taken over approximately 50 percent of the coal competitive energy market on the east coast.

Mr. Taft said shutting out residual oil would definitely hurt American manufacturers in 30 States employing 30,000 people in manufacturing for export to Venezuela. But the damage already done to the coal industry has contributed to a decline of employment in American coal mining from 400,000 men in 1950 to 214,000 in 1954, has cost the coal miners $81 million in wages or the equivalent of 25,000 jobs for 1 year, and cost railroad labor $44 million in wages. Approximately 75,000 miners went off the payrolls in 1954 alone.

Mr. Taft said that the real employment problem in coal mining is the turn to strip mining which he said accounts for fully 25 percent of total bituminous production. Actually, strip-mining production in 1953 (the latest year for which statistics are available) represent only 23.1 percent of the total national production of bituminous coal. In 1947, strip-mine production represented 22.1 percent of the total national production—an increase of only 1 percent in 6 years. These facts are certainly far different from those presented by Mr. Taft in support of his misinformation that "the real employment problem in coal mining is the turn to strip mining."

The number of strip mines has declined from 1,750 in 1947 to 1,554 in 1953; production has declined from 139,395,000 tons in 1947 to 105,448,000 tons in 1953 and the number of men employed in strip mines has fallen from 43,338 in 1947 to 31,088 in 1953.

Mr. Taft says, "This is a technological change opposed as vigorously by the United Mine Workers as is the importation of residual oil, but with less publicity.

The United Mine Workers do not oppose, never have, technological changes. Their vigorous opposition of strip mining has been against the nonunion strip miners. Historically the United Mine Workers have encouraged technological improvements in coal mining. It is exemplified by the fact in the United States the average production of coal per man per day is 8 tons. In England and on the continent where these changes were opposed by the union, the average is 1½ tons per man per day.

At the mine the cost is lower than it is abroad.

Mr. Taft in his statement, implied that with a bituminous coal production of 400 million tons in 1954, the addition of only 70 million tons would be ample for this country's war needs. The actual facts do not support Mr. Taft's statement. In the first year of World War II, the requirements for coal rose 130 million tons and coal supplied 82 percent of the grand total added energy needs in this first year of the war. Likewise, Mr. Taft failed to mention that in World War II the supplies of foreign oil on the east coast received by tanker, dropped 93 percent as a result of submarine sinkings.

Seemingly, Mr. Taft attempts to present himself as a technical expert in coal production when he says "existing mines by going to a full week without overtime, could add 150 to 200 million tons a year." Mr. Taft assumes that the current production capacity of the bituminous coal industry is 670 million tons annually. That figure is for 1953 and it ignores completely the current availability of manpower and the condition of the necessary machinery and equipment to produce coal. Between October 1953 and October 1954, according to the Bureau of Mines, there was a reduction of 74,000 miners. The Bureau of Mines figure of capacity is directly related to days worked and number of employees. With the indicated reduction of employees by 27 percent, the potential capacity is cut proportionately. On that basis mine capacity as of October 1954 would have been more nearly at less than 500 million tons.

As a matter of fact, as of now the anticipated coal mine production for 1955 is much less than 500 million tons, more nearly 400 million tons.

Mr. Taft makes the categorical statement "that there is no evidence that shutting out residual oil helps coal," and then he continues with a personal observation that he personally found "that the mines in southern Kentucky and Tennessee on the Southern Railroad at least, had no competition from residual oil since the last reduction in freight rates down there." These statements are wholly untrue. In the first place, foreign oil today potentially displaces 47 million tons of coal equivalent, principally in the east coast energy markets. In fact, through operation of various price understandings and market agreements within the oil cartel, bituminous coal is now virtually wiped out of the east coast energy market, and if the flood of imported oil continues, it will be wholly eliminated. The present coal displacement by foreign oil represents approximately 25 percent of the total production of coal in the principal coal-mining States of West Virginia and Pennsylvania, and such a tonnage reduction sponsors a chain reaction which affects the entire coal-producing areas.

Mr. Taft's statement regarding the mines in southern Kentucky and Tennessee is contradicted by the president of the Southern Appalachian Coal Operators Association, which is made up of the coal mineowners in southern Kentucky and Tennessee, who in a telegram to the chairman of the House Ways and Means Committee, say:

"Regarding Mr. Taft's testimony that coal mines southern Appalachian area particularly those located on Southern Railway have been materially helped in competition with residual oil by reduction in freight rates. Reduced freight rates have helped a few cases in competition with natural gas but cannot find in any instance of help in competition with residual oil sufficient to regain or hold coal in these seaboard markets."

The record shows that residual fuel oil imports are being dumped primarily in one geographic area, namely the east coast, the heart of our industrial arsenal. This foreign residual oil originates in the main from Venezuela, which today is living on a level of prosperity unequaled by any section of the United States, principally because the majority of the income in Venezuela is derived from taxes amounting to 50 percent of the value of the petroleum products which it exports, 90 percent to the United States.

It is time for the Congress to end the folly of destroying a major portion of our domestic industry, namely coal mining and domestic oil production, with unreasonable and excessive importations of foreign oils. Further, it is time for the oil industry spokesmen, including Mr. Taft, to temper presentations, such as that made before this committee, with some factual research and reasonableness so that the consideration of their own selfish interests might be leavened somewhat by a respect for American businessmen and workers, who today are being seriously and vitally affected economically by trade advantages granted to foreign nations.

(Whereupon, at 5 p. m., Tuesday, February 8, 1955, the committee adjourned to reconvene at 10 a. m., Wednesday, February 9, 1955.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

WEDNESDAY, FEBRUARY 9, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Representative Richard Bolling presiding.

Present: Senators Douglas, Sparkman, and Goldwater, Representatives Bolling (presiding), Kelley and Talle.

Representative BOLLING (presiding). The committee will come to order. Senator Douglas has to be at a meeting of the Rules Committee and will be delayed for a time.

During yesterday's hearing Senator Douglas asked that the following remarks and materials from his discussion be inserted at the beginning of today's hearing:

> The Department of Commerce has issued a report on the labor force as of this morning, and I would like to read some of the salient figures from that report.
>
> It shows a decline in the number of employed of 538,000 as of the week of January 2 to 8, 1955, as compared to the week of December 5 to 11, 1954. The unemployment figures jibe fairly well with the employment figures. There is an increase in the numbers unemployed from 2,838,000 to 3,447,000 or 509,000. I would like to point out that unemployment is 260,000 greater than it was last year, January 1954, despite the fact that we have had a year in which we had population growth among the working population of close to three-quarters of a million. Nevertheless, in spite of this the number of unemployed has arisen by 265,000. It is true that there is normally a seasonal decline in employment between December and January, but I would like to make the point that this tremendous upsurge to which the President's economic advisers point in their report has not been sufficient to offset to any appreciable degree the usual seasonal decline.

Representative BOLLING. This morning the panel will discuss economic statistics and their role in helping public and private agencies carry out the objectives of the Employment Act of 1946.

A year ago the Joint Economic Committee created a Subcommittee on Economic Statistics. That subcommittee was composed of Representative Henry O. Talle, chairman, Senator Frank Carlson, and myself.

In July 1954, the subcommittee held hearings on the adequacy of economic statistics, and filed a report with the full committee, which in turn submitted the report to the Congress. The report was published as House Report No. 2628 and will be inserted in this record at the conclusion of today's hearing (see p. 1095). Recommendations 6 and 7 of that report read as follows:

> 6. *A section on economic statistics should be included in the President's annual budget and more consideration given to an adequate economic statistics program in the President's Economic Report.*—The various statistical programs of the executive agencies and their costs should be brought together and discussed. Proposed changes in these programs and their relation to the overall Federal statistical system should be pointed out.

The program presented next January should be prepared after careful appraisal of suggestions received by this subcommittee and incorporated in the published hearings. The subcommittee hopes that the various statistical advisory committees to Federal agencies will be asked to review these hearings and that the President's program submitted next January will represent a big step forward in the development of a realistic and adequate economic statistical system.

7. *The subcommittee recommends that the full committee devote one panel session to economic statistics at its hearing next year, premilinary to submitting its own report to the Congress on March 1.*—This would provide opportunity for review of the statistical program submitted in the President's budget and economic report. It would equip this committee and subcommittee to be an effective voice in congressional consideration of programs in the next session of the Congress.

It is to carry out these recommendations that we have arranged for this session today.

Our first witness will be Dr. Donald R. Belcher, Assistant Director, Bureau of the Budget. Following Mr. Belcher's testimony and questioning by the committee, we will call upon a panel of distinguished users of economic statistics for their views with respect to the program for improving statistics set forth in the President's budget and the Economic Report.

Mr. Talle.

Representative TALLE. Mr. Chairman, this seems to be the appropriate time for inserting in the public hearings of some materials that would serve, I believe, as a good preface to our work today. I refer to the report the chairman just mentioned, House Report No. 2628, 83d Congress, 2d session, and specifically to page 6 of that report, and to recommendation No. 9 of our subcommittee.

The recommendation is as follows, and I quote:

9. *The Federal Reserve System might well expand its statistical checks and analysis programs where it has special interest and competence.*—The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories; (2) savings; (3) consumer and business expectations.

This request includes a thorough review of and basic research into concepts, existing data, sources and procedure for improving these statistics.

It is a genuine pleasure to report that this recommendation was acted on favorably by the Federal Reserve, and I should like, Mr. Chairman, to have inserted in the public hearings an exchange of correspondence between the Chairman of the Board of Governors of the Federal Reserve, Mr. Martin, and myself, as chairman of the subcommittee, so that the record may be complete and may show that the Federal Reserve proceeded to name five task forces to carry out this work. I am confident that anyone who examines the personnel of these five task forces will be impressed by their competence to serve. These five task forces will be ready to report by June 30 of this year. I ask unanimous consent, Mr. Chairman, that the staff be permitted to arrange these materials in satisfactory order for inclusion in the printed hearings.

Representative BOLLING, Without objection, it is so ordered.

(The information referred to is as follows:)

CONGRESS OF THE UNITED STATES

JOINT COMMITTEE ON THE ECONOMIC REPORT

Representative Henry O. Talle, chairman of the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report, released today correspondence with William McC. Martin, Jr., Chairman of the Board of Governors of the Federal Reserve System, describing five task groups composed of independent experts drawn primarily from business and academic circles who have been asked to evaluate current statistical information in the fields of savings, business inventories, and business and consumer expectations.

The work is being undertaken in response to a request from the subcommittee made in a report prepared after its hearings this past summer. At that time the subcommittee asked that the Federal Reserve in exploring the adequacy of present statistics with the cooperation of other executive agencies, include a thorough review of and basic research into concepts, existing data, sources and procedure for improving statistics in these important areas.

After careful consideration of the subcommittee's request, the Board of Governors of the Federal Reserve System determined that the most useful way of proceeding with these studies would be to organize expert task groups, each headed by a consultant nationally recognized for his work in the statistical area to be examined. Dr. Raymond Goldsmith of the National Bureau of Economic Research will head the committee to evaluate savings statistics, Dr. J. Frederic Dewhurst, executive director of the Twentieth Century Fund will be chairman of the committee on inventory statistics, Prof. Arthur Smithies, chairman of the department of economics of Harvard University has undertaken the chairmanship of the committee on consumer expectations, Dr. Martin Gainsbrugh, executive director of the National Industrial Conference Board has agreed to be chairman of a committee on general business expectations, and Dr. George Terborgh, director of Research of the Machinery and Allied Products Institute will be chairman of a committee on plant and equipment expenditure expectations.

The special significance of each of the individual studies is spelled out in the attached letters from Chairman Martin to the individual task force chairmen. In the case of savings, for example, the letter emphasizes the highly strategic position which savings occupy in the functioning of the general economy, and particularly with respect to developments in money and credit markets, cyclical fluctuations in business activity, and long-run growth in capital, productivity, and living standards.

The study of the movements of inventories is cited as of key importance to economic and financial analysts concerned with the problems of changes in the business cycle. In writing to the task group studying inventories, Chairman Martin also pointed out that only in recent decades has any appreciable volume of information concerning inventory fluctuations been available and hence of necessity much of the work in collecting and analyzing inventory data has been experimental in nature.

Surveys of consumer expectations, attitudes, buying plans and related information are also a relatively recent development in economic analysis although the consumer plays an extremely important role in determining short-term business fluctuations as well as in long-run economic growth. Because of different methodological techniques and the range of problems involved, the subcommittee's original request for an evaluation of statistics on business expectations has been divided into two categories: a study and appraisal of existing statistics in the field of general business expectations and a study and appraisal of statistics relating to fixed capital outlays and expectations.

Chairman Martin emphasized that each task group is given ample latitude for inquiry, leaving the question of priority of interest to the group's discretion. Final reports have been requested for June 30, 1955, but it is suggested that postponements may be necessary in some instances in order to fulfill the requirements of accuracy and completeness. A list of the 33 experts participating in these studies is included with the attached correspondence between Congressman Talle and Chairman Martin.

DECEMBER 15, 1954.

Mr. WILLIAM McC. MARTIN, Jr.
Chairman, Board of Governors,
Federal Reserve System, Washington, D. C.

DEAR CHAIRMAN MARTIN: I am highly gratified by your letter of December 14 setting forth in detail the splendid plans of the Board for carrying out, in response to the request of the Subcommittee on Economic Statistics, the evaluation of available statistical information and ways for improving our programs in the fields of savings, business inventories, and business and consumer expectations. I am sure that Senator Frank Carlson and Congressman Richard Bolling, the other members of the subcommittee, join me in congratulating the Borad on enlisting the services of such outstanding experts.

We shall look forward to receiving the final reports of the task groups next June and will want to keep in touch with their work as it progresses. To this end I am asking the staff of the Joint Economic Committee to keep a close liaison with you and the task groups. Thank you again for your thoughtful and wholehearted cooperation.

Sincerely,

HENRY O. TALLE,
Chairman, Subcommittee on Economic Statistics.

DECEMBER 14, 1954.

Hon. HENRY O. TALLE,
Chairman, Subcommittee on Economic Statistics,
House of Representatives, Washington 25, D. C.

MY DEAR MR. TALLE: This is in reference to Governor Szymczak's letter of August 11 in which he indicated to you that the Board would explore possibilities of providing your Subcommittee on Economic Statistics with an evaluation of available statistical information in the fields of savings, business inventories and business and consumer expectations. After considerable study of the matter and several conferences with members of the staff of the Joint Committee and the interested executive agencies, the Board determined that it could make the most valuable response to your subcommittee's request by organizing five task groups, composed of independent experts drawn primarily from business and academic circles, who would be asked to prepare evaluations of the adequacy of available statistical information in their special areas of assignment.

I am happy to be able to report to you at this time that a very distinguished group of professors and businessmen have agreed to serve on these committees. Dr. Raymond Goldsmith of the National Bureau of Economic Research will head the committee to evaluate savings statistics, Dr. J. Frederic Dewhurst of the 20th Century Fund will be chairman of the committee on inventory statistics, Prof. Arthur Smithies of Harvard University has undertaken the chairmanship of the committee on consumer expectations, Dr. Martin Gainsbrugh of the National Industrial Conference Board has agreed to be chairman of a committee on general business expectations, and Dr. George Terborgh of the Machinery and Allied Products Institute will be chairman of a committee on plant and equipment expenditure expectations. It seemed highly desirable to us to break this analysis of the available information on business expectations into these two categories since they involve different methodological techniques and present somewhat different problems. A complete list of the task forces is attached for your information.

In each case we have indicated to the members that we hope to have final reports by June 30, 1955. So far as we can ascertain now it will be possible for all the committees to meet this deadline. I should add, however, that in dealing with experts of the intellectual caliber and integrity that have been assembled here, both the Board and your subcommittee must recognize the possibility that the individuals concerned will be reluctant to release a report until they are completely satisfied as to its accuracy and completeness. Therefore, in order to get the very best results, we must be prepared to yield to postponements if necessary.

For the further information of your subcommittee I am also attaching copies of letters I have sent to each of the chairmen, which set forth in some detail the suggested scope of each study. As is evident from the tone of the letters, we have endeavored to give each task group ample latitude for inquiry, leaving the question of priority of interest to their discretion.

The Board is very hopeful that this approach will produce a group of reports which will represent a real contribution to knowledge and understanding of the problems of data collection and interpretation and that the reports will serve as a basis for improvement of both public and private statistical programs in these areas over the years ahead.

Sincerely yours,

WM. McC. MARTIN, Jr.

COMMITTEE ON SAVINGS STATISTICS

Raymond Goldsmith, chairman, National Bureau of Economic Research
Solomin Barkin,[1] Textile Workers Union of America
Simon Kuznets, Johns Hopkins University and National Bureau of Economic Research

[1] Committee members added subsequent to the issuance of the December 21, 1954, press release.

James J. O'Leary, Life Insurance Association of America
Roy L. Reierson, Bankers Trust Co.
Edward Shaw, Brookings Institution and Stanford University
Dorothy S. Projector, secretary, Federal Reserve Board

COMMITTEE ON CONSUMER EXPECTATIONS

Arthur Smithies, chairman, Harvard University
Guy H. Orcutt, Harvard University
Samuel Stouffer, Harvard University
James Tobin, Yale University and Social Science Research Council
Hazel Kyrk (retired), University of Chicago
Harold C. Passer, Eastman Kodak Co.
Bert Seidman,[1] American Federation of Labor
Vernon G. Lippitt, secretary, Harvard University

COMMITTEE ON INVENTORY STATISTICS

J. Frederic Dewhurst, chairman, The 20th Century Fund
Lester, Kellogg, John Deere & Co.
Moses Abramovitz, Stanford University and National Bureau of Economic Research
Joseph K. Heyman, The Trust Co. of Georgia
Mrs. Ruth Mack, National Bureau of Economic Research
William Shaw, E. I. duPont de Nemours
Arthur L. Broida, secretary, Federal Reserve Board.

COMMITTEE ON GENERAL BUSINESS EXPECTATIONS

Martin Gainsbrugh, chairman, National Industrial Conference Board
Orin E. Burley, University of Pennsylvania
Sanford Parker, Fortune Magazine
Ashely Wright, Standard Oil Co. of New Jersey
Elmer Bratt, Lehigh University
Albert Hart, Columbia University
Millard Hastay, secretary, National Bureau of Economic Research

COMMITTEE ON PLANT AND EQUIPMENT EXPENDITURE EXPECTATIONS

George Terborgh, chairman, Machinery and Allied Products Institute
Walter Hoadley, Armstrong Cork Co.
Irwin Friend, University of Pennsylvania
Miles L. Colean, consulting economist, Washington, D. C.
William Butler, Chase National Bank
Paul Simpson, secretary, Federal Reserve Board

LETTERS TO COMMITTEE CHAIRMEN FROM CHAIRMAN MARTIN

BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM,
OFFICE OF THE CHAIRMAN,
November 22, 1954.

Mr. RAYMOND W. GOLDSMITH,
R. W. Goldsmith Associates, Inc.,
Washington, D. C.

DEAR MR. GOLDSMITH: I am most pleased to learn of your willingness to serve as a consultant to the Board in the capacity of chairman of a small committee of distinguished economists and statisticians to undertake a study and appraisal of existing statistics in the field of savings.

The study your committee is undertaking is one of several being made by the Board, in cooperation with other Federal agencies and private organizations, in response to a request addressed to the Board by the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report of the 83d Congress, 2d session. The subcommittee's request is stated as follows in the progress report of August 5, 1954:

"The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations.

[1] Committee members added subsequent to the issuance of the December 21, 1954, press release.

This request includes a thorough review of, and basic research into, concepts, existing data, sources, and procedure for improving these statistics."

The language of the request indicates a desire on the part of the subcommittee for a comprehensive review and appraisal of the present status of our knowledge in the field of savings and for a set of broad, but also as specific as possible, recommendations for improvements in existing concepts, methods, and statistics, and for the development of new concepts and statistical data if these are deemed necessary. This clearly calls for consideration of the purposes for which savings data are now being or could be used. The committee, however, is not being asked to make any recommendations as to which governmental agencies, or private organizations, should be responsible for providing data in the savings field. The target date for completion of committee reports is June 30, 1955.

Saving occupies a highly strategic position in the functioning of the economy generally and particularly so with respect to developments in money and credit markets, cyclical fluctuations in business activity, and long-run growth in capital, productivity, and living standards. Construction of adequate, pertinent, and prompt measures of savings has been a major task of economists and statisticians for many years and a number of concepts and measures are now available.

Your committee has an unusual opportunity to further progress in this area by providing at this time a broad, objective, and expert examination of the field taking into account the place of savings in our financial structure, the analytic uses being made of savings data, and the present and prospective needs for such information by those concerned with determination of governmental policy, by private business and financial analysts, and by students of the economy in general.

The focus of interest of the study is in the improvement of statistics relating to all phases of saving in our economy. This would include the amounts and forms of savings of various groups—consumers, noncorporate businesses, corporate businesses, and (mainly to fill out the picture) government. The distribution of savings by income classes and other significant groups, as well as the other bodies of savings data, is appropriate for evaluation by your committee. Presumably, some part of the committee's time will need to be devoted to problems of collection and processing of data, including appraisal of sampling procedures as these relate both to present series and to possible new series.

Mr. Ralph A. Young, Director of the Division of Research and Statistics, will serve as the Board's liaison with the committees and he will be in touch with you from time to time as the work of your committee progresses. Mr. Young and members of the research staff are prepared to provide your committee whatever assistance they can and the cooperation of other agencies is assured.

I wish to express to you and your colleagues on the savings committee my great appreciation for your willingness to undertake this important task.

Very truly yours,

WM. McC. MARTIN, Jr.

BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM,
OFFICE OF THE CHAIRMAN,
Washington, D. C., November 22, 1954.

Mr. J. FREDERIC DEWHURST,
Twentieth Century Fund, New York, N. Y.

DEAR MR. DEWHURST: I am most pleased to learn of your willingness to serve as a consultant to the Board in the capacity of chairman of a small committee of distinguished economists and statisticians to undertake a study and appraisal of existing statistics in the field of inventories.

The study your committee is undertaking is one of several being made by the Board, in cooperation with other Federal agencies and private organizations, in response to a request addressed to the Board by the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report of the 83d Congress, 2d session. The subcommittee's request is stated as follows in the progress report of August 5, 1954:

"The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations. This request includes a thorough review of, and basic research into, concepts, existing data, sources, and procedure for improving these statistics."

The language of this request clearly indicates a desire for a comprehensive appraisal of existing inventory data and of means for improving them. Such an appraisal patently calls for consideration of the purposes for which inventory statistics are being or should be used. It also implies consideration of the relations between inventory statistics and other data, such as those for prices and for sales, output, and new orders. In some fields, output figures for successive stages may provide the most useful clues available as to changing inventory positions.

The field of inventory study is one of the most important in the whole area of economic and financial analysis, particularly with reference to problems of cyclical fluctuation. Private business policies often depend on inventory changes in particular fields and in the economy as a whole. Government economic and monetary policies of a broad nature are often affected by inventory developments and so also are some other more specialized Government programs, notably those for defense stockpiling and farm price supports.

Only in recent decades has anv appreciable volume of information concerning inventory fluctuations been available and of necessity much of the work in collecting and analyzing inventory data has been experimental in nature. Further major progress in this field may be feasible in the years ahead. Your committee has an unusual opportunity to contribute to such further advance by analyzing actual and potential uses of data concerning inventories, appraising the progress which has been made so far in developing inventory information adequate for analysis, and making recommendations concerning the further development of statistical information in this field.

In view of the basic nature of the inquiry, attention may well be given to long-term as well as short-term objectives. Also, due consideration will need to be given to the effects which recent improvements in techniques of data collection, processing, and analysis may have in making possible an improved inventory statistics program. The committee, however, is not being asked to make any recommendations as to what agencies should be responsible for providing inventory data.

The target date set for completion of committee reports is June 30, 1955.

Mr. Ralph A. Young, Director of the Division of Research and Statistics, will service as the Board's liaison with the committees and he will be in touch with you from time to time as the work of your committee progresses. Mr. Young and members of the research staff are prepared to provide your committee whatever assistance they can and the cooperation of other agencies is assured.

I wish to express to you and your colleagues on the Committee on Inventory Statistics my great appreciation for your willingness to undertake this important task.

Very truly yours,

WM. McC. MARTIN, Jr.

BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM,
OFFICE OF THE CHAIRMAN,
November 30, 1954.

Mr. ARTHUR SMITHIES,
Department of Economics, Harvard University,
Cambridge, Mass.

DEAR MR. SMITHIES: I am most pleased to learn of your willingness to serve as a consultant to the Board in the capacity of chairman of a small committee of distinguished social scientists to undertake a study and appraisal of existing statistics in the field of consumer expectations.

The study your committee is undertaking is one of several being made by the Board, in cooperation with other Federal agencies and private organizations, in response to a request addressed to the Board by the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report of the 83d Congress, 2d session. The subcommittee's request is stated as follows in the progress report of August 5, 1954:

"The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations. This request includes a thorough review of, and basic research into, concepts, existing data, sources, and procedure for improving these statistics."

The language of the request indicates a desire on the part of the subcommittee for a comprehensive review and appraisal of the present status of our knowledge in the field of consumer-survey information and for a set of broad, but also as specific as possible, recommendations for improvements in existing concepts, methods, and statistics, and for the development of new concepts and statistical data if these are deemed necessary. This clearly calls for consideration of the purposes for which consumer survey data are now being or could be used. It also requires consideration of these data in relation to other statistics concerning consumer behavior.

Surveys of consumer expectations, attitudes, buying plans, and related information are a relatively recent development in economic analysis. They have received the serious attention of a relatively limited number of scholars. Of necessity, much of the work has been and still is experimental in terms of their psychological underpinnings, the statistical techniques utilized, and the economic usefulness of the findings either for explaining the past or predicting the future. Your committee has an unusual opportunity to provide thoughtful evaluation and direction to this promising area of investigation.

The consumer—his current income and financial position, his debts and assets, his plans and expectations, and his attitudes about his economic situation and prospects—play an extremely important role in short-term business fluctuations as well as in long-run growth. Statistical data about consumer financial positions and economic behavior are potentially of great significance for policymakers. In approaching an evaluation of this field of statistics, it would be appropriate to include some analysis of the uses now being made of consumer expectations and related data and possible future needs for statistics in this field by persons concerned with governmental policy, by private business, labor, and financial analysts, and by students of the economy in general.

In view of the basic nature of the inquiry, the study should be undertaken on a broad basis with an eye to long-run as well as short-run objectives. Presumably some part of the committee's time will need to be devoted to problems of collection and processing of data, including appraisal of interviewing techniques, questionnaire construction, and sampling procedures, as these relate both to present surveys and to possible new sources of information.

The request of the subcommittee is directed toward the whole field of consumer survey statistics, including the Board's survey of consumer finances as one among several surveys. It is not envisaged that your report, or those of the other committees, should make any recommendations as to the agency or agencies, public or private, who should have responsibility for particular statistical series. You should feel perfectly free, of course, to criticize, if you like, any of the work presently being carried out in the field. The target date for the completion of the committees' reports is June 30, 1955.

Mr. Ralph A. Young, Director of the Division of Research and Statistics, will serve as the Board's liaison with the committees and he will be in touch with you from time to time as the work of your committee progresses. Mr. Young and members of the research staff are prepared to provide your committee whatever assistance they can and the cooperation of other agencies is assured.

I wish to express to you and your colleagues on the Committee on Consumer Expectations my great appreciation for your willingness to undertake this important task.

Very truly yours,

Wm. McC. Martin, Jr.

Board of Governors of the Federal Reserve System,
Office of the Chairman,
December 6, 1954.

Mr. Martin R. Gainsbrugh,
National Industrial Conference Board,
New York, N. Y.

Dear Mr. Gainsbrugh: I am most pleased to learn of your willingness to serve as a consultant to the Board in the capacity of chairman of a small committee of distinguished economists and statisticians to undertake a study and appraisal of existing statistics in the field of general business expectations.

The study your committee is undertaking is one of several being made by the Board, in cooperation with other Federal agencies and private organizations, in response to a request addressed to the Board by the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report of the 83d Congress, 2d session. The subcommittee's request is stated as follows in the progress report of August 5, 1954:

"The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations. This request includes a thorough review of, and basic research into, concepts, existing data, sources, and procedure for improving these statistics."

The language of the request indicates a desire on the part of the subcommittee for a comprehensive review and appraisal of the present status of our knowledge in the field of general business expectation statistics and for a set of broad, but also as specific as possible, recommendations for improvements in existing concepts, methods, and statistics, including proposals for development of new statistical data if these are deemed desirable. This would also call for consideration of the purposes for which data are now being or could be used.

Surveys of general business expectations and related information are a relatively recent development in broad economic analysis, although, of course, they have been used for many years for planning by individual companies in some areas. Of necessity, much of the work has been and still is experimental in terms of the statistical techniques utilized and the economic usefulness of the findings either for explaining the past or predicting the future. Your committee has an unusual opportunity to provide thoughtful evaluation and direction to this promising area of investigation.

In view of the basic nature of the inquiry, the study should be undertaken on a broad basis with an eye to long-run as well as short-run objectives. Presumably part of the committee's time will need to be devoted to problems of collection and processing of data, including appraisal of interviewing techniques, questionnaire construction, and sampling procedures. as these relate both to present surveys and to possible new sources of information.

As you know, another committee under the chairmanship of George Terborgh is making a study of expectations with respect to plant and equipment outlays. Your committee, therefore. will need to focus mainly on general business expectation statistics and surveys.

The request of the subcommittee is directed toward the general field of business expectation statistics, including privately sponsored as well as governmental series; in fact, most of the presently available statistics are collected and issued by private organizations. It is not envisaged that your report, or those of the other committees, should make any recommendations as to the agency or agencies, public or private, who should have responsibility for particular statistical series. You should feel perfectly free, of course, to criticize, if you like, any of the work presently being carried out in the field. The target date for the completion of the committees' reports is June 30, 1955.

Mr. Ralph A. Young, Director of the Division of Research and Statistics, will serve as the Board's liaison with the committees and he will be in touch with you from time to time as the work of your committee progresses. Mr. Young and members of the research staff are prepared to provide your committee whatever assistance they can and the cooperation of other agencies is assured.

I wish to express to you and your colleagues on the Committee on General Business Expectations my great appreciation for your willingness to undertake this important task.

Very truly yours,

WM. McC. MARTIN, Jr.

BOARD OF GOVERNORS OF THE FEDERAL RESERVE STSTEM,
OFFICE OF THE CHAIRMAN,
November 30, 1954.

Mr. GEORGE TERBORGH,
Machinery and Allied Products Institute,
Ring Building, Washington, D. C.

DEAR MR. TERBORGH: I am most pleased to learn of your willingness to serve as a consultant to the Board in the capacity of chairman of a small committee of distinguished economists to undertake a study and appraisal of the adequacy of existing statistics relating to fixed capital outlays and expectations. The study your committee is undertaking is one of several being made by the Board, in cooperation with other Federal agencies and private organizations, in response to a request to the Board by the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report of the 83d Congress, 2d session. The subcommittee's request is stated as follows in recommendation No. 9 in the progress report of August 5, 1954:

"The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations. This request includes a thorough review of, and basic research into, concepts, existing data, sources, and procedure for improving these statistics."

Fixed capital outlays, although a relatively small part of gross national product, occupy a highly strategic position in the economy generally, particularly so with respect to developments in capital markets, cyclical fluctuations in output and employment, and long-run growth in output and living standards. The task your committee is undertaking is to appraise the adequacy of present data and concepts and to prepare a set of recommendations for improving such information in the field of plans and expectations with respect to plant and equipment expenditures. The committee, however, is not being asked to make any recommendations as to what governmental agencies, or private organizations, should be responsible for providing data in these fields. The target date for completion of the committee's report is June 30, 1955.

Comprehensive data relating to prospective plant and equipment outlays and plans for expenditures are relatively recent and in many respects they are still experimental. Your committee has an unusual opportunity to contribute to further progress in this area by examining basic concepts and statistical methods in the light of the current uses and prospective needs for such information by students of the economy, business, and financial analysts, and those concerned with governmental policy.

In view of the breadth of the subcommittee's request it would appear appropriate, if your committee so desired, to include as part of its study an appraisal of capital outlays and plans for State and local governments and nonprofit organizations as well as those of farmers and private businesses. The committee may also wish to consider, among other things, the relation of capital outlays to economic growth, technological change, and financing patterns. Presumably an important part of the committee's time will need to be devoted to problems of collection and processing of data, including appraisal of sampling procedures, and to exploring the needs and possibilities for developing new series in important fields.

Mr. Ralph A. Young, Director of the Division of Research and Statistics, will serve as the Board's liaison with the committees and he will be in touch with you from time to time as the work of your committee progresses. Mr. Young and members of the research staff are prepared to provide your committee whatever assistance they can and the cooperation of other agencies is assured.

I understand that you are already exploring these and other problems with members of the Board's research staff. May I express again my appreciation of your acceptance of this assignment.

Very truly yours,

WM. McC. MARTIN, Jr.

Representative BOLLING. Senator Goldwater, did you have some material you wished to put in?

Senator GOLDWATER. Not at this time.

Representative BOLLING. Mr. Belcher, will you proceed?

OPENING STATEMENT OF DONALD R. BELCHER, ASSISTANT DIRECTOR, BUREAU OF THE BUDGET

Mr. BELCHER. Mr. Chairman and members of the committee, responding to the request of this committee, I am happy to present the following statement in regard to provisions made in the 1956 budget for the improvement of economic statistics by various agencies of the Federal Government.

A sound and balanced statistical system is a primary requirement for sound administrative policies. This is true as regards the decisions and actions of the Federal Government itself, both legislative and executive. It is equally true in the fields of private enterprise—agriculture, business, and labor. The needs for accurate and prompt knowledge of the ebbs and flows in all major areas of our economic life require improvement and strengthening of our basic system of statistical intelligence.

Such a system of statistical intelligence may be viewed as consisting of two or more or less distinguishable categories. The first may be called the overall analysis of the economic situation, and is typified by national product and income accounts, indexes of production, trends of employment and unemployment, earnings of all manufacturing corporations, and the volume of business investment. The second category, or "specialized analysis," is comprised of such data as production of individual crops, production by selected manufacturing industries, price movements of individual commodities, and employment and unemployment by specific industries and localities. To appraise the overall movements of the economy it is necessary to study the several parts, but the parts themselves cannot be competently interpreted without reference to the general framework of the economy as a whole.

As agencies of the Federal Government undertake to respond to legitimate demands for more and better economic statistics, it is of primary importance that proper balance be preserved, not only between the general and the specific, but also within each of these broad categories. It has long been and is now the objective of the Bureau of the Budget, in formulating appropriation recommendations to the President each year for inclusion in his annual budget, to do all in its power to strengthen the statistical system and at the same time to maintain that proper balance.

As I said to your subcommittee last July, the Office of Statistical Standards within the Budget Bureau draws on all available sources in formulating its judgment as to what the statistical program of the Government should be. In preparing the 1956 budget, we have been greatly influenced by the testimony given last July by experts both within and outside the Federal Government, as well as by recommendations contained in the progress report of the subcommittee under date of July 30, 1954. The 1956 budget contains provision for a major expansion in many statistical programs.

This year, for the first time and in response to the request of your subcommittee, the budget document contains, on pages 1203–1204, a special analysis of "Federal Economic Statistical Programs." It shows that, for the major current statistical programs, the President has recommended the amount of $32.2 million for fiscal 1956, as compared with estimated expenditures of $27.4 million in the current year, or an increase of $4.8 million.

I believe it desirable that this special analysis be incorporated in the record before this committee, and accordingly I shall not undertake to repeat all of the detail therein contained. Provision for a number of periodic census programs (namely, the censuses of agriculture, business, manufactures, and mineral industries) was made, in large part, by appropriations of $24.4 million in fiscal 1955. The 1956 budget includes the $10.7 million required for their completion, plus $500,000 for an intercensal housing survey. With regard to the current statistical programs, however, it may be helpful if I comment on some of them in fairly broad terms.

Representative TALLE. Mr. Chairman, I ask unanimous consent that the special analysis referred to by the witness be incorporated in the record.

Representative BOLLING. Without objection, that will be done.

(The information referred to is as follows:)

SPECIAL ANALYSIS I. FEDERAL ECONOMIC STATISTICAL PROGRAMS[1]

This analysis presents the current and recommended levels of the major economic statistical programs of the Federal Government. It is intended to facilitate evaluation of the overall system of Government statistics by specific subject-matter areas and to show the proposed changes in the budget recommendations for the fiscal year 1956 for statistics of employment and unemployment, construction and housing, and other important areas of economic conditions or activities.

A sound and balanced statistical system is a necessary basis for sound administrative policies. The needs of business, agriculture, labor, and Government for accurate and prompt knowledge of the ebbs and flows in all major areas of our economic life require improvement and strengthening of our basic system of statistical intelligence.

CURRENT PROGRAMS

For a number of years the current programs of the statistical agencies have operated at a nearly fixed level, despite increases in operating costs. There have been no major expansions in these programs to keep pace with the demands for improved measures of changing economic conditions, although the major economic censuses, which are essential as benchmarks, were initaited in the fiscal year 1955. To meet the demands for better current measures, for the fiscal year 1956 the budget provides increases amounting to $4.8 million, as shown in the following summary:

Direct obligations for major current statistical programs, by broad subject areas

[In millions]

Program	1954 actual	1955 estimate	1956 estimate
Employment and unemployment, wages, industrial injuries	$4.9	$4.9	$6.8
Prices and price indexes	1.6	1.7	2.0
Construction and housing	4.5	.5	1.5
Production and distribution	14.5	15.7	16.6
Population and vital statistics	1.5	1.5	1.6
National income and analysis of business trends: State and local governments	3.2	3.1	3.5
Electronic equipment development			.2
Total, major current programs	26.2	27.4	32.2

This table does not include all the current statistical programs of the Government. Many of the Government's statistical activities, including some which contribute to our overall system of economic information, are closely tied to and frequently part of administrative operations—for example, reporting activities which arise from the unemployment insurance operations of the Bureau of Employment Security. The agencies whose programs are included, in whole or in part, in this subject-matter summary are shown in the table at the end of this special analysis.

Employment and unemployment, wages, industrial injuries: The number of persons employed, their hours of work and wages, and the number of those looking for work are of concern to the Government in formulating policy and to businessmen, labor groups, and the general public as a guide in making many day-to-day economic decisions. Information on labor turnover (industrial hires, layoffs, and quits) throws additional light on the current economic situation.

One of the problems of most concern in recent months has been the nature of the impact of unemployment during the period of adjustment from an unusually high level of defense spending. The need for greater detail on the labor force, further improvement of statistics on the extent and incidence of unemployment, and more information on the employment situation and outlook in specific areas has been made apparent during the transition period. Increases are recommended for the fiscal year 1956 to enable the Bureau of the Census and the Bureau of Labor Statistics to strengthen their respective programs in this vital area.

Provision is also made for some extension in the fiscal year 1956 of the industry and community wage surveys conducted by the Bureau of Labor Statistics, and for expansion of the BLS statistics on industrial accidents to increase their usefulness in promoting safety.

[1] From the budget of the United States, for the fiscal year ending June 30, 1956, p. 1203.

Prices and price indexes: The collection of price data and the computation of indexes of prices and the cost of living are a basic element in our system of economic intelligence. The statistical series currently maintained in this area by the Bureau of Labor Statistics and the Department of Agriculture are of strategic importance in many different connections—notably, for example, use of the BLS consumer price index as a factor in setting wage rates for millions of workers, and use of agricultural price indexes in determining parity ratios.

Postwar revisions have been completed of the BLS consumer price index and wholesale price index. For the fiscal year 1956 the budget includes a major survey by the Agricultural Marketing Service to obtain the present pattern of farmers' expenditures to determine if there is need for revising or reweighting the index of prices paid by farmers. This survey will also supply information needed, for analysis of many farm problems.

Construction and housing: Construction is a major economic activity, carried on by thousands of small builders scattered throughout the Nation. Because of its sensitivity to economic conditions and the dependence placed upon it by so many related activities, adequate information on construciton is of key significance in appraising economic trends. Estimates now available are limited to the number of new nonfarm dwelling units started and the dollar volume of all new construction activity. The latter series is based on scattered data and can be relied on to reflect only long-term trends or substantial changes in the acitvity.

For the fiscal year 1956 the budget includes a major increase for the construction statistics program of the Business and Defense Services Administration, to improve the soundness and reliability of the new-construction activity series and to permit compilation of data on expenditures for alterations and repairs and on residential vacancies. Provision is also made for the Bureau of Labor Statistics to obtain statistics on characteristics of new housing being built and on the organization and structure of the home-building industry, and to initiate studies of materials and labor requirements for construction.

In addition the increase for this area included under current programs, the budget for the fiscal year 1956 provides for an intercensal housing survey, as noted below under periodic census programs.

Production and distribution: The broad area of production and distribution includes work of the Department of Agriculture on farm economics, market research, crop and livestock estimates, and related subjects, and work of other agencies—primarily the Bureau of the Census—on current business and industrial statistics, foregin trade and shipping, and related matters.

Farm production costs and farming metnods have drastically changed under the impact of new technology, and the survey of present patterns of farmers' expenditures proposed for 1956 will aid in analysis of farm income and farm practices. Provision is also made in the Agricultural Marketing Service for further market research and improvements in the accuracy of the estimates and forecasts of crop and livestock production. In the Agricultural Research Service, the budget provides for further work in the fiscal year 1956 on the economics of production, designed to develop information to help improve farm practices.

The 1956 budget also provides for annual sample surveys of retail trade and manufacturing activity by the Bureau of the Census.

Population and vital statistics: The only increase provided in this area for the fiscal year 1956 is recommended to enable the National Office of Vital Statistics to reduce the timelag in publishing reports of vital statistics. The increase in the number of certificates of births and other vital events to be processed and tabulated has resulted in excessive timelags in the publication of these reports.

National income and analysis of business trends; State and local governments: The Office of Business Economics in the Department of Commerce is responsible for making estimates of the national income and gross national product and other national accounts. A small increase is included in the budget for the fiscal year 1956 for the work of this office on analysis of national economic trends, primarily to provide for use in the national income-product accounts of the results of the business censuses being taken this year.

The quarterly financial reports program, which collects income statements and balance sheets from manufacturing corporations, is one of the important analytic tools for determining present and prospective levels of economic activity. This program is conducted jointly by the Federal Trade Commission and the Securities and Exchange Commission. For the fiscal year 1956 the budget provides for increasing the usefulness of this program by enlarging its scope to include mining and trade corporations.

Tabulations of income-tax returns by the Internal Revenue Service are used as benchmarks for most current series on the financial condition of business and for major components of the national income and product accounts.

State and local governments in toto represent an important segment of the national economy, spending over $30 billion a year. For the fiscal year 1956 the budget provides for filling a gap in our information in this area by including funds for the Bureau of the Census to develop annual State-by-State estimates of expenditures, receipts, and changes in debt of State and local governments.

Electronic equipment development: Efforts in the fiscal year 1956 directed toward developing specialized electronic equipment for use in the censuses of business, manufactures, and mineral industries scheduled for 1958 and the censuses of population, housing, and agriculture scheduled for 1960 will result in significant reductions in the costs of these censuses and in the time required between enumeration and publication of many of the basic tabulations. Funds for development of this equipment are included in the regular 1956 budget for the Bureau of the Census.

PERIODIC CENSUS PROGRAMS

Censuses of agriculture, business (wholesale and retail trade and the service trades), manufactures, and mineral industries are scheduled at 5-year intervals. These periodic canvasses of all establishments and farms are important to business and agriculture and serve as benchmarks by means of which the accuracy of many Government and private statistical series is maintained, and the trends shown by current series are evaluated. The major costs of the present censuses, which cover the calendar year 1954, were provided for in the appropriations enacted for the fiscal year 1955. The budget for the fiscal year 1956 includes funds for the completion of these censuses.

An intercensal housing survey to be made by the Bureau of the Census is also included in the budget for the fiscal year 1956. This survey will obtain needed information on the number and characteristics of the Nation's housing units and on changes in the amount of housing since the 1950 decennial census of housing.

Direct obligations for major economic statistical programs, by agency

[In millions]

Agency	1954 actual	1955 estimate	1956 estimate
CURRENT PROGRAMS			
Department of Agriculture:			
Agricultural Marketing Service: Marketing research and agricultural estimates	$8.4	$10.2	$11.0
Agricultural Research Service: Economics of production, included under farm and land management research	1.3	1.4	1.5
Department of Commerce:			
Bureau of the Census	6.8	6.2	7.4
Business and Defense Services Administration:			
Construction statistics, included under industry divisions	.1	.1	.9
Office of Business Economics	.9	.9	1.0
Department of Health, Education, and Welfare: Public Health Service: National Office of Vital Statistics	1.3	1.3	1.4
Department of Labor: Bureau of Labor Statistics	5.5	5.4	6.8
Department of the Treasury: Internal Revenue Service: Statistical reporting	1.6	1.7	1.7
Federal Trade Commission: Financial reports, included under economic and financial reports	.1	.1	.3
Securities and Exchange Commission: Preparation of operational and business statistics	.2	.1	.2
Total, current programs	26.2	27.4	32.2
PERIODIC CENSUS PROGRAMS			
Department of Commerce:			
Bureau of the Census:			
Census of agriculture		16.0	6.0
Censuses of business, manufactures, and mineral industries		8.4	4.7
Intercensal housing survey			.5
Spot checks of business, manufactures, and agriculture	1.5		
Total, periodic census programs	1.5	24.4	11.2
Total, major economic statistical programs	27.7	51.8	43.4

Mr. BELCHER. Manpower: An appreciable strengthening of statistics in the field of manpower seems called for, both to improve our overall understanding of the economic situation as it affects employment and also to support the Secretary of Labor in developing his programs.

We have been particularly impressed that, in the area of employment and unemployment statistics where we have some of our most detailed statistics, there is a need for still more detail, precision, and sensitivity to short-run changes in the economy. We are, therefore, recommending a doubling of the Current Population Survey sample to provide better and more detailed information on the labor force, employment and unemployment. Some funds for research and improvement of these series are also included.

The monthly indicator of the number of the unemployed needs to be supplemented by additional information on the characteristics of those who are presently without jobs—who are they, where are they, how long have they been without work, and whether their joblessness is due to seasonal or cyclical factors. To provide this information we have endorsed the request of the Secretary of Labor for funds to study the present problems of chronic area and industry unemployment, frictional unemployment, characteristics of the jobless, and the structural changes in the labor force lying beyind these current patterns. It is desirable also to survey the employment and unemployment of the labor force in selected industrial areas each year, using the same techniques now used for the national estimates of unemployment, with the Secretary of Labor choosing the areas in response to the needs of the current situation.

To round out the national and area picture, figures are needed in more detail and with greater accuracy regarding factory labor turnover rates—accessions, quits, discharges, layoffs, and the like; as well as greater detail and more accurate information on employment trends in that growing segment of our economy, the service trades. We propose to add also to the detail we now have on employment, hours and earnings by industries by cooperating with the States in the preparation of such series in some 14 additional metropolitan areas.

For many years the Occupational Outlook Handbook of the Department of Labor has been one of the most important tools available to schools, employment offices, and others interested in vocational guidance from the point of view of labor market opportunities. The last edition is now seriously out of date. To keep this valuable handbook in tune with the times, we are recommending that a regular program of revision be begun in 1956.

We are also providing for some extension of the industry and community wage surveys and for expansion of statistics on industrial accidents to increase their usefulness in promoting safety.

Prices: There have been major revisions of the Wholesale Price Index and the Consumers Price Index since 1950. We feel, and your panel of last summer seemed to share this feeling, that these economic series meet fairly well the usual needs. However, there is now a modest provision in the Bureau of Labor Statistics appropriation for continued research to which we can look for continual review.

Weights for the Index of Prices Paid by Farmers are based on data relating to farm daily expenditures in 1937–41. A survey of farmers' expenditures is provided in the Department of Agriculture budget for 1956. This survey will collect data on the current pattern of expenditures and supply the information needed in reviewing the weights for this index. In addition to this use, the survey will also provide much better information for computing net farm income—a significant figure for appraising the condition of agriculture and, of course, an important component in other national aggregates.

Financial, national income and governments: In the area of current business statistics, provision is made for expanding the financial reports program, conducted jointly by the Federal Trade Commission and the Securities snd Exchange Commission, to include mining and wholesale and retail trade corporations, and to provide preliminary estimates of the quarterly net income of the corporations covered. Increases are requested also to improve the savings estimates, to permit a special study of plant and equipment expenditure estimates to determine what factors are responsible for differences between anticipated expenditures and actual expenditures for the same period, and for a study of the problems related to the collection of current financial statistics covering unincorporated business.

Improvements in the accuracy of our national income and product estimates will be facilitated by the projects included in this year's budget request. In particular, provision is made for incorporating in those estimates the reliable comprehensive data which will become available in the census of business and manufactures for 1954, and statistical tabulations by the Internal Revenue Service for the same year. Through integration with the FTC–SEC financial reporting program noted above, the national income work will utilize data from that program without the expense and burden of special collection. Planning for improvements in our inventory and manufactures sales estimates is also provided in the budget increases.

Provision is being made in the Bureau of the Census budget to expand the present sample survey of State and local government finances so that estimates of revenues, expenditures, and debt can be obtained on a State-by-State basis. Such information is needed in dealing with the problems of intergovernmental relations and will also facilitate the taking of the 1957 census of governments.

Production and distribution: The importance of accurate current information on production and distribution of both agricultural and industrial products cannot be overemphasized. The development of a research program to improve crop and livestock estimating methods was initiated in fiscal 1954 and a start on its gradual expansion to cover an increased number of crops and additional sections of the country is provided for in this budget. In addition, provision is made for expansion of marketing research directed toward improved product quality and improved efficiency in the marketing of agricultural products. Such research serves as a basis for more intelligent decisions regarding assembly, storage, processing, and distribution of farm products. Increased attention will also be given to research designed to provide data on changes in farming called for in different farming areas in view of prospective prices, costs, and other conditions.

Continuation of annual sample surveys of manufacturing and retail trade during the years between the quinquennial censuses of manufactures and trade was recommended by the Secretary of Commerce's Intensive Review Committee. While such a survey covering 1954 was not needed in view of the major censuses covering these areas, the 1956 budget provides for a resumption.

Construction and housing: Statistics on construction and housing are generally regarded as critically inadequate. The Bureau of Labor Statistics series on the number of new nonfarm dwelling units started was revised last year and is as firm as it can be made with the techniques and data available from present resources. However, it does not include farmhouses and its coverage of nonfarmhouses in rural areas is weak.

The series on expenditures for new construction of all types, for which BLS in the Department of Labor and BDSA in the Department of Commerce are jointly responsible, is seriously deficient. The BDSA budget contains funds for a program which will make substantial improvements in these data next year. As a byproduct of the surveys planned to collect data on nonresidential construction, the deficiencies in the housing starts series for rural areas which I just mentioned will be largely corrected.

One phase of construction activity on which we have had no reliable data has to do with the volume of expenditures for alterations, repair, and modernization. Last year the Bureau of the Census made a small survey which tended to show that such expenditures by homeowners alone were much higher than was previously believed, approaching in fact the expenditures for new homes. Census and BDSA are now doing similar preliminary work on commercial properties. The BDSA budget contains funds for the regular and continuing collection of data on the volume of such activity on all types of properties.

The last housing census was taken in the spring of 1950. Additions to the housing supply through new construction are being made at an unprecedented level since 1949—well over a million units a year. However, lacking current measures of such quantitative factors as demolition and conversions and such qualitative factors as "fix-up" and modernization, the census budget contemplates an intercensal housing inventory, to be taken in 1956 on a sample basis. This will provide much needed information on the effect of all of these forces on the amount and quality of the Nation's housing supply. Data on resisential vacancies will be provided periodically by a program supported by funds in the BDSA budget.

The three programs I have just mentioned—new construction, alterations and repairs, and the housing and vacancy surveys—account dollarwise for 85 percent of the improvement in the statistical program for this area. The rest of the program provides for surveys and studies by BDSA and BLS of building materials and labor requirements for construction, and characteristics of new houses being built, and the organization and structure of the home-building industry.

All of the programs in this area are recurring and should be continued annually, except the census housing survey which would be repeated during the period between decennial censuses only as conditions warrant. I should mention also that the studies of materials and labor requirements would cover selected types of construction on a rotating basis so that these requirements for all types of construction would be covered about every 5 years.

Population and vital statistics: During the past few years the processing of certificates of births and other vital events and publication of the annual compendium of final data have lagged far behind desirable goals. An increase in funds for the fiscal year 1956 will enable the National Office of Vital Statistics to recapture lost ground in approximating an optimum schedule for the publication of vital statistics of the United States.

Conclusion: In its report of last July, your subcommittee put great emphasis on the needs of private economic interests and of Government policymakers for increasing quantity and improved quality of economic statistics, and pointed out the essential and unique role which the Federal Government must take in helping to satisfy that need.

I believe that viewpoint has widespread acceptance in our Government. Despite budgetary limitations, our statistical agencies have long been in the forefront of new statistical methods and their output over the years has shown great overall improvement, both in coverage and in quality.

For fiscal 1956, the President has recommended appropriations to the several agencies which, in addition to completing the special censuses already underway, will provide for expansion of $4.8 million, or about one-sixth, in present levels, for the current statistical programs. This contemplates not only general strengthening throughout the statistical system but, in particular, marked increases in the fields of manpower and construction statistics where the need for more and better economic information is most generally recognized. The increases are all directed at known weaknesses or gaps in existing statistics and will measurably improve our economic intelligence. In the two fields of major increases, I am convinced that the expanded programs will raise the entire level of accuracy and detail, and correct major deficiencies disclosed during the postwar period.

I want to thank you for your attention and again express appreciation for the opportunity of appearing before this committee.

Representative BOLLING. Thank you, Mr. Belcher.

Mr. Talle, do you have some questions?

Representative TALLE. Yes, Mr. Chairman.

Mr. Belcher, in the Joint Economic Report of last February, House Report 1256, 83d Cong., 2d sess., the committee recommended that the various executive agencies comply with the committees' staffs' suggestions for improving labor force employment and unemployment statistics, pages 49 and 50 in that report.

Would you outline the steps which have been taken to comply with those recommendations or suggestions?

Mr. BELCHER. Well, specifically as to that area, in that area we have the largest single item of increase in the recommended budget for 1956. That is an increase from estimated expenditures of $4.9 million in 1955 to a budget figure of $6.8 million in 1956, or an increase of $1.9 million in that manpower area. So we have given very serious consideration to that recommendation.

Representative TALLE. I want to say, again, that the cooperation of the executive agencies with our committee has certainly been excellent, and I foresee that it will continue to be so.

Mr. BELCHER. Thank you, sir. I am very happy to hear that.

Representative BOLLING. Senator Douglas.

Senator DOUGLAS. Mr. Belcher, are you the representative of the Bureau of the Budget in charge of statistics or generally supervising governmental statistics?

Mr. BELCHER. I am Assistant Director of the Bureau and assigned various responsibilities, and I have been giving special attention to the area of statistics in the absence of an Assistant Director in charge of the Office of Statistical Standards.

Senator DOUGLAS. Some years ago I used to use the statistical series of the Government quite fully, although in the last 15 years it has been impossible for me to do so. Up until 1921, the Government collected statistics on the amount of fixed and working capital in manufacturing, and then I am sorry to say, on the recommendation of an advisory committee of statisticians, this series was discontinued.

Now I have not had a chance to study the various censuses since then. Do you know whether we now have amounts of capital invested and total amounts of capital used in the various industries?

Mr. BELCHER. I would suppose we would have in connection with the census of manufactures. May I ask Mr. Stapp, who is Assistant Chief of the Office, about that fact?

Mr. STAPP. There has been a certain amount of decreasing emphasis on the amount of capital——

Senator DOUGLAS. Do you have the amount of capital for increases?

Mr. STAPP. They get the amount invested and the amount increased.

Senator DOUGLAS. Do you have figures of total capital or just the annual increments?

Mr. STAPP. Senator Douglas, there are a number of sources for such data and I cannot recall the exact status.

Senator DOUGLAS. Would you be good enough to prepare a memorandum on this question? I know it is difficult to translate these figures into money terms because you have the problem of original cost as compared with current valuation. This, however, has always seemed to me a highly important series, and the British dominions have very detailed periodic figures on this. Of course, their censuses of manufactures are very poor but it did seem to me a great mistake to discontinue our series on this subject. At an appropriate time I would like to urge an expansion in this direction because it has great theoretical and great practical importance, too.

Mr. BELCHER. May we submit a statement as to the current situation on that?

Senator DOUGLAS. Yes, I would appreciate it very much.

(The material requested is as follows:)

INFORMATION AVAILABLE FROM FEDERAL STATISTICAL AGENCIES ON CAPITAL INVESTED IN MANUFACTURING

(1) Quarterly data on working capital, assets, liabilities and other financial items appear in the quarterly financial report, a joint release of the Federal Trade Commission and the Securities and Exchange Commission. This release gives data on a company basis on individual asset items (such as property, plant, and equipment) as well as liability, income, and surplus items. The data are available for all manufacturing corporations, and for 23 individual industry groups (such as food, tobacco, machinery, etc.) in manufacturing.

(2) Annual data, in still greater detail, are published in the Internal Revenue Service's Statistics of Income, Part 2, Corporations (table 4).

(3) Quarterly data are also available on the amount of investment made in the current quarter. These figures on plant and equipment expenditures by manu-

facturing corporations appear regularly in the survey of current business and are based on the joint surveys of the Office of Business Economics and the Securities and Exchange Commission. The survey also publishes estimates of anticipated capital expenditures. These estimates (which are based upon anticipations of business firms) are made quarterly for two quarters in advance and once a year for a full calendar year.

The above data relate only to manufacturing corporations. However, corporations account for over 90 percent of net income and sales in all manufacturing. Consequently the data can be taken as generally indicative of manufacturing business as a whole, though some industry segments, such as petroleum, encompass appreciable amounts of nonmanufacturing facilities.

(4) Annual data for plant and equipment expenditures and for inventories by establishments is provided in detailed industry groups beginning with 1949 in the Census Bureau's annual sample survey of manufactures. In addition, expenditures for manufacturing establishments under construction and not yet in operation at the end of the year are also collected. Information on plant and equipment expenditures and inventories for all manufacturing establishments was collected in the census of manufactures for 1939, 1947, and currently for 1954. The Census Bureau did not collect data on capital expenditures between the years 1921–37. Data on total capital invested by manufacturing establishments consisting of plant and equipment, inventories and other assets were last collected for 1919.

Representative BOLLING. Senator Goldwater.

Senator GOLDWATER. I have no questions.

Representative BOLLING. Senator Sparkman.

Senator SPARKMAN. I have no questions.

Representative BOLLING. Thank you very much, Mr. Belcher.

Mr. BELCHER. It was a great pleasure to be here.

(Mr. Belcher's prepared statement appears at p. 1099.)

Senator GOLDWATER. It is going to be necessary for me to leave. This is the particular time of year when Republicans go forth to extoll the virtues of Lincoln, and I have to depart for that purpose today, but I am sure you understand the necessity of that.

Representative BOLLING. Certainly.

Senator GOLDWATER. Before I go, though, I would like to comment that I have had many, many letters from constituents in Arizona and business friends in other parts of the Nation complaining about the present business census that has gone out. It is out. There is nothing we can do about it.

Pointing this up was an article in Business Week on the 5th of February, entitled "Where the Census Goes Wrong." I have had that article copied, because it points up very pointedly the type of remarks that I have been receiving on the census.

Mentioned in this article is the improvement of census of manufactured articles statistics, which is a report of the Advisory Council on Federal Reports.

Mr. Chairman, I would like to ask unanimous consent that this article from Business Week, together with a copy of this report, be incorporated in the record at this time.

Representative BOLLING. Without objection, that will be done.

(The information referred to above is as follows:)

[Business Week, February 5, 1955]

WHERE THE CENSUS GOES WRONG

AN INDUSTRY ADVISORY GROUP SAYS MANY OF THE CENSUS OF MANUFACTURERS CLASSIFICATIONS ARE MISLEADING

Sometime within the next 2 weeks, every manufacturing plant in the United States is supposed to tell the Census Bureau how much business it did last year, what its chief products were, and how many people it employed. But census officials have been warned that the results, when they are tabulated and published later in the year, will be far from an accurate picture of what United States industry really is, or how it operates.

The warning was made by a committee of top economists and statisticians in a report for the Advisory Council on Federal Reports. The Council, which works closely with the Statistical Standards Division of the Bureau of the Budget, is composed of private industry representatives. The census study was made by a special subcommittee of the Council.

Objections.—In general, the committee, in an 11-to-1 majority report, accuses the Census Bureau of clinging to outmoded ideas of what constitutes an "industry," and of failing to adjust its data to reflect modern practices.

In particular, the committee says census data fails to allow for the trend toward diversification of products, and for the amount of output for in-plant use only.

The result—in the opinion of committee members—is needless trouble for business on a number of fronts:

Businessmen trying to use census data to measure potential markets are hampered by lack of complete coverage.

Antimonopoly legislators and the Federal Trade Commission are given a false picture of the degree to which output is concentrated in a few plants.

The real productivity of labor is obscured by unreliable information on total output within individual plants. And labor productivity is becoming more and more a big factor in union negotiations.

Too late?—It's too late to change the forms, or to obtain additional information from manufacturers, in time for this year's census. But the committee hopes Census will still change some of its processing of the raw data to conform to its recommendations. It also recommends that Census raise warning signs over some of its data that the committee feels will be particularly misleading.

To see what's involved, think of the information supplied by businessmen as falling into two broad categories: (1) Facts about products, and (2) facts about the establishment as a whole. These break down further into the subdivisions that cause much of the confusion in the business census.

I. What are products?

Plants are asked to report on the dollar value of final products that are shipped, sometimes on the number of units produced, too. The committee has praise for these figures—as far as they go. The trouble is they stop short of really listing what most plants make and often fall far short of measuring actual output. Here's why:

"Final products shipped"—the key to census data on products—fails to pick up information about goods produced for internal use. If the product is not shipped as a separate unit, it is not counted. That means millions of dollars' worth of such items as containers, casting, stampings, forgings, and machined products simply disappear as far as the census of manufacturers is concerned.

Misleading.—This flaw in census data can lead to serious errors in measuring the size of an industry. The committee cites the case of cutting tools, jigs, dies, and fixtures. This is classified as a separate industry under census rules.

Suppose you're a supplier to this industry and want to check on the size of your market. The last census of manufacturers—taken for 1947—reports a grand total of 74,522 workers in this industry. But General Motors Corp. alone employs 18,000 skilled tool, die, jig, and fixture makers—of whom only 500 are included in the census figures. That's because the other 17,500 turn out products that are used in the same plant where they are made, instead of being shipped.

Thousands of additional workers are turning out these products for other manufacturers. So the census figures ludicrously understate the size of the industry.

Wrong impression.—That's a serious enough flaw when a market analyst is trying to judge a sales potential. It becomes even more serious when Government officials wade cheerfully into the same statistics and make deductions about how output is divided among plants.

In a study published last year, FTC used census data to report on trends in concentration of output for the "cutting tools, jigs, fixtures, etc.," industry among others.

FTC showed that in 1935 the four leading producers accounted for more than one-fifth of sales; by 1947 their share had dropped to only one-fourteenth. To the industry advisory committee, such figures are utterly meaningless as long as they disregard output for internal use.

More paperwork.—The committee notes progress in reporting on products for internal use in some textile, chemical, and primary metal lines. It wants this reporting extended to other types of plants. If applied to everything, this would throw a terriffic new load of paperwork on company officials, so the committee recommends that Census obtain the additional data only where there is a clear public interest, or where the companies involved volunteer to take on the extra labor. Where output for internal use is not reported, the committee asks Census to clearly label its published data as incomplete, even on this year's results.

II. What is an industry?

Manufacturers are asked to supply information for each plant as a whole, covering such points as number employed, payrolls, man-hours, and value of materials used. For some purposes—such as reporting general industrial activity in a State or region—the result is accurate, the committee believes. But when Census parcels out the returns into industry classes, confusion sets in.

Census recognizes 453 "industries," largely defined on the basis of products shipped. However, many plants produce goods that can be classified in more than 1 industry.

Nail industry.—The committee picks nails and spikes as an example of what happens to census data.

The 1947 census showed that this particular industry consisted of 68 establishments, which employed 3,805 workers and shipped $30 million worth of products. That's not an accurate picture of nail and spike production, because:

First, the 68 establishments shipped only $23.5 million worth of nails and spikes—not $30 million worth. The balance of output consisted of items that belong to some other industry classification. They are not named in census data.

Second—and more confusing to the market analyst, economist, or the public official seeking guidance—the $23.5 million worth of product made by the "industry," was less than one-fifth of actual shipments of nails and spikes. Nearly $100 million worth was shipped by establishments that are classified in other industries, mostly steel.

"It is evident," the committee says, "that neither the employment * * * nor any of the other general establishment statistics represent either clear or complete statistics of economic activity in the production of nails and spikes."

The committee believes that half the other 452 census industries suffer from the same lack of clear data, including automobiles, steel, metal processing, textiles, chemicals, and rubber.

III. The productivity tangle

Consider, too, what happens to productivity, if computed from census industry data. Productivity is computed for a given class of industry by dividing the value of the product shipped by the number of man-hours. Simple enough. But here's what happens to the figures when some plants are chiefly assemblers and others are integrated.

The error.—Manufacturer A is an assembler of rear axles for the automobile industry. He is classified with the motor vehicles and parts industry. But he buys forged axle shafts from the iron and steel forgings industry, he buys castings to house the differentials from the grey iron foundries industry, his stampings come from the metal-stamping industry, he buys machined parts from the machine shops industry. He merely assembles these components—bought from four separate industries—so his 1,000 employees can turn out 50,000 axle assemblies at a high rate per man-hour.

Manufacturer B is also classified in the motor vehicles and parts industry and also makes rear-axle assemblies. But he has an integrated operation—does his own forging, casting, stamping, and so on. Obviously, if he also produces 50,000 axle assemblies in the same period as manufacturer A, he has to employ many more workers and pile up many more man-hours per axle assembly. The productivity of his workers would thus appear to be much lower than A's.

Under census procedures, A and B are dumped into the same industry class, and a figure on productivity obtained for the industry as a whole. Applied either to A or to B, this figure is meaningless because it fails to differentiate between the assembler and the integrated producer.

The same flaw applies to many other industries. An auto maker who buys many components—such as Kaiser—will appear to have higher productivity than Ford, whose plants are integrated.

IMPROVEMENT OF CENSUS OF MANUFACTURES INDUSTRY STATISTICS—REPORT OF THE SUBCOMMITTEE ON THE CENSUS OF MANUFACTURES TO THE COMMITTEE ON THE CENSUS OF MANUFACTURES, ADVISORY COUNCIL ON FEDERAL REPORTS

ADVISORY COUNCIL ON FEDERAL REPORTS,
Washington, D. C., December 9, 1954.

Mr. T. E. VELTFORT,
Chairman, Committee on the Census of Manufactures,
Advisory Council on Federal Reports,
Washington, D. C.

DEAR MR. CHAIRMAN: Earlier in 1954, the Intensive Review Committee submitted its report on the programs of the Bureau of the Census to the Secretary of Commerce. Among its 51 recommendations, 7 dealt with the census of manufactures, and 1 of them (recommendation No. 16) forms the basis for the work of this Subcommittee on the Census of Manufactures Recommendation No. 16 of the Intensive Review Committee reads as follows:

"That the Bureau, in collaboration with other Federal statistical agencies and the Office of Statistical Standards, actively seek to provide expanded data on processes employed and materials used and to provide where practicable for the presentation of general census statistics in terms of product classes with a view to making published data for the industries concerned more meaningful."

Accordingly, the Subcommittee on the Census of Manufactures was created by action of your Committee on the Census of Manufactures of the Advisory Council on Federal Reports on June 9, 1954. The subcommittee was instructed "to study the problems related to the task of making census of manufactures data more effective to users, and to present a joint report for submission to the Bureau of the Budget through the parent Committee on the Census of Manufactures of the Advisory Council."[1]

The census of manufactures is one of the most important sources of statistical information. In fact, it is the only source of many data describing the manufacturing segment of our economy and its operation. Moreover, census of manufactures data form the primary basis for numerous current statistical series of national importance issued regularly by the Federal Reserve Board, the Department of Commerce, the Department of Labor, the Federal Trade Commission, and other Government agencies and private organizations. In addition, a great deal of economic as well as statistical analysis is built directly or indirectly upon census data, and forms the basis for legislative, governmental, and business actions of often far-reaching importance. Under these circumstances it is evident that systematic errors in the census of manufactures would be of immense public as well as private significance.

The subcommittee has found that the census statistics of so-called industries are seriously deficient on several important counts. Nevertheless, because they are in so many cases the only data available for what they purport to portray, Census statistics are used widely and indiscriminately in spite of their many weaknesses. Teachers as well as practicing statisticians and economists, both in and out of Government, are no more protected from hidden inaccuracies of these statistics than are laymen whose use of census data is only occasional. Most users take census industry statistics at face value, although some of their shortcomings can be ascertained by diligent and protracted study of general explanations, industry definitions, appendixes and other "fine print material" appearing in the "big" census volumes. However, these notations can hardly be called adequate when the Department of Commerce, itself, has computed and published concentration ratios for hundreds of separate "industries" on the basis of census statistics of shipments, even though as much as 99 percent of the shipments of an industry's products had been excluded from these data.[2]

Aside from the widespread use of census statistics in this manner, it is obvious that industry concepts have proven to be susceptible to varying interpretations. An industry often means different things to different people, having certain dimensions in one case, while possessing different characteristics in others. Perhaps the principal cause of the confusion as to what a given industry really is lies in the acceleration of industrial development that has taken place over the past 20 or 30 years. Industrial establishments have multiplied their functions, they have developed new products, processes, and techniques, and they have thereby rendered

[1] Minutes of the meeting of the Committee on the Census of Manufactures, June 9, 1954, p. 6.
[2] "* * * I do not believe that the Census Bureau can be held responsible for the misuse of data by persons who are too lazy to read, or by persons with axes to grind, or by charlatans."

obsolete the historical and traditional concepts of many industries with which they had been identified. With the growth of old industries, the building up of new ones, and the overlapping of products and processes, there has come a proportional complication of the task of applying meaningful statistical measurements to industrial activities.

It is evident that in the manufacturing area, technological development has left the development of adequate statistics far behind. With this view in mind, the subcommittee has set for itself a twofold task: First, to bring out some of the inadequacies of current census industry statistics from the standpoint of both concepts and use; secondly, to suggest certain standards of purity which should be applied in the compilation and publication of such data.

These standards of statistical purity are submitted by the subcommittee as goals to be achieved in the interest of making census industry statistics portray modern industry in an accurate manner. However, it is recognized that their application will involve difficulties of interpretation, classification, and reporting. Yet, because the attainment of meaningful statistics depends to a large extent upon their successful solution, these practical problems need to be given exhaustive and continuing study.

Whie the subcommittee requests to be discharged at this time, its members entertain the hope that their report is but the first of a series of steps which will ultimately lead to high quality in census industry statistics. In fact, the members of this subcommittee would hardly have devoted an inordinately large amount of time and effort to the preparation of this report, had it not been for their belief that they were evolving statistical goals to the attainment of which the cooperative efforts of Government and industry will be directed in the future.

(Senator Goldwater has approved the deletion of the names of the Subcommittee on the Census of Manufactures in accordance with the request made in Mr. Veltfort's letter of February 16, 1954, to Chairman Douglas. See p. 1054.)

SUMMARY OF RECOMMENDATIONS

The Subcommittee on the Census of Manufactures has concerned itself exclusively with the product statistics and with the so-called industry statistics of the census of manufactures, which latter are breakdowns of general establishment data by industry classifications. The subcommittee's recommendations are summarized as follows:

I. In order to make products statistics more comprehensive, the subcommittee recommends that the Bureau of the Census include therein more data on production for internal use. However, since this would unavoidably add some additional reporting burdens upon respondents, the recommendation is qualified by public necessity or demand on the part of respondents concerned. (See p. 14.)

II. Mainly due to the fact that industrial establishments are frequently engaged in the production of articles "belonging to" more than one industry, there is at present a considerable amount of statistical overlapping between the census industries. This introduces inaccuracies of varying degrees in the industry statistics of the census of manufactures. The subcommittee believes that users of industry statistics published by the Bureau of the Census are entitled to expect that the data describing industrial operations conform to a common standard of reliability. Since 100 percent homogeneity and 100 percent industry coverage [3] will rarely be attainable, the subcommittee recommends that the Census Bureau, and other Government agencies involved, strive to set up a system of industrial classification under which the general establishment statistics for each industry classification would be at least 90 percent pure with respect to both of these criteria. These tests should be based upon a comprehensive measure of industrial activity, but because it is too late to change the design of the current census schedules, the subcommittee suggests that for purposes of the 1954 census of manufactures the tests of homogeneity and industry coverage may be based upon values of shipments of end products only.

III. The second major defect in the industry statistics of the census of manufactures has been found by the subcommittee to arise from the inexact and incomplete definition of industries. Accordingly, the subcommittee recommends that henceforth each industry definition based upon products made should contain an accurate list of the products and/or component parts which are included in that industry, or an equally accurate listing of parts classified elsewhere, and the industries to which they have been assigned.

[3] For the purpose of measuring "homogeneity" of industry statistics, the primary products of an industry are expressed as a percent of that industry's total production; for measuring "industry coverage," the primary products of an industry are expressed as a percent of the total output of these products by all industries.

IV. In addition, the subcommittee has come to the conclusion that a meaningful and precise definition of an industry requires also a definition of the scope of the term "manufacturing" in each case. The subcommittee therefore recommends that each industry definition based on products must include a clear description of what processing is comprehended by the term "manufacture" for that industry. (See p. 35.)

V. The method of measuring statistical purity on the basis of value of shipments, suggested for the 1954 census of manufactures, is not acceptable as a permanent solution. Therefore, the subcommittee recommends that the Census Bureau, and other Government agencies concerned, strive to set up for all subsequent annual surveys and for all complete censuses after the 1954 census of manufactures a system of homogeneity and industry coverage tests based upon comprehensive measures that encompass and evaluate all intermediate processes and products, whether shipped, transferred, or used internally, which are recognized as separate industries by the Bureau of the Census. (See p. 36.)

VI. Furthermore, the subcommittee recommends that, beginning with the 1954 census of manufactures, all industry breakdowns of establishment statistics, wherever published, display prominently the applicable measures of homogeneity and industry coverage. (See pp. 24 and 37.)

CENSUS OF MANUFACTURES STATISTICS

Census of manufactures industry statistics are of two general kinds, product statistics and establishment statistics.

The basic reporting unit in the census of manufactures is an "establishment," which usually means a plant, although different types of industrial operations conducted at the same location may be broken down into two or more establishments for census purposes. Each establishment reports:

1. The dollar value (and sometimes number of units) of its shipments broken down by product (product statistics).
2. Total employment, man-hours, payrolls, value of materials used, etc., for the entire establishment (establishment statistics).

Hereafter in this report whenever the terms "product statistics" and "establishment statistics" are used, they are used in accordance with the above definitions.

The Census Bureau recognizes some 6,000 separate manufactured products. Establishments, as far as practical, report separate dollar values and quantities for their shipments of each of these different products. Each establishment reports the "establishment" total for employment, man-hours, payrolls, etc., and there is no effort to divide these statistics between products. The Census Bureau combines product shipment information, regardless of establishments, into product shipment totals for each product. The establishment data, on the other hand, are combined, usually according to the standard industrial classification, into so-called industry statistics.

PRODUCT DATA

Because each establishment is required to break down its shipments by products, the Census Bureau can compile reasonably accurate and useful totals of the shipments of individual products or groups of products. The subcommittee calls specific attention to the fact that the totals of product data in the census are complete precisely because in the compilation and reporting of product data the industrial classifications of the producing establishments are disregarded.

A problem arises, however, whenever a plant produces a product for incorporation into some other product prior to shipment. In many such cases, the shipments of that component will not be reported as such separately, so that the census reports on the shipments of that product are necessarily an incomplete measure of output.

For example, the census measures only the dollar value of containers shipped as such, and has no record of the very large quantity of containers produced by establishments to package their product.

The errors introduced into economic analyses as a result of this deficiency in the census of manufactures are illustrated by the report of the Federal Trade Commission on Changes in Concentration in Manufacturing, 1935 to 1947 and 1950, published in 1954. On page 41, reference is made to changes in concentration in various tools and machinery industries. One of the 135 industries (out of the 453 recognized in the 1947 census of manufactures) included in the analysis as being comparable with its counterpart in 1935 is the cutting tools, jigs, fixtures, etc., industry (No. 3543). The report states "In 1935 the four leading producers of cutting tools, jigs, and fixtures accounted for more than a fifth of the sales of that important industry. By 1947 their share had dropped to only one-fourteenth."

It is known that the largest automobile producer employs over 18,000 skilled tool, die, jig, and fixture builders and similar skilled mechanics, of which less than 500 work in the only one of its plants classified in the cutting tools, jigs, fixtures, etc., industry (No. 3543). The other plants employing the balance of over 17,500 such skilled workers, are classified by the census in other industries.

The last census of manufactures, however, reports a grand total of only 74,522 production and related workers in the cutting tools, jigs, fixtures, etc., industry, which figure includes not only the skilled mechanics but also all unskilled workers and trainees directly engaged in production, as well as all maintenance, repair, warehousing, shipping, and packing workers, and many others. Thus, as measured by employment, the census figures for this industry are understated by about 20 percent due to the omission of some of the intermediate production of one company, alone. Similar conditions may be expected to prevail with respect to other companies and other industries.

It is quite evident from the foregoing that statistics on the establishments classified by the Bureau of the Census in the cutting tools, jigs, fixtures, and so forth industry fall far short of measuring the economic activity involved throughout the economy in the production of the very items which are supposed to define this industry. Hence, the concentration ratios computed by the Federal Trade Commission are in this case of no significance whatsoever. This same condition obtains in varying degree in all other industries for which the census figures fail to include production for internal use.

The discrepancy between actual production and the census data on shipments of a product is especially important in the case of "process" and "service" type products such as castings, stampings, forgings, machinings, galvanizing, and so forth. The product data on stampings, for example, includes only the output of establishments which shipped their product without further processing or fabrication, and it excludes all stampings produced by establishments which shipped their stampings as assemblies or as components of other products.

In a number of industrial operations, notably certain textile, chemical, and primary metal production, the Bureau of the Census, in cooperation with the respondents, has evolved reports of product statistics which include data on internal consumption. This has done much to improve the quality and meaning of the product statistics concerned, but they do not cover all operations where substantial internal consumption occurs, nor have they been applied to those products or processes which are common to less closely related industrial operations.

Recommendation I

When, for adequate public reasons, it is necessary to obtain accurate totals of the production of a product or use of a process, including production for internal use, throughout all industry, rather than only on shipments and interplant transfers, the Census Bureau should broaden its inquiry to obtain data on such production for internal use. However, whenever it is impractical to obtain such information because of the pervasive extent of the products or processes throughout manufacturing, or because it is not vital for public purposes, the product data published for establishments producing and shipping such product as an end product should carry a clear designation of their limited character.

This, of course, will require that the Bureau of the Census establish some criteria of what constitutes "adequate public reasons" for the purpose of such inquiries, since obviously the additions of any items to the schedules are necessarily the cause of additional expense and burden to respondents. There are other cases in which requests arise for data for industry uses which will have no necessary public purpose. For these, it is recommended that the criteria provide that when the respondents who will be subjected to the inquiry join in on the request and are willing to support it, the additional information be gathered and that the tabulations of such special requests be at the expense of those requesting the information.

To illustrate the former situation, it is hardly conceivable that there is any public need for measures of output of "metal stampings" as such. Furthermore, it would be virtually impossible within any practicable limits of reporting for every establishment in the United States which makes stampings in some form for further fabrication in their own plants to report such production. Therefore, if the census continues to provide statistics on the value of "metal stampings" produced or shipped by plants primarily so engaged, attention should be called to the fact that the data do not include any information regarding the output of stampings by other establishments engaged in producing them for internal use or further fabrication within their own plants.

ESTABLISHMENT STATISTICS BY INDUSTRY

When establishment statistics are grouped by geographic areas alone, without further breakdown by industry, both accuracy and comprehensive coverage are obtained—at least conceptually. Designed to measure total manufacturing activities in specific areas, the finished statistics represent data for every manufacturing establishment within the confines of the area's geographic boundaries, and cover all of the reported activities of each of those establishments.

To illustrate, the 1947 census of manufactures reports that in the State of Ohio there were some 12,303 manufacturing establishments with 1,194,603 employees receiving $3,560,075,000 in salaries and wages. The census further reports that these establishments accounted for $6,359,006,000 in value added and made expenditures for new plants and equipment aggregating $498,254,000.

Geographic totals of establishment data not subdivided by industry are of high quality only because both the object of the classification (plant or establishment) and the boundaries of the class (the geographic area) are clearly defined.

The second principal classification of establishment data is by industry. According to the census there are 453 industries, largely defined on the basis of products shipped.

However, many establishments are engaged in manufacturing operations classifiable in more than one "industry." They ship not only those products which define the industry to which they have been assigned—called primary products—but also so-called secondary products, that is, products "belonging to" other industries. As a result, many statistics tabulated by industry include establishment data associated with the output of secondary products belonging to other industries. At the same time, they exclude establishment data associated with the output of their primary products by establishments classified in other industries. This introduces serious deficiencies in the industry statistics of the Bureau of the Census whenever total establishment data—employment, payrolls, man-hours, value of product, value of materials purchased, value added by manufacturing, and so forth—are related to the products which define the industry.

Requirements of statistical purity

Some of the statistical effects of classifying establishments by industry on the basis of their principal products may be illustrated by the example of the nails and spikes industry (Standard Industrial Classification No. 3481).

According to the 1947 census of manufactures, this industry consisted of 68 establishments employing 3,805 employees who were paid a total of $9,876,000 in salaries and wages, and shipping some $30,038,000 worth of products. To the unwary user of these statistics, it would seem reasonable to expect that substantially all of the $30 million of shipments of this industry consisted of nails, brads, and spikes; that this represented substantially all of the nails, brads, and spikes shipped by American manufacturing establishments; and that the 3,805 employees reported for the industry were in their various ways responsible for turning out the national output of nails, brads, and spikes.

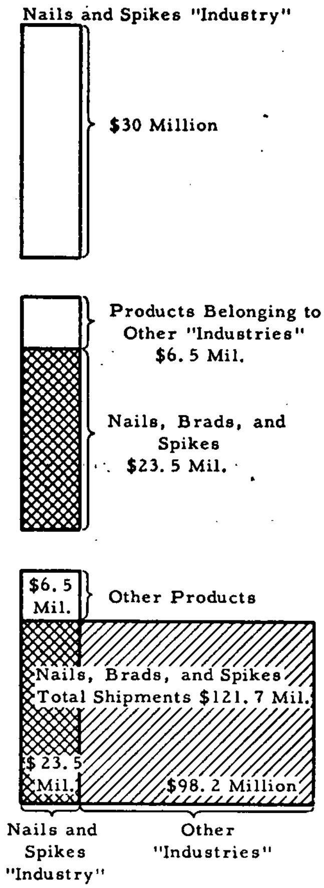
The facts, however, are that these expectations of reasonable statistical comprehensiveness are not realistic. As chart I illustrates, the expectation that substantially all of the output of these establishments consisted of nails, brads, and spikes is erroneous, because actually more than one-fifth of the products shipped by the 68 establishments making up the nails and spikes industry as defined by the census were neither nails, nor brads, nor spikes, but some undefined "secondary products."

Even more serious is the fact that the nails and spikes industry's shipments accounted for less than one-fifth of the total shipments of nails, brads, and spikes by all producers. Nearly $100 million worth of nails, brads, and spikes were shipped by establishements classified in other industries, while less than $24 million were shipped by the so-called nails and spikes industry. (Moreover, an unknown quantity of brads were produced by establishments for their own use and not reported as such, but included as a part of other products.)

It is evident that neither the employment (number of employees, production workers, man-hours, payrolls) nor any of the other general establishment statistics, such as expenditure on plant and equipment, cost of materials, etc., value of inventories, value added, represented either clean or complete statistics of economic activity in the production of nails and spikes.

CHART I

EXAMPLE OF AN "INDUSTRY" THAT IS NOT AN INDUSTRY



1. The total value of shipments of the 68 establishments which were classified as the NAILS AND SPIKES "INDUSTRY" in 1947 was

2. Less than 80% of this consisted of PRODUCTS WHICH DEFINE THIS "INDUSTRY" (Nails, brads, and spikes)

3. OTHER "INDUSTRIES", however, produced and shipped more than FOUR TIMES AS MANY NAILS, BRADS, AND SPIKES

4. So that the NAILS AND SPIKES "INDUSTRY" accounted for ONLY 19% OF THE PRODUCTS WHICH DEFINE IT, and 21% OF ITS SHIPMENTS CONSISTED OF PRODUCTS OF OTHER "INDUSTRIES". In addition many more nails and spikes were made in establishments for their own use.

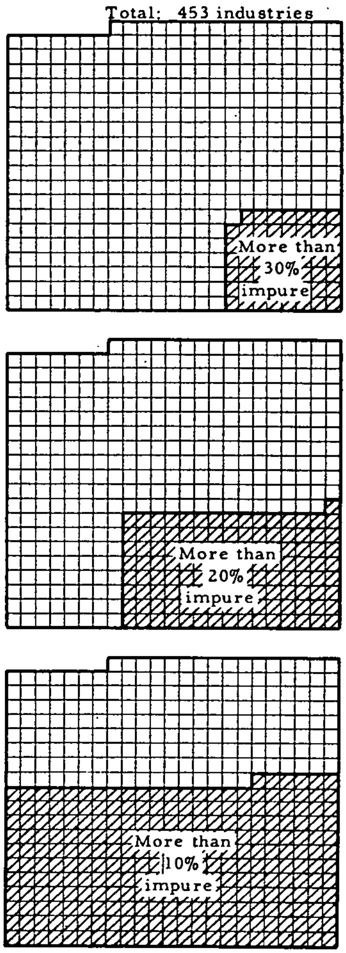
Source: Census of Manufactures: 1947 - Vol. II, p. 624.

The example of the nails and spikes industry is exceptional only in that the 1947 census of manufactures permits us to ascertain in what "alien" industries the bulk of the shipments belonging to the nails and spikes industry are actually made. If the other 452 industries for which establishment data were compiled in the 1947 census are analyzed with respect to such overlapping production between industries, it will be found that the majority of them do not conform to a reasonable standard of purity, even if the criteria developed by the Bureau of the Census, itself, are used for such analysis.

The Bureau of the Census measures the extent of overlapping of production between industries, that is, the purity or coverage of the industry statistics, by two separate ratios. In the Bureau's homogeneity ratio, an industry's shipments of primary products are expressed as a percent of its shipments of all

CHART II

FAR MORE THAN ONE-HALF OF ALL "INDUSTRIES" IN THE
1947 CENSUS OF MANUFACTURES
DID NOT MEET THE SIMPLE 90% "PURITY TESTS"



1. According to the Bureau of the Census, the statistical data of 55 industries were less than 70% pure, as measured by the simple "homogeneity" ratio, the "industry coverage" ratio, or both.

2. 121 industries were less than 80% pure.

3. While the data of 259 industries (57% of the total) were less than 90% pure.

Source: Bureau of the Census, special tabulation from 1947 Census of Manufactures

products; in the Bureau's industry-coverage ratio, an industry's shipments of primary products are expressed as a percent of the shipments of these products by all industries. Both of these Census Bureau ratios are based merely upon shipments of end products. To distinguish them from the comprehensive measures of statistical purity recommended later in this report by this subcommittee, these Census Bureau measures will be referred to henceforth as the simple homogeneity or the simple industry-coverage ratios, tests, or criteria.

In the last census—1947—the simple homogeneity ratios of the various industries ranged from a low of 59 percent (beauty and barber shop equipment) to 100 percent—the simple industry-coverage ratios from a low of four-tenths of 1 percent (yarn mills-silk system) to 100 percent. In all, as chart II shows, 55 industries, among the total of 453 industries, were less than 70 percent pure with respect to homogeneity, industry coverage, or both; 121 industries were less than 80 percent pure by these tests; 259 industries, considerably more than one-half of the total, were less than 90 percent pure; and only 10 of the 453 were 100 percent pure.

This wide range in the purity of the census industry statistics makes them practically useless for many purposes. For example, Department of Commerce [4] and the Federal Trade Commission [5] have attempted to use the census industry data to measure the concentration of output by the largest firms in each industry. The BLS has attempted to use the data to measure productivity by industry.[6] In each case, low homogeneity and low coverage in so many industries has raised grave issues.

The subcommittee believes that the data describing industrial operations should conform to a common standard of reliability both as to industry coverage and homogeneity, and be clearly labeled as to their statistical purity. The subcommittee therefore recommends:

Recommendation II

(*a*) That the Census Bureau, and other Government agencies involved, strive to set up a system of industrial classification such that the establishments representing any industry would account for at least 90 percent of the total shipments of products defined as belonging in that industry, and that at least 90 percent of their total shipments would represent such products. Furthermore, where any industry falls short of these standards, serious consideration should be given to the question of whether any separate information should be published for that industry, or whether its establishments should appear only in higher order aggregates.

(*b*) That statistics of the census of manufactures display prominently for each industry breakdown, wherever published, the applicable measures of homogeneity and industry coverage.

The subcommittee is aware that shipments are not always an adequate basis for measuring homogeneity and industry coverage, as will be demonstrated later. Nevertheless, no better measure is available to the Bureau of the Census for the 1954 census of manufactures.

Definition of industry

The second major defect in the industry statistics of the census of manufactures arises from the inexact and incomplete definitions of industries. In general, an industry is now defined by the Bureau of the Census to include:

1. All establishments primarily engaged in the manufacture or assembly of certain products; plus, in many cases—

2. All establishments primarily engaged in the manufacture of some of the component parts of those products.

In numerous cases, this definition fails to define adequately what products are included in a particular industry.

---

[4] See Letter of December 1, 1949, and report from Secretary of Commerce Sawyer to the chairman of the House Subcommittee on Study of Monopoly Power. In contrast to the Federal Trade Commission, the Secretary of Commerce completely ignored the serious limitations of his Department's own Census Bureau data for the purposes of measuring concentration. Furthermore, the Commerce Department discarded none of the census industry statistics for failure to meet any minimum standard of homogeneity or coverage. As a result, the concentration ratios of the majority of the industries are overstated, in many cases to a very substantial extent. For example, while the Secretary of Commerce claimed that the four largest companies in the so-called yarn mills-silk system industry accounted for 61.4 percent of the shipment of products defining this industry, the true figure is less than 0.3 percent (three-tenths of 1 percent).

[5] See Report of the Federal Trade Commission on Changes in Concentration in Manufacturing, 1935–47 and 1950 (Washington, 1954). Ch. I of this report is devoted exclusively to a description of the limitations of the census data for the purposes of measuring concentration. Two-thirds of the census "industries" had to be discarded because they were not comparable between the census years. Forty-nine were discarded because they failed to meet the Federal Trade Commission's minimum standard of purity with respect to homogeneity and coverage of 67 percent. The Commission added: "A measure of doubt on this score (homogeneity and coverage) still attaches to the interpretation of concentration measures for some industries in which the coverage of primary products (coverage ratio) or the importance of primary products among all products (homogeneity ratio) was not much more than 67 percent in 1947."

[6] See technical note on the measurement of trends in output per man-hour (Division of Productivity and Technological Developments, U. S. Department of Labor, Bureau of Labor Statistics, Washington, April 15, 1954). This report states: "The Bureau of the Census of the U. S. Department of Commerce is the most important source of product statistics for the manufacturing industries." "The man-hour data to be used in constructing the indexes for manufacturing are drawn almost entirely from the Bureau of the Census for the years 1947–52." On the basis of the preceding discussion, serious reservations arise whether any of the existing census industry statistics are sufficiently reliable as to homogeneity and coverage for such calculations.

For example, the hard-surface floor coverings industry (No. 2274 is defined to include:

"Establishments primarily engaged in manufacturing linoleum, cork carpets, asphalted-felt-base, and other hard-surface floor coverings, not elsewhere classified. Establishments primarily engaged in manufacturing rubber floor coverings are classified in industry 3099, and asphalt floor tile, in industry 3292."

While this definition specifically excludes some of the most popular hard-surface floor coverings, if fails to mention many others such as ceramic, plastic, and wood-floor coverings. Consequently, the designation "hard-surface floor coverings" is inadequate.

The industry definitions also fail to provide precise information as to when establishments manufacturing the component parts of a product are to be included in the same industry as establishments manufacturing the complete product. For example, the definition of the computing and related machines industry (No. 3571) makes no mention of the status of establishments engaged in the manufacturing of component parts of computing and related machines.

In other cases, the industry definitions specifically include some of the component parts of a product and exclude others, but fail to mention the status of many remaining parts. For example, the so-called motor vehicles and parts industry (No. 3717) is defined to include, in addition to the manufacture of complete vehicles, certain parts, such as bodies, engines and parts, brakes and parts, clutches, axles, transmissions, etc., and certain accessories. Specifically excluded are tires and tubes, glass, hardware, headlamp, ignition systems, and batteries. Nothing is said, however, about a long list of other parts, such as shock absorbers, exhaust mufflers, bumpers, fenders, hoods, heaters, steering mechanism, etc. Thus, it cannot be ascertained from the industry definition offered by the Bureau of the Census which establishments primarily engaged in the manufacture of such component parts are included in the motor vehicles and parts industry and which in some other industry.

Accordingly, the subcommittee recommends as follows:

Recommendation III

Each industry definition based upon products made should contain an accurate list of the products and/or component parts which are included in that industry, or an equally accurate listing of parts classified elsewhere, and the industries to which they have been assigned.

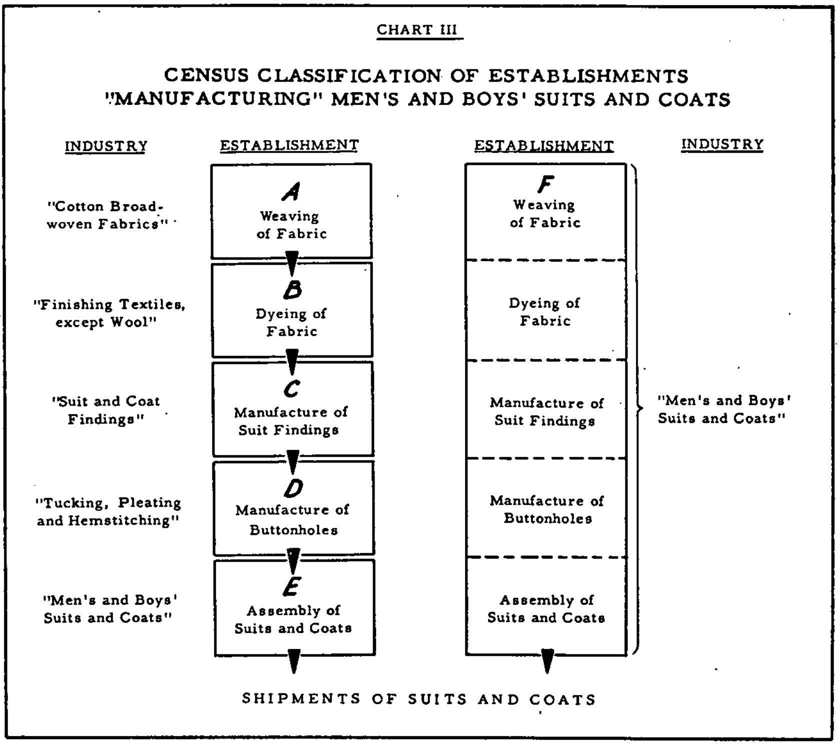
All of the foregoing recommendations can and should be adopted in the compilation and publication of the 1954 census. The subsequent analysis and recommendations will require changes in census procedures which cannot be made at this time for the 1954 census, but should be adopted for all subsequent censuses and annual surveys.

Definition of "Manufacturing"

While the adoption of the foregoing recommendation would dispel doubt and uncertainty as to exclusion or inclusion of certain establishments from a specific industry, this would not be sufficient to achieve a meaningful and precise definition of an industry in all cases.

The typical census-industry definition includes "establishments primarily engaged in manufacturing" a particular product or group of products. However, the term "manufacturing," itself, and the scope of manufacturing activities that applies to any particular industry, are not adequately defined. Most manufactured products are not the result of a single operation, but go through a series of distinct and sometimes technologically unrelated processes which are often performed in separate establishments. Thus, it is frequently impossible to determine from the Census publications or instructions which processes or operations are carried on by the establishments included in an industry.

For example, assume that there are six separate establishments involved in the manufacture of men's and boys' suits and coats (see chart III). Establishment A weaves the fabric and transfers or sells it to establishment B, which dyes the fabric. Establishment C manufactures the findings. Establishment D may make the buttonholes, and in establishment E all the materials are assembled into the final product and shipped. In this hypothetical case, the Census would conclude that only establishment E is primarily engaged in the manufacturing of men's and boys' suits and coats (Industry No. 2311). Establishment A would appear in one of the textile fabrics industries (group 22); B in the appropriate finishing industry (No. 2261); C in the suit and coat findings industry (No. 2312); and D in the tucking, pleating and hemstitching industry (No. 2395).



If establishment F performed all of these operations and produced all of these intermediate products, the entire establishment, including all of its operations and all of its intermediate products, would be included in the men's and boys' suits and coats industry.

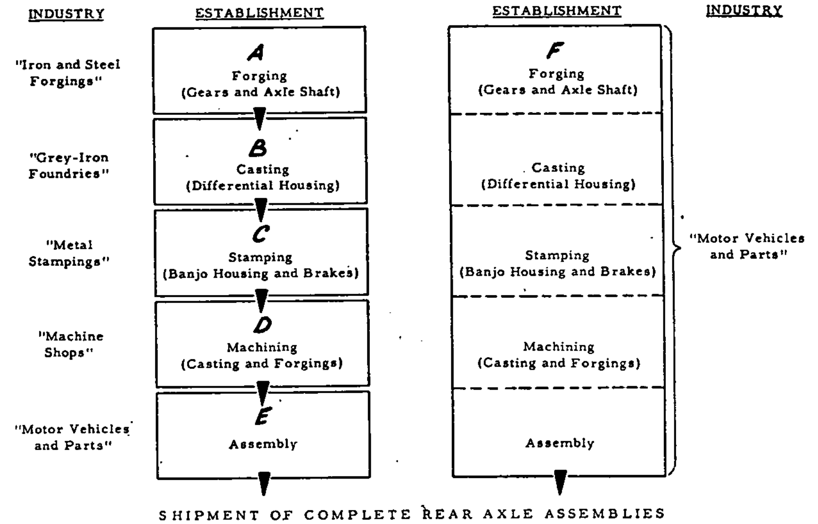
Thus, the term "manufacturing" as used by the Census is a very elastic one. It may include all of the operations and all of the intermediate products necessary to produce a particular product, or it may include only the final assembly operation. Furthermore, establishments performing the same operation and producing the same products can end up in entirely different industries. Establishments A and F both weave fabrics destined to become men's and boys' suits and coats, but the 2 establishments and their products appear in 2 entirely different industries. The same is true of establishments B, C, and D as compared with F. So in this example only establishments E and F, which have very little in common, are in the same industry according to the Census.

The problem is identical in many other industries. The manufacture of a metal product, for instance, may involve any number of a whole host of processes such as rolling, drawing, forging, casting, annealing, heat-treating, stamping, enameling, lacquering, galvanizing, engraving, plating, polishing, machining, etc. It may also involve the production of a variety of intermediate products such as nuts, bolts, wire, springs, containers, motors, bearings, etc.

For example, as shown in chart IV, the manufacture of a rear-axle assembly for a motor vehicle involves five principal processes, namely, forging, casting, stamping, machining, and assembly. Each of these operations, when performed in separate establishments is classified in a separate industry, according to the Census. An establishment (A) which did only the forging of the axle shaft would be classified in the iron and steel forging industry (No. 3391). Establishment B, which casts the differential housings, would be in the gray-iron foundries industry (No. 3321). Establishment C, which performed the stampings on the banjo housing and brake parts, would belong to the metal stampings industry (No. 3463). Establishment D, which machined the castings and forgings, would be in the machine shops industry (No. 3599). Establishment E, which assembled all of these parts, would be in the motor vehicles and parts industry (No. 3717). Also in this latter industry would be any establishment (F) that performed all of these operations, or any combination of them culminating in final assembly. Similarly, any other pattern of operations would always land the integrated establishment in its entirety in the category reflecting the most advanced step of operations. Thus, the establishments manufacturing this particular product may be classified in any one of five different industries, depending upon the stage of fabrication.

CHART IV

CENSUS CLASSIFICATION OF ESTABLISHMENTS "MANUFACTURING" MOTOR VEHICLE REAR AXLE ASSEMBLIES



The induscriminate adding of data for establishments which, although shipping the same end products, are not comparable in terms of integration of their operations, results unavoidably in statistics that cannot possibly portray the true economic characteristics of an industry. What is the significance of a value added total for an industry consisting of establishment E, involved only in assembly, added to that of establishment F, which performs the whole series of processes leading to the final product? The only way by which such statistics could be made meaningful would be to include the value added by all of the processors, A through D, who produced the material assembled by E.

The same criticism applies to all other industry totals—employment, payrolls, materials purchased, and investment. In such situations, ratios of any of these components to the total value of products shipped, even though this latter figure be perfectly accurate, necessarily have in them an error of indeterminate magnitude. Under these circumstances, how can it be maintained that the census statistics for any of these industries are comprehensive or meaningful?

Accordingly a precise definition of an industry requres a clear statement not only as to the products included therein, but also as to the range of manufacturing processes which are involved.

Recommendation IV

Each industry definition based on products made must include a clear description of what processing is comprehended by the term "manufacture" for that industry.

METHODS OF MEASURING STATISTICAL PURITY

When industries are thus properly defined, it will than be possible to develop and apply more satisfactory measures of purity or accuracy than the Bureau's present simply homogeneity and coverage ratios, the use of which was recommended earlier for purposes of the 1954 census only. Accordingly the following recommendation is made on the basis of recommendations III and IV for all subsequent annual surveys and for all complete censuses after the 1954 census of manufactures:

Recommendation V

(*a*) The Census Bureau, and other Government agencies involved, should strive to set up a system of industrial classification such that the establishments representing any industry would account for at least 90 percent of the manufacturing activities defined as belonging in that industry, and that at least 90 percent of their total activities would respresent such activities. Furthermore, where any industry falls short of these standards, serious consideration should be given to the question of whether any separate information should be published for that industry, or whether its establishments should appear only in higher-order aggregates.

The above tests should be based upon comprehensive and nonduplicating measures of the activities of enterprises constituting an industry. To be comprehensive the measures must encompass and evaluate all intermediate processes and products, whether shipped, transferred, or used internally, which are recognized as separate industries by the Bureau of the Census. If applied only to the value of shipments of end products, the tests would not be in harmony with the proposed method of defining industries.

(*b*) The subcommittee also recommends that the Bureau of the Census display prominently for each industry breakdown of establishment statistics, wherever published, the applicable measures of homogeneity and industry coverage.

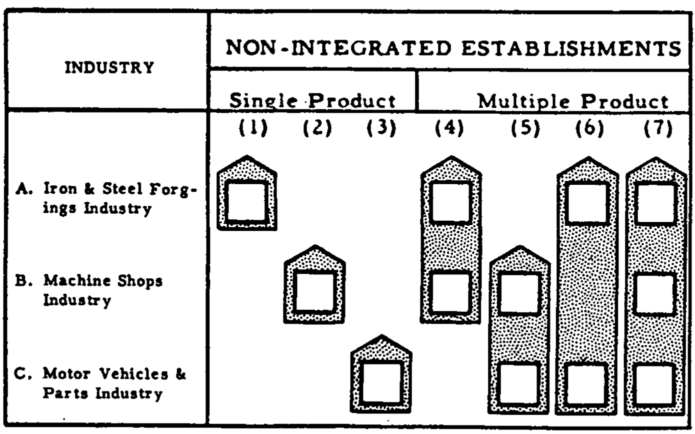
Such tests can be illustrated by a series of examples involving various types of establishments whose activities are in 1 or more of 3 different industries, as defined by the Bureau of the Census.

In all, 17 different establishments are used in these examples, each designed to represent a different but representative type. However, not all different types could be accorded recognition. For instance, establishments operating in more than three different SIC industries were not included, but their treatment under the accuracy tests is apparent from that of some of the other establishments shown in these examples.

The first chart (chart V) deals with so-called nonintegrated establishments. This term is used here to mean establishments which do not engage in intermediate

CHART V

TYPES OF NON-INTEGRATED ESTABLISHMENTS



production between industries. That is to say, none of their products are used within the same establishment in the manufacture of other products belonging to other industries, nor do they engage in manufacturing processes which constitute separate and different industries, by themselves.

Nonintegrated establishments may be either of the single-product or the multiple-product type. In the former case, they are assumed to produce and ship only 1 single product, or a group of products belonging to only 1 industry. That is, their output and shipments consist only of the primary products of the respective industry. When nonintegrated establishments are of the multiple-product type, they are assumed to produce and ship not only primary products but also so-called secondary products, which are products belonging to other industries.

Chart V shows 7 such nonintegrated establishments, of which the first 3 are assumed to produce only a single product, or a group of products belonging to only 1 industry.

For example, if the three industries were to represent the iron and steel forgings, machine shops, and motor vehicles and parts industries, respectively, establishment 1 might be engaged in producing steel forgings; establishment 2 might perform machining operations on steel forgings and other products; and establishment 3 might produce automotive parts by assembling the machined forgings and other components.

Under these conditions each establishment would be homogeneous, as all of the activities are carried on within the confines of each industry.

The next 4 establishments (establishments 4, 5, 6, and 7) are also nonintegrated establishments, but each of them is assumed to produce products which belong to 2 or more industries. for example, establishment 4 may produce both forgings and machine-shop products, selling or shipping all of its output of both products to other establishments; establishment 5 may carry on both machining and assembly operations, but it would sell or ship all of its machine-shop products, using only component parts purchased elsewhere in its assembly operations. In similar fashion, establishment 6 might produce forgings and assemble finished automotive parts, while establishment 7 might carry on all three types of operations.

Present census industry classification practices raise no difficulty with the single product establishments, since all of the activities of each of them fall wholly within one industry. With respect to the nonintegrated multiple-product establishments, the industry classification of each is determined by the principal products shipped. Establishment 4 would be in either the iron and steel forgings or the machine-shops industry, depending on the value of shipments of products belonging to each industry. The classification of establishments 5, 6, and 7 would be determined by the same criterion.

If the 3 industries consisted only of these 7 establishments and their shipments values were as indicated in chart VI,[7] industry A, the iron and steel forgings industry (comprising establishments 1 and 4), would have a simple homogeneity ratio of 80 percent (160:200), since $40 of establishment 4's shipments consisted of industry B products. However, the simple industry coverage ratio of industry A would be 89 percent (160:180), since only $20 worth of forgings were shipped by establishments 6 and 7, which belong to other industries.

The simple homogeneity ratio of industry B (consisting only of establishment 2) would be 100 percent (100:100), but its simple industry coverage ratio would be only 67 percent (100:150).

In the case of industry C, consisting of establishments 3, 5, 6, and 7, the simple homogeneity ratio would be 93 percent (370:400), but its simple industry coverage ratio would be 100 percent (370:370).

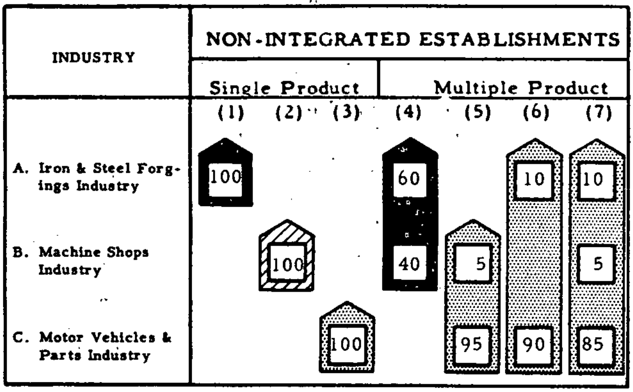
However, nearly all modern industrial establishments carry on integrated manufacturing operations. As this term is used here, they engage in intermediate production in industries other than those in which they are classified on the basis of their principal product shipments. That is to say, some of their products are used within the same establishment in the manufacture of other products (end products belonging to other industries). Or, in turning out their end products they engage in manufacturing processes which, by themselves, constitute separate census industries. Chart VII shows 10 different integrated establishments, of which the first 4 (establishments 8 through 11) are of the single-product type and the remaining 6 (establishments 12 through 17) of the multiple-product type. In

[7] For purposes of simplicity it has been assumed for these charts that all establishments are of equal size, in terms of the measures used.

CHART VI

INDUSTRY CLASSIFICATION OF NON-INTEGRATED ESTABLISHMENTS

Census Method



NOTE: Figures indicate dollar values of shipments

chart VII and all subsequent charts, intermediate products or processes are shown by round symbols, whereas end products (products shipped or transferred) are represented by square symbols.

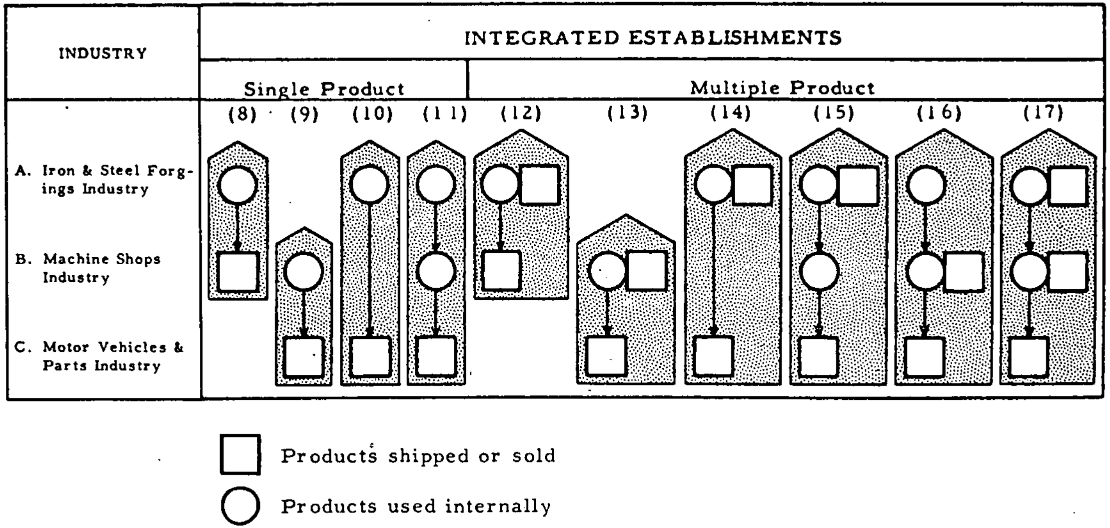
It should be pointed out that the difference between intermediate products and secondary products is only one of use. For the purposes of these examples, intermediate products are those, belonging to other industries, which are produced and used internally by an establishment in the fabrication of its end products. On the other hand, secondary products are products of an establishment which belong to an industry different from the one in which the establishment is classified and which are sold by that establishment or transferred to other establishments, rather than used internally. Thus, the same product can be both an intermediate product and a secondary product. For example, an establishment making electric fans, classified as belonging to the electrical appliances industry, might make fractional horsepower motors, which belong to (are primary products of) the electric motors and generators industry. The motors used in its production of electric fans are intermediate products, but the same types of motors sold or transferred to other establishments are secondary products.

As in the case of nonintegrated establishments, a distinction is being made in these charts among integrated establishments between those of the single product and those of the multiple-product type, the term "product" relating solely to end products and not including intermediate products.

As shown on chart VII, the integrated single product establishment 8 might be engaged in turning out (shipping) only machine-shop products (industry B). However, it also operates a forging shop, which is classifiable in industry A, but all of its forgings are machined further in its own machine shop, and none of them are sold or shipped as forgings. Establishment 9 may ship finished automotive parts (industry C) exclusively. In addition to its assembly operations, however, it also operates a machine shop, but all of its machine-shop products are used in the assembly of finished automotive parts, and none of them are shipped or sold as machine-shop products. Other patterns of integration exist in establishments 10 and 11.

CHART VII

TYPES OF INTEGRATED ESTABLISHMENTS



Integrated establishments of the multiple-product type differ from those of the single-product type in that they ship or sell not only the end products of their integrated activities, but also products belonging to other industries (secondary products). In the case of establishments 12 through 17, it has been uniformly assumed for purposes of these illustrations that the shipments of secondary products corresponded to some or all of their intermediate products, but this assumption is merely one of convenience.

The next chart (chart VIII) is designed to show how the homogeneity and industry coverage tests presently used by the Bureau of the Census operate in the case of the 10 integrated establishments introduced in chart VII. For this purpose, hypothetical shipment values have been inserted for the end products of these establishments, both primary and secondary. However, since the census method completely disregards integrated activities and intermediate products belonging to other industries, no values have been assigned to these operations or products.

It will be seen from this chart that under the present census method of deriving homogeneity and industry coverage measures, only two establishments 8 and 12) are deemed to belong to industry B. Establishment 8 is considered to be 100 percent homogeneous since all of its shipments consist of industry B products. Establishment 12 is considered to be only 90 percent homogeneous, since 10 percent of its shipments consist of industry A products. As a whole, therefore, under present census practices, this industry is considered to be 95 percent homogeneous (190:200).

As to the industry-coverage ratio, the Census Bureau would recognize only establishments 13, 16, and 17, all of which belong to industry C, to be engaged in turning out industry B products. Moreover, it would limit recognition to industry B products shipped or sold, disregarding all of the products of the same type which were used by these establishments in further production. On this basis, the Census Bureau would conclude that the statistics for industry B were 88 percent pure (190:215) as to industry coverage.

On the fasis of the methods recommended by the subcommittee, however, these tests would give entirely different results. It will be recalled that these methods require not only a strict definition of industry in terms of end products shipped, but also in terms of intermediate products and processes. Under the assumption that industry B is defined to include only establishments primarily engaged in turning out industry B products and carrying on only those manufacturing processes which are ordinarily associated with, and peculiar to, that industry, chart IX shows a breakdown of the operations of the same 10 integrated establishments in each industrial activity on the fasis of a common measure, namely, man-hours (any other suitable common measure of activities, such as payrolls or physical output, would serve as well). For example, while the Census Bureau (see chart VIII) disregards the intermediate production of establishment 8 belonging to industry A, assigning the value of all of its operations to industry B, the subcommittee's method recognizes the true importance of each of them. Hence, chart IX distinguishes on the basis of a convenient common measure (man-hours) between the establishment's forging activities (industry A) and its maching activities (industry B). Similar differentiations are made in all other establishments.

Since the Census Bureau's method of classifying establishments as to industry on the basis of principal products shipped is not altered by the recommendations of the subcommittee, establishments (8) and (12) remain the only ones "belonging" to industry B. However, their activities in both industry B and in other industries, when measured by the subcommittee's comprehensive purity test, indicate a true "purity" of only 40 percent (80:200), instead of the spurious "purity" of 95 percent under the census method.

Similarly, as to industry coverage, the recommendations of the subcommittee call for recognition of the intermediate industry B products or processes of establishments belonging to other industries, as well as of secondary product shipments. As a result, the comprehensive industry coverage test for industry B now shows only 24 percent purity (80:340), compared with a spurious purity of 88 percent under the census method.

The preceding illustrations not only compare the operation of the census and subcommittee tests of homogeneity and industry coverage, but they also show clearly why the census tests are necessarily inaccurate and misleading in the case of all industry statistics which encompass integrated establishments to any appreciable extent.

Since the application of the subcommittee's tests to the hypothetical industry B statistics would show that they do not conform to a reasonable standard of purity, a question arises as to alternative statistical presentations which might meet the

new tests. This is illustrated in the remaining charts which contain all of the 17 establishments discussed previously.

These charts will deal with the same three industries, the iron and steel forgings, the machine shops, and the motor vehicles and parts industries, and the 17 integrated and nonintegrated establishments are assumed to operate within them according to the patterns previously assumed. The first step, illustrated in chart X, would be to test the motor vehicles and parts industry under the assumption that it is defined to comprise only assembly operations. As can be seen from the chart, this industry tests 100 percent (820:820) for industry coverage, but only 68 percent (820:1,200) for homogeneity. Thus, under this narrow definition, the statistics of the motor vehicles and parts industry would not conform to the required standards of purity.

Since it is obvious that a relatively large number of establishments classified in the motor vehicles and parts industry carry on operations belonging to the machine shops industry, on both a nonintegrated and integrated basis, the next attempt to produce statistics of acceptable purity for the motor vehicles and parts industry involves widening of the definition of that industry to include also the machining of automotive parts, an activity which hitherto was classified in the machine shops industry. The results of this are shown in chart XI. With a widened definition, the homogeneity ratio has been raised from 68 percent to 85 percent (1,270:1,500), while the industry coverage ratio has been lowered slightly from 100 percent to 97 percent (1,270:1,310).

Assuming that the standard of purity is 90 percent for both tests, the statistics of the motor vehicles and parts industry defined to comprise both the assembling and machining of automotive parts would still not be of sufficient purity. The next step, therefore, would be to expand the definition of the motor vehicles and parts industry still further. This has been done in chart XII by including not only the machining and the assembling of automotive parts but also the forging. As the chart is constructed, this would result in 100 percent purity both as to homogeneity and industry coverage. In practice, however, 100 percent purity will seldom be attained, since it is always likely that at least one integrated establishment classified in some other industry carries on operations, however small, within the confines of the particular industry that is being tested.

Basically, the recommendations of the subcommittee for standards of statistical purity are independent of any particular system of classification. Measuring only end results, they are applicable to any industrial classification system.

It should be pointed out that the recommendations for a revised standard industrial classification that have been prepared by the Advisory Council's SIC industry panels may have a definite bearing upon the tests of statistical purity which have been recommended by this subcommittee. These panels of the Advisory Council started out with the knowledge that many of the fine breakdowns of the present standard industrial classification do not permit logical segregation of plants, and therefore cause difficult problems of classification and a good deal of misleading statistical information. The changes which have been recommended by these panels may by themselves result in statistics of higher homogeneity and industry coverage.

In recommending improved industry definitions and improved homogeneity and industry coverage tests, and the adoption of a reasonable (90 percent) standard of purity based upon these tests, the subcommittee has established a goal to be achieved in future census industry statistics as well as in the industrial breakdowns of future annual surveys.

APPENDIX

RESERVATIONS BY——

RECOMMENDATION II, 1954 CENSUS

Coverage ratio

Recommendation II of the subcommittee report states "that the establishments representing any industry in the 1954 census must account for at least 90 percent of the total shipments of products defined as belonging in that industry * * *."

Under this coverage ratio 46 percent, or about 208, of the 452 industries separately reported in the 1947 census could no longer be published as separate industries. The establishment data associated with each of these 208 industries would henceforth be included with the establishment data of a more broadly defined industry.

However, the identity of each of the 208 industries, with respect to separate establishment data, would be permanently lost. It is doubtful whether any improvement in the census is accomplished, for instance, by no longer identifying the fact that there are 68 establishments which are primarily engaged (to the extent of 80 percent of their total value of shipments) in the production of nails, spikes, and brads.

These 68 establishments, which in 1947 employed 3,278 production workers and accounted for $15,721,000 of value added by manufacture, would be buried in probably the two digit industry "primary metal industries," which in 1947 consisted of 5,363 establishments, 1,010,055 production workers and $5.8 billion of value added.

I do not believe that we should recommend any particular coverage ratio, and certainly not a 90 percent ratio. It is my position that the Bureau of the Census, in conjunction with the Budget Bureau, is in a much better position than our subcommittee to judge the demand by industry and the public for establishment statistics for groups of establishments defined as industries by the Standard Industrial Classification Code. So long as the limited nature of the establishment statistics associated with the industry are adequately defined, I believe that the decision to publish such data should rest upon the demonstrated demand of the respondents concerned, or upon adequate proof of public need.

Homogeneity ratio

The report of the subcommittee recommends that the homogeneity ratio should be set at a minimum of 90 percent for the 1954 census. Although a 90 percent ratio is a desirable goal, I doubt whether we should impose such a high limitation in the 1954 census.

Naturally, a 90 percent ratio could be applied for 1954, but it may cause more disruption than the resulting increase in statistical purity is worth. To the extent that multiproduct establishments are able and willing to report in the future separate establishment data for their main products, the homogeneity ratio should improve as a natural result of such separate reporting.

Also, it should be kept in mind that in 1954, and for some years in the future, defense production may influence industry product mixes to a great extent. Large concerns may keep and report separate establishment data for their defense business; but I doubt whether smaller concerns are doing this.

In view of these facts, I believe that the subcommittee should suggest an 80 percent, instead of a 90 percent, homogeneity ratio for the 1954 census, and recommend that this ratio be increased gradually to a minimum of 90 percent.

RECOMMENDATION V, FUTURE CENSUSES AND ANNUAL SURVEYS

The subcommittee has said (recommendation IV) that industries should be defined in such a manner as to include not only the end products shipped but the extent to which the industry includes certain processes and intermediate production. Furthermore, in recommendation V, part (a), the subcommittee states that groups of establishments so defined must meet a 90 percent coverage ratio in order to finally qualify them for publication as an industry.

In my opinion recommendation V, part (a) is not desirable. Some of my reasons for so believing are as follows:

Under recommendation IV and V, part (a), all nonintegrated establishments which engage in activities similar to those in integrated establishments could not normally be grouped into a separate industry. Data for all these nonintegrated, establishments would be included with data relating to integrated establishments at whatever level of integration is decided upon as defining the new concept of an industry.

As I see it the only way to avoid this is by taking one of two possible courses of action:

1. Count establishments more than once.
2. Require that multiple product and process establishments report separately establishment data for each product or process.

I believe that the first proposal is certainly unwise, and I am sure that neither the Bureau of the Census nor the subcommittee would endorse such a procedure.

As to the second proposal, the Bureau of the Census has suggested that it should be carried out to a limited extent. In my opinion, this proposal has merit, and should be adopted wherever it is practical, and would not place undue burdens upon respondents. Obviously this division of integrated establishments for reporting purposes could never be accomplished to the extent necessary to satisfy recommendation V.

Recommendations IV and V, part (a), treated together, create additional conceptual burdens in defining an industry. Even if these burdens are satisfactorily overcome, the question arises as to whether the concepts could be successfully applied to the taking and reporting of the census.

ADVISORY COUNCIL ON FEDERAL REPORTS,
Washington 6, D. C., February 16, 1955.

Senator PAUL DOUGLAS,
Chairman, Joint Committee on the Economic Report,
Congress of the United States, Washington 25, D. C.

DEAR SENATOR DOUGLAS: This letter refers to action by the Joint Committee on the Economic Report to incorporate in the record of the February 9 public hearings a document submitted by Senator Barry Goldwater entitled, "Improvement of Census of Manufacturers Industry Statistics." As you may recall, Senator Goldwater stated that the document was a report of the Advisory Council on Federal Reports.

We have examined the document in the possession of the joint committee and wish to advise that it is not a copy of the final report submitted, which was a confidential report under the same title submitted to the Office of Statistical Standards, Bureau of the Budget. The document examined is an early and tentative draft which lacks subsequent changes, and an important qualifying amendment which was insisted upon by the council's 40-man committee on the census of manufactures of which I am chairman. This committee would not permit the report to be submitted to the Bureau of the Budget until these modifications had been made.

Since the document possessed by the joint committee is unofficial but is to be made public, I feel an obligation to indicate that it has no status, a fact which should be pointed out in the published record.

Also, may I ask you to delete the names that appear following the table of contents? These persons served with the understanding that, in keeping with a 12-year council tradition, any report prepared would be confidential, and not for publication. They have emphasized that as a result of an article in Business Week, February 5, they do not subscribe to the interpretation being placed upon the report and would object to being connected with it publicly and by name without considerable qualification and reservation. This article, also made a part of the joint committee record at the request of Senator Goldwater, did not name the subcommittee.

Therefore, in deference to the wishes of these men and to protect relations between them and their companies, I respectfully ask that their names not be published in the record of the February 9 public hearings of the Joint Committee on the Economic Report.

Sincerely yours,

T. E. VELTFORT,
Chairman, Committee on the Census of Manufactures.

Senator SPARKMAN. Mr. Chairman, before you get started, as I have told you previously, I must go to a meeting of the Foreign Relations Committee. I have hurriedly gone through the statements you gentlemen have presented. I want to apologize to them for not being able to stay and participate in the panel discussion. I think it is most helpful, and I think this committee is greatly indebted to the subcommittee headed by Mr. Talle last year which made this study on the need for better statistics.

I wish I could stay for the meeting.

Representative TALLE. On behalf of the other members of the subcommittee and myself, may I say I am grateful to my colleague for his comments.

Representative BOLLING. Mr. Eggert, will you proceed?

OPENING STATEMENT OF ROBERT J. EGGERT FOR THE CHAMBER OF COMMERCE OF THE UNITED STATES

Mr. EGGERT. Mr. Chairman, my name is Robert J. Eggert. I am marketing research manager, Ford Division, Ford Motor Co., and a member of the committee on business statistics, Chamber of Commerce of the United States.

The chamber is gratified that the joint committee is devoting this panel to economic statistics. The various statistical programs, lodged in some dozen agencies, can thus be compared and evaluated. We also appreciate the special analysis of economic statistics in the 1956 budget. The analysis greatly facilitates evaluation of the Government's statistical program.

We hope that panel discussions such as these, and the special budget analysis, both recommended in the July 30, 1954, progress report of the Subcommittee on Economic Statistics, will be repeated each year. They should aid materially in improving Government statistics.

Business needs prompt and accurate statistics for day-to-day and long-range planning, and I would like to introduce in the record here my own personal views. I want to strongly endorse the request for funds to strengthen our statistical programs. We use many of these statistics daily in our production-planning activities. Not only we, but our employees, suppliers, dealers, as well as our customers, have a real stake in their accuracy.

Money spent in obtaining more comprehensive facts that aid Government management decisions will result in adding more value both to the manufacturing and marketing areas of our economy.

The Government also needs these statistics for the same reasons.

In most cases, poor statistics are worse than no statistics. Poor or inadequate statistics can be highly misleading and even dangerous.

The average businessman makes decisions on the basis of these statistics. He counts on them being accurate, and often if he didn't have them available he would spend more time deliberating the pros and cons of the decision. He counts on the figures being reliable and he uses them. Poor statistics can be dangerous.

So the Government should make every effort to improve the quality and adequacy of its statistical reporting. While there is great demand for new statistics and new statistical programs, any new series should not be launched at the expense of essential existing series.

We have seen instances where private statistical reports differ from Government reports, although covering the same statistical ground. We have seen how several Government bureaus reporting on the same, or closely similar economic activities, have reported conflicting and divergent trends.

For this reason, we hope this joint committee will make every effort to encourage the qualitative improvement of the Government's statistical work.

Real progress has been made and we encourage further improvement.

At the same time, in our dynamic economy there are bound to be needs for statistical pioneering, and we welcome the work of the joint committee in this respect.

We endorse President Eisenhower's budget message statement:

> We do not have all the statistical information required in our dynamic economy. I am therefore recommending a Governmentwide effort to improve statistics in those areas where our work has been most handicapped by incomplete information.

The chamber, believing that Government spending today means a tax burden approaching the highest level in our history, has repeatedly urged that all Government activities not strictly essential be treated as luxuries and reduced accordingly.

Recognizing the vital importance of our whole national economy of accurate, prompt, and usable statistics, however, the chamber has supported not only the regular censuses, but has also recognized that the censuses should be supplemented by the collection of current statistics as needed, with the national interest being the criterion of need.

Total estimated Federal expenditures for statistical programs drop from $51.8 million in fiscal 1955 to $43.4 million in fiscal 1956.

Senator DOUGLAS. Mr. Eggert, that is due entirely, is it not, to the census of agriculture and the census of business and manufacturing are tapering off, so it does not represent any real economies. It simply represents the fact that we have passed the periodic census.

Mr. EGGERT. The major census, yes, I agree that is correct. I believe this covers that point.

The periodic census programs, which the chamber supported vigorously last year, are estimated to cost $24.4 million in fiscal 1955, but the budget request drops to $11.2 million in fiscal 1956—reflecting the relatively small amount of work remaining to complete these censuses.

Current statistical programs, including those related to employment, unemployment, wages, prices, construction, housing, population, national income, and other subjects are estimated to cost $27.4 million in fiscal 1955. Several of these programs would be improved under the 1956 budget, with the total amounts requested rising to $32.2 million.

I now would like to mention some of the most needed improvements in Government statistics.

Unemployment and employment data: One of the most important Government statistics is the number of unemployed. It is sometimes termed "a statistical trigger." When unemployment rises, demands are made for the Government to initiate recovery programs.

The Bureau of the Census now makes a monthly estimate of unemployment, broken down by sex, age, color, and duration of unemployment.

This helps characterize the total number of unemployed, but does not tell where the unemployed are located, and their usual or previous occupations. The Bureau of Employment Security collects weekly information regarding the recipients of unemployment compensation, yet these 2 series are not collated into 1 unemployment figure.

Senator DOUGLAS. Mr. Eggert, do you think the size of the sample should be increased?

As I understand it, it is now 25,000 families.

Mr. EGGERT. That would help.

Senator DOUGLAS. Have you made estimates as to how many additional families should be included?

Mr. EGGERT. I have not, Senator, but based solely upon my personal views, the sample could well be doubled for more accurate reporting in this area. I think there is always a need for coordinating.

Senator DOUGLAS. I wonder, Mr. Chairman, if we could have a poll of the members of the panel on this point, as to whether they feel there is a need for a larger sample.

Representative BOLLING. Mr. Hoadley.

Mr. HOADLEY. I would agree that the sample should be increased.

Senator DOUGLAS. By how much?

Mr. HOADLEY. At least doubled, but the precise amount of increase of course would depend upon how much detailed information is to be required.

Representative BOLLING. Mr. Reed.

Mr. REED. My field is population and vital statistics. I haven't any feeling on this point.

Representative BOLLING. Mr. Ruml.

Mr. RUML. It should certainly be increased to the point where the conclusions are not changed by any further increase.

Representative BOLLING. Mr. Teper.

Mr. TEPER. There is no question that the sample should be increased. The Special Committee on Employment Statistics, appointed last year by the Secretary of Commerce, made that recommendation.

We did not at that time suggest by how much the sample should be increased, because of possibility that even the doubling size of the sample may not yield proper results.

Senator DOUGLAS. If you doubled the sample and found approximately the same results you have now, it would be an indication that you would not have to double again.

Mr. TEPER. I would be very much surprised, after the future revision of the sample takes place if we would not find some differences in results from those shown by the present samples.

Representative BOLLING. Mr. Veltfort.

Mr. VELTFORT. I have no particular opinion on it. I would concur in general with what Mr. Ruml said, that the samples should be increased up to the point where increasing it further showed no difference.

Representative BOLLING. Mr. Watkins.

Mr. WATKINS. I would agree, Mr. Chairman, that the sample should be increased. I am not in a position to say by how much. I can tell you this: the rule of thumb that I have followed in my company in sampling problems of this sort is first to find out from technicians what is the minimum sample required and then double it.

Mr. HOADLEY. I would like to add that the size of the proper sample hinges upon the amount of breakdown information needed. This is a very important consideration.

Mr. EGGERT. The Bureau of Labor Statistics publishes monthly the extremely valuable series of nonagricultural employment classified by industry and by State.

We are gratified that the 1956 budget includes increased funds to improve the data for trade, finance, services, State and local governments—and other industries—and also improve the employment data on a State basis.

We also endorse the increase in expenditures from $4.9 million in fiscal 1955 to $6.8 million in fiscal 1956 for employment, unemployment, wages, industrial injuries, and related statistics.

I might add here, personally I feel some consideration should be given to the fringe benefits.

Construction statistics: Construction is a major sector of our economy, yet construction statistics are extremely deficient.

We support the recommended increase from $0.5 million in fiscal 1955 to $1.5 million in fiscal 1956 for this purpose, an increase which should greatly improve data in this important field.

Dr. Walter E. Hoadley, a member of this panel, is chairman of the chamber's subcommittee on construction statistics, and more familiar with this problem. He probably will discuss it in greater detail.

I have a table here on construction statistics which I would like to have incorporated in the record but which I will not read in the interests of saving time.

Representative BOLLING. Your prepared statement will be incorporated in the record.

Mr. EGGERT. Financial statistics of State and local governments: The Bureau of the Census reports on State and local government fiscal operations are of significant use by business and all levels of government. We are gratified the 1956 budget includes increased funds to improve these statistics, particularly since a comprehensive census in this field is not due for several years.

Electronic equipment: Electronic equipment has substantially speeded up and improved the accuracy of labor force, foreign trade, and other census statistical series. Reports from the censuses of business, manufactures, and minerals will be available considerably sooner due to use of electronic equipment.

We support the increased use of electronic equipment in the periodic censuses scheduled for 1958 and 1960.

Lack of timeliness is perhaps the most common complaint about Government statistics, and increased use of electronic equipment should help reduce the timelag in processing statistical data.

Value added by distribution: A notable gap in the Federal statistical program is information on the value added by distribution.

We all know goods retail for more than the manufacturer's selling price. For many years the Bureau of the Census has published figures showing the value added by manufacturing industries.

But there is no corresponding series on the value added by wholesale trade, retail trade, and other aspects of distribution. The accompanying chart summarizes the flow of goods in our economy from producers of raw materials in agriculture and mining.

Most of the goods pass through manufacturing, wholesale trade, and retail trade to final consumers. A smaller amount of goods flow from various stages of processing to the capital account of business and to government.

Other goods flow directly from manufacturers to personal consumers, bypassing wholesale and retail outlets.

This chart is greatly simplified. There is some flow from wholesale firms to consumers, some from agriculture directly to consumers and some goods flowing up the chart instead of down.

For purposes of simplification, these other flows were not marked.

The fact that products acquire added value as they move from field, forest, or mine through a processing plant or factory has long been reflected in the Bureau of the Census data showing value added by manufacturing.

The concept that manufactured products continue to acquire additional value as they move through the channels of trade to the point of ultimate sales or use, however, has not received equal acceptance.

Now is the time to do spade work developing the concepts and techniques necessary for computing value added by distribution. And I want to make it clear that we are not recommending that immediate information be collected here. This is a matter of developing proper concepts and proper techniques so this can be done correctly and accurately.

This is the important step at this stage rather than rushing out with schedules and trying to collect this information.

A good illustration of the constant need for upgrading statistical work and reporting is indicated by a special subcommittee on the census of manufactures which made a report to the Advisory Council on Federal Reports.

The nature of the problem is fully discussed in Business Week, February 5, 1955, pages 114 to 117, and alluded to in the Chattanooga Times for January 22, 1955.

I also have copies of these two items attached to my testimony.

When our economy was simpler and less interdependent, there was less need for statistics.

But in today's highly dynamic economy, with its steady population growth, a constant shifting of population, new raw materials continually being developed, new products reaching the market daily, and indeed whole new industries, both the Government and business executive are in constant need of up-to-date, high-grade statistical information.

The 1956 budget recommendations for economic statistics are supported by the chamber because these expenditures are needed to provide business with data vitally needed in today's expanding economy.

I again want to repeat that we appreciate very much the interest of the committee in this area and we think real progress is being made and will continue to be made.

(Mr. Eggert's prepared statement appears at p. 1104.)

Representative BOLLING. Thank you, Mr. Eggert.

Mr. Hoadley.

OPENING STATEMENT OF WALTER E. HOADLEY, JR., TREASURER, ARMSTRONG CORK CO., LANCASTER, PA.

Mr. HOADLEY. Thank you, Mr. Chairman.

One of the most significant developments affecting both private and public decision-making in recent years has been the growing use of economic statistics.

Moreover, at the present time there is noticeable interest in business in still more adequate economic information. This interest arises, first because of concern over the adequacy of many present Federal economic statistics now being used as a basis for important public-policy decisions, and second, because of the recognized need for more satisfactory economic data to help guide future business planning, which has obvious implications for the entire economy.

The interest of this committee in economic statistics, as evidenced in the hearing today as well as in several previous activities, plus the new feature in the budget message drawing specific attention for the first time to the Federal program in economic statistics are commendable developments. It is encouraging to know that at long last important Federal economic statistics which now influence critical policy decisions by leaders in Government, business, labor, and agriculture have achieved sufficient official recognition to be considered worthy of separate study and analysis.

The Economic Report states "Economic statistics are now closely scrutinized and widely commented upon by men and women in different walks of life" (p. 65). Such a statement would have been far less true 5 years ago and certainly would have had considerably less meaning 25 years ago. Nevertheless, the words "closely scrutinized" just quoted certainly must be intended to mean "read" or "scanned" rather than carefully appraised. Detailed analysis of many economic statistics provided by Government would disclose to almost anyone major deficiencies which are neither widely known nor understood. There has been a definite advance in economic literacy but Government figures, all too often, are being accepted as "official" and hence seemingly almost by definition "precisely accurate." Government, therefore, has increasing responsibility for greater accuracy and reliability of its economic statistics as their use continues to grow.

Just as more extensive and precise measurement devices have become a necessary part of increasingly complex industrial machinery, there is increased need for more comprehensive and accurate measures of what the Economic Report has termed "our complex and industrialized society" (p. 2).

I wholeheartedly endorse the basic economic tenets or guides to policy outlined in the Economic Report (p. 2), and particularly the first proposition that "competitive markets, rather than Government directives, are as a rule the most efficient instruments for organizing production and consumption."

The important—at times dominant—role of Government in current and future economic life, however, can never be minimized, and particularly by the management of any business enterprise.

Forecasting what policies government will adopt and pursue, frankly, has become one of the most critical aspects of business planning.

Is it any wonder that business managements have become vitally concerned about the quality and availability of economic statistics provided and used by government in making and administering public policies?

In my opinion, one of the greatest risks facing business organizations today is to be found in possible unsound public policies—both as to scope and timing—simply because those in authority may not have adequate or trustworthy information available upon which to base their judgments. Let me illustrate this point with regard to homebuilding activity.

As everyone here today knows, the postwar building boom continues with renewed vigor, despite many earlier and some current fears of an imminent collapse.

Because of favorable congressional action 2 years ago, it is now possible to know with considerable reliability from reports of the Bureau of Labor Statistics how many new nonfarm homes are being started each month.

But what information is now available to indicate the extent to which housing needs and demands are being met?

What significance is to be attached to current reports by the Bureau of Labor Statistics that nonfarm housing starts are at an annual rate of over 1,400,000 while new households, as estimated by the Bureau of the Census, are now less than 800,000 per year.

Senator DOUGLAS. Mr. Hoadley, is that a net increase or is that gross amount of new households? That is, is this the new households minus the deaths?

Mr. HOADLEY. This presumably is a net figure, but unfortunately official household data are still highly tentative and fragmentary. Census Bureau releases within recent weeks caution against their use even in indicating year-to-year changes.

Senator DOUGLAS. But this takes account of the breaking up of households through death?

Mr. HOADLEY. Within the limits of techniques and funds available, I believe efforts are made to allow for such factors in making estimates of net new households, Senator.

Is the new home building industry and hence the Nation facing serious trouble? Is credit too easy? In many respects, the key to future new homebuilding lies in the vacancy rate and in the trend of value of older homes. Yet, almost no trustworthy information on either subject is now available. This should be a matter of grave concern for government which has a great influence upon, as well as stake in, housing.

How present housing laws and credit policies can be properly administered in the face of these statistical deficiencies is at least a very open question to me.

The highly fragmentary and until very recently almost complete absence of information on the important and quite evidently expanding home fixup—i. e., repair and modernization—market unquestionably causes undue emphasis on new homes in public policies pertaining to residential construction.

Until the size and characteristics of the fixup market become known, it is hardly reasonable to expect that any well-conceived program to develop this market will emerge. Yet, expanded fixup work probably offers the greatest single opportunity to stabilize the vast but always vulnerable new-home-building industry.

Anyone who investigates the quality of the information now being released by Government on nonresidential construction activity knows the deplorable inadequacy of many current estimates. When it is recognized that these deficiencies are transmitted directly into the national product statistics, there is serious reason to question whether the latter figures—widely used for public and private policy purposes—in any real sense are accurately measuring the course of general business.

These observations on the inadequacy of many Federal construction statistics, of course, should not be interpreted to mean that all Government construction data are bad or that the statisticians preparing them are incompetent.

The plain fact is that the current statistical program simply cannot meet the policy requirements of the dynamic and far-flung construction field in 1955 and 1956.

Senator DOUGLAS. Mr. Hoadley, as I remember it, there were two private indexes of construction: F. W. Dodge and the Engineering News-Record.

Mr. HOADLEY. Yes, sir.

Senator DOUGLAS. You have been discussing Government statistics in the field of construction. What would you say about these two private indexes?

Mr. HOADLEY. Senator, in many respects we would have to make the same type of indictment against them. The figures which are available from these private sources do serve many very valuable purposes, but they are not compiled specifically for public policy use.

Senator DOUGLAS. Well, as I remember it, and I followed these for quite a time rather closely, they showed exactly opposite conclusions, Engineering News-Record showing great declines last year and F. W. Dodge showing appreciable increases. I must say I was puzzled and bewildered by these contradictions. I wonder, therefore, if you would not recommend to these companies that they improve their statistics as well.

Mr. HOADLEY. Senator, I know that the questions you have raised have been discussed with the managements of these private construction reporting organizations. I think we can say a good deal of new thought is being given currently to the collection of private construction data.

Senator DOUGLAS. I wanted to point out that it wasn't merely Government statisticians who got into these difficulties and misled the public, because I think those two series constitute the most extraordinary contradiction I know of.

Mr. HOADLEY. Your observations merely illustrate the plight of anyone trying to determine precisely what is going on in construction today.

Senator DOUGLAS. I am glad this is not an indictment of the Government bureaucrat, then.

Mr. HOADLEY. The expanded statistics program proposed in the President's budget message,[1] if adopted, will eliminate some of the most serious statistical gaps and deficiencies in construction mentioned here by providing additional funds for the Business and Defense Services Administration, the Bureau of Labor Statistics, and the Bureau of the Census. The new program also will provide badly needed benchmark information as well as up-to-date facts on labor and material requirements in construction and make available an answer to many heated questions concerning whether large or small builders are making the most progress and what types of homes are in greatest demand.

One other phase of Federal economic statistics, namely, industrial classification, merits at least passing attention.

[1] Special Analysis I, Federal Economic Statistical Programs, Budget of the U. S. Government for the fiscal year ending June 30, 1956, pp. 1203–1204.

This problem is highly important to the extent that the United States census of manufactures uses inexact or incomplete definitions of industries. Scrambled or overlapping industry data, moreover, often used by Government and others to measure productivity or so-called concentration ratios—i. e., the percentage one or a few firms have of total industry investment, and so forth—obviousl yare misleading when applied to any specific industry or industry group.

It would seem highly essential that tabulation procedures for the 1954 Census of Manufactures take full cognizance of this industrial classification problem.

Moreover, before any future census of manufactures is undertaken, further careful consideration should be given to the report of the Watkins Intensive Review Committee which studied the entire census program last year as well as to the recommendations of a subsequently appointed subcommittee of the Advisory Council on Federal Reports.

In a brief opening statement covering such a broad field as economic statistics, it is natural to stress areas requiring attention and improvement. The forward strides of Federal Government statistics in recent years, however, certainly must not be overlooked. A number of gains in coverage, timeliness, and statistical accuracy have been achieved despite many sharp cutbacks in appropriations. Nevertheless, the current general economic statistics program of the Federal Government has many serious shortcomings for policymaking as well as other purposes.

Business needs for economic statistics clearly are mounting in order to help insure future stability and growth of individual enterprises and hence the country as a whole. Many—perhaps most—business organizations with which I am familiar accept the responsibility to provide their own detailed, market-type statistics, but they properly look to Government for broad statistical information essential to sound public policies and necessary as benchmarks for private business planning.

In conclusion, let me again stress the importance of the Federal Government's current and proposed economics-statistics program for both public and private policymaking purposes.

I have only cited two illustrations of areas requiring prompt statistical improvement in the public interest. Others have been mentioned in earlier hearings before this committee and no doubt will receive attention today.

Major corrections in Government economic statistics can be achieved provided the program summarized in the budget message receives favorable action by the Congress. In my opinion, the program warrants very serious consideration and approval.

Thank you very much, gentlemen.

Representative BOLLING. Thank you, Mr. Hoadley.

(Mr. Hoadley's prepared statement appears at p. 1102.)

Representative BOLLING. Mr. Reed.

OPENING STATEMENT OF LOWELL REED, PRESIDENT, JOHNS HOPKINS UNIVERSITY, AND PAST PRESIDENT, AMERICAN STATISTICAL ASSOCIATION

Mr. REED. I am Dr. Reed, president of Johns Hopkins. My field of interest in statistics has been that of population and vital statistics and I have devoted my life to that. I shall confine my remarks to those two fields. I would like to say I appreciate very much the opportunity of speaking and I want to express my opinion of the importance of these hearings. I would like to start first by stressing the importance of population and vital statistics as a part of economic statistics because our economy is fundamentally dependent on the people that we have, and we need to have the best knowledge that we can as to our population; the various breakdowns of the population into the normal classes that you recollect, the occupational unemployment statistics with regard to them and all of those facts with regard to population. So what I would call population statistics and vital statistics are an extremely important part of commission figures. I have just two points I would like to stress with regard to the field of population and vital statistics. The first one Mr. Belcher mentioned, manpower statistics. I think there is no doubt but what we will need more and better manpower statistics in the future.

We are coming to the point where the programs of the country are dependent on the people to carry them out rather than material things and we need to know how many people we have. By manpower statistics I would like to emphasize the fact that I do not mean just employment or occupational statistics.

When we came to stress manpower in connection with Selective Service, we noticed that the occupational statistics did not furnish the information we needed. What we needed to know was the people and their capacities, not just what they were doing.

Senator DOUGLAS. How could you measure that, Dr. Reed?

Mr. REED. Well, we have measured that in various ways, in terms of the roster of scientific personnel. That was an attempt to do that and certainly that has proved to be extremely valuable. We have within that limited field statistical material that is of assistance. That needs to be extended to a great many other technical skills. We probably do not need to do it in the detail as was done by the scientific people but we do need to do it. The recent report of the Manpower Commission which emphasizes education in the field of manpower has several areas that could not properly be carried out unless one could get an evaluation of the skills that people now have and the skills you would wish to train them for.

Within the working life of our people the skills and the things we demand of our people change. What we are asking of our people 30 years ago is not the same as it is now. We educate people for certain occupations. We need to look ahead and see that we are not caught short on engineers in various fields. That is what I would mean by manpower statistics. There are fragments of statistics scattered through the Government that have bearing on manpower in my opinion beyond occupation and employment statistics. I would recommend that the Office of Statistical Standards do a study in that regard and do some planning in regard to what manpower statistics might be. Certainly we are not in a position to go into the collection of those statistics at the present time for the very reason you bring out, but I want to stress the importance of having knowledge of that type in the future. The other area I would like to speak of is vital statistics and health statistics. I know provision is made in the budget for bringing those statistics up to date. They are so far behind they are not as useful as they might be, but the point I want to emphasize is the need we have for health statistics and by that I mean statistics which tell us something about illness and disability within our population. Again, when we have come to periods of stress, disabilities have shown up in our Selective Service statistics, the importance of not knowing that——

Senator DOUGLAS. I wonder if it would not be important to get the distribution of cases of illness by duration and by cost.

Mr. REED. Senator, it would be extremely important. I was going on to say that the health programs that have been under consideration by the Government and will be, all of them are going to demand statistics of that type. We are not collecting those statistics except in very fragmentary form.

Senator DOUGLAS. I have had the feeling, sort of what I would call a commonsense observation, that the differences in the field of cost of medical care do not lie in the field of ordinary sicknesses but what I once termed "catastrophic sicknesses," and that is where the problem comes, sicknesses of long duration or requiring expensive surgery. Do you have any judgment on that?

Mr. REED. Yes. It is perfectly correct that the most difficult and the most important problem in health insurance is in the field of those long or catastrophic illnesses. And they are the ones which lend themselves to insurance because the ordinarily recurring illnesses can be anticipated, foreseen, and provided for out of current income; isn't that true? And it is with that idea in mind that I emphasize the importance of having health statistics. I would like to go on and say that it is not merely for the insurance point of view that we need these health statistics. There are many other reasons why we need to know the health status and particularly the disability status of our population. We have heard a lot about rehabilitation but at the present time the areas that should be stepped into with regard to rehabilitation are not well known, and so I want to stress the fact that I think the Government should investigate the problem of health statistics and go into that. There is a report on health statistics at the present time prepared by the National Advisory Committee on Vital Statistics. I am Chairman of that. But that report is in the hands of the Public Health Service and in the hands of the Office of Statistical Standards. I think that report should be brought up, should be given consideration, and the Government should decide what it is to do.

Senator DOUGLAS. When was that report prepared, Doctor?

Mr. REED. The report was prepared a year ago or a little more.

Senator DOUGLAS. Has any action been taken on it as far as you know?

Mr. REED. It has received consideration. But I feel it should be picked up and attention given to it.

Senator DOUGLAS. Progress has not been striking.

Representative TALLE. In connection with manpower statistics, Mr. Reed. I would like to ask you about technicians. There must be a considerable shortage of qualified technicians. Especially in connection with veterans' hospitals, it is said often, "We can't staff them properly, we don't have technicians. We may have the doctors, but we don't have the people to assist them."

Mr. REED. Well, I had technicians in mind when I was speaking of the subprofessional personnel. But it is not merely technicians in the field of medicine and in our hospitals, it is also technicians in handling our scientific equipment. When we go into this atomic age we need not merely scientists, but we need technicians, too, and we do not know how many people of that type we have, how many we should train and we need a body of knowledge with regard to manpower that embraces technicians in the medical field and in all fields.

Representative TALLE. That would be true in any field in which the application of science and invention has been rapid, would it not?

Mr. REED. That is right.

Senator DOUGLAS. Dr. Reed, I do not want to throw a brick through a plate glass window, but isn't it true that one reason for this difficulty of getting technicians in the field of public health is the fact that the organized medical profession does not want semiskilled attendants, nor do the nurses; they want skilled people to perform unskilled work; isn't that true?

Representative BOLLING. Senator Douglas, would you say I should rescue Dr. Reed by saying this is not statistics?

Senator DOUGLAS. Since Dr. Reed is the head of one of the first-rate medical schools in the country, I suppose he should not be asked to comment on that.

Mr. REED. Well, the whole problem of medical care that I have worked with intensively has many features of that sort mixed in with it, Senator Douglas, as you know. On the other hand, those are not the points that I was discussing today. What we need is basic knowledge in order to meet some of those questions.

Senator DOUGLAS. I think, in addition to basic knowledge, you have some obstacles which would have to be overcome in the professional organizations, both of nurses and doctors.

Representative BOLLING. Mr. Reed.

Mr. REED. That completes everything that I have. I hope that my report, which I have paraphrased, will be included.

Representative BOLLING. That will be done, without objection.

(Mr. Reed's prepared statement appears at p. 1116.)

Representative BOLLING. Mr. Ruml.

OPENING STATEMENT OF BEARDSLEY RUML, OF NEW YORK, N. Y.

Mr. RUML. Mr. Chairman, may I file certain data in the interests of time?

Representative BOLLING. That will be done.

Mr. RUML. My name is Beardsley Ruml. I am chairman of the business committee of the National Planning Association and a member of the research and policy committee of the Committee for Economic Development. It is my purpose to discuss the role of statistics in the making of public and private policy decisions and to urge continued and accelerated progress in the development of the stactical series now available.

Today we are overwhelmed by recent scientific and technological advances which have occurred in the fields of physics, chemistry, biology and medicine. It is not surprising that the less spectacular and less certain new insights in economics and finance are not so widely known. The full import of these advances I am confident are not yet understood, but we do know enough to know that some things that may competent people thought were true are either false or true in a different way that was believed. Let me give three examples.

In 1937 an eminent economist advised the Treasury that unless the budget was soon balanced, the interest rate would go to 6 percent or even 8 percent, the way it had in France. And yet during the war, the national debt rose from $45 billion to $275 billion on a declining rate of interest.

In 1941 we were told that we would have to choose between guns and butter, that to arm for war in two hemispheres we would have to cut our standard of living sharply. And yet in 1944 the general overall standard of living was at least as high as in 1941, and in addition we produced some $80 billion worth of armament. The miracle of production came out of productivity that had been growing unnoticed beneath the surface of a low actual output for a period of more than 10 years.

To take a third example, during the 1930's most people believed that a deficit in the Federal budget was inflationary. Today we can see that a nation that has millions of unemployed who want to work and ample idle plant and raw materials is much like a factory or a company that has a sizable amount of unused capacity. Under such circumstances, an increase of demand tends to reduce unit costs, and therefore under competition tends to reduce prices rather than to increase them. For the same reasons, Federal deficits prudently incurred in times of excessive unemployment, since they also tend to reduce costs, tend to be deflationary rather than inflationary as far as the purchasing power of the dollar is concerned.

These and other discoveries and insights in economics and finance are of the greatest importance in the determination of policy, and they rest on research made possible by objective statistical reporting. To select one contribution of conspicuous value, consider the work on the measurement of national income under the leadership of Wesley C. Mitchell and Edwin F. Gay in the National Bureau of Economic Research beginning in 1921. It is difficult for us today to realize that only 30 years ago not only did we not have the statistics to work with, but many concepts such as gross national product, which grew out of the statistics, did not even exist.

Senator DOUGLAS. Do you think this introduction of gross national product is an unmixed blessing?

Mr. RUML. No. Like all things human, there are both weaknesses and strengths.

Senator DOUGLAS. I think it has led to an exaggeration of the real national income because it includes transfer payments and provisions for depreciation and obsolescence. I have viewed with some alarm the way in which the net income figures tend to be pushed to the back and gross national product figures pushed to the fore. I think this was a disease characteristic of the bureaucrats of my own party, but I now find that it is adopted with equal alacrity by the bureaucrats of the present dominant political party.

Representative BOLLING. Senator, maybe it would be a good idea if we got the views of the other members of the panel on GNP.

Senator DOUGLAS. Yes, certainly.

Representative BOLLING. Mr. Teper, would you care to comment on that point that has just been raised?

Mr. TEPER. I think Senator Douglas is right. The figures of both net national income and GNP must be used with caution. We actually do not know what the degree of error is in either of these figures. There is plenty of room for additional studies in this area.

Representative BOLLING. Mr. Veltfort, would you care to comment on that?

Mr. VELTFORT. I think the transfer payments are washed out in the gross national product figure. (See table D–5, Economic Report of the President.)

Senator DOUGLAS. Well, As I recall, it includes benefit payments to veterans, interest on the public debt, but I would not say, since the public debt has been primarily incurred because of war, I would not say that such payments were in addition to consumable income.

Mr. VELTFORT. My overall comment would be, as I will point out when I talk, that all of those statistics must be used with an understanding of how they are made up, and there must be constant improvement in their makeup.

Senator DOUGLAS. Well, I would like to suggest to the members of our staff, that we put a little more pressure on the Council of Economic Advisers to play up national income as well as gross national product, and bring that to the fore more.

Mr. WATKINS. Mr. Chairman, I would like to enter a dissent. We are talking about two different concepts. One is gross national product, which by definition is the estimated sum total of the value of all of the goods and services produced by the economy. I think that is an exceedingly useful concept. There are difficulties in preparing the estimates and room for improvement, but I think it is a useful series.

Now we have also estimates of the national income. Both of these series serve useful purposes, and I am convinced myself that GNP is more usable. Naturally, we have to produce enough to take care of depreciation, and that is a part of our total output.

Representative TALLE. Mr. Chairman.

Representative BOLLING. Mr. Talle.

Representative TALLE. In reply to the Senator's comment about the Republicans doing the same thing that the Democrats do——

Senator DOUGLAS. Only more so.

Representative TALLE. I would like to recite the sage remark of Uncle Dooley, who said, "A body is always doin' what everybody else is doin', though there mayn't be no sense in it."

Representative BOLLING. Mr. Eggert, do you want to comment?

Mr. EGGERT. Speaking from my personal point of view, I would like to voice a modest dissent. We find the personal income and disposable income very useful, and to this extent I would agree with Senator Douglas.

However, we also feel that gross national product is a useful tool as a measure of the physical growth, and we use it. I personally think it is an understatement of our increase in our output. It does not measure, as I understand it, the tremendous amount of do-it-yourself type of activity, the fact that a lot of people are working on Saturdays on their own.

I do not believe that gets into the gross national product concept. Because of that, if we had a true measure of our total output of goods and services, it might actually be higher and might reach more, Senator Douglas.

Senator DOUGLAS. I am not proposing that we discontinue the series for gross national product, but I viewed with some concern the fact that the figures on net national income fade out in the discussion of national prosperity. The one figure which is quoted tends to be a gross national product figure, which includes provisions for simply keeping the stock of capital equipment going without any net additions.

Representative BOLLING. I think it is a very interesting question. I think perhaps its greatest importance lies out of the purely statistical field in the interpretation that the people generally put on the significance of the figure.

Mr. HOADLEY. I would merely add that the Senator is certainly right, gross national product is becoming the more popular measure. I would add also that both concepts, gross and net, are essential and obviously have to be used with discretion, but I think Mr. Ruml's point was some years ago we had no overall measure of what was going on in the country, and that we tended to use indirect means in judging what was happening through pig iron production or selected measures and barometers, rather than attempting to measure the entire economic activity in dollars for the country as a whole.

I think it is a very forward step, but again I would say we have to use these new measures with caution.

Representative BOLLING. Mr. Reed.

Mr. REED. I have no comment on that.

Representative BOLLING. Mr. Ruml, I would like to assure you, we are not going to take all of this time out of your time.

Mr. RUML. Valuable as our present statistical series are, there is much room for improvement in coverage, accuracy and speed of reporting. Let me mention 2 specific examples of statistical inadequacy at 2 most crucial points.

First, consider our inadequate knowledge of increase in productivity per man-hour from year to year. Is it 2 percent, or 3 percent, or even more? Does it increase arithmetically or geometrically? Has increase been exhausted in some lines and hardly begun in others? Today we are using overall figures based on historical general experience modified by the shrewd insight of particular students. But the consequences of these estimates for policy cannot be exaggerated, and the choice of 2 percent or 3 percent in productivity increase per man-hour per year means the choice of 20 percent or 30 percent in the increase of gross national productivity 10 years from now, a difference of some $35 billion. Clearly our statistics on productivity must be as accurate and as meaningful as it is humanly possible to make them.

The second area which I will mention as needing improved statistical reporting is the field of savings. Here I mean not only the figures on savings banks, but knowledge with respect to the current withdrawals from consumption and their distribution by classification.

In the United States no longer is last week's income a reliable guide to this week's spending; no longer does this week's spending tell an adequate story on next week's consuming.

Today as never before the ordinary individual can get along without current purchasing for his day-to-day requirements. If he decides to change or to restrict his habitual consumption, he can do so without doing violence to his health or well-being.

So also today as never before the ordinary individual has cash, or its equivalent, that he can use to buy the things he wants or the things he thinks he may some day want. Thus, consumer spending is not necessarily consumption.

The consumer in the United States is not absolutely free—sooner or later he must buy some things to satisfy his minimum requirements. However, in the aggregate, the consumer is free as never before—free to postpone, free to reduce, free to anticipate, free to switch from one unnecessity to another. Economic determinism no longer contains him.

Accordingly we need as never before comprehensive, accurate, meaningful and prompt statistics on the savings and spending behavior of American citizens. Without such knowledge the making of policy and the implementation of policy can be based only on an experience which is largely personal, imperfect and obsolete.

The responsibility for improving the statistical series in these and other important areas lies upon the agencies who have these assignments and upon the appropriating bodies from whom the necessary funds are derived. Clearly the sums that can be efficiently applied are immeasurably smaller than the financial consequences of the decisions for which the statistical series will be used.

Here I wish to emphasize a suggestion which has already been made. A special responsibility must be assigned to the Federal Reserve System, not only because its earnings provide abundant resources for statistical research and reporting, but also because the vital Open Market Committee, in its determinations to act or not to act, needs to have before it for its own use, a very large proportion of the statistical requirements for all public and private policy decisions.

If the Federal Reserve System would only see to it that the statistics it needs for its own operations are available to the public and to it, the back of the problem of statistical reporting would have been broken.

I am not suggesting that the Federal Reserve System should take over the collection of all the statistics it needs, or even that it should be a coordinator of existing public and private statistical bureaus. What I am suggesting is that the Federal Reserve System should assume a residual responsibility to make certain that it gets promptly from whatever source the statistics that it itself needs, and that it supports the researches requires to keep the quality of the various statistical series at a high level and to improve their comprehensiveness, meaning and availability.

To be sure, a statistic is only the shadow of a fact. But it is after the reading of these shadows that decisions are made. And the decisions affect the well-being of us all.

Representative BOLLING. Mr. Ruml, it is a matter of profound regret to me that our colleague, Congressman Patman, was not here to hear the latter part of your testimony. I am quite confident that he would have been very much interested. His interest in the Federal Reserve System is very well known.

Senator DOUGLAS. Well, are you going to let Mr. Ruml off as easily as this?

Representative BOLLING. I thought I would leave the harder work to you.

Senator DOUGLAS. Mr. Ruml, do I understand your recommendation to be that you think it is easier to get appropriations for the Board of Governors of the Federal Reserve System than it is from Congress, since the Board of Governors will appropriate money which is not their own and which otherwise they would have to turn into the General Treasury.

Mr. RUML. Well, I would call the funds coming from the Federal Reserve Board allocations, rather than appropriations, in order to make a distinction between the methods.

Senator DOUGLAS. In other words, that the Board of Governors would not watch the allocations as closely as we would watch appropriations.

Mr. RUML. No, I think they would watch them in a different way. For example, in the appropriations, the question of what rate is paid as compensation to an individual is very important, and in the other case the quality of the individual becomes very important. I think both have their values as tests of efficiencies.

Senator DOUGLAS. Well, it is a very canny answer.

In other words, you think the Federal Reserve has earnings which could be tapped for statistical purposes to a greater degree than the tax revenues of the Government?

Mr. RUML. Well, I think there are earnings, I do think there is some flexibility that makes it possible to do on a qualitative basis sometimes things that can not be done in a regular Government bureau, and that is all I meant by my remarks.

Representative BOLLING. I am not quite clear on this. Are you suggesting that it is absolutely impossible to convince the Congress to do what is necessary in the statistical field?

Mr. RUML. Oh, no; I think it is quite possible, but it may take a long time.

Representative BOLLING. So this is an expediency to substitute the Federal Reserve. I am not being entirely facetious, but it is in effect a practical expediency?

Mr. RUML. I think it would give at certain points a qualitative and a time impact that would be very desirable, but, as I say in my testimony, I am not suggesting the substitution of one for the other, but only that the Federal Reserve should take what I call a residual responsibility, thereby not interfering in any way with what the Congress does appropriate to the standard agencies of the statistical bureau.

Representative BOLLING. But you would agree, I assume, that, ideally, much of this work should not be thus segregated in the hands of the Federal Reserve, because the Federal Reserve does have a unique position with regard to the Government policy. It would be preferable, I take it, if certain statistical information were decided to be essential to a wise policy political decision, that it would be made available through the more ordinary channels, rather than in an agency which is purposely somewhat insulated?

Mr. RUML. Let me give an example in the savings field. I think it would probably take two or three hundred thousand to do the initial experimental and intellectual work to get the kind of reporting that then would be standard reporting.

Now that could be done any time by the Federal Reserve. Then Congress can decide whether it should be there or in Commerce, or somewhere else when it comes to the operation.

Representative BOLLING. I do not want to give the idea that I am hostile to the plan. I just want to be sure I have it in proper perspective for myself.

(Mr. Ruml's prepared statement appears at p. 1117.)

Representative BOLLING. Mr. Teper.

OPENING STATEMENT OF LAZARE TEPER, RESEARCH DIRECTOR, INTERNATIONAL LADIES' GARMENT WORKERS UNION, NEW YORK, N. Y.

Mr. TEPER. I appreciate the opportunity of meeting with you for the discussion of the recommendations on economic statistics made in the President's annual budget and Economic Report. The annual budget of the President does offer a useful overview of the proposed Federal statistical programs, though in a skeletonized form. However, the President's Economic Report, aside from some scattered comments on individual statistical series and contrary to your last year's recommendations, gives no consideration to a program of adequate economic statistics.

In the interest of brevity, I will limit my remarks to a review of only a few of the issues, leaving the rest of my comments to the statement which I would like to offer now for the record.

Representative BOLLING. That will be done.

Mr. TEPER. The decline in employment which started in mid-1953 naturally spurred on the interest in adequate employment and unemployment statistics and the annual budget reflects this concern. The need for strengthening unemployment statistics, you will recall, has been dramatically brought to the fore through the issuance of revised unemployment estimates for January 1954 which exceeded the older estimates by 728,000.

The investigation of this discrepancy, conducted by a special committee chaired by Frederick F. Stephan, of Princeton University, with Lester R. Frankel, of Alfred Politz Research, Inc., and myself as members, revealed that, at least in part, this discrepancy, brought about by operational difficulties during the transition from the 68- to 230-area sampling, was caused by lack of sufficient funds.

However, it also appeared that, despite the basic soundness of the census approach, the current sample was probably not large enough to insure the maximum of accuracy for the future and to provide the needed detail. We also felt that although the new estimating procedure, now in use, did raise the accuracy of some of the labor force breakdowns, it failed to do so in the case of the unemployment estimates and that, therefore, the new estimating technique should be, at best, viewed as experimental.

Much still remains to be done to improve the measurement of the labor force and of its characteristics. Some of the problems bear on the problem of concepts and the use of the term "employed" to cover not only those who work as little as 1 hour in the course of the enumeration week but also many of those who worked not at all.

Senator DOUGLAS. How would they include as employed people who did not work?

Mr. TEPER. The term "employed," as used by the census, includes people who have a job but who were not at work during the particular enumeration week.

Senator DOUGLAS. You mean the layoffs?

Mr. TEPER. Yes. This group includes short-term layoffs of less than 30 days.

Senator DOUGLAS. I always believed those should be included and I believe now those figures are published and transmitted to us in the Economic Indicators.

Mr. TEPER. That is correct. These figures are shown separately in the Economic Indicators. They have been shown separately, at least for sometime, in the back part of the Monthly Report on the Labor Force. However, the term "employed" has been much too frequently used, both by responsible officials and by people outside of the Government, as synonymous with "at work." This confusion is undesirable. In the case of persons laid off for less than 30 days, the issue is relatively clear—they are out of work for economic reasons. How about those who were unemployed during the particular survey week but who got a job which is to start within the next 30 days? They are also treated by the census as though they were employed during the particular survey week. However, by no means of imagination were they employed at that time. Persons who did not work in the same week because of bad weather are also treated as employed, although bad weather, as one of those acts of God, is just as much of an economic fact which affects the levels of employment.

Senator DOUGLAS. Take the building trade. If we had a severe winter the volume of building construction would go down. Suppose you have snowstorms or cold weather, and the man does not work at his trade—he is counted as employed.

Mr. TEPER. If during the survey week it is reported that a man's inability to work was caused by bad weather, he is counted among the employed. However, he will also be separately tabulated as among those with a job but not at work. This group is deemed to be part of the employed.

Now then, there is another group, shown in the miscellaneous category of those with a job but not at work. While no published breakdowns are available on who is included in this group, the little that I have seen in the course of our investigation suggests that quite a number of individuals should be more properly classified among the unemployed. This category does, of course, include a number of borderline cases. It is a difficult area to classify properly.

Senator DOUGLAS. Would you give an illustration of this?

Mr. TEPER. Some people in this group may be improperly classified because they work on an irregular schedule or because they are enumerated in their off season. Others may be between jobs or may otherwise be erroneously classified. Of course, some improper classifications are unavoidable, and I want to make it very clear that the Census Bureau has not been deficient in handling that particular group. However, this group does exceed, at times, a half million persons. This is not an insubstantial number and more work needs to be done in this area to improve classification.

Senator DOUGLAS. Now these errors you think are not compensating but cumulating, they operate to minimize the amount of unemployment and to maximize the amount of employment?

Mr. TEPER. That is correct. Nor is the situation improved, because theoretically one can sit down, analyze the different breakdowns, and recombine them to provide more meaningful categories within certain limits—one cannot really do it in all cases. Nonetheless, this is not helpful for the public in general or for the responsible officials who tend to use data as published, in terms of three groups: Employed, unemployed, and out of the labor force. Significantly, the out-of-the-labor-force category also includes a number of people more properly classed as unemployed. They may not be looking for a job solely because the jobs are not available in their communities.

Senator DOUGLAS. That is the subject you are going to treat in your next sentence.

Mr. TEPER. Yes. I want to draw your attention to the fact that some six studies conducted by the Census Bureau in the past, though inconclusive, have shown the size of the group classified out of the labor force, but available for jobs if jobs were available, has ranged, at the time of those surveys, from 11 to 73 percent of the number counted as unemployed.

There is a distinct need to review the current definitions of unemployment as used by the Census and to eliminate the source of confusion which arises when the term "employed" is misused as synonymous with "at work."

Senator DOUGLAS. I confess to some confusion on this point. It used to be said, in the great depression of the thirties, that the number seeking work increased because, with income shrinking, wives and parents and young people would seek work who ordinarily would not be in work, and that, therefore, unemployment was cumulative.

The modern interpretation is that you rule out from seeking employment people who have no prospect of getting a job. I am a little confused on this point.

Do I make my question clear?

Mr. TEPER. Yes. First, I would like to comment on the last part of your statement. There is undoubtedly some discrepancy between those who can be called unemployed, however defined, and their number obtained as a result of a physical count. This is due to the fact that the information is secured on the basis of specific questions, from persons other than the person concerned, not the unemployed person, but the housewife, or someone else. In this way some imperfections unavoidably creep into the enumeration, simply because the respondents do not have complete information or because of misunderstandings. That may be responsible for some discrepancies. As to the first part of your question, there is no doubt that there are 2 separate movements or 2 distinct kinds of tendencies which occur at the time unemployment deepens. They are well illustrated in the Pennsylvania coal mine regions, where, with the mines shut down, the miner may be deemed as not available for work, because technically there are no jobs in his line, because he intends to stick to mining. Because he knows such jobs are not available, he may not even look for work.

Of course, if the mine were to reopen, he would be the first one to go back. In the meantime, the people who enter the labor force, seek work and get jobs, are the women of the family, the daughters and the wives. They may work in the garment shops, for example. Thus we find that a number of new people were drawn into the labor force at the time when others are counted out of it.

The wage earners who normally would have been part of the labor force would resume work as soon as work is available in their line. They do look at apparel work, for some reason, as the women's work. Therefore, they do not seek work in the apparel shops. It is possible, therefore, that in the course of enumeration, if asked the question: "Are you looking for work?" the man may shrug his shoulders or the woman may say that he isn't looking for work.

Well, there is no acceptable work for him to look for. And as a result, he may be considered by the Census Bureau as out of the labor force.

Senator DOUGLAS. So you think that this factor has also operated to reduce the published figure of unemployment?

Mr. TEPER. It may very well have done so; yes, sir.

Senator DOUGLAS. Many people have been counted as not seeking work and hence not unemployed?

Mr. TEPER. Yes. This would occur when the members of their household would report them as not seeking work, without volunteering an additional statement at the same time explaining that they are not seeking work because there is no work available in their town.

Now the Census will count a person as unemployed if such an additional explanation is volunteered by the respondent. However, many people are not very articulate. As a result, any enumeration which relies on the ability of the respondent to provide additional elaborations and clarifications, not directly called for by the questions asked, will definitely result in an undercount, just because many people answer only the specific question asked and say no more.

Representative KELLEY. Mr. Chairman, do you think there are many who would report that they were not looking for work?

He may feel himself helpless in the face of the economic situation in the area he is in, that work is not available to him. However, I can't imagine there are very many in the category who would say that they are not looking for work.

In my experience I haven't found that to be true in very many instances.

Mr. TEPER. Well, sir, if I could give you the exact figure we would not need to make the surveys of the labor force. Such figure could only be produced by additional studies. That is one of the reasons why I cited the findings of the six prior studies made by the Bureau of the Census. They were made between 1946 and 1949. They concerned themselves specifically with the out of the labor force group, trying to discover whether it is a pure group or whether it also included a number of cases of people who may not have been properly classified as out of the labor force and who may not have been looking for work because they thought job opportunities were not available.

Now, each of the six surveys showed that this group represented a different percentage in relation to the total number counted as unemployed. The range was very wide.

Senator DOUGLAS. Mr. Teper, do you have a tabulation of the range of these variations?

Mr. TEPER. Yes.

Senator DOUGLAS. I wonder if that could be made a part of the record.

Mr. TEPER. There are six figures. They are 73, 11, 22, 20, 18, and 16 percent; these figures have been calculated by Mr. A. J. Jaffe, one of your former students, and Mr. Charles D. Stewart of the Bureau of Labor Statistics, and are found in their book, Manpower Resources and Utilization, page 460.

Representative KELLEY. Is that included in your comprehensive statement for the record?

Mr. TEPER. I did not refer to all these figures but I did give their range.

Representative KELLEY. I might interject this, Mr. Chairman.

There are many men who are out of work and probably feel helpless in getting positions because if they are over 40 or 45 years of age, the door is closed in most instances to those men seeking work in other industries. There is quite a group in that category.

Do you find that in your experience?

Mr. TEPER. Well, I have been looking at a study of labor mobility in the New England States, which was just released. It deals with the textile industry. It shows that after the textile mill shutdowns in New England, the older textile workers encountered much more unemployment in their ranks than the younger workers. There was a definite correlation between unemployment and age. The study has also shown that, by and large, the unemployed were relatively immobile.

People were looking for work in their own neighborhood areas. They were not too well informed about available job opportunities.

This is one of the reasons why some unemployed feel frustrated. They just do not know what the employment opportunities are.

Representative KELLEY. Well, the employment opportunities are severely restricted anywhere if they are over the age of 45.

Mr. TEPER. That is right.

Representative KELLEY. That is quite a large group. I have that impression. There are no statistics to show just how many would be in that group. That applies even to the professions, even in engineering today.

With all of the advertisements you see in the newspapers for engineers, yet if an engineer finds himself unemployed in an industry that he has worked in he finds difficulty in getting positions anywhere, even in spite of the fact they are looking for engineers, and the difficulty is that he is over 45.

Mr. TEPER. That is right. You will find the monthly reports on the labor force do show how many unemployed as defined by the Census Bureau, there are by age brackets. From these figures, despite their limitations, one can evaluate the situation with regard to those over 45.

However, there is no information on the duration of unemployment in the different age groups. Yet such knowledge is very important because the duration of unemployment may be much more serious among the oldsters than in the younger groups.

Representative KELLEY. The striking thing is that we are concerned about the shortage of technicians and engineers and yet we have them, experienced ones who are in an age bracket where it is difficult for them to find jobs, in spite of the shortage.

Mr. TEPER. To continue, there is also a need for enlarging the present sample size, for information on the gross changes in the labor force, and for improvements in quality checks on interviewing.

Parenthetically, the undesirable practice, introduced last year, of making the employment of field enumerators a subject of political patronage should be abandoned.

Senator DOUGLAS. Mr. Teper, may I ask a question on that?

I have always felt there was a role for political patronage in appointing enumerators, and it has always been the policy of my party as well as the other, to hire the census enumerators through political channels. And I think on the whole they have done a good job. Generally there is no tendency toward bias in the collection of population figures, although occasionally you get overambitious local boosters who want to send up the population figure for a community, but do you think there is a possibility of an internal bias if you recruit enumerators for collecting figures on unemployment?

Mr. TEPER. Well, I remember an old study made by Stuart Rice in the twenties. He was studying the bias of interviewers engaged in the study of homeless men. There were two enumerators. One was a Socialist, I believe, and the other was a Prohibitionist. The Socialist found that the causes of homelessness were economic and the Prohibitionist found that it was all due to drink.

Now, it is pretty difficult to assess to what extent the interviewer bias affects the end results of enumerations. There is no doubt that when a political party, whichever it may be, attempts to impress the public that things are pretty good and that unemployment is low, that those who adhere to that particular party may accept the statements of their leaders on faith, and, as a result, may neglect doing the kind of probing that is necessary in the course of the enumeration in order to get accuracy. However, political hiring of enumerators for the monthly surveys seems to cause more serious problems on other grounds.

For example, I found in talking to people in the field that the number of local political leaders would tell the census people informally that they had no candidates who were interested in work for $1.25 an hour for 1 week in a month. Furthermore, some felt that any party worker who would take such jobs would come under the Hatch Act and that, as a result, they would no longer be able to continue their political activities. Even when local political leaders had no one to recommend, they did not want to put it in writing because of fears that the higher political echelons would take it as lack of interest in patronage. Thus, when there were vacancies and needs for replacements, frequently, no recommendations were forthcoming. This caused bad operational delays, which did not help the proper conduct of enumeration.

Senator DOUGLAS. Is it not true that almost any administration whatever its political complexion will try to minimize the amount of unemployment?

Mr. TEPER. That is right.

Senator DOUGLAS. And therefore if you have people selected for this type of census by the patronage method, whatever the party, you will get a tendency to reduce the number of unemployed by saying some people are not seeking work or that others have jobs even though they do not work.

Mr. TEPER. That is likely.

Senator DOUGLAS. Don't you think that is inevitable?

Mr. TEPER. Let me say that rechecks of the census enumerations did show discrepancies of response, yet I cannot say that they were due to the bias of the enumerator. It is reasonable, however, to assume that the politically selected enumerators will introduce bias.

I have no proof of it.

Representative TALLE. Mr. Chairman.

Representative BOLLING. Mr. Talle.

Representative TALLE. May I agree with Senator Douglas that the census taking has been satisfactory. That is what you said, was it not, Senator?

Senator DOUGLAS. In the main, satisfactory.

Representative TALLE. My only firsthand contact with that was last year when the agricultural census was taken, and I think the Census Bureau deserves credit for being very helpful. I made it a point to stay out of it in every way I could because I don't enjoy patronage problems. The Census Bureau was very helpful in selecting a supervisor and an assistant for the district, in selecting crew leaders for the various counties in my district and in giving examinations in order to get qualified people for the actual enumeration. The supervisor in my district was also the supervisor of an adjoining district. The central office was at Cedar Rapids, Iowa.

I thought very good work was done and I don't think anybody ever raised any question about partisan political maneuvering.

Senator DOUGLAS. Well, you didn't give up making recommendations as to who should serve as enumerators, did you?

Representative TALLE. I didn't say a word about it.

Senator DOUGLAS. Well, I think you are almost unique among Congressmen.

Representative TALLE. I left that to the organization back home that worked with the Census Bureau.

Senator DOUGLAS. Which organization?

You left that to the county chairman? That gave you political enumerators probably of a lower quality than if you had selected them yourself.

Representative TALLE. I didn't even say that. I was just saying how it was done.

Senator DOUGLAS. In other words, it was done by the county chairman. I think that has been the common practice and it is certainly not unique among Republicans. We did it, and I don't think it resulted in any real error, but the point I am trying to make out is that there isn't as much of a dispute as to how many people you have except the conflict between truth and local boosterism, but that in the case of unemployment whatever party is in power wants to get as low a figure as possible in order to minimize the adverse political effect of a high figure, and therefore I think it is much more dangerous to get politically selected enumerators in the field of unemployment, Dr. Reed, than in the field of vital statistics.

Mr. TEPER. I would like to draw your attention, sir, that unemployment data are also gathered at the time the decennial enumerations of population take place.

Representative BOLLING. Do you have something to say about it, Mr. Watkins?

Mr. WATKINS. Mr. Chairman, I don't want to take the time of the committee unduly, but I would like to ask to have inserted in the record at this point the recommendations of the Intensive Review

Committee to the Secretary of Commerce on this question of political selection of enumerators.

It is page 25 in Appraisal of Census Programs, a summary paragraph on page 3, and recommendation No. 5 on pages 4 and 5. (See below.)

Very briefly, the committee felt that political nomination was not the most efficient way to select enumerators.

Senator DOUGLAS. All kinds of enumerators.

Mr. WATKINS. Quite. We made a strong recommendation and we stated also that we felt the Members of Congress when apprised of the situation would be willing to forego this patronage privilege in return for the opportunity of selection of enumerators solely on the basis of qualification.

Representative TALLE. Mr. Chairman.

Representative BOLLING. Mr. Talle.

Representative TALLE. I think I should probably add something to what was said, because Senator Douglas put some words in my mouth.

I wanted to emphasize the helpfulness of the Census Bureau in doing that job and I was very glad the Bureau did it, because it certainly relieved me of a great many questions that I might have been asked. While I have not inquired into it, I have been told that enumerators were not Republicans only, that some other people were found to be qualified to do the work, too.

Senator DOUGLAS. We have 5,000 enumerators and I felt the Republicans should have some, so we appointed 50 Republicans. I dare say that the percentage of Democrats whom you appointed would not be in excess of that, and I am not making any complaint about this point. I would like to sometime debate with these gentlemen about the whole problem of running a democracy, running political parties which cannot be done entirely with voluntary help. This is a matter that scientists have not considered quite scientifically, but I will say that where you get a bias from the use of such enumerators then I think there is a serious question as to whether they should be political appointees.

Mr. WATKINS. May I point out that we are merely assuming political bias. I know of no evidence that would bear out that assumption.

Senator DOUGLAS. Where there is an incentive there is generally a result, because the will precedes the act always.

Representative BOLLING. Perhaps at this point I could take care of a technical matter or two.

Without objection the request of Mr. Watkins will be complied with and the material inserted. I would also like to have the permission of the committee to have inserted a letter of December 21, signed by the staff director and addressed to the Bureau of the Census on the same subject.

Without objection that will be done.

(The material and letter referred to follows:)

EXCERPTS FROM THE REPORT OF THE INTENSIVE REVIEW COMMITTEE, APPRAISAL OF CENSUS PROGRAMS

Political recommendation has traditionally played a part in the selection of supervisors and enumerators for the decennial census. The effect has been, in some areas at least, to adulterate the influence of the Bureau's careful planning and to produce defective results. Present needs require, and present State employment service and other recruiting and training services and methods facilitate, the selection of personnel on the sole basis of qualifications:

That appropriate steps be taken to assure the recruiting and training of qualified field supervisors and enumerators for the 1960 census through substituting for political nomination the sole test of qualification.

SELECTION OF ENUMERATORS

Another problem is that traditionally imposed on the Bureau by the procedures involved in the selection of supervisors and enumerators for the conduct of the decennial census (including the census of agriculture). At best the task of selecting competent and reliable persons for this temporary employment for a few weeks once in 10 years is a difficult one; and it is understandable that in the past political nomination by the majority party at the time of the census would have been resorted to. Today, however—and speaking more precisely of the next census, for 1960—it must be said that these political procedures are a legacy of an outmoded past. With the creation and development of the State employment services and the United States Employment Service, and the development of methods and techniques for recruiting and training, there can no longer be any justification for resort to those outmoded procedures.

Under those procedures, the careful planning of the Bureau for the decennial censuses has tended in some if not many areas to lose much of its effect through employment of supervisors and enumerators unqualified for their work. The results of the decennial census are of such importance to our economy and to our society generally that the same careful planning should go also into the selection of field supervisors and enumerators. Qualification should be the sole criterion for employment.

It is the belief of this committee that the Members of Congress would willingly forego this small patronage. Through long resort to that practice (with the exception of the census of 1880), it has been accepted as an unquestioned tradition; but this committee believes that the leaders of the Congress, both majority and minority, need only to have the problem brought to their attention to deal with it in a manner appropriate to the conditions of the present age. The stakes are large in terms of the indispensable decennial census results, and the patronage sacrifice would be slight.

DECEMBER 21, 1954.

Dr. ROBERT W. BURGESS,
Director, Bureau of the Census, Department of Commerce,
Washington 15, D. C.

DEAR DR. BURGESS: Several members of the Joint Economic Committee have asked the committee staff about the possible effect on the Bureau's current employment statistics of hiring only enumerators obtained through recommendations of local political leaders, for the collection of these statistics. As you know, the Special Advisory Committee on Employment Statistics appointed by the Secretary of Commerce in the appendix to its August 1 report on The Measurement of Employment and Unemployment by the Bureau of the Census in its Current Population Survey also expressed concern with such a recruitment procedure, particularly from the standpoint of delays that it may cause in making vitally needed replacements.

It would be helpful in answering queries from Committee members if we could be brought up-to-date on the Census Bureau's latest thinking on this matter. This, of course, is in accordance also with the Committee's desire, as expressed in its 1953 annual report (H. R. 1256), to see that all steps possible are taken to insure the adequacy and accuracy of such data. We would deeply appreciate having your comments on the exact nature of the problems which arise in employing enumerators for the current population surveys and your evaluation of the need or lack of need for a change in the present procedure.

Sincerely yours,

GROVER W. ENSLEY, *Staff Director.*

(For Mr. Burgess' reply see p. 1264.)

Representative BOLLING. Mr. Talle, do you have something further?

Representative TALLE. Yes. I should like to emphasize that my constituency has high standards which leads me to say that our panelist, Mr. Beardsley Ruml, is a gentleman on whom I have some claim because his father is an eminent practicing physician in my district, in the city of Cedar Rapids, Iowa. We are very proud of the Ruml family.

Representative BOLLING. Thank you, Mr. Talle.

Mr. Teper?

Mr. TEPER. The need for greater detail on the labor force is, as I have already pointed out, recognized by the annual budget. We really know too little about the impact of the recent recession on the different strata of our working population. More information is needed on the characteristics of the unemployed, including their occupations and last industry attachments, and about the character of unemployment and its duration.

Much of these data must be local in character.

Today we have to rely on unemployment compensation claims for such data. These fail to reveal, however, the full extent of unemployment, partly because of statutory differences and also on account of the underenumeration of the unemployed because of exhaustion of benefit rights, late filings, insufficient wage credits for eligibility, or disqualifications such as in the case of voluntary quits. The activities proposed by the annual budget should go a long way in narrowing the informational gap.

There is a distinct need to provide local benchmarks for the determination of the characteristics of the labor force. Such a program, encompassing 15 to 20 labor market areas, is proposed by the Bureau of Labor Statistics. It plans to have this work carried out by the Census Bureau since it now collects related information for the country as a whole.

Improvements are also planned for the Bureau of Labor Statistics statistics of nonagricultural employment and payrolls, through provision of more data for local labor markets, by bettering its data for trade, service, and financial establishments, and by developing a much more adequate system of labor turnover statistics.

These plans need to be supplemented by the additional developments of employment data for several industries for which it is not presently available, as well as by data on employment in the smaller establishments. There is also, by the way, an important need to improve farm employment statistics presently gathered by the Department of Agriculture.

A need also exists for additional current information on the unemployment insurance beneficiaries, including data on their occupational and industrial characteristics and the number of benefit right exhaustions.

Studies of the labor conditions would not, however, be complete without additional statistical information, some of which the Bureau of Labor Statistics is planning to undertake subject to the will of the Congress. Data need to be provided on occupational trends and outlook and on the extent of the potential demand for labor under a variety of conditions, such as national emergency or the long-range public works program.

More information also is called for on occupational wage rates in the different industries. These statistics are inadequate at the present time, both in coverage and frequency of collections. There is also a need for studies of collective bargaining patterns, of the nature and extent of the different fringe benefits, for statistics on the incidence, severity, and causes of industrial accidents, and for development of studies of workmen's compensation operations in the different States.

Additional work is also required on the levels of living of our population. The President's budget recommends the conduct of a survey of farmers' expenditures, to provide data on their patterns of living and to obtain information for the revision of indexes of prices paid by farmers. Similar investigations are needed for the urban population.

Such studies have last been made in 1951; the changes in incomes and consumer habits since that time render them obsolete.

Senator DOUGLAS. Do you have to make surveys of this as often as every 5 years?

Mr. TEPER. I think that in the case of the consumer expenditure surveys, a 5-year schedule is about right, sir. There is also a need to appraise the conceptual differences between the Consumers' Price Index and the index of prices paid by farmers in order to determine their effect on the movements of these indexes.

In the field of housing, it seems desirable to supplement the proposed statistical program by data showing to what extent new construction meets the economic needs of American families—at what prices is new housing sold or rented, the characteristics of buyers and tenants of new housing, and the degree of replenishment of housing inventories.

The President's Economic Report omits to provide Congress with projections of the needed levels of employment, production, and purchasing power to assure useful employment opportunities. The same situation occurred last year and was, in effect, criticized by your committee. There can be no doubt that something more than is contained in the Economic Report is called for in the way of an analysis of the prospects of the economy.

The text of the Economic Report also draws attention to omission of important data on which some of the conclusions are based. For example, the report contends that a 90-cent minimum wage level is the highest possible which can now be economically justified. No supporting statistical or other data is offered for these conclusions and, at least as of the early part of this week, none were released.

The need for improving the statistical work of the Federal Government definitely exists and increased appropriations for this purpose are a necessity.

Your committee, I am sure, will make it clear to Congress.

Representative BOLLING. Thank you, Mr. Teper.

(Mr. Teper's prepared statement appears at p. 1119.)

OPENING STATEMENT OF THEODORE E. VELTFORT, MANAGER, COPPER AND BRASS RESEARCH ASSOCIATION, NEW YORK, N. Y.

Representative BOLLING. Mr. Veltfort?

Mr. VELTFORT. I should make it clear to begin with that I am making this statement not in my official capacity, but on the basis of the experience I have gained as member of many advisory committees and groups which have considered various aspects of the economic statistics here under discussion.

Thus, I should point out for many years I have been a member of the Advisory Council on Federal Reports and I have also been a member of the Business Research Advisory Committee of the Bureau of Labor Statistics.

In the Economic Report of the President there were but few direct recommendations relating to economic statistics. Implicit throughout the report, however, is the reliance which Government administrators must place on a wide range of nationwide economic statistics in order to arrive at sound conclusions. These statistics must present the essential facts of the multifarious sectors of our ever-expanding economy, with all the complexities inherent in that economy. There is implicit, also, the need for effective keys to better understanding of the interrelationships of these many measures of our economic activity as well as of the interdependence of the activities on the National and on the State and local levels.

It is unquestionably in recognition of this basic situation that certain recommendations have been made with respect to the Federal economic statistical programs, in the budget for the fiscal year ending June 30, 1956. While I have, of course, no way of judging the adequacy or inadequacy of the estimates presented, there is little doubt that our Federal statistical programs must steadily grow with the increase in the extent and complexity of our economy. Even more important, provision must be made for the constant improvement in these statistical measures which will permit better informed administrative policies and this, of course, will require reasonable appropriations for its implementation. That much along these lines needs to be done is amply demonstrated by the testimony given at the hearings before the Subcommittee on Economic Statistics last year. In view of this overall situation the projected statistical program appears quite reasonable.

Coming now to the more specific question of what additional improvements should be made, there should be, first of all, continued and vigorous coordination and rationalization of Federal statistical activities as envisioned in the Federal Reports Act of 1942 and further implemented by the Budget and Accounting Procedures Act of 1950. Every encouragement and assistance should be given to those charged with the responsibility of effectuating these acts.

It would be obvious to any reasonable person working with the various governmental agencies which deal with statistics that their personnel are characteristically conscientious, devoted to their tasks and quite openminded to advice from informed sources. A tribute to the effectiveness of their work is the growing confidence with which many series of Federal statistics are being utilized. But it would be unrealistic not to recognize certain important areas of improvement. One of the most obvious needs is the periodic availability of overall statistical measures which can be used to check interim series based on samples and data blown up from partial surveys. Such benchmarks are afforded by the various Federal censuses. These censuses should be scrupulously provided for at regular intervals and adequate provision made for their constant improvement in content and coverage and for their comprehensive analysis. These regular periodic complete censuses should be supplemented by intermediate intercensal surveys in areas where frequent check is necessary on a national scale, such as, for instance employment and housing.

I most definitely urge, also, the expanded use of advisory committees and groups representing both those who have to supply the statistical information as well as those who use the data compiled. This is essential in order to keep the statistical programs sound and assure that the statistical activities will be limited to those which produce reliable end results. Here it is important to realize that reasonably depend-able overall results may be obtained from the accumulation of subsidiary data which by themselves cannot safely be used due to weaknesses of classification. Advisory committees and groups also help to extend the understanding among the various segments of the public which they represent, of what the Government agencies are attempting to do statistically and what the resultant data really signify. Such knowledge, I believe, is already being extended to an encouraging degree through the experience which representatives of management and labor in the many areas of our economy are now receiving through their participation in existing advisory committees. Such advisory groups, too, can help to coordinate public with private statical activities and obviate duplication of effort and expense. They can help to reduce the reporting burden, improve the promptness of returns where that is essential, and help to eliminate misinterpretation.

Not the least contribution which such advisory groups can make is practical assistance in the important continual reevaluation of the various statistical series and in their prompt modification where necessary. At this point it seems desirable to warn against the deferring of such reviews and modifications until violent changes which impair or destroy comparability, become necessary. Such development of the Federal statistical programs need not necessarily increase either overall expense or reporting burden as substantial savings may readily result from the elimination of meaningless detail and from improved methods of collection.

To function effectively our Federal assemblage of statistics must be augmented as occasion requires by new series which will accurately reflect important aspects of our economic development. Some of these are, of course, already receiving current attention as incidental to the regular statistical activities of the various agencies and some are specifically provided for in the 1956 budget but it should be possible to provide further, a reasonable appropriation for statistical exploration for statistical exploration of certain facets of our economy which are not completely understood. To mention a few of these, there is first, the problem of the growth in pensions. This was alluded to in the President's report. Not only may the growth in the funds required to meet pension obligations and their investment have a profound effect on our capital structure, but much needs to be known as to the extent to which our increased productivity will support this unproductive offset. Also, I might add, we should study the effect that pension plans have on emplyment opportunties for older persons.

Speaking of pensions, they are also one of the elements of supplementary compensation, commonly referred to as fringe benefits, among others being vacation allowances, insurance, hospitalization, and the various obligatory contributions which have to be made by large classes of employers. It is now quite inaccurate to compare wage rates in various industries and localities without taking into consideration these supplementary items of compensation, and certainly any comparison of wage rates to those of the past must also reflect this relatively new aspect in this field.

Study is currently being made of measuring so-called labor productivity, or as better termed, output per man-hour. It seems to me that such a series might be of questionable value without a comparable series of the units of capital required for the increase in productivity and a series to reflect the contribution of management, including particularly technicians. Also, it appears to me quite important that when we talk about the increase in our gross national product we know not only what that means in the way of labor requirements or employment, but also know what will be needed in the way of capital investment and in managers and technicians. So, obviously much remains to be done in this entire field of productivity.

We need to have more information on the interrelationship of the various segments of the economy. Thus, we need to know what effect an increase or decrease in construction, for instance, has on dependent businesses or what effect in different areas of business changes in the activity of, let us say, the automotive industry will have. This study of such interrelationships presents exceedingly complex problems, although considerable groundwork has been done. I might add that because of the fact that the basic data for such information must be national in scope, it seems obvious that the original collections and analyses of such data must be done by Government agencies.

Finally, I think we will all quickly admit that our tax structure has a profound effect on the health of our economy. I believe that due to the absence of appropriate statistical information we are inclined to draw too broad conclusions as to where and how a tax should be imposed to produce a given revenue. But what data have we now to permit reliable conclusions as to the final impact of taxes? Who ultimately pays them and what is the end result on prices, wages, disposable income, savings, and business incentives? In conclusion, let me pay my sincere respect to the overall effectiveness of the statistical work of our Federal agencies who have been dealing with these problems, the fine spirit of public service which is evidenced by such exploratory sessions as this and the constructive cooperation of the many hundreds of individuals from all walks of life who have assisted in this work.

Certainly, all available means should be used to gain the confidence of those among the public who are the source of Federal statistics and those who utilize the resultant data directly or indirectly, and to eliminate all needless burden and expense in the gathering of these statistics.

Once a broad realization can be secured of how basic to sound government administration an adequate aggregation of reliable statistical information is, the constant backing and filling with respect to appropriations to make this essential administrative tool a good one, should no longer be the problem it has been.

Mr. Chairman, may I add a few words with respect to the items that appeared in the press with respect to the report which the Advisory Council on Federal Reports made to the Bureau of the Budget on the Census of Manufactures, particularly in view of the fact that the article which appeared on this subject in Business Week on February 5 entitled "Where the Census Goes Wrong," has been incorporated in the record of these hearings. I happen to be chairman of the council's committee on the census of manufactures, and I believe that a few words of explanation are necessary in fairness to that committee.

In the first place, the publicity given to the council's report is completely unofficial and not authorized by either the committee or the council. In that respect it suffers from a lack of a full statement of all the different conditions which had to receive consideration in the rather extended discussion which occurred between the committee and representatives of the Government agencies concerned preceding the issuance of the report. There were, of course, many differences of opinion among the committee members as to how specific improvements in the census could best be made, and even when the report was drafted a number of the members submitted reservations and qualifications. In order to simplify the presentation of the report, the members of the committee were generally willing to omit these reservations and qualifications in view of the discussions which had already been had with the Government agencies and the understanding that the report was being submitted in the usual confidential and advisory manner.

I feel sure that I am speaking for the members of the committee when I say that if they had thought for a moment that this report would receive publicity they would have insisted individually on adding qualifying comments and reservations. I am pointing out this situation so that it may be given adequate consideration when the report and the attendant publicity is being given your attention.

Representative BOLLING. Thank you very much.

Mr. Watkins?

STATEMENT OF RALPH J. WATKINS, DIRECTOR OF RESEARCH, DUN & BRADSTREET, INC., AND PRESIDENT OF THE AMERICAN STATISTICAL ASSOCIATION

Mr. WATKINS. Mr. Chairman, every citizen of our country has a vital interest in the statistical programs now being reviewed by the Joint Committee on the Economic Report and other committees of the Congress. For what is at stake can be stated very simply as the continued growth and stability of the American economy. The economic growth we attain and the economic stability we achieve over the years ahead will be the resultants of the innumerable decisions being made every day by the millions of units that make up our enterprise system and by the thousands of public agencies that make up essential elements of the framework of that system. Those decisions must be based on information, and if they are to further the twin goals of growth and stability, that information must be accurate and timely. In short, good management requires that we have good statistical records on the condition and trends of the economy, and that we have them promptly.

It is a source of satisfaction to the statisticians and economists of the country that the Joint Committee on the Economic Report has assumed a leadership role in this field of economic statistics. The pioneering work done in 1954 by the joint committee's Subcommittee on Economic Statistics represented a contribution to public understanding of the place that statistical programs occupy in our economy. The subcommittee's hearings and reports have helped bring about, I believe, a more intelligent understanding, in the Nation generally as well as within the Congress and the executive branch of the Government, of why we must have these statistical measures.

It is entirely fitting that the joint committee has assumed this role of leadership, for measurement of the economy supplies the indispensable foundation for the Economic Report of the President. Indeed, the economic programs advanced in the report could neither be conceived and formulated by the President nor appraised by the joint committee without recourse to the great mass of statistical measures of change in our economy.

It is my earnest hope that the joint committee will continue to exercise this function of leadership. It is a very much needed role.

It is similarly heartening to note that the budget of the United States Government for fiscal year 1956 carries a special analysis and recapitulation of the Federal statistical programs, in line with the recommendations of the joint committee's Subcommittee on Economic Statistics.

The programs there outlined are, I believe, sound and merit support. I have only two qualifications. I have some doubts as to whether the inter censal housing survey is adequate. I am not in a position to express any final judgment, but my recollection is that the intensive review committee contemplated a larger sample for that important survey. As a second item that is related to the budget, I note that there is still no statutory authority for the annual sample survey of manufactures. That survey has been on an ad hoc basis from year to year. I believe it should be made a regular part of the statutory census program, in line with the recommendations of the intensive review committee.

The transformations that have taken place in the American economy over the past quarter century and the profound shifts in our thinking that have occurred constitute, in my judgment, a great peaceful revolution of historic proportions. It is now taken for granted that we are committed as a people and as a government to whatever public and private actions may be required to further our progress toward the twin goals of economic growth and economic stability.

Since the end of World War II we have experienced two recessions, in 1948–49 and in 1953–54, and our institutions successfully met the test of preventing those recessions from developing into vicious spirals of credit liquidation and major depression. That success was no accident and affords renewed proof of the depth of the transformations we have achieved in our economy and in our thinking about the economy. The gain to our society represented by these transformations is of tremendous significance and is reflected in a pervasive spirit of confidence in our future. I cite just two bits of evidence: First, the great upsurge in population growth that has added 32 million people to our population since the census of 1940, that brought a baby crop of more than 4 million in 1954, and that promises to push our population above 200 million by around 1970; and second, the phenomenal record of new plant and equipment expenditures by American industry since the end of World War II of more than $200 billions. These are indeed eloquent evidences of widespread faith in the future.

The principal point I wish to stress, however, is that these transformations in our economy and in our thinking could not have occurred if we had not had a great body of statistical measures of the condition of the economy and skilled technicians to analyse those measures. The sound management of the American economy is dependent on good statistical records and on good analysis; and this dependence extends throughout our society, in private business management as well as in the administration of government.

In stressing the dependence of good management on statistical records, it is well at the same time that we seek to enter a caveat on the limitations of our statistical measurements. In the nature of the case, our measurements of the condition of the economy can only be approximations. Our economy is too massive and too complex to afford any basis for claims to perfection or certainty in our economic measures. The estimates and indexes that are carefully prepared to measure the state of the economy in terms of gross national product, national income, industrial production, employment and unemployment, and so forth, represent at any given time the best approximations the technicians can arrive at, on the basis of the information available to them at the time and on the basis of the extent of the analysis that time and funds permitted. It would be unfortunate if our widespread dependence on statistical records should lead us to accept them as representing perfection or certainty. Rather, we must recognize that these measures are not perfect, they cannot represent certainty; and the best we can claim is that these measures are reasonable approximations at the time and under the given circumstances. A corollary is that our statistical measurements of the state of the economy are subject to revision from time to time in the light of better information and on the basis of improved analysis.

I am led at this point to draw this generalization: In the dynamic American economy, there is more economic growth and more economic activity going on at any one time than can be measured at that time. Almost invariably our measurements of growth and economic activity in the country turn out to be underestimates. The reasons are fairly clear in this complex, continental economy of ours. It is an economy of unprecedented change and mobility; and since World War II it has been characterized particularly by a degree of technological change that clearly merits the term "technological revolution." The impact of rapidly developing science and technology has meant the birth of many new industries, the development of many new products, the transformation of old industries, and the stepping up of development in newer industrial areas. It is not difficult to understand, then, why it is so difficult at any one time to secure adequate measurements or estimates of all the economic activity in the country.

As an example of what I am talking about, it may be noted that for about 4 years after the end of the 1948–49 business recession, our best available measurements led us to believe that gross national product declined in that recession from peak to trough by around 5 percent and that industrial production declined from peak to trough by 18 percent. About 4 years later, when more complete information had become available and after more adequate analysis could be made, we learned the gross national product had declined only about 3 percent; that industrial production had not declined 18 percent but only about 10 percent. It is hazardous to make predictions, but my own guess would be that several years hence, when we undertake further revisions of our indexes and estimates, we will conclude that the 1953–54 recession was even a milder recession than our present measures make it out to have been.

For several reasons I feel a special interest in the statistical programs being reviewed by the Joint Committee. In a sense, these reasons add up to the perspective of a long memory. In the first place, the company that I am connected with has a tradition of more than a century—

extending back to 1841—of vital interest in facts and figures on the condition of the economy. Its basic objective has been the promotion and protection of trade through the supplying of accurate, unbiased, and timely information. Toward this same aim, the company has pioneered over the years in developing and supplying publicly statistical measures of the condition of the economy, including price indexes, vital statistics on business, births, and deaths, the record of new incorporations, statistics of business failures, and surveys of businessmen's expectations. The last-named series was initiated in response to a specific request from the Joint Committee on the Economic Report in the spring of 1947; and others of these series go back many decades.

Secondly, it was my privilege in the fall of 1953 to be named by Secretary of Commerce Weeks as chairman of the Intensive Review Committee, a group of nine men from outside the Federal Government given the task of appraising the programs of the Bureau of the Census. That experience was a great education to all who participated in it and revealed strikingly both the widespread interest in and dependence on those basic statistical programs throughout the country on the one hand; and on the other hand the fact that these programs were being neglected and that the ultimate cost of that neglect would be very seriously measured in terms of lessened economic growth and heightened economic instability. And here I want to seize the opportunity of expressing the deep appreciation of all of us who served on the committee for the splendid reception given our recommendations by both the administration and the Congress.

I come now to the third phase of the "long memory" with which I approach your tasks here. It relates to the work of the American Statistical Association, of which I am honored to be president during 1955. This association is one of the oldest of our national professional and scientific groups, having been organized in 1839 and incorporated in 1841. Its objects are—

* * * to foster in the broadest manner statistics and its applications, to promote unity and effectiveness of effort among all concerned with statistical problems, and to increase the contribution of statistics to human welfare.

Under this purpose, the association has long interested itself in the statistical programs of the Federal Government and has been called on to play significant roles under many administrations. As an example, I may cite the Committee on Government Statistics and Information Services, set up in June 1933, jointly by the association and the Social Science Research Council. That committee undertook a comprehensive review of the Government's statistical programs and made numerous recommendations for improving the standards of such work and for its better organization. Specifically, the work of this committee led to the establishment by Executive order of the Central Statistical Board in 1933 and its statutory enactment in 1935. That Board continued in existence until 1939 when by Reorganization Plan No. 1 its functions were placed in the Bureau of the Budget as the Division of Statistical Standards (later changed to Office of Statistical Standards). Over the years the Office of Statistical Standards and its predecessors have been concerned with the never-ending task of raising statistical standards, resolving differences between Federal agencies, eliminating duplication among agencies, exercising control over questionnaires and seeking to hold to a reasonable minimum the burden on respondents, and performing leadership functions in the field of statistics.

For many years the American Statistical Association has had a standing committee advisory to the Bureau of the Census. That committee has been a very active one, meeting generally 3 or 4 times a year in a 2-day session with the Director of the Census and his senior staff.

Similarly, the association has had for a number of years a standing committee advisory to the Office of Statistical Standards, meeting generally 3 or 4 times a year with the head of the Office of Statistical Standards and members of his staff.

Enough has been said to make clear the close interest of the association in the programs now before the joint committee and other committees of the Congress. There is, however, one further matter that merits some comment. This relates to the leadership role of the Office of Statistical Standards of the Bureau of the Budget, a subject on which grave concern is felt by many observers.

As noted earlier in my remarks, the precursor of this Office was set up originally as an independent agency, the Central Statistical Board. That Board functioned for about 6 years, and I believe it is fair to say that it was recognized as an outstanding Federal agency of distinctive contributions in the field of statistical coordination and leadership. For reasons that were doubtless considered good and sufficient, that Board was abolished under Executive Order No. 1 and its functions transferred to the Bureau of the Budget. In 1948 the Commission on Organization of the Executive Branch of the Government, popularly known as the first Hoover Commission, named a task force to report on Federal statistical agencies. The task force report was prepared by the National Bureau of Economic Research under the specific direction of Drs. Frederick C. Mills and Clarence D. Long. The task force reviewed the work of the statistical agencies, including what was then known as the Division of Statistical Standards of the Bureau of the Budget, as the coordinating body in the Federal statistical system. Among other recommendations the Hoover Commission task force report recommended:

> That there be maintained in the Executive Office of the President an Office of Statistical Standards and Services having general responsibility for the development and maintenance of a system of statistical intelligence and for its economical management. It should have powers necessary to the full coordination of the elements of that system, and for the enforcement of desired procedures and appropriate standards. This Office should discharge the present duties of the Division of Statistical Standards, but should have scope for greater initiative and authority appropriate to a broader role. It will seek to insure the accuracy, representativeness, timeliness of publication, and comparability with other data of all statistical series serving public purposes. The work of this Office should be largely confined to supervisory and staff functions, with a minimum of routine duties. Its personnel should include men of the highest administrative and technical competence. The head of the Office shall be appointed by the President.

The task force outlined in considerable detail and with forward-looking imagination the significant functions that would be performed by the recommended Office of Statistical Standards and Services, "subject to the direction of the President." Its status would thus have been that of an arm of the Executive Office of the President, coordinate with the Council of Economic Advisers. Among other functions recommended was that of annually summarizing and coordinating the operating expenses and appropriation requests of statistical agencies and appraising them for the benefit of the Bureau of the Budget, the President, and the Congress. Similarly, it was recommended that the Committees on Appropriations of the House and Senate and other congressional committees should request representatives of the Office of Statistical Standards and Services to testify before them concerning appropriations for statistical purposes and legislation involving statistical functions.

The Hoover Commission itself recommended that the coordinating function be continued within the Bureau of the Budget but that the Division of Statistical Standards be strengthened. Chairman Hoover and Commissioner Flemming had reservations, noting that statistical activities were "not distinctly related to the all-important purposes of the Office of the Budget," and recommending that the function be placed in the Office of General Services, under a responsible director who could be held accountable to the Executive, the Congress, and the public. In general, the Commission in its report accepted and endorsed the recommendations of its Task Force on Statistical Agencies, subject only to the stated differences of opinion with respect to the location of the coordinating function.

In summary, it may be said that both the executive and legislative branches of the Government were supplied with an exceptionally competent and comprehensive review of Federal statistical activities, and of the coordinating function in particular, by men of high standing. As the Commission noted in its report, Prof. Frederick C. Mills of Columbia University, research director for the Commission's review of statistical services, was former president of both the American Statistical Association and the American Economic Association. The associate director, Dr. Clarence D. Long, was professor of economics at Johns Hopkins University. The project had also the benefit of the counsel of an advisory committee composed of five men of national distinction. So much for the record of what was recommended to be done.

Now, how have the recommendations of the Hoover Commission and its Task Force on Statistical Agencies fared? By and large, I think we may say that those recommendations have been ignored and forgotten. Moreover, I believe the record will make clear that the coordinating and leadership function for Federal statistical programs has been neglected and starved and permitted to decline very seriously in content and prestige. Let me hasten to add that I do not intend that statement to be taken as reflecting any criticism whatever on those who have been responsible for the work of the Office of Statistical Standards of the Bureau of the Budget. They are my friends, and I have great respect for them. The difficulties are, I believe, too deep seated to justify any criticism of individuals. I do contend that the stature of this very important function of coordinating Federal statistical programs and of exercising leadership in that field has shown a marked decline; and in particular that the provision for that function in the Federal Government today is little more than a faint shadow of the structure envisioned by the Hoover Commission and its Task Force on Statistical Agencies.

Very able and conscientious men have labored to make a success of this statistical coordinating function, but despite their labors it is the widespread conviction that the function has deteriorated and that the outlook is not bright. We must therefore ask ourselves the question as to the causes of this deterioration. It is my personal view that the basic cause lies in the location of this statistical coordinating function as a subordinate unit of the Bureau of the Budget. As Chairman Hoover and Commissioner Flemming noted in the Hoover Commission report, statistical activities are "not distinctly related" to the main purposes of the Bureau of the Budget.

I would go still further and say that both on a priori grounds and on the record of the past decade and a half, there is a fundamental lack of compatibility and congeniality between the normal functions of the Bureau of the Budget and those of the Office of Statistical Standards. I would contend that the significant leadership functions outlined by the Hoover Commission task force report do not belong in the Bureau of the Budget and will never have any promise of being performed adequately so long as the statistical coordinating function remains in the Bureau of the Budget. Again, let me hasten to say that these remarks are not intended as being critical of the present officials of the Bureau of the Budget or of their predecessors. They are and have been exceptionally able and conscientious officials. It is the incompatibility and uncongeniality of functions to which I am directing these words.

I happen to know that the Director of the Bureau of the Budget in 1939 was strongly opposed to having the statistical coordinating function placed within the Bureau of the Budget, and I think for the same reasons of incompatibility and uncongeniality of function that I have referred to. Over the past decade and a half we have had a succession of very able men in the post of Director of the Budget. I have known practically all of them, and I have great respect for every one of them. At the same time, I would say that not one of them has had the basis for appreciation and sponsorship of the statistical coordinating and leadership functions, as those functions were spelled out in the Hoover Commission documents. Moreover, I believe it is unfair to expect a man who has the necessary qualifications for the directorship of the Budget Bureau to have also the basis for appreciation of and sponsoring these statistical programs. It would be equally unfair to expect the Director of the Bureau of the Budget to function also as the Chairman of the President's Council of Economic Advisers.

It is sometimes said that it would be very dangerous to remove the statistical coordinating function from the Bureau of the Budget because of the belief that the function could not survive the vicissitudes of changes in the administration and of changes in the Congress. This argument does not impress me, for I can see no merit in the mere survival of a function, particularly in a context of attenuation of the function with the threat of decline to little more than routine matters. Perhaps this statistical coordinating and leadership function cannot be carried out in a manner that will impress itself on the executive and legislative branches of the Government as a highly important function? Or perhaps the leadership within the executive and legislative branches of the Government is unable to comprehend the importance of the function, say, as outlined in the Hoover Commission documents and in the related report on the statistical agencies of the Federal Government by the National Bureau of Economic Research? If so, then it may be better to let the function die or remain in suspension until new leadership arises, or until we learn through painful experience that the function of statistical coordination and leadership is one of very serious concern to the Federal Government and to all groups in our citizenship.

If I may close with a final recommendation, it would be that the joint committee undertake a careful review of the Hoover Commission documents referred to and bring its judgment to bear on the question of the conditions under which vitality and full flowering of the statistical coordinating and leadership function might be expected to develop.

Representative BOLLING. Thank you, Mr. Watkins.

Are there questions from members of the committee to any member of the panel?

Mr. Talle.

Representative TALLE. Mr. Chairman, may I address myself for a moment to Mr. Eggert? I think you emphasized in your paper the need for recognition of the value added by distribution. There was a study made of that last year, as I remember it. Are you familiar with that study?

Mr. EGGERT. I am not familiar with the full detail. I reported on the Boston Conference for Distribution. Four or five of us joined in that. Perhaps that is the study you are referring to. At that time we still felt that this information was needed rather than it being available, and to my knowledge there is no study that I recall that really gives us the kind of information that this important field needs.

Representative TALLE. I suppose it is a matter of the full understanding of the concept of utility. The textbooks on economics say that an economic good is not fully produced until it is in the form in which it is wanted, in the place where it is wanted, at the time when it is wanted. Manufacturing, of course, illustrates form utility. It is a time utility and place utility which you contend should be properly recognized.

Mr. EGGERT. The time and place you have mentioned are primarily in this area of distribution and they do contribute tremendously to the final value of our goods. On the other hand, when you read the statistics in this area, there is just a strong emphasis upon the cost of marketing or the cost of distribution and there is constant reference to this being the cost element, and it is true that it does cost, while here in processing and production we have this value-added concept, which tends to emphasize the value side of that function, and the point I am really trying to make is that these both contribute to value added, eventual value added, as you have put it so well to the place utility.

Representative TALLE. This raises a question that has a long history. In the early days as the history of economics reveals, the merchant did not occupy a high place in society, as you know, and the Physiocrats back in 1752 put the full emphasis on agriculture as being the creative occupation.

Adam Smith took a more enlightened view. I wish to ask Mr. Veltfort about wage scales. We discussed this matter of the effect of wage rates in another panel the day Professor Harris of Harvard was here. I think the question was raised why do industries move from New England to the South, and what effect do the wage scales have on this shift. If I remember Professor Harris correctly, he contended that the wage scales had quite a little to do with it. I will have to check that, however, but the point was made that if the statistics indicate only the outright payment per hour, or payment per piece, it is not enough, because, as Mr. Veltfort pointed out, the fringe benefits may be the deciding factor.

Mr. VELTFORT. In our own industry we have made some analyses of that. It is interesting to note the opposite variation of direct wages as against supplementary compensation.

A high wage industry may not have as high supplementary compensation, and vice versa. The two may balance combined, where there might be quite a bit of unbalance in either of those two categories.

Mr. TEPER. Sir, I would like to make a comment on this point. There is no question that we need studies of fringe benefits. I would like to draw attention, however, that it is very difficult to measure the current worth of some fringe benefits; pensions are one of those.

As textbooks on actuarial aspects of pensions indicate, there are many different ways of funding a given pension, each resulting in substantially different current costs. There is no uniformity in this field. There is no uniformity of formulas used by actuaries in computing such cost. It is definitely an area to be studied, but the figures now available, such as the figures produced by the United States Chamber of Commerce on the fringe benefits, must be taken with a great deal of salt.

Representative TALLE. I was thinking of Adam Smith when you mentioned how people beyond 45 do not like to leave the place where they are living. I think he puts it this way. "Human beings are, of all baggage, the most difficult to transport." Henry Ford and some other people have modified that. Mobility of labor is certainly very much increased, but nevertheless inertia does settle down on people more heavily after middle age begins. They do not like to leave their happy homes.

Finally, I want to thank all of you for your contributions. This has been a splendid discussion and I am delighted to find so much interest in the subject, including the interest shown by the audience.

A multiplication table is not highly romantic, and neither are statistics. To find so many people present for this hearing is certainly very encouraging. It is most worth while for the Government, Congress and the executive agencies of Government, and representatives of business and labor, and highly specialized students come together to discuss and cooperate in improving something so important as statistics. There is no substitute for this kind of knowledge.

Representative BOLLING. Thank you, Mr. Talle.

Mr. Kelley.

Representative KELLEY. I have nothing except one remark, and that is that I hope and wish that the Congress could provide adequate funds, especially for the Bureau of Labor Statistics which has been crippled in the past, therefore information it provides I feel is quite inadequate. It is not sufficient. There is a great need for that. That is all.

Representative BOLLING. Does any member of the panel wish to make any further comment?

Mr. Eggert.

Mr. EGGERT. Mr. Chairman, I realize the hour is very late, but I thought perhaps the members of the committee would be interested in some charts which illustrate the use of statistics on the part of the

Ford Motor Co. and the way that we use them, and I believe at this late date all I request is that they be inserted in the record, if agreeable.

Representative BOLLING. Without objection, that will be done.

(The charts referred to appear at p. —.)

I have one question that I would like to ask each member of the panel to comment on. You are all familiar with the level of statistical appropriations recommended in the President's budget. I believe the figure is $43.4 million. I would like to get a statement from each member of the panel as to whether he individually supports at least that level of expenditure in the appropriation for fiscal year 1956.

Mr. EGGERT. For the Chamber of Commerce, I would say we support at least that figure.

Mr. HOADLEY. I would concur.

Mr. REED. I would, too.

Mr. RUML. Yes.

Mr. TEPER. I believe so, too.

Mr. VELTFORT. Yes.

Mr. WATKINS. Yes.

Representative BOLLING. Without objection, I would like permission to insert at the conclusion of today's record miscellaneous material which has accumulated over the period of the hearings.

On behalf of the committee and on behalf of the subcommittee in particular, I would like to express our appreciation for your participating in what we all consider a very interesting panel.

The committee is adjourned.

(The supplementary material referred to and the extended statements of the panel follow:)

[H. Rept. 2628, 83d Cong., 2d sess.]

REPORT OF THE JOINT COMMITTEE ON THE ECONOMIC REPORT

The following progress report to the Joint Committee on the Economic Report was prepared by the Subcommittee on Economic Statistics, composed of Representative Henry O. Talle, chairman, Senator Frank Carlson, and Representative Richard Bolling. The unanimous report from the subcommittee was submitted on July 30, 1954, and approved for transmittal to the Congress by the full committee on August 5, 1954. The report, and additional findings by the subcommittee, will be given further consideration by the full committee in connection with its report on the 1955 Economic Report of the President.

PROGRESS REPORT OF THE SUBCOMMITTEE ON ECONOMIC STATISTICS, JULY 30, 1954

The Subcommittee on Economic Statistics of the Joint Economic Committee, appointed April 16, 1954, pursuant to the recommendation contained in the committee's report of last February (H. Rept. 1256), has completed exploratory hearings and presents the following progress report.

In its exploratory hearings and deliberations the subcommittee had a twofold objective: It wished to obtain a representative picture of the needs for economic statistics, both within the Government and among its citizens, and it sought suggestions for improvements in the Nation's statistics. Inasmuch as the subcommittee is concerned with Federal economic statistics as a whole, it hopes to find means for improvement not only in particular statistical activities and series but even more in the relationships among them.

Exploratory hearings by the subcommittee July 12 and 13

Great care was exerted in planning the hearings held by the subcommittee July 12 and 13. The subcommittee and staff contacted many organizations and individuals in preparing the agenda and selecting the witnesses. The subcommittee wanted a factual statement outlining present programs and recommendations of the appropriate executive Government agencies. It also wanted the views of the users of Federal economic statistics. In all cases the witnesses were asked to submit written statements in advance. The printed hearings are now available to those interested. The 360 pages of testimony provide a storehouse of information on present statistical programs and the statistical needs of our economy.

The subcommittee first heard from the Assistant Director of the Bureau of the Budget, who submitted a detailed statement on the statistical resources of the Federal Government. The statement lists the Federal agencies that produce economic statistics, the major series provided, and information on the Federal funds devoted to statistical work. An important section of the Bureau's statement outlines the steps needed, in its judgment, to improve the statistical services of the Federal Government. The statement discusses certain basic needs which exist in connection with many statistical series and makes recommendations for improvement of statistics in individual subject fields.

Included as appendixes to the Bureau's statement are memorandums prepared by staff members of the Bureau's Office of Statistical Standards which give additional information on the major needs for improvement of statistics within the individual staff member's field of assignment and review. The principal data-collecting and data-analyzing agencies of the Federal Government also submitted opinions which were included in the appendix to the Bureau's statement.

The chairman of the Council of Economic Advisers appeared before the subcommittee to present a statement on the statistical needs of the Council in assisting the President to appraise economic trends and formulate economic policies in the executive branch. The Council's statement emphasizes the need for (1) more prompt and frequent reporting; (2) improvements in existing data; (3) improvements in presentation; and (4) filling gaps in existing information.

The second day of hearings was devoted to a panel discussion with 12 distinguished users of economic statistics representative of or covering the following fields: industry, labor, finance, food and agriculture, consumer finances, State and local government, foreign economics, construction, savings and investment, and retail trade. Each expert presented his observations with respect to (1) the statements of the Bureau of the Budget and the Council of Economic Advisers (these statements were supplied to the panel members several days in advance of the hearings); (2) the general concept of an overall system of economic statistics; (3) significant weaknesses in major existing statistical series as to concepts, accuracy, timing, collections, procedures, and the like; (4) gaps in the Nation's economic statistics and suggestions for closing those gaps; and (5) the kind of statistics and other economic information specifically needed in analyzing the economic plans and expectations of consumers, government and business.

In addition to the non-Government panel, representatives of the major statistics-producing and coordinating agencies of the Federal Government participated in the roundtable discussions which followed.

Other individuals and organizations submitted written statements or observations which were incorporated in the printed hearings.

Preliminary findings and recommendations of the subcommittee

Perhaps the greatest single need for improvement is the further integration of Federal statistical activities into a more closely knit and hence more useful statistical system. The Nation is entitled to an intermeshed and smoothly working statistical mechanism which is completely objective, impartial, and staffed by technical personnel of the highest competence.

The subcommittee has received many suggestions for significant statistical improvements. In this short time it has not been possible to evaluate all of this testimony and to prepare a complete list of needed improvements. We wish to summarize, however, major findings and recommendations which have resulted from the work so far, and to indicate plans of the subcommittee for the balance of this year:

1. *Private economic interests and Government policymakers require an increasing quantity and improved quality of economic statistics.*—In its hearings the subcommittee was informed of the statistical needs of some of the important users of Federal data. It hopes to extend its knowledge in this field. A major impediment to statistical development has been the general lack of a clear understanding particularly by the Congress, of the ways in which statistics are used in Government and in private affairs. The subcommittee is considering the preparation of a factual statement, as comprehensive and precise as possible, of the uses made of statistics and setting forth needs of Government and private enterprise—business, agriculture and labor—for additional statistical data. Statistics are used not only for administrative and operating purposes, but also as necessary aids in

promoting high-level employment, economic stability and growth. The proposed statement would include interpretation of the data needs of those engaged in research on business fluctuations and on the development of economic science.

It is clear that intelligent economic judgments can only be made on the basis of adequate factual information. The private enterprise system rightly looks to Government for such facts. Only the Federal Government can assemble and publish the array of economic statistics needed. The Congress, State and local legislative bodies, and public administrators in all levels of government must have improved economic statistics. Programs for national security, taxation, agriculture, housing, schools, highways and virtually every activity of government depend, in both formulation and execution, on the knowledge and use of economic statistics. In today's complex world hundreds of millions of dollars may be involved in the trend of a single statistical series. Wage rates and agricultural support payments are but two examples. Statistics are also needed in the everyday activities of the small, or average, consumer, farmer, businessman, laborer and researcher, some of whom may not even be aware of the uses they make of statistics or the needs they have for them.

The subcommittee notes particularly the needs of the Joint Committee on the Economic Report for improved information on the economic outlook. Knowledge of and the relations between and among the plans, programs, and expectations of consumers, businesses, and governments are necessary in appraising the overall outlook and in considering appropriate economic policy measures. Constant attention and study should be given to statistics which may be particularly useful in indicating changing economic trends, although our dynamic economy does not permit reliance on such statistics alone for predicting future economic conditions.

Speed in gathering and disseminating economic information is another important need, not only of this committee but of policymakers generally.

2. *The principal stumbling block to providing an adequate economic statistical program is the lack of financial support.*—The primary responsibility for this support rests with the Congress, but the executive branch has the responsibility for providing strong leadership. The subcommittee realizes the importance of economy in Government, and it appreciates the need for carefully screening requests for statistical improvements, and for efficiently planning statistical programs to avoid duplication of effort, harassment of suppliers of data, as well as waste and extravagance generally. At the same time in the light of the need for adequate statistics, past economies have gone too far. Increases are necessary, well justified, and will pay dividends to the economy—and in so doing to the Federal Treasury.

3. *Administrative agencies which produce statistics as a byproduct should be sncouraged to recognize their obligations to the statistical system.*—A major part of the available economic statistics results from the administration of such governmental functions as tax collection, the regulation of railroads and banks, and the processing of claims for unemployment insurance. These "administrative statistics" cost relatively little because their production is incidental. The wide dependence upon them is one of the principal reasons for the extreme decentralization that characterizes Federal statistical organization. The subcommittee is gratified that such administrative agencies as the Internal Revenue Service and the Bureau of Old-Age and Survivors Insurance are now providing "benchmarks" for statistical series produced in other agencies, thus hastening the creation of an integrated statistical system in which figures from many separate sources may be fitted together. There is need, however, for more rapid processing and releasing of the data.

4. *Greater emphasis on the development of an overall program of economic statistics by the executive branch of the Government is needed.*—To fit together the economic statistics produced by different Federal agencies so that their aggregate constitutes an integrated system requires a strong and aggressive coordinating unit. The Federal Reports Act of 1942, together with the Budget and Accounting Procedures Act of 1950, provide the necessary legislative authority for this purpose. In particular the second of these acts places the major responsibility for formulating a coordinated statistical program in the President, acting through the Director of the Bureau of the Budget. It is essential for users of statistics, such as the Council of Economic Advisers, to make known their needs. It is especially important for the Council of Economic Advisers to give adequate and appropriate support within the executive family, and in relations with the Congress, to meeting those needs. This support should also take the form of setting forth specifications and providing technical assistance in the development of programs. The heads of major Federal statistical-producing agencies have much to contribute in designing and executing an integrated statistical system. AdministrateiA machinery should insure that these talents are fully utilized.

However, the final responsibility for assessing the relative importance of many different uses, and for developing an orderly and well-rounded system, and for deciding where in that system the statistical implementation can most effectively and efficiently be carried out, is fixed in the Office of Statistical Standards in the Bureau of the Budget to which this authority is delegated. The progress made in the last 20 years in developing an integrated set of economic statistics under the leadership of the Central Statistical Board and its successor, the Office of Statistical Standards, has been substantial and is to be commended. Nevertheless, it is clear the need to achieve and maintain statistical integration in an adequate and complete system still exists. This is a responsibility of the executive branch of the Government.

5. *More attention should be given by Federal agencies to studying concepts and methods of operation, and to setting forth the limitations of the data appearing in their published reports.*—Complete precision in statistics is probably unattainable and the subcommittee is well aware that there is always a margin of uncertainty attached to statistical results. Its only concern is that adequate steps be taken to measure this lack of precision and to acquaint the user of data with its nature and extent. Relatively greater expenditure of effort and funds needs to be directed by a majority of Federal statistical agencies to an examination and analysis of the built-in limitations upon their findings and the degree of reliability that can be placed upon them.

6. *A section on economic statistics should be included in the President's annual budget and more consideration given to an adequate economic statistics program in the President's Economic Report.*—The various statistical programs of the executive agencies and their costs should be brought together and discussed. Proposed changes in these programs and their relation to the overall Federal statistical system should be pointed out.

The program presented next January should be prepared after careful appraisal of suggestions received by this subcommittee and incorporated in the published hearings. The subcommittee hopes that the various statistical advisory committees to Federal agencies will be asked to review these hearings and that the President's program submitted next January will represent a big step forward in the development of a realistic and adequate economic statistical system.

7. *The subcommittee recommends that the full committee devote one panel session to economic statistics at its hearings next year, preliminary to submitting its own report to the Congress on March 1.*—This would provide opportunity for review of the statistical program submitted in the President's budget and Economic Report. It would equip this committee and subcommittee to be an effective voice in congressional consideration of programs in the next session of the Congress.

8. *Adequate and timely benchmark data from regular censuses of agriculture, business, manufactures, minerals, and State and local government are desperately needed.*—The census data are the foundation of an adequate program of economic statistics. Economists and statisticians recognize that current economic data based on samples and spot studies must be corrected periodically by the use of censuses if they are to maintain their accuracy. Thus, these benchmark statistics have much more significance than just their contribution to historical research. All necessary steps should be taken by the executive branch and the Congress to carry out the census programs as scheduled. We emphasize to administrative agencies the need for speeding up the availability of such data.

9. *The Federal Reserve System might well expand its statistical collection and analysis programs where it has special interest and competence.*—The subcommittee is requesting the Federal Reserve to explore, in cooperation with executive agencies, the adequacy of present statistics in three basic areas: (1) Inventories, (2) savings, and (3) consumer and business expectations. This request includes a thorough review of, and basic research into, concepts, existing data, sources and procedure for improving these statistics.

10. *The staff is directed to proceed with the revision of economic indicators.*—The suggestions submitted by some 50 subscribers (incorporated in the printed hearings) will be reviewed for possible adoption but complying with the generally expressed desire to maintain the present basic format and contents.

11. *The committee staff is directed to keep the subcommittee informed of progress on revisions and improvements underway or proposed.*—The subcommittee is particularly interested in the implementation given the recommendations for improvement in labor force, employment and unemployment statistics contained in the committee's February report (H. Rept. 1256) and in construction statistics.

Representative HENRY O. TALLE, Iowa, *Chairman*,
Representative RICHARD BOLLING, Missouri,
Senator FRANK CARLSON, Kansas,
Subcommittee on Economic Statistics.

[Press release of Wednesday, February 9, 1955]

EXECUTIVE OFFICE OF THE PRESIDENT,
BUREAU OF THE BUDGET,
Washington 25, D. C.

STATEMENT OF DONALD R. BELCHER, ASSISTANT DIRECTOR, BUREAU OF THE BUDGET

Mr. Chairman and members of the committee, responding to the request of this committee, I am happy to present the following statement in regard to provisions made in the 1956 budget for the improvement of economic statistics by various agencies of the Federal Government.

A sound and balanced statistical system is a primary requirement for sound administrative policies. This is true as regards the decisions and actions of the Federal Government itself, both legislative and executive. It is equally true in the fields of private enterprise—agriculture, business, and labor. The needs for accurate and prompt knowledge of the ebbs and flows in all major areas of our economic life require improvement and strengthening of our basic system of statistical intelligence.

Such a system of statistical intelligence may be viewed as consisting of two more or less distinguishable categories. The first may be called the overall analysis of the economic situation, and is typified by national product and income accounts, indexes of production, trends of employment and unemployment, earnings of all manufacturing corporations, and the volume of business investment. The second category, or specialized analysis, is comprised of such data as production of individual crops, production by selected manufacturing industries, price movements of individual commodities, and employment and unemployment by specific industries and localities. To appraise the overall movements of the economy it is necessary to study the several parts, but the parts themselves cannot be competently interpreted without reference to the general framework of the economy as a whole.

As agencies of the Federal Government undertake to respond to legitimate demands for more and better economic statistics, it is of primary importance that proper balance be preserved, not only between the general and the specific, but also within each of these broad categories. It has long been and is now the objective of the Bureau of the Budget, in formulating appropriation recommendations to the President each year for inclusion in his annual budget, to do all in its power to strengthen the statistical system and at the same time to maintain that proper balance.

As I said to your subcommittee last July, the Office of Statistical Standards within the Budget Bureau draws on all available sources in formulating its judgment as to what the statistical program of the Government should be. In preparing the 1956 budget, we have been greatly influenced by the testimony given last July by experts both within and outside the Federal Government, as well as by recommendations contained in the progress report of the subcommittee under date of July 30, 1954. The 1956 budget contains provision for a major expansion in many statistical programs.

This year, for the first time and in response to the request of your subcommittee, the budget document contains on pages 1203–1204 a special analysis of Federal economic statistical programs. It shows that, for the major current statistical programs, the President has recommended the amount of $32.2 million for fiscal 1956, as compared with estimated expenditures of $27.4 million in the current year, or an increase of $4.8 million.

I believe it desirable that this special analysis be incorporated in the record before this committee, and accordingly I shall not undertake to repeat all of the detail therein contained. Provision for a number of periodic census programs (namely, the censuses of agriculture, business, manufactures, and mineral industries) was made, in large part, by appropriations of $24.4 million in fiscal 1955. The 1956 budget includes the $10.7 million required for their completion, plus $500,000 for an intercensal housing survey. With regard to the current statistical programs, however, it may be helpful if I comment on some of them in fairly broad terms.

MANPOWER

An appreciable strengthening of statistics in the field of manpower seems called for, both to improve our overall understanding of the economic situation as it affects employment and also to support the Secretary of Labor in developing his programs.

We have been particularly impressed that, in the area of employment and unemployment statistics where we have some of our most detailed statistics, there is a need for still more detail, precision, and sensitivity to short-run changes in the economy. We are, therefore, recommending a doubling of the current population survey sample to provide better and more detailed information on the labor force, employment, and unemployment. Some funds for reseaech and improvement of these series are also included.

The monthly indicator of the number of the unemployed needs to be supplemented by additional information on the characteristics of those who are presently without jobs—who are they, where are they, how long have they been without work, and whether their joblessness is due to seasonal or cyclical factors. To provide this information we have indorsed the request of the Secretary of Labor for funds to study the present problems of chronic area and industry unemployment, frictional unemployment, characteristics of the jobless, and the structural changes in the labor force lying behind these current patterns. It is desirable also to survey the employment and unemployment of the labor force in selected industrial areas each year, using the same techniques now used for the national estimates of unemployment, with the Secretary of Labor choosing the areas in response to the needs of the current situation.

To round out the national and area picture, figures are needed in more detail and with greater accuracy regarding factory labor turnover rates—accessions, quits, discharges, layoffs, and the like; as well as greater detail and more accurate information on employment trends in that growing segment of our economy, the service trades. We propose to add also to the detail we now have on employment, hours, and earnings by industries by cooperating with the States in the preparation of such series in some 14 additional metropolitan areas.

For many years the Occupational Outlook Handbook of the Department of Labor has been one of the most important tools available to schools, employment offices, and others interested in vocational guidance from the point of view of labor market opportunities. The last edition is now seriously out of date. To keep this valuable handbook in tune with the times, we are recommending that a regular program of revision be begun in 1956.

We are also providing for some extension of the industry and community wage surveys and for expansion of statistics on industrial accidents to increase their usefulness in promoting safety.

PRICES

There have been major revisions of the Wholesale Price Index and the Consumers' Price Index since 1950. We feel, and your panel of last summer seemed to share this feeling, that these economic series meet fairly well the usual needs. However, there is now a modest provision in the Bureau of Labor Statistics appropriation for continued research to which we can look for continual review.

Weights for the index of prices paid by farmers are based on data relating to farm family expenditures in 1937–41. A survey of farmers' expenditures is provided in the Department of Agriculture budget for 1956. This survey will collect data on the current pattern of expenditures and supply the information needed in reviewing the weights for this index. In addition to this use, the survey will also provide much better information for computing net farm income—a significant figure for appraising the condition of agriculture and, of course, an important component in other national aggregates.

FINANCIAL, NATIONAL INCOME AND GOVERNMENTS

In the area of current business statistics, provision is made for expanding the financial reports program, conducted jointly by the Federal Trade Commission and the Securities and Exchange Commission, to include mining and wholesale and retail trade corporations, and to provide preliminary estimates of the quarterly net income of the corporations covered. Increases are requested also to improve the savings estimates, to permit a special study of plant and equipment expenditure estimates to determine what factors are responsible for differences between anticipated expenditures and actual expenditures for the same period, and for a study of the problems related to the collection of current financial statistics covering unincorporated business.

Improvements in the accuracy of our national income and product estimates will be facilitated by the projects included in this year's budget request. In particular, provision is made for incorporating in those estimates the reliable comprehensive data which will become available in the Census of Business and

Manufactures for 1954, and statistical tabulations by the Internal Revenue Service for the same year. Through integration with the FTC-SEC financial reporting program noted above, the national income work will utilize data from that program without the expense and burden of special collection. Planning for improvements in our inventory and manufactures sales estimates is also provided in the budget increases.

Provision is being made in the Bureau of Census budget to expand the present sample survey of State and local government finances so that estimates of revenues, expenditures, and debt can be obtained on a State-by-State basis. Such information is needed in dealing with the problems of intergovernmental relations and will also facilitate the taking of the 1957 Census of Governments.

PRODUCTION AND DISTRIBUTION

The importance of accurate current information on production and distribution of both agricultural and industrial products cannot be overemphasized. The development of a research program to improve crop and livestock estimating methods was initiated in fiscal 1954 and a start on its gradual expansion to cover an increased number of crops and additional sections of the country is provided for in this budget. In addition, provision is made for expansion of marketing research directed toward improved product quality and improved efficiency in the marketing of agricultural products. Such research serves as a basis for more intelligent decisions regarding assembly, storage, processing, and distribution of farm products. Increased attention will also be given to research designed to provide data on changes in farming called for in different farming areas in view of prospective prices, costs, and other conditions.

Continuation of annual sample surveys of manufacturing and retail trade during the years between the quinquennial Censuses of Manufactures and Trade was recommended by the Secretary of Commerce's Intensive Review Committee. While such a survey covering 1954 was not needed in view of the major censuses covering these areas, the 1956 budget provides for a resumption.

CONSTRUCTION AND HOUSING

Statistics on construction and housing are generally regarded as critically inadequate. The Bureau of Labor Statistics series on the number of new nonfarm dwelling units started was revised last year and is now as firm as it can be made with the techniques and data available from present resources. However, it does not include farmhouses and its coverage of nonfarm houses in rural areas is weak.

The series on expenditures for new construction of all types, for which BLS in the Department of Labor and BDSA in the Department of Commerce are jointly responsible, is seriously deficient. The BDSA budget contains funds for a program which will make substantial improvements in these data next year. As a byproduct of the surveys planned to collect data on nonresidential construction, the deficiencies in the housing starts series for rural areas which I just mentioned will be largely corrected.

One phase of construction activity on which we have had no reliable data has to do with the volume of expenditures for alterations, repair, and modernization. Last year the Bureau of the Census made a small survey which tended to show that such expenditures by homeowners alone were much higher than was previously believed, approaching in fact the expenditures for new homes. Census and BDSA are now doing similar preliminary work on commercial properties. The BDSA budget contains funds for the regular and continuing collection of data on the volume of such activity on all types of properties.

The last housing census was taken in the spring of 1950. Additions to the housing supply through new construction are being made at an unprecedented level since 1949—well over a million units a year. However, lacking current measures of such quantitative factors as demolition and conversions and such qualitative factors as fixup and modernization, the Census budget contemplates an intercensal housing inventory, to be taken in 1956 on a sample basis. This will provide much needed information on the effect of all of these forces on the amount and quality of the Nation's housing supply. Data on residential vacancies will be provided periodically by a program supported by funds in the BDSA budget.

The three programs I have just mentioned—new construction, alterations and repairs, and the housing and vacancy surveys—account dollarwise for 85 percent of the improvement in the statistical program for this area. The rest of the program provides for surveys and studies by BDSA and BLS of building materials and labor requirements for construction, and characteristics of new houses being built, and the organization and structure of the homebuilding industry.

All of the programs in this area are recurring and should be continued annually, except the Census housing survey which would be repeated during the period between decennial censuses only as conditions warrant. I should mention also that the studies of materials and labor requirements would cover selected types of construction on a rotating basis so that these requirements for all types of construction would be covered about every 5 years.

POPULATION AND VITAL STATISTICS

During the past few years the processing of certificates of births and other vital events and publication of the annual compendium of final data have lagged far behind desirable goals. An increase in funds for the fiscal year 1956 will enable the National Office of Vital Statistics to recapture lost ground in approximating an optimum schedule for the publication of vital statistics of the United States.

CONCLUSION

In its report of last July, your subcommittee put great emphasis on the needs of private economic interests and of Government policymakers for increasing quantity and improved quality of economic statistics, and pointed out the essential and unique role which the Federal Government must take in helping to satisfy that need.

I believe that viewpoint has widespread acceptance in our Government. Despite budgetary limitations, our statistical agencies have long been in the forefront of new statistical methods and their output over the years has shown great overall improvement, both in coverage and in quality.

For fiscal 1956, the President has recommended appropriations to the several agencies which, in addition to completing the special censuses already underway, will provide for expansion of $4.8 million, or about one-sixth, in present levels for the current statistical programs. This contemplates, not only general strengthening throughout the statistical system but, in particular, marked increases in the fields of manpower and construction statistics where the need for more and better economic information is most generally recognized. The increases are all directed at known weaknesses or gaps in existing statistics and will measurably improve our economic intelligence. In the two fields of major increases, I am convinced that the expanded programs will raise the entire level of accuracy and detail, and correct major deficiencies disclosed during the postwar period.

I want to thank you for your attention and again express appreciation for the opportunity of appearing before this committee.

Statement of Walter E. Hoadley, Jr., Treasurer, Armstrong Cork Co., Lancaster, Pa., on Economic Statistics

One of the most significant developments affecting both private and public decision making in recent years has been the growing use of economic statistics. Moreover, at the present time there is noticeable interest in business in still more adequate economic information. This interest arises, first because of concern over the adequacy of many present Federal economic statistics now being used as a basis for important public-policy decisions, and second, because of the recognized need for more satisfactory economic data to help guide future business planning, which has obvious implications for the entire economy.

The interest of this committee in economic statistics, as evidenced in the hearing today as well as in several previous activities, plus the new feature in the budget message drawing specific attention for the first time to the Federal program in economic statistics are commendable developments. It is encouraging to know that at long last important Federal economic statistics which now influence critical policy decisions by leaders in government, business, labor, and agriculture have achieved sufficient official recognition to be considered worthy of separate study and analysis.

The Economic Report states "Economic statistics are now closely scrutinized and widely commented upon by men and women in different walks of life" (p. 65). Such a statement would have been far less true 5 years ago and certainly would have had considerably less meaning 25 years ago. Nevertheless, the words "closely scrutinized" just quoted certainly must be intended to mean "read" or "scanned" rather than carefully appraised. Detailed analysis of many economic statistics provided by Government would disclose to almost anyone major deficiencies which are neither widely known nor understood. There has been a definite advance in economic literacy but Government figures, all too often, are being accepted as "official" and hence seemingly almost by definition "precisely accurate." Government, therefore, has increasing responsibility for greater accuracy and reliability of its economic statistics as their use continues to grow.

Just as more extensive and precise measurement devices have become a necessary part of increasingly complex industrial machinery, there is increased need for more comprehensive and accurate measures of what the Economic Report has termed "our complex and industrialized society." I wholeheartedly endorse the "basic economic tenets" or guides to policy outlined in the Economic Report, and particularly the first proposition that "competitive markets, rather than Government directives, are as a rule the most efficient instruments for organizing production and consumption." The important—at times dominant—role of Government in current and future economic life, however, can never be minimized, and particularly by the management of any business enterprise. Forecasting what policies Government will adopt and pursue, frankly, has become one of the most critical aspects of business planning. Is it any wonder that business managements have become vitally concerned about the quality and availability of economic statistics provided and used by Government in making and administering public policies?

In my opinion, one of the greatest risks facing business organizations today is to be found in possible unsound public policies—both as to scope and timing—simply because those in authority may not have adequate or trustworthy information available upon which to base their judgments. Let me illustrate this point with regard to home-building activity.

As everyone here today knows, the postwar building boom continues with renewed vigor, despite many earlier and some current fears of an imminent collapse. Because of favorable congressional action 2 years ago, it is now possible to know with considerably reliability from reports of the Bureau of Labor Statistics how many new nonfarm homes are being started each month. But what information is now available to indicate the extent to which housing needs and demands are being met?

What significance is to be attached to current reports by the Bureau of Labor Statistics that nonfarm housing starts are at an annual rate of over 1,400,000 while new households, as estimated by the Bureau of the Census, are now less than 800,000 per year? Is the new home-building industry and hence the Nation facing serious trouble? Is credit too easy? In many respects, the key to future new home building lies in the vacancy rate and in the trend of value of older homes. Yet, almost no trustworthy information on either subject is now available. This should be a matter of grave concern for Government which has a great influence upon, as well as stake in, housing. How present housing laws and credit policies can be properly administered in the face of these statistical deficiencies is at least a very open question to me.

The highly fragmentary and until very recently almost complete absence of information on the important and quite evidently expanding home fix-up (i. e., repair and modernization) market unquestionably causes undue emphasis on new homes in public policies pertaining to residential construction. Until the size and characteristics of the fix-up market become known, it is hardly reasonable to expect that any well-conceived program to develop this market will emerge. Yet, expanded fix-up work probably offers the greatest single opportunity to stabilize the vast but always vulnerable new home-building industry.

Anyone who investigates the quality of the information now being released by Government on nonresidential construction activity knows the deplorable inadequacy of many current estimates. When it is recognized that these deficiencies are transmitted directly into the national product statistics, there is serious reason to question whether the latter figures—widely used for public and private policy purposes—in any real sense are accurately measuring the course of general business.

These observations on the inadequacy of many Federal construction statistics, of course, should not be interpreted to mean that all Government construction data are bad or that the statisticians preparing them are incompetent. The plain fact is that the current statistical program simply cannot meet the policy requirements of the dynamic and farflung construction field in 1955 and 1956.

The expanded statistics program proposed in the President's budget message,[1] if adopted, will eliminate some of the most serious statistical gaps and deficiencies in construction mentioned here by providing additional funds for the Business and Defense Services Administration, the Bureau of Labor Statistics, and the Bureau of the Census. The new program also will provide badly needed benchmark information as well as up-to-date facts on labor and material requirements in construction and make available an answer to many heated questions concerning whether large or small builders are making the most progress and what types of homes are in greatest demand.

One other phase of Federal economic statistics, namely, industrial classification, merits at least passing attention. This problem is highly important to the extent that the United States census of manufactures uses inexact or incomplete definitions of industries. Scrambled or overlapping industry data, moreover, often used by Government and others to measure productivity or so-called concentration ratios obviously are misleading when applied to any specific industry or industry group.

It would seem highly essential that tabulation procedures for the 1954 census of manufactures take full cognizance of this industrial classification problem. Moreover, before any future census of manufactures is undertaken, further careful consideration should be given to the report of the Watkins "Intensive Review" Committee which studies the entire census program last year as well as to the recommendations of a subsequently appointed subcommittee of the Advisory Council on Federal Reports.

Business needs for economic statistics clearly are mounting in order to help insure future stability and growth of individual enterprises and hence the country as a whole. Many—perhaps most—business organizations with which I am familiar accept the responsibility to provide their own detailed, market-type statistics, but they properly look to Government for broad statistical information essential to sound policies and necessary as benchmarks for private business planning.

In conclusion, let me again stress the importance of the Federal Government's current and proposed economics statistics program for both public and private policymaking purposes. I have only cited two illustrations of areas requiring prompt statistical improvement in the public interest. Others have been mentioned in earlier hearings before this committee and no doubt will receive attention today. Major corrections in Government economic statistics can be achieved provided the program summarized in the budget message receives favorable action by the Congress. In my opinion, the program warrants very serious consideration and approval.

Statement of Robert J. Eggert for the Chamber of Commerce of the United States with Respect to Economic Statistics

My name is Robert J. Eggert. I am marketing research manager, Ford division, Ford Motor Co., and a member of the committee on business statistics, Chamber of Commerce of the United States.

The chamber is gratified that the joint committee is devoting this panel to economic statistics. The various statistical programs, lodged in some dozen agencies, can thus be compared and evaluated. We also appreciate the special analysis of economic statistics in the 1956 budget. The analysis greatly facilitates evaluation of the government's statistical program.

We hope that panel discussions such as these, and the special budget analysis, both recommended in the July 30, 1954, Progress Report of the Subcommittee on Economic Statistics, will be repeated each year. They should aid materially in improving Government statistics.

Business needs prompt and accurate statistics for day-to-day and long-range planning. Government also needs these statistics for the same reasons.

In most cases, poor statistics are worse than no statistics. Poor or inadequate statistics can be highly misleading and even dangerous. So the Government should make every effort to improve the quality and adequacy of its statistical reporting. While there is great demand for new statistics and new statistical programs, any new series should not be launched at the expense of essential existing series.

We have seen instances where private statistical reports differ from Government reports, although covering the same statistical ground. We have seen how

[1] Special Analysis I—Federal Economic Statistical Programs—Budget of the United States Government for the Fiscal Year Ending June 30, 1956 (pp. 1203–1204).

several Government bureaus reporting on the same, or closely similar economic activities, have reported conflicting and divergent trends.

For this reason, we hope this joint committee will make every effort to encourage the qualitative improvement of the Government's statistical work.

At the same time, in our dynamic economy there are bound to be needs for statistical pioneering, and we welcome the work of the joint committee in this respect.

We endorse President Eisenhower's budget message statement: "We do not have all the statistical information required in our dynamic economy. I am therefore recommending a governmentwide effort to improve statistics in those areas where our work has been most handicapped by incomplete information."

The chamber, believing that Government spending today means a tax burden approaching the highest level in our history, has repeatedly urged that all Government activities not strictly essential be treated as luxuries and reduced accordingly.

Recognizing the vital importance to our whole national economy of accurate, prompt, and usable statistics, however, the chamber has supported not only the regular censuses, but has also recognized that the censuses should be supplemented by the collection of current statistics as needed, with the national interest being the criterion of need.

Total estimated Federal expenditures for statistical programs drop from $51.8 million in fiscal 1955 to $43.4 million in fiscal 1956.

The periodic census programs, which the chamber supported vigorously last year, are estimated to cost $24.4 million in fiscal 1955, but the budget request drops to $11.2 million in fiscal 1956—reflecting the relatively small amount of work remaining to complete these censuses.

Current statistical programs, including those related to employment, unemployment, wages, prices, construction, housing, population, national income, and other subjects are estimated to cost $27.4 million in fiscal 1955. Several of these programs would be improved under the 1956 budget, with the total amounts requested rising to $32.2 million.

I now would like to mention some of the most needed improvements in Government statistics.

Unemployment and employment data.—One of the most important Government statistics is the number of unemployed. It is sometimes termed a "statistical trigger." When unemployment rises, demands are made for the Government to initiate recover programs.

The Bureau of the Census now makes a monthly estimate of unemployment, broken down by sex, age, color, and duration of unemployment. This helps characterize the total number of unemployed, but does not tell where the unemployed are located, and their usual or previous occupations. The Bureau of Employment Security collects weekly information regarding the recipients of unemployment compensation, yet these two series are not collated into one unemployment figure.

The Bureau of Labor Statistics publishes monthly the extremely valuable series of nonagricultural employment classified by industry and by State. We are gratified the 1956 budget includes increased funds to improve the data for trade, finance, services, State and local governments, and other industries, and also improve the employment data on a State basis.

We also endorse the increase in expenditures from $4.9 million in fiscal 1955 to $6.8 million in fiscal 1956 for employment, unemployment, wages, industrial injuries and related statistics.

Construction statistics.—Construction is a major sector of our economy, yet construction statistics are extremely deficient. We support the recommended increase from $0.5 million in fiscal 1955 to $1.5 million in fiscal 1956 for this purpose—an increase which should greatly improve data in this important field.

Dr. Walter E. Hoadley, a member of this panel, is chairman of the chamber's subcommittee on construction statistics, and more familiar with this problem. He probably will discuss it in greater detail.

Financial statistics of State and local governments.—The Bureau of the Census reports on state and local government fiscal operations are of significant use by business and all levels of government. We are gratified the 1956 budget includes increased funds to improve these statistics, particularly since a comprehensive census in this field is not due for several years.

Electronic equipment.—Electronic equipment has substantially speeded up and improved the accuracy of labor force, foreign trade and other census statistical series. Reports from the censuses of business, manufactures, and minerals will be available considerably sooner due to use of electronic equipment. We support the increased use of electronic equipment in the periodic censuses scheduled for 1958 and 1960. Lack of timeliness is perhaps the most common complaint about Government statistics, and increased use of electronic equipment should help reduce the time lag in processing statistical data.

Value added by distribution.—A notable gap in the Federal statistical program is information on the value added by distribution. We all know goods retail for more than the manufacturer's selling price. For many years the Bureau of the Census has published figures showing the value added by manufacturing industries. But there is no corresponding series on the value added by wholesale trade, retail trade and other aspects of distribution. The accompanying chart summarizes the flow of goods in our economy from producers of raw materials in agriculture and mining. Most of the goods pass through manufacturing, wholesale trade, and retail trade to final consumers. A smaller amount of goods flow from various stages of processing to the capital account of business and to government. Other goods flow directly from manufacturers to personal consumers, bypassing wholesale and retail outlets. This chart is greatly simplified. There is some flow from wholesale firms to consumers, some from agriculture directly to consumers and some goods flowing up the chart instead of down. For purposes of simplification, these other flows were not marked.

The fact that products acquire added value as they move from field, forest, or mine through a processing plant or factory has long been reflected in the Bureau of the Census data showing value added by manufacturing. The concept that manufactured products continue to acquire additional value as they move through the channels of trade to the point of ultimate sales or use, however, has not received equal acceptance. Now is the time to do spadework developing the concepts and techniques necessary for computing value added by distribution.

A good illustration of the constant need for upgrading statistical work and reporting is indicated by a special subcommittee on the census of manufactures which made a report to the Advisory Council on Federal Reports. The nature of the problem is fully discussed in Business Week, February 5, 1955, pages 114 to 117 and alluded to in the Chattanooga Times for January 22, 1955.

When our economy was simpler and less interdependent, there was less need for statistics. But in today's highly dynamic economy, with its steady population growth, a constant shifting of population, new raw materials continually being developed, new products reaching the market daily, and indeed whole new industries, both the government and business executive are in constant need of up-to-date, high-grade statistical information.

The 1956 budget recommendations for economic statistics are supported by the chamber because these expenditures are needed to provide business with data vitally needed in today's expanding economy.

[From the Chattanooga (Tenn.) Times, Jan. 22, 1955]

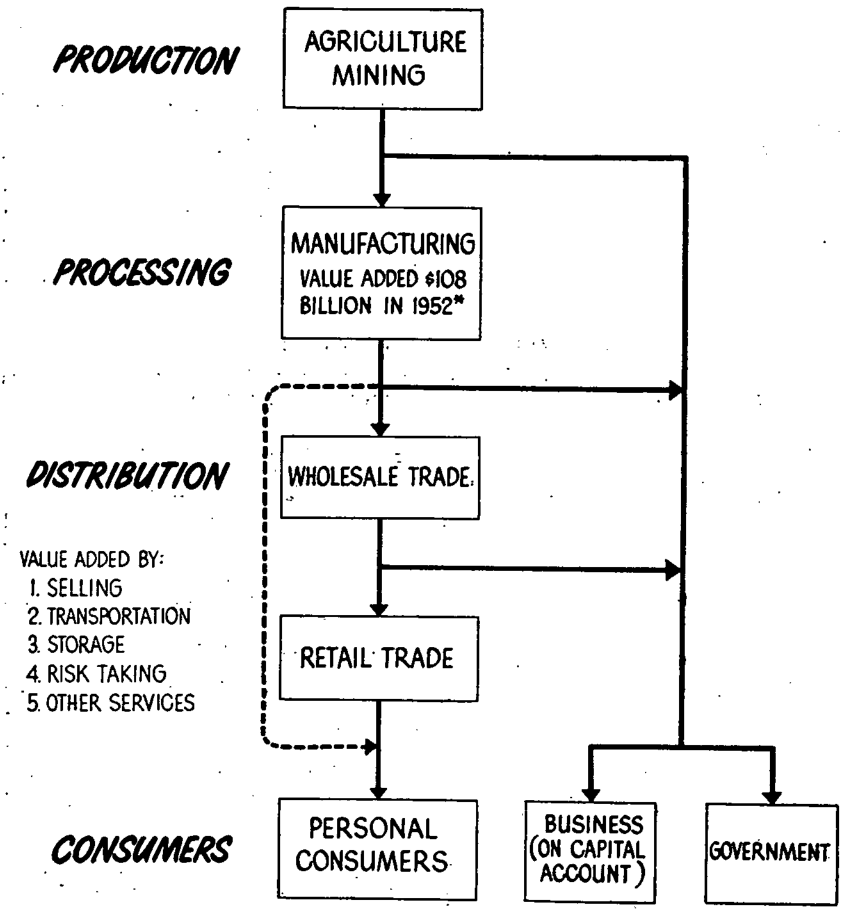
Industry Census Draws Criticism—Advisory Council Charges Misleading Picture of Business in United States

Washington, January 21.—Industry representatives of the Advisory Council on Federal Reports have notified the Bureau of the Budget in a special report that the census of manufactures, of which a 1954 version is now in preparation, is "seriously deficient on several important counts" and gives a misleading picture of the concentration of production in various industries.

The report, drafted by a council subcommittee headed by Stephen M. DuBrul, chairman of the business research staff of General Motors Corp., observes: "Because they are in so many cases the only data available for what they purport to portray, census industry statistics are used widely and indiscriminately in spite of their many weaknesses. Teachers, as well as practicing statisticians and economists, both in and out of Government, are no more protected from hidden inaccuracies of these statistics than are laymen whose use of census data is only occasional."

The report ascribes existing confusion in the census figures to the acceleration of industrial development that has taken place over the past 20 or 30 years. "Industrial establishments have multiplied their functions, they have developed new products, processes and techniques, and they have thereby rendered obsolete the historical and traditional concepts of many industries with which they have been identified," it states. "With the growth of new ones, and the overlapping of products and processes, there has come a proportional complication of the task of applying meaningful statistical measurements to industrial activities."

FLOW OF GOODS



*SOURCE: Annual Survey of Manufacturers

FINANCED BY INDUSTRY

The report of the council, a body whose financing derives from seven industrial groups including the National Association of Manufacturers and the United States Chamber of Commerce and whose members are appointed by the director of the Bureau of the Budget, was aimed at improving the method of tabulating the 1954 census, which will be the first conducted since 1947, although surveys of a lesser scope are made every year. Although some of the subcommittee members have favored publicizing the report, and although some 200 copies have been distributed in and out of Government, the Budget Bureau has insisted that the recommendations be kept secret while the officials of the Census Bureau have a chance to study them. The council has not received any response to the study from the Census Bureau, which received it on last December 9.

A major target of criticism in the report were the census industry figures, which are used to measure the concentration of output by the largest firms in each industry and are therefore the basis for the monopoly charges made frequently against big business.

SECONDARY PRODUCTS

The report maintains that the breakdown of manufacturing into 453 industries fails to recognize the secondary products of many of the individual manufacturers and that it therefore gives a misleading picture of the concentration. The report on the nails and spikes industry in the 1947 census is cited as an example. A total of 68 establishments are represented by the census as shipping some $30,038,-000 worth of products. The report notes that the "unwary user of these statistics" might deduce that the shipments consisted completely of nails and spikes and that this represented all of the nails and spikes shipped by American manufacturers. Actually, it relates, more than one-fifth of the shipments by these concerns were of totally different secondary products. In addition the nails and spikes shipped by them accounted for less than 20 percent of the total United States shipments of nails and spikes because nearly $100 million worth were produced as secondary products by other producers, chiefly in steel mills.

The subcommittee further urges the Census Bureau to be extremely specific in labeling industries and qualifying its statistics to avoid misinterpretation.

[From Business Week, Feb. 5, 1955]

WHERE THE CENSUS GOES WRONG—AN INDUSTRY ADVISORY GROUP SAYS MANY OF THE CENSUS OF MANUFACTURES CLASSIFICATIONS ARE MISLEADING

Sometime within the next 2 weeks, every manufacturing plant in the United States is supposed to tell the Census Bureau how much business it did last year, what its chief products were, and how many people it employed. But census officials have been warned that the results, when they are tabulated and published later in the year, will be far from an accurate picture of what United States industry really is, or how it operates.

The warning was made by a committee of top economists and statisticians in a report for the Advisory Council on Federal Reports. The council, which works closely with the Statistical Standards Division of the Bureau of the Budget, is composed of private industry representatives. The census study was made by a special subcommittee of the council.

Objections.—In general, the committee, in an 11 to 1 majority report, accuses the Census Bureau of clinging to outmoded ideas of what constitutes an "industry," and of failing to adjust its data to reflect modern practices.

In particular, the committee says census data fails to allow for the trend toward diversification of products, and for the amount of output for in-plant use only.

The result—in the opinion of committee members—is needless trouble for business on a number of fronts:

Businessmen trying to use census data to measure potential markets are hampered by lack of complete coverage.

Antimonopoly legislators and the Federal Trade Commission are given a false picture of the degree to which output is concentrated in a few plants.

The real productivity of labor is obscured by unreliable information on total output within individual plants. And labor productivity is becoming more and more a big factor in union negotiations.

Too late?—It's too late to change the forms, or to obtain additional information from manufacturers, in time for this year's census. But the committee hopes Census will still change some of its processing of the raw data to conform to its recommendations. It also recommends that Census raise warning signs over some of its data that the committee feels will be particularly misleading.

To see what's involved, think of the information supplied by businessmen as falling into two broad categories: (1) facts about products and (2) facts about the establishment as a whole. These break down further into the subdivisions that cause much of the confusion in the business census.

I. WHAT ARE PRODUCTS?

Plants are asked to report on the dollar value of final products that are shipped, sometimes on the number of units produced, too. The committee has praise for these figures—as far as they go. The trouble is they stop short of really listing what most plants make and often fall far short of measuring actual output. Here's why:

"Final products shipped"—the key to census data on products—fails to pick up information about goods produced for internal use. If the product is not shipped as a separate unit, it is not counted. That means millions of dollars' worth of such items as containers, castings, stampings, forgings, and machined products simply disappear as far as the census of manufactures is concerned.

Misleading.—This flaw in census data can lead to serious errors in measuring the size of an industry. The committee cites the case of cutting tools, jigs, dies, and fixtures. This is classified as a separate industry under census rules.

Suppose you're a supplier to this industry and want to check on the size of your market. The last census of manufactures—taken for 1947—reports a grand total of 74,522 workers in this industry. But General Motors Corp. alone employs 18,000 skilled tool, die, jig, and fixture makers—of whom only 500 are included in the census figures. That's because the other 17,500 turn out products that are used in the same plant where they are made, instead of being shipped.

Thousands of additional workers are turning out these products for other manufacturers. So the census figures ludicrously understate the size of the industry.

Wrong impression.—That's a serious enough flaw when a market analyst is trying to judge a sales potential. It becomes even more serious when Government officials wade cheerfully into the same statistics and make deductions about how output is divided among plants.

In a study published last year, FTC used census data to report on trends in concentration of output for the "cutting tools, jigs, fixtures, etc." industry, among others.

FTC showed that in 1935 the four leading producers accounted for more than one-fifth of sales; by 1947 their share had dropped to only one-fourteenth. To the industry advisory committee, such figures are utterly meaningless as long as they disregard output for internal use.

More paperwork.—The committee notes progress in reporting on products for internal use in some textile, chemical, and primary metal lines. It wants this reporting extended to other types of plants. If applied to everything, this would throw a terrific new load of paperwork on company officials, so the committee recommends that census obtain the additional data only where there is a clear public interest, or where the companies involved volunteer to take on the extra labor. Where output for internal use is not reported, the committee asks census to clearly label its published data as incomplete, even on this year's results.

II. WHAT IS AN INDUSTRY?

Manufacturers are asked to supply information for each plant as a whole, covering such points as number employed, payrolls, man-hours, and value of materials used. For some purposes—such as reporting general industrial activity in a State or region—the result is accurate, the committee believes. But when census parcels out the returns into industry classes, confusion sets in.

Census recognizes 453 "industries," largely defined on the basis of products shipped. However, many plants produce goods that can be classified in more than one industry.

Nail industry.—The committee picks nails and spikes as an example of what happens to census data.

The 1947 census showed that this particular industry consisted of 68 establishments, which employed 3,805 workers and shipped $30-million worth of products. That's not an accurate picture of nails and spike production, because:

First, the 68 establishments shipped only $23.5-million worth of nails and spikes—not $30-million worth. The balance of output consisted of items that belong to some other industry classification. They are not named in census data.

Second—and more confusing to the market analyst, economist, or the public official seeking guidance—the $23.5-million worth of product made by the "industry," was less than one-fifth of actual shipments of nails and spikes. Nearly $100-million worth was shipped by establishments that are classified in other industries—mostly steel.

"It is evident," the committee says, "that neither the employment * * * nor any of the other general establishment statistics represent either clear or complete statistics of economic activity in the production of nails and spikes."

The committee believes that half the other 452 census industries suffer from the same lack of clear data—including automobiles, steel, metal processing, textiles, chemicals, and rubber.

III. THE PRODUCTIVITY TANGLE

Consider, too, what happens to productivity, if computed from census industry data. Productivity is computed for a given class of industry by dividing the value of the product shipped by the number of man-hours. Simple enough. But here's what happens to the figures when some plants are chiefly assemblers and others are integrated.

The error.—Manufacturer A is an assembler of rear axles for the automobile industry. He is classified with the "motor vehicles and parts" industry. But he buys forged axle shafts from the "iron and steel forgings" industry, he buys castings to house the differentials from the "grey iron foundries" industry, his stampings come from the "metal-stamping industry," he buys machined parts from the "machine shops" industry. He merely assembles these components—bought from 4 separate "industries"—so his 1,000 employees can turn out 50,000 axle assemblies at a high rate per man-hour.

Manufacturer B is also classified in the "motor vehicles and parts" industry and also makes rear axle assemblies. But he has an integrated operation—does his own forging, casting, stamping, and so on. Obviously, if he also produces 50,000 axle assemblies in the same period as manufacturer A, he has to employ many more workers and pile up many more man-hours per axle assembly. The productivity of his workers would thus appear to be much lower than A's.

Under census procedures, A and B are dumped into the same industry class, and a figure on productivity obtained for the industry as a whole. Applied either to A or to B, this figure is meaningless because it fails to differentiate between the assembler and the integrated producer.

The same flaw applied to many other industries. An auto maker who buys many components—such as Kaiser—will appear to have higher productivity than Ford, whose plants are integrated.

Statement Prepared for the Panel Discussion With the Joint Economic Committee by Lowell J. Reed

We all recognize that sound and well-integrated statistical information is necessary for the planning and evaluation of governmental programs at the local and national level and also for the use in the programs and operations of business and industry. It is, therefore, gratifying to those of us who work in the field of statistics to have the Joint Economic Committee devote a portion of its hearings to this topic.

Since my working career within the university and as a consultant to government and industry has been in the field of population and vital statistics, I shall confine my remarks to these two subjects. Together they constitute a single item in the classification of the statistical program of the Government as presented for the year ending June 30, 1956. This item accounts for 1.5 millions of dollars out of 26.2 millions in the 1954 actual and for 1.6 millions out of 32.2 millions in the 1956 estimate.

It is important to realize population and vital statistics are very properly a part of economic statistics. In a very fundamental sense the economy of the country is dependent on the number of people that we have and their status as to age, sex, education, etc., and it is from our population statistics that we get this information. Through the vital statistics we get indexes of the health and working strength of the people, and these indexes also are of importance in evaluating the economy of the country. It is necessary that we continually review these areas of statistics to determine whether or not there are important gaps in our information. I shall devote my remarks this morning to discussion of two special forms of population and vital statistics that in my opinion need strengthening.

The first is that of manpower statistics. It must be clearly recognized that by manpower statistics we do not mean employment or occupational statistics alone. What is needed is a body of statistical knowledge that gives us a measure of the potentialities and capacities of our people as related to the productive activities in our society.

We have had 1 or 2 short-term solutions to this problem taken under the stress of the major wars of recent years and also under serious depression conditions. We have never, however, attempted to develop manpower statistics in this country in a continuous sense, and as a result have had to scratch them together as an emergency arose. With the conditions in the world what they are today and with every likelihood that we will need to make the most effective use of our manpower in the years to come, it seems that we should start without delay in building up this body of information. The increasing complexity of our industrial skill, with its demand for people trained in an ever-wider variety of skills, also indicates a growing need for statistics in this field. Since manpower statistics to be of use must concentrate on the number of people classified according to their skills and capacities, it is obvious that the statistics will have to go into greater detail with regard to the occupations for the satisfactory pursuit of which a higher degree of training is required. The present attempts to evaluate our scientific manpower represent an illustration of one phase of this problem. This activity, however, leaves untouched a wide variety of technical skills for which we will have increasing need in the future.

A number of departments of the Government are now collecting figures that in one way or another have bearing on this problem. We have pertinent material in such statistical series as those on employment, occupation, production, prices, national income, scientific manpower, etc. Before any attempt is made to compile manpower statistics as such, a study should be made of the contribution to this problem of the work in such fields as those just mentioned. From such a study a sound program for obtaining statistical information pertinent to the manpower problem could be developed.

The second statistical need to which I should like to call your attention is that of health statistics. Our earlier public health programs were planned for the most part on statistics relating to births and deaths. We have, however, progressed far beyond this stage. We need better health statistics if we are to implement our present health and medical programs, our rehabilitation programs, our private insurance systems in the field of health, and such health programs as were presented by President Eisenhower in his recently outlined program on health legislation. Planning for such programs as that embraced in the Hill-Burton bill call for better knowledge of health conditions as they would be presented by a well-organized statistical program in this field.

We have taken several health surveys in this country and we have some fragmentary series of health statistics. What is needed is a continuing body of figures relating to health so that a knowledge of present status and trends of the health of the people can be determined and action planned that will lead to a continuing improvement in the state of health of our people.

These two areas are the primary gaps as I see them in the general field of population and health statistics. In emphasizing these I do not wish, however, to detract from the importance of the statistical programs in this field that are now being carried on.

I wish to thank you for the opportunity of presenting this statement to you.

Statement of Beardsley Ruml for the Joint Committee on the Economic Report

My name is Beardsley Ruml. I am chairman of the business committee of the National Planning Association and a member of the research and policy committee of the Committee for Economic Development. It is my purpose to discuss the role of statistics in the making of public and private policy decisions and to urge continued and accelerated progress in the development of the statistical series now available.

Today we are overwhelmed by recent scientific and technological advances which have occurred in the fields of physics, chemistry, biology, and medicine. It is not surprising that the less spectacular and less certain new insights in economics and finance are not so widely known. The full import of these advances I am confident are not yet understood, but we do know enough to know that some things that many competent people thought were true are either false or true in a different way than was believed. Let me give three examples.

In 1937, an eminent economist advised the Treasury that unless the budget was soon balanced, the interest rate would go to 6 percent or even 8 percent the way it had in France. And yet during the war, the national debt rose from $45 billion to $275 billion on a declining rate of interest.

In 1941 we were told that we would have to choose between guns and butter, that to arm for war in two hemispheres we would have to cut our standard of living sharply. And yet in 1944 the general overall standard of living was at least as high as in 1941, and in addition we produced some $80 billion worth of armament. The miracle of production came out of productivity that had been growing unnoticed beneath the surface of a low actual output for a period of more than 10 years.

To take a third example, during the 1930's most people believed that a deficit in the Federal budget was inflationary. Today we can see that a nation that has millions of unemployed who want to work and ample idle plant and raw materials is much like a factory or a company that has a sizable amount of unused capacity. Under such circumstances, an increase of demand tends to reduce unit costs, and therefore under competition tends to reduce prices rather than to increase them. For the same reasons, Federal deficits prudently incurred in times of excessive unemployment, since they also tend to reduce costs, tend to be deflationary rather than inflationary as far as the purchasing power of the dollar is concerned.

These and other discoveries and insights in economics and finance are of the greatest importance in the determination of policy and they rest on research made possible by objective statistical reporting. To select one contribution of conspicuous value, consider the work on the measurement of national income under the leadership of Wesley C. Mitchell and Edwin F. Gay in the National Bureau of Economic Research beginning in 1921. It is difficult for us today to realize that only 30 years ago not only did we not have the statistics to work with, but many concepts such as gross national product which grew out of the statistics did not even exist.

Valuable as our present statistical series are, there is much room for improvement in coverage, accuracy, and speed of reporting. Let me mention 2 specific examples of statistical inadequacy at 2 most crucial points.

First, consider our inadequate knowledge of increase in productivity per man-hour from year to year. Is it 2 or 3 percent, or even more? Does it increase arithmetically or geometrically? Has increase been exhausted in some lines and hardly begun in others? Today we are using overall figures based on historical general experience modified by the shrewd insight of particular students. But the consequences of these estimates for policy cannot be exaggerated, and the choice of 2 or 3 percent in productivity increase per man-hour per year means the choice of 20 or 30 percent in the increase of gross national productivity 10 years from now, a difference of some $35 billion. Clearly our statistics on productivity must be as accurate and as meaningful as it is humanly possible to make them.

The second area which I will mention as needing improved statistical reporting is the field of savings. Here I mean not only the figures on savings banks, but knowledge with respect to the current withdrawals from consumption and their distribution by classification.

In the United States no longer is last week's income a reliable guide to this week's spending; no longer does this week's spending tell an adequate story on next week's consuming.

Today as never before the ordinary individual can get along without current purchasing for his day-to-day requirements. If he decides to change or to restrict his habitual consumption, he can do so without doing violence to his health or well-being.

So also today as never before the ordinary individual has cash, or its equivalent, that he can use to buy the things he wants or the things he thinks he may some day want. Thus, consumer spending is not necessarily consumption.

The consumer in the United States is not absolutely free; sooner or later he must buy some things to satisfy his minimum requirements. However, in the aggregate, the consumer is free as never before—free to postpone, free to reduce, free to anticipate, free to switch from one unnecessity to another. Economic determinism no longer contains him.

Accordingly we need as never before comprehensive, accurate, meaningful, and prompt statistics on the savings and spending behavior of American citizens. Without such knowledge the making of policy and the implementation of policy can be based only on an experience which is largely personal, imperfect, and obsolete.

The responsibility for improving the statistical series in these and other important areas lies upon the agencies who have these assignments and upon the appropriating bodies from whom the necessary funds are derived. Clearly the sums that can be efficiently applied are immeasurably smaller than the financial consequences of the decisions for which the statistical series will be used.

A special responsibility must be assigned to the Federal Reserve System, not only because its earnings provide abundant resources for statistical research and reporting, but also because the vital Open Market Committee, in its determinations to act or not to act, needs to have before it for its own use a very large proportion of the statistical requirements for all public and private policy decisions. If the Federal Feserve System would only see to it that the statistics it needs for its own operations are available to the public and to it, the back of the problem of statistical reporting would have been broken.

I am not suggesting that the Federal Reserve System should take over the collection of all the statictics it needs, or even that it should be a coordinator of existing public and private statistical bureaus. What I am suggesting is that the Federal Reserve System should assume a residual responsiblity to make certain that it gets promptly from whatever source the statistics that it itself needs, and that it supports the researches required to keep the qualtiy of the various statistical series at a high level and to improve their comprehensiveness, meaning, and availability.

To be sure, a statistic is only the shadow of a fact. But it is after the reading of these shadows that decisions are made. And the decisions affect the well-being of us all.

Supplement to Testimony of Beardsley Ruml

With reference to the earnings of the Federal Reserve System and amounts spent for research of all kinds, including statistical, the figures are as follows:

[In thousands]

	Earnings	Research expenditures		
		Total	Board	Banks
1953	$298,000	$4,794	$1,751	$3,043
1954	341,000	5,009	1,741	3,268
1955 (estimated)	250,000	5,241	1,750	3,491

It is possible that some statistical reporting by the system is not classified as research expenditure.

The earnings of the System are turned back to the Treasury, where they are classified as miscellaneous receipts. The total item "miscellaneous receipts" compares with System earnings as follows:

[In millions]

	Miscellaneous receipts	FRS earnings
1953	$2,311	$298
1954	2,302	341
1955 (estimated)	2,486	250

STATEMENT SUBMITTED TO THE JOINT COMMITTEE ON THE ECONOMIC REPORT BY LAZARE TEPER, DIRECTOR OF RESEARCH, INTERNATIONAL LADIES' GARMENT WORKERS' UNION (AFL)

The Economic Report of the President, by the massive use of economic statistics in its analyses, aptly demonstrates the all-pervasive importance of statistical intelligence in the conduct of the affairs of the Government. The use of quantitative data is not limited to the Government but is just as valuable in private policy formulation and decision making. The Government is, however, the major producer of economic statistics. The maintenance and development of a sound and balanced statistical program within the executive branch is, therefore, a matter of great public concern. This fact has, of course, been long recognized by your committee and your interest in the development of adequate and accurate economic data for public and private policy making has contributed materially to the enhancement of the Federal statistical programs. In this your committee deserves full commendation. By setting up a Subcommittee on Economic Statistics and by recommending that a section on economic statistics be included in the President's annual budget and that more consideration be given to an adequate economic statistics program in the President's Economic Report you have performed a valuable public service.

The recommendations made by your committee to the President, however, have been met only in part. The two page summary of the current and recommended levels of the major economic statistical programs has been included in the annual budget and it does provide a useful, though unduly skeletonized, overview of the proposed Federal activities in the field of economic statistics. Aside from scattered comments on individual statistical series, the President's Economic Report does not give consideration to an adequate economic statistics program as called for by you.

The slowdown in business activity which the country experienced beginning with the middle of 1953, and the growth of unemployment which paralleled it, unavoidably raised the question about the adequacy of the existing statistical data on employment and unemployment. Your Joint Economic Report noted, for example, last year that "the extent of involuntary unemployment may not be fully reflected in current statistics" and that "available information upon the degree of involuntary short workweek and of short-term layoffs, as well as of reasons for apparent withdrawal from the work force, fall short of expressing fully and promptly decreases in employment arising from such forms of underemployment" (p. 4 f.). The special analysis of the statistical programs in the President's annual budget also recognized the desirability for more adequate data on employment and unemployment, both nationally and locally. This is, of course, sound.

The need for strengthening the existing labor force statistics has been dramatically brought out a year ago when the Census Bureau released its estimates of unemployment for the preceding January on the basis of the new 230-area sample and when these figures exceeded by 728,000 the earlier estimates based on the old 68-area sample. The investigation of this discrepancy by a special committee on employment statistics, under the chairmanship of Prof. Frederick F. Stephan of Princeton University, with Lester R. Frankel of Alfred Politz Research, Inc., and myself as members, brought out that this discrepancy appeared to have been due primarily to several operating difficulties brought about by the transition and that it was brought about, at least in part, by a lack of sufficient funds. It also focused attention on the serious weaknesses in the labor force survey due to the inherent difficulties of classifying the population, the nature of the extended field operations and the problems of interviewing, the limitations of funds and of personnel, and the several unresolved technical problems calling for additional research work. Accordingly, the special committee urged that additional appropriations be made by Congress in order to insure the maximum accuracy of the survey, to further enlarge the sample size to make the estimates more sensitive to pockets of unemployment which may develop in local areas, and to strengthen field work and other operating aspects of the survey. It also drew attention to the fact that while the composite estimating procedure, introduced in connection with the new sample, had considerable merit and was apt to improve the accuracy of measurement for a number of labor force breakdowns, it was not likely to improve the estimates of unemployment. It was urged, therefore, that this estimating technique be deemed experimental, subject to a continued scrutiny, and that alternative estimating procedures be investigated.

The special committee also drew attention to the undesirable practice, introduced last year, of employing field enumerators only on recommendation of local Republican Party organizations. Aside from the fact that this procedure made staff replacements more difficult when local party officials were found to be unwilling to go on record that they had no suitable candidates, for many additional reasons this does not appear to be the most desirable system of recruiting and should be abandoned.

The Bureau of the Census has contributed much, in the last decade, to developing measurement of the labor force and to the evolution of interviewing, classification and sampling techniques and to the solution of many complex technical problems encountered in the course of the survey. Given adequate funds and personnel, the Bureau can expand its contribution in the future as successfully as it has done in the past. And, of course, there are still many problems to be solved.

One of these relates to the existing classification used in describing the status of individuals in relation to their gainful activity. At the present time, an individual is deemed "employed" even when he works but 1 hour in the course of the enumeration week and, in some cases, even if he works not at all. In the latter group fall those who were laid off for periods of less than 30 days with an expectation of recall, persons who expect to start on new jobs in the next 30 days, people who were prevented from working during the particular week by bad weather. Similarly, those on vacations or sick are also counted among the employed, as are some others whose unemployment status may be confused by prior job attachment.

Similarly, some persons who would have been available for employment, if job opportunities existed, tend to be classified with those out of the labor force. It is, of course, likely that the size of this group changes with the swings of the business cycle, with the changing patterns of chronic unemployment and with changes in personnel policies of business. Six special Census Bureau studies made between 1946 and 1949, though inconclusive, show that the size of this group expressed as a percentage of the number of persons classified as unemployed was significant, ranging from 11 to 73 percent in the different enumerations.

The current definition of the unemployed, as used by the Bureau of the Census, is unduly limited and fails to answer all operationally meaningful questions. There is also no doubt that for different purposes one may wish to classify population differently. The problem could be solved through the introduction of a more detailed, multipurpose classification which would then permit the combination of the different groups in the population into more meaningful categories needed for economic or other types of analyses.

At the same time, the abandonment of the present broad classification of individuals into "employed," "unemployed," and "out of the labor force" may help to eliminate some of the undesirable misunderstandings which constantly arise when the technical meaning given to the term "employed" in the labor force surveys is improperly taken as synonymous with those actually at work. Canada recognized this problem several years back. To eliminate confusion, the Canadian population is now classified into four groups: "persons at work," "persons with jobs not at work," "persons without jobs and seeking work," and "persons not in the labor force," with additional breakdowns under each of these headings.

The work on the revision of the labor force concepts is carried on by an intergovernmental committee in the Bureau of the Budget. Over the years, this group, under the chairmanship of Dr. Gladys Palmer of the University of Pennsylvania, performed most valuable service and did much to improve all phases of the labor-force investigations. The special committee on employment felt, however, that the work of this group could be further enhanced by the establishment of a more broadly representative group of substantial stature and composed of individuals both inside and outside the Government to conduct a program of studies and conferences to review the many remaining major problems in the field of labor force measurement. By bringing together experts and users of this data both from the governmental as well as from private circles, it was hoped that speedier progress could be made in this difficult field.

The need for greater detail on the labor force is properly recognized in the President's annual budget. Similarly, it is recognized that more information is called for on the extent and incidence of unemployment in the various sections of the country and on employment outlook.

There can be no doubt that the lack of sufficient data handicaps analyses and decisions with regard to unemployment. It is impossible, at the present, to fully analyze the impact of the recent recession on the laboring masses of our Nation. We do not know what were the shifts in and out of the labor force, or in and out of employment. We do not know the occupations or the last industry attachments of the unemployed. Our information on distribution of unemployment as between the different major labor markets is far from complete and has to be derived as a byproduct of the unemployment compensation administration. Statistics of unemployment derived from these administrative records fail to reveal its full extent even for those covered by the system. This is due to the differences between the unemployment compensation laws, to underrepresentation caused by delays in filing of claims or exhaustion of benefit rights, to lack of sufficient wage credits for eligibility or to disqualifications of claimants such as in the case of voluntary leaving of employment. The President's Economic Report courts understatement when it notes, on page 89, that "the statistics of insured unemployment *probably understate somewhat* the amount of unemployment among workers covered by the insurance program." [Italics supplied.]

Current information on the number of persons exhausting unemployment insurance claims, not now available, would materially enhance the value of these administrative statistics, as would information on the occupations and most recent industry attachments of the unemployment insurance recipients. Even then, however, such data will not provide accurate information on the severity and level of unemployment. This can only be provided by means of household surveys of the labor force. Greater detail, including that on gross changes in the labor force, will go a long way in supplying the desired data.

One of the best sources on the state of employment in the country is provided by the monthly data gathered, in cooperation with the various State agencies, by the Bureau of Labor Statistics. These figures measure monthly changes in the number of employees on the payrolls in the nonagricultural industries in the several industries, States, and major labor-market areas. In addition to the number of employees on the payrolls, information is secured on the number of man-hours paid for and on the amount disbursed in payrolls. This, in turn, permits the calculation of average weekly and hourly earnings and of average hours of work. Although individuals working for more than one employer in the course of the enumeration week may be counted twice since the data is based on establishment reports, the President's Economic Report is not necessarily justified when it suggests, on page 86, that the decline in the number of persons employed in nonagricultural establishments in the 13 months ending August 1954 "may well be somewhat overstated." As a matter of fact, we do not know very much about the extent of dual job holding and whether dual job holdings tend to decline when employment drops, or conversely, whether they tend to rise because employees reduced to part time due to unavailability of full-time employment take on supplementary jobs. This is one area which deserves future study which your committee may wish to recommend.

There is, however, room for important improvements in the employment statistics gathered by the Bureau of Labor Statistics. Employment data are not available, for example, for a number of industrial subdivisions (i. e., those coded on a four-digit basis). There is a need for extending coverage to smaller firms. Employment statistics for trade, service, and financial establishments are weak, and their reliability should be improved, particularly in view of the growing importance of this sector of our economy. Collection of local data, which has been curtailed in recent years as a result of budgetary stringencies, ought to be restored to its prior magnitude in order to provide data on the interregional shifts in employment.

Local data on employment, payrolls, and man-hours also need to be supplemented by information on the extent of unemployment and labor turnover in such areas. Periodic surveys of the labor force in the major labor market areas would provide important benchmark data for the classification of areas into labor surplus or labor shortage categories and thus materially enhance the estimates made by the Bureau of Employment Security which now have to be based on unemployment insurance claims, employment statistics, and whatever other miscellaneous information there may be. At the same time, these local surveys would yield many details, not now available, on the characteristics of local labor force, and the nature and extent of local unemployment. A much better base would thus be provided for governmental decisions designed to cope with unemployment problems. These local periodic surveys, based on a sampling of households, need not be, of course, carried throughout the Nation all at once. Rather, they could be done gradually, by analyzing a number of labor market areas each year on a rotating basis. At the present time, the Bureau of Labor Statistics hopes to be able to contract for this work with the Bureau of the Census which could couple this activity with the monthly surveys of the labor force. The program deserves a favorable congressional consideration.

Data on the state of local labor market conditions needs to be supplemented by information on labor turnover. The present statistics on hirings, layoffs, and quits unfortunately are inadequate and do not cover all the major industries. Nor do they provide data by State or local labor markets. Yet there is a decided need for more data on labor turnover. This can be secured by strengthening the existing national sample, by collecting data for a more comprehensive body of industries and by providing local area information. Such statistics will be invaluable in highlighting the changing patterns of economic stability or instability throughout the country.

A word about farm employment statistics gathered by the Agricultural Marketing Service of the Department of Agriculture. These data are gathered by means of a mail questionnaire and are notoriously weak. Serious attention must, therefore, be given to the improvement of data for this important sector of our economy.

Collection of data on employment, unemployment, and labor turnover, which I have discussed, is but one step in the development of a comprehensive picture of labor conditions throughout the Nation. Studies of past and current employment developments need to be supplemented by inquiries into occupational prospects. Estimates must be developed showing the potential demand for labor under a variety of conditions, including that generated by mobilization or by public works programs. Determination of job prospects in different lines of activity and occupations is also invaluable in providing basic materials for vocational guidance and counseling of our youth. Similarly, studies of employment problems of special groups in our population, such as women or oldsters, should contribute much in developing employment opportunities for them.

There is also a need to strengthen the collection of wage rate information by industry and occupation. This program has suffered considerably during the recent period, partly for budgetary reasons and in part because of the diversion of activity to the collection of wage rate information on a community basis. At the present time, occupational wage rate data are collected for too few industries and much too infrequently. And yet this information is essential for appraisal of wage relationship within the same industry in the different sections of the country as well as for many other purposes.

Wage information must, of course, be supplemented by other data bearing on industrial problems. These include studies of collective bargaining agreement patterns, of the nature and extent of fringe benefits, of statistics on incidence, severity, and causes of industrial accidents, as well as of the administration and experience under workmen's compensation in the various States. The latter statistics, gathered by the States, are particularly defective. The only hope for their improvement is through a Federal investigation into the nature and character of the available data. It will thus become possible to develop the minimum standards for an adequate reporting and analytical system in this field.

There is also much need for studies into the levels of living of the various segments of our population. For the fiscal year 1956, the President's annual budget proposes that a survey of the farmers' expenditures be made. It would furnish data on the patterns of their living and provide data for the possible revision of the indexes of prices paid by farmers. There is a need for a similar investigation of consumer expenditures and family budgets for urban dwellers. Such studies were last conducted in 1951. Despite the tremendous importance of this material, not only for the Government but for labor and market research as well, much of this information was not even tabulated for lack of appropriations.

Much of this information is now, however, out of date because of changes in the levels of incomes and the patterns of consumption. There exists, therefore, a need for another look. Such investigation will be useful not only for rechecking the Consumers' Price Index but also for the measurement of intercity differences in living costs. Conceptual differences between the Consumers' Price Index, which is used generally to reflect the prices paid by urban employees, and the index of prices paid by farmers also need looking into. Inasmuch as these 2 sets of figures are used in making adjustments in the incomes of these 2 important groups, it is important to establish the extent to which their conceptual differences influence the behavior of the 2 indexes.

Incidentally, the President's Economic Report suggests on pages 95 and 97 that for "technical reasons" the Consumers' Price Index might have failed to reveal fully the downward adjustment in the terms of purchase of durable goods which has taken place since mid-1953. These fears are not altogether justified. While admittedly no price index is a perfect instrument, yet it is doubtful whether the vagaries in the prices of consumer durables during the recent past influenced the Bureau of Labor Statistics index to any significant degree. Not all such goods were sold at a hidden discount during this period. Furthermore, purchasers at discount frequently were called upon to pay extra for many services available to other consumers without charge, such as for delivery, installation, and the like. These extra charges materially cut down differentials if some did in fact exist. Furthermore, because durable goods are not purchased frequently and play but a minor role in the everyday life of the consumer, the end effect on the overall index at best was insignificant during this period, and well within the normal degree of accuracy.

An important factor affecting the living standards of the Nation is housing. Information on this and other construction activity presently available is unnecessarily scant and the President's annual budget recognizes this fact. Funds are, therefore, requested to enable the Business and Defense Services Administration and the Bureau of Labor Statistics to increase their activity in this area. Aside from the information on the physical characteristics of new housing, it is highly desirable to develop data to show how well new construction meets the economic needs of American families at different levels of income and in different sections of the country. It is important to know at what prices housing is sold or rented, the characteristics of the buyers and tenants of new housing, and the extent to which the existing housing inventories are replenished. The Federal Government has a direct interest in such information, both on account of its large-scale program of guaranteeing housing mortgages and loans and because construction of wrong type of housing may lead to a rise in foreclosures and a fall in real estate values.

The various economic censuses for 1954 should help materially in providing the much-needed benchmark information for many current statistics. Adequate funds will, of course, be needed to insure the tabulation and publication of much of this material. New census data will help to improve the estimates of national income and of the gross national product. This is another area where much additional work needs to be done. As pointed out in the President's Economic Report, pages 84 and 85, the alternative methods of estimating gross national product result in statistical discrepancies which make it impossible to ascertain the precise nature of comparative changes in the economy.

In connection with the development of the current business statistics, work also needs to be done in the inventory field. These figures leave much to be desired. In view of their importance in the evaluation of the national economic trends, this work should command high priority.

The Employment Act of 1946 directs the President to set forth in his economic report the levels of employment, production, and purchasing power obtaining in the United States and such levels needed to assure useful employment opportunities for those willing, able, and seeking to work, in accordance with the act's declaration of policy. The President is also directed to set forth the current foreseeable trends in the levels of employment, production, and purchasing power. In his first economic report, transmitted last year, the President failed to provide a detailed quantitative projection of the Nation's economic budget. This omission was duly noted by your committee's Joint Economic Report (H. Rept. 1256, 83d Cong., 2d sess., p. 2), which pointed out: "As the Federal Government curtails its defense purchases it seems especially desirable that our economic thinking be as precise as possible in indicating the nature and magnitude of the adjustments called for to permit our economy to continue stable and to expand." The gap left by the President had to be filled by your committee.

This year, however, the President again failed to take heed of the statutory injunction and your committee's reminder regarding the need for detailed quantitative projections. There is little doubt, however, that in the formulation of the Chief Executive's plans with respect to the Federal economic programs, appropriate projections had to be made by the executive departments inlcuding the Council of Economic Advisors. It is to be regretted that the results of this work were not made available to Congress and through it to the general public at large. The need for such information on all levels of public and private policy formulation is great. A disservice is thus rendered to the Nation in withholding the material available to the executive branch from public gaze.

The nonpublication of detailed statistical data which led the President to certain conclusions and recommendations in his report also handicaps Congress, as well as the general public, in their evaluation of the particular judgments. A case in point is offered, for example, by the recommendation made on page 58 of the Economic Report that the minimum wage be raised to 90 cents an hour. Congress is told that "such action would increase the wages of about 1.3 million workers by an average of about 9 cents an hour" and that "90 cents an hour is the highest minimum wage that can be economically justified in present circumstances." Although it is generally known that appropriate data have been compiled by the Department of Labor, such information as well as any other analyses which led the President to his conclusions have not been made public—at least, as of the early part of this week. Your committee is thus deprived of important information needed by you in the performance of your statutory duties.

Another type of shortcoming brought about by the unavailability to Congress and the public of the needed statistical data is illustrated by the brief reference made on page 4 of the Economic Report regarding the importance of productivity increases as the core of economic expansion. Although a chart is given in the report (p. 5) on the output per man-hour in major industries for the 1909–53 period, nowhere in the report is there any supporting data for these graphs. The credit for the charts is given to the Council of Economic Advisers which presumably derived the data from various Government and private sources. For some time, the Bureau of Labor Statistics has been working on the preparation of such indexes. To date, none were released. Yet the importance of these figures is undeniable; the compilation of productivity information by the Council of Economic Advisers and its use in the Economic Report underlines this fact.

It may not be amiss, therefore, to note that the Chairman of the Council of Economic Advisers, Dr. Arthur Burns, in his communication to your Subcommittee on Economic Statistics dated July 6, 1954, expressed a hope that "all agencies will press forward to the fuller explanation of their statistical data and their limitations" (Economic Statistics: Hearings before the Subcommittee on Economic Statistics of the Joint Committee on the Economic Report, July 12, and 13, 1954, p. 167). This sound precept undoubtedly should apply with equal force to vital data produced by the Council, particularly when these are used in as important a context as that of the President's Economic Report. I hope that your committee will call for these important statistics and for the description of the methods used in their compilation. You may also wish to spur on the prompt completion and release of productivity data now worked on by the Bureau of Labor Statistics.

Another comment needs to be made in connection with the statistical data contained in the President's Economic Report. Increasingly the analyses in the report tend to rely on the seasonally adjusted data. There is no question but that the technique of "correcting" the raw figures through the elimination of the effect of seasonality is a very useful one, provided the end results are used with caution and in conjunction with the raw data. Over the years, seasonal patterns do not remain static. And yet, whatever changes occur in seasonal patterns they cannot be detected until the passage of several years. As a result, the adjustments tend to lag behind the times. While the effects of such a lag may be relatively small when long-range movements are under consideration, they are apt to seriously distort short-term perspectives when seasonal patterns change. Thus, for example, when the automobile industry modified its seasonal pattern in the latter part of last year by introducing new car models at an earlier date, the seasonally adjusted employment series, attuned to the patterns of earlier years, showed an undue increase; yet it merely reflected a change in the pattern of seasonality rather than an actual gain. A proper caution must therefore be exercised in relying on such figures.

The proposals for increased budgetary appropriations for the statistical work in the executive branch of the Federal Government is a step in the right direction.

For several years, the appropriations for statistical activities have lagged behind the need and permitted attrition of much useful work. To assure a sound development of the statistical programs in the future, it is desirable to strengthen the Office of Statistical Standards in the Bureau of the Budget by increasing its personnel and by giving it independent status and thus permitting it to take a more active role in the development of the Federal statistical programs.

Your committee, I am sure, is fully cognizant of the existing statistical gaps. Your interest in the matter will be a major contribution in inducing Congress to make adequate provisions for an improved Federal statistical system.

COMMENTS SUBMITTED BY THE BUREAU OF THE CENSUS AND DIRECTOR ROBERT W. BURGESS CONCERNING STATEMENTS AND TESTIMONY AT JULY 1954 HEARINGS ON STATISTICS

DEPARTMENT OF COMMERCE,
BUREAU OF THE CENSUS,
Washington 25, February 7, 1955.

Mr. GROVER W. ENSLEY
Staff Director, Joint Committee on the Economic Report,
Washington, D. C.

DEAR MR. ENSLEY: In accordance with conversations between you and Mr. Eckler, we are submitting comments concerning the statements and testimony of various witnesses in the course of the hearings last summer before the Subcommittee on Economic Statistics. It is my understanding that these comments are still in order, even though some months have passed since the hearings. As you know, during much of the intervening period our staff has been very heavily involved in connection with the four major censuses—agriculture, business, manufactures, and mineral industries, which were referred to by a number of the witnesses. We have, however, undertaken to make a review of all the prepared statements and discussions, in order to locate any points which in our opinion require correction, explanation, or other modification.

Our comments, which are submitted as an attachment to this letter, are grouped according to the subjects for which the statistics are compiled—agriculture, business (retail, wholesale, and service trades), foreign trade, governments, housing and construction, industry, and population—with a final section on other statistical programs. We have also included statements on our work on seasonal adjustments, on interagency operations, and on sampling.

In addition, I have appended some comments of my own on the relation of efficiency to the size of an organization primarily concerned with collecting statistics from the public. These comments relate to a point made by Mr. Belcher in his discussion of a central statistical agency, and are submitted on a personal basis as a matter of administrative propriety.

In the future work of the subcommittee, some members may wish to look at the materials which we prepared for our Intensive Review Committee and which they published in the exhibits to their report, part II, pages 805–934. In those materials, copies of which were sent to the committee some time ago, we discussed content of the census programs, sampling, and other matters of interest to the subcommittee. The members may also wish to examine the report of our Special Advisory Committee on Employment Statistics. If you do not have a copy of the latter report, we shall be glad to send one to you.

It is my judgment that the hearings before the Subcommittee on Economic Statistics accomplished a very important task, providing a clear picture of many of the uses made of Government statistics, of the way different parts of the program fit together, and of the need for certain improvements. I believe there is no doubt that the numerous expressions of support for the statistical programs of many Government agencies, including in particular support for the 1954 censuses in a number of important fields, have paved the way for a much greater acceptance of this important part of the Government's activities. I am glad to note, therefore, that the full committee is planning to devote a panel session on February 9 to economic statistics.

If clarification or expansion of any of our comments seems to be required, please let us know.

Sincerely yours,

ROBERT W. BURGESS,
Director, Bureau of the Census.

RELATION OF EFFICIENCY TO SIZE OF STATISTICAL ORGANIZATION—SUBMITTED BY ROBERT W. BURGESS, DIRECTOR, BUREAU OF THE CENSUS

With reference to Mr. Belcher's statements in regard to the organization of agencies handling economic statistics, my experience in the past 2 years as Director of the Bureau of the Census, the largest general-purpose statistical organization in the United States Government, suggests some comments designed to contribute to a fuller analysis of the problem of the relation of size of organization to efficiency.

1. As indicated by Mr. Belcher, any agency that has a regulatory and/or enforcement function to carry out should collect the statistical returns that are necessary tools for its administrative operations. Such an agency often can and does secure some of the information it needs from a general purpose agency, such as the Bureau of the Census, and in turn often facilitates the work of the general purpose agency by drawing off addresses, summaries, or other useful material from its records. The main job of an administrative agency, however, is different in nature and purpose, and calls for concentrated attention without an injurious degree of diversion of effort to collaboration with other agencies. The main bulk of administrative statistics, therefore, cannot advantageously be centralized.

2. It is important to give separate attention to the function of collecting economic statistics from the public. The function of interpreting, as distinguished from explaining, the statistical results is analytical and calls for different points of view, and in large measure, for different professional experts.

In many cases interpretation can be performed most effectively by a different organization than the one that actually collects the data. At times, to be sure, it seems best to group the unit that collects the data closely with the unit or individual that interprets. In most cases, however, it is advantageous to divide responsibility clearly between those who collect and those who interpret the statistics.

Supplementing the above remarks on separation of the function of collecting and interpreting, and referring to the discussion between Mr. Talle and Dr. Burns on page 176 of the hearings, I feel it is important to emphasize the principle that the planning of any statistical survey should be done jointly by those who will use or interpret the resulting statistics, those who will collect the data, and if possible, representatives of those individuals and businessmen who will furnish the basic information. Users of the results would often like information that experts in collecting know cannot be collected accurately or even at all.

3. Mr. Belcher's judgment that the size of a centralized operation for United States Government statistics would be almost staggeringly big (cf. last 2 paragraphs, p. 149 of hearings) does not, in my opinion, give full weight to the 2 limitations noted in points 1 and 2; that is to say, the special treatment of administrative statistics and the separation of interpretation from collection and explanation. It would be my tentative estimate that centralized operations limited as indicated would not be more than 100 percent larger, as measured by full-time permanent personnel, than the present Census Bureau.

I believe such a larger organization, if it followed the principles of division of responsibility exemplified by the present Census organization, might well be more efficient than the present fragmented Federal statistical organization. The contrary point of view is like saying that a regiment of infantry can be an efficient fighting organization but that a brigade of two regiments cannot be efficient because of the difficulties of organization. It is recognized in the field of military organization that the relations between higher officers are somewhat different than the relations of captains and lieutenants to the men under them, but satisfactory patterns of leadership at the higher level have been developed.

4. The preceding comments are not intended to present complete arguments for or against the establishing of a centralized data collecting agency. This issue, as noted by Mr. Belcher, has many aspects and the purpose of these comments is merely to present some supplementary views as to the necessary effect of size on the effectiveness of a statistical organization

COMMENTS ON THE JULY 1954 HEARINGS BEFORE THE SUBCOMMITTEE ON ECONOMIC STATISTICS, SUBMITTED BY THE BUREAU OF THE CENSUS

These comments relate to the following subjects: Agricultural statistics, business statistics (retail, wholesale, and service trades), foreign-trade statistics, governments statistics, housing and construction statistics, industry statistics, population statistics, other statistical programs, seasonal adjustment of monthly series, interagency operations, and sampling.

AGRICULTURAL STATISTICS

The Department of Agriculture expressed a need for more agricultural information—especially information on tractors and other machines, fertilizer and lime, etc. (p. 97). The 1954 census of agriculture will provide figures on the number of tractors and other important types of machines on farms in each county and State. It will also provide measures of expenditures for such items as labor, feed, gasoline and oil, fertilizer and lime. The extent to which fertilizer and lime are used on the 4 or 5 most important crops in each State will be shown.

The 1954 census of agriculture, taken in the final quarter of 1954, will provide comprehensive up-to-date statistics on farms; farm acreage; farm products; livestock numbers; inventory of the important machines on farms; a count of farms with selected facilities; the employment, hours of work, and rates of pay of persons working on farms; the principal farm expenditures, including cash rent; the number of farms mortgaged; and the value of farm land and buildings.

The principal results from the census will start to become available, by counties, in early 1955, and will be available for all counties in the United States by the beginning of 1956. Final summaries and analyses will be published by the end of 1956.

Agricultural statistics were omitted from the list of principal economic statistics produced by the Bureau of the Census (p. 33). The following entries should be inserted:

Agriculture: Semimonthly during harvesting season, report of cotton ginned; quinquennial census of agriculture; decennial censuses of drainage and irrigation.

BUSINESS (RETAIL, WHOLESALE, AND SERVICE TRADES) STATISTICS

A. Sampling

The Budget Bureau's comments on limitations of sales and inventory series are substantially correct (p. 23), but the initial sentence, "Current statistics on inventories and sales are inadequate" might well be qualified in view of recent improvements in the samples for these surveys. (Gaps in data mentioned by the Budget Bureau are discussed below.) In retail trade, a new probability sample has been selected which produces a sound statistical sales series. The wholesale trade survey has, for the first time, been put on a probability sample base; as a result, wholesale statistics with a measurable sampling variability will be issued this fiscal year. Greater accuracy in industry detail in both the wholesale inventory and sales series and the retail sales series is dependent on increasing the size of the sample. This would necessitate an increase in the budget for these surveys.

A Budget Bureau staff memorandum indicates that "Because these samples [for annual surveys of retail and wholesale trade] deteriorate after a few years as a result of changes in the business population which cannot be kept account of adequately, sample surveys should not be expected to be an adequate substitute for full censuses for long periods of time" (p. 49). This reference to deterioration may be misleading. At present, both the retail and wholesale trade surveys are conducted in such a manner as to reflect business births and deaths. It is true, however, that a complete census provides a means of periodically checking size and other changes and thus improving sample survey efficiency.

The same memorandum contains the following statement: "Technical problems associated with the introduction of a new sample of retail establishments in 1953 have affected the reliability of the estimates for some purposes, especially year-to-year comparisons" (p. 51). Discrepancies introduced by basic revisions in sample design are believed to be an unavoidable part of the price paid for improvement.

Mr. Kellogg questioned the adequacy of the retail trade sample for making estimates of farm machinery sales because the sample is largely urban (p. 314). Analysis of the sample does not indicate that there is any special degree of unreliability because of any inadequacies of representation of rural areas. Retail sales figures are not currently published for farm machinery. The retail sample is designed to provide estimates of total retail sales most efficiently. Data for individual kinds of business are a byproduct of this operation and can be provided only for the largest ones. The sample is designed to represent all types of communities, rural as well as urban, by the size of the sample is not adequate to produce estimates of satisfactory precision for kinds of business such those that are important only in rural and small urban communities. Either an increase in the size of the total sample or special supplementation in rural areas would be necessary to provide satisfactory estimates of sales of farm machinery dealers.

Differences between the advance estimates (issued 10 days after the close ot the month) and the final estimates (issued 35 to 40 days after the close of the month) have occasioned some concern (see pp. 51 and 87). Thus far, month-to-month changes in total retail trade as shown in the two reports have been similar. Infrequently, however, changes in a specific kind of business, as shown in the two reports, have been different in degree but similar in direction. In rare cases, where the final figures showed virtually no change, these small changes have been different in direction. It should be noted that since the 10-day series is only 1 year old, there is not enough experience as yet for thorough analysis of its behavior. At any rate, improved techniques now being tested and improvements in the basic sample for both series should reduce the differences.

Mr. Roos stated, "There is constant revision of sales data until 4 months after sales actually occurred" (p. 341). Revision of retail sales data by the Bureau of the Census has been virtually eliminated by improvements in timing of collection and in tabulation procedures. Final estimates are now issued 35 to 40 days after the close of the month. (Previously, preliminary figures were issued at that time, and final figures appeared a month later.) Under the new technique, revisions of final estimates are rarely required. Of course, the Office of Business Economics, which adjusts these data for seasonal factors, may make changes as a result of revision of its seasonal adjustment factors.

Mr. Roos pointed out that jewelry store sales data were discontinued as a separate item in 1953 although they were continued as a part of total durable goods sales (p. 341). These figures were discontinued because of their high sampling error. It does not follow, however, that the durable goods data are inadequate. In fact, the sampling error for the durable goods group is relatively low despite the high sampling error in some of its components.

B. Gaps in the statistics

Need for data on retail inventories was mentioned by the Budget Bureau (p. 23), the Office of Business Economics (p. 108), and the Council of Economic Advisers (p. 167). The Bureau conducted exploratory surveys on retail inventories during fiscal 1954. The results of these surveys indicated a strong likelihood that a direct measure of dollar inventories of retail establishments could be developed. Work in this field is continuing in fiscal 1955.

The Council of Economic Advisers noted the need for data on sales and inventories of consumer durable goods at successive stages of the distributive process (p. 169). The Bureau has conducted a small-scale test of some aspects of this problem and is continuing a minimum-testing program. Any substantial achievement, however, requires the additional funds needed for a larger scale operation.

The Budget Bureau (p. 51), the Office of Business Economics (p. 107), Miss Kyrk (p. 246), Mr. Rosenbaum (pp. 296–298), and Mr. Roos (p. 341) pointed to the value of data on individual commodities. The budget for the 1954 census of business ($9 million for that census compared with $13.4 million for the 1948 census) is not sufficient to permit collection of merchanise-line statistics for retail trade. In connection with the 1954 census, exploratory work will be undertaken to improve the techniques for collecting merchandise-line statistics.

Mr. Rosenbaum criticized the conceptual approach in the monthly retail-trade series and felt that sales by type of merchandise are more meaningful that sales by type of retail store (pp. 296–298). Without any deprecation of the importance of sales by type of merchandise, it may be noted that the national estimates of the volume and trends of retail trade provided by the Bureau indicate the functioning of groups of economic enterpirses. Businessmen and their trade associations make direct use of sales by kind of business, because the store is the business unit and the trade association is made up of businessmen engaged in similar activities. Decisions on taxes, bank credit, consumer credit, construction programs, Government outlays, and other Government actions which directly affect business activity also can be aided by this type of information.

Sales estimates by type of merchandise or by commodity would meet a need the importance of which is not questioned. The Bureau of the Census has discussed with the Budget Bureau and other interested Government agencies the possibility of obtaining national estimates of sales and inventories of some of the major household appliances; and the Bureau of the Census tested a procedure for getting these data. It concluded that it could probably provide monthly estimates for a number of major consumer items if it were so directed. However, complete monthly estimates on a commodity or merchandise-line basis do not appear feasible at present because retailers cannot provide this information from their records. Even in a complete census of business, such data are very difficult to collect and the reliability of the results is at least uncertain even if collected.

The Budget Bureau pointed to the need for annual data on retail credit sales (pp. 51 and 71) indicating that "a more accurate analysis of consumer credit would be possible if a breakdown of retail sales by type of transaction * * * were provided in the annual retail-trade surveys." The statement is correct with reference to the lack of such figures. However, a breakdown of accounts receivable by type of transaction has been provided in the last two annual retail trade surveys and presumably will be continued in future annual surveys. The Federal Reserve Board, which furnishes part of the funds for conducting the annual retail trade survey has regarded the accounts-receivable information as considerably more important than the credit sales by type breakdown. The inclusion of the latter in the annual survey would add appreciably to cost and to respondent burden.

Budget Bureau staff memorandum No. 3 makes a series of recommendations on plant and equipment expenditures data (pp. 47–48). The Bureau plans to test the collection of capital expenditures data in connection with the 1954 census of business.

The Budget Bureau indicated that current statistics on personal service trades receipts are inadequate (p. 23). It would be relatively simple, within the framework of its current program sample design, for the Bureau of the Census to provide monthly service trade statistics. No funds, however, have been made available for this purpose.

Miss Kyrk pointed to the need of extending the scope of the census of business to service trades previously not covered (p. 246). This possibility should be explored in preparing for the 1958 census of business. Limitations in the enumerator type of canvass have prevented the Bureau from including those trades; but with present techniques for identifying business establishments (e. g., use of the administrative records of the Internal Revenue Service and the Bureau of Old-Age and Survivors Insurance), extension of the census scope may be feasible.

Mr. Rosenbaum suggested annual reports of retail sales for cities with populations of 100,000 or more (p. 303). Such data could be provided if the retail survey sample were expanded, but funds for doing this have not been available.

The Office of Business Economics recommended that information on distribution of manufacturers' sales and sales to Government by manufacturers and wholesalers be obtained in the census of business (p. 107). Business establishments generally seem to have considerable difficulty reporting the desired data in these fields. The reasons for the difficulty include lack of knowledge by the manufacturer of the class in which the customer falls, and even when this is known, failure to attach a usable record of such facts to the sales record. In the 1954 censuses, the Bureau is collecting information on distribution of manufacturers' sales from those manufacturing fields where, after consulting industry advisory groups, it concluded that such collection was feasible. The Bureau is also exploring new collection methods during the census period.

Wholesalers' direct sales to the Federal Government are being obtained in the 1954 census on a very large proportion of the wholesale forms; however, the recommendations in industry conferences indicated that it was not feasible to collect data for sales to other governmental bodies.

The Department of Agriculture noted that the census data were of limited use for certain studies because no data were collected on cost of goods sold (p. 94). While the analytical needs for such data have been well established, there has been a long-standing reluctance on the part of some business groups to have such data collected, because of fear that the results would be used to criticize, and perhaps even to control, profits.

An electrical machinery company in the survey taken by the National Industrial Conference Board indicated that it "never felt sure of the stock-sales ratio given in the wholesale trade report" (p. 214). The figures would be more useful to them if they were reported in terms of inventory turnover, that is to say, based on inventory at estimated sales value.

Before the wholesale sample was revised, the Bureau described the ratios as representing the experience only of the respondents in the survey. The ratios derived from the revised sample, however, will not have this limitation. The revised sample is a probability sample and is designed to reflect the conditions in the trades reported. The results should therefore be more useful.

The stock-sales ratios in the wholesale trade report are a byproduct of the data on sales and on inventories at cost, which are collected in the wholesale survey.

To provide inventory turnover measures (defined as ratios of sales to inventories at sales value) would require either collecting inventories at sales value or continuing to collect inventories at cost value and adjusting them to sales value with appropriate markup factors.

C. Duplication in collection

Mr. Rosenbaum stated that both the Bureau of the Census and the Federal Reserve Board collect information on sales and stocks from department stores and furniture stores, and information on sales from household-appliance stores, auto dealers, and other stores (pp. 295–296). This statement, while previously correct, no longer holds as a general description of method. For more than 10 years, the 2 agencies have had a cooperative arrangement for the collection of department-store information. This arrangement has served substantially to eliminate duplicate contacts with these firms to collect the same information. It also generally extends to other types of retail stores, such as furniture stores, apparel stores, household-appliance stores, and lumber yards. As a result, there is little duplication in collection.

D. Delays in getting information.

The Council of Economic Advisers stated that it has been handicapped by the lag of information on inventories (p. 165). Earlier timing of data on wholesalers' inventories would require an operation comparable to the advance reporting in the retail 10-day sales series. This could be considered as soon as the new wholesale panel operation is stabilized—provided, of course, that funds are available for that purpose. In retail inventories, the first job is to establish a reliable series.

Mr. Rosenbaum referred to the delay in release of monthly retail sales estimates, to the neglect of seasonally adjusted data, and to the announcement of figures in the newspapers several days before the report arrives by mail (p. 296).

The description of the release of monthly retail sales estimates as delayed does not seem justified. Since October 1953, the Bureau has published an advance report on retail trade 10 days after the end of the month to which the data refer. This release provides sales estimates for the 10 major kind-of-business groups in retail trade and for grocery stores and department stores. The final estimates are published 4 weeks later in the Monthly Retail Trade Report and provide detail for an additional 25 kinds of business.

The Office of Business Economics adjusts the advance estimates of total sales for seasonal factors, and the adjusted percentage comparisons with previous month and previous year appear in the advance report. OBE also adjusts the final estimates of sales by kinds of business and publishes them in the Survey of Current Business. The detailed Monthly Retail Trade Report, however, has not carried the adjusted figures, and the possibility of including them is being explored.

Inevitably, figures are announced in the newspapers before the report reaches all subscribers. At the time a report is released, the Department of Commerce places on its press table a press release summarizing the contents of the report. Newspapermen and representatives of the news services may take the release and wire the information to newspapers in all parts of the country. The Department is scheduled to mail the reports to subscribers within 1 day after the release date. This has seemed to be a reasonable procedure, which could be improved only at considerable cost.

E. Budget problems

Mr. Rosenbaum suggested a budget geared to the known peaks and valleys in the work so that failure to make a specific appropriation would not eliminate a regular project, such as the census of business (pp. 323–325). As was pointed out at the hearings, it was impossible to take a $9 million census of business without a specific appropriation, because the appropriation for the regular current activities was only about $6 million. The real need, we believe, is for the Congress to recognize as reasonable a budget program which follows a regular census cycle although it may fluctuate from year to year.

The problem of financing intermittent operations like the censuses was explored by the Hoover Commission. Drs. Frederick C. Mills and Clarence D. Long made the following comments in the Task Force Report on Statistical Agencies:

"Advance planning and advance commitment of funds are necessary in a program of basic census work and in some other statistical activities. The system of annual appropriations, with recurrent periods of budgetary uncertainty and occasional sharp fluctuations in the scale of major recurrent statistical programs, has at times made planning and programing difficult and has induced instability in statistical operations. Unexpected changes sometimes result in the loss of funds previously expended on preliminary work."

The Intensive Review Committee in its report, Appraisal of Census Programs, referred to those comments and noted:

"That problem remains unsolved and in fact has been aggravated by the severe budgetary uncertainties that have developed since the Hoover Commission task force report was written."

F. List of Bureau activities

In the list of principal economic statistics produced by the Bureau of the Census (p. 33), the following items should be added:

Monthly: Secondary inventories of principal petroleum products by PAD districts, and quarterly measures of storage capacity.

Current (5 dates in marketing season): Canned food report, distributors' stocks of important canned food items (fruits, vegetables, and juices).

The item "Monthly: Retail trade reports * * *" should be amended to include the word "regional," after the word "national."

FOREIGN TRADE STATISTICS

"The concluding paragraph of the Department of Agriculture statement (p. 100) may be misleading. It reads:

"Beginning January 1, 1954, similar sampling, in this case of 5 percent, is taken of imports with a value of $200 or less. The Department of Agriculture is frequently interested in the origin of these small-value imports and recommends the resumption of tabulation and publication of full details."

The figure should be "$250" instead of "$200." More important, however, we believe that the information desired could not be obtained if the 5-percent sampling were superseded by full compilation. For imports, the limiting factor is lack of sufficient detail on informal entries valued under $250. Since these informal entries constitute the bulk of the total of imports under $250, the statistics would not provide the information desired, even if all entries under $250 were tabulated. Important policy problems would be raised if substantially more detailed reporting on the informal entry forms were required. It is perhaps true, however, that full compilation of those under $250 entries which provide sufficient detail and an increase from 5 to 10 or 20 percent in the size of the sample for the informal entries would somewhat increase the usable detail, but would probably meet only a relatively small part of the Department of Agriculture needs.

The Bureau of Labor Statistics made the following statement (p. 124):

"Foreign-trade statistics are tabulated to show imports and exports in relation to tariff schedules. On rare occasions, funds have been supplied to the Bureau of the Census to enable them to retabulate these statistics by SIC groups."

The following statement is more accurate:

"Foreign-trade statistics are tabulated by commodity without regard to the industry in which they are produced; but funds have been made available on rare occasions so that the Bureau of the Census could retabulate the figures in such a way as to approximate the Standard Industrial Classification."

Mr. Burns made the following statement (page 164):

"(1) We have urged the various statistical agencies of the Federal Government to accelerate the reporting of economic information. Notable progress has been made in the reporting * * * of exports and imports * * *"

This statement gives undeserved credit to the Bureau of the Census, since the release dates for export and import data are now about the same as they were in April 1953. The improvement in release dates during the past year remedied the lateness in release dates which occurred in July 1953 during the period of large staff turnover. Thus, there has been no fundamental change in release date schedules. By using Univac, we anticipate that we can improve schedules, but we could not do this in any other way with present resources and workload.

The following are typographical errors:

Page 58, line 5, after section heading "Recommendations," "minimize" should be "maximize."

Page 59, second line after italicized heading, "(PT 985)" should be "(FT 985)".

GOVERNMENT STATISTICS

The Budget Bureau (in a staff memorandum on p. 74) and the Council of Economic Advisers (p. 169) suggested more frequent than annual reporting on State and local government finances. We believe a practicable approach to this problem would be to cover, monthly or quarterly, certain significant segments of financial operations rather than to attempt comprehensive coverage of revenue, expenditure, debt, and assets totals. Existing statistics on State and local government payrolls, for example, have been available in the past on a quarterly basis from Bureau of the Census surveys and will be available in the future (after January 1955) from Bureau of Labor Statistics data. (Responsibility for the conduct of quarterly surveys of State and local government employment and payrolls currently is being transferred from the Bureau of the Census to the Bureau of Labor Statistics.) Payroll expenditures account for $13 billion of the total of $33 billion spent annually by State and local governments. Addition of a monthly or quarterly survey of State and local government construction expenditure, as described by the Bureau of the Census on page 104, would add another $7 billion in expenditure coverage. Statistics on public assistance payments and unemployment compensation benefits are available on a monthly basis; these would provide perhaps another $3 billion of expenditure coverage. The total of these sources would cover roughly $23 billion out of $33 billion of total spending and would provide extremely significant information on intrayear trends in State and local expenditure.

As to revenue, an intrayear survey of tax collections, which is believed to be practicable, plus integration of existing data on other types of revenue might cover as much as $26 billion of the approximately $33 billion collected by State and local governments from their own sources and from Federal aid. More frequent than annual information might also be obtainable on debt and debt transactions.

We believe that substantially more value per dollar spent would be obtained from this combination approach to intrayear financial statistics than would be yielded by an attempted coverage of all types of revenue, all expenditures, debt, and assets.

In the list of principal economic statistics produced by the Bureau of the Census (p. 33), the "quarterly" entry for governments should read:

"Quarterly: National estimates of public employment and payroll based on reports from a sample of governmental units."

(After January 1955 responsibility for this activity transferred to Bureau of Labor Statistics.) The "annual" group should include the following:

Annual: State-by-State estimates of public employment and payroll based on reports from a sample of governmental units.

HOUSING AND CONSTRUCTION STATISTICS

The need for statistics on alteration and repair expenditures was mentioned several times during the hearings (pp. 23–24, 55, 88, 116–117, 166, 275, and 285). In our letter to the Budget Bureau, we indicated that we were investigating this problem (p. 102), and Mr. Colean also mentioned our activity (p. 287). The first results of our investigation are now available. On September 13, 1954, the Bureau of the Census issued a release showing total expenditures by homeowners for repairs and alterations during the first 5 months of 1954. A more detailed report (series H–101, No. 1) was issued on December 18.

Following the survey of expenditures on residential properties, the Census Bureau is doing some preliminary work in preparing for a similar survey on commercial properties. This work is being developed under the sponsorship and with the cooperation of the staff of the Business and Defense Services Administration. An initial exploration is being made by the Census staff on the problems involved in making a survey of retail business properties.

Statements on deficiencies and gaps in the housing field suggest and strengthen the Census Bureau's proposed program to conduct an intercensal housing survey. This was recommended by the Intensive Review Committee, and the Bureau has requested funds for this purpose for the fiscal year 1956.

The Budget Bureau (p. 56), the Department of Agriculture (pp. 98–99), Mr. Colean (p. 278), and Mr. Roos (p. 337) indicated that the increase in the number of dwelling units reported by the Bureau of the Census between 1940 and 1950 is greater than the number of housing starts reported by the Bureau of Labor Statistics for that period. They point out the problems involved. The data from the censuses of housing should be reconciled with the BLS data on housing starts, and we believe that there is considerable need for a measurement of the components reflected in the net change in the housing inventory—new construction, conversions, demolitions, etc.

In the list of principal economic statistics produced by the Bureau of the Census (p. 33), the "occasional" group for Population and Housing should include the following: Rent and income surveys for local housing authorities.

INDUSTRY STATISTICS

The Bureau of the Budget made the following statement on current statistics of industrial production (p. 25):

"Continuation of the present census program for current commodity series, and the annual survey of manufactures will adequately meet the informational needs for current data, with the possible exception of the coverage of building materials."

We believe that the Budget Bureau may have overlooked some inadequacies in the current program. The need to expand the current commodity series (Facts for Industry) was mentioned in their staff memorandum on the Federal Reserve index of industrial production and also by three other participants. The comments are as follows:

"The Board may recommend that the Bureau of the Census collect more monthly data on manufactured products to replace certain of the series on input of materials or labor now used in the index to represent the output of products and to serve as components in industries which are only skimpily represented by makeshift series. Specifically, if current data on the output of certain important products were available, for example, on flat glass, brass mill products, woven synthetic fabrics, and soap and other detergents, the index could be further strengthened. The Census Bureau may also be urged to collect more and better annual series on products to compute better annual industry and other detailed indexes with which to adjust the levels of the monthly indexes constructed from data on man-hours or the consumption of materials, and to replace certain of the deflated-value or other estimated annual series" (Bureau of Budget Staff Memorandum No. 7, p. 63).

"The Federal Reserve index of industrial production, which is developed from basic data compiled by other organizations, would be strengthened by the collection of physical output data for important products for which adequate current information is not now available. Some of these data, such as for glass, brass-mill products, and woven synthetic fabrics, for example, would be desirable on a monthly basis; others, such as data for various types of machinery, converted paper products, and manufactured cereal products, would be necessary only annually" (Federal Reserve Board, p. 86).

"More monthly series on production quantities would reduce the dependence of the monthly Federal Reserve indexes on man-hour data. Additional physical quantity data are also required to strengthen the annual Federal Reserve indexes for many areas" (Council of Economic Advisers, p. 166).

"One of the particularly useful series of reports providing specific information on the extent of the market for selected consumer goods in terms of physical units, as measured by manufacturer's inventories, is the Facts for Industry series of the Bureau of the Census. They have additional value because of their almost complete industry coverage and because of their frequency—monthly or quarterly. Only a few trade associations have been able to match the comprehensive coverage and accuracy of these reports. Consideration should be given to the supplementation of these series by reports on other consumer products of importance for which data are not now available" (Arthur Rosenbaum, Sears, Roebuck & Co., p. 303).

According to our information, the present coverage of metal fabricating industries is quite inadequate as far as output data are concerned. Annual data—and for certain areas more frequent data—are badly needed in the fields of pumps and compressors, special and general industrial machinery, and electrical equipment and supplies. Statistics are lacking for a number of chemical industries (such as drugs and medicines and insecticides) as well as for selected wood products and converted paper products.

In a number of consumer and producer-goods industries, the annual surveys mentioned above would serve as benchmarks for less complete Government and private monthly and quarterly surveys. They would measure changes in coverage and provide certain data not obtained in the current reports.

In addition to the need for limited expansion of the 65 current commodity series, there is a need for further attention in these surveys to coverage of new producers entering the field and to revisions of content to reflect technological changes and new products.

In the list of principal economic statistics produced by the Bureau of the Census (p. 33), the entry for Facts for Industry should read as follows:

"Facts for Industry series: Monthly, quarterly, and annual: shipments, production, stocks, and orders, 65 commodity surveys covering about 2,000 commodities."

POPULATION STATISTICS

Several witnesses from Government and private organizations commented on the Bureau's statistics on employment and unemployment, which are collected in the Current Population Survey. Some of their recommendations had been made also by the Bureau (see pp. 101–102) and some represent new demands.

We believe that modest efforts can be made to achieve some of the recommended improvements with existing personnel and funds, but that substantial amounts of new funds must be provided before work can be started on others. Work is already in process on the following projects: Seasonal adjustments, compilation of monthly data on part-time employment and unemployment of family heads, studies of the relationship of unemployment estimated by the Bureau of the Census to insured unemployment reported by the Bureau of Employment Security, review of labor force concepts, and the regular publication of data on gross changes in the labor force. A program of control and measurement of the quality of the labor force statistics has also been launched. Funds to strengthen and expand the national sample for the current survey have been requested for the fiscal year 1956.

Among the projects which would require sizable amounts of additional funds, the compilation of labor force data for individual cities or standard metropolitan areas was most frequently urged. The need for such data has been recognized in times of both labor shortage and labor surplus; however, funds were provided only for the fiscal year 1947. Other recommended projects in this category were a periodic survey of consumer incomes, expenditures, savings, debts, and other economic subjects by family characteristics (mentioned by the Budget Bureau, p. 17, Mr. Burns, p. 164, and Mr. Shishkin, p. 229); a comprehensive survey of low-income families (mentioned by Mr. Burns, pp. 168 and 171, and Mr. Lubin, p. 262); a quinquennial census of population and data on illness and impairments of the population (mentioned by Budget Bureau, p. 85).

Mr. Roos suggested that the Bureau of the Census "revise its sampling of household formation data so as to relate the error of estimate to the change in households rather than to the absolute number, the reason being that the change is the important factor in market analysis" (p. 337).

There are two thoughts implicit in this suggestion. One is to revise the sample design to provide better estimates of change in the number of households; the other is to publish errors of estimates relating to change rather than to the absolute number. On the first point, the Bureau has been aware of the problems involved ever since it began to tabulate results from the current population survey for the purpose of providing estimates of the number of households. It has undertaken extensive research projects, the largest being under a contract with the Housing and Home Finance Agency in 1949–52, to develop plans for a sample survey to measure change with an error of about 5 to 10 percent of the change. It has also done research to discover any other limitations of the present estimates in order to provide a basis for revisions of procedure which will reduce errors of estimate. On the second point, sampling errors have been published for those figures which the survey was designed to provide. The Bureau is always ready to make available, upon request, any other estimate of sampling error which a particular user would like to have.

The second paragraph of the criticism enclosed with Mr. Roos' letter (p. 337) reads as follows:

"As we have pointed out the Bureau of the Census did not reconcile the discrepancy in its 1950 figures on the number of households until April 1953. The number of households reported by the census of population has now been revised upward by about 1 million and the number reported by the same Bureau's survey of population by several hundred thousand."

The number of households obtained in the 1950 census has not, strictly speaking, been "revised." In the quotation above, Mr. Roos is referring to the differences between the 1950 census figure on number of households and the numbers of households shown by the postenumeration survey (a quality recheck of a sample of the 1950 census returns) and by the current population survey. The postenumeration survey showed a total number of households about a million above the number shown by the complete census, but it is incorrect to state that this fact constituted a revision of the census figure. The difference provides an estimate of the net effect of errors of underenumeration and overenumeration of persons as household heads. Some of the errors arose from missing some entire households in the census, others from misclassifying some enumerated persons as members of households maintained by other persons instead of as heads of households, etc.

The Current Population Survey is based on a scientifically selected sample of households and has provided annual figures on the number of households since the middle 1940's, in connection with data collected on employment and unemployment. The figure shown by this survey for March 1950 was about 600,000 above the April 1950 census figure for the number of households. At the time the survey figure for March 1950 was prepared, the estimating procedure in use involved the adjustment of figures collected in the field to independently determined distributions of population classified by age, sex and veteran status. These distributions then had to be based on data from the 1940 census brought forward by taking into account the numbers of births and deaths, the amount of net immigration, and the aging of the population since 1940. The necessary details from the 1950 census for preparing independent estimates based on the 1950 census were not available until 1953. A report issued in October 1953 indicated that the effect of using the revised materials was to show an estimated number of households for March 1950 that was 350,000 greater than on the former basis. This revision had no connection, therefore, with the results of the Post-Enumeration Survey mentioned above.

OTHER STATISTICAL PROGRAMS

Mr. McCracken mentioned the need to bring Historical Statistics of the United States, 1789–1945 up to date (p. 232). This publication was brought up to date at the end of 1952 with Continuation to 1952 of Historical Statistics of the United States, 1789–1945. Before and after this continuation was issued, the Bureau carried forward and revised the historical series in the Historical Appendix of the annual Statistical Abstract of the United States. A more thorough revision of Historical Statistics is now being planned.

In the list of principal economic statistics produced by the Bureau of the Census (p. 33), the "other" group should include: Annual: Statistical Abstract of the United States; occasional: Historical Statistics of the United States; county and city data book.

SEASONAL ADJUSTMENTS OF MONTHLY SERIES

Several participants at the hearings mentioned the need for seasonal adjustments of monthly series. Following, for example, is the statement of the Council of Economic Advisers (p. 167):

"In analyzing month-to-month changes in economic activity, difficulties of interpretation frequently arise because of doubt about the magnitude of seasonal factors. The need for seasonal adjustment is especially great in the areas of construction, employment, production, sales, inventories, and banking. Although a considerable number of important series are available in seasonally adjusted form, many are not. Furthermore, some of the seasonal adjustments now practiced seem obsolete or otherwise defective."

The Bureau of the Census is preparing to publish seasonally adjusted monthly data for many of its key series, including those showing industrial production, import and export of commodities, and the labor force and its components. The Bureau already publishes, jointly with the Office of Business Economics, seasonally adjusted retail sales statistics with the original unadjusted figures.

The Bureau uses its Univac electronic computer to make some of these computations. This machine makes seasonal index computations and seasonal adjustments at very high rates of speed and at low cost. The Bureau has programed a method which takes advantage of the capacities of the Univac and has utilized it for many series. This method is based on the most common technique for computing seasonal movements (ratio to 12-month moving average) but, in addition, it includes refinements, elaborations, and tests that have not previously been practicable for most agencies because of the large computational workload.

Because the Univac is so well suited to the seasonal computations and because a seasonal index computation program has already been prepared, the Bureau makes these computations on a cost basis for other Federal agencies. Approximately 500 series (including about 100 Bureau of Census series) have been completed.

INTERAGENCY OPERATIONS

In its statement, the Budget Bureau mentioned the importance of records of administrative agencies, referring to data collected by the Internal Revenue Service and the Bureau of Old-Age and Survivors Insurance in their administrative operations (pp. 17–18). The Budget Bureau indicated that the data for County Business Patterns (published jointly by the Bureau of the Census and the BOASI) were developed from the BOASI records, and that the Bureau of the Census is exploring the feasibility of using BOASI data to improve its intercensal population estimates. An additional use of administrative records—for the 1954 censuses of business, manufactures, and imneral industries—is worth noting. Also worth mentioning are the services provided by the Bureau of the Census to the administrative agencies.

Use of administrative records in the 1954 censuses

In the 1954 censuses of business, manufactures, and mineral industries, the Bureau makes important use of income tax returns and also employers' reports under the Federal Insurance Contributions Act (the basis for the BOASI current data). Practically all businesses file an income-tax return showing sales or receipts, kind of business, and geographic location. All employers in business, manufactures, and mineral industries (about two-thirds of all business concerns) file a return under the Federal Insurance Contributions Act. The Bureau uses the FICA return (collated with BOASI records) to develop a mailing list of employers; these employers are then asked to report in the censuses. The Bureau uses the income-tax return directly, without any additional canvass, to get basic data for nonemployers in the census of business. (Few nonemployers are within the scope of the censuses of manufactures or mineral industries.)

The Budget Bureau pointed out some of the limitations in administrative records (pp. 17–18, 28, and 43). Despite the problems involved in overcoming these limitations, we believe that use of administrative records in the 1954 censuses provides at least three advantages. (1) It reduces the cost of the census of business, probably without reducing its statistical quality. (Data for previous censuses have been collected in a door-to-door canvass of all business establishments, which is much more expensive than the new plan.) (2) It relieves the small businesses (non-employers) of the burden of making a report. (3) It provides the Bureau with an up-to-date mailing list of employers. This should improve the coverage of the censuses and increase the efficiency of the operation.

Services to other Federal agencies

The Bureau of the Census uses the resources it has acquired as a data-collecting agency to provide services at cost to other Federal agencies for their administrative needs. In general, these services are of four types: (1) tabulations on Bureau equipment of data collected by other agencies, (2) special tabulations of data collected by the Bureau, (3) collection and tabulation of data according to the specifications of another Federal agency, and (4) consultation with and advice to other agencies on statistical problems.

The computation of seasonal indexes (discussed above) illustrates the use of Bureau equipment for work on the data of other agencies as well as data produced in the Bureau.

Special tabulations are often made of data collected in the censuses and kept on punchcards or magnetic tape. An example of this is the occupation-by-industry data from the 1950 census of population which were tabulated for a number of metropolitan areas for the Bureau of Employment Security. That Bureau sent the machine-sheet tabulations to appropriate State employment security agencies to use in counseling, job promotion, and community employment programing.

The Bureau of the Census collects and tabulates data for other Federal agencies on subjects in which they are interested. For example, the Bureau will interview a sample of the population about their smoking habits to get information for the Department of Health, Education, and Welfare on the relationship between smoking and various diseases. Such a survey can be taken as a supplement to the regular monthly current population survey at exceedingly low cost. Some of the Bureau's facts for industry surveys have been modified to meet the administrative needs of the Business and Defense Services Administration. As another illustration, the Department of Agriculture has obtained from the Bureau special surveys on employment of farmworkers.

SAMPLING

Since Mr. Talle inquired (p. 159 of hearings) about the effectiveness and reliability of sampling and the Bureau conducts much of its work on the basis of sampling, it seems appropriate to add to this statement a brief discussion of sampling supplementary to Mr. Belcher's answer to Mr. Talle's question.

The first point about sampling to which attention should be called is that many kinds of statistical studies make some use of sampling, sometimes of a purely haphazard type. For example, the limited experience that one person has is often taken as a sample on which to base broad generalizations; the man of good judgment often shows it by informal allowance for the smallness of the area that he really knows.

A haphazard method of drawing a sample is to be sharply distinguished from a method that makes use of scientific principles derived largely from the mathematical theory of probability. These principles are aimed at determining, by application of established procedures, a sample which is a reasonably representative cross section of the aggregate. If the principles of sampling are properly applied to the design of the sample, and if a large enough sample is taken, it is possible to get results from the sample which approximate closely the results which would have been obtained by a complete enumeration. Also, with an appropriately designed sample, it is possible to derive from a knowledge of the design and from the sample results a good measure of the precision of the sample estimates. An important problem is to design the sample so that the results are as accurate as are needed, but also so that the total cost of developing the design, taking the sample, and deriving the results, is kept near the minimum consistant with the desired degree of precision. Sampling theory provides effective guidance in the solution of this problem.

In actual experience, the Census Bureau has found that sound use of sampling procedures is effective in many cases in reducing cost tremendously, both for the collection of data and for processing, and in making possible more timely reporting of results. Many surveys now carried out regularly would not have been feasible at all on a complete basis, with the available funds and within acceptable time limits.

Another point to note is that through sound sampling the quality of the survey results can sometimes be improved as compared with the results of a complete census. For example, in a relatively small sample survey, more attention can be devoted to the selection, training, and supervision of interviewers than would be feasible for a much larger operation. Consequently, more careful measurements can be made for each particular case in the sample by spending more time on it and by concentrating the attention of the more adequately trained staff that is available.

With reference to the limitations of sampling, it is important to note that a sample selected on sound principles to represent a small subgroup with a satisfactory degree of reliability proves to be relatively large and hence the savings in cost as compared to complete enumeration, are relatively small in such cases. It is, therefore, desirable to use complete censuses where results of high accuracy are needed for small areas or for very detailed classes of the population. Complete censuses brought up to date from time to time are also useful in providing the background for the design of efficient samples, e. g., such background items as the distribution of manufacturing establishments by industry, location, and number of employees, or the distribution of the population by small areas and by such characteristics as age, sex, race, residence, family status, and occupation or industry. The proper combination of complete censuses and sampling surveys provides the most satisfactory statistical background for understanding the characteristics of the population of the United States and its economic development.

Further explanation and elaboration of this subject of sampling can be found in statements entitled "Sample Surveys versus Censuses" and "Obtaining Results Sooner at Lower Cost" which are included in the exhibits to the report, Appraisal of Census Programs, of the Intensive Review Committee, pages 842–849.

Miscellaneous Comments and Statements Received for the Record

National Planning Association,
Washington, D. C., February 9, 1955.

Hon. Paul H. Douglas,
Senator from Illinois, United States Senate,
Washington 25, D. C.

Dear Senator Douglas: At this morning's hearings I heard you say that you thought that the gross national product (GNP) is not the best possible measurement of economic activity as a whole and, if I understood correctly, you expressed preference for the national income.

I do agree with your notion that there is an element of double counting in the GNP. The prices of all goods include an allowance for depreciation. In addition, the GNP measures the output of producers' goods used as replacements. To the extent, therefore, that depreciation allowances are used for financing the purchase of producers' goods for replacement we have double counting in the GNP estimates. On the other hand, I see an even more serious deficiency in the concept of national income as used by the Department of Commerce. National income not only excludes depreciation but also indirect business taxes, which amount to about $30 billion. This is apparently done on the assumption that indirect business taxes are shifted forward and thereby are reflected in the price level. For measuring the development of actual production we use deflators. Thereby, we eliminate a price rise which is caused by additional business taxes. To the extent that business taxes are shifted backward they are not reflected in incomes or prices. Therefore, the national income estimate does not reflect those Government activities which are financed by business taxes. (There is a controversy as to whether it is proper that certain Government purchases of goods and services enter the GNP. Some of the Government purchases are, so to speak, intermediate goods, the value of which is reflected in consumer and producers' goods.)

Whatever the merits of this argument are, there is no reason to disregard a part of Government activities equal to the amount of indirect business taxes. In the light of the great uncertainty as to which Government services should be regarded as intermediate and which as final goods, I would think that we would be making a lesser error if we included all taxes in our measurement of the total of all private and Government activities. The concept I would prefer is what the Department of Commerce has called the net national product. This is the GNP minus depreciation.

I have made this point repeatedly in my own writings on national economic accounting. However, in practical statistical work I have continued to use the GNP in spite of my knowledge that it has this element of double counting in it. The reason is simply that the GNP concept is now so generally used that I think it would create confusion if, for reasons of professional perfectionism, one individual uses a concept which is not generally known. And I do not think that we are reaching any wrong conclusions by the use of the GNP as a frame of reference for studying the rate of economic growth or for comparing total production among various countries or the economic structure of various countries. Nevertheless, I think it is important that the economists and statisticians do not forget that there is that element of impurity in the measurement they are using. That is the reason I welcomed very much your making this point at the hearings.

Very truly yours,

Gerhard
Gerhard Colm.

United Textile Workers of America,
Washington, D. C., January 27, 1955.

Hon. Paul Douglas,
Chairman, Joint Congressional Committee on the Economic Report,
Senate Office Building, Washington, D. C.

Dear Senator Douglas: In February 1954, we submitted a detailed comprehensive report on the textile industry to the members of the Joint Committee on the President's Economic Report. In that report, as per the enclosed copy, we opened with the statement that we could not tell your committee if our national economy was headed for a depression, but we did know that the textile industry was depressed.

Nothing has happened within the past year to change this situation. In fact, the chaos in the industry has been aggravated by mergers, migrations and monopolistic tendencies; about 150 textile firms, employing more than 50,000 workers, have been merged during the past 13 months. Among the largest mergers, consolidations, and absorptions in the textile industry during the last year were Burlington Mills' acquisition of Pacific Mills, Goodall-Sanford and Interstate Hosiery Mills; Textron's merging of interests with American Woolen and Robbins Mills; Lowenstein's purchase of Wamsutta; and United Merchants and Manufacturers' purchase of A. D. Juilliard & Co.

The bulk of this production has been transferred from union textile centers to nonunion areas of the South, and some of it to Puerto Rico; wages have been reduced, and the Walsh-Healey modest minimum wages determined by the Labor Department are still tied up in the courts with no prospects of any early decision.

The President has recommended a substandard minimum wage of 90 cents per hour, which has given encouragement to nonunion textile employers in the continuance of "cutthroat" competition. In addition, the textile industry is gravely concerned with a foreign trade policy which would increase unemployment.

With reference to general business conditions and prospects in textiles, I wish to quote herewith a current analysis, recently published by Standard and Poor's:

"PROBABLE PATTERN

"Despite a trend toward more efficient operations, overcapacity remains a problem in this industry, which has a comparatively well-defined cycle of roughly two years from trough to trough. Since trade statistics in this field are neither as current nor as complete as might be desirable and there are numerous small operators, the tendency is for improvement in demand, such as that witnessed recently, to be pyramided along the line. Hence, supplies mount in a relatively short time, leading to overaccumulation of inventories.

"It is our belief that the present upswing in the textile industry will be comparatively short-lived, with another decline starting perhaps in the third quarter of this year. The second quarter may be the best this year from a volume and profits standpoint."

In view of the conditions I have mentioned, and others not enumerated, I respectfully suggest that this industry, the most seriously affected by unemployment and other adverse circumstances, should be given special treatment by Congress. I have been authorized by our executive council to urge upon your committee the advisability of an investigation or a study of the textile industry.

We are dealing here with an industry employing around 1 million production workers; a prime essential and a strong arm of our defense program, with wages 46 cents lower than the gross hourly average—$1.36 for textiles and $1.82 for all factory workers.

Congress would render a necessary and distinct public service by taking a close look at the worst segment of our industrial economy.

I am sending copies of this communication to all members of the Joint Committee on the President's Economic Report, and we would appreciate a favorable response at your earliest convenience.

Very truly yours,

ANTHONY VALENTE,
International President.

STATEMENT OF ANTHONY VALENTE, INTERNATIONAL PRESIDENT, UNITED TEXTILE WORKERS OF AMERICA, AFL

We cannot tell you if our national economy is headed for a depression or for prosperity—we do not know. We can tell you that the textile industry is depressed, and all available sources of information will support this statement. In almost every report received from State and Federal agencies handling employment figures, you will find the decline in textiles pronounced and heavy in varying degrees.

We are dealing with an industry employing approximately 1 million workers, with about 8,000 mills spanning and crisscrossing the Nation from coast to coast and from border to border. For statistical purposes, the Department of Labor divides the industry into regions such as New England, the Middle Atlantic, the Southeast, the Southwest, the Great Lakes, the border States, and the Pacific. Attached hereto is a list of the States within each of these categories (exhibit A).

For the purpose of this statement, I will attempt to simplify our explanation by treating chiefly with the 2 regions employing almost two-thirds of the textile working force—the Southeast and New England; and with 2 branches of textiles—

cotton and synthetics and woolen and worsteds. At the same time I want to emphasize, however, that the employment conditions which I bring to your attention herein exist throughout the industry and not only in the Southeast and New England.

The unemployment and underemployment in textiles takes on a more serious aspect when we consider that in numerous communities in New England and in the South textiles is the principle industry, and, in many towns, the only means of employment. That is one of the reasons why we have struggled to have Government contracts channeled into distressed areas, a policy supported by President Eisenhower in his announcement of Tuesday, December 29, 1953. We know, of course, that even if this policy was carried out to the letter, it would not solve the textile-employment problem. But it would help if procurement officials would carry out the directives of the Office of Defense Manpower.

Without discussing this issue in detail, I am attaching hereto pertinent material bearing on the subject (exhibit B). I wish only to add that we are receiving numerous pleas from the South, and in particular from Senator Maybank's State of South Carolina (exhibit C), for allocation of contracts. The Senator, as you know, is leading the opposition to the President's directive for aid to distressed areas.

NEARLY ONE-HALF MILLION UNEMPLOYED OR UNDEREMPLOYED

Our reports from the field give us a breakdown of employed, unemployed, and underemployed. Our estimates do not agree with Government textile figures, which show a complete separation of approximately 100,000 workers in the year 1953. Our spotcheck reports from all regions indicate the separation of 125,000 workers, with the figure still rising. It should also be mentioned that Government surveys do not include the underemployed or part-time workers. Our survey leads us to the conclusion that about 375,000 textile workers are working 2, 3, or 4 days a week. While there have been some mill closings in the South, the chief cause of distress in that region is part-time employment.

We can also state that more than 45 percent of the present working force are employed part time with further curtailments in prospect. The average weekly hours in New England and the South are now down to 36, according to our representatives' estimates. To get a clear picture of what this means we must, of necessity, discuss wages and conditions.

In December 1953, the average hourly wage for all manufacturing was $1.79, as compared to $1.37—or 42 cents less—for over 1 million textile workers. This industry, second only to food as an essential one, is close to the bottom of the industrial wage ladder. This industry, which has reached the highest point in man-hour productivity, is on the low level of consumer demand.

The tremendous gain in man-hour production can be visualized by a concrete example. With all the textile migrations, liquidations, and employment losses in New England, that region is producing more textiles today than it did in 1920.

Right here we bring our problem into focus, not with the words of labor representatives but in the work and studies of Paul Mazur, a recognized authority, economist, banker, and financial adviser. In his recent book, The Standards We Raise, Mr. Mazur answers the question, "How can we secure a rising level of prosperity at a time when recession threatens?" He calls for a shift of emphasis from production to consumption with an increase in living standards.

In this connection we can tell you that 1 million textile workers, comprising a family consumer power of 5 million people, are unable to satisfy their wants and requirements. In many cases they are denied even life's necessities and are forced to eke out a meager existence because of low wages and insecure employment conditions. In our experience we have known the bread winner of the family, the weaver of sheets, who could not afford to put sheets on his bed. We cite this fact in our effort to convince the committee that the basic cause of unemployment is underconsumption, and this Congress should not adjourn without prescribing measures for the stimulation of purchasing power and increased consumer demand.

MINIMUM WAGES

We will not attempt to analyze the President's Economic Report and recommendations to Congress. Our comment is directed to the failure of the President to recommend an increase in the minimum wage. Here was an opportunity to invoke a living wage and an increase in purchasing power for millions of workers, thereby stemming the tide of unemployment. Congress can and should do this. In times such as these, a waiting game can be tragic. No one, in or out of Congress, who has never experienced the plight of the unemployed can realize the physical deprivation and mental torture of the victims. It will be a calamity if Congress closes its eyes and hearts to this problem and leaves Washington with the false notion that this economic dislocation will right itself.

On the same day the President bypassed an increase in the minimum wage under the Fair Labor Standards Act, the Secretary of Labor handed down the long-awaited decision increasing the minimum wage for the woolen and worsted industry from $1.05 to $1.20, under the Walsh-Healey Public Contracts Act. This followed the decision of the late Secretary of Labor, Maurice Tobin, on January 15, 1953, increasing the cotton and rayon minimum from 87 cents to $1. This wage determination was enjoined by a group of Southern textile manufacturers, and the issue is now gathering dust in the courts while hundreds of thousands of low-paid workers are deprived of their rightful wages. The minimums in these industries had not been raised for 5 years. During that time living costs soared to the highest point.

The $1 an hour minimum was blocked with the aid of the Fulbright amendment, a rider added to the Defense Production Act in 1952, paving the way for court actions, weakening Walsh-Healey legislation and administration, and causing endless delays which practically nullifies minimum standards and freezes wages at subnormal levels in Arkansas, Mississippi, and other Southern States.

The cotton and rayon and woolen and worsted mills in New England and the Middle Atlantic States have been, and are now, paying these prescribed minimum wages. A few cotton and rayon mills in the South are also paying the minimum, but 500,000 unorganized Southern textile workers have no protection either from the Government or the union and we are prevented from organizing by the unfair provisions of the Taft-Hartley Act and by a conspiracy of opposition as demonstrated in one instance by the attached letter received from the chamber of commerce of Orangeburg, S. C. (exhibit D).

This denial of organizational rights is a valid reason to urge Congress to act against this attack on minimum standards as a means of reemployment, decent working conditions, and increasing consumer demand. In addition, Congress can ease the misery of unemployment by accepting and passing the President's recommendations for increased unemployment insurance and lengthening of the time period.

We also recommend a minimum wage of $1.25 an hour under the Fair Labor Standards Act, and a reduction of the 40-hour workweek as a compensatory measure for increased man-hour productivity. The textile industry is in dire need of immediate congressional regulatory action. We, therefore, urge your support of H. R. 574, the national textile bill now before Congress.

We recommend to you a study of the textile industry made by the Conference of New England Governors in 1952, as well as a series of three speeches delivered in the Senate by Senator John Kennedy. Also attached hereto are two articles taken from a textile trade paper, one dealing with unemployment insurance claims in the Southern textile States (exhibit E), and the other a reference to the closing of 4 mills in the State of North Carolina (exhibit F).

In closing, we respectfully urge serious consideration and favorable action on the part of Congress to the unemployment problem in the textile industry.

Exhibit A

Textile Designated Regions With Breakdown Into States

New England: Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.
Middle Atlantic: New Jersey, New York, and Pennsylvania.
Border States: Delaware, District of Columbia, Kentucky, Maryland, and West Virginia.
Great Lakes: Illinois, Indiana, Michigan, Minnesota, Ohio, and Wisconsin.
Southeast: Alabama, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia.
Southwest: Arkansas, Louisiana, Oklahoma, and Texas.
Pacific: California, Nevada, Oregon, and Washington.

Note.—There are textile plants in States not mentioned here. The BLS textile surveys omit plants with less than 21 workers.

Exhibit B

Surplus Labor Areas

In connection with the set-asides of Government contracts for distressed areas, we reported last month that out of 42 designated surplus-labor areas, 25 were south of the Mason-Dixon line. Only three in New England: Lawrence and Lowell, Mass.; and Providence, R. I.

This was our reply to the unfortunate attempt by Senator Maybank and others, to inject sectionalism into the effort to provide Government contracts for idle workers in distressed areas. Since then we have had scores of messages from the South, including the State Mr. Maybank represents in the United States Senate, South Carolina. These letters and resolutions explain the unemployment situation and plead to be included in the set-aside policy.

GOVERNMENT CONTRACTS

On Monday, January 25, at a conference with Secretary of Labor Mitchell, he told us that the employment classifications had been changed for release the next day, and while he agreed with us and President Eisenhower on the policy of channeling Government contracts to distressed areas, our membership should understand that Government contracts have been greatly reduced during the past year. We knew about the reductions but we expect the procurement agencies to carry out the President's directive and report on what is being done to provide work for the unemployed.

The international officers will meet with the officials of the Defense Mobilization Agency in the effort to secure all available contracts for distressed unemployment areas.

In the woolen and worsted minimum-wage decision, handed down on January 28, the Secretary announced that from May 1951, through March 1953, a total of 696 Government contracts subject to the Public Contracts Act, of a total value of $516,023,000, were let for products of the woolen and worsted industry.

In the new surplus labor classifications, 9 more areas have been added to the 42 named in the November listings. These are the areas now listed in group IV as the most seriously effected by unemployment:

Lawrence, Mass.
Lowell, Mass.
New Bedford, Mass.
Webster, Mass.
Providence, R. I.
Atlantic City, N. J.
Gloversville, N. Y.
Mayaguez, P. R.
Ponce, P. R.
San Juan, P. R.
Cumberland, Md.
Asheville, N. C.
Durham, N. C.
Winston-Salem, N. C.
Altoona, Pa.
Clearfield-DuBois, Pa.
Indiana, Pa.
Johnstown, Pa.
Pottsville, Pa.
Scranton, Pa.
Middlesboro-Harlan, Ky.
Paintsville-Prestonburg, Ky.
Harrin-Murphysboro-West Frankfort, Ill.
Kenosha, Wis.
Texarkana, Tex.-Ark.
Sunbury-Shamokin-Mt. Carmel, Pa.
Uniontown-Connellsville, Pa.
Wilkes-Barre-Hazleton, Pa.
Big Stone Gap-Appalachia, Va.
Covington-Clifton Forge, Va.
Beckley, W. Va.
Fairmont, W. Va.
Morgantown, W. Va.
Parkersburg, W. Va.
Point Pleasant, W. Va.
Ronceverte-White Sulphur Springs, W. Va.
Gadsden, Ala.
Jasper, Ala.
Cedartown-Rockmart, Ga.
LaFollette-Jellico-Tazewell, Tenn.
Newport, Tenn.
Muskegon, Mich.
Corbin, Ky.
Hazard, Ky.
Madisonville, Ky.
Pikeville, Ky.
Ionia-Belding-Greenville, Mich.
Terre Haute, Ind.
Vincennes, Ind.
Albuquerque, N. Mex.
Tacoma, Wash.

Exhibit C

Resolution unanimously adopted by South Carolina Textile Council composed of all affiliated local unions in South Carolina of the United Textile Workers of America, American Federation of Labor, on Sunday, January 31, 1954.

RESOLUTION

Whereas the President of the United States has directed the Federal procurement agencies to negotiate contracts with firms in labor surplus areas at prices established through competitive formal bidding procedures; and

Whereas this revised manpower policy seeks to encourage prime contractors to award subcontracts to firms in labor surplus areas, in order to help relieve distress and furnish work; and

Whereas we have gone over carefully the designated areas as classified by the Department of Labor as of January 26, 1954, and find that out of 140 designated labor surplus areas, 57 are in the South; and

Whereas we along with other interested groups are seeking to have additional areas in the South added to this list, due to continued and widespread unemployment; and

Whereas we have followed the bitter fight of Senator Burnet R. Maybank of South Carolina against this Defense Manpower Policy of the President; and

Whereas we emphatically deny that the workers in South Carolina are satisfied with conditions; or the attitude of Senator Maybank: Now, therefore, be it

Resolved, That, we the United Textile Workers of America-AFL and all affiliated local unions in South Carolina, respectfully request Senator Burnet R. Maybank to cease his fight against this defense manpower policy, which, if carried out, will enable many of us in South Carolina and throughout the South to work and earn a living for our families; and be it further

Resolved, That we respectfully request Senators Maybank and Johnston, and all Congressmen from South Carolina to use their influence in support of this defense manpower policy; and be it further

Resolved, That a copy of this resolution be sent to all Members of Congress and Senate from South Carolina, to all Members of Congress and Senate from the States wherein any area has been designated as a labor surplus area, a copy to the President of the United States, Vice President of the United States, to the Speaker of the House, and copies to the International Office of the United Textile Workers of America, affiliated with the American Federation of Labor.

SOUTH CAROLINA TEXTILE COUNCIL,
JAMES SMITH, *President*,
C. H. PEARSON, *Secretary-Treasurer*.

EXHIBIT D

Following is a copy of a letter which was mailed by the Chamber of Commerce of Orangeburg, S. C., to the employees of a packinghouse in that city in October, 1953.

DEAR ——— ———: It has been reported to us that you are actively supporting the union in its attempt to organize the Southland Provision Co.

We would not care whether the company was unionized or not, if it were not for the fact that we are afraid that this union activity will result in Orangeburg losing a payroll of about one-half a million dollars and about 175 Orangeburg citizens losing their jobs.

Union activity has already caused Orangeburg to lose one industry this year.

The merchants and citizens of Orangeburg are requesting us to circulate after the election, the names of those who tried to help the union and hurt Orangeburg. We intend to do this.

The merchants and citizens of Orangeburg feel that those who help run industry away from Orangeburg and who cause Orangeburg to lose the benefits of large payrolls should not be given any special privileges in the future in the way of job preference, credit, etc.

For this reason, if you are not active for the union, please notify us so we will not do you the injustice of putting your name on the black list.

Sincerely yours,

——— ———.

EXHIBIT E

[From the Daily News Record (textile trade paper) Thursday, January 21, 1954]

THE PULSE OF THE MARKET

RISE IN UNEMPLOYMENT INSURANCE CLAIMS SAID TO SHOW EXTENT OF CURTAILMENTS

Unemployment insurance claims in a number of key textile-producing States are said to emphasize the extent of curtailment and shutdowns. In many merchandising centers in the New York market, there is a tendency to discount reports of curtailment. However, Government figures on applications for unemployment insurance filed for the week ended January 9 are said to point up the reduced operations.

While the Government figures cover all industry, it is pointed out that textiles represent a major producing element in certain States.

Total claims for unemployment, and the increases in unemployment insurance claims, in some textile-producing States as reported by the United States Department of Labor, for the week ended January 9, are:

State	Total	Rise from previous week	State	Total	Rise from previous week
North Carolina	23,733	12,037	Alabama	6,151	2,499
Pennsylvania	56,455	9,045	South Carolina	6,765	3,657
Virginia	7,912	4,279	Georgia	7,560	3,127

The report notes that "administrative factors, layoffs due to inventory taking, lack of orders, production changes, particularly in the textile industry, accounted for the increase in North Carolina."

EXHIBIT F

[From the Daily News Record (textile trade paper)]

FOUR NORTH CAROLINA MILLS CLOSE, ONE LIMITS OUTPUT

GASTONIA, N. C., February 1.—Five textile plants in and around Kings Mountain employing more than 700 have halted operations or are running on limited schedule.

Although termed "seasonable" declines by some executives, it is believed by others to be worse. One textile man remarked it was a hand-to-mouth situation, with customers demanding immediate shipment.

A check at Kings Mountain revealed that Bonnie Cotton Mills, with about 100 employees, is closed because of lack of orders and to make machinery installations. It expects to resume operations soon on a 3-day basis. Consolidated Textiles, Inc., with a payroll of 285, is operating on a week-on-week-off basis.

Other plants that have closed because of lack of orders are Slater Manufacturing Co., with 60 employees; Kings Mountain Manufacturing Co., with 115; and Freida Manufacturing Co., at Crowders Mountain, recently purchased by Carlton Mills, Inc., with 150.

NATIONAL PLANNING ASSOCIATION,
Washington 9, D. C., December 23, 1954.

Hon. JESSE P. WOLCOTT,
Chairman, Joint Committee on the Economic Report,
Congress of the United States, Washington 25, D. C.

DEAR REPRESENTATIVE WOLCOTT: On behalf of the board of trustees of the National Planning Association and its committee of New England, it is my pleasure to transmit herewith a report entitled "The Economic State of New England." This report grew out of the favorable national reaction to a special report (The Impact of Federal Policies on the Economy of the South) prepared under the auspices of the National Planning Association's committee of the South, which was issued in July 1949 as a joint committee print.

In December 1949 the joint committee asked the NPA to organize a committee of New England for the purpose of making an impartial report concerning the impact of Federal policies on the New England economy.

In accepting the request to set up a committee of New England to make the study, the NPA stressed that, in accordance with its established procedures, the committee members would be drawn from a cross section of leaders from all parts of the area, who would be broadly representative of the varied interests of New England. NPA emphasized that the success of such a study depended in large measure on the support and cooperation of the local people.

On November 13, 1950, following almost a year's preparatory work and consultation with public officials and private citizens of the region, NPA held an organizing meeting. The committee, headed by Dr. Leonard Carmichael, is composed of 95 leaders active in the region's agriculture, business, manufacturing, labor organizations, educational and financial institutions, Government agencies, and press and radio.

A research advisory committee of 35 distinguished social scientists headed by Dr. Sumner H. Slichter counseled the staff. At the initial meeting the committee decided to broaden its objective and conduct "an honest self-appraisal of New England's economic problems on which strong, effective action could be based."

The committee itself participated actively in the study through seven study panels. Each of the sections which make up The Economic State of New England has been approved for publication by the appropriate committee study panel. Thus, through the panels, the research staff was given the benefit of the experience and knowledge of the distinguished leaders on the committee. The first director of research was Arthur A. Bright, Jr., of the Federal Reserve Bank of Boston, who died in May 1953. The work he initiated was completed by George H. Ellis, Dr. Bright's successor at the bank.

The completion of this report provides the joint committee with a comprehensive survey considerably broader than indicated in the original request concerning Federal policies. Because of its impartial approach and the support it received from many different segments of the economy, it is believed that the study will be useful for some years to come for all who wish to understand the New England economy.

I attach a copy of a letter which Dr. Carmichael has received from Gov. John Lodge, chairman of the New England governors conference.

The relationships between the Federal Government and New England are many and varied; therefore, the committee considered it best to treat them in the context of its entire report on the economy of New England. On the other hand, the committee is mindful that the original interest of the joint committee was limited to an investigation of the impact of Federal policies in the region. Dr. Carmichael intends, therefore, to explore the possibility of obtaining from the committee a statement setting forth the principal matters of Federal policy and any recommendations that the committee may have concerning the relationships between the Federal Government and New England.

Meanwhile, we wish to point out that The Economic State of New England is divided into 20 sections. These include The Forests of New England; The Fisheries of New England; Agriculture in New England; Minerals and New England; Water, Fuel, and Energy in New England; New England's Vacation Business; the People of New England and Their Employment; Employment Fluctuations in New England; Wages in New England; Labor-Management Relations in New England; The Financial Resources of New England and Their Use; Freight Rates and New England's Competitive Position; The New England Transportation System and Its Use; New England's Industrial Management; Technical Research in New England; New England's Financial Relations With the Federal Government; State and Local Taxation and Expenditures in New England; Business and Economic Information in New England.

The remaining two sections are interpretive. They are Transitions in New England, which traces the economic history of the region, and Goals for New England, which makes recommendations for the future.

Sincerely yours,

H. Christian Sonne.

State of Connecticut, Executive Chambers,
Hartford, December 14, 1954.

Dr. Leonard Carmichael,
Secretary, Smithsonian Institution, Washington 25, D. C.

Dear Dr. Carmichael: The New England governors conference, meeting in Boston on November 18, last, received through Dr. George H. Ellis, a very interesting summary of The Economic State of New England. The thoroughness, competence, and usefulness of that report are evident, and the governors wish to extend this expression of their appreciation to you and to all the members and staff of the committee of New England of the National Planning Association.

We are deeply impressed by the contributions of research guidance, technical information, and financial support freely provided by the committee members and other participants in this study. The standards of technical accuracy and soundness of judgment achieved in this study provide a solid basis for evaluation of proposals for advancing New England's economic welfare.

On behalf of the governors of New England, I want to express through you to all concerned in this notable project the thanks of the people of New England.

Sincerely yours,

JOHN LODGE,
Chairman, New England Governors Conference.

JANUARY 20, 1955.

Hon. GEORGE M. HUMPHREY,
Secretary of the Treasury,
Washington 25, D. C.

DEAR MR. SECRETARY: The Joint Committee on the Economic Report begins its hearings on the President's Economic Report on Monday, January 24. An important element in the economic picture is the Federal budget. As you are aware, neither the President's budget message nor his Economic Report spells out the economic assumption which underlie the estimates of receipts which are included in the budget. Our committee, of course, needs this information in order to reach some judgment of the budget and its economic impact.

In the past, the information has been given in our committee hearings. For example, last year you appeared before the committee on Tuesday, February 2, accompanied by the Honorable Marion B. Folsom, the Under Secretary of the Treasury. At your request, he responded to a question of Chairman Wolcott as follows:

"Mr. Chairman, our estimates, as the Secretary has indicated, are based on the assumption that business and employment and income will continue substantially at the present high level. First, corporation profits are the most variable factor with us and the most difficult to estimate. In the Economic Indicators, this publication you get out each month, the latest figures from that show that in 1952 corporation profits before taxes were $39.2 billion. That is for the year 1952. For 1953, the first quarter, they were estimated at an annual rate of $44.6 billion; the second quarter, $45.9 billion; the third quarter, $43.3 billion. That is an average for the first 9 months of $44.6 billion a year.

"We estimate that the year 1953 as a whole will be close to $44 billion. Our assumption for corporate profits for the year 1954 * * * is $43 billion.

"On personal income, the same document shows that the total personal income has fluctuated, in July of 1953 through November 1953, between $287.5 billion and $285.4 billion. We are assuming in our estimates a personal income of $285 billion" (hearings before the Joint Committee on the Economic Report on the January 1954 Economic Report of the President, 83d Cong., 2d sess., pp. 55–56).

We would like to have by Tuesday, January 26, a similar statement as to the specific economic assumptions underlying the 1956 budget so that these may be entered into the record.

Sincerely yours,

PAUL H. DOUGLAS,
Chairman, Joint Committee on the Economic Report.

P. S.—A further question. The budget message of the President in January 1954 estimated budget receipts for fiscal 1955 at $62.7 billion and the deficit at $2.9 billion. The budget message this January shows an estimate of receipts of $59 billion and a deficit of $4.5 billion for the same period. How much of the reduction in the estimate of budget receipts and of the increase in the deficit for fiscal 1955 results from (1) tax reductions beyond those recommended by the President; (2) decline of personal income and corporate profits from the levels assumed last January; (3) changes in estimates of expenditures; and (4) other factors?

THE UNDER SECRETARY OF THE TREASURY,
Washington, January 25, 1955.

Hon. PAUL H. DOUGLAS,
Chairman, Committee on the Economic Report,
Room 10B, Senate Office Building,
Washington 25, D. C.

MY DEAR MR. CHAIRMAN: This is in reply to your letter of January 20 requesting information concerning the economic assumptions used in estimating net budget receipts for the President's budget message of January 17, 1955, as well as an explanation for the difference between the current estimate for the fiscal year 1955 and the estimate shown in the budget message of January 21, 1954.

As you know, the two most important basic assumptions used in our estimating procedure are personal income and corporate profits. Current estimates assume personal income, as defined by the Department of Commerce, of $286.5 billion and $298.5 billion in the calendar years 1954 and 1955, respectively. Corporate profits, as defined by the Department of Commerce, are assumed to be about $36 billion in calendar 1954 and $38.5 billion in calendar 1955.

The current estimate of net budget receipts for the fiscal year 1955 is $59 billion. This is a decrease of $3.6 billion from the estimate of $62.6 billion made in January 1954. The Excise Tax Reduction Act of 1954 accounts for $1 billion of this difference. Another $100 million is due to the fact that the general tax revision bill, as finally enacted, reduced the revenues by $1.4 billion as compared with an estimate of $1.3 billion used in January 1954.

A decrease of $1.9 billion in corporate tax receipts is due to a lower estimate of corporate profits for the calendar year 1954 than that originally assumed. As I indicated before your committee, the original assumption for corporate profits in 1954 was $43 billion based on a continuation of the profit levels then assumed to prevail at the end of 1953. In July 1954 the Department of Commerce corporate profits series was revised downwards for the entire period since the series was started in 1929. The reduction in the 1953 profits figure was $2.5 billion. This had the effect of reducing the $43 billion estimate to $40.5 billion on the new basis.

Furthermore, it became apparent as the year 1954 developed that corporate profits in 1954 would be appreciably lower than they had been in 1953. This was reflected in estimates made during the year by the Department of Commerce and the Council of Economic Advisers and also by the very substantial reduction in corporate profits in the fourth quarter of 1953, as compared to the first 9 months of 1953. The first estimates for the last quarter of 1953 were not made until after the budget had been prepared and submitted in January 1954.

By contrast to the change in the estimate of corporate profits, you will note that the current estimate of personal income of $286.5 billion is very near to the original assumption of $285 billion.

Another $200 million of the decrease in estimates of net budget receipts is attributable to changes in the estimate of miscellaneous or nontax receipts. The remaining difference of $400 million reflects adjustments, based upon the most recent experience, in the statistical relationship of tax receipts to various parts of the national income.

For the foregoing reasons, the estimate of net budget receipts for the 1955 fiscal year has now been revised downward by $3.6 billion to $59 billion. However, due to a cut in estimated spending from $65.6 billion to $63.5 billion, the estimated increase in the deficit is only $1.6 billion, or considerably less than the estimated decrease in receipts.

I hope this information will meet your needs.

Sincerely yours,

M. B. Folsom,
Under Secretary of the Treasury.

Congress of the United States,
House of Representatives,
Washington, D. C., February 10, 1955.

Mr. John W. Lehman,
Joint Committee on the Economic Report,
Senate Office Building,
Washington 25, D. C.

Dear Mr. Lehman: I am transmitting, herewith, a statement by Mr. Frank Lily, research statistician, Spokane, Wash., for consideration by the joint committee during the current hearings.

Kindest regards and best wishes.

Sincerely,

Walt Horan, *Member of Congress.*

Members of the Joint Committee on the Economic Report:

Gentlemen: This statement of Views on the Economic Report which I am submitting for the hearings for research groups is based on more than 40 years of research work in a variety of social, business and financial fields. For most of that time my primary interest has been metal mining and monetary statistics. Presently I am reserach statistician for the mines research bureau of Spokane and president of the American Constitutional (Hard Money) Association.

Disraeli is quoted as saying, "I hate definitions," and I think most people hate them because definitions limit their tendency to generalize and disregard semantics. Be that as it may, I propose at this juncture to define the two principal words in the subject of the hearings; namely, research and economics, thereby limiting myself to the definite meanings as given in the dictionary.

Research: re, again; kercher, to seek, examine anew. Examine, in turn: ex, out; agere, to weigh in the intellectual balance.

Economics; science of the production, distribution and consumption of wealth; economist: an expert in economics, one who expends money, time or labor judiciously and without waste.

There is no place in research or economics for prejudices, desires, attachments, hopes, fears or even ideals. Facts, good or bad, must be faced squarely and evaluated without bias.

It is a wholly fair assumption that both the President and his Council of Economic Advisers welcome the reweighing in an "intellectual balance" by Members of Congress, research and economic groups and the public.

Unavoidably perhaps in a public document, the Economic Report generalizes rather broadly in statements with regard to "A high and rising standard of living brings to more of our people the opportunity for continued intellectual and spiritual growth," which calls up the observation that while it brings more opportunity we actually have more crime in proportion to our population than countries having much lower (economic) standards of living. Evidence that "high and rising standards of living" do not of themselves provide economic stability is found in the history of the great civilizations of the past.

Greece, Rome and numerous other countries of the past enjoyed during their early and middle stages "free institutions". Their people were ambitious, skilled, enterprising and patriotic. Their populations also increased as ours is presently doing, their educational levels rose, their skills improved, et cetera, et cetera. These, however, were not enough to assure "continuation of economic growth" which the Economic Report boldly, and I hope accurately, predicts for this country.

No one will question that the role which the Government should play is "to create an atmosphere favorable to economic activity by encouraging private initiative" and to "widen opportunities for less fortunate citizens". But the facts are that initiative in private business is so limited by taxes that no young man of today can reasonably hope to establish a business and build it from the ground up without outside capital.

The statement that "Fiscal and monetary measures foster an expectation of improving economic conditions and encourage people to maintain a high rate of expenditure" puts the emphasis on spending, and that is, of course, exactly what the public is doing with the result that personal debts are being incurred with little or no regard to an "inevitable rainy day" and the waste in both money and morals involved in unpaid debts.

The various indirect references to the growth of our Nation's economy entirely omits any mention of the tremendous growth on the "tares" of personal, corporate, municipal and national debt that have been sown widespread throughout the land. Few people realize that our national debt exceeds the combined debt of the rest of the world.

The possibility that "our country can within a decade increase its production from the current annual level of about \$360 billion to \$500 billion" means little or nothing if the dollar continues to lose about 5 percent of its purchasing power each year as it has done each year since 1939. The fact that there is now approximately \$30 billion of currency in circulation as compared with \$7 billion in 1939 merely means that it now takes over 4 times as much currency to run our economy and does not mean that we are 4 times better off or even as well off. Our national debt in the meantime has risen from around \$40 billion to \$278 billion and is still to increase.

The real danger in the national debt picture is not so much in the amount or the annual interest which aggregates over \$6 billion, but in the fact that the larger part of our stock of money is monetized national debt. Evidence of this is found in the fact that although United States Treasury gold holdings are now less than they were at the end of 1939 our stock of currency has increased by approximately \$30 billion and exceeds our Treasury's gold holdings by over \$32 billion.

Incidentally, the economic report makes no reference to the fact disclosed by Deputy Secretary of the Treasury Burgess that, as of January 31, 1954, total Treasury gold holdings were for the first time since the boom-and-bust year of

1929 less than the amount required under the law as a reserve for Federal Reserve notes and to meet potential conversion of foreign short-term dollar balances which, by the way, are now substantially higher than last February.

Another matter in this connection that has not been mentioned is that foreigners are estimated to hold some $10 billion in United States currency or its equivalent in Government bonds; which they as foreigners could convert into gold although this privilege is denied to American citizens. This is a contingency that must be acknowledged as potentially dangerous to our economy. It is fundamental that (1) no country can be more sound than its economy, (2) no economy can be more sound than its country's money, (3) no money can be sound that is not as good as gold. And the only money good as gold is either gold coin or money that can be converted into gold coin. This, by the way, is the "honest" constitutional money promised by President Roosevelt and also in the Republican platform adopted in Chicago. No reference to either promise is made in the economic report.

This is neither the place nor the time to enter into a discussion of the merits and demerits of the gold standard. Suffice it to say that such a standard would not be a panacea for every economic ill, because it is not reasonable to expect it to do what no religion has ever done—protect mankind against greed and man's inhumanity to man.

In this connection, I quote from a statement made by economist W. Randolph Burgess when he was chairman of the executive committee of the National City Bank of New York:

"Historically one of the best protections of the value of money against the inroads of political spending was the gold standard—the redemption of money in gold in demand. This put a checkrein on the politician. For inflationary spending led to the loss of gold either by exports or by withdrawals by individuals who distrusted government policies. This was a kind of automatic limit on credit expansion. It limited the area of money management. The power to redeem money in gold also gave the people confidence in the soundness of their money.

"Of course the modern economic planners don't like the gold standard just because it does put a limit on their powers. They argue with some cogency that a gold drain may impose credit restrictions just at a time when the country is in depression and credit restriction is undesirable. There are two answers to this. One is that even under the gold standard there are large areas for money management, as was amply demonstrated in the United States in the twenties. The second point is that politically managed money is almost always too liberal and almost never puts the brakes on expansion early enough or firmly enough. It is so easy for the desire to finance the Treasury cheaply to interfere with tightening credit when the welfare of the people will be served by resisting inflation. These political and human considerations are the real reason why we need the gold standard.

"I have great confidence that the world will return to the gold standard in some form because the people in so many countries have learned that they need protection from the excesses of their political leaders."

There is, I believe, a general agreement among economists that inflation is still the No. 1 threat to our economy and American way of life but I find nowhere in the Economic Report any suggestion as to what can or should be done about this problem. On the other hand, the report recommends an increase in the national debt limit which, if we can judge by past experience, means further deflation of the dollar by inflation.

Historical researchers of the reasons for the fall of the great civilizations of the past agree that debt was the principal factor. Incidentally, the regimented and controlled economic policies enacted and used by Rome were remarkably similar in all essential respects to recent laws and controls in this country.

It is my understanding that this hearing is being conducted primarily for the purpose of examining the Economic Report and not for the purpose of receiving recommendations for legislation in connection with monetary reform and the halting inflation which is the responsibility of the President's Economic Advisers. I am, therefore, submitting this statement without suggestions or recommendations.

FRANK LILLY,
Research Statistician, Spokane, Wash.

(Whereupon, at 1 p. m., the committee adjourned to Thursday, February 10, 1955, at 10 a. m.)

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

THURSDAY, FEBRUARY 10, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas (chairman) presiding.

Present: Senators Douglas (presiding), O'Mahoney, Flanders, and Sparkman; Representatives Bolling, Kelley, and Talle.

The CHAIRMAN. Gentlemen, may we come to order, please.

We have invited representatives of the main national economic interest groups to testify on the President's Economic Report, representatives of management groups, employer groups, labor groups, and farm groups, and we have given them the alternative of testifying today on the 10th of February or next Wednesday, on the 16th of February. Three groups elected to testify this morning. We are very glad to have them here.

Mr. Kennedy, of the United Mine Workers, will testify on the 16th. Mr. Shuman, of the American Farm Bureau Federation, Mr. Newsom, of the National Grange, Mr. Schmidt, of the Chamber of Commerce of the United States of America, and Mr. Don Mahon, of the National Brotherhood of Packinghouse Workers, will also testify then.

We also invited Mr. Meany, of the American Federation of Labor, Mr. Kestnbaum, of the Committee for Economic Development, and Mr. Riter, of the National Association of Manufacturers, but they wrote us very kind letters saying they were unable to come on that date.

We have made an earnest effort to hear from all groups. This morning we will hear from Mr. Reuther, president of the Congress of Industrial Organizations, Mr. Harry See, national legislative representative of the Brotherhood of Railroad Trainmen, and Mr. Baker, of the National Farmers Union.

Mr. Reuther, we shall begin with you. We are very glad to have you.

OPENING STATEMENT OF WALTER REUTHER, PRESIDENT, CONGRESS OF INDUSTRIAL ORGANIZATIONS

Mr. REUTHER. Thank you, Senator Douglas, and members of the committee.

I should like first to express my appreciation for the opportunity of appearing here, and I should like to submit for the record my prepared statement and then elaborate on that orally, if I might.

The CHAIRMAN. Very well.

Mr. REUTHER. We of the CIO believe that the American people have a right to expect that the President's Economic Report to Congress would be an analysis of the economic situation based upon the economic facts of life, and in reading the President's Economic Report we are both disappointed and disturbed because we believe the report does not reflect that measure of vision or understanding or realism that the present situation requires. We are disturbed because we believe that the administration still is unable to differentiate between confidence and complacency, and we believe that where they talk about confidence in many aspects of the report, they are again reflecting the complacency which has characterized the administration's economic attitude for the past two years.

Now in reading the Employment Act of 1946, which created the basis for the report coming to Congress on the part of the President, we find in section 3 (a) that the President has certain basic obligations of responsibility under the act. In section 3 (a) of that act, the President is required to provide the estimates of production goals and the purchasing power that can be attained in terms of the goals of that Employment Act of 1946, and we would like to suggest, Mr. Chairman, that your committee ask the President of the United States to comply with the law and to carry out his obligations as they are stipulated in the law.

Specifically, we believe your committee ought to ask the President to present Congress with the estimated required goals of employment, production, and purchasing power for attaining maximum employment in 1955.

Secondly, that he should present Congress and the American people with a program for carrying out the declared policy under the law "to promote maximum employment, production, and purchasing power."

And, thirdly, he should explain what the Republican administration means by the term "maximum employment." We think that the President's Economic Report fails to carry out his obligations because he doesn't deal with these basic requirements of the law.

Now what bothers us about the President's report is that we believe it reflects a kind of banker mentality, and we believe that the people who are primarily the architects of the administration's economic and fiscal policies are operating as bankers instead of operating in terms of the basic needs of the American people and the American economy. We think that they are operating the American economy as though they were operating a countinghouse, instead of dealing with the fact that they are responsible for administering the most important economy in the free world at a time when freedom is being pressed by the forces of Communist tyranny.

Now, Mr. Humphrey, the Secretary of the Treasury, is undoubtedly the chief architect of the economic and fiscal policies of this administration, and we are disturbed by the fact that Mr. Humphrey would have us believe that the most important and compelling problem that we need to meet in America on the economic front is to fight the threat of inflation. There is no serious inflation in America, and yet all of the efforts being made would have us believe that the No. 1 problem is fighting inflation, when the No. 1 problem is finding an answer to the basic problem of how do we achieve and maintain full employment and full production in a peacetime economy.

This kind of banker mentality would have us believe that our problem is one of national solvency when everyone ought to realize that we are faced with the kind of problem where the question is one of national survival.

Now, Mr. Humphrey wrote an article very recently and I have a copy of it here. It appeared in Nation's Business, the January issue, in which he deals with this whole question of what he considers to be the No. 1 problem, the question of inflation, and this policy that Mr. Humphrey expresses in the article here, I think, runs through every important Government agency at the administrative level of our Government. When we get a slight improvement in the general economic picture, instead of encouraging further improvement and stimulating those kind of activities that will make for further improvement, the banker mentality reflected by Mr. Humphrey and his associates, move in and they begin to put the brakes on long before we have reached any recovery in proportions that would create inflationary threats.

Now, we've had a very small improvement. We recaptured only about 40 percent of the economic ground that we lost during the recession in the past 18 months.

Senator FLANDERS. Would you repeat that again?

Mr. REUTHER. We recaptured only about 40 percent of the ground that we lost. If you take the December 1954 index; that is, the industrial-production index it stood at 130, and when you compare the December 1952 index with 1954, you find in 1952, in December, it was 133. In other words, the recovery has not been sufficiently great to surpass the index points that we reached 2 years ago, and yet with that slight recovery, they immediately move in and begin to tighten up and recreate the hard-money policy.

You get the testimony of Mr. Martin, head of the Federal Reserve Board; you get the testimony of his assistant, and there you get a reflection of this same attitude, that the problem, the threat, is inflation.

Therefore, we have to tighten up. When Mr. Martin is asked what do you mean, how do you measure when we have an inflationary threat, he says the minute we get beyond any point that may approach economic growth of more than 3 percent a year, we put the brakes on, and because we may get near that point, they have withdrawn more than a billion dollars from the money supply.

This is obviously an effort to make money more valuable so that the bankers will get the benefit of money with greater value. I think this is a very dangerous point of view, and if permitted to continue unchecked, can create very serious problems.

Now, the trouble with Mr. Humphrey and this banker mentality is, that they are driving the American economy down the highway to the future, except that they are deciding where they are going by looking through the rearview mirror. They know where they have come from, but they do not know where we are going, and here is what Mr. Humphrey said in this article in Nation's Business in January. He said that—this is in order to show that things are going really well—he says that 1954 was six times better than 1900. I would hazard a guess than 1954 was 600 times better than 1700, but the way to judge where we are going in the future is not where we were in the past. We have to measure the future by the unlimited possibilities of economic growth that science and technology now make possible, and yet these men with little faith and little vision keep talking about where we have been, instead of talking about where we ought to be going in terms of the dynamic qualities of our free economy, and that bothers us.

It bothers us because what we do in America with the American economy, which is without question freedom's most important asset in a material sense, what we do in the way of mobilizing the productive power of the American economy and harnessing the unlimited creative genius of the free human spirit in America, will be a decisive factor in the struggle against the forces of Communist tyranny; and yet these people with the banker mentality keep talking about it as almost as good as last year, it is six times better than 1900, when we ought to be saying it is not good enough because we are not utilizing fully the productive potential that we have in this great country of ours.

Now, we believe that your committee ought to insist upon a definition of what we consider to be maximum employment. We in the CIO believe that in a free economy you have to have a normal float of workers who are seeking jobs. That is a part of the normal process of a free economy in a free society. We believe that the level of the amount of unemployment required to facilitate the movement and the healthy shift in job opportunities should not exceed 2 to 2½ percent of the civilian labor force, which means that 1½ million people in that category would be adequate to meet the mobility needs of our free economy. Yet in 1954 we had an average unemployment in excess of 3.2 million people, and when you add to that the people who were partially employed or partially unemployed, we think that that raised the average to around 5 million, which means that around 3½ million people were unemployed, about the normal levels required to meet the needs of a healthy free economy, and when you look at the job outlook in terms of the future, there are no facts to support the optimism reflected in the President's report. Production has gone up. There has been some improvement in the general overall economic picture, but while industrial production went up 3 percent in December of 1954, as compared with December 1953, for the same period nonfarm jobs decreased 765,000.

In other words, production went up 3 percent, but employment in the nonfarm categories went down 765,000. Even the chamber of commerce—and no one would accuse them of advocating a bold economic program—even they have admitted recently that while the Nation's production will increase, the amount of unemployment will also increase while production is going up modestly.

We need roughly 800,000 new jobs each year to take care of just the increase in our labor force, but when you add to those 800,000 new jobs that we need to take care of the new people coming into the labor force, the jobs that we need to take the place of those people displaced by technological progress, then we begin to get some appreciation of how many new jobs we need to create each year in order to maintain full employment and full production.

I believe that at the current rate of labor-force growth and technological progress, we need from 2½ to 3½ million new jobs a year, to take up the slack created by the ability of fewer people to create more economic wealth by the utilization of more advanced tools of production, and that means we are heading for trouble, because the rate of labor-force growth is getting faster each year, and technological progress makes the worker more productive each year. The combination of those two factors means that we are in trouble if we do not begin to find a way to expand and facilitate economic growth to take up the slack.

Now the St. Louis Post-Dispatch had an editorial some weeks back which I thought laid the problem down simply, and I would like to read it, if I may. This is from the January 10, 1955, St. Louis Post-Dispatch. It is entitled "The Deficit in Jobs."

Is the national economy sitting on a time-bomb?—

they ask.

We ask the question in all seriousness because the trend of employment statistics continues to be disturbing. We ask it in spite of the resolute cheerfulness of Secretary of Labor Mitchell and Secretary of Commerce Weeks. In the latest of their monthly reports, the two Cabinet members say that although total employment fell by more than a million jobs in December, the decline was largely seasonal, due to less activity in farming and construction, and the like.

In the summer the administration is cheerful about the rise in outdoor jobs and plays down any decline in factory employment. In the winter it hails the rise in factory jobs and dismisses the loss of outdoor jobs as largely seasonal. But is this really the wise way to approach the problem? Is it not better to face all of the facts all of the time, winter and summer? Is it not better to face facts now than to have them hit us like a blockbuster later on?

The overriding fact which Messrs. Mitchell and Weeks consistently overlook is that in spite of some encouraging gains, employment is not rising enough to match the growth of the Nation. Total employment in December, they reported, was 60,688,000 jobs. What they did not tell us is that this is the lowest December since 1950.

The editorial continues:

Is December, then, a bad month to look at, because of seasonal declines in outdoor jobs? Well, let us look at the month of highest total employment, August. In 1954, the peak employment was 62,276,000. That was the lowest peak month in any year since 1949. It is all very well to say that 62 million jobs are a lot of jobs. They are, but they are not enough for a growing country and an expanding economy—

and then they go on to develop the point further.

You see, if we break through this unfounded optimism and this dangerous economic wishful thinking, and if we look at the economic facts of life, we must conclude that we are in trouble because our economy is not growing at a rate sufficiently large to accommodate these two important economic factors: one, the growth of the labor force, and secondly, the fact that advancing science and technology makes it possible to create greater and greater economic wealth with fewer and fewer man-hours of labor.

Senator SPARKMAN. Mr. Chairman, may I ask a question at that point, or would Mr. Reuther rather continue?

Mr. REUTHER. No; any time at all, Senator Sparkman.

Senator SPARKMAN. I want to go back to that St. Louis Post-Dispatch editorial and see if I caught correctly the figures, which I think are most significant.

Will you read that total of employment in December 1954 again?

Mr. REUTHER. The total of employment. I will back up here where they start talking of December. Total employment in December, that is, of 1954, they report was 60,688,000 jobs.

Senator SPARKMAN. Your next statement was that 60,688,000 is the lowest for any December since 1950.

Mr. REUTHER. Yes.

Senator SPARKMAN. Even leaving out of consideration the growth of the labor force each year, at about an 800,000 figure?

Mr. REUTHER. That is right.

Senator SPARKMAN. If that is true, the December figure recognizes no increase in employment to take care of any increase in the labor force over a period of 4 years.

Mr. REUTHER. That is right.

Senator SPARKMAN. In other words, it seems to me that is quite a significant slump. Now, may we get the same comparison on the August 1954 figure?

Mr. REUTHER. All right. The December figure is the low point.

Senator SPARKMAN. I realize that. But I am really getting the comparison over a period of 4 years in the case of the December figures, 5 years in the case of the August figure.

Mr. REUTHER. In 1954, the peak for August employment was 62,276,000. That was the lowest peak of the month in any year since 1949.

Senator SPARKMAN. And, again, that does not take into consideration the growth of the requirement for jobs.

Mr. REUTHER. That is correct. It is at this point where an unfounded optimism and this dangerous kind of unwillingness to accept the realities of life frighten us, because it means trouble ahead.

The most single important economic factor in terms of a new development in America is the thing that we call automation.

It is the thing that is going to revolutionize the whole concept of mass production in America. It is revolutionizing how we keep books in our offices, how we keep payroll records, how we maintain inventory controls, and yet this technological development which marks the second phase of the industrial revolution is not even mentioned in the President's report. They do not even mention it, and yet it is an item that requires a great deal of attention on the part of the American people, American industry, American labor, American agriculture, and the American Government.

Now, what is this automation thing doing? Well, it is just revolutionizing production. In the auto industry we now are able to machine a full engine block without a single human hand touching it, and do it in 14.6 minutes, and yet that operation is already antiquated, based upon the more efficient methods coming off the drawing board. They are prepared now to assemble television sets by automation, without a single human hand touching the television set.

General Electric Co. now, I am told, has an electric brain, one of these Univac machines, that can control their total inventory for millions of end products, down to the finest little screw in some turbine or some television set. That machine can control the inventories, sends out instructions when they ought to produce items, how many they ought to produce in order to replenish their inventories and where to send them.

I am told an insurance company can put in one little corner of a modern office building, electronic and automated accounting machinery to keep the records of premiums and payments of benefits, and can do in that one corner of one office building what 3,000 clerical workers used to do. This is the record of automation and there is not one word of it in the report, just as though these people were living in a little dream world.

That frightens us.

Senator FLANDERS. May I make a comment at this point?

Mr. REUTHER. Yes, you may, Senator Flanders.

Senator FLANDERS. I have been familiar over many years with automation, as far as machine tools are concerned. I believe it began with the airplane-engine cylinder blocks during the war. No, it really began back in the Waltham Watch Co. in 1900, when they transferred parts from machine to machine, each one a simple machine, but that application never extended. The cylinder-block machine of high production in World War II was the real beginning of automation, except for the automobile-frame production.

What is the name of the company that developed it?

Mr. REUTHER. A. O. Smith.

Senator FLANDERS. It is true that very great gains are made by this process, but there are a lot of people engaged in servicing the automatic tools whom we do not see. There are the designers, there are the tool-shop sharpeners, there are the inspectors, and so forth. There is, nevertheless, a net gain in the reduction of labor, but we should not say that just because we see nobody on the line it means that there is nobody doing the work. Automation reduces the amount of labor materially, but by no means totally. It is the new factor in manufacturing.

The bookkeeping machines are marvelous things to watch. They go clickety, click, and a payroll comes out with all the immense number of deductions that are required by our Government activities, social security of various sorts, deductions for bonds, and everything else taken out of the individual's pay.

By the time the deductions are made there sometimes is a surprisingly small sum at the end, but these machines go clickety, clickety, and everything is lovely. The investigations I have made in the companies I am acquainted with leave the balance in favor of these automatic methods, but by no means overwhelmingly so, because there is a lot of background work to it; there is the rental of the machines, there is the price paid for the cards, and so forth.

Mr. REUTHER. I am aware of that.

Senator FLANDERS. It is not all a net gain. Yet, I agree with you, Mr. Reuther, in feeling that this is a major development in our industry, and should have the attention of all of us here, and of the administration.

I just wanted to make clear my belief that it was not as complete an abolition of labor as you would think, just standing and looking at it.

Mr. REUTHER. I am aware of that, Senator Flanders. I know that while automation displaces a great deal of direct labor, it does create greater opportunities in the production of machines, that unless there was an economic saving, automation would not come into being.

When Ford Motor Co. or General Motors does something like that, they take into account their economic savings, in relation to their direct and indirect labor costs, and obviously the saving justifies the machines. Now, even in the tool industry—and I know you are familiar with that, coming out of the tool industry as you have—at MIT they are even automating the tool machines, the machines that make the tool machinery.

Senator FLANDERS. Did you ever read a book called Player Piano, by a man named Voniger?

Mr. REUTHER. I do not believe I have.

Senator FLANDERS. This has to do with a company when it gets 100 percent cybernetic.

It is not anything of particular importance in this hearing, but I would advise you to get to that book and see the concept an engineer has of this country when it has gone a hundred percent automatic.

Mr. REUTHER. The point I am making here, Mr. Chairman, is that we are on the threshold of the second phase of the industrial revolution, with science and technology giving us the most wonderful tools with which to create ever greater economic abundance, and that our basic problem in America is the fact that we have made unprecedented progress in the physical sciences, in the art of working with machines and material, and we have failed to make comparable progress in the human and social sciences, and in relating this technical progress to human progress.

That is our basic problem, and we just cannot ignore the question of automation, because automation is going to bring a revolution into the lives of the people of America, and what we need to do is to have the good sense to gear the great abundance made possible by that technical revolution with the needs and hopes and aspirations of people.

That is what we are really talking about and that is what this committee is hearing testimony about. How can we as a free people utilize our economic resources, our productive power, to make a better life for people, so that people can find the answer to their economic and material needs, so that we can facilitate the growth of man as a spiritual, moral, and cultural being.

That is really what we are trying to do, and automation is one of the great tools that science has given us to build on, and here the President's report does not even mention it.

I believe that your committee ought to give very careful consideration to a thorough and comprehensive study of the impact of automation upon the future economy of America, its broad economic and social implications, and how we can begin to harness the great power of this revolution in the field of technology to meeting the needs of the people of our country. I would urge that your committee give very careful consideration to such a comprehensive study of the long-range economic and social impact of automation upon the American economy and upon the American people.

Now much of the optimism in the economic outlook that the President's report attempts to reflect is based upon the fact that the auto industry is booming. Now it is booming, and I say this is going to be the shortest boom that the industry has ever experienced, and I know a great deal about the economics of this industry.

The industry is building up and I think we are heading for trouble, because if you will take the figures that we are reflecting in our production schedules, they spell trouble down the road unless we change the overall economic picture for the better.

Now the auto industry obviously has a direct bearing upon many other basic industries.

When auto booms, steel booms, because we are the largest consumer of steel, rolled steel. The rubber industry booms, because we are the largest consumer of rubber. The glass industry booms, because we consume the largest portion of high-grade flat glass. We put millions of yards of textiles in automobiles. There are tens of thousands of miles of electrical wiring that go into the armatures for the generators and starters and all that. So the auto industry has a tremendous impact upon a large segment of the American economy. But what is happening in the auto industry?

Well, the most optimistic reports for 1955, and these are dreamed up by the sales divisions, and they have the rosiest of the rosy colored glasses, and they say that 1955 should give us anywhere from 5½ million cars to 5,800,000, and 1 fellow got up to almost 6 million. That is the very maximum, and reflects the most optimism, and yet in January we actually produced 660,000 cars, at the annual rate of 7,800,000. Wards Automotive Report, which is a very reliable agency in reporting projected production schedules because they get their sources directly from the corporations, they claim that the projection for March is 748,000 cars for the month, or an annual rate in excess of 9 million cars.

Now if we are producing at an annual rate of 9 million cars, and the most optimistic projections are that we will sell 6 million cars, what happens after we make the 6 million cars, at the rate of 9 million a year? The auto industry obviously will go into a nosedive, but the steel industry will go into a nosedive, before the auto industry, because they buy their steel from 30 to 60 days in advance and that is true of many of the other basic industries. Now I say to try to build the economic outlook and the optimism reflected in the President's report upon the auto industry is certainly unrealistic and dangerous.

The CHAIRMAN. Mr. Reuther, may I ask a question at this point? On page 6 of your prepared statement, in the second paragraph, you state that inventories are rising and that the industry is not able to sell at that rate of production.

I have seen certain statements which I do not have at hand at the moment, but I believe they have been published in the New York Times and Wall Street Journal, in which some of the heads of the automobile companies have said that their current sales were equal to current production and that there was no present accumulation of inventory.

Mr. REUTHER. I am familiar with those statements, and your statement is correct. They claim that they are just hardly able to keep up with demand.

This is part of the mumbo-jumbo by which they hypnotize themselves into believing that everything is going to be wonderful. Now the facts as reported by two business publications are as follows: Wards Automotive Report said that in January they had roughly 500,000 automobiles in inventories.

The CHAIRMAN. Those are new cars in the hands of new car dealers.

Mr. REUTHER. Business Week made that projection, 500,000 in January.

The CHAIRMAN. There has been some bootlegging of new cars into the used car market, hasn't there?

Mr. REUTHER. That is right, there has been some of that.

The CHAIRMAN. And those cars would not be included in the 500,000 figure.

Mr. REUTHER. That is right. These are new cars that people are trying to sell as new cars and not being bootlegged through the used car market.

Now Business Week says that in January there were 500,000 new cars in inventory and Ward's Automotive Report—again I think the most reliable source for this kind of economic data—they project that based upon the level of sales, and based upon the levels of production, that by the end of March there may be 661,000 cars in inventory.

Now this is the picture, and if you build the economic prosperity of America, and you try to say that this slight improvement will go further because the auto industry is booming, you are building the future on economic sand unless you change the overall economic picture, and that, of course, is exactly what we ought to be doing. There is no reason why the auto industry cannot continue to build automobiles. There is no reason why the steel industry cannot continue to expand its capacity and provide full employment, because there is plenty of work to do in America, but the trouble is we are not trying to facilitate the economic growth and the expansion essential to achieve full employment and full production, and that is essentially the weakness of the President's report.

Senator FLANDERS. Mr. Chairman, may I ask a question?

The CHAIRMAN. Certainly.

Senator FLANDERS. Mr. Reuther, is it not true that unfortunately the automotive industry has always been seasonal, so that this is not a new misfortune but an old one?

Mr. REUTHER. The auto industry historically has been seasonal, but during the past 6 or 8 years we have operated at fairly high capacity.

One of the reasons they used to say the industry had shut down was the seasonal peak and fall in demand and, secondly, they had big model changes, but we learned during the past 6 or 8 years that you can change models without losing much production. They continue to run the old model while they get the new model on the second line parallel to the first line.

The auto industry has been seasonal but it need not be seasonal. We can stabilize production in the auto industry because there are no natural economic factors over which we cannot finally get some measure of control, not perfect control, but enough to level out the peaks and fill in the deep valleys, and if we cannot do that, Senator Flanders, then we have got to admit that we haven't got the good sense that I think the American people have.

Senator FLANDERS. It is a question, it seems to me, of sales and psychology, rather than industrial planning.

Mr. REUTHER. Well, this idea that people have to be psychologized to buy something they need I don't believe. When people need something and they have the money to buy it, you do not have to sell them on the fact that they need it, but when they haven't got the money to buy the things they need, they are in trouble, and that is why we are in trouble in this country.

Senator FLANDERS. The question is, Will they buy in 1955 or wait for 1956?

Now I bought a 1954 when it was offered me, so I am personally contributing to stability.

Mr. REUTHER. I think that just reflects your general conservative economics.

Senator SPARKMAN. You do not mean by that that he had to pay a lower price for that car?

Mr. REUTHER. I think he did.

Senator SPARKMAN. That is New England frugality.

Senator FLANDERS. As a matter of fact, I bought a 1954 demonstrator car and got a still lower price. Now, Mr. Chairman, I am reminded of one of our hearings when we had a group of economists. I think it was I who raised the question as to whether there was not some value in figuring out what would be a normal and proper annual demand for automobiles and for housing. It is my recollection that the economists with one accord turned thumbs down on it. They would rather leave it to private initiative to go up and down and look out the rear window and see what happened.

Now I could agree with them as far as planning production is concerned, but it did seem to me then and it seems to me now that we ought to have some notion of what a high and proper normal is in housing and in automobiles, so that we might have something to compare our current production to.

I hope that point will be in the report, and if it is not, in the body of the report, I will take the opportunity of putting it in a footnote to the report.

Mr. REUTHER. I would like to say, Senator Flanders, I have unlimited faith in the future of the American free economy. I just think it is the best economic system in the world, and I believe if we have the good sense to gear its productive power to the needs of the people, that the future holds great promise for all of us.

Senator FLANDERS. You were a while back, Mr. Reuther, speaking mildly critically of the Secretary of the Treasury and the Chairman of the Board of Governors of the Federal Reserve System, yet the Chairman in an interview here entitled "Don't Be Afraid of Prosperity" seems to be a little bit inclined to be on your side.

Mr. REUTHER. Just a little bit, that is what bothers me. He ought to be a whole lot on the side of the whole concept of an expanding and growing economy.

Senator Flanders, you have got to recognize that Mr. Martin—I have not read that particular article, but I have read other testimony of his before congressional committees—believes that the normal and acceptable and desirable economic growth is somewhere around 3 percent. I think it is somewhere between 5 and 7 percent and I think that is conservative.

I believe that last year based upon the economic growth that actually was achieved between the years 1940 to 1953, that if we had had a reflection of that normal economic growth and utilized the increase in labor force and fully utilized the improvement in our technology, that we could have created last year in the year of 1954, $40 billion more wealth than we created. That means that every American family could have had $850 greater purchasing power.

Senator FLANDERS. What was that range?

Mr. REUTHER. I think from 5 to 7 and I think that is conservative.

Senator FLANDERS. Is that in arithmetical or geometrical progression?

Mr. REUTHER. Obviously it is a compounding.

Senator FLANDERS. I hope you know what geometric progression does to a small amount in a small number of years. It is terrific.

Mr. REUTHER. I also know what automation does.

The CHAIRMAN. When you use your figure of 5 to 7 percent that is for the economy as a whole?

Mr. REUTHER. That is correct.

The CHAIRMAN. Since the working force grows by 1.2 percent a year, that would mean an increase in output per man of, say, 3.8 to 5.8 per man, and then if there is a reduction in the number of hours, that would be another factor.

Mr. REUTHER. That is right.

The CHAIRMAN. So I think Mr. Martin may have been using an hourly figure which is naturally smaller than the total output figure.

Senator FLANDERS. Mr. Chairman, with regard to automation, I feel confident that I can predict that it is going to be a determining feature in our national output, but I think I can also predict that it is going to move into that position of a determining feature much more slowly than both those who hope for it and those who fear it think.

Mr. REUTHER. You see, I do not fear automation. I welcome automation. I welcome automation because I think automation will give our free people the tools with which to build a better life and that is what I am in favor of. I think we all are. I think, Senator Flanders, the thing that is basically wrong with our economy is that we have not achieved this dynamic and expanding balance between purchasing power and productive power. I think that is the key to the future, that as we are able to expand our ability to create greater and greater wealth, we must find a way to get purchasing power in the hands of people to consume that wealth.

Now we got in trouble in 1929, and I have an article here from Fortune, part of an article from Fortune. This is from the February issue of Fortune, "What Caused the Great Depression?" There is one short paragraph entitled "How the Pie Was Sliced," and I quote:

> Factory productivity as measured by output per manpower increased rapidly in the twenties but hourly wages did not keep pace in the second half of the decade. Although some of the fruits of rising productivity were passed on in lower industrial prices, these reductions were only partially reflected in consumer prices.

Then they illustrate this with a chart and it goes on to say:

> The lower chart shows what the upper suggests, a rising share of national income in the late 1920's went to upper income groups: interests, profits, rents, etc., rose 14 percent, between 1928 and 1929, while wages and salaries rose only 7 percent, and the farmers' income went down proportionately.

This is why we got into trouble in 1929 according to Fortune and that is why we are in trouble now.

Now I am not remotely suggesting that we are heading for a depression, because I think in the last 20 years there has been enough sense in Government to build into our economy some safeguards against that kind of catastrophe.

The CHAIRMAN. You mean this was during the 20 years of reason?

Mr. REUTHER. That is right, during the 20 years of reason, during which time we put some restraints in our free economy, essential to avoid these catastrophic economic breakdowns.

Senator FLANDERS. I might amend that by saying, during 20 years of war prosperity. It is a difficult thing to obtain in peacetime the same degree of production and employment that we have in war. We must recognize that it is not easy, but that we are trying to solve the problem. I can agree that we are not doing it as successfully as we should, but I think we should recognize the difficulty of the solution.

Mr. REUTHER. I think, Senator Flanders, we can all agree that solving these problems is not easy. It is not easy to preserve freedom in the world. It is not easy to preserve peace in the world. A lot of things are not easy, but we have to do the difficult as a matter of survival, and for the first time in the history of human civilization we have the tools with which to solve this problem. When Marx wrote his whole concept of the class struggle, what he calls dialectical materialism, he based that on the fact that society in all those years was divided between warring nations and warring economic groups, struggling to divide up economic scarcity. Marx could not understand what has happened in America, this great and wonderful miracle of the great creative genius of the free mind and free spirit.

We are not now engaged in the old historic battle of dividing up scarcity. We have the first opportunity to cooperate, free management, free labor, free Government cooperating to create and share abundance. That is what we are talking about, creating and sharing abundance, instead of dividing up economic scarcity. This is the new revolution. The Communists are just a bunch of reactionaries because they are living in the past.

This concept of abundance is the key to the future of freedom and peace in the world and when you say it is difficult, sure it is difficult, but I ask the simple question that a worker in Detroit has asked me many times. During the war when we were making the weapons of war and destruction, we not only had full employment for every able-bodied man and woman, but we got the grandfathers and grandmothers out of retirement and we had a simple employment policy in almost every factory in Detroit. The employment director was instructed, "When they ask for a job, don't ask for their qualifications, just feel them. If they are warm, put them on the payroll."

We ask ourselves, if we could have that situation during wartime, why can't we now have full employment making the good things of life for people in peacetime. It is difficult but it can be done.

Frankly, we better find a way, because if we don't then freedom will not win in the struggle against Communist tyranny.

Senator FLANDERS. Mr. Reuther, in the words of the judge who was examining Saint Paul, "Almost thou persuadest me to be a Christian."

Just to get down to a practical question, it seems, Mr. Chairman, that we do have to have some clear agreement on the way in which we determine and the means by which we provide the proper division between the returns from production as between consumption and investment. We cannot let the extremes of either of them become too small and it is a matter of mutual concern of management, labor, and government, to get clear in their minds, if clearness is possible, what is the proper division between investment and consumption.

Mr. REUTHER. I agree with you completely, Senator Flanders, and that is the key, the achievement of this dynamic expanding balance between these two factors. We had a full employment conference here in Washington some months back, and when we thought of asking someone from the administration to come over to express the administration's economic program and their general economic and fiscal policies, we asked Secretary Humphrey to come and he came and he made a speech. We got into a discussion of this thing and he got into the question you raised. We said at that time with a very high level of unemployment that what we needed to do was to broaden the purchasing power base of our economy so that people would have the money to create the demand for the goods that we know how to create based upon the capacity that we already have. Mr. Humphrey said: "I disagree with that. The only way you can get full employment is not to expand the purchasing power base, but to provide greater incentives on top of the economic structure so that people will get more money to create investment and create new factories and new jobs by that procedure." And we said: "Mr. Humphrey, we agree that if we were in a situation where the demand was greater than the capacity to meet that demand, then the emphasis should be shifted to try to provide increased capital to expand the basic productive capacity of our country." But we are now in a position where the emphasis must be shifted to the purchasing power factor in our economy because what we need is not greater steel capacity, because the month that the Secretary of the Treasury was before our conference, the steel industry was producing at 61 percent of capacity. We did not need more steel capacity, we needed more customers to buy the things made out of steel.

The auto industry right now—here is a clipping out of the Detroit Free Press—where the fellow who is supposed to be the authority on this sort of thing says that the capacity of the auto industry is between 11 and 12 million cars a year, so that if we make 6 million cars a year, that is only 50 percent of what our capacity is.

Now do we need more productive capacity or do we need more customers to buy the automobiles we already have the capacity to create?

Really, the secret of how a free economy has to operate, in our opinion, is to maintain this dynamic balance between productive capacity and purchasing power. At the point that purchasing power begins to crowd capacity, you shift the emphasis and you expand capacity, and when you have expanded capacity, which means that more tools for creating greater economic abundance have been realized, you then shift back the emphasis on greater purchasing power and achieve this dynamic balance; and we are now at the short end of the purchasing power part of our economy but the unfortunate part about it is that Mr. Humphrey and the administrative policy of this Government is directed towards creating greater incentives for people who invest when we ought to create greater purchasing power on the part of people who need to buy.

Senator FLANDERS. You would not want to put the emphasis, would you, Mr. Reuther, entirely on expansion of production. You would want also to put the emphasis of investment for new products, new means for production, the search for new markets?

There is much more to it than just simply saying increasing steel capacity.

There has got to be investment in many things besides simple expansion of existing type of plant.

Mr. REUTHER. Obviously. That is part of a healthy normal economic growth but at the present time there is a serious imbalance between productive power and purchasing power, and we have to correct that imbalance by increasing purchasing power to achieve a balance where we will have full employment.

We believe in incentives. We believe that individual initiative and incentives are a source of the very large portion of the motivating power that drives us forward for progress in America. But it is a peculiar thing, you know. You sit down across the bargaining table with corporation executives who get $600,000 a year and we always compute it on an hourly rate basis because we can understand it better—some of them three-hundred-and-some dollars per hour—and we do not object to that. But when they talk about incentives, they always talk as though it is a one-way street and they are driving and they are the only ones. If it is right for a fellow getting $500,000 to get $600,000, then why isn't it right for a fellow getting $4,000 a year to have the incentive to get $5,000 a year? I ask these fellows what kind of mental gymnastics they go through to make it morally right and economically sound to fight for $600,000 when they are getting $500,000, but economically and morally wrong to fight for $5,000 when you get $4,000. This is having 1 set of economic values for all of the people of America, instead of 2 sets of standards. Mr. Humphrey feels if you give more to the few people who have so much, it will somehow trickle down; and they haven't learned a thing since Andrew Mellon occupied that job in the Government.

The world has moved ahead, but the mentality in that kind of thinking has stood still, and that is why we are in trouble. Thirty-seven percent of the families in 1953 in America received less than $3,000 income, and I think it would be well for your committee to probe that. You talk about looking for new markets. That is the biggest potential market.

Senator FLANDERS. We have looked at that problem in a series of studies. We made a study of the low-income groups which revealed many things, and I hope, Mr. Chairman, that we will continue with that study this year, not merely to uncover the conditions but also to see what can be done in the way of positive remedies for it.

Mr. REUTHER. I would like to conclude by making several suggestions that I think ought to be carried forward by appropriate legislation. On the housing front, there is a tremendous job to be done in America. No one can be proud of American slums and no one can be proud of the fact that thousands of families in America's farming sections live in shacks, and no country has done as bad, compared with the resources we have, on housing as we have done. We need 2 million houses a year to take care of this problem.

There are tremendous and tragic deficits on the educational front. We need 375,000 new classrooms right now and by 1960 we will need 600,000 new classrooms. We have got to meet that problem.

There is a tremendous hospital need and health facility need. There is the road problem and flood control and many other problems of that description, which could provide great opportunities for employment.

We believe minimum-wage legislation is an area in which you can begin to raise some of these low-income families up to where they can begin to buy the things they need for healthy, decent living in our modern atomic age and we think the minimum-wage legislation ought to be raised to $1.25.

There is the question of the farmers. We are very disturbed about farm income in America. The CIO, representing roughly 6 million industrial workers, is worried about the fact that the income of American farmers continues to go down, because we believe that our prosperity in the cities is inseparably tied together with the economic conditions of people on the farms. They got in trouble first in the 1920's, and we got in trouble after they got in trouble. We think legislation ought to be adopted to give farmers full equity in terms of their economic contribution to our free economy. And we think that the emphasis ought to be placed on helping the farmers who farm the land, the family-sized farmers rather than the farmers who farm the farmers.

We think, also, obviously at the collective bargaining table we have to get higher wages because higher wages mean greater purchasing power to offset the increasing productivity of technological progress.

We are going after the guaranteed wage in our industry because we believe it to be economically sound, to be morally right and to be socially responsible in terms of the basic needs of our free society. We believe that unemployment compensation should be increased, so that workers who are laid off are not withdrawn from the market in terms of sustaining their purchasing power, so that we do not begin to compound the negative economic factors because nothing breeds unemployment like unemployment itself. We think that unemployment compensation benefits should be raised so that people's purchasing power can be protected.

On the tax front, we believe that the Government has an overriding responsibility to use its power to try to get into the economy an improvement of those economic factors that will make for greater economic activity, full employment, and full production. We disagreed with the tax laws of 1954. We think they gave tax relief to the people who did not need it and denied essential tax relief to those who did need it.

We said that about 95 percent of the tax relief was going to wealthy corporations and upper income families and only 5 percent of the relief went to families in the $5,000 bracket or under. We think that was wrong. We think it was bad economics and we think it was morally wrong because it raised the standard of luxury of the people who had more than they needed, when the basic economic need was to raise the standard of those who had too little.

Take the General Motors Corp.—and I cite these things because these are the facts of life that we have to deal with in America, if we are going to defend freedom and peace—General Motors Corp. last year made $1,640 million before taxes. They made $7 million for every operating day, and yet the tax law in 1954 gave the General Motors Corp. $219 million tax reduction. You can say that went to people, people own stock in General Motors. During the discussion on this point they attempted to make it look as though everybody in America owned a block of General Motors stock.

Senator FLANDERS. What was the specific element in the new tax law which relieved General Motors of taxation?

Mr. REUTHER. General Motors got $219 million reduction in taxes because of the laws passed last year.

Senator FLANDERS. What was the item in the law that made that possible?

Mr. REUTHER. Well, first of all you had the excess-profits tax eliminated.

Senator FLANDERS. That is true. That was it, was it?

Mr. REUTHER. Well, that was the biggest item.

Senator FLANDERS. I just wanted to make sure what it was.

Mr. REUTHER. That was the biggest item.

Senator FLANDERS. I voted for it and would vote for it again.

Mr. REUTHER. Now if you take this $219 million, where does it go? Well, there are a few big holders of General Motors stock and most of the $219 million goes to those people. We figured it out, that one family in General Motors that owns a big block of stock got $78,000 more take-home pay by that tax reduction in General Motors.

The CHAIRMAN. How much?

Mr. REUTHER. Seventy-eight thousand dollars that one family, one holder of stock—his equity in that $219 million.

Senator FLANDERS. How much of it went back to the Government?

Mr. REUTHER. Well, that was his take-home.

Senator FLANDERS. Yes; take-home but it didn't stay home.

Mr. REUTHER. Well, some of it gets passed back to the Government. We are aware of that. And when I bargain for GM workers we also bargain for the right to pay Uncle Sam a little more, if the GM workers get a wage increase big enough to get in the higher income bracket, we will with great cheerfulness pay that additional tax burden, so we want to share that privilege along with the family I am talking about that got the $78,000. But the real nub of the problem is what happens to the $78,000—the family that got that already had over a million dollars income, do they buy one more pair of shoes?

Senator FLANDERS. I will guarantee if I know who the family is they did not get more than 20 percent of it. I think our progressive income tax is a grand thing, but we have to remember whenever we use these figures what it does. There was no $78,000 for that family. There probably wasn't more than $15,000 for that family.

Mr. REUTHER. Well, I think you are wrong, and I will be glad to get you all of the detailed economic facts about it. But let's take your $15,000 figure and pursue my point. This family already has everything it needs, and when it got the additional $15,000, using your figure. it did not buy one more pair of shoes because it had all of the shoes it needed.

They did not buy one more quart of milk; they didn't buy one more suit of underwear; they didn't call the doctor one more time. But there are millions of families in America who did not have the purchasing power not to buy an extra pair of shoes when they didn't need it, but to buy the shoes they needed. Why are the dairy farmers in trouble, not because they produce too much milk but because millions of children of America are denied adequate milk for healthy normal growth and what we need to realize is that we have not got too much production in America. We just haven't found a way to gear this abundance to the basic needs of our people. And if you had done what we proposed and other groups proposed and raised the individual income tax exemptions from $600 to $800 last year instead of giving General Motors $219 million tax reduction, you would have put in the hands of middle and low-income families $4½billion of high-velocity purchasing power that would not have been put in salt brine. It would have shown up on the store counters of America, buying the necessities of life. That would have expanded demand, increased demand would have reflected itself in employment, employment in greater purchasing power, greater purchasing power in greater demand and the economy could have begun to reverse the negative economic factors and have begun to compound positive economic factors, and that is the key to where we are going.

We believe in the American free economy, but we believe that if we are going to make it work that we have got to find a way to achieve this dynamic balance between productive power and purchasing power.

We have got to find a way to gear it to the needs of people and the only way you can gear it to the needs of people is to provide the American people with the purchasing power to translate needs into demand, and demand into employment opportunities. That is what we are proposing, and we believe that the Government has an overriding responsibility in this matter. We believe in our free-enterprise system, with individual initiative and incentive doing as large a share of the total economic job as is possible, but when there is an economic deficit, which threatens the well-being and security of our Nation, then the Government, as the agency of all of the people, has the responsibility of overcoming that deficit. And I think that is the problem before your committee.

The CHAIRMAN. Mr. Baker has to leave at 11:45 in order to take an airplane, and I wondered if you would be willing to stop for the moment, and after he presents his statement then perhaps we could continue with questioning.

Mr. REUTHER. I would be most happy.

(Mr. Reuther's prepared statement appears at p. 1200).

The CHAIRMAN. John A. Baker, who is assistant to the president of the National Farmers Union; Mr. Baker.

OPENING STATEMENT OF JOHN A. BAKER, ASSISTANT TO JAMES G. PATTON, PRESIDENT, THE NATIONAL FARMERS' UNION

Mr. BAKER. Thank you, Mr. Chairman. As you know, Mr. Chairman, Jim Patton, national president of Farmers' Union, had planned to participate in this hearing, but owing to its being rescheduled he was unable to be here.

I shall read a brief summary of Mr. Patton's statement and submit for the record certain supplementary material.

As we figure it, Mr. Chairman, national farm gross income in 1955 will probably be more than $7 billion short of a full employment level and realized net income of farm operators will be about 3½ billion lower than is needed as the basis for an expanding full-employment economy. In 1955, America's farm families should be a $40 billion market for commodities and services instead of the $31.5 billions projected by the President's Economic Report.

Mr. Patton's statement continues: I submit this statement to you as one who helped shape the Employment Act of 1946, and who still believes that loyalty to its principles and success in its objectives are vital to America in these times of world crisis and domestic distress.

Lest you feel that my reference to domestic distress is overdrawn, I call your attention to two significant facts. First, the income of the average United States farm family has dropped from about $200 per month in 1952 to $150 per month in 1954 and under the Eisenhower sliding-scale farm program a further drop to only $100 per month would be allowed.

Second, unemployment is officially announced to have risen by 538,000 in January, bringing the total to 3,347,000. As has become customary, the Government press releases surround this further downturn with a rosy glow—they say it is "seasonal."

The small decrease in unemployment in the last quarter of last year was really seasonal, but the rosy press releases forgot about seasonal adjustments then—they asked us to cheer a big improvement.

An increase of more than half a million in unemployment in 1 month is not just seasonal; it is mighty serious. If we were in a great upsurge of business, it would overcome the seasonal factors and bring about a drop in pathologically high unemployment.

The President's 1955 Economic Report reaches a new low under the Employment Act. It highlights the wrong facts; it misconstrues the facts that it highlights; and it fails to carry through to logical conclusions as to policy or program even of the facts it does present.

The Economic Report does contain an impressive array of charts, graphs, and tables. So do other Government manuals. But this array is used to conceal, not to reveal, significant meaning for economic policy.

The Economic Report is supposed to be a great interpretive document—and the interpretation is lacking in the report you have under consideration.

Here are a few of the questions that the report makes no attempt to answer, or even really to raise.

Is employment too high or too low, and how much reemployment do we need for maximum employment?

Is production sufficient, and how much do we need for maximum production?

Is purchasing power sufficient, and is it well distributed, and how much adjustment do we need for different groups for maximum national production?

These are not merely random questions. They are the core of intelligent consideration of economic policy.

They are the central questions that the statute directs be answered in the Economic Report. The report does not even raise these questions. It abandons the field of sound economic analysis. It cuts the ground from under intelligent discussion of economic policy. And specifically it flouts not only the spirit but the very letter and explicit mandate of the Employment Act.

This breach occurs, I submit, because the Economic Report misses the whole heart and purpose of the Employment Act. The act does not call for an historical encyclopedia of cold data.

It does not call for mere forecasts.

It calls for a true and bold statement of our economic needs and capacities, and for a program based upon these needs and capabilities. This the 1955 report totally and distressingly lacks.

The Economic Report does not set any growth goals for this year.

Without established growth goals, how can we possibly determine where the deficiencies are or how to surmount them?

How fast is automation creating the need to find new jobs for displaced workers?

How far is consumption short of the requirements for a full economy?

What tax and spending policies, by the Government, would specifically address themselves to solving identified problems and overcoming stated weaknesses in the economy?

How have the policies of the Government, thus far used, worked to overcome these weaknesses, if at all?

Nowhere in the report can one find significant attention to these questions—in quantitative and meaningful terms. Platitudes and easy optimism are to be found in abundance. One can hardly disagree with its conclusions, because it selects no vital problems to reach conclusions about.

I cannot discuss the farm features of the report, because there are none.

The job of preparing the kind of Economic Report envisioned by the Employment Act of 1946 remains to be done.

I strongly urge that the committee write a report to the Congress which specifically sets forth the size of our needs to achieve maximum employment, production, and purchasing power, along with a program adjusted to these great purposes.

Since the Economic Report has not provided these materials for the committee to evaluate, I respectfully submit that the committee, prior to doing its own job, needs to do the job that the Economic Report should have done but did not do.

Mr. Chairman, I request that the remainder of Mr. Patton's statement, which consists of the rationale and statistical detail of our calculation of a 1955 full employment income and an illustrative documentation of the shortcomings of the 1955 Economic Report be inserted in the record of these hearings.

The CHAIRMAN. It will be done.

Mr. BAKER. Thank you very much.

(The information referred to appears at p. 1191.)

Representative BOLLING. Mr. Chairman, I have some questions.

The CHAIRMAN. Mr. Bolling.

Representative BOLLING. I have something that ties in with the statements of both Mr. Reuther and Mr. Baker. On the occasion of Dr. Burns' appearance before the committee in executive session, I obtained the permission of the committee to submit to him in writing certain questions. One of those questions is as follows: The Employment Act in section 3 (a) states that the Economic Report of the President shall set forth the levels of "employment, production, and purchasing power obtaining in the United States and such levels needed to carry out the policy declared in section 2." The President's Economic Report on page 24 states: "With economic activity continuing to expand, it is reasonable to expect that the Nation's output within the coming year will approximate the goals of maximum employment, production, and purchasing power, envisaged by the Employment Act."

I asked Dr. Burns, "What are these levels or goals for 1955 in terms of employment, unemployment, production, and purchasing power?

"What specific forces do you see operating in the economy that will raise the levels of demand sufficient to reach the goals of the Employment Act?"

The answer to this among other questions has just been received a few minutes ago. While I will not ask to read all of the answer because it is an extended argument, in apologia I would say, I would like to read a page or two of it and the remainder will be available in the record in the first day's hearings when the questions were asked. (See pp. 36–48.)

The answer given is that "Section 3 (a) of the Employment Act states that the '* * * the Economic Report of the President shall set forth the levels of production, employment, and purchasing power obtaining in the United States and *such levels needed to carry out the policy declared in section 2*' ".

The CHAIRMAN. And that is to promote maximum employment, production, and purchasing power.

Representative BOLLING. Right. The italics beginning with the word "such" have been added by Dr. Burns. "The act does not clarify the italicized phrase," the answer continues.

Its interpretation is left to the President and his Council of Economic Advisers. The phrase can be interpreted as calling for a numerical specification of economic goals or it can be interpreted as calling for a specific of objectives whether in terms of numbers or otherwise as can be made. In the former case one would assert that "to carry out the policy declared in section 2, employment must be X, production must be Y, and so on.

"In the latter case one might assert that to carry out the production goals in employment 2 must be higher or substantially higher. The drop in employment, if any, in the recent past, after allowing for an increment of growth, would suggest the general order of the magnitudes that are involved. For internal purposes the Council utilizes and makes all sorts of quantitative estimates. It seems unwise, however, to publish near-term estimates that rest heavily on assumptions and conjecture, and that is bound to be the case with numerical goals or targets.

'"The use of such estimates by the President in his Economic Report would not render a useful service to the Nation."

I stop there with a reemphasis that this does not include all of Dr. Burns' answer. I agree very strongly with Mr. Reuther and Mr. Baker that we should have some quantitative statement of the goals we should achieve in accordance with the Employment Act and the specifics as to what is to be done. This is not a new matter as the members of the committee will remember. This is a matter that was treated in the unanimous section of our report of last year, and I think it raises perhaps the most important question confronting not just the committee but the country. I felt, therefore, that it was appropriate without having the opportunity to digest all of the answer to get to make this information available to the panelists at this time, as well as to the members of the committee.

Representative KELLY. Mr. Chairman.

The CHAIRMAN. Mr. Kelly.

Representative KELLY. That brings up a point in my mind. I have contended that the authors of the Economic Report have exercised more than the normal amount of ingenuity in missing the point, and the point is this: there is a mandate in the full Employment Act to provide maximum employment, maximum production, and maximum purchasing. The report misses that pretty much, as I said. You cannot have maximum production power unless you have maximum purchasing power; that is true.

There is no use in having maximum production if you do not have maximum purchasing power. In many areas of the country today there is a great deal of unemployment, and I have said this for the record before and I am going to repeat it. It appears that those in authority in this Government are satisfied in order to balance the budget and to prevent inflation, to do so at the price of misery and distress in these areas, and that calls, I think, for some very dynamic action to be taken in order to aid those areas, and I might add this, too, that while we uphold this prosperity in the country generally, there is not a very great distribution of this prosperity. That is all.

The CHAIRMAN. Congressman Talle.

Representative TALLE. No questions.

The CHAIRMAN. Senator Sparkman..

Senator SPARKMAN. Nothing more.

The CHAIRMAN. Senator O'Mahoney..

Senator O'MAHONEY. I would like to wait for Mr. Reuther to continue.

Mr. REUTHER. Well, I was prepared to conclude. I would just like to point out in response to the last point that Senator Flanders made; he implied that when you give this great tax relief to the top of the economic pyramid by providing greater incentives for people to invest their money in plant expansion, that the expansion of industry then would be carried on. If you gave great tax relief, that would reflect itself in greater expansion of investment in new plant and equipment.

The record will show that the contrary is true, that we have had the greatest capital expansion during those periods when there was a great market, when there was a great deal of consumer purchasing power, because no one builds factories unless there is a demand to fill, by the productive capacity that factory will have.

If you take the period from the first quarter of 1953 through the first quarter of 1955 and you get the projection of business expenditures, you will find that during the very period when the Republican administration was giving the greatest incentives to the so-called investing group in America—during that period—capital expansion, investment in new plants and equipment, declined from the annual rate of 28.56 billion in the first quarter of 1953 to the first quarter of 1955 where the projection is 26.3 billion. So something quite contrary is happening.

If you could get an expansion of the purchasing power of millions of American low and middle income groups, and that purchasing power would reflect itself in demands for all of the good things of life that people need in such great quantities, that would do more to expand capital investment than anything else, because they would build the factories then to satisfy the growing demand. Businessmen do not carry on industrial expansion unrelated to the economic position of people.

I think one of the problems in America is that Mr. Humphrey, in his kind of economics, believes the essential problem is balancing the budget. Our problem essentially is balancing the American economy, and ultimately you can balance the Federal budget only by balancing the individual family budgets of the American people, and administration spokesmen like Mr. Humphrey do not understand that because their family budgets have always been more than balanced.

The CHAIRMAN. Mr. Reuther, may I call attention to table D-1 of the report of the Council on page 137. That has a figure on private domestic investment and in the third column it shows for 1953 a total figure of 51.4 billions for 1953, and of 46.1 billions for 1954, or a fall of about 5 billion or around one-tenth. Part of that was a decline in inventories, but if you take producers durable equipment which would be capital goods, that is a decline from 24.4 billions in 1953 to 22.4 billions in 1954, a fall of 2 billions or again by one-tenth, so that these figures seem to bear out your statement that despite the tax favors which were granted to stimulate investment in 1954, they did not have the effect of so doing. Of course, it could be argued that the investment would have been still less had it not been for the tax favors but it did not produce a net increase.

Mr. REUTHER. I think you are absolutely right, Senator Douglas, I would like to just make mention of a related point. The National City Bank reported that 457 corporations in America during the first half of 1954 turned out 7 percent less production but made 7 percent greater return. Now General Motors made 35 percent greater profit last year than they did in 1953, and yet their production went down.

The CHAIRMAN. Was that before taxes or after?

Mr. REUTHER. The 35 percent is after taxes. The General Motors Corp. made 35 percent more profit after taxes in 1954 than in 1953 although they had less production. When you get the stock-market boom in which you get inflation of stock prices out of less production, then you are dealing with, I think, dangerous economics. If the stock market went up because we were booming and we were creating greater economic wealth and the higher stock prices reflected the creation of greater economic wealth, you could say, "Well, that was a sound proposition." But when 457 corporations, on the average, made 7 percent more profit out of less production and that is a pretty good cross section of American industry, that is dangerous. Now if all of the working people and all of the farmers in America asked for more wages for less production, we could get in trouble real quick. We are asking for more wages because we are creating greater production with these wonderful tools that automation gives us.

Senator O'MAHONEY. Have you any figures showing a comparison of employment with these profit figures?

Mr. REUTHER. Yes. In the early part of my testimony I got into a comparison of what was happening in terms of employment and some of those figures are in my prepared statements, but I pointed out that while we had, say in December of 1954, an increase of 3 percent in production, by comparison with December of 1953, we nevertheless had I think 765,000 less nonfarm jobs, so production is going up, and employment is coming down.

Senator O'MAHONEY. Is it true that profits are going up and employment is going down?

Mr. REUTHER. That is correct; that is what is happening.

Senator O'MAHONEY. And have you made the specific comparison in this statement?

Mr. REUTHER. That is right. I thought there were some very dramatic figures contained in an editorial in the St. Louis Post-Dispatch which illustrated the relationship between 1954 at the low period and how far back you had to go to match that in terms of a low period for employment or a high period for unemployment and then we took the peak month which was August 1954 and compared that and you had to go back to 1949 before you got a comparable figure.

The CHAIRMAN. Mr. Bolling.

Representative BOLLING. I have some questions.

Mr. Reuther, in a statement that Senator McNamara of Michigan entered in the record yesterday, and which I would like to have included in the record of this hearing, he said that the fact that the automobile industry is today borrowing jobs from the future and the debt will probably be paid this fall, may be the basis for something approaching disaster in Michigan before the year is over.

(The information referred to above is as follows:)

THE SENATE MUST BE ALERT TO PREVENT UNEMPLOYMENT—EXTENSION OF REMARKS OF HON. PAT MCNAMARA OF MICHIGAN IN THE SENATE OF THE UNITED STATES, WEDNESDAY, FEBRUARY 9, 1955

Mr. President, I ask unanimous consent to have printed in the appendix of the Congressional Record some data taken from the January Economic Report of the President, some quotations from the Employment Act of 1946, and some conclusions drawn from these data and quotations.

The data given in the Economic Report of the President are as follows:

Year	Total employment [1]	Gross national production [2]	Production per employed worker [3]
	Millions	*Billions*	
1929	49.4	$104.4	$2,110
1948	62.9	257.3	4,090
1953	67.3	364.9	5,415

[1] Table D-16, p. 153.
[2] Table D-1, p. 137.
[3] The figure in this column is derived from the preceding columns.

Source: Economic Report of the President, January 1955.

The years shown above were prosperous years. Even 1953 was a good year before the Republican administration decided to slam on the brakes and almost threw us through the windshield.

The figures for these 3 prosperous years draw attention to the fact that, while the number of workers grew, their production grew even faster. The amount of money that had to be spent in order to keep each of these workers on the job grew with amazing speed. In 5 years, from 1948 to 1953, it jumped by $1,325 per worker.

This growth in production per worker continues. If we were to achieve full employment in 1955, the average worker's production would probably run approximately $5,860, nearly $450 greater than his production 2 years ago.

However, this increase in production would take place only if the buying power in the pockets of our people and investments by our business firms and spending by government kept up with this astonishing growth in production.

This is not likely to happen unless this Congress decides to make it happen. My understanding is that while spending by consumers is expected to increase a little, no one expects the increase to be enough to push total spending to the necessary level in view of the drop in investment by business and in government spending. However, I can only guess at this, because the Economic Report sent us by the President tells us nothing about this, perhaps the most crucial single fact in the economic picture.

The result may well be that there will not be full-time jobs for all those who are able, willing, and seeking work. Millions of American homes may again feel the blight of having the breadwinner laid off. Additional hundreds of small-business men may close their doors. Small farmers may continue to feel the pinch as their incomes fall. And the goods and services that ought to be forthcoming to raise living standards for American people are likely to be choked off at the source.

In Michigan, the memory of 1954 is kept alive by the fear of what lies ahead in 1955.

Even before the auto shutdowns in late 1954, approximately 215,000 people were out of work in Michigan, with 135,000 of them in Detroit alone. The fact that the automobile industry is today borrowing jobs from the future, and that the debt will probably be paid this fall, may be the basis for something approaching disaster in Michigan before the year is over.

We cannot blame this economic failure on nature or on any other force beyond our control. The blame lies with those people in high places who refuse to plan for full production, who may even prefer that we have something less than full employment and full production.

The laws of this country place the responsibility for this situation on the President of the United States. Public Law 304, the Employment Act of 1946, declares that "* * * it is the continuing policy and responsibility of the Federal Government to use "all practicable means * * * to coordinate and use all its plans, functions, and resources for the purpose of creating and maintaining * * * conditions under which there will be afforded useful employment opportunities, including self-employment for those able, willing, and seeking work, and to promote maximum employment, production, and purchasing power."

The act declares further, "The President shall transmit to the Congress * * * a program for carrying out this policy together with such recommendations for legislation as he may deem necessary or desirable."

If the Senate has yet received from the President the kind of program and recommendations which I believe were contemplated by this act, and which would give this body the material we need, to reach the goal of full employment, I have not been able to discover it.

As a matter of fact, his Economic Report is slient on some of the points where it ought to be most useful. It leaves out some of the most important information that this Congress ought to have to work with.

I am sure that the Joint Committee on the Economic Report, under the chairmanship of the able and distinguished Senator from Illinois, Senator Paul Douglas, will do whatever is possible to remedy the failure of the administration to do what the act requires and the country needs. I hope that when the committee makes its recommendations, this body will be alert to do what must be done, and do it quickly, if 1955 is not to be another year of inexcusable unemployment, underproduction, and hardship for many people.

Representative BOLLING. I gather from what you said earlier that you would agree that if you have a rate of production now that leads to almost a total layoff in late fall, that that would certainly be true of Michigan.

Mr. REUTHER. Unless there are some factors which bring about the needed and desired economic improvement in the overall situation, we will be in trouble in Michigan this fall.

Representative BOLLING. This would be a very serious situation in Michigan, but according to your testimony, I gather that because of the impact of the automobile industry, the impact would be felt not only in Michigan, but it would be felt in many, many areas of the country, those that produce steel, those that produce glass, and all of the items that go into the production of automobiles.

Mr. REUTHER. It would be felt disproportionately in Michigan, but the impact would be all through steel, glass, and all of these industries closely allied with automobile production.

Representative BOLLING. This is not only a local production, but a much broader problem.

Senator SPARKMAN. May I intervene at this point?

I call your attention to the fact that not only is it felt through other industries as a way of getting out to areas greater than Michigan, but we feel it in Alabama when you cut down employment in Michigan, because Mr. Wilson said, I believe, that they were expected to go back South anyhow when cold weather comes. That is not the reason they come back South. They come back down there when they are without jobs and simply swell the totals of local unemployment and swell the totals that go on relief and emergency rations. I assume that happens over a great area of the country.

Mr. REUTHER. I am sure it does, Senator Sparkman.

Representative BOLLING. I have one more question. In the Employment Act it says, "In exercising its powers, functions, and duties, the Council may constitute such advisory committees and may consult with such representatives of industry, agriculture, labor, consumer, State and local governments, and other groups as it deems advisable."

In the answers to the questions which I mentioned earlier, there was a question that bore on this, but I would like to have Mr. Reuther's comment on the amount of participation the groups he is associated with or knows of have had. What opportunity have they had for consultation, what advice has been solicited of these groups?

Mr. REUTHER. To begin with, I think the act provided this participation because I think every important economic group in the country has a contribution to make. Industry, agriculture, and labor ought to be consulted so the Government can try to get the benefit of any contribution any group might make.

In the past, in other administrations, we were consulted. The CIO and other labor groups had arrangements with the Council of Economic Advisers where periodically we would sit down and spend a considerable amount of time discussing many aspects of economic problems.

We would raise questions and they would say to us, we would like to have your point of view on this particular problem, how do you react to this situation, this is the way it is developing, and we had a flow of information two ways, and we learned a lot of things from them and I think they learned certain things from us.

During the past year we had an invitation only one time to meet with the Council of Economic Advisers. The invitation came directly after the November election and the meeting was held 1 or 2 days before Thanksgiving. I think we can say in all good conscience that as far as the present activities of the Council of Economic Advisers is concerned, we have not had the kind of opportunity to make our contribution to the work of that agency which I think is required by the law.

Representative BOLLING. Mr. See, would you mind answering the question just put to Mr. Reuther, although you have not had an opportunity to testify.

Mr. SEE. I do not know that our people have ever been called upon by the committee or by the board to consult with them. If they have, it is not to my knowledge.

Senator O'MAHONEY. You would know if your organization had been called upon.

Mr. SEE. I think I would.

Representative KELLEY. Mr. Chairman.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. I would like to direct this question to Mr. Reuther.

You mentioned the guaranteed annual wage. There is some misunderstanding about that. I would like to have you explain it. Would a guaranteed annual wage mean an indefinite period or would it have limitation?

Mr. REUTHER. The proposal that we intend to make to the auto industry has what we call limited commitments. It is for a period of 12 months, and at the end of that period the worker would exhaust his guaranty. And at the end of that period if he went back to work he would begin to build credit again. We do not think the guaranteed annual wage is a panacea that will cure all of our problems. However, we believe it is one of the unused democratic tools that our free society has to use, and what we have to do is to get further incentives in the industry so that we will create economic incentives for more rational planning of their production.

That is why, we believe, as I said earlier, that our demand is economically sound. We think it is feasible and we think at the bargaining table we can develop economic facts to support the economic soundness of our position. We think it is morally right. We believe that a worker who gives his time and skill and attention to an industry is entitled to an annual wage, because he has to live and eat for the year and support his family by the year.

Industry rewards all of its top executives by the year, it pays taxes by the year, it meets its outstanding financial obligations by the year. The only economic factor in production that is dealt with by the hour or by the piece is the human equation, and we think that, obviously, is the most important equation. We believe that if we provide economic incentives through the guaranteed annual wage, this auto industry which has been notorious for its chaotic and irrational and unsound production planning will begin to get that degree of stability into the industry, so that we are not booming for a few months and walking the streets for a few months and booming again for a few months.

If we can stabilize the auto industry, we will also contribute toward stability in the steel industry and other industries, and this thing can begin to spread in our whole economy. We believe that the auto industry is a logical place to start because the economic resources of that industry can carry the guaranteed annual wage without any difficulty.

When you think that the General Motors Corp. made $1,640 million profit in 1 year—that is before taxes—that is a comparable figure to try to compare costs to, and the other thing is that we are very worried about where we are going in America, in light of the tremendous technological progress that we are making.

There have been times in the history of the free labor movement when people fought against technological progress because they felt the advance of technology threatened their job security. We do not have that philosophy. We have always said we welcome technological progress. If they can find a way to do it easier with fewer people, fine.

We would like to encourage that, but we would like to get the benefit of it. We think technical progress should not mean greater human insecurity; it should mean shorter hours, and higher living standards, an opportunity to grow intellectually and spiritually and culturally.

Work is not an end, it is a means to an end, whereby we create the material needs to satisfy our basic needs, and having done that we can then do these other things. Now, creative work is something different, but when you are just tightening a bolt in an automobile factory, that is not creative work. That is the kind of thing you ought to have to do as little of as possible to earn your bread and butter, so you will have an opportunity to do real creative work.

We had an argument about 3 months ago in 1 of the factories where 8 men were doing a job as a team and those 8 men had about

8 different operations. One follow would tighten a bolt for a half hour, and then move over and tighten this bolt. An engineer came down with a stopwatch and said if we had those fellows just tightening the same bolt all of the time, we could turn out more cars with the same number of workers.

I said: "How would you like to come out of school to the point where you were gainfully occupied in industry and look forward to 45 years of tightening 1 nut in an automobile?"

That isn't why we organize a free society. That isn't what we are defending in the world. We are trying to defend and preserve and extend the idea that people as human beings can solve their economic problems by the organization of their resources and their productive power and their technology and their know-how, and to satisfy human needs so that people can become better human beings.

Frankly, if you ask me, whether we are going to lick the Communists by guns or by this approach, I will say by this approach, because we cannot win a war of negative values, but we can win a struggle of positive values. We get frightened at these little men of no faith when they look backward instead of ahead. The guaranteed annual wage, as I repeat, is not a panacea, but it is another one of the democratic tools we have to work with in trying to find a way to gear our expanding economy to the basic needs of people.

Representative KELLEY. Mr. Chairman, may I ask Mr. See what he thinks about the guaranteed annual wage?

Mr. SEE. Congressman Kelley, our brotherhood is working on such a plan now. We employed Mr. Latimer about a year ago and he is working on a plan for the Brotherhood of Railroad Trainmen and the Brotherhood of Locomotive Firemen. It is based, Mr. Chairman, on the Railroad Unemployment Insurance Act.

Mr. Latimer told me yesterday he had the plan about ready to present to our people now.

Representative KELLEY. Mr. Chairman, I have been asked this question by people who ask about a small industry which probably has not a great deal of capital; how can it guarantee an annual wage?

Mr. REUTHER. Well, I think that the future of small business in America generally is inseparably tied together with our achievement of a full employment, full production economy. When we get in trouble, small business goes down the economic drain. That is the trouble in the auto industry. The small independent producers cannot survive in a contracting market. They cannot survive when the economic pie that they are sharing gets smaller each year because their share of the smaller economic pie is not big enough to justify investment in automation and these other technological advances and the result is they go down the drain. What small business ought to do in America—it ought to join with farmers and labor groups and other progressive-minded people in the joint effort to achieve a full employment, full production, expanding economy, because they can survive only if they share abundance. They cannot survive trying to get a little piece of scarcity, and I think we have to tell the small-business people that their future lies down the road of abundance and full employment and full production, and if we do not get that, they are in trouble.

When the General Motors Corp. got more than 50 percent of the total production of the auto industry, last year, when 6 independent companies together got less than 5 percent, those independents are in trouble. And you cannot say, well, why don't we, the union, give them a break economically, because then what you do is you begin to compete in terms of who can lower the standards most, and that rat race will lead nowhere.

You have to raise standards and obviously you cannot get the little guys to pioneer, but once you get the big industries moving, they will create the stability which will then give the economic resources to the small guy. We had the same problem with pensions. When we talked about pensions they said, well, even if you make the big companies do it, the little companies will go down the drain, and yet we have made more progress on pensions with the little companies because they are nearer people, and sometimes, under the human equation, better. But the real answer to the future of small business is an expanding economy in which they share and participate in the great effort of creating greater and greater abundance. There is no other way out.

Senator O'MAHONEY. Is it true, Mr. Reuther, that these small companies in the motor industry exist by sufferance of General Motors, and 2 or 3 other big companies?

Mr. REUTHER. I believe in a period of contracting markets, in a period when the market does not enable small companies to get a share of the market sufficiently large to justify the expanding of their facilities, what you say is so.

They can only exist on their own economic feet in an expanding market and expanding economy.

Senator O'MAHONEY. What about the situation in previous years; what you have said now is based on automation. I am talking about the conditions which have brought us to this stage.

Mr. REUTHER. Well, I think you will find that during those periods of high economic activity, small business has always prospered, and during periods of reduced economic activity the smaller companies with limited resources are the ones that do not survive nearly as well as the big companies.

General Motors was the only automobile company that made profits during the worst years of the depression. They still made a profit, while thousands and thousands of small companies were going bankrupt and going out of business, and I think that the process of technological progress which is moving forward at an accelerated rate intensifies the economic position and makes more difficult the ability of small business to survive, because technology is related to volume.

You cannot put in a half-billion dollars' worth of machinery to build half that much production. It just does not pay. But if you are going to build, as General Motors does, billions of dollars' worth of automobiles, then you can afford to put in half a billion dollars of automation, because you get that much back, and more.

Volume is the key to unit cost, unit cost is the key to competitive position, and volume, therefore, really, I think, is the salvation of small business.

Senator O'MAHONEY. Well, does the future of automation indicate that unless there is something to counteract it, perhaps General Motors in another 2 years will have 75 percent of the output?

Mr. REUTHER. Well, I do not think they could get that much. I think General Motors can increase its percentage of the total market at the expense of some of its competitors in the next several years, but I do not think they could get that much.

They could take away everything the independents have, and that would only be 5 percent. Then they have to get into Ford's.

Senator O'MAHONEY. When you speak of the independents, whom do you mean?

Mr. REUTHER. The 2 companies that now make up American Motors, Hudson and Nash, and the 2 companies that now make up the Studebaker & Packard Corp., Studebaker and Packard, and the 2 companies that now make up the Kaiser-Willys combination, Kaiser and Willys; those 3 companies had less than 5 percent last year and General Motors had 50 percent.

Senator O'MAHONEY. Ford and Chrysler still have some staying power.

Mr. REUTHER. That is right. Chrysler lost a lot of ground last year, they lost nearly 50 percent of their market. They went from 22 percent down to 11 or 12 percent. They, I think, will make some comeback. It is a peculiar thing about the auto industry, and I suppose, on the one hand, you can admire the spirit of it, but you can certainly question the economic judgment that goes into that spirit.

When you talk to these people, they say that they are all going to beat the other guy, and they all say there is going to be a dip in production, but only the other guy will lose production. We are just going to keep going in high gear, and if you took a piece of paper and you added up how much each one was going to gain, it would be about 175 percent of total production.

The CHAIRMAN. There is an analogy in this. College graduates are supposed to know something about mathematics, but the alumni of every college expects their team to be a constant winner and everybody expects that they will exceed the average and not fall below. This a peculiarity of American optimism.

Mr. REUTHER. Except that we should not build our economic future on that kind of economics.

Senator O'MAHONEY. Mr. Reuther, you told us you were asked once by the Council of Economic Advisers for suggestions with respect to the Economic Report. Were you ever consulted by any of the automobile companies or any of the other corporations which produce the commodities members of the CIO work upon?

Mr. REUTHER. Well, I would say that the amount of consultation which corporations invite us to participate varies with their insecurity. When they have a problem, they want us to consult them night and day, and when they have not got a problem, they go their merry way, and do not ask for our advice. The smaller companies are a little better in that respect. That is because their problems are bigger.

Senator O'MAHONEY. Are you receiving enough consultation at the present time from Congress?

Mr. REUTHER. Well, I would give a most emphatic no to that. We are hoping this session of Congress will do better by the people than the last session.

Senator O'MAHONEY. Let me ask you, unless you have already testified about it, what fact you have discovered and what conclusion you have reached about the present level of production of our automobiles.

Mr. REUTHER. Well, I touched upon that. The figures indicate that auto production, based upon January, and as it is projected through March, that the industry will be operating somewhere between levels of 8½ to 9 million cars a year, but the most optimistic projection of sales is 6 million, so we are operating roughly at 3 million higher than the sales would justify.

Senator O'MAHONEY. An association of automobile dealers recently had a convention of some sort. Were you represented at that convention?

Mr. REUTHER. No, I was not. We do not participate in the meetings of such associations.

Senator O'MAHONEY. I did not think you would, but I thought you might follow up such meetings to see how the dealers react.

Mr. REUTHER. We are cautious about such things because inevitably when we do something in that area, the industry raises questions of managerial prerogatives, that we are interfering in management, and so forth.

Senator O'MAHONEY. I have no thought of your interfering in management. I am only thinking of your watchful eye.

Mr. REUTHER. Well, we watch these things very carefully.

Senator O'MAHONEY. What conclusion have you reached then with respect to whether or not the automobile dealers of the country are feeling satisfied about the situation?

Mr. REUTHER. I think they are very unhappy. I think that the auto dealers are unhappy because I think they are being compelled to take automobiles for which they have no customers. That is where bootlegging comes in. The fellow said I can't sell this as a new car but I will bootleg it somewhere and may make $5 on the transaction, but they always bootleg them in some district where the other fellow is trying to sell cars, and the other fellow bootlegs in other areas, and that creates a great deal of dissatisfaction among dealers at the present time.

Senator O'MAHONEY. You feel there is a compulsion for dealers to take more cars than they can sell?

Mr. REUTHER. Business Week says there are currently inventories of 550,000 cars, and Ward's Automotive Report says by the end of March there may be 661,000 cars in inventory. Obviously, when you build inventories that fast, you can only build them when the companies are pushing more cars in the hands of dealers than the dealers are able to dispose of.

The CHAIRMAN. You could not legally prove that the dealers are compelled to take these cars because the pressure is subtle and by word of mouth?

Mr. REUTHER. That is right.

The CHAIRMAN. And indirect and illusive, rather than brutal and forced; isn't that true?

Mr. REUTHER. I think its effects are brutal but I think the technique is not brutal.

Senator O'MAHONEY. How many dealers does General Motors have throughout the country, do you know?

Mr. REUTHER. I do not know. It is very sizable. They have, of course, one of the best dealer organizations.

Senator O'MAHONEY. Well, would it be possible for your staff of experts to determine it?

Mr. REUTHER. Oh, we know. I do not know offhand. We have those figures back in Detroit. I would be very happy to get them for you.

Senator O'MAHONEY. I wish you would, and put them in here, because we are talking now about the effect of this one corporation upon the economy of the whole country. When you have large corporations producing such a tremendous proportion of the particular commodities that go into trade all over the country, you have a center of economic stimulus and of economic depression, and any study of the economic effect must go into that aspect of it.

(The material supplied by Mr. Reuther is as follows:)

Passenger-car dealers in the United States in 1954

Company	United States passenger-car dealers [1]	United States franchised new-car dealers [2]
Chrysler	10,292	----------
Chrysler-Plymouth	3,349	3,491
DeSoto-Plymouth	2,883	2,954
Dodge-Plymouth	[3] 4,060	4,140
Ford Motor Co	8,407	----------
Ford	6,564	6,590
Lincoln-Mercury	1,104	1,774
Mercury	739	----------
General Motors	[4] 20,790	----------
Buick	3,509	3,414
Cadillac	1,743	1,610
Chevrolet	7,533	7,522
Oldmosbile	3,878	3,664

Company	United States passenger-car dealers [1]	United States franchised new-car dealers [2]
General Motors—Con.		
Pontiac	4,127	4,072
Hudson	1,766	2,017
Nash	1,531	1,623
Packard	1,520	1,433
Studebaker	2,491	2,749
Kaiser-Frazer	----------	2,127
Willys	----------	1,973
Kaiser-Willys	[5] 2,339	----------
Total United States franchises	49,136	47,184
Minus dual franchises	6,955	----------
Net number of United States dealerships	42,181	----------

[1] As of Jan. 1, 1954, as estimated by Automotive News Almanac for 1954.
[2] As of Mar. 1, 1954, as estimated by R. L. Polk & Co. and published in Automotive News Almanac for 1954.
[3] Total includes a few exclusive Dodge dealers.
[4] In a General Motors press release for Jan. 17, 1955, reference was made to 18,500 GM dealers and distributors.
[5] Kaiser-Willys recontracting program incomplete as of Jan. 1, 1955.

Mr. REUTHER. I would like to qualify, if I may, my statement that dealers are being crowded with more cars than they can sell. I will make one exception, Cadillac. Cadillac dealers have more customers than they have cars.

Senator O'MAHONEY. Well, would you regard that to be a result of last year's tax law?

Mr. REUTHER. I would think that that had a great deal to do with it. Unfortunately, America will have to ride the lower priced cars to prosperity. It would be fine if we could all ride in a Cadillac, but I am afraid we can't.

The CHAIRMAN. Mr. Talle.

Representative TALLE. No questions.

The CHAIRMAN. Thank you very much, Mr. Reuther.

Mr. REUTHER. Thank you for this opportunity.

The CHAIRMAN. Mr. See, of the Brotherhood of Railway Trainmen.

OPENING STATEMENT OF HARRY SEE, NATIONAL LEGISLATIVE REPRESENTATIVE OF THE BROTHERHOOD OF RAILROAD TRAINMEN

Mr. SEE. Mr. Chairman, I am appearing on behalf of Mr. Kennedy, the president of the brotherhood, who was invited by the committee to be here, and who found it impossible to do so.

My name is Harry See, and I am national legislative representative of the Brotherhood of Railroad Trainmen, with offices at 10 Independence Avenue SW., Washington 24, D. C. The headquarters of the brotherhood are located in the Standard Building, Cleveland, Ohio. We represent brakemen, yardmen, conductors, switchtenders, train baggagemen, and other classes of employees on railroads. The brotherhood has approximately 200,000 members employed in train service in the United States and Canada.

The President's Economic Report declares that "the Government is mindful of its great responsibility to help assure balanced economic growth." The report states also that the administration program for 1955 is directed to fostering longtime economic growth rather than imparting "an immediate upward thrust to general economic activity."

Since the President's report was issued the Federal Reserve Board has taken action to slow down what has been called "the strong recovery phase" of the American economy. The President of the New York Federal Reserve Bank described this as a change from a policy of actively encouraging lending by the commercial banks to one of "letting credit tighten up a bit." This seems to mean that the Eisenhower administration's interpretation of "balanced economic growth" and avoiding "an immediate upward thrust" requires a slower rate of expansion in business activity than prevails at the present time.

The experience of 1953 indicates that we cannot use tight credit to slow down economic expansion without the risk of reducing job opportunities. Therefore, I ask the question, Is this the time to slow down business expansion?

According to the Interstate Commerce Commission, employment on class I railroads has declined from 1,239,000 in July 1953 to 1,027,000 in December 1954, a reduction of 212,000 in 18 months. This is a 17 percent decline in employment over the period. . According to the President's report, average unemployment on a national basis rose from 2.5 percent of the labor force in 1953 to 5 percent or 3,230,000 in 1954. In December 1954, unemployment was 2,838,000. I include this in my statement because I believe it is necessary to points which I develop later.

I do not need to tell this committee that not only are 3 million wage earners out of work, but hundreds of thousands of jobseekers have withdrawn from the labor market because there is no prospect of finding work and still other workers are on part time. I understand there are estimates that unemployment may reach 4 million in 1955 and 5.5 million in 1956, even on the basis of currently anticipated increases in economic activity.

The present is no time to take any action that will run the risk of reducing employment opportunities.

Our national production is still short of the level necessary to provide maximum employment. Employment in the railroad industry has declined every month since July 1953. Railroad transportation is a service industry that cannot prosper unless and until industry generally prospers. Carloadings, although showing a tendency to increase in recent weeks are still below the levels reached in 1953.

Carloadings and railroad employment will not increase until there is an expansion of industrial output. We know that the growth in our economy in 1954 lagged behind 1953; that industrial production and carloadings were behind 1953. We get no satisfaction from comparing 1954 with earlier years and saying that it was our second best year. Railroad and other workers are still out of work and the prospect is for even greater unemployment unless business activity expands.

A major portion of the decrease in employment in the railroad industry is brought about by the continued drop in the production and hauling of coal. Production of bituminous coal was 630.6 million tons in 1947. In 1954, the output of bituminous coal had fallen to about 390 million tons, a decline of 38 percent over a 7-year period. Carloadings of bituminous coal were 9,088,000 in 1947 and 5,650,000 in 1954, a decline of 3,438,000 carloads, or about 38 percent over this period.

To illustrate one of the causes for this deterioration in the coal and railroad transportation industries, let me first state that in the year 1954 this country imported 128,327,160 barrels of residual fuel oil. This figure is equal to 30,557,500 tons of coal. Using the average figure of 60 tons of coal per carload, this would translate the 128,327,160 barrels of oil into 509,291 carloads of coal.

To realize how much of an effect this has on employment, we must first take a look at the decrease in the carloadings of coal in the three major coal regions.

In the eastern region, for the year 1952, there were 1,170,489 cars of coal loaded. In the year 1954 in this same region, only 903,222 cars were loaded, a decrease in the 2-year period of 267,267 cars.

In the Allegheny region, 1,657,472 cars of coal were loaded in 1952, while in 1954 carloadings totaled 1,367,062, a decrease of 290,410 cars.

In the Pocahontas region, in the year 1952, carloadings of coal totaled 1,831,106, while in 1954 they amounted to 1,485,409, a decrease of 345,697 cars. The combined decrease of carloadings of coal in these 3 regions for 1954 as compared with 1952 totals 903,374 cars.

So far we have discussed only the drop in total carloads of coal. To carry the translation further in terms of railroad manpower, the loss of 903,374 carloads would equal 1,130 trains, using 80 cars per train as an average number. This is still not the complete picture, however, for so far we have spoken only of carloads of coal lost.

As you well know, the other side of this movement is the bringing of empty cars to mines for the transportation of coal to consumers. To determine the total number of trains and crews displaced by this operation, the number of 1,130 trains must be doubled, since there would be a like number of movements of empty cars to the mines before there would be the same movement of loaded cars out of the mines.

Senator O'MAHONEY. Let me interrupt, Mr. See, to remark that if you had included the Rocky Mountain region in this computation, you would have found a similar story of reduced production and increasing unemployment in the coal-mining regions.

Mr. SEE. I think that is true, Senator. That would be true in every coal-mining region.

Senator O'MAHONEY. Well, I just hate to see Wyoming overlooked. That is all, Mr. See.

Mr. SEE. I understand that the coal situation isn't so good, and that residual oil does not have much to do with that. It is largely the dieselization of the railroads that owned the coal mines, in the first place.

Senator O'MAHONEY. That has some bearing.

Mr. SEE. I do have the coal-loading figures for some of the western railroads.

Senator O'MAHONEY. I think it would be well if you put them in the record.

Mr. SEE. I would be glad to do that.

(See p. 1215.)

Mr. SEE. We thereby see that actually 2,260 trains are affected. To continue, the average haul from mine to consumer is 300 miles. Crews are paid on a 100-mile-a-day basis. The number of trains affected then becomes three times the above figure, or 6,780. Since 5 men constitute a train crew, the astounding total of 33,900 man-days lost is realized.

This figure applies, you will recall, only to the three coal regions mentioned above, the Eastern, Allegheny and Pocahontas, and does not by any means indicate total loss in railroad employment as a result of the decline in coal production.

The above figure represents only road train and engine crews. It does not include the associated employment of yardmen or the large number of nonoperating employees used in connection with such traffic.

I do not wish to leave the impression that every one of the man-days lost in these three coal regions is attributed directly to the importation of residual fuel oil. But it is a tremendous factor on certain railroads with a large coal hauling business, such as the Pennsylvania, New York Central, Western Maryland, Virginian, Chesapeake & Ohio, Norfolk & Western, and the Clinchfield. We do not have the decrease in employment for this period for each separate railroad, but if the committee desires that kind of information, the Interstate Commerce Commission is in a position to furnish it.

On one railroad, the Norfolk & Western, as of January 28, 1955, approximately 2,000 employees have been furloughed. Only 20 percent of these employees have been able to find jobs in other industries. Total employment on this carrier at high-level employment is over 17,000.

I might add within the past couple of weeks I was in eastern Tennessee and was informed that employment on the Clinchfield Railroad was just about 50 percent what it was 2 years ago, and the Clinchfield is a large coal hauling railroad.

I stated these facts on the importation of residual fuel oil before the Ways and Means Committee on January 31. I urged that committee to place a quota limitation on the importation of residual fuel oil. I am restating these facts before this committee because I want it to understand the effects of these importations on the coal and railroad industries.

The President's economic report has supporting evidence of the effect of the decline of the coal industry. The map on page 90 of the report (chart B-3) shows a belt of the greatest unemployment among insured workers. Of the 9 States showing the greatest insured and unemployment, 4 are coal-producing States. Pennsylvania has unemployment of 7 percent of the total insured, West Virginia 10.9 percent, Kentucky 10.3 percent, and Tennessee 8.6 percent.

For the United States as a whole, insured unemployment in 1954 was 5.2 percent of covered employment.

A representative of our union, Mr. Van Parsons, general chairman on the Western Maryland Railway, described to this committee the unemployment among railroad workers in Cumberland, Md. At Altoona, Pa., there are 585 car-repair workers including carmen, machinists, carpenters, welders, and pipefitters out of work. And that statement comes from a sheet put out by the Railroad Retirement Board to their National Employment Service. Yet the national total of cars awaiting repair rose from 87,637 in 1954 to 116,200 in January 1955, while the number of locomotives awaiting repair over the same period rose from 1,919 to 2,513.

We take the position that if the Pennsylvania Railroad started repairing the equipment that needs repairing, they could put a lot of people out of work in Altoona back to work. That could be true in any town where there are railroad shops.

Railroad employment at Cumberland and Altoona will not increase until an improvement in general business conditions results in a greater coal output and a greater demand for railroad services.

The President says that the vigor of the recent recovery suggests that economic expansion will "probably" continue during the coming months and that it holds out the promise that we shall achieve a "high and satisfactory" level of production and employment in the current year. He says further that—

> it is reasonable to expect that the Nation's output within the coming year will approximate the goals of "maximum employment, production and purchasing power" envisaged by the Employment Act.

This statement does not commit the administration to work for a level of production that will reduce unemployment to a bare minimum. What is a "high and satisfactory" level of employment? Why are our sights set merely on approximating the goals of maximum employment, production, and purchasing power? The report fails to define the goals required by the act. Is the word "approximate" used to evade this responsibility?

Does the administration look back to the level of production and employment of 1953 as a satisfactory level of production and employment for 1955? A return to "the good old days" of 1953 will not meet the needs of 1955 and future years. We must look ahead to the necessity of increased production and employment. The labor force is growing because of the growth in population. The annual net increase in the number of people seeking employment is about 700,000, and I think Mr. Reuther raised that to 800,000. At least one forecast was made before this committee that average unemployment may increase by as much as 1 million to about 4 million in 1955.

One conservative investment publication, the Magazine of Wall Street, January 8, estimates an increase in unemployment to almost 4 million in 1955 and to 5.5 million in 1956 on the basis of the present level of business activity. Even this publication complains that "a prosperous America cannot afford the stigma of chronic rising unemployment."

From my own industry I can report that there has been displacement of workers by investment in diesel power, centralized traffic controls, pushbutton freight yards, and other modern equipment and methods. Dieselization, for example, means less man-hours in repair shops. It also means longer trains with lower requirements for operating labor and increased hazards in hauling the longer trains.

The trend to modernization increases output per worker in all industry, including the railroad industry, justifying higher wages. But increasing productivity per worker means less men to turn out the same work. We must adjust our national economic policies to provide employment for the workers displaced by the increasing use of automatic machinery and more efficient methods and equipment.

I need not remind this committee of the harsh impact of continued unemployment. I fear that the policy of permitting credit to tighten up may have damaging and far-reaching effects on American industrial activity. It may halt recovery entirely. "Letting credit tighten a bit" means turning our backs on the effects of unemployment. As a nation we must not show this indifference to the urgent needs of millions of unemployed and underprivileged American citizens.

We have given two reasons—growth in the labor force and increase in productivity—why a return even to the high output and employment of 1953 will fall short of the need of the American economy in the current and future years. We believe the administration is overly concerned about the threat of inflation and not sufficiently concerned about the necessity of a definite program of governmental expenditure on a National, State, and local basis that will assure full employment of the Nation's men and resources in the years ahead.

The problems associated with expansion such as labor shortages and a tendency for higher prices must be measured against the hardships to more millions of unemployed Americans which is likely to result from tightening credit at the present time. We must decide between the two as long as we have millions of unemployed. There can be no doubt where the decision will be once the choice is made clear. Our democratic society will not tolerate unemployment, but will demand a rising national output and a job for every man seeking work.

The following steps should be taken to give the needed boost to employment and national output:

The President's recommendation that we postpone the lowering of the corporate income tax scheduled for April 1, 1955, should be adopted. The revenue needs of the Government should be met from this source rather than from the excise taxes.

The excise taxes should be kept no longer than the date of April 1, 1955, when many of them are scheduled to be lowered. These taxes transfer purchasing power from consumers to the Government with the effect of curtailing spending for consumer's durable and other goods and in that way hold down employment. The removal of the excises would encourage business and help employment.

In the railroad and transportation industries generally, the wartime excises on the charges for the transportation of persons and property are adding to the burdens of the railroads and other common carriers, and encouraging the use of nontaxed means of transportation, both passenger and freight. The tax on passenger fares was enacted to discourage the use of commercial carriers during the war when their facilities were overloaded with travel, much of which was not essential to the war effort.

The tax on freight charges discriminates against distant shippers and pyramids until it is actually many times the original tax. These taxes are a Government-imposed burden on an industry that is losing ground to private untaxed carriers such as the private passenger automobile and the private motortruck, and should be removed to provide a needed stimulus to the public agencies of transportation.

The President's recommendation to increase the present national statutory debt limit should be adopted to enable the Treasury to borrow when necessary to meet the needs of a full-employment economy. Similarly, the States should act on the President's recommendation to remove and to relax the local tax rate-limiting and debt-limiting statutes as means of enabling these local jurisdictions to increase the scale of their public-works programs.

Individual income taxes should be reduced through the method of increasing personal individual income-tax exemptions. This would give substantial aid to lower income receivers and would add to mass purchasing power and thus help employment.

The national minimum wage should be raised to $1.25 per hour. The President's proposal to raise the wage to 90 cents per hour is wholly inadequate.

The President's recommendation that the Federal old-age and survivors insurance should be extended to Federal personnel should be adopted. However, I do not believe the President goes far enough in this change. There should be a substantial increase in retirement benefits to keep pace with the increase in living costs. I might say for the employees of the industry of which I am a member that railroad retirement benefits can, in my judgment, be increased without a tax increase and without jeopardizing the reserve fund.

I am not sure that the President recommends including under the unemployment-insurance system the employees of State and local governments, and employees who work for firms employing fewer than four persons. Presumably the President asked only for consideration of this change, because it is a State responsibility and because he wants, above all, for it to remain a State responsibility. I believe that this change should be adopted and that it should become a responsibility of the Federal Government.

Likewise, the President asked the States to consider revising unemployment-insurance benefits so that in all cases they equal at least one-half of the regular earnings. I believe this change should be adopted and that it should become a responsibility of the Federal Government.

There should be a minimum term of unemployment benefits of 26 weeks, but I believe that employees with longer records of contributions to the system should have a longer period of benefits. These changes should be effected through Federal legislation.

The recommended changes in the unemployment-compensation system should not be left to the States, but should be assumed by the Federal Government. The States have failed to take any action toward accomplishing these objectives. For example, President Eisenhower twice in 2 years has asked the States to consider raising the weekly benefits to equal one-half the worker's weekly wage. No State has yet adopted this standard. We need Federal legislation to incorporate these needed reforms into the social-security system, on a uniform, nationwide basis.

The recommendations of the President for expansion of the Federal program of aid for fellowships, research, teacher training, and other related educational activities should be acted upon without delay and upon a scale commensurate with the size of the problem.

There is no lack of authoritative statements of needs for the necessity of aid to the States and school districts in the construction of school buildings. It is unnecessary to await a report from the forthcoming President's conference on educational needs. The conference is not scheduled to meet until late this year. Its report and recommendations may not be available in time for legislation by the next session of Congress. We all know the urgent needs of our children, the crowded condition of the classrooms, the overburdened teachers. The need of the public-school system is immediate and growing. The present Congress should take action to remedy this shortage without waiting for any more surveys or reports.

The President's report places primary responsibility of any public works for schools, hospitals, hydroelectric development and other public investment on the States and local units of government and private enterprise. The report reads as if undertakings on conserving water resources, involving the development of hydroelectric power were small, local projects in which people of several States had no interest.

I need only read a partial list of such projects, such as the Tennessee Valley, Hells Canyon on the Snake River, Grand Coulee and Bonneville on the Columbia River, and the Great Central Valley of California to show that the power, irrigation, and flood control and conservation of resources far transcend the resources of any small locality and private capital and have a public interest to the people of a vast area which extends beyond State boundaries. It may be said to affect vital interests of the entire Nation.

In my own State of California private interests and local capital were never equal to doing the job of controlling the recurring floods of northern California and relieving the arid conditions of the Central Valley. The State attempted it and was never able to raise the huge amounts of capital required. Then Franklin Roosevelt and Harold Ickes gave us the Central Valley project prepared jointly by the United States Corps of Engineers and the Bureau of Reclamation.

The result is that today major floods are unknown in northern California and hundreds of thousands of acres of desert in the Sacramento and San Joaquin Valleys are under cultivation. This great Central Valley project, which has resulted in a vast increase in private enterprise in the area, could not have been accomplished without Federal funds and management.

The CHAIRMAN. Is it not true that the State of California now wants to get this back again for themselves?

Mr. SEE. Yes, I have heard something about that, Senator. I have not been around California much in the past few years, but I read it.

The CHAIRMAN. But without any limitation on the size of the land holdings.

Mr. SEE. I think that is right. They would do away with the 160-acre limit. I might say that 2 or 3 times we had the Water Power Act on the ballot in California for the voters to vote on, and we never were able to secure votes enough because of the immense amount of money, the financial burden it would place on the State.

Senator O'MAHONEY. Well, wasn't the bond issue authorized several years ago?

Mr. SEE. No, those measures failed during the times I was in the campaign. I think not, Senator.

Senator O'MAHONEY. It is my recollection that before the Central Valley project was undertaken by the Federal Government, the State of California had actually authorized a bond issue but no effort was made to proceed under that issue when the opportunity presented itself to get Federal money.

Mr. SEE. I would be glad to check on that, Senator, and let you know definitely. (See letter p. 1215.)

The administration's withdrawal from such great public undertakings means the nondevelopment of many of our resources and partial, even wasteful, development of many others. It means that private, monopolistic financial interests can dictate the terms of sale of such products as hydroelectric power. In many instances dependence on local units of Government and private enterprise will mean almost no conservation and irrigation whatsoever. The move by the Eisenhower administration to emphasize the responsibility of the localities and private capital is a large and significant step backward. It means a definite slowing down in the development in our resources, if not halting such development altogether.

On new schools, hospitals, water systems, the report simply says that they constitute the largest part of the demand for public works and are traditionally provided by the States and their governmental subdivisions. The report claims that in most cases the capacity of municipalities appears to be adequate for financing these needed improvements. The proposal to remove debt-limiting and tax-rate-limiting statutes, suggestions for broadening the market for bond issues of local governments and the coordination of public works planning is the extent to which the administration would go in giving Federal assistance to these subdivisions. Experience has shown that the States and municipalities have not met the problem of financing public works on the scope necessary to meet the needs of our present-day population.

I believe that direct Federal grants must be made available to the States and their subdivisions to insure that such projects be undertaken. That is the basis of the commonly accepted plan to aid our public schools, including the construction of buildings; it similarly should be the basis of a nationwide plan for the construction of hospitals, water systems, and other resource conservation projects.

There is no doubt that we need modernization of our highway system. But we do not need improvement in highways to enable people to get from one place to another more rapidly than before as much as we need certain other public construction such as schools and hospitals.

Moreover, I believe that before we undertake a vast program of modernization of public highways with the Federal Government contributing the lion's share of the cost, there should be some form of Federal highway user taxation. The commercial vehicles that are the major factor in highway deterioration should pay a charge commensurate with the benefits they derive from and the wear they cause on the highway roadbed.

Unless we make such a provision for financing the modernization of our highways, such improvements become an outright subsidy to one form of transportation at the expense of the American taxpayer.

The present program of underwriting home mortgages by the Government should be continued, and the increase on the insurance authorization requested by the President should be adopted. There should also be a huge expansion in the low rental housing program beyond the 35,000 per year requested by the administration. We cannot hope to provide equal opportunities for our citizens without providing decent dwellings for all.

If these steps are taken, I believe we will go far along the road to full employment and toward bringing prosperity to such industries as coal and railroads. I believe that the consummation of those steps will also accomplish some longstanding objectives for the improvement of living conditions of vast numbers of our underprivileged citizens.

I wish to thank the members of this committee for their time and attention.

The CHAIRMAN. Mr. Talle.

Representative TALLE. No questions, thank you.

The CHAIRMAN. Thank you very much, Mr. See.

(Mr. See's prepared statement and a supplemental letter appear at pp. 1210–1216.)

The CHAIRMAN. Next Wednesday we will continue the hearings of representatives of economic interest groups. At that time we will hear from Mr. Kennedy, the vice president of the United Mine Workers of America; Mr. Shuman, president of the American Farm Bureau Federation; Mr. Newsom, master, the National Grange; Mr. Schmidt, chief economist, Chamber of Commerce of the United States of America; and Don Mahon, president, National Brotherhood of Packinghouse Workers, and secretary of the National Independent Union Council.

(The prepared statements and supplemental material received from the panel are as follows:)

A FARMER'S PLEA FOR EXPANDING FULL EMPLOYMENT ECONOMY—STATEMENT OF JAMES G. PATTON, PRESIDENT, NATIONAL FARMERS' UNION

Mr. Chairman and members of the Joint Committee on the Economic Report, for the record, my name is John A. Baker. I am assistant to the president of National Farmers Union, for research and legislative service. As you know, Mr. Chairman, Jim Patton, national president of Farmers Union, had planned to participate in this hearing, but owing to its being rescheduled he was unable to be here.

I shall read a brief summary of Mr. Patton's statement and submit for the record certain supplementary material.

As we figure it, Mr. Chairman, national farm gross income in 1955 will probably be more than $7 billion short of a full employment level and realized net income of farm operators will be about $3½ billion lower than is needed as the basis for an expanding full employment economy. In 1955, America's farm families should be a $40 billion market for commodities and services instead of the $31.5 billions projected by the President's Economic Report.

Mr. Patton's statement continues: I submit this statement to you as one who helped shape the Employment Act of 1946, and who still believes that loyalty to its principles and success in its objectives are vital to America in these times of world crisis and domestic distress.

Lest you feel that my reference to domestic distress is overdrawn, I call your attention to two significant facts. First, the income of the average United States farm family has dropped from about $200 per month in 1952 to $150 per month in 1954 and under the Eisenhower sliding scale farm program a further drop to only $100 per month would be allowed. Second, unemployment is officially announced to have risen by 538,000 in January, bringing the total to 3,347,000. As has become customary, the Government press releases surround this further downturn with a rosy glow—they say it is seasonal. The small decrease in unemployment in the last quarter of last year was really seasonal, but the rosy press releases forgot about seasonal adjustments then—they asked us to cheer a big improvement. An increase of more than half a million in unemployment in 1 month is not just seasonal; it is mighty serious. If we were in a great upsurge of business, it would overcome the seasonal factors and bring about a drop in pathologically high unemployment.

The President's 1955 Economic Report reaches a new low under the Employment Act. It highlights the wrong facts; it misconstrues the facts that it highlights; and it fails to carry through to logical conclusions as to policy or program even of the facts it does present.

The Economic Report does contain an impressive array of charts, graphs, and tables. So do other Government manuals. But this array is used to conceal, not to reveal, significant meaning for economic policy. The Economic Report is supposed to be a great interpretive document—and the interpretation is lacking in the report you have under consideration.

Here are a few of the questions that the report makes no attempt to answer, or even really to raise.

Is employment too high or too low, and how much reemployment do we need for maximum employment?

Is production sufficient, and how much do we need for maximum production?

Is purchasing power sufficient, and is it well distributed, and how much adjustment do we need for different groups for maximum national production?

These are not merely random questions. They are the core of intelligent consideration of economic policy. They are the central questions that the statute directs be answered in the Economic Report. The report does not even raise these questions. It abandons the field of sound economic analysis. It cuts the ground from under intelligent discussion of economic policy. And specifically it flouts not only the spirit but the very letter and explicit mandate of the Employment Act.

This breach occurs, I submit, because the Economic Report misses the whole heart and purpose of the Employment Act. The act does not call for an historical encyclopedia of cold data. It does not call for mere forecasts. It calls for a true and bold statement of our economic needs and capacities, and for a program based upon these needs and capabilities. This the 1955 report totally and distressingly lacks.

The Economic Report does not set any growth goals for this year. Without established growth goals how can we possibly determine where the deficiencies are or how to surmount them?

How fast is automation creating the need to find new jobs for displaced workers?

How far is consumption short of the requirements for a full economy?

What tax and spending policies, by the Government, would specifically address themselves to solving identified problems and overcoming stated weaknesses in the economy?

How have the policies of the Government, thus far used, worked to overcome these weaknesses, if at all?

Nowhere in the report can one find significant attention to these questions—in quantitative and meaningful terms. Platitudes and easy optimism are to be found in abundance. One can hardly disagree with its conclusions, because it selects no vital problems to reach conclusions about.

I cannot discuss the farm features of the report, because there are none.

The job of preparing the kind of Economic Report envisioned by the Employment Act of 1946 remains to be done.

I strongly urge that the committee write a report to the Congress which specifically sets forth the size of our needs to achieve maximum employment, production, and purchasing power, along with a program adjusted to these great purposes. Since the Economic Report has not provided these materials for the committee to evaluate, I respectfully submit that the committee, prior to doing its own job, needs to do the job that the Economic Report should have done but did not do.

Mr. Chairman, I request that the remainder of Mr. Patton's statement, which consists of the rationale and statistical detail of our calculation of a 1955 full employment income and an illustrative documentation of the shortcomings of the 1955 Economic Report be inserted in the record of these hearings.

Lest my criticisms of the Economic Report seem too harsh, lest us take a look on page 24 of the report. On this page, it is stated that "the business recovery now under way is powerfully supported by underlying forces of economic growth." This sounds very encouraging indeed. But then the report says, on the same page, that Federal spending is going to decline further; that the prospects for plant and equipment expenditure are uncertain; and that further expansion of consumer spending may be expected. Assuming these forecasts to be correct, how much do they add up to? At best they add up to a very moderate increase in total output.

But we know that, to restore full employment and full production, we need a tremendous increase in total output. We need it to make up for the fact that we are now at least $30 billion below maximum output. We need it to make up for the fact that we must raise output about 8 percent above current levels, by the end of this year, to restore maximum employment. Measured against these needs, which the report does not even state, its own forecast turns into a very dismal picture.

But then the report goes on to say, still on the same page, that "with economic activity continuing to expand, it is reasonable to expect that the Nation's output within the coming year will approximate the goals of maximum employment, production, and purchasing power envisaged by the Employment Act."

This last statement has no real content whatsoever, because the Economic Report does not define maximum employment or production or purchasing power. But let us see where we come out, when we do define them.

Maximum employment would require, by the end of this year, that almost 3 million new jobs be created, to reduce unemployment to full employment levels and to absorb more than a million people entering the labor force and scheduled to return from the Armed Forces. Are we on our way toward this goal, when in January employment dropped by more than a half million and unemployment rose more than a half million?

Maximum production means that our output in the fourth quarter of this year must rise at least 8 percent above current levels, or about $30 billion. Are we on our way to this goal, when the much heralded business upturn of the last few months has lifted output by only about 1½ percent, and when almost everybody admits that this upward flurry was caused mainly by a level of automobile production, and accompanying steel production, enormously higher than anybody expects can be maintained for the balance of this year?

Maximum purchasing power means that we need to add about $18 billion to personal incomes between now and the fourth quarter of this year, to get sufficient expansion of consumer buying. Are we on our way to this goal, when personal incomes have risen by only $2½ billion during the past year and a half?

Maximum purchasing power also means that we need by the end of this year to raise farm personal income, as a share of total personal income, by $4 billion or more. Even if we did this, we would be far short of any kind of parity of income for agriculture.

Are we on our way to this goal when gross farm receipts, on an annual basis, have dropped $3 billion since 1951; when farm operators' net income, measured in uniform 1954 dollars, has dropped about $7 billion since 1947; and when farm personal income has dropped more than $4 billion since 1951, or a fall of 20 percent while total personal income increased 8 percent?

Are we on our way to this goal, when per capita farm income has dropped from $851 in 1946 to $649 in 1954? Per capita farm income is now about one-third as high as per capita nonfarm income, while it was almost half as high just after World War II. While real per capita nonfarm income is now slightly higher than just after World War II, real per capita farm income is almost 20 percent lower.

Are we on our way to this goal, when the farm parity ratio has recently fallen to the lowest levels in about 14 years?

And what goals are we on the way to, with respect to using our enormous productive power—more than 7 percent of which now lies idle—to meet the basic needs of our people?

National security is being cut billions of dollars below what the best informed experts advise.

International economic aid, a major fortification of the free world, is being slashed further and further.

With a current shortage of classrooms at primary and secondary levels of education of more than 350,000, and with a present backlog of school construction estimated at $10 billion, the portion of the Federal budget represented by outlays for education and general research is little more than half a cent for each dollar in the budget, and no real increases are being projected.

Under our old-age insurance system, the average monthly checks are between $50 and $60 per person, including benefits for dependents, which in many parts of the country is barely a quarter of the requirements for maintaining minimum standards of health and decency. What kind of shabby treatment is this of our older people.

Our national resources development programs are being slashed further and further. Soil conservation and reforestation, flood control and power, scientific experimentation and valley developments, are being neglected at a rate which is not only depriving our people of necessary services, but also corroding the base for the growth of industries and enterprise.

Measures to supplement the incomes and standard of living of almost 7 million American family units who have incomes of less than $1,000 a year are being pushed aside. The proposals to increase the minimum wage laws do not even keep up with the changes in the cost of living, since the original 40-cent law was adopted; in terms of current higher standards of living and higher productivity, the 90-cent proposal is as out of date as two-wheel brakes.

A tax policy is being maintained which has already displayed in practice the fallacy of watering the tree at the top and neglecting it at the roots. The tax concessions to corporations, dividend holders, and well-to-do individuals have not stimulated investment, in the face of the great deficiencies in consumer markets measured against the needs for an expanding economy. The kind of tax policies which would help lower income families, for example, through lifting the exemptions, have not been adopted.

In the face of millions of urban and rural slums, a rehousing program is being recommended by the Government which does not even rise to the dignity of a token program.

The Economic Report of the President makes no attempt to match its proposals and programs against the size of the needs to be met. Failing to do this, even its own programs are not supported by the economic analysis; although these programs are pitifully inadequate in all cases and misdirected in some cases.

Beyond all question, we are now facing a fantastic increase in productivity and technology, dramatized by automation. Although production in our great manufacturing industries is now somewhat higher than a year ago, employment is 5 percent lower. We are at the start of a new industrial revolution, which will plunge us into depression or carry us to new heights of prosperity and abundance, depending upon how soundly and how quickly leadership responds to this challenge. Yet, reading the Economic Report. one would hardly know that this problem of advancing technology—in some respects the greatest economic problem we face—even exists.

It was not toward the end of this kind of Economic Report that hundreds of public-spirited Americans worked and toiled to create the Employment Act of 1946. It was not to achieve this kind of Economic Report that the Congress, by a majority of both parties, passed this act. What could happen to our country, if men in high places, like the President and economic advisers basically responsible for the preparation of this report, are permitted without challenge to ignore the requirements of the act under which they serve, and to evade the responsibilities which the nature of their positions would impose upon them even if the Employment Act did not so clearly do so?

I believe in our American system of checks and balances. I feel that this committee should both check and balance these economic advisers and, even the President, where clear duty requires it. It should issue a report which tells them what the law requires them to do. It should balance their neglect, by itself writing a report which lives up to the promise of the Employment Act.

We are living under world conditions which require that we do our best. It is not enough to say that we are not in a serious depression. The vital issue is that we are wasting millions in manpower and billions in idle productive facilities which could be utilized to strengthen our country against external enemies and to strengthen it at home against poverty, injustice, economic insecurity, and glaring shortages in those educational and health facilities which are bearing upon the citizens of tomorrow.

The American people have the right to expect the best. Their leaders should provide them with the best. I am confident that this committee will do its part in providing that kind of leadership.

CALCULATION OF FULL EMPLOYMENT FARM INCOME

The farming segment of the national economy should be enabled to make its full contribution to the attainment and sustaining of an expanding full employment economy. To do so, it must be able to earn by sale of its products a sufficient national farm gross income to pay all farm production and capital depletion and replacement costs and leave a national farm net income that will give farm families a purchasing power equivalent to their numbers in an expanding full employment economy.

Admittedly, there is room for argument as to the amount of national gross farm income that is required to keep farmers from being a drag on national prosperity. Outlined in the paragraphs that follow is one logical method of arriving at such a figure.

To do their part to maintain an expanding full employment economy in future years, farm families should have at least the same relative per worker income as they had in high employment years of the immediate past. The most recent 5 individual years in which the number of unemployed averaged less than 3.5 percent of the civilian labor force were 1953, 1952, 1951, 1948, and 1945. (See table I.)

The average realized farm net income per unpaid family worker during those years was $1,914, as reported by the United States Department of Agriculture. In a real sense this figure can be considered as the farm workers' income that was consistent with a full employment economy in the immediate past.

For the national economy to grow at the rate required to maintain full employment, the incomes and purchasing power of consumers must keep pace with the increasing productivity per man-hour made possible by advancing technology. The nearest approach to this by any large group of consumers in the economy has been the workers in manufacturing establishments, although their wages have seriously lagged behind the required rate in past 2 years. Certainly, the family workers on America's farms should be enabled to keep pace with the retarded rate of increase in hourly wages of manufacturing workers. This is the minimum that an expanding full employment economy can allow, if depressive maladjustments are to be prevented.

Hourly wages of manufacturing workers averaged $1.48 during the 5 most recent maximum employment years. In December 1954, the figure was $1.83 or 24 percent greater. To keep pace, the average net farm income per family worker should in 1955 be at least $2,373.

The Department of Agriculture reports an estimated 6.5 million family workers on farms in 1954.

For each of these to be enabled to earn a full employment income of $2,373 would mean a national realized net income of farm operators of $15.4 billion.

Turning now to the production cost component of farm gross income, annual national farm operating costs, in the 5 full employment years of the past period, averaged $19.9 billion. During the same period, farm operating costs were 58 percent of the gross income. By 1954 farm operating costs took up 63 percent of gross farm income, owing largely to increased mechanization, higher land values and thus higher variable and overhead farm costs of production per unit of product. This was a further extension of a constant trend observed over the entire 45 years for which statistics are available to chart it.

Income available to cover farm operating costs and capital impairment and depreciation in 1954 had to be 9 percent higher than in the base period years.

Moreover, the per unit cost of production items (prices, wages, interest, and taxes) rose from the average of the base period years from an index of 259 (1910–14 equals 100) to 284 (1910–14 equals 100) or by 9 percent. Farmers in 1954 not only had to buy 9 percent more off-farm goods and services relative to output, but also had to pay 9 percent more per unit for what they bought.

If farm production is not to lag behind population increases, provision must be made to cover the increased cost of producing the increased supply required by a larger national and world population. Since the base period years, United States population increased by 7 percent meaning that food and fiber consumption and production and therefore income to cover production costs needed to be that much greater to maintain per person consumption rates. And, it should be noted that in none of the base period years did increases occur in so-called agricultural surpluses. It would be reasonable to suppose therefore, that a full employment economy in future years should be equally capable of using and paying the production cost of an equivalent supply of farm output as in the base period years. However, augmented foreign demands growing out of this was caused by heavy production in some of the base years; therefore farm production did not advance as rapidly as population increases. Total farm output in 1955 will probably be about 3 percent higher than in the base period years. (An index of 107 as compared with 104.)

Multiplying the $19.9 billion base period average farm production costs by the several adjustment percentages just discussed gives a 1955 full employment farm cost and production figure of $24.3 billion.

Adding national full employment farm net income of $15.3 billion to national full employment farm costs of production of $24.3 billion results in a 1955 full employment farm gross income total of $39.7 billion.

If farmers are to maintain the farm plant of the Nation and make their full contribution to production and purchasing power to an expanding full employment economy, national total farm gross income in 1955 should be close to $40 billion instead of the approximately $32½ or $33 billion now forecasted by the United States Department of Agriculture.

Interestingly enough, if prices received by farmers in 1955 were supported at 100 percent of parity instead of allowing them to drop to the current 86 percent of parity level, national farm gross income would be about $38.4 billion. This indicates that 100 percent of parity prices as now calculated are about 3 percent lower than a true level of farm prices that would be fully consistent with an expanding full employment economy.

Statistical Summary

Calculation of 1955 full employment farm gross and net income

(a)	Acreage annual realized net income of farm operators (base period years)	$13, 900, 000, 000
(b)	Average number farm family workers (base period years)	7, 200, 000
(c)	Acreage net income per farm family worker	$1, 914
(d)	Wages per hour of manufacturing workers (base period years)	$1. 48
	January 1955	$1. 83
	Index for January 1955 (base period=100)	124
(e)	1955 full employment farm net income per family worker	$2, 373
(f)	Number of family workers on farms, 1954 average	6, 500, 000
(g)	Total 1955 full employment national realized net income of farm operators	$15, 400, 000, 000
(h)	Average annual farm operating costs (base period years)	$19, 900, 000, 000
(i)	Increase in ratio of operating costs to gross income (index)	109
(j)	Increase in farm output (index base period=100)	103
(k)	Farm cost of production index:	
	Base period	266
	January 1955	290
	Increase over base	109
(l)	Total 1955 full employment level farm cost of production	$24, 300, 000, 000
(m)	Total 1955 national full employment farm gross income	$39, 700, 000, 000

TABLE I.—*Economic indicators for 5 most recent years of full employment*

Year	Percent unemployed in civilian labor force	Realized net income of farm operators	Family workers	Manufacturing wages	Farm operating costs	Farm grain income	United States population	Cost of production index	Output index
	Percent	*Billions*	*Millions*	*Per hour*	*Billions*	*Billions*	*Million*		
1953	2.4	$13.3	6.6	$1.77	$22.2	$35.4	159.6	286	108
1952	2.7	13.6	6.7	1.67	23.2	36.8	157.0	298	107
1951	3.0	14.5	7.0	1.59	22.4	36.9	154.4	292	103
1948	3.4	15.6	8.0	1.35	18.9	34.5	146.6	266	104
1945	1.9	12.3	7.9	1.02	13.0	25.3	139.9	190	96

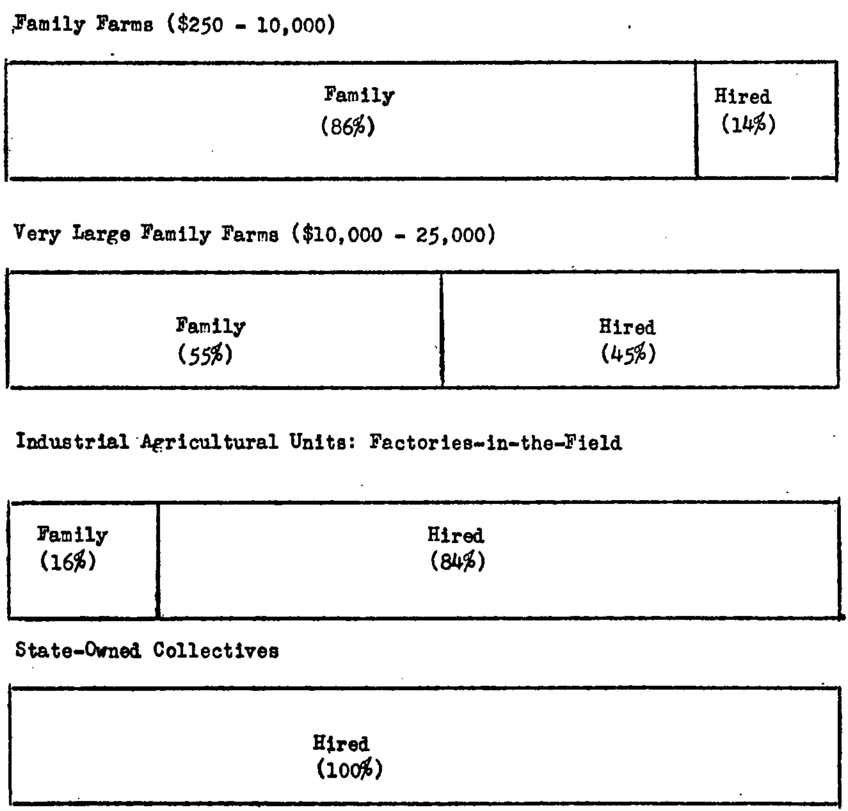
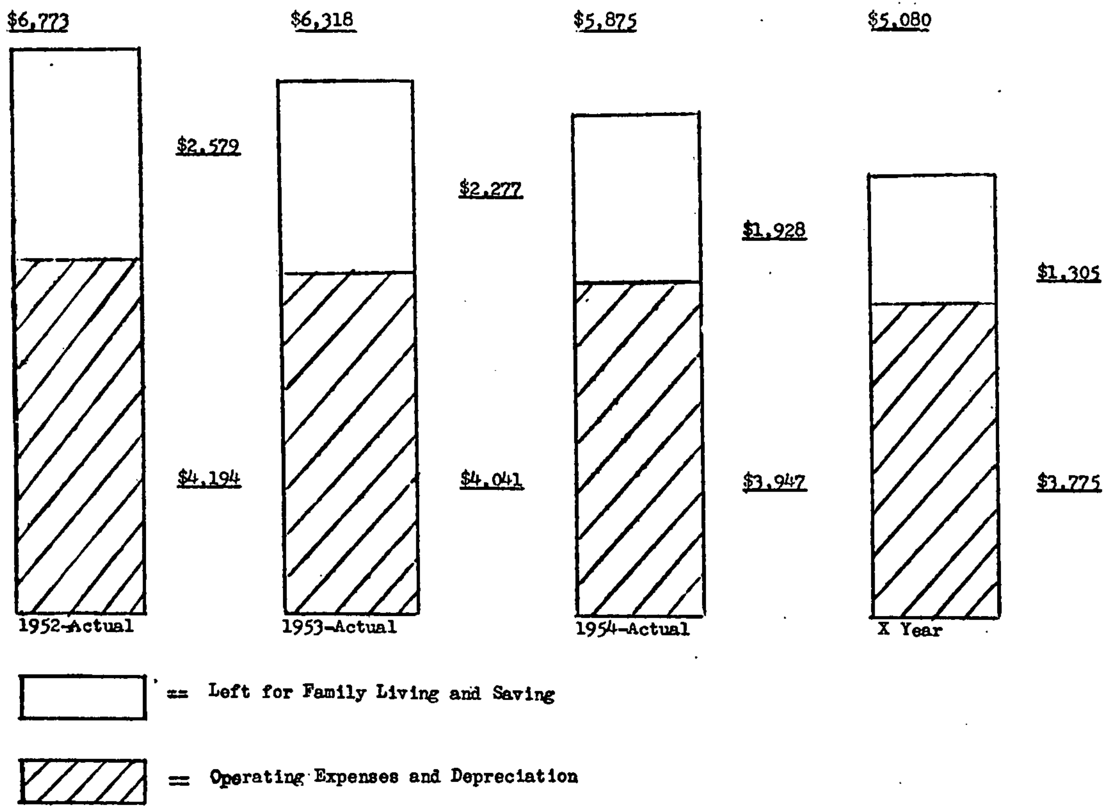
FAMILY ESSENCE OF FAMILY FARM

Proportion of Labor Performed by Family and by Hired Labor



DEPRESSION HITS FAMILY FARMS — IS WORSE YET TO COME?



Statement by Walter P. Reuther, President, Congress of Industrial Organizations

The CIO is pleased to have this opportunity to discuss the President's Economic Report and current economic trends before this committee today.

Let me say at the outset that we in CIO were disappointed by the President's Economic Report. We had expected more substance in the report, an analysis of our current situation, an examination of major trends with emphasis on labor force growth and productivity, a spelling out of guideposts for attaining full employment in 1955 and maintaining it in the years ahead.

The Employment Act of 1946 clearly states that "The President shall transmit to the Congress at the beginning of each regular session * * * an economic report" that shall include the presentation of "such levels (of economic activity) needed to carry out the policy" of promoting maximum employment, production, and purchasing power "current and foreseeable trends in the levels of employment, production, and purchasing power" and "a program for carrying out the policy" of promoting maximum employment, production, and purchasing power.

The Economic Report fails to fulfill the administration's obligation under the law. The report does not present the American people with production and consumption goals for attaining full employment. It utterly fails to deal with labor force growth and rising productivity—the two factors that make economic expansion both possible and necessary. It does not present a program for achieving maximum employment, production, and purchasing power in 1955 and in the years ahead.

I would suggest that this committee address a letter to the President, requesting him to fulfill the requirements of the Employment Act of 1946, by "setting forth * * * such levels (of economic activity) needed to carry out the policy of promoting maximum employment, production, and purchasing power."

In my opinion, the report, unfortunately, continues the administration's past policy of digging its head in the sand when confronted by economic problems.

One would think that the Economic Report would analyze and discuss the failure of nonfarm employment to grow in the past 5 months, despite increases in production. Yet the Economic Report fails to do so.

One would think that a report by the President of the United States on the economic state of the Union in January 1955 would discuss automation and its implications for economic expansion, production, consumption, and employment. Yet the Economic Report fails to do so.

One would think that the Economic Report would analyze and discuss the decline in farm income that continued through 1954. One would think, too, that the report would analyze the relatively deteriorating position of small business. Yet the Economic Report failed to discuss these problems.

It would be too time-consuming to detail the glaring gaps and omissions of the report. But these omissions apparently reflect the administration's lack of concern for important areas of our economy. This lack of concern troubles me and I am certain that it troubles many thinking Americans.

I am troubled, for example, by the administration's complacency concerning employment trends. The Economic Report speaks in optimistic tones, but in January 1955, the latest month for available information, nonfarm employment was lower than in the same month of 1953 and 1952. Are we to be optimistic about an economic situation in which employment is worse than in the 2 preceding years?

I am troubled by the administration's constant preoccupation with inflation some forty-odd months after the peak of the post-Korean inflation has passed, at a time when a realistic appraisal of the current situation would lead one to believe that present levels of production and employment may not be sustained beyond the next few months.

I am troubled when in December 1954, with unemployment approximately 4½ percent of the civilian labor force, the Secretary of the Treasury Humphrey heralds the defeat of inflation as a major achievement of the administration.

I am most troubled because I firmly believe that the administration is selling the American people short; that its pretty, half-hearted economic programs are based on an hypnotic preoccupation with statistical indexes of the long-run past rather than with the tremendous strides toward economic abundance that present American technology and ingenuity are making possible.

There was a time when the Nation's leadership had a buoyant faith in America and in the limitless possibilities for growth and improvement in a free society. I fail to find evidence of such faith in the President's Economic Report.

Instead. the administration seems to be complacent about a level of economic activity at which unemployment is 4½ to 5½ percent of the civilian labor force. The administration seems to be satisfied with some vague projections of a possible 3 percent rate of economic growth into the future, simply because that has been the expansion rate over the long-run past.

The productive ability of the American economy, however, is growing by leaps and bounds. The ingenuity of American technology is now making possible economic growth potentials beyond anything achieved over any past period of time.

Within the next few years the civilian labor force will be growing at an accelerating rate. This means that an increasing number of people will be available for work to produce additional wealth.

We are now at the start of what some scientists tell us is the second industrial revolution. Automation makes possible the automatic office, as well as the automatic factory, with the likelihood that entire plants, offices, or departments in much of industry and commerce will be operated by electronic-control mechanisms within the coming decade or two. And in the offing is the development of atomic power and the possible practical use of solar energy. Productivity increases in the period ahead may well be tremendous, making possible the creation of abundance in terms undreamed of before.

These growth potentials will make possible vast improvements in the living conditions of the American people. They can be a major asset in developing both national strength and the power and stability of the free world.

But what we get from the Economic Report, and from the administration generally, is an avoidance of any mention of this tremendous potential for rapid economic growth and improved living conditions. From the administration we have received no analysis of this potential, no guideposts for future economic growth, no discussion of the probable temporary dislocations airsing from automation, no preparation of the Congress and of the people to meet the new technology and to use it for the benefit of the Nation.

THE CURRENT ECONOMIC SITUATION

Within the past few months there has been an upturn in the general level of production. But there is little in the pickup to date to make me feel satisfied about the likelihood of sustaining "a high and satisfactory level of employment and production" in 1955, as the Economic Report confidently assures us.

Unemployment in January was higher than in any recent January since 1950, when the economy was moving out of the 1949 recession. Employment is still lagging behind the point reached a year and a half ago. And the pickup itself seems to be largely based on high levels of auto production that can be sustained through the year 1955 only by much greater auto sales than anyone in the industry expects.

An examination of employment trends would be sufficient to make any reasonable person lose his complacency about the state of the national economy. As far as employment goes, the picture is one of stagnation.

There is no indication that nonfarm employment is rising to give full-time jobs to those who are now unemployed or employed only part time, as well as to absorb the growth of the labor force in an increasingly efficient productive economy. Despite the moderate pickup in production in the last few months, the level of manufacturing employment has remained relatively stationary, and nonfarm employment as a whole has not risen much more than seasonally. Many employed workers are still on part-time jobs.

Despite the pickup in production, and in the face of a growing labor force, nonfarm employment in recent months has not been "the second best," as administration spokesmen usually refer to economic conditions in 1954, but worse than in the previous 2 years.

With the labor force growing and productivity rising, employment must increase substantially each year, if full employment is to be maintained. The planned reduction in the size of the Armed Forces this year is an additional factor to be considered as part of the employment picture as it shapes up for 1955.

If we examine available employment figures for January or any recent month, however, we find a clear picture of stagnation on the job front. In January 1955, the level of industrial production was almost 5 percent greater than in January 1954, but nonfarm employment was down 300,000 and manufacturing employment was down 500,000.

In addition, manufacturing employment in January was below the level reached in the Januarys of 1954, 1953, and 1952, and it was the same as in January 1951, 4 years ago. Nonfarm employment, as a whole, was below the previous two Januarys.

	Industrial production index	Unemployment	NonFarm employment	Manufacturing employment
		Million	*Million*	*Million*
January 1951	122	2.5	46.0	15.9
January 1952	121	2.1	47.1	16.0
January 1953	134	1.9	48.8	17.1
January 1954	125	3.1	48.1	16.4
January 1955	[1] 131	3.3	47.8	15.9

[1] Our estimate.

Source: Federal Reserve Board and U. S. Department of Labor.

Stagnation on the job front has particularly hurt the employment opportunities of Negroes, younger workers and older workers. In January, for example, 10.8 percent of the nonwhite male labor force was unemployed, compared with 4.8 percent in January 1953.

The failure of employment opportunities to expand has likewise brought special pressures on scores of communities throughout the Nation, where unemployment has remained for a year at 6 percent or more of those willing and able to work.

Employment will of necessity have to increase considerably above current levels if full-time job opportunities are to be provided for those now unemployed and on part-time work, in addition to absorbing the growing labor force in an economy whose productivity is rising rapidly. And that means rising sales, based on growing markets and increasing consumer spending.

But what is the picture as regards production and sales?

The recent pickup has been based upon (1) the start of production of 1955 model autos and its impact upon related industries; (2) the rebuilding of inventories in some industries after many months of inventory liquidation.

Last October, automobile assembly hit a low of 223,200 cars. In December, after the start of production on 1955 models, the total number of autos assembled jumped to 556,000. In January, about 660,000 passenger cars were assembled. Ward's, the industry journal, reports that passenger-car production is scheduled at 748,800 for March.

These high levels of auto production have had their effects upon production levels in other industries—such as steel, rubber, and glass. But how long can automobile production remain at first-quarter rate of 8¼ million cars a year?

Even the optimists in the industry do not predict that auto production in 1955 will be substantially above 1954, when about 5.5 million passenger cars were produced. Passenger car production, it is estimated, will be 5.8 million this year.

In almost any city in the country, you will find that the new models are already being sold below list price. Business Week reports that auto inventories are already above 500,000. Ward's predicts that a continuation of current production and sales trends will bring auto inventories close to the alltime peak of 661,000 by the end of March. Indeed, it is possible that the auto inventory peak may be reached as early as a month from now.

At the present rate of production, over 2 million passenger cars will be produced in the first quarter of this year. It is quite obvious that this production rate cannot be maintained throughout the year, unless sales should jump substantially over present and anticipated levels.

With inventories mounting, a continuation of present production and sales relationships means that auto production will inevitably fall within the next few months. Such a drop in auto production would be accompanied by layoffs and part-time work, especially among the independent auto producers, and by cuts in production and employment in related industries.

If auto and related production drops some 3 or 4 months from now, where are the economic forces to take up the slack and lift production and employment to higher levels in the last half of the year? I fail to find any evidence for confidence in the continuation of even the present pickup through 1955.

Steel production has turned up, reflecting in good part the high output of automobiles. But even after the upturn, the steel industry is still operating at about 85 percent of capacity.

Spokesmen for the steel corporations are optimistic about steel output in 1955, yet their optimism is merely in the range of 95 million tons (75.5 percent of capacity) to 100 million tons (79.5 percent of capacity). Even at a 100-million-ton level this year, average steel employment will be only slightly above 1954 but would still be about 50,000, or 9 percent, below 1953. The estimate of 95–100 million tons in 1955—by comparison with 88 million last year—can be achieved only by an increased sales volume, which means high levels of auto and agricultural implement production, new plant and equipment outlays, appliance production, and construction expenditures.

Business and Government economists have predicted that business investment in new plant and equipment will continue to slip this year. A significant turnaround in this sector of the economy will depend largely upon growing consumer markets and significant improvements in general economic conditions.

The rate of change in business inventories has already shifted in the fourth quarter of last year, much of it connected with auto and related production. The annual rate of inventory reduction dropped from $4.8 billion in the third quarter of 1954 to $1.5 billion in the fourth quarter. A turnaround to a general and sustained level of inventory building can be expected only if business sales rise substantially. It was the failure of consumption to keep pace with the production of goods that forced the inventory liquidation of the past 15 months.

Increased housing construction last year was one of the props under the economy. There have been predictions of a further increase this year. Many economists, however, have raised doubts as to whether housing construction will remain high through 1955, considering present income levels, income distribution, and current Government policies. Even the present rate of housing construction may decline sometime during the year, if the housing market is not bolstered by increased incomes among low- and middle-income families and by improvements in the Government's housing programs.

The decline in farm income has affected many industries, including agricultural implements, autos and steel. There is no indication that farm income will rise this year, under present expectations and Government programs; indeed, many observers anticipate further declines.

On balance, therefore, if one omits the possibility of a new irse in defense expenditures, there well may be a leveling off or deciine of economic activity during the latter part of 1955, unless sales rise substantially above the present. That would mean a decline from a level that is already considerably below full employment.

A small improvement in economic activity in 1955, as compared with 1954—a 2-percent increase for example—would utterly fail to bring the economy up to anything approaching full employment. It would likewise fail to bring economic activity back to where it was in 1953. Two years of population growth, labor-force increases, rising productivity, and increased productive capacity would not be met. It would mean rising unemployment and increasing hardships for millions of families and scores of communities throughout the Nation.

In 1954, unemployment was 3.2 million, or 5 percent of the civilian labor force. This year, if the economy expands no more than 2 to 3 percent, the growth of the labor force and rising productivity will result in an increase in unemployment by 1 to 1½ million over 1954.

The likelihood of a further rise in unemployment this year is not the exclusive prediction of the CIO. May I recall to this committee that not one of the economists in your opening day's panel expected unemployment by the end of this year to be less than in 1954; many anticipated significant increases in unemployment to accompany a slight upturn in general economic activity.

The administration, however, apparently sees no need for adopting policies and programs to stimulate the level of economic activities this year. Confronted by a failure of the economy to expand sufficiently to attain full employment, administration leaders continue to do battle with a phantom bugaboo of inflation.

Instead of acting to stimulate economic activity, the administration seems to have embarked on a deflationary policy of tightening the money supply. The new monetary policy is described as a shift from "active ease" to "plain ease." Whatever the description, the Federal Reserve Board has been tightening the money supply through its open-market operations, and the Treasury has announced a new 40-year bond issue at a 3 percent interest rate. As a result, interest rates on Government bonds have already moved up.

Unfortunately, I am compelled to draw the conclusion that the administration is satisfied with a state of economic activity in which some 5 percent or more of the civilian labor force is unemployed.

A DEFINITION OF FULL EMPLOYMENT

Too often people speak of full employment without defining what they mean. Indeed, it is likely that there are those in business and Government who would consider the present state of affairs—with over 5 percent of the civilian labor force unemployed—as full employment.

To me, full employment means a level of economic activity at which job opportunities are available for all persons willing and able to work.

In a free economy such as ours, people must be free to move from job to job and from one part of the country to another. Such persons would be temporarily unemployed. But such frictional and seasonal unemployment, resulting from job changes, geographical shifts of the population, and seasonal fluctuations, need not be more than 2¼ percent to 2½ percent of the civilian labor force in our industrialized economy.

In other words, to maintain full employment would require Government action when economic activity starts to decline and when unemployment rises above the 2¼ percent to 2½ percent level—about 1.5 to 1.7 million at present—for any period of successive months. A full-employment policy requires that the Government be prepared at all times with a series of programs to stimulate demand—ranging from stimulating consumer income through monetary, credit and tax policies to public-works programs. It likewise requires vigilance and flexibility—a willingness on the part of the Government to act positively and decisively on the economic front.

That is my understanding of full employment. It is also my understanding of the general scope of Government responsibility under the Employment Act of 1946.

The Economic Report and Government actions in the past 18 months clearly indicate that the administration has a different but publicly undefined definition of full employment. I repeat my suggestion that this committee request the President to spell out in clear and direct terms the administration's definition of full employment and its concept of Government responsibility under the Employment Act.

The continued lag of economic activities below full-employment levels is a waste of manpower and productive capacity. It is a loss of an opportunity to advance the living conditions of the American people and to strengthen the national economy in a world beset by international tension.

There has been a growing gap ever since mid-1953 between the actual rate of production and what is needed for sustaining full employment. Although the administration spends much time talking about budget deficits, it has utterly failed to mention the national economic deficit resulting from the downturn in economic activities.

As a result of the reduced levels of production in the past 18 months, some $35 billion of goods and services that should have been produced have been irretrievably lost.

These billions of dollars of lost production—food, clothing, homes, autos, household appliances, schools, hospitals, roads, and capital equipment—are lost forever, just as were the opportunities for improved living conditions during the depression of the 1930's.

ECONOMIC GROWTH

Economic growth has become as widespread and accepted a term as full employment. Most people agree that economic growth is essential for full employment, but what is meant by economic growth?

The administration apparently is satisfied with the possibility of an average yearly increase of something like 2 to 3 percent, even in 1955, when we must lift the economy out of the downturn of the past 18 months. As I said before, I think the administration is selling the American people short, that the President and his Council of Economic Advisers have failed to indicate how the Nation's tremendous potential for growth can be utilized to sustain full employment.

Economic expansion is both possible and necessary because of (1) the growing labor force; (2) rising productivity.

It is now estimated that the average yearly growth of the civilian labor force is some 700,000 to 800,000, and will continue to rise at an increasing annual rate within the coming decade.

This year the civilian labor force may increase by 900,000 to a million, if the size of the Armed Forces is reduced as planned.

In 2 or 3 years, the growth of the civilian labor force will be accelerating, as those who were born since 1939 start looking for jobs. The annual growth of the civilian labor force within the next 5 years will likely be about 800,000 to a million a year. Between 1960 and 1965 the average annual growth of the civilian labor force will probably be about a million to a million and a quarter.

This means that the civilian labor force, which has been growing at an average annual rate of about 1 percent in the recent past, will be expanding at an average rate of about 1.2 to 1.8 percent a year in the decade ahead. An increasing number of job opportunities will have to be created each year if full employment is to be attained.

Productivity, too, will probably be rising at an accelerating rate in the period ahead, at the very time when civilian labor force growth will also be accelerating. The rise in productivity means more output per man-hour. But it also means that if the Nation's total production of goods and services stands still, millions of workers will be displaced because their manpower will no longer be needed.

In the recent past, productivity has been rising at an average annual rate of close to 4 percent. Improvements in labor skills, in existing machines and work flow, when combined with the introduction of automation, could well bring average annual productivity increases to 5 to 6 percent, or more. A 5 to 6 percent average annual rate of productivity increases may well be a conservative estimate, when one considers the changes in technology that are now taking place.

For about 15 years scientists have been bringing forth a host of new developments in the fields of electronics and atomic energy. Many of the electronic devices developed during World War II in connection with military equipment have been applied since then to civilian uses. The most common term encompassing these developments of electronic machines and computers is automation, which has been heralded as introducing the second industrial revolution. The impact of this new technology on our economy and society will no doubt be tremendous in the years ahead.

Automation has been described as the automatic handling of parts between progressive production processes, the use of feed-back control devices which allow individual operations to be performed without the necessity for human control, the use of electronic computers capable of recording and storing information and performing complex mathematical operations on such information. Automation makes possible the automatic office, as well as the automatic factory. Technology experts tell us that within the coming decade or two a fair-sized proportion of American industry and commerce will be fully or partly automated.

No one can be certain, at present, about the degree of its effect upon productivity and the labor force. But the implications are clear from an examination of the facts on hand.

I will present only a few random examples of automation as it now operates:

John I. Snyder, Jr., president and chairman of the board of U. S. Industries, Inc., states: "At least in some industries automation * * * is already an earmark of one or more parts of the plant process, whether the end product is a cylinder block, a vitamin capsule, or a 155-millimeter shell.

"Thus, outside of the oil industry, there are relatively few completely automatic factories now in operation, but a number of companies have automatized sections of their plants. General Motors' radiator cap department, for example, is outfitted with machinery that puts together stampings, rivets, screws, gaskets, and springs into finished radiator caps capable of passing automatic inspection. General Electric produces a chassis with a stamped circuit upon which, without turnover, are assembled other circuit components feeding automatically from the top of the assembled machinery.

"Our own company, U. S. Industries, Inc., operates perhaps the only fully automatic factory now producing. It is a Government-owned 155-millimeter shell plant at Rockford, Ill."

A spokesman for Ford, which operates an automated engine plant in Cleveland, says: "Automation reduces labor tremendously. Our experience has shown that we can count on a reduction of 25 to 30 percent in what we call direct labor."

It has been estimated that 154 engine blocks run through the production line at that Ford plant in an hour, require 41 workers on the line. The same production base, under older production methods, required 117 men.

Business Week reports that Pontiac's new automation line is expected to boost production 25 percent, without any increase in manpower.

The use of automation at the Thompson Products plant cut labor costs on the automative valve line by 25 percent, according to the magazine Factory Management.

A recent article in the Scientific Monthly reports that Univac has taken over "a variety of accounting jobs at General Electric's Louisville plant, where General Electric is bringing together its electric appliance manufacturing units in one place. The Univac will undertake the preparation of payrolls, basing its computations on information stored in its memory concerning wage rates, overtime, and the various deductions that must be made. It will compile sales records and prepare bills. It is expected ultimately to be used to make sales analyses, denote regional shifts in the sale of various appliances, and to modify production accordingly."

The same article reports that an inventory-control computer is now in operation at the John Plain mail order house in Chicago; "it handles 90,000 tallies a day, keeping track of inventory on the 8,000 items in the catalog."

The New York Times reports: "Three major insurance companies have gone electronic or are arranging to do so imminently. To hired hands like Univac and IBM's 701 will be entrusted such jobs as billing you for your premiums, calculating agents' commissions, figuring out dividends, and, ultimately, working up all the company's actuarial data."

Automation holds out the promise of vast improvements in living conditions, leisure, and national strength. It likewise promises the elimination of routine, repetitive jobs. But the widespread introduction of automation within the coming decade or two will present us with serious economic and social problems involving dislocations of the labor force, geographical shifts of industry, labor displacement, the upgrading of labor, and the need for substantial yearly increases in consumer purchaser power for rapidly growing markets.

There are people who say that the economy will, in the long run, adjust itself to the labor displacement and disruption of the new technology. The long run, whatever that means, is not the consideration, for, as Lord Keynes once said, in the long run we are all dead. The question is whether our economy and society shall drift along aimlessly into dislocations and disruptions, mass unemployment, and catastrophic depression. In the world of 1955, the very suggestion of drifting along without foresighted policies is an indication of blindness to the realities of life which, unfortunately, include a cold war that could well turn into a hot one.

In a recent paper on automation before the Southern Economic Association, Profs. W. S. Buckingham and S. F. Dallas stated: "Those who disparage fears of technological unemployment often assume the existence of a self-adjusting labor market. However, there is a real danger that imperfections in the labor market will seriously delay absorption of the displaced workers."

A little thought given to the economic and social impact of automation will indicate that there is no automatically self-adjusting market and that automation's widespread introduction will bring in its wake serious problems for factory and office workers in scores of companies and communities.

We have also been told that automation will create jobs in an expanding electronics industry to absorb those who are displaced from their factory and office employment by automated machines and electronic computers. It is true that the electronic industry is expanding, but will it create enough jobs to absorb any large number of those who are displaced elsewhere in the economy? The facts do not give much hope on that score.

Productivity in the electronics industry is also expanding rapidly, with the introduction of laborsaving devices, new materials, and automation. A Department of Labor study states: "Electronics output in 1952 was 275 percent higher than in 1947 but was produced by only 40 percent more workers * * *.

"Output per man-hour (in the electronics industry) may rise even faster during the next few years, as a result of improvements in manufacturing techniques * * * These trends toward automation may result in the greatest reduction in unit manhours in the industry's history during the next few years."

Will automation create new secondary industries and new jobs?

Professors Buckingham and Dallas answer: "Automation does not promise to create as much secondary investment as did some of the earlier developments in technology. The introduction of the automobile and the resulting increase in primary investment in that industry stimulated a wave of investment in the oil, rubber, highway, and construction factors of the economy. In this respect, automation will not make the far-reaching investment impression on the economy that the introduction and later improvements in automobiles, railroads, and canals, for example, created."

There will probably not be a significant growth in secondary investment, arising as an immediate response to the widespread introduction of automation. In addition, it is well to recall that studies by the National Bureau of Economic Research, of which Chairman Burns of the Council of Economic Advisers was the Research Director, indicate that the productivity of capital (plant and equipment), as well as of labor, has been increasing. The output of a unit of capital now is greater than it was in the past. Automation will likely speed up that trend, with an effect on investment as well as on employment.

What can we do to minimize the economic and social dislocations that the new technology will bring in its wake? Certainly we can learn much more about automation and its social and economic impact than we know at present. Government and private groups can cooperate to enable us to pass through the transition period without permitting human suffering and the undermining of our national strength. It would be senseless and dangerous to permit anything like a repetition of the dislocations and suffering that accompanied the industrial revolution or the productive advances of the 1920's.

The potential impact of the new technology upon our social, economic, cultural, and political life must be carefully studied and examined. I would recommend, therefore, that this Joint Committee on the Economic Report undertake a full-scale study of automation and its social and economic implications. I am certain that such a factual study—and proposals for private and public policies—will be welcomed by industry, labor, and the American people as a whole, to help guide us through the transition to the world of abundance that the new technology is bringing forth.

MEETING THE CHALLENGE OF FULL EMPLOYMENT

There are real problems at present—with 3⅓ million persons unemployed and others employed only part-time—in returning the economy to a full-employment level.

From an annual rate of $369.9 billion in the second quarter of 1953, before the downturn started, the gross national product declined to $357.1 billion in 1954, instead of rising as it should to provide full employment. The production losses of the past 18 months are lost forever.

To return the economy to a full-employment level in 1955 and provide full-time job opportunities for the unemployed and those on part-time work schedules, the gross national product must rise approximately 10 percent this year, to $393 billion.

Even in a more normal year, the economy is compelled to expand at a rapid rate to sustain full employment. In such a year, with a civilian labor force of 64 to 65 millions, the economy is burdened with the responsibility of providing over 3 million new job opportunities, when productivity rises 4 percent and the labor force increases by 1 percent, to absorb the increase in the labor force, as well as the displacement effect of rising productivity. The answer to such responsibility is economic expansion, not by 2 to 3 percent rate, but by a 5 percent rate. It was substantial economic expansion of that approximate magnitude, achieved through growing markets and rising demand, that gave us high levels of employment in the recent past.

How much more serious will these problems be in the coming decade, even should automation be introduced relatively slowly, if the labor force growth is 1.5 percent a year and annual productivity increases come to 5 to 6 percent? Under such conditions the economy will be burdened with the responsibility of providing annually 4½ to 5 million new job opportunities. Economic growth in such a period would have to be at a yearly rate of some 6 to 7 percent to maintain full employment.

To meet the challenge of attaining full employment today, as well as to meet the challenge of the new technology, our sights must be raised, goals must be lifted, problems must be frankly faced and publicly discussed. To shut our eyes to the new technology, as the Economic Report does, is not going to help us over the hurdles in the coming years, when the new technology comes into its own.

We are having difficulties today trying to maintain even a 4 percent rate of annual growth. We have found it difficult to sustain rising levels of consumer demand sufficiently to match even our present productive capacity and efficiency. Can we feel complacent about the likelihood of requiring a much more rapid rate of economic expansion? Can we attain the sharper rises in consumer demand, needed for continued economic expansion, without public and private planning to meet the changes as they occur?

In discussing automation, Mr. Snyder, of United States Industries, states that a "reduction of labor costs is only a part of the point. Another highly desirable feature of automation, in relation to labor, is the fact that machines are easier to control than people * * *."

But if people do not have jobs, incomes and purchasing power, who is going to buy the flood of products flowing out of automated production? Certainly not the machines.

The present problem of trying to maintain a high and rapidly rising consumer demand will become even more pressing after the new technology proceeds to make available an increasing volume of goods and services. The widespread introduction of automation, too, will create labor displacement problems in thousands of plants and scores of communities; the national economy will probably be required to create some 4½ to 5 million new job opportunities annually to sustain full employment.

The challenge of sustaining full employment must be met. Private groups and Government must cooperate to provide continuing economic expansion for full employment. Government must take leadership in this effort to provide policies and programs for maintaining economic growth.

SUGGESTED POLICIES

A mass production economy requires mass consumption. Our major economic difficulty in the past 18 months has been an insufficiency of consumer purchasing power to sustain full employment. With the new technology increasing the efficiency of production, this problem will grow in importance.

Collective bargaining can help to build strength into the economy's mass consumption base. Substantial wage improvements will enable consumers to buy the increasing volume of goods made available by improved productive techniques.

My own union, the UAW–CIO, will soon be bargaining with the great auto corporations. As you know, the United Auto Workers is demanding a guaranteed annual employment plan from the industry, as well as wage increases and other improvements in working conditions.

We are confident that a guaranteed employment plan is feasible, that it would help to minimize wide seasonal fluctuations in auto production, such as occurred, for example, in 1953 and is being repeated at present. We believe that assured annual employment and incomes can give wage and salary earners an opportunity to plan ahead and to improve their living conditions on a continuing basis. A guaranteed annual employment plan could provide a more secure basis for mass consumption throughout the year. It would induce management to plan its widespread introduction of automation for periods of expanding demand and rising employment.

Assured annual incomes and increased buying power of wage and salary earners represent actions by private groups in the economy to achieve the necessary rising levels of consumer spending. But even such achievements—important as they are in helping to raise consumer income—are, in themselves, not sufficient at present to sustain full employment. Government action is also essential, if the required strength of the mass consumption base is to be strengthened sufficiently to assure that job opportunities will be available for all persons willing and able to work.

One area that needs revision is taxes. The Federal Government's tax policy should be geared toward strengthening consumer buying power and eliminating inequities from the tax structure. The CIO has advocated that the present $600 personal income-tax exemption should be raised immediately to $800, and eventually to $1,000.

Excise tax cuts scheduled for April 1 should be permitted to go into effect. The 52 percent corporate tax rate should be retained for at least another year.

Needed revenue can be made up by retaining the 52 percent corporate tax rate, as well as by closing last year's newly enacted "loopholes," such as reduced taxes on dividend income, and by closing the long-standing "loopholes"—such as the split-income provision and depletion allowances.

Special attention must be focused upon those millions of American families in the low-income groups—those who are earning less than $3,000 a year and constitute a vast potential market for goods and services. The low-income groups have thus far received the smallest share of the benefits of our present technology. Their inability to buy the goods produced in increasing volume will become even more serious as the new technology becomes more widespread.

The Joint Committee on the Economic Report should prepare a study of the problems of the lower-income families (with earnings below $3,000 a year), with a view toward devising public and private programs to improve their purchasing power and living conditions. It is of no constructive purpose to state the obvious, with incredible hesitation and caution, as the Economic Report does, when it says: "A small and shrinking, but still significant, number of American families have cash incomes under $1,000 per family. By current standards, most of them must be considered poverty stricken."

The Federal legal minimum wage should be raised to $1.25 an hour, and coverage under the law should be extended to millions of workers who now lack its protection. The Economic Report's half-hearted proposals of a 90-cent legal minimum and a vague "gradual approach" to extending coverage is not realistic or very helpful in the light of the present wage structure, living costs, and productivity. Legal minimum wages under State laws must be increased above present woefully inadequate levels.

The present inadequate unemployment compensation system must be modernized. Congress and State legislatures should substantially increase both the amount and duration of unemployment compensation payments.

A national health program should be adopted, including national health insurance, as part of an improved social-security system and with full reservation of free choice of doctors and patients, and Federal financial aid to medical education of all types, hospital construction, and consumer cooperatives in the field of medical care.

Two million new housing units a year should become the national goal, with Government policies set to achieve it.

Farm programs, such as price supports, marketing, storage, rural electrification and telephone service, low-cost credit and conservation, should be improved to strengthen the income position of the family farmers and to increase the consumption of agricultural production.

Low-interest loans, under liberal terms, are necessary to encourage small businesses, as well as to sustain high levels of residential construction.

A comprehensive public works program is essential. Such a program should not be viewed as a mere antirecession device, but rather as a continuing program to keep the structure of society strong; in periods of decline, public works programs should be accelerated without the necessity of delays. Our public services—such as schools, hospitals, roads, airports, parks, libraries and museums—are in need of continuing repair, improvement, and expansion. The Federal Government should start on a program of expanded Federal aid to education, health facilities, roads, and airports, through direct Federal programs, as well as grants and loans to the States and local governments.

A national full-employment program, designed to lift the national economy out of a state of stagnation, must be supplemented by a program of special assistance to chronically distressed areas, such as communities in the hard-coal regions of Pennsylvania and the old textile towns of New England. Federal Government agencies should assist State and local governments, as well as private groups, in attracting new industries, in the placement of Government contracts in such areas, and in developing programs of assistance—such as retraining and travel allowances, if necessary—to the working people of these chronically distressed communities.

The domestic economic policies of Government and private groups should be focused on the need to build increasing strength into the economy's mass consumption base. This is required immediately, to bring the national economy to a level of full employment. It is also needed for the long-run, to help adapt the national economy to the new technology—to the rising productivity of both labor and capital.

With man-hour output rising, we should soon be able to reduce the length of the workweek, if all-out war can be avoided. The 30 to 35 hour workweek in industry and commerce, the 2½- or 3-day weekend, and extended vacations—these may become accepted and widespread within the coming decade, as we adjust our economy and system to the new technology.

The rise in productivity in the past has made it possible for us to increase both leisure and the production of goods and services. Rising productivity now—and the more rapid rises that are in the offing—make possible further increases in leisure.

In aristocratic societies in the past, only the well-born few had an opportunity for higher education and leisure, for enjoying the riches of this earth. Here in America, we have been building a democratic society—based on an efficient system of production—where the opportunity for education, culture, and leisure should be available to all.

The reduction of the workweek to 40 hours and the prevalence of paid holidays and vacations—proud achievements of organized labor and the New Deal—brought a share of the benefits of rising productivity to working people in the form of increased leisure. Part of the response to this increased leisure has been the growing request for additional education services of all types and the rising importance of leisure-related industries, such as do-it-yourself, gardening tools, sports equipment, motels, and book publishing.

As the new technology increases our leisure still further in the years ahead, an increasing proportion of the Nation's total production of goods and services will probably be directed toward leisure-related activities, such as additional education, museums, libraries, parks, sports, and resort centers. The Federal Government, the States and local governments should plan now for the required long-run development of such community and national resources.

A share of our productive know-how should also be made available to the vast underdeveloped areas of the world, where over a billion people live in unbelievable poverty and slums. It is our national obligation to assist these peoples to achieve material progress, freedom, and national independence. This, too, requires Federal Government policies and programs to help the peoples of underdeveloped regions to help themselves and attain improved living conditions, as well as national dignity among the free nations of the world.

Our economy's productive ability has been a major source of strength in the past. It is now a beacon of hope to the free world in this period of international tension.

The job of sustaining economic strength and full employment rises above partisan politics. All Americans should be united in the effort to keep America economically strong.

STATEMENT OF HARRY SEE, NATIONAL LEGISLATIVE REPRESENTATIVE, BROTHERHOOD OF RAILROAD TRAINMEN

Mr. Chairman and members of the committee, my name is Harry See, and I am national legislative representative of the Brotherhood of Railroad Trainmen, with offices at 10 Independence Avenue SW., Washington 24, D. C. The headquarters of the brotherhood are located in the Standard Building, Cleveland, Ohio. We represent brakemen, yardmen, conductors, switchtenders, train baggagemen, and other classes of employees on railroads. The brotherhood has approximately 200,000 members employed in train service in the United States and Canada.

The President's economic report declares that "the Government is mindful of its great responsibility to help assure balanced economic growth." The report states also that the administration program for 1955 is directed to fostering long-time economic growth rather than imparting "an immediate upward thrust to general economic activity."

Since the President's report was issued the Federal Reserve Board has taken action to slow down what has been called "the strong recovery phase" of the American economy. The president of the New York Federal Reserve Bank described this as a change from a policy of actively encouraging lending by the commercial banks to one of "letting credit tighten up a bit." This seems to mean that the Eisenhower administration's interpretation of "balanced economic growth" and avoiding "an immediate upward thrust" requires a slower rate of expansion in business activity than prevails at the present time.

The experience of 1953 indicates that we cannot use tight credit to slow down economic expansion without the risk of reducing job opportunities. Therefore, I ask the question, Is this the time to slow down business expansion?

According to the Interstate Commerce Commission, employment on class I railroads has declined from 1,239,000 in July 1953 to 1,027,000 in December 1954, a reduction of 212,000 in 18 months. This is a 17-percent decline in employment over the period. According to the President's report, average unemployment on a national basis rose from 2.5 percent of the labor force in 1953 to 5 percent or 3,230,000 in 1954. In December 1954 unemployment was 2,838,000. I include this in my statement because I believe it is necessary to points which I develop later.

I do not need to tell this committee that not only are 3 million wage earners out of work, but hundreds of thousands of job seekers have withdrawn from the labor market because there is no prospect of finding work and still other workers are on part time. I understand there are estimates that unemployment may reach 4 million in 1955 and 5.5 million in 1956, even on the basis of currently anticipated increases in economic activity.

The present is no time to take any action that will run the risk of reducing employment opportunities.

Our national production is still short of the level necessary to provide maximum employment. Employment in the railroad industry has declined every month since July 1953. Railroad transportation is a service industry that cannot prosper unless and until industry generally prospers. Carloadings, although showing a tendency to increase in recent weeks are still below the levels reached in 1953.

Carloadings and railroad employment will not increase until there is an expansion of industrial output. We know that the growth in our economy in 1954 lagged behind 1953; that industrial production and carloadings were behind 1953. We get no satisfaction from comparing 1954 with earlier years and saying that it was our second best year. Railroad and other workers are still out of work and the prospects is for even greater unemployment unless business activities expands.

A major portion of the decrease in employment in the railroad industry is brought about by the continued drop in the production and hauling of coal. Production of bituminous coal was 630.6 million tons in 1947. In 1954 the output of bituminous coal had fallen to about 390 million tons, a decline of 38 percent over a 7-year period. Carloadings of bituminous coal were 9,088,000 in 1947 and 5,650,000 in 1954, a decline of 3,438,000 carloads or about 38 percent over this period.

To illustrate one of the causes for this deterioration in the coal and railroad transportation industries, let me first state that in the year 1954 this country imported 128,327,160 barrels of residual fuel oil. This figure is equal to 30,557,500 tons of coal. Using the average figure of 60 tons of coal per carload, this would translate the 128,327,160 barrels of oil into 509,291 carloads of coal.

To realize how much of an effect this has on employment, we must first take a look at the decrease in the carloadings of coal in the three major coal regions.

In the eastern region, for the year 1952 there were 1,170,489 cars of coal loaded. In the year 1954 in this same region only 903,222 cars were loaded, a decrease in the 2-year period of 267,267 cars.

In the Allegheny region, 1,657,472 cars of coal were loaded in 1952, while in 1954 carloadings totaled 1,367,062, a decrease of 290,410 cars.

In the Pocahontas region in the year 1952 carloadings of coal totaled 1,831,106, while in 1954 they amounted to 1,485,409. a decrease of 345,697 cars. The combined decrease of carloadings of coal in these 3 regions for 1954 as compared with 1952 totals 903,374 cars.

So far we have discussed only the drop in total carloads of coal. To carry the translation further in terms of railroad manpower, the loss of 903,374 carloads would equal 1,130 trains, using 80 cars per train as an average number. This is still not the complete picture, however, for so far we have spoken only of carloads of coal lost. As you well know, the other side of this movement is the bringing of empty cars to mines for the transportation of coal to consumers. To determine the total number of trains and crews displaced by this operation, the number of 1,130 trains must be doubled, since there would be a like number of movements of empty cars to the mines before there would be the same movement of loaded cars out of the mines.

We thereby see that actually 2,260 trains are affected. To continue, the average haul from mine to consumer is 300 miles. Crews are paid on a 100-mile-a-day basis. The number of trains affected then becomes 3 times the above figure, or 6,780. Since 5 men constitute a train crew, the astounding total of 33,900 man-days lost is realized. This figure applies, you will recall, only to the three coal regions mentioned above, the Eastern, Allegheny, and Pocahontas, and does not by any means indicate total loss in railroad employment as a result of the decline in coal production.

The above figure represents only road train and engine crews. It does not include the associated employment of yardmen or the large number of nonoperating employees used in connection with such traffic.

I do not wish to leave the impression that every one of the man-days lost in these three coal regions is attributed directly to the importation of residual fuel oil. But it is a tremendous factor on certain railroads with a large coal hauling business, such as the Pennsylvania, New York Central, Western Maryland, Virginian, Chesapeake & Ohio, Norfolk & Western, and the Clinchfield. We do not have the decrease in employment for this period for each separate railroad, but if the committee desires that kind of information, the Interstate Commerce Commission is in a position to furnish it. On one railroad, the Norfolk & Western, as of January 28, 1955, approximately 2,000 employees have been furloughed. Only 20 percent of these employees have been able to find jobs in other industries. Total employment on this carrier at high level employment is over 17,000.

I stated these facts on the importation of residual fuel oil before the Ways and Means Committee on January 31. I urged that committee to place a quota limitation on the importation of residual fuel oil. I am restating these facts before this committee because I want it to understand the effects of these importations on the coal and railroad industries.

The President's Economic Report has supporting evidence of the effect of the decline of the coal industry. The map on page 90 of the report (chart B–3) shows a belt of the greatest unemployment among insured workers. Of the 9 States showing the greatest insured unemployment 4 are coal-producing States. Pennsylvania has unemployment of 7 percent of the total insured, West Virginia 10.9 percent, Kentucky 10.3 percent, and Tennessee 8.6 percent. For the United States as a whole, insured unemployment in 1954 was 5.2 percent of covered employment.

A representative of our union, Mr. Van Parsons, general chairman on the Western Maryland Railway, described to this committee the unemployment among railroad workers in Cumberland, Md. At Altoona, Pa. there are 585 car-repair workers including carmen, machinists, carpenters, welders, and pipefitters out of work. Yet the national total of cars awaiting repair rose from 87,637 in 1954 to 116,200 in January 1955, while the number of locomotives awaiting repair over the same period rose from 1,919 to 2,513.

Railroad employment at Cumberland and Altoona will not increase until an improvement in general business conditions results in a greater coal output and a greater demand for railroad services.

The President says that the vigor of the recent recovery suggests that economic expansion will probably continue during the coming months and that it holds out the promise that we shall achieve a "high and satisfactory" level of production and employment in the current year. He says further that "it is reasonable to expect that the Nation's output within the coming year will approximate the goals of maximum employment, production and purchasing power envisaged by the Employment Act."

This statement does not commit the administration to work for a level of production that will reduce unemployment to a bare minimum. What is a "high and satisfactory" level of employment? Why are our sights set merely on approximating the goals of maximum employment, production and purchasing power? The report fails to define the goals required by the act. Is the word "approximate" used to evade this responsibility?

Does the administration look back to the level of production and employment of 1953 as a satisfactory level of production and employment for 1955? A return to "the good old days" of 1953 will not meet the needs of 1955 and future years. We must look ahead to the necessity of increased production and employment. The labor force is growing because of the growth in population. The annual net increase in the number of people seeking employment is about 700,000. At least 1 forecast was made before this committee that average unemployment may increase by as much as 1 million to about 4 million in 1955. One conservative investment publication (the Magazine of Wall Street, Jan. 8) estimates an increase in unemployment to almost 4 million in 1955 and to 5.5 million in 1956 on the basis of the present level of business activity. Even this publication complains that "a prosperous America cannot afford the stigma of chronic rising unemployment."

From my own industry I can report that there has been displacement of workers by investment in diesel power, centralized traffic controls, pushbutton freight yards, and other modern equipment and methods. Dieselization, for example, means less man-hours in repair shops. It also means longer trains with lower requirements for operating labor and increased hazards in hauling the longer trains.

The trend to modernization increases output per worker in all industry, including the railroad industry, justifying higher wages. But increasing productivity per worker means less men to turn out the same work. We must adjust our national economic policies to provide employment for the workers displaced by the increasing use of automatic machinery and more efficient methods and equipment. I need not remind this committee of the harsh impact of continued unemployment. I fear that the policy of permitting credit to tighten up may have damaging and far-reaching effects on American industrial activity. It may halt recovery entirely. "Letting credit tighten a bit" means turning our backs on the effects of unemployment. As a Nation we must not show this indifference to the urgent needs of millions of unemployed and underprivileged American citizens.

We have given two reasons—growth in the labor force and increase in productivity—why a return even to the high output and employment of 1953 will fall short of the need of the American economy in the current and future years. We believe the administration is overly concerned about the threat of inflation and not sufficiently concerned about the necessity of a definite program of governmental expenditure on a national, State, and local basis that will assure full employment of the Nation's men and resources in the years ahead.

The problems associated with expansion such as labor shortages and a tendency for higher prices must be measured against the hardships to more millions of unemployed Americans which is likely to result from tightening credit at the present time. We must decide between the two as long as we have millions of unemployed. There can be no doubt where the decision will be once the choice is made clear. Our democratic society will not tolerate unemployment, but will demand a rising national output and a job for every man seeking work.

The following steps should be taken to give the needed boost to employment and national output:

The President's recommendation that we postpone the lowering of the corporate income tax scheduled for April 1, 1955 should be adopted. The revenue needs of the Government should be met from this source rather than from the excise taxes.

The excise taxes should be kept no longer than the date of April 1, 1955 when many of them are scheduled to be lowered. These taxes transfer purchasing power from consumers to the Government with the effect of curtailing spending for consumer's durable and other goods and in that way hold down employment. The removal of the excises would encourage business and help employment.

In the railroad and transportation industries generally, the wartime excises on the charges for the transportation of persons and property are adding to the burdens of the railroads and other common carriers, and encouraging the use of nontaxed means of transportation, both passenger and freight. The tax on passenger fares was enacted to discourage the use of commercial carriers during the war when their facilities were overloaded with travel, much of which was not essential to the war effort. The tax on freight charges discriminates against distant shippers and pyramids until it is actually many times the original tax. These taxes are a Government-imposed burden on an industry that is losing ground to private untaxed carriers such as the private passenger automobile and the private motortruck, and should be removed to provide a needed stimulus to the public agencies of transportation.

The President's recommendation to increase the present national statutory debt limit should be adopted to enable the Treasury to borrow when necessary to meet the needs of a full-employment economy. Similarly, the States should act on the President's recommendation to remove and to relax the local tax rate-limiting and debt-limiting statutes as means of enabling these local jurisdictions to increase the scale of their public-works programs.

Individual income taxes should be reduced through the method of increasing personal individual income-tax exemptions. This would give substantial aid to lower income receivers and would add to mass purchasing power and thus help employment.

The national minimum wage should be raised to $1.25 per hour. The President's proposal to raise the wage to 90 cents per hour is wholly inadequate.

The President's recommendation that the Federal old-age and survivors insurance should be extended to Federal personnel should be adopted. However, I do not believe the President goes far enough in this change. There should be a substantial increase in retirement benefits to keep pace with the increase in living costs. I might say for the employees of the industry of which I am a member that railroad-retirement benefits can, in my judgment, be increased without a tax increase and without jeopardizing the reserve fund.

I am not sure that the President recommends including under the unemployment insurance system the employees of State and local governments, and employees who work for firms employing fewer than four persons. Presumably the President asked only for consideration of this change, because it is a State responsibility and because he wants, above all, for it to remain a State responsibility. I believe that this change should be adopted and that it should become a responsibility of the Federal Government.

Likewise the President asked the States to consider revising unemployment-insurance benefits so that in all cases they equal at least one-half of the regular earnings. I believe this change should be adopted and that it should become a responsibility of the Federal Government. There should be a minimum term of unemployment benefits of 26 weeks, but I believe that employees with longer records of contributions to the system should have a longer period of benefits. These changes should be effected through Federal legislation.

The recommended changes in the unemployment compensation system should not be left to the States, but should be assumed by the Federal Government. The States have failed to take any action toward accomplishing these objectives. For example, President Eisenhower twice in 2 years has asked the States to consider raising the weekly benefits to equal one-half the worker's weekly wage. No State has yet adopted this standard. We need Federal legislation to incorporate these needed reforms into the social-security system, on a uniform, nationwide basis.

The recommendations of the President for expansion of the Federal program of aid for fellowships, research, teacher training, and other related educational activities should be acted upon without delay and upon a scale commensurate with the size of the problem. There is no lack of authoritative statements of needs for the necessity of aid to the States and school districts in the construction of school buildings. It is unnecessary to await a report from the forthcoming President's conference on educational needs. The conference is not scheduled to meet until late this year. Its report and recommendations may not be available in time for legislation by the next session of Congress. We all know the urgent needs of our children, the crowded condition of the classrooms, the overburdened teachers. The need of the public-school system is immediate and growing. The present Congress should take action to remedy this shortage without waiting for any more surveys or reports.

The President's report places primary responsibility of any public works for schools, hospitals, hydroelectric development, and other public investment on the States and local units of government and private enterprise. The report reads as if undertakings on conserving water resources, involving the development of hydroelectric power were small, local projects in which people of several States had no interest. I need only read a partial list of such projects such as the Tennessee Valley, Hells Canyon on the Snake River, Grand Coulee and Bonneville on the Columbia River, and the Great Central Valley of California to show that the power, irrigation, and flood control and conservation of resources far transcend the resources of any small locality and private capital and have a public interest to the people of a vast area which extends beyond State boundaries. It may be said to affect vital interests of the entire Nation.

In my own State of California private interests and local capital were never equal to doing the job of controlling the recurring floods of northern California and relieving the arid conditions of the Central Valley. The State attempted it and was never able to raise the huge amounts of capital required. Then Franklin D. Roosevelt and Harold Ickes gave us the Central Valley project prepared jointly by the United States Corps of Engineers and the Bureau of Reclamation. The result is that today major floods are unknown in northern California and hundreds of thousands of acres of desert in the Sacramento and San Joaquin Valleys are under cultivation. This great Central Valley project, which has resulted in a vast increase in private enterprise in the area, could not have been accomplished without Federal funds and management.

The administration's withdrawal from such great public undertakings means the nondevelopment of many of our resources and partial, even wasteful, development of many others. It means that private, monopolistic financial interests can dictate the terms of sale of such products as hydroelectric power. In many instances dependence on local units of government and private enterprise will mean almost no conservation and irrigation whatsoever. The move by the Eisenhower administration to emphasize the responsibility of the localities and private capital is a large and significant step backward. It means a definite slowing down in the development in our resources, if not halting such development altogether.

On new schools, hospitals, water systems, the report simply says that they constitute the largest part of the demand for public works and are traditionally provided by the States and their governmental subdivisions. The report claims that in most cases the capacity of municipalities appears to be adequate for financing these needed improvements. The proposal to remove debt-limiting and tax rate-limiting statutes, suggestions for broadening the market for bond issues of local governments and the coordination of public-works planning is the extent to which the administration would go in giving Federal assistance to these subdivisions. Experience has shown that the States and municipalities have not met the problem of financing public works on the scope necessary to meet the needs of our present-day population.

I believe that direct Federal grants must be made available to the States and their subdivisions to insure that such projects be undertaken. That is the basis of the commonly accepted plan to aid our public schools, including the construction of buildings; it similarly should be the basis of a nationwide plan for the construction of hospitals, water systems and other resource conservation projects.

There is no doubt that we need modernization of our highway system. But we do not need improvement in highways to enable people to get from one place to another more rapidly than before as much as we need certain other public construction such as schools and hospitals.

Moreover, I believe that before we undertake a vast program of modernization of public highways with the Federal Government contributing the lion's share of the cost, there should be some form of Federal highway user taxation. The commercial vehicles that are the major factor in highway deterioration should pay a charge commensurate with the benefits they derive from and the wear they cause on the highway roadbed. Unless we make such a provision for financing the modernization of our highways, such improvements become an outright subsidy to one form of transportation at the expense of the American taxpayer.

The present program of underwriting home mortgages by the Government should be continued, and the increase on the insurance authorization requested by the President should be adopted. There should also be a huge expansion in the low rental housing program beyond the 35,000 per year requested by the administration. We cannot hope to provide equal opportunities for our citizens without providing decent dwellings for all.

If these steps are taken, I believe we will go far along the road to full employment and toward bringing prosperity to such industries as coal and railroads. I believe that the consummation of these steps will also accomplish some longstanding objectives for the improvement of living conditions of vast numbers of our underprivileged citizens.

I wish to thank the members of this committee for their time and attention.

BROTHERHOOD OF RAILROAD TRAINMEN,
Washington 24, D. C., February 17, 1955.

Hon. PAUL H. DOUGLAS,
Chairman, Joint Committee on the Economic Report,
Senate Office Building, Washington 25, D. C.

DEAR SENATOR DOUGLAS: During the time I was testifying before the Joint Committee on the Economic Report, February 10, Senator O'Mahoney requested me to furnish for the record information concerning the amount of coal produced and loaded in Wyoming for the past few years, which is in line with the figures given the committee for three of the coal-producing regions in the Eastern States.

Senator O'Mahoney also requested information on the Central Valley project in California.

I attach a memorandum concerning the Central Valley project, also one in connection with the coal production in the State of Wyoming. The information on the Central Valley project is from my own records and those of the Public Affairs Institute of Washington, D. C. The information on the coal production in Wyoming is from records of the National Coal Association.

My kind personal regards.

Respectfully,

HARRY SEE,
National Legislative Representative.

THE CENTRAL VALLEY PROJECT

Attempts have been made repeatedly to prevent costly floods, develop the hydroelectric energy going to waste from falling waters making their way to the sea, and enable farmers to utilize both electricity and water for their vast rich lands of the Central Valley in California. Several times inclusive programs were offered, but opposing interests prevented enactment of laws and the appropriation of moneys required.

There finally emerged a Central Valley project for which the people of California authorized the issuance of $170 million in bonds in December 1933. This was supposed to defray the beginning, under State auspices, of the great project. But the depression was on, and the bonds were not salable.

The Federal Works Administration was then being formed, and the State of California sought Federal aid for the Central Valley project. To obtain assistance from that agency, it was necessary to revise the Central Valley Act to comply with Federal requirements. The State of California vigorously applied itself to the task of obtaining Federal assistance all through 1934 and 1935. The Rivers and Harbors Act of 1935 made the first allocation of funds to launch the project, an initial $12 million to start Shasta Dam. After some delays, Congress made its first appropriation in June 1936. In 1937, the project was reauthorized in the Rivers and Harbors Act and assigned to the Bureau of Reclamation. Thereafter, repeated appropriations have been made.

By 1953, over half a billion dollars had been spent, 7 dams constructed, 665,000 kilowatts of electricity installed, 7,500,000 acre-feet of water impounded in reservoirs for flood control and irrigation purposes. Yet, according to the master plan, this is only a partially completed project.

The distance yet to go may equal that already traversed. The demand of an increasing population has already outstripped these facilities. Only the Federal Government's large resources can provide the funds needed for the yet vast development which is needed for the Nation's defense and economic growth.

Data on bituminous coal in Wyoming

Item	1939	1945	1950	1951	1952	1953	1954

JANUARY 1955 ECONOMIC REPORT OF THE PRESIDENT

WEDNESDAY, FEBRUARY 16, 1955

CONGRESS OF THE UNITED STATES,
JOINT COMMITTEE ON THE ECONOMIC REPORT,
Washington, D. C.

The joint committee met at 10 a. m., Senator Paul H. Douglas (chairman) presiding.

Present: Senator Douglas (presiding), Representatives Patman (vice chairman), Bolling, and Kelley.

The CHAIRMAN. Mr. Shuman, we will ask you to lead off?

We are very proud to claim Mr. Shuman as a distinguished Illinoisan and former president of the Illinois Agricultural Association, now president of the American Farm Bureau Federation.

Mr. SHUMAN. Thank you, Mr. Chairman.

STATEMENT OF CHARLES B. SHUMAN, PRESIDENT, AMERICAN FARM BUREAU FEDERATION

Mr. SHUMAN. Mr. Chairman, and members of the committee, I appreciate the opportunity to discuss important aspects of the President's economic report with you. Although the current economic report says very little about agriculture, it deals with matters that are of fundamental importance to farmers.

We are in agreement with the general philosopsy expressed in the report, but in disagreement with a number of the specific recommendations for legislative action. Rather than to make a detailed analysis of the report, I desire to make some general comments, and then to call attention to various sections which can be used to illustrate the areas where we agree and the areas where we disagree.

Nothing is more fundamental than general prosperity to the welfare of agriculture. General prosperity does not automatically insure farm prosperity. It does, however, provide the base on which farm prosperity can be built. On the other hand, we can see no possibility of building an island of farm prosperity in a sea of general depression.

Agriculture currently is in the midst of some difficult adjustments, made necessary by overexpansion to meet abnormal demands that have now receded. The completion of these adjustments will be greatly facilitated by the maintenance of a prosperous and expanding general economy. Failure to achieve this objective inevitably would mean disaster for agriculture. A relatively small increase in the overall domestic consumption of farm products would absorb most of our present surpluses, but a decrease in domestic consumption of similar magnitude would compound the adjustments that need to be made.

While we have a domestic market that is really fabulous in comparison with that to be found in other countries, and while we have every confidence that this market could be expanded, we still have a very real need to expand our foreign markets. Agriculture has been going through a technological revolution. Production per man-hour has increased 78 percent since 1940. Total farm production has increased 52 percent despite a 30-percent decrease in farm population since 1935–39.

The CHAIRMAN. Mr. Shuman, you say that the increase in productivity per man since 1940 has been greater in agriculture than in industry itself?

Mr. SHUMAN. My opinion is that it has been greater than most of industry. There may be some exceptions.

The CHAIRMAN. Greater than the average?

Mr. SHUMAN. That is my conclusion, yes.

The CHAIRMAN. And, therefore, is your conclusion from this that the cost per unit for farm products has decreased relatively more in agriculture than in industry?

Mr. SHUMAN. Yes; I think our efficiency has increased relatively more than that of industry.

The CHAIRMAN. In terms of money cost. Anticipating some of your later remarks, is this one of the reasons why you favor flexible price supports over fixed-price supports?

Mr. SHUMAN. Well, I would not couple the two, particularly, except in this regard. The fixed-price supports have tended to preserve inefficiencies, in our opinion. I think that is the main connection.

There is no reason to believe that farmers will not continue to increase output at least as rapidly as our domestic market will grow in the next few years, if prices are favorable and production is not unduly restricted. Hence, we need larger foreign markets to absorb the surplus productive capacity that now exists in agriculture. We presently have the capacity to produce at least 15 percent more agricultural products than our domestic market will absorb at present prices. However, we have been exporting only about 10 percent of our farm production. This situation is complicated by the fact that some commodities, such as wheat, cotton, tobacco, and rice, are more dependent on exports than others are.

A decline in exports from the high levels which existed a few years ago contributed to the accumulation of cotton, wheat, and rice supplies, which in turn forced the application of marketing quotas to these crops. The acres being forced out of the production of quota crops are being used to increase the production of other commodities, many of which have no price support. At the same time, the price-support programs now in effect for these crops are encouraging producers to do everything possible to offset the effects of reduced acreage by increased use of other resources, such as labor and fertilizer. The change in direction of farm-price-support programs made possible by the Agricultural Act of 1954, will help to correct this situation in time, but the problem cannot be solved overnight. In the meantime, we need to make every legitimate effort to reduce the adjustment that is needed by expanding exports of the farm commodities which we can produce to the greatest comparative advantage.

We are in general accord with the President's recommendations for foreign-trade legislation, but have suggested a number of improvements to the House Ways and Means Committee. For example, we recommended that the Reciprocal Trade Agreements Act be extended for 4 years instead of 3, to give greater stability to our foreign-trade policy; that the authority of the President to reduce United States tariffs in exchange for reciprocal concessions from other countries be exercised with special emphasis on tariffs which exceed an ad valorem equivalent of 25 percent; that our Government insist that other nations live up to the spirit of their commitments under trade agreements if they are to receive concessions made by the United States; and that the President be authorized to negotiate for conditions in foreign countries which would create a more favorable climate for private investment.

The CHAIRMAN. Mr. Shuman, may I ask a question at this point?

Mr. SHUMAN. Yes.

The CHAIRMAN. Would you favor simplification of customs procedures in the direction of fewer classifications of commodities and as regards the fixation of a uniform price standard to be used in fixing ad valorem duties?

Mr. SHUMAN. Well, we are in favor of simplification of customs procedures, and I think that would certainly cover the matter of reducing the number of classifications.

Now, on the other matter I am not too well versed.

The CHAIRMAN. There are 5 or 6 different standards by which the value of a commodity can be judged, and sometimes a switch from one to the other——

Mr. SHUMAN. We certainly would be in favor of simplification in that regard.

The CHAIRMAN. What is your feeling about the escape clause?

Mr. SHUMAN. We are in favor of the escape clause.

The CHAIRMAN. You mean retention of the escape clause?

Mr. SHUMAN. Yes.

The CHAIRMAN. What about the peril points?

Mr. SHUMAN. We have given general support to the peril points. We believe there should be some limitation on tariff concessions, but that the peril points should be used with a good deal of discretion. They certainly could nullify all of the advantages of reciprocal trade if they were used indiscriminately.

The CHAIRMAN. So if we could lay down standards to follow in determining where the peril point would be, that would be helpful?

Mr. SHUMAN. Yes.

Our current policy resolutions state that:

> consideration should be given to the corporate tax rate on income from investments abroad and comparable treatment of individuals who invest abroad.

We are not prepared at the moment to take a position on the President's specific proposal that the tax rate on corporate income from foreign sources be reduced by 14 percentage points as our board of directors has not yet considered this proposal. We would like to point out, however, that the President's proposal does not provide the comparable treatment for income earned abroad by individual investors which our policy resolution recommends.

Farm Bureau policies long have emphasized the importance of measures to bring about a more stable general price level as a means of providing a favorable climate for economic growth and a rising standard of living. We have been particularly concerned with the problem of maintaining stability in recent years, because the record shows that inflations growing out of wars often have been followed by serious depressions.

The record which the Economic Repart presents with regard to Federal actions in the field of monetary and fiscal policy in 1953–54, and the effect which these actions apparently had in moderating the post-Korea adjustment, encourages us in our belief that monetary and fiscal policies can be used successfully to avoid wide swings in the general price level. The record that has been made thus far in checking the inflation which followed Korea, and in adjusting our economy to a lower level of defense spending and more normal conditions, is truly remarkable. It certainly justifies the continued use of monetary and fiscal tools to avoid both inflation and deflation.

The section of the report which describes the measures taken to stimulate the economy during 1954, does, however, mention one type of activity that seems to us to be undesirable. On page 20, the report says:

> The Government also attempted to assist localities suffering from unemployment by channeling contracts to them as far as feasible, by boosting the allowable rate of accelerated amortization on facilities needed for the mobilization base * * *.

We regard it as a very questionable procedure for the Government to (1) depart from the principle of placing defense contracts with the lowest responsible bidder, or (2) use its power to grant accelerated amortization to influence the location of defense plants for any reason other than defense considerations.

As a matter of fact, we feel that the power to grant accelerated amortization is so much subject to abuse under present conditions that it should be terminated.

Our policy resolution on this subject reads, as follows:

> The accelerated amortization program, under which the Government has allowed industry a rapid tax writeoff on part or all of the cost of new facilities, appears largely to have served its purpose encouraging a rapid expansion of our productive capacity for defense. We, therefore, urge that the program be terminated as soon as possible. As a long-time policy, any encouragement that may be found to be necessary to bring about the construction of new facilities should be provided through generally applicable provisions of law rather than by programs which require that the Government pass on individual projects.

Whatever justification there may have been during World War II or the Korean mobilization period for eccelerated amortization, we can see no such justification now, particularly in view of the liberalized and generally applicable depreciation provisions of the new tax code.

We have been disturbed by press reports that the Office of Defense Mobilization has undertaken to develop a standby program for the institution of rationing, price, and wage controls in a period of "stepped-up or all-out mobilization." We will oppose enactment of standby price and wage controls. Sound monetary and fiscal policies are the only effective means of dealing with an inflation threat.

The CHAIRMAN. Mr. Shuman, may I interrupt there?

Mr. SHUMAN. Yes.

The CHAIRMAN. Would that be true on the outbreak of a world war?

Mr. SHUMAN. Well, we think that it might be necessary, perhaps, to have rationing of some short materials, but the need in the outbreak of war would be for stepped-up production, and our experience with price and wage controls was that it throttled or reduced production, and we think the situation would be the same in war or peace.

If war should come suddenly, rationing might help us to make an equitable distribution of any commodities that happen to be in actual or potential short supply; however, our really urgent need in such circumstances would be to increase production. Price and wage controls cannot possibly prevent inflation because they deal with symptoms rather than fundamental causes. On the contrary, such controls contribute to inflation by hampering production and by providing a screen behind which inflation can gain headway before the people know what is happening. Our experience in the early months of Korea provides a good case history of how standby controls actually can aggravate an inflationary situation.

We are opposed to the President's recommendation that the minimum wage be raised to 90 cents per hour. Our reasons for opposing a higher minimum wage are well expressed in the following extracts from the Economic Report itself:

> Minimum wage laws do not deal with the fundamental causes of low incomes or poverty.
>
> * * * A higher minimum might well cause lower production and substantial unemployment in several industries, and—whether directly or indirectly—it would probably bring generally higher prices in its wake. Such effects would make the gains of covered workers illusory, and they would lower the standard of living of uncovered low-wage workers.

In the statement just quoted, the Economic Report, of course, was referring to a minimum higher than 90 cents per hour. Nevertheless, we think the same argument applies to the proposal for a 90-cent minimum. It certainly would be applicable if business activity were to decline appreciably from its present high level. For similar reasons, we oppose the suggestion that Congress and the States consider the question of bringing substantial numbers of additional workers under the coverage of minimum-wage laws.

Our current policy resolutions recognize that the Federal Government has, and should continue to have, a responsibility for the development of an integrated highway system. This can be accomplished without any increase in Federal appropriations. Our resolutions state that:

> In view of present conditions, we are opposed to any expansion of Federal participation in financing of highway construction.

Arguments in support of this position are:

1. In each of recent years total highway construction has reached a new peak. On the basis of the present program progress toward a better highway system is being made.

2. During the next few years the rate of highway construction under the present program will be accelerated. More Federal money will be available under the 1954 Federal Aid to Highway Act.

The CHAIRMAN. As a matter of fact, Mr. Shuman, that virtually doubled the amounts which had been previously appropriated, as I remember.

Mr. SHUMAN. I think that is correct.

Vice Chairman PATMAN. Do I understand you to say that you are for the toll roads?

Mr. SHUMAN. No, no. Up in the first point, in each of recent years total highway construction has reached a new peak. I may have slurred over the word "total," but we are not for toll roads.

Vice Chairman PATMAN. You are against toll roads?

Mr. SHUMAN. Well, we have no position on toll roads.

Vice Chairman PATMAN. Don't you think you should have?

Mr. SHUMAN. May I state for the record what our position is? I was under the wrong impression. We favor toll roads only where traffic congestion and other traffic problems justify the construction of an additional major highway which may be practically and economically operated on a toll basis. We favor self-amortization of toll road construction costs. Economic feasibility on a self-liquidating basis should be determined prior to the initiation of any project. We oppose the allocation of Federal or State highway funds for the construction of toll roads.

Vice Chairman PATMAN. May I make this suggestion: I hope you do not favor toll roads for the reason that the average toll road rate is about a cent a mile. Now, that is the equivalent of about 17½ cents additional tax on every gallon of gasoline.

Now, if you put just 2 cents a gallon tax on the gasoline, you would have enough money for good roads all over, and everybody could use them, and I see no reason why you should just pick out a few people or a few localities and make them pay at the rate of 17½ cents for each additional gallon of gas to ride on it.

Mr. SHUMAN. Our State farm bureaus, of course, have the problem of coping with various proposals.

Vice Chairman PATMAN. And it is an archaic deal, going way back. You never get rid of these things. Down in my section of the Southwest we had an old ferry there, across Red River. I will bet the cost of the two ferries didn't aggregate $500, just made out of old scrap lumber. But they made not several hundred dollars, but sometimes thousands of dollars a day putting automobiles across, and trucks, and they built a fine bridge there, and the night before it was to be started and dedicated the next morning, it was blown up. It was said the private enterprise fellows blew it up, that it was wrong to destroy that ferry, and you cannot get rid of these toll things once you get them started. It took us a couple of years to get the bridge built back but, of course, during that time private enterprise was making a lot of money and they seemed to think it was justified.

Representative KELLEY. Mr. Chairman, the success of the Pennsylvania Turnpike as a toll road has certainly been outstanding. It is a main artery of travel. Of course, the provision is that when it is paid for, the toll ceases; is that right, Mr. Kennedy?

Mr. KENNEDY. I think so.

Vice Chairman PATMAN. You see, these deducts get hold of it from the very beginning and you never overtake them. They have the advantage.

Mr. SHUMAN. As you noted from our position, Senator, essentially the American Farm Bureau believes the toll road is a State situation, and so we have just set up our viewpoint as to the limitations and safeguards which should be included.

Our third reason for opposing the President's suggestion on highways is that the proposed bond program is unsound financing. It is primarily a device to keep this expenditure out of the budget and to give the budget an appearance of being balanced—but in actual fact it would still be a spending program with borrowed money..

4. It would put the Federal Government in the highway business on a major scale. We cannot assume the Federal Government would step out of the highway construction business at the end of the 10-year period. On the contrary, there is every likelihood that a new program, involving more borrowed money, would be presented at the end of the 10-year period.

5. In the long run, the "man who pays the piper calls the tune." Already there is argument with respect to what should be required of State governments in connection with the program. This program would continue the trend by which State governments are becoming mere provinces of a superstate.

6.. The States are quite competent to build their own highway systems with enough Federal aid to insure integration. The financial position of the States is good compared with that of the Federal Government. At the end of fiscal 1953, the total indebtedness of the 48 State governments was $7.8 billion and total State revenues exceeded total State expenditures by $1.1 billion.

In lieu of increased Federal appropriations for highway construction, we recommend termination of the Federal motor-fuel taxes, as a means of providing increased opportunity for the States to raise funds for highway construction. If the Federal motor-fuel taxes are not repealed, we shall insist that provision we made for the exemption of motor-fuel used for nonhighway purposes.

The Economic Report contains other recommendations which are of interest to Farm Bureau people. However, I have covered the areas that seem to us to be most deserving of discussion here today.

The CHAIRMAN. Mr. Shuman, the amount of the Federal aid which is provided for highways is now approximately equal to the receipts, as I remember it, from the Federal gasoline tax. If you abolish the Federal gasoline tax, are you proposing to abolish Federal aid to highways at the same time?

Mr. SHUMAN. No, sir, we do not make that proposal.

The CHAIRMAN. That would increase the Federal deficit then.

Mr. SHUMAN. Yes, to that extent.

The CHAIRMAN. Well, close to $900 million a year.

Mr. SHUMAN. We are proposing that the Federal gasoline tax be abolished, presuming, of course, that most of the States would take it up.

The CHAIRMAN. But if you do not abolish Federal aid, the expenditures continue where this source of revenue is eliminated, and the deficit is increased.

Mr. SHUMAN. We would probably favor reduction in the Federal appropriations.

The CHAIRMAN. In other words, a smaller rate of increase in the Federal deficit.

Mr. SHUMAN. Yes. We are in favor of enough to assure integration of the highway systems. The economic report contains other recommendations which are of interest to Farm Bureau people; however, I have covered the areas that seem to us to be most deserving of discussion here today.

I would be glad to answer any questions.

Vice Chairman PATMAN. Have you said anything about interest rates in your statement?

Mr. SHUMAN. Not in this statement.

Vice Chairman PATMAN. I was disappointed in the Farm Bureau about a year ago, when there was a bill up to allow the President to increase interest rates, and that bill got through by unanimous consent in the House. I was watching it and I made a speech against it, and I thought it was convincing. An effort had been made to increase the interest rates on housing and it was defeated by an overwhelming vote in the House.

Since all of the others had been denied an increase, I did not think the farmers should be the only victims, and I was not there, and I do not mean to say that I was the watchdog for the entire Congress. It just happened that nobody objected to it and it went through, permitting the President to increase interest rates up to 1 percent.

Do you recall that bill?

Mr. SHUMAN. I do not recall that particular bill.

Vice Chairman PATMAN. I wonder if the rates have been increased under the bill. Do you recall that?

Mr. SHUMAN. I am not informed.

Vice Chairman PATMAN. Anyway, I was disappointed that the farmers were not on the job to make sure that we were not the only victims, but they were last year.

Mr. SHUMAN. Our position on that matter of Federal interest rates, as well as Federal fiscal and monetary policy, is that there should be enough flexibility and that it should be used as a means not only of checking inflation, but also of checking deflation, and if these Federal powers are used, there has to be some flexibility.

Vice Chairman PATMAN. But that flexibility should not be all against the farmer. That word "flexibility" seems to apply as to the moneylenders upward for them, and that is where this flexible business has not resulted in very much good for the farmer, as I see it. So that word does not sound good to me. It is a bad word for me. I just do not like it.

Mr. SHUMAN. I guess it is all in the point of view, our definition of flexibility.

Vice Chairman PATMAN. That is all.

The CHAIRMAN. Mr. Bolling.

Representative BOLLING. No.

The CHAIRMAN. Mr. Kelley.

Representative KELLEY. No.

The CHAIRMAN. Thank you very much, Mr. Shuman.

Mr. SHUMAN. Thank you.

The CHAIRMAN. Mr. Kennedy.

STATEMENT OF THOMAS KENNEDY, VICE PRESIDENT, UNITED MINE WORKERS OF AMERICA

Mr. KENNEDY. Mr. Chairman, my name is Thomas Kennedy, vice president of the United Mine Workers of America. I am not an economist, thank the Lord.

The CHAIRMAN. Is this a boast or a confession?

Mr. KENNEDY I think it is a confession. I have read the report. I do not have any prepared statement. I have read this report of the President's, and I would like to talk briefly with respect to one of our basic industries in the United States, the coal industry. It is in bad shape. I think last December, in my statement to the Ways and Means Committee of the House, we had about 165,000 people idle in the mining industry.

There are various reasons for that idleness, the competition of natural gas and fuel oil, the dumping of residual oil from Venezuela. We can compete, I think, with the fuel oil and natural gas, as such, but we cannot compete with the residual oil that is dumped on the eastern seaboard, and which is sold for as low as 2½ cents a gallon in some periods over the past number of years.

We are vitally affected also with respect to some of these reciprocal-trade arrangements that are contemplated in the President's message. For instance, on the exportation of coal from the United States to Europe and to Asia, there is no reason under God's sun why we could not export about 35 or 40 million tons of coal per year if we had any sense. The chief exporting country now in Europe is Poland. They produce about a hundred million tons a year, approximately so, and that Polish coal is going to France, Belgium, it is going, some of it, to England, it is going to the Scandinavian countries, and I do not know, but in my judgment it is subsidized by the Government of Poland or Russia, or wherever you please, in order to compete with the American coal.

You will find if you go into the situation with respect to, say, the Republic of Western Germany, we can put American coal into Hamburg in successful competition with the Ruhr coal or Western Germany coal, but you cannot get it in because the federal Government of Western Germany requires an import license, and they will not grant any import license, and I think one of the ironic situations is the fact that in a lot of these countries that get American aid, such as France and England, and other countries that buy Polish coal, they buy it with our money, I mean with our dollars.

That is the only way that Poland will sell coal, to get American dollars, and I even found during the war that they were exchanging Polish coal for iron ore in Sweden and they were taking that iron ore back to make weapons to kill our people in Korea, our soldiers. The whole situation doesn't make sense with respect to participation of the coal industry of the United States in the coal business in Europe and in Asia.

Getting back to the situation in England where they have nationalized the coal industry. I do not think there is any doubt about it, but that England is buying coal from Poland. She started to buy some from us this winter, and I think at the same time England is exporting coal, probably for trade-balance purposes, I don't know. They recently sent some coal, some anthracite up to Boston, and there is no question about it, the cost of producing British coal is much higher than the cost of producing American coal, so how they can manage to get that over here without subsidy and sell it in competition with our coal is beyond me.

For instance, on productivity, in the United States in the coal industry we produce 8 tons per day per man. In Great Britain they produce 1.24 tons per day per man.

On the Continent it is about 1.20. It is very hard to get the figures from Poland because it is a difficult proposition, but Poland has an advantage because during the war Russia was able to get mining machinery from the United States, and that mining machinery was diverted eventually to Poland and to Czechoslovakia, so they are able to have better mechanization in those mines than they have elsewhere in Europe.

One point that I have to make with reference to the American coal industry is this: If we had a war tomorrow, we would be on a coal economy overnight, and I happen to know because I was on the Advisory War Council of Solid Fuels during the war, and when World War II started we were on a coal-economy overnight.

If that happened again, it would take us from 8 months to a year to put our coal industry into shape to meet the needs of this Nation and to provide coal for our allies, and I think, Mr. Chairman, that somewhere along the line we should have a national-fuels policy enacted by the Congress of the United States so that we know where we are at, and so that this basic industry could be protected and so that it would be in a position to meet any emergency that might arise. It is not in that position today.

We produced during the war even under price controls referred to by the previous speaker, and I want to say in connection with price controls, price and wage controls, that I was on the War Labor Board during the war and we found that wage controls were rigidly enforced, but price controls were not, because I remember coming up here to the Senate with Senator Wayne Morse and a committee from the War Labor Board during the war asking Congress to do something with respect to price controls, that we were rigidly enforcing wage controls. Notwithstanding wage controls during the war, coal production was increased so that we produced in 1 year over 700 million tons of coal in the United States, and certainly the price controls did not affect production in that sense because production was substantially increased. But we find another situation with respect to these competitive fuels in the coal industry, natural gas and fuel oil.

As I said, we can compete with fuel oil and natural gas. But you are going to run out of it.

As a matter of fact, today a lot of these oil companies that control some of the natural gas outlets are trying to get permission to import gas from Canada and from Mexico and applications are now before the Federal Power Commission for that purpose so that in this picture as affecting the basic coal industry, we have many angles and I do not think it is adequately covered in this economic report of the President, although I understand that they are about to release or are now working on a report that brings into question the whole national fuel policy idea.

Vice Chairman PATMAN. Do the oil companies, the major oil companies, that are doing business in foreign countries get the 27½ percent depletion allowance on the gross earnings that they make in foreign countries?

Mr. KENNEDY. Congressman, I don't know. I couldn't answer that question. I really do not know.

Vice Chairman PATMAN. It would place you at a great disadvantage if that were true; would it not?

Mr. KENNEDY. That is right.

Vice Chairman PATMAN. I think if I were you, I would look into that. I think they are.

Mr. KENNEDY. Getting that depletion?

Vice Chairman PATMAN. Yes. If they do, of course it is in violation of every reason that was ever given for depletion allowance in this country.

Mr. KENNEDY. Well, I know that they get 27 percent here. The coal industry gets what, 15 or 10? I think it is 10 percent.

Representative KELLEY. Yes; 10 percent.

Vice Chairman PATMAN. You mean on coal?

Mr. KENNEDY. Yes.

Vice Chairman PATMAN. But I was talking about the oil.

Mr. KENNEDY. Well, oil gets 27, and coal gets 10.

Representative KELLEY. There are only 2 or 3 big oil companies that are dumping this residual oil on the eastern seaboard of the United States from Venezuela.

Mr. KENNEDY. Yes; the bulk of it is coming from Venezuela, and I was rather amused before the Ways and Means Committee the other day. Some minister from Venezuela sent a statement up to the committee to the effect that Venezuela was ready to meet any emergency occasioned by war or otherwise and that Venezuela believes in justice and liberty. Venezuela is a military dictatorship. There is absolutely no freedom in the country except such as is allowed by a general or somebody else, and yet we are "paying the piper" in the coal industry for that very situation.

The CHAIRMAN. Mr. Kennedy, who are the oil companies which have the concessions in Venezuela and are importing oil into the United States; do you know?

Mr. KENNEDY. I think practically all of the big ones, Senator, Standard especially, and practically all of the big ones.

The CHAIRMAN. But no independents; no small ones.

Mr. KENNEDY. I don't know of any independents.

Representative KELLEY. If I may answer that, there are 2 or 3 of the large oil companies of the United States that control the importation of residual oil into the United States. Standard of New Jersey is one. I cannot think of the other two, but they are the other major oil companies.

Mr. KENNEDY. Well, it displaces over 30 million tons of coal a year.

Representative KELLEY. Is that the effect?

Mr. KENNEDY. Yes, about 32 million tons.

Representative KELLEY. Mr. Chairman, if I may say this: I quoted those figures before this committee. Mr. Charles Taft was here and he disputed the figure with some compilation of figures which he had showing that the coal industry had not lost very much, maybe a million tons to residual oil. Well, it seems a rather simple matter to determine how much coal has been displaced by simply adding up by simple arithmetic what each coal company has lost.

Now that is reported regularly and they know why their coal orders have been discontinued, and it is not a complex matter at all to determine that.

Mr. KENNEDY. Not at all. It is over 30 million tons.

Representative KELLEY. Per year.

Mr. KENNEDY. That means about 3 weeks work in the bituminous mining.

Representative KELLEY. It means about 24,000 men, doesn't it?

Mr. KENNEDY. Yes.

Representative KELLEY. Of course I cannot understand all of this tonnage of residual oil that is being dumped on the eastern shores. If it does not displace coal, what does it do? They cannot put it down for people to eat. It is not good for lubrication. It is not good for anything except combustion.

Mr. KENNEDY. In heavy industries, utilities, and otherwise.

Representative KELLEY. So it must displace something, and it displaces coal of course.

Mr. KENNEDY. Well, I do not think I have anything else, Mr. Chairman.

The CHAIRMAN. Thank you very much, Mr. Kennedy.

Mr. Kelley?

Representative KELLEY. Yes, I have a couple of other questions. Mr. Charles Taft also made the statement here criticizing the United Mine Workers organization for interfering with the technical improvements in the coal industry, and he cited, for example, the stripping operations, that they have opposed that.

Now of course he overlooked the fact or he was misinformed that the objection of the United Mine Workers to stripping was that many of them were nonunion, that is the point.

Mr. KENNEDY. That is the only reason. Charlie Taft is nuts, and he is getting paid for that. We have always favored mechanization in the coal-mining industry, and went along with it and supported it because we realized that in order to improve your wage and conditions standards you have got to have new values and you have got to increase production, and that is not true in Europe. It is not true in England, but we have always favored mechanization.

Representative KELLEY. And your figures that you cited, 8 tons per man per day average, is due to the fact that there has been encouragement for mechanization in the industry.

Mr. KENNEDY. That is correct.

Representative KELLEY. All right. Would you know anything about the 10 million tons of coal that Mr. Stassen was going to buy, his organization was going to buy, to be shipped to the various European countries? I understand there hasn't been more than a million and a half tons of coal shipped there out of the total of 10 million that he advertised was to be done and that was last fall.

Mr. KENNEDY. Well, I think the answer to that, Congressman, is this: Evidently the top level administration here in Washington decided to buy and ship 10 million tons of coal to Europe just before the election, and when it got down to the lower branches of Government, they found out they did not have the money to buy it or to ship it, so they have been trying to rearrange their trade situation in Europe for them to take this coal, using money that has already been appropriated to these European countries for various activities, with the result that very little of that coal has been shipped. I do not think there has been a million tons shipped so far.

Representative KELLEY. Now another thing, Mr. Chester Potter of the press—he is quite a noted writer—yesterday or a few days ago pointed out the fact about coal going to Formosa, and that 800 men in the United States would be thrown out of work. Mr. Stassen is stopping the exportation of coal from the United States to Formosa, the coal to be bought over there, I suppose, with our money.

Mr. KENNEDY. Well, we could very easily take care of the coal requirements anywhere. We are shipping coal to Japan now as a matter of fact.

Representative KELLEY. Another question, on this question of idleness of the coal mines. You said that we would be in a coal economy overnight perhaps.

Mr. KENNEDY. We would.

Representative KELLEY. In the case of all-out effort for war. Well, the longer the mines are idle, the more difficult it is going to be to get on a coal economy, and for two reasons, as I see it. One of them is that there is attrition in the number of men leaving the industry, particularly younger men. You do not get them back. They have gone elsewhere, and the second one is if many mines are idle for a while, it takes some time to get them into production, due to geological conditions that affect various mines like the conditions of the coal seam itself and the strata above and very frequently below the coal seam.

In many cases there is the possibility that the cost of opening those mines would be prohibitive, and millions of tons of coal would be lost.

Mr. KENNEDY. That is correct.

Representative KELLEY. That has been true in the past; we have lost millions and millions of tons of good coal due to the ups and downs of the economy in the United States. I think that is somthing that we ought to be well aware of, that it is a basic industry and a natural resource very valuable to this country in times of peace and particularly in times of war.

That is all I have, Mr. Chairman.

Representative BOLLING. Thank you.

Mr. Mahon.

STATEMENT OF DON MAHON, PRESIDENT, NATIONAL BROTHERHOOD OF PACKINGHOUSE WORKERS; AND SECRETARY, NATIONAL INDEPENDENT UNION COUNCIL

Mr. MAHON. Mr. Chairman and members of the committee, my name is Don Mahon. I am president of the National Brotherhood of Packinghouse Workers and secretary of the National Independent Union Council.

The following facts will illustrate the seldom recognized size and importance of the independent union labor movement in the United States.

According to the Bureau of Labor Statistics of the United States Department of Labor, there were in excess of 50 million nonagricultural workers gainfully employed in this country. The combined membership claimed by the major federations is between 15 and 16 million. The remainder of the previously mentioned 50 million are in independent unions or are still unorganized.

There are both large and small independent unions.

There will still be some competition in the organization of workers.

Competition has proven to be one of the most dominant factors in the creation and development of our form of government. It accounts, to a large degree, for our leading position in the world today from the standpoint of economic and industrial might.

Competition has proved to be wholesome in all lines of endeavor. In politics, competition has created the two-party system.

The result has been the best form of government thus far devised by man. The "ins" and the "outs" compete constantly, so we are doubly protected. Competition in business has been a dominant factor in developing and making our country the industrial giant of the world. This same spirit of competition has also proved to be beneficial in most cases to the members when practiced in the field of organized labor. In our country, a man may belong to the church, the political party, or the union of his choice. He may also change whenever he so desires. This competition for the right and privilege to represent workers keeps the union constantly striving to better the wages and working conditions of its members.

The results are self-evident. The standard of living, of the American worker, is the best illustration of the advantages of our free and independent way of life. It is unequalled in all the world. The Communists and totalitarians advocate "one big union" and "one big company," both belonging to the state. There is no personal freedom. Competition, as we know it, would be rank treason. An American-type businessman or industrialist, as well as a union organizer, would soon be liquidated. A glimpse into the wages and working conditions of such countries reveals the fallacy of the totalitarian philosophy. We think American workers want no part of it. We petition your committee, and the administration, to give due consideration to this fact.

In accordance with the invitation we have received from your committee, we are here to offer our suggestions with respect to the "main recommendations" in the President's Economic Report. The President's Report refers to the obligation of the Federal Government under the Employment Act, "to promote maximum employment, production, and purchasing power." And with "other essential considerations of national policy."

To accomplish these things we believe primary consideration should go to the youth of America. In order to properly prepare the young men and women of today, who are coming steadily into the labor market in ever-increasing numbers, we propose that the Government make available, to all those who are high school graduates and capable of qualifying, an opportunity to attend college, or learn a higher-skilled trade, in order to better fit them for the complicated industrial and social problems facing our Nation now and in the future.

We would propose that this be accomplished by extending our free school system to include college. The Federal and State Governments could participate in this program in various ways, depending upon the requirements of particular areas.

A good example may be illustrated by a recent bill introduced in the Connecticut Legislature. Under its terms the State would grant tuition to medical students without obligation, providing they practiced in the State for a certain number of years following graduation. The same provision could qualify on a national basis. While it is true that insurance for medical and hospital expenses has greatly broadened during past years, at the same time the actual cost of such hospital and medical services has so far outdistanced the usual coverage that many working families are still grossly underserviced with respect to these important services and facilities. There is undoubtedly an ever-increasing need for additional medical, dental, and nursing personnel which cannot be fulfilled with the present system. It is certainly in the best interests of our Nation to encourage such training. The Federal Government should supplement such funds.

PAST ECONOMIC GROWTH

The trend toward modernization of factories, to produce greater efficiency, was brought about largely through the introduction of labor-saving machines, and devices that cut down on the demands for manpower.

This is considered to be progress. Anyone who raises his voice against it is immediately accused of standing in the way of the inevitable.

Unfortunately, our experience has been that many of the jobs, eliminated by machines, were those of the higher skills. There is a never-ending attempt, by management, to reduce the rates of pay, for those who perform the work that is left after the machines are introduced. This is in spite of the fact that a substantial number of workers are usually eliminated entirely by the machine itself. Management should not use the introduction of machines, as a method of reducing the rates of pay for skilled workers.

Actually, management receives great compensation, through greater production, and added efficiency. Every time it drives down the wages of the higher paid workers, management is guilty of reducing all workers to the same level. In reality they are practicing the theory that will eventually eliminate the individual incentive to earn more. This has always been the principal reason for workers striving to improve themselves, such improvements being, of course, in the form of a higher-paying job. When such jobs are eliminated, the greatest single factor resulting in the independent and aggressive nature of the American worker, will have been eliminated. We believe this phase of transition requires serious consideration too.

The growth potentials of our economy, in the long run, are largely dependent upon the skills and ability of our workers. To develop and operate the complicated and technical methods and devices is most necessary to successfully live and survive in a highly mechanized and explosive world.

Availability of trained workmen with the highest skills is most essential.

Therefore, our proposal for training at these higher levels, and accompanying apprenticeship programs sponsored by the Federal Government, is most essential. In this manner the role of the Federal Government in the progress of a glorious economic future may be ours as mentioned in the President's report.

We agree that it can be achieved only by wise men in our national household. The ever-increasing output per man-hour in major industries, from the period 1909 to 1953, is clearly indicative of the greater efficiency and additional mechanization of transportation, industry and all the related factors that comprise the industrial picture in the United States today.

To balance this very interesting chart, with the ever-increasing and expanding population of our Nation, it is essential that more people be given an opportunity to participate, not to have a smaller number engaged and a great backlog of unemployment. Unless hours of employment and production are fairly well balanced and fairly well counterbalanced, one or the other will swamp the ship of state and all of us along with it.

In building the floor of personal and family security, particular attention should be given to the case of the disabled worker. Under existing social security this unfortunate individual, and his family, receive no benefits until he has reached the age of 65. Obviously, very few workers who are totally and permanently disabled, so that they cannot perform their usual tasks, ever live to see the age of 65. This glaring loophole in the law must be closed. To correct this situation and related matter our organization has proposed a resolution, which, with your permission, we will submit for the record.

With respect to necessary improvements related to unemployment compensation, we have also adopted an appropriate resolution which we submit for your further consideration at the finish of this statement.

The President's report indicates that we have ended a year of transition, while our economy was undergoing contraction. At the same time, there is a continuing rise in the stock market. All other prices will be affected to a degree. These factors are especially alarming to many of our older citizens who must depend on an income that was established when prices were about half their present level. These facts cannot be ignored. The only practical method to assist these retired people is by increasing their benefits under the social-security and old-age survivors benefits.

We oppose the lowering of tariff barriers at the expense of American workmen. Our standard of living, undoubtedly the highest in the world, was brought about and maintaind by safeguarding American workers from sweatshop, low-cost, inferior, and foreign-made products. To do away with this time-honored and basically sound principle would be very unwise. Only by maintaining this high standard, which is an example for all the world, can we expect to maintain the superior working forces necessary to win in a world threatened by communism.

We endorse the President's recommendations with respect to expansion of our public assets. In the modernizing of the highway system, our union favors separate facilities for cars and trucks. We have adopted a resolution covering this subject and submit it for your consideration as part of the record.

In the interests of all sections of our society we feel that the individual and the small group should receive fair and equal consideration. For this purpose we recommend passage of House Resolution 25 to provide a committee for small unions in the same manner as now provided for small business. Comparable rules should be adopted in the Senate.

We endorse the plan to create an advisory committee in the Department of Labor providing it is representative of all labor and does not discriminate against minorities.

We recognize the highly complex nature of the undertaking of this joint committee. We know there is no simple solution that will solve these questions from now on. However, we have great faith in the ability of our Government to meet and master the problems herein enumerated.

Certainly our best insurance for the future is the proper preparation of our younger citizens so they are properly qualified to take their place in this picture. Our proposals would more properly prepare them for positions in which they can help to guide the destiny of this great Nation, as an example for all the world.

Representative BOLLING. Thank you, Mr. Mahon. Without objection, the various resolutions Mr. Mahon mentioned in the body of the statement will be included in the record of the hearings.

(The information referred to is as follows:)

SOCIAL SECURITY FOR DISABLED WORKERS

Whereas the present social-security law does not provide any protection for workers who become totally and permanently disabled before they reach the age of 65: Now, therefore, be it hereby

Resolved, That in cases of total and permanent disability of any worker, covered by social security, such worker shall be eligible for benefits immediately, regardless of age. (Disability to mean: To an extent that they cannot perform their usual work or trade); be it hereby further

Resolved, That because of the increasing size of the work force, that the age requirement on social-security benefits be lowered from age 65 to 60 years of age, for all those covered by the act, providing they choose to retire.

INCREASED UNEMPLOYMENT BENEFITS

Whereas the present unemployment compensation law does not provide a decent standard of living for unemployed workers in most States; and

Whereas the maximum now provided was predicated on living conditions and costs of several years ago and is hardly enough to keep body and soul together for those who are unfortunate enough to be unemployed; and

Whereas a breadwinner with a family is particularly hard hit by the present limitations: Now, therefore

We hereby petition the Members of Congress to enact legislation which would make funds available to raise the maximum payments in an amount sufficient to meet the requirements of unemployed workers in order to maintain a decent standard of living.

IMPROVED HIGHWAY FACILITIES

Whereas a program of Federal and State public work can be used to better our way of life: Now, therefore, be it hereby

Resolved, That a system of upper highways, with separate facilities for trucks, be started as an antidote to depression and for the elimination of unemployment, also as a method, more practical than all the slogans on earth, to relieve the fearful and needless highway death toll; be it further

Resolved, That such agencies also create parks and vacation facilities convenient to all workers and their families, who cannot always get to mountain or seashore facilities.

Representative BOLLING. Mr. Kelley, do you have any questions?

Representative KELLEY. No, Mr. Chairman.

Representative BOLLING. Mr. Schmidt.

OPENING STATEMENT OF EMERSON P. SCHMIDT FOR THE CHAMBER OF COMMERCE OF THE UNITED STATES

Mr. SCHMIDT. Mr. Chairman, my name is Emerson P. Schmidt, director of economic research of the Chamber of Commerce of the United States of America, a federation composed of 3,100 State and local chambers of commerce and trade associations with an underlying membership of more than 1.5.

I have filed a statement for the record, Mr. Chairman, but I will attempt to summarize it, if that is agreeable with you.

Representative BOLLING. That is agreeable.

Mr. SCHMIDT. We appreciate the opportunity to review the President's Economic Report. In terms of economic analysis, it is excellent. It constitutes a sharp, comprehensive survey of the national economic events of the past year. The economic philosophy and policy on the whole are admirable. The entire report is written in an excellent English style—a matter worthy of comment, relative to the generally poor writing found in most Government reports to the point where the intelligent layman cannot understand them.

While the economic analysis is excellent, question needs to be raised in regard to several of the recommendations for the future, summarized beginning on page 69, to which we will return later.

Whether some of these recommendations belong in an Economic Report may be questioned.

We wish to commend the President, his associates, and the Congress for their performance last year in terms of the Employment Act of 1946. A year ago there were both moderate and dire predictions of the impending downward trend of the economy. To some extent the Employment Act is based on the theory that economists or politicans can forecast the economic future. The 1955 Economic Report puts this matter into proper perspective.

While there are those so bold as to project in great detail the precise amount of gross national product, national income, employment, et cetera, necessary to obtain the goals of the Employment Act of 1946, others with a clear comprehension of the steady fluidity and dynamism of our economy are less sure on all of these points. When the employment bill was introduced in 1945, this idea of making detailed plans and detailed projections—models to which the economy should conform—was in the saddle, an American version of popular foreign 5-year plans.

The bill called for detailed annual national budget prejections, or targets which then would become the duty of the administration to attain, from year to year. The Congress did not write this requirement into the act.

We believe that the President is to be commended in avoiding this type of projection.

There are bound to be continuous surprises, and detailed projections can never be very accurate. For example, the labor force increased by nearly 1.9 million individuals from May to June 1953. But in 1954, from May to June, quite contrary to almost universal expectations, the labor force increased by only 1 million.

In the light of these uncertainties, who would dare determine what is a reasonable or a desirable goal for a year or 18 months ahead? Who knows what policies are needed in precise terms?

The administration and Congress took a number of steps to ease the transition from the Korean war boom. The dire projections through most of 1954 were based on the alleged inadequacy of these steps. The administration is to be commended for the shrewdness of its analysis and particularly for the fact that it was not stampeded into taking additional extensive steps to mitigate the contractions of 1954.

As the chairman of this committee, Senator Douglas, said in 1952:

> I submit as a rough judgment that probably we should not run a governmental deficit unless unemployment exceeds 8 percent, and, indeed, possibly slightly more than that. When unemployment is between 6 and 8 percent, the governmental budget should at least balance and therefore be neutral in its effects. When unemployment is over 8 percent, we should have a deficit; but when it is under 6 percent, there should be a surplus (Senator Paul H. Douglas, Economy in the National Government, 1952, p. 254).

A sound contracyclical policy must be flexible. As put by the Douglas subcommittee and reaffirmed by the Patman subcommittee:

> Timely flexibility toward easy credit at some times and credit restriction at other times is an essential characteristic of a monetary policy that will promote economic stability rather than instability.

We are now in a recovery phase. The economy has moved to a point above the halfway mark between the moderate decline of 1954 and the high inflationary peaks of the Korean war boom. In fact, disposable income is now at an alltime high, and was higher in every quarter of 1954 than ever before. For example, had the administration and the Congress followed the more dire predictions, we might have embarked upon a make-work public works program. This turned out to be not necessary. It also might have overboomed the construction industry, created scarcities, and driven costs out of line to the point where such a boom in the private sector would have been nipped in the bud and led to more unemployment rather than less.

The 1955 Economic Report, in spite of ventures into the sociological area, shows an excellent appreciation of the key role of entrepreneurship, innovation and new invention.

While the importance of purchasing power is recognized, the simple, naive view that depressions are caused by lack of "purchasing power" is given no credence in the report—a view of which we have heard much since mid-1953. This view could be summarized about like this:

But we are not using fully all the private plant and equipment which we already have. Why save and invest more? Why not raise buying power?

Without minimizing the importance of buying power, this is not the whole story for at least four reasons:

(1) Billions of private dollars of money savings are always being made, partly because even when incomes decline many individuals through habit, through savings plans or because of uncertainty, still want to save. These savings need to be currently invested in order to become income to others and thereby help sustain prosperity.

(2) Our existing plant, equipment and commercial facilities are deteriorating, becoming obsolete, and need steadily to be replaced, upgraded and improved. What company or business is as well located and as modernly equipped as it would like to be?

(3) Even at full employment, we never use all investment at capacity levels. The economy needs elbowroom and flexibility so that underutilization even on a fairly broad basis is no proof of the overall adequacy of investment.

(4) The only way in which we can pave the ground for a new forward upthrust in our struggle to raise our level of living is to put more and more dollars into new, well-managed, profitable investment.

There is some reason to believe that the rate of capital formation, which underlies saving, has been too low in the last several decades. The National Bureau of Economic Research, a group of outstanding economists and noted for their objectivity and freedom from the ideological battle, in reviewing the last eight decades, states:

> It is a challenging fact that most of the rise in tangible capital per person came in the period before the great depression. Between the 1870's and the 1920's, capital per person rose at a fairly consistent average annual rate of about 2.5 percent. Since the war capital per person has grown rapidly, but this recent acceleration has not yet done much more than offset the decline during the preceding 15 years; on net balance per capita real tangible reproducible capital today is only moderately above the predepression high (34th annual report, p. 6).

Indeed, the Bureau tells us that with the average family income of about $5,000 at present, if we maintain the last 80 years' rate of progress in the next 80 years, our grandchildren will have average family incomes of about $25,000 of 1953 purchasing power—a level now attained only by about 1 percent of the Nation's families. Obviously, this would require fabulous quantities of new investment. Under competition, its benefits trickle, flow and spread all around to benefit every factor or agent of production.

It is gratifying to note from the Economic Report that progress has been made in redrawing the line separating private and public enterprise, and that steps have been taken to dispose of numerous enterprises "for which public operation was inefficient or of doubtful advantage." The increase in the amount of Government contracting with private firms for necessary services and facilities, as an alternative to producing them itself, is also a move in the right direction. The limitation on National Government participation and maximizing local effort in the development of our natural resources is also to be commended.

We would like, however, to ask the joint committee to give consideration to two basic problem areas:

(1) Is it necessary or desirable for the National Government to move into additional fields, as recommended by the economic report? and

(2) Are the policies of our National Government adequate to preserve our Federal system of government, with strong, responsible States as part of that Federal system?

Since the economic report is looked to by many for thoroughly objective analysis, are all of the following subjects appropriate for inclusion in it?

The administration asked Congress to provide for 35,000 public (tax-financed) housing units in each of the next 2 years. How was this figure derived? Why not one-half that number, or twice as many, or 10 times as many?

Furthermore, when government enters a relief field, it has generally been assumed that all persons within the relief category should be equally eligible. But in the very nature of public housing, one public housing installation will be located here, another one there, etc., while vast numbers of other families in a similar financial category will receive no such subsidy, just because they happen to live in a village, town, city, or county where no public housing project happens to be launched. This is discrimination.

In the interest of nondiscrimination and equality before the law, it would seem that no Government relief program should ever be launched, unless all individuals or families in that relief category have equal access to the handout, or the subsidy.

Furthermore, these public housing projects are creating social problems.

The SBA, if continued, should be integrated in the Department of Commerce, so that small-business men, who constitute the bulk of our members, can get the benefit of all the work of the Department. In the Chamber's report, Small Business, published in 1954 (revised), we show the central importance of small business to our way of life and progress. Better management, we found, is the greatest need of small business. The heavy tax burden is a great handicap and the basic need is not Government loans.

Representative BOLLING. In what way is the small-business man denied these benefits?

Mr. SCHMIDT. It is just that he has two places to go, and it adds to the confusion, and we believe that a bureau should be ready at hand to indicate the available materials from the Department of Commerce as a whole.

Furthermore, we have found in our study which was very carefully reviewed that the crucial need of small business is not financing but better management and therefore a vast program of tax-supported loans does not answer the problem. While we have no proposal with respect to the International Finance Corporation, the same argument should be applied to it. If more foreign lending is desirable, private lenders may be expected to take advantage of production and profit opportunities. If it is felt that such projects are dubious and, therefore, unattractive to private investors, can we justify spending the taxpayer's money to foster these ventures? As foreign nations rediscover the essential conditions within their own countries to attract foreign capital, it is inconceivable that American investors will overlook profitable opportunities to make private investments, and thereby keep these matters in less frictional private hands.

The budget is unbalanced. The Economic Report states that taxes on individuals and business are still too high, but urges the postponement of the scheduled tax reductions. Yet all these proposals for new and expanded expanditures are found among the recommendations.

A number of proposals have been put forward to finance projects outside of the debt limit. Thus, there is discussion of an "independent authority" to raise the capital for one program. Other groups were quick to take their cue and are urging similar propositions for financing outside of the debt limit.

Incurring debt for capital expenditures in the case of individuals, business, and government may be justified at times, but we should avoid complicating our budget and debt statistics by making it appear that the debt is smaller than it actually is.

We hope that the joint committee also will examine the program for area development. It has been suggested that special tax-amortization benefits be provided for new defense facilities located in surplus labor areas. This, like other proposals, of course, has a strong humanitarian appeal, but it also could lead to the uneconomic location and allocation of resources. The same question must be raised in regard to placing Government contracts in labor surplus areas. Similarly, our stockpiling program seems to have taken on an aspect of subsidy or relief.

The Government's procurement and defense planning programs should have a sound economic base. The Government as buyer should act like any other prudent buyer, that is, obtain the best possible products at the lowest possible price, with due regard, of course, for national security issues.

A contrary approach tends to raise the cost of defense expenditures and makes it more difficult to balance the budget. Such contrary approach also may furnish a mere temporary prop which will lead only to greater and greater pressures for more and more artificial and uneconomic supports on an ever-widening front.

What the Economic Report has to say on lifting the minimum wage is significant. A year ago the administration expressed a preference for a higher minimum wage, but said then that the timing was bad. Now, owing to recovery, the timing is found appropriate. Does this mean that a new higher minimum is good only when it has little or no effect?

Why 90 cents an hour, why not 85 cents, or $1.05, or—as some have said—$1.25? Somehow the President has discerned—but just how, we are not told—that 90 cents is the safe maximum: that—

> A higher minimum might well cause lower production and substantial unemployment in several industries * * *. It would probably bring generally higher prices in its wake. Such effects would make the gains of covered workers illusory, and they would lower the standard of living of uncovered low-wage workers.

This, we feel, is an effective statement of the self-defeating characteristics of any minimum-wage legislation.

The expansion of coverage of the act to more occupations and industries may bar more workers from jobs, or force them to overcrowd the remaining uncovered jobs and depress wages there.

Again, minimum-wage legislation has a strong humanitarian appeal, but what moral right does the Government have to bar a worker from employment unless he can find an employer willing and able to pay him 90 cents an hour? Or $1, or $1.25 an hour? And why, incidentally, does our Government have different minimum-wage laws fixing highly different wages under at least three different programs: (1) the Fair Labor Standards Act, (2) the Walsh-Healey Act, and (3) the Davis-Bacon Act?

These laws are not self-enforcing. A substantial battery of unproductive Government workers must be employed to administer these laws: bureau chiefs, subchiefs, department heads, subdivision heads, lawyers, accountants, economists, public administrators, stenographers, typists, file clerks, charwomen, sweepers, janitors, and on and on in Washington and scattered throughout numerous field offices. The joint committee could perform a valuable service by taking a good solid look at this matter as it considers the minimum-wage recommendation.

The President's Economic Report contains a significant but short analysis of the financial position of State and local government. It makes a number of suggestions on updating State and local outmoded tax-rate and debt limits.

Today the gross debt of State and local governments stands at about $38 billion, as against $20 billion in 1939, and $17 billion in 1929. In 1929 and 1939, their debts were equal to 16.5 percent and 22 percent of our total gross national product, respectively. But today they represent only 11 percent of our gross national product.

At the same time the National Government debt, however, has greatly risen relative to the growth of our economy as shown by the accompanying tabulation.

	National debt	Gross national product	National debt as percent of gross national product
1929	$16.9	$103.8	16
1939	45.9	91.1	50
1954	278.9	356.0	78

In spite of this showing, however, the Economic Report recommends increased expenditures for many programs which traditionally have been handled at the State and local level and for many expenditures for many new such programs.

The National Government is asked to assume a great responsibility for local public education. And yet, the National Treasury must go right into these local communities to collect the revenue which it will pass back to them, minus the usual brokerage fee charged by Washington.

A further real danger, of course, rises in the possibility of ultimate control of the content of education. The Supreme Court said:

> It is hardly lack of due process for the Government to regulate that which it subsidizes.

(*Wickard* v. *Filburn* 1942.) Indeed, in this session one Member of the House introduced a resolution to create a Commission to write a textbook on communism for our schools (Congressional Record, January 31, p. A519).

To help obviate the foregoing danger, it is only fair to add, this Member of the House wants to give every citizen a chance to review and object to the content of the textbook and every Member of Congress is expected to review it before voting upon it (p. A521).

If this procedure were followed in every case, bureaucratic control of education might be minimized and most efforts at textbook writing by the National Government might die aborning.

Freedom depends on the dispersal of power and it is better to have 48 (or 1,000 times 48) local school administrations and educational experiments than to have education controlled from centralized Washington bureaus. To say that nothing of this kind is now contemplated is not enough.

While the President in his special message on school needs, February 8, 1955, discusses the foregoing point and is thoroughly aware of it, he nevertheless said:

> But too many teachers are underpaid and overworked and, in consequence, too few young men and women join their ranks. Here is a shortage, less obvious but ultimately more dangerous than the classroom shortage.

Now it won't be very difficult for individuals to latch on to that statement of the President and say we must now subsidize teachers' salaries, and as has been said by the Court, whatever the Government subsidizes, it has a power to regulate, and in this connection it must be recognized that in spite of the humanitarian appeal, there is a vast difference between nationwide problems, such as teachers' salaries, and juvenile delinquency, and national problems, such as national defense. Fire control and juvenile delinquency are nationwide problems but not national problems.

Furthermore, grant-in-aid programs can and often do warp State and local expenditures. The aided programs grow at the expense of the unaided.

A significant example of this trend is the field of individual health. While the present administration has gone quite far in recommending a flood of health programs, the New York Times, February 3, 1955, in a lead editorial, nevertheless enumerates a whole series of health features which it regrets that the President failed to mention in his health message of January 31—a message covering a broad range of expanded and new programs.

The Economic Report, while it does not urge congressional action in the field of unemployment compensation, attempts to tell the States what they should do, rather than permit a multitude of experiments at the State level. That is on pages 55–57.

Thus, the report recommends uniform duration of benefit payments for every eligible worker regardless of how long he has held a job.

Many States have assumed that there are some workers who perhaps are fairly well attached to the labor market but who, because of substantially less than standard qualifying wages, should, nevertheless, not be wholly excluded from getting assistance.

In Michigan, for example, an employee who has worked some, in at least 14 weeks, is entitled to some benefits, but the number of benefit weeks rises in a definite two-thirds ratio to the number of weeks of work up to the 26-week maximum. Should Michigan pay unemployment compensation for 6 months to employees who work only 3 months? Or, should only workers who are employed 52 weeks be eligible for the "uniform duration" or 26 weeks' benefits?

Again, the Economic Report recommends that the benefit should be equal to 50 percent of the unemployed worker's "regular weekly wages." When the combined social security and withholding tax was nonexistent or small, this formula seemed fairly appropriate. But today under this formula a 50 percent benefit of regular wages would be substantially more than 50 percent of regular take-home pay, and it must be remembered that the benefits are tax free, and the unemployed worker avoids numerous expenses such as transportation, outside lunch, work clothes, and so forth. This recommendation, furthermore, would favor the single worker and discriminate against the worker with family responsibility. Are not the States in better position to determine these matters?

The Economic Report states that the District of Columbia unemployment compensation laws should be drafted so as to be a model for the States. Just what there is about the economy of the District of Columbia, where our chief product is words, that would make a system of unemployment compensation adapted to its conditions, appropriate for North Dakota, or Michigan, or New Jersey, is not clear.

When Congress acts as the legislative body for the District of Columbit, it merely pretends to be setting a national pattern. If it were, then the citizens in the other States should be disfranchised as in the District of Columbia.

Every new program, every new bureau, and every new function adds to the burdens of overworked Members of the Congress. These Members serve, in a sense, as the Board of Directors of the National Government phases of our society.

These programs and functions have grown and grown to the point that probably only a handful of "members of the Board" could make a passing grade in an examination of the statutes, regulations, programs, organization, and operation of even 5 percent of the bureaus or programs for which they vote and to which they make appropriations from year to year.

Does this make for sound government? Why are Members of the Congress so persistently anxious to add to their overload of work and responsibility—a responsibility which, in all frankness, they would have to admit of being incapable of discharging in the sense in which we think of the responsibility of a board of directors in a private business, a church, or a charity?

Thus, in conclusion, as we see it, the Economic Report seems to be based on high-grade understanding of the power of monetary and fiscal policies in governing the stability and growth of our economy.

Extraneous matters appear to be included in the report, matters which are better handled elsewhere—if they must be made to be national issues.

While many fine things are said on the importance of State and local government, the report recommends many steps which, in fact, would reduce their responsibility and their financial capacity to meet their own needs in their own way.

Representative BOLLING. Thank you, Mr. Schmidt.

Are there questions, Mr. Kelley?

Representative KELLEY. Yes, Mr. Chairman.

Mr. Schmidt, on page 4 you say—

> had the administration and the Congress followed the more dire predictions, we might have embarked upon a make-work public works program.

And then you say in the next sentence:

> This turned out to be not necessary.

Are you sure it won't be necessary 6 months from now or even a year?

Mr. SCHMIDT. No, nobody can predict the future.

Representative KELLEY. At least there is a grave possibility or probability that that will be necessary?

Mr. SCHMIDT. And we would recommend planning and a shelf of blueprints for public works with priorities so that you could go into that kind of program for legitimate needed public facilities.

Representative KELLEY. In certain areas, particularly?

Mr. SCHMIDT. Well, it might be highways, it might be post offices. That would be a matter for determination.

Representative KELLEY. Then, of course, you have another side of the picture; that is, local communities could have their own blueprints prepared, and all that would be necessary, then, for the Federal Government in order that these municipalities could get the financial aid would be that the Federal Government would look over these blueprints of communities and satisfy themselves as to whether they were necessary or not or whether they were feasible. Now that is what I had in mind on a public-works program, that it should be handled by local communities; for instance, in building your city halls and improving streets and sewerage systems, and that sort of thing, which would be direct aid to communities where it is necessary and where they need the assistance.

Mr. SCHMIDT. But you would not have the Federal Government build us a city hall in Oakton, Va., where I live.

Representative KELLEY. No, only the point is that it is partially paid for by the local communities and the Federal assistance would be only a percentage of the cost, say a 45–55 basis or a 50–50 basis, something like that, very similar to the one we had administered by Mr. Ickes back in 1930.

It was pretty effective and I have never found any criticisms of that program.

Mr. SCHMIDT. Well, I read Mr. Ickes' diary and he had a lot of criticism on that.

Representative KELLEY. There was a lot of criticism on the WPA, but not on the PWA. Of course, he did not handle the WPA. Then you are opposed to a minimum wage in any sense, I take it?

Mr. SCHMIDT. Well, we are raising questions whether you really can accomplish anything for the benefit of the worker. Creating a minimum wage does not create wages. It may destroy jobs.

Representative KELLEY. Here is a point, though. If an industry or an employer cannot pay a living wage, has he any right to be in business? If you raise the minimum wage for all employers, then you naturally raise the price of the product, the cost of the product, but it puts a premium on good management.

Mr. SCHMIDT. It also puts a premium on eliminating any factor of production that is overpriced, and you might be overpricing labor and therefore minimizing the use of labor, the point that Mr. Mahon was pointing out; that is, every businessman is always thinking in terms of combining the factors of production, raw materials, machinery, equipment, labor, different kinds of labor, and it is his duty under the pressure of competition to minimize this cost. If you artificially raise any factor of production, whether it is power or containers or raw materials, competition will force economy of its use in production. We think, as the farm bureau so admirably pointed out, that the best thing you can do is to promote sound fiscal and monetary policies so we will have high-level employment, and then we think the wage situation will take care of itself. Incidentally, if I may, I would like to mention for the record that I think there was one error made here in statistics. It was said that during the war prices were relatively uncontrolled, while wages were controlled. I just made a quick calculation, which I would suggest Mr. Ensley correct, if it is not quite right.

Representative KELLEY. Mr. Kennedy made that statement.

Mr. SCHMIDT. Yes. The rough calculation I have made very quickly from the figures I have here, in manufacturing, average hourly wages jumped 61 percent from 1939 to 1945, the period he was talking about, and the consumer price index went up 29 percent, only half as fast, whereas he said exactly the opposite happened. But I would prefer to have Mr. Ensley check my arithmetic. I think I am substantially correct.

Mr. KENNEDY. Well, I happened to be on the hot seat at that time on the War Labor Board and I know what was going on.

Mr. SCHMIDT. Well, all we have are the Government's figures. The officials figures from the Bureau of Labor Statistics, for which we have great respect.

Representative BOLLING. Of course, there is this factor in it. You mentioned manufacturing wages alone. That can be checked very easily.

Mr. SCHMIDT. As a matter of fact, the unorganized wages went up about twice as fast as manufacturing; for instance, domestic servants, farm labor went up twice as fast in this period as the union wages or manufacturing wages as a whole.

Again, I am using very rough figures subject to correction, if I have under or over stated them. So we think that market forces are much more effective in doing good for the citizen, the worker, the family, than intervention by the Government.

Take a case like this toll road. I think we are all disgusted and almost shocked at the time we waste going to and from work, the money wasted by businessmen with trucks standing idle waiting for the light to change.

Representative KELLEY. Even Congressmen going back and forth meet interference.

Mr. SCHMIDT. There is only one reason why we have that congestion—because we do not have free-market determinations. When you have free-market determinations, you have no shortage, but we have been overproducing automobiles and trucks relative to the amount of money we have put into highways, and for that reason I am for toll roads, because under toll roads you have an automatic technique for increasing the supply of highway facilities relative to the growth and demand.

Now I can see there are some arguments against toll roads, but the minute you deviate from free-market forces, you create problems. All of our great power shortages in the past 5 or 6 years have been in areas where you have public power, and the reason for that is that public power is always underpriced because it does not carry its full share of the cost, such as taxes, and it has various other subsidies, so it is underpriced, and whenever you underprice anything, you tend to create shortages, but when you have market forces, this tends to bring about equilibrium.

Representative BOLLING. I would like to interject that we had a fine example of market forces at work in 1929.

Representative KELLEY. Let me go back to minimum wages for just a moment. I remember these examples. I am reminded that when the process of organizing the steel industry, let us say, and let us say the coal industry also, the argument against it strongly was it will raise the wages for coal operators and steel manufacturers will be put in a bad spot because they will have to increase their prices, and so on.

That has not been proven true at all, because we have even low costs in those industries today and the men are getting substantial wages, a living wage, and they have purchasing power.

If these industries cannot raise the wages themselves, to increase the standard of living of the workers, then the Government must do something about it. It is not that the Government wants to do it, they are compelled to do it because the responsible people won't do it.

Mr. SCHMIDT. I have agreement with your aims, but I think market forces are the way to do it. The Socialist is the one that believes in these interventions and I know you are not a Socialist. We made a study on steel wage rates and steel prices for a period of 10 or 12 years, and the correlation is almost perfect. Normally that is not true. Normally wages go up about twice as fast as prices.

Representative KELLEY. I doubt whether the wages in the steel industry were lower 10 or 15 years ago, whether there would be any more market for steel than there is right now. I think the only answer to that is that people have more money to buy the things which they want.

Mr. SCHMIDT. Absolutely. We have got to have a continuous flow of income. Everybody's income is a cost to everybody else, and all I argue is that artificial cost raising will damage people rather than help.

Representative KELLEY. We always pinpoint when we want to reduce costs we say the things we have to do is reduce wages, but there are other factors.

Mr. SCHMIDT. No; I do not know of any businessman that thinks that way. The businessman thinks in terms of increasing productivity, and that is why he wants more investment, and that is the theory of the new Internal Revenue Code, more rapid depreciation. The theory is, you will encourage new investment, raise the productivity, and thereby make the wage-paying capacity increase, and that is how we raise our standard of living.

Mr. MAHON. Mr. Chairman, Mr. Schmidt made reference to my statement. In our brief statement we did not have time to cover all of the points. Our union favors at least $1 or $1.25 minimum wage, and we know of no hardship created by the last advance in the minimum wage, and we think it is essential now in order to protect our people.

Representative BOLLING. Thank you.

Mr. Kennedy, do you have something to say?

Mr. KENNEDY. Yes. In response to Mr. Kelley's suggestion, I think in the last 15 years we have increased wages in the coal industry about $8 or $9 a day, and yet the cost of coal is lower today than it was 15 years ago.

Representative KELLEY. And you know why, Mr. Kennedy, because the wages were raised; therefore, the coal operators and coal producers had to do something about it. And what did they do? Mechanized.

Mr. KENNEDY. That is right.

Representative KELLEY. Machinery.

Mr. SCHMIDT. But you create unemployment, too. You have some hard choices to make.

Mr. KENNEDY. Certainly.

Representative KELLEY. Sure it did, but those working in the industry had a substantial living wage; that is the point.

Mr. SCHMIDT. Here again I would say let market forces try to solve these problems, and they will do it better than through bureaus.

Representative KELLEY. We have the argument of which comes first, the hen or the egg. You believe in production. I believe in purchasing power first.

Mr. SCHMIDT. I do not think economists would agree with you.

Representative BOLLING. Gentlemen, I think it might be well to return to this discussion after we have heard Mr. Newsom, who is now here. I know that I am going to have to leave very shortly before 12 o'clock, and I think it would be well if we heard Mr. Newsom and then returned to the discussion.

Would that meet with your approval?

Representative KELLEY. I do not know whether I can meet this afternoon.

Representative BOLLING. No, we cannot. I propose to finish this morning.

Representative KELLEY. I am sorry, I will have to leave here in a few minutes.

Representative BOLLING. Do you have further questions, Mr. Kelley?

Representative KELLEY. No. I do not like to leave you alone, Mr. Chairman.

Representative BOLLING. I will try to protect myself.

Representative KELLEY. I am sure you can.

(Mr. Schmidt's prepared statement appears at p. 1248.)

Representative BOLLING. Mr. Newsom.

STATEMENT OF HERSCHEL D. NEWSOM, MASTER, THE NATIONAL GRANGE

Mr. NEWSOM. Thank you, Mr. Chairman. I think perhaps, in addition to expressing appreciation for the privilege of making this statement here, I ought to apologize for my inability to be here on schedule this morning. We just simply were not ready, having returned yesterday from a meeting out in Spokane.

We have such a stake in this total economic policy that it does seem appropriate to file a statement, even though we have attempted to keep it very brief, and so we are very grateful for the privilege of pointing out, in our opinion and in our lay, rural point of view, it seems clearly evident from the behavior of our economy in the past year that we have demonstrated that present economic tools, when properly used, are quite effective. We have avoided a depression and are now again resuming our normal economic growth. For more Americans this will mean good jobs and a rising standard of living.

Unfortunately, farmers will not share in a rising national income in the year ahead. According to the figures on page 147 of the Economic Report of the President, farmers' net income has fallen from \$16.7 billion in 1948 to \$11.9 billion in 1954. During this same period wages in manufacturing industries have increased from \$1.35 an hour to \$1.81. Farm prices have fallen from a peak of 313 in February 1951 to 244 in January 1955, a decline of 22 percent. At the same time, farm costs have risen 2 percent. Farm prices were at only 86 percent of parity on January 15, 1955.

The income of farm people in 1954 was less than half of the income of city and town people, measured on a per capita basis. The income figure for farm people included all earnings from investments and off farm employment, as well as a cash value on produce consumed on the farm and imputed rental value of the dwellings.

Let's assume it is possible to reach a $500 billion gross national product during the next few years. My question is, Can we reach it if agriculture represents a dead weight in the other direction? In fact, our economy must expand on a gradual stable basis. Agriculture wants to be part of that expansion. We want to share in it and reap its benefits. In fact, we must do just exactly that, or agriculture will slip toward a "peasant type" of operation, and the full total economy will be roadblocked, stagnated, and otherwise prevented from attaining its greatest possible potential level of output, and the level of living of all people will suffer as a result.

Our American institutions have done a marvelous job of keeping our economy producing at near capacity and progressing. Unfortunately, we have not done so well keeping such productive balance that the benefits of greater production and greater income are spread equitably among the various groups in our economy according to productive output—at least insofar as agriculture is concerned.

The faster our economy grows, the greater becomes the problem of maintaining balance between enterprises, and between the products of each enterprise. This is as true in agriculture as anywhere else.

If the number of people and the amount of capital resources employed in each of our American enterprises are unable to adjust to the changes in demand and technology that will occur by 1965, we will find an ever-growing disparity of income between various economic segments of our economy. This will manifest itself by low income and by what we in agriculture call surpluses and by unemployment of workers in certain industries. Unless we keep in balance with the changes brought by economic progress, we may be able to attain our goal of a $500-billion output by 1965.

We must agree that some disparity of income serves an economic function of attracting labor and capital from declining to expanding segments of our economy, but we must recognize also that severe and persistent disparity of income may be the symptom of the growing inability of our economy to adjust the employment of labor and capital in the various enterprises to the differential effects of change in market demands and progress.

The difficulty which our economy has in adjusting resources to progress, which then causes disparity of income for some groups, or which causes unemployment, is a source of dissatisfaction with our free market, free-enterprise system. Persistent disparity is therefore a threat to our free-enterprise system, at least in the sense it invites all sorts of effort by Government to equalize income, often by interference in markets.

We believe intensive study of the problem of resource adjustment necessary to accommodate progress will provide many answers. The only sound solution to disparity of income lies in facilitating resource adjustment, and we believe our Government can do much to aid such adjustment within the framework of our free-enterprise thinking. To the extent we succeed in bringing about parity of income by this method, we will greatly reduce demands for Government interference in prices and markets and for other demands for Government redistribution of income.

Returning now to the farm problem, we do not believe that a return to free-market prices will cure it. Instead, the disparity would widen, displaying more fully the graver symptom of the inability of our economy to adjust its resources to changes in demand and technology. At one time, low prices or disparity of income might have generated the cure, but with the "institutionalized" economy of today, this adjustment does not happen fast enough to keep up with changes as reflected in a free market today.

We must be reluctant to reducing the overall productive capacity of agriculture to what the market will currently take at satisfactory prices. Instead, we favor an all-out effort to increase the demand for farm products to fit a high productive capacity of agriculture granting that we must proceed to balance our own productive output as between farm products. In the past, we have been remiss in this and much too dependent on direct Government price support. The National Grange has long been concerned with the loss of our normal and historical markets abroad for wheat, cotton, and rice that arises when our price supports are above world market prices as they frequently are. We see no reason for giving up our normal world markets or becoming a residual supplier simply because we must try to preserve a reasonable level of farm income. This is why we, for a number of years, have advocated a two-price plan so that farmers could sell a normal quantity abroad at competitive world prices.

Because we have given so much attention to maintaining aggregate expenditure and aggregate production, we have looked upon the income-disparity problem as a nuisance problem and have dealt with it by expediences such as applying monopolistic price and production policies or by subsidies. We must hereafter deal with it more fully as a resource-adjustment problem or by expanding markets. It is more than a matter of eliminating unjust income disparity, because our economy will not be able to accommodate progress unless resource adjustment takes place well enough that it can be reflected in fair income distribution.

Let me say that we should not reduce farm price supports below the levels now set. To reduce price supports would not only create a hardship for farm families, but would also risk dislocations in industries serving agriculture, with possible loss of national confidence and a chain reaction downward. Farmers are an important market for many businesses.

Reducing price supports below present levels would not solve the farm problem, but it would only give us a fuller indication of the exact location and extent of overcapacity, the unbalance within agriculture, and prove the inability of free prices to bring about corrections in pattern of production without serious consequences both to rural people and to our total economy—our economy is today too full of institutionalized factors.

As we seek ways of expanding farm markets and bringing our agricultural plant into balance, we must of course be sure that there is reasonable opportunity for price to help guide the needed shifts in people and resources. Total United States planning simply must, however, provide that farm income shall be safeguarded in this era of expanding economy or expansion will be limited, or even reversed.

Representative BOLLING. Thank you, Mr. Newsom.

On behalf of the committee, I would like to thank all of the members of the panel for their presence and participation.

Without objection, there will be included at the appropriate place in the record various material received by the committee and its staff.

This is the conclusion of the hearings this year on the President's Economic Report for 1955, and the committee will now adjourn to reconvene on the call of the Chair.

(The prepared statements of members of the panel and other materials are made a part of the record, as follows:)

Testimony of Dr. Emerson P. Schmidt for the Chamber of Commerce of the United States

My name is Emerson P. Schmidt, director of economic research of the Chamber of Commerce of the United States of America, a federation composed of 3,100 State and local chambers of commerce and trade associations with an underlying membership of more than 1.5 million.

We appreciate the opportunity to review the President's economic report. In terms of economic analysis, it is excellent. It constitutes a sharp, comprehensive survey of the national economic events of the past year. The economic philosophy and policy on the whole are admirable. The entire report is written in an excellent English style—a matter worthy of comment, relative to the generally poor writing found in most Government reports—to the point where the intelligent layman cannot understand them.

While the economic analysis is excellent, question needs to be raised in regard to several of the recommendations for the future, summarized beginning on page 69, to which we will return later. Whether some of these recommendations belong in an economic report may be questioned.

ECONOMIC ANALYSIS

We wish to commend the President, his associates, and the Congress for their performance last year in terms of the Employment Act of 1946. A year ago, there were both moderate and dire predictions of the impeding downward trend of the economy. To some extent the Employment Act is based on the theory that economists or politicians can forecast the economic future. The 1955 economic report puts this matter into proper perspective. The hazards of prediction were shown in the chamber's reported entitled "Business and Economic Forecasting." Your staff director thought enough of this to supply a copy to each member of the joint committee.

While there are those so bold as to project in great detail the precise amount of gross national product, national income, employment, etc., necessary to obtain the goals of the Employment Act of 1946, others with a clear comprehension of the steady fluidity and dynamism, of our economy are less sure on all of these points. When the employment bill was introduced in 1945, this idea of making detailed plans and detailed projections—models to which the economy should conform—was in the saddle, an American version of popular foreign 5-year plans. The bill called for detailed annual national budget projections, or targets which then would become the duty of the administration to attain, from year to year. The Congress did not write this requirement into the act. We believe that the President is to be commended in avoiding this type of projections.

There are bound to be continuous surprises, and detailed projections can never be very accurate. For example, the labor force increased by nearly 1.9 million individuals from May to June 1953. But in 1954, from May to June, quite contrary to almost universal expectations, the labor force increased by only 1 million.

In the light of these uncertainties, who would dare determine what is a reasonable or a desirable goal for a year or 18 months ahead? Who knows what policies are needed in precise terms?

Members of the permanent civil service in the National Government generally adhere rigorously to facts and reasonable projections. The United States Treasury, the Bureau of the Budget, and many other Government agencies, just like the business executive, must make estimates of revenue, expenditure, demands for goods and services, shifts in prices and costs.

Spokesmen for the party in power at any time must keep on talking optimistically, regardless of current developments. The ardent politician of the opposition party may not be able to keep a note of triumph out of his gloomy predictions.

TRANSITION

The administration and Congress took a number of steps to ease the transition from the Korean war boom. The dire projections through most of 1954 were based on the alleged inadequacy of these steps. The administration is to be commended for the shrewdness of its analysis and particularly for the fact that it was not stampeded into taking additional extensive steps to mitigate the contractions of 1954. As the chairman of this committee, Senator Douglas, said in 1952:

"I submit as a rough judgment that probably we should not run a governmental deficit unless unemployment exceeds 8 percent and, indeed, possibly slightly more than that. When unemployment is between 6 and 8 percent, the governmental budget should at least balance and therefore be neutral in its effects. When unemployment is over 8 percent, we should have a deficit; but when it is under 6 percent, there should be a surplus" (Senator Paul H. Douglas, Economy in the National Government, 1952, p. 254).

A sound contracyclical policy must be flexible. As put by the Douglas subcommittee and reaffirmed by the Patman subcommittee:

"Timely flexibility toward easy credit at some times and credit restriction at other times is an essential characteristic of a monetary policy that will promote economic stability rather than instability."

We are now in a recovery phase. The economy has moved to a point above the halfway mark between the moderate decline of 1954 and the high-inflationary peaks of the Korean war boom. In fact, disposable income is now at an all-time high, and was higher in every quarter of 1954 than ever before. For example, had the administration and the Congress followed the more dire predictions, we might have embarked upon a make-work public works program. This turned out to be not necessary. It also might have overboomed the construction industry, created scarcities, and driven costs out of line to the point where such a boom in the private sector would have been nipped in the bud and lead to more unemployment rather than less.

The 1955 Economic Report, in spite of ventures into the sociological arena, shows an excellent appreciation of the key role of entrepeneurship, innovation, and new investment. While the importance of purchasing power is recognized, the simple, naive view that depressions are caused by lack of purchasing power is given no credence in the report—a view of which we have heard much since mid-1953. This view could be summarized about like this: But we are not using fully all the private plant and equipment which we already have. Why save and invest more? Why not raise buying power?

Without minimizing the importance of buying power, this is not the whole story for at least four reasons:

(1) Billions of private dollars of money savings are always being made, partly because even when incomes decline many individuals through habit, through savings plans or because of uncertainty, still want to save. These savings need to be currently invested in order to become income to others and thereby help sustain prosperity.

(2) Our existing plant, equipment, and commercial facilities are deteriorating, becoming obsolete, and need steadily to be replaced, upgraded, and improved. What company or business is as well located and as modernly equipped as it would like to be?

(3) Even at full employment, we never use all investment at capacity levels. The economy needs elbowroom and flexibility so that underutilization even on a fairly broad basis is no proof of the overall adequacy of investment.

(4) The only way in which we can pave the ground for a new forward upthrust in our struggle to raise our level of living is to put more and more dollars into new, well-managed, profitable investment. Human wants are limitless. Whole new industries are being born. Others are on the threshold. Just because existing facilities in established lines may be used for a time at less than 100 percent of capacity, that gives us no clue to the need for new capacity, in new lines. The new potentials are all around, waiting to be researched, analyzed, and exploited.

There is some reason to believe that the rate of capital formation, which underlies saving, has been too low in the last several decades. The National Bureau of Economic Research, a group of outstanding economists and noted for their objectivity and freedom from the ideological battle, in reviewing the last eight decades, states:

"It is a challenging fact that most of the rise in tangible capital per person came in the period before the great depression. Between the 1870's and the

1920's, capital per person rose at a fairly consistent average annual rate of about 2.5 percent. Since the war capital per person has grown rapidly, but this recent acceleration has not yet done much more than offset the decline during the preceding 15 years; on net balance, per capital real tangible reproducible capital today is only moderately above the predepression high" (34th Annual Report, p. 6).

Indeed, the bureau tells us that with the average family income of about $5,000 at present, if we maintain the last 80 years' rate of progress in the next 80 years, our grandchildren or great-grandchildren will have average family incomes of about $25,000 of 1953 purchasing power—a level now attained only by about 1 percent of the Nation's families. Obviously, this would require fabulous quantities of new investment. Under competition, its benefits trickle, flow, and spread all around to benefit every factor or agent of production.

That we can maintain prosperity and progress without new investment is doubted by all economists. Prof. David M. Wright in his noted book Capitalism states:

"But investment is the basic problem. Measures to stabilize consumption (public works, unbalanced budgets, etc.) may indeed keep the slump from getting worse. But they are after all mere first aid, that is, if we are not just trying to smuggle socialism in by the back door. Until growth once more gets underway and with it new investment, there cannot be a spontaneous recovery of the private economy."

This multiplier or trickle-down philosophy is not likely to be very popular or have many defenders. The Economist (London) has frequently pointed out that there are very few votes for saving and capital formation in Western democracies. But new sustained investment is important. It needs wider understanding and support. The analysis of the Economic Report should help and is to be commended for its balanced approach.

It is gratifying to note from the Economic Report that progress has been made in redrawing the line separating private and public enterprise, and that steps have been taken to dispose of numerous enterprises "for which public operation was inefficient or of doubtful advantage." The increase in the amount of Government contracting with private firms for necessary services and facilities, as an alternative to producing them itself, is also a move in the right direction. The limitation on National Government participation and maximizing local effort in the development of our natural resources is also to be commended.

Similarly we endorse the emphasis on competition in our private economy and recognize the key role which the Government plays in this sphere.

SOME QUESTIONS

We would like, however, to ask the joint committee to give consideration to two basic problem areas:

(1) Is it necessary or desirable for the National Government to move into additional fields, as recommended by the Economic Report, and

(2) Are the policies of our National Government adequate to preserve our Federal system of government with strong responsible States, as part of that Federal system?

Since the Economic Report is looked to by many for thoroughly objective analysis, are all of the following subjects appropriate for inclusion in it?

PUBLIC HOUSING

The administration asked Congress to provide for 35,000 public (tax-financed) housing units in each of the next 2 years. How was this figure derived? Why not one-half that number, or twice as many, or 10 times as many?

The number of public-housing units which will be built is not the only issue. Any precise figure does not answer the fundamental question: In what sense is it the responsibility of the National Government (the taxpayer) to provide housing for certain citizens? Every million dollars of tax money taken from the people for public housing must make it a little harder for some lower-moderate-income people to build their own homes. If the concept of public housing grows and grows, it may become an accepted way of life. It could induce more and more people to look to the Government for all or part of the cost of their housing. It inevitably will reduce the incentive for some of our citizens to try to build their own homes. Throughout history, the effort to escape poverty has been the great incentive which has helped raise our production and our incomes.

Why taxpayers generally should subsidize the building of new homes for certain families, when often such taxpayers cannot afford to build new homes of similar quality, for themselves, should be questioned.

Furthermore, when Government enters a relief field, it has generally been assumed that all persons within the relief category should be equally eligible. But in the very nature of public housing, one public housing installation will be located here, another one there, etc., while vast numbers of other families in a similar financial category will receive no such subsidy, just because they happen to live in a village, town, city, or county where no public-housing project happens to be launched. This is discrimination.

In the interest of nondiscrimination and equality before the law, it would seem that no Government relief program should ever be launched, unless all individuals or families in that relief category have equal access to the handout, or the subsidy.

Furthermore, these public-housing projects are creating social problems. Children in the same general neighborhood are made to fall into two classes. One group comes from self-supporting families, and the other group gets taxpayer subsidized housing. This establishes community conflicts, class distinction, and can lead to endless friction.

Finally, such public-housing expenditures, like all other unessential or less essential expenditures, make it that much harder to balance the annual budget.

SMALL BUSINESS ADMINISTRATION

A question also should be raised as to the continuation and particularly the proposed expansion of the Small Business Administration, especially its banking business. If a business proposition is a good one, some private lender or private lending institution generally is ready to help finance the project. If the proposition is doubtful, the promoters are likely to have difficulty in raising funds, and this leads to a call on Government for assistance. Why should the general taxpayer become financially involved in risky enterprises? The SBA, if continued, should be integrated in the Department of Commerce, so that small-business men, who constitute the bulk of our members, can get the benefit of all the work of the Department. In the chamber's report, Small Business, published in 1954 (revised), we show the central importance of small business to our way of life and progress. Better management, we found, is the greatest need of small business. The heavy tax burden is a great handicap and the basic needs is not Government loans.

INTERNATIONAL FINANCE CORPORATION

The same argument should be applied to the proposed International Finance Corporation. If more foreign lending is desirable, private lenders may be expected to take advantage of production and profit opportunities. If it is felt that such projects are dubious and therefore unattractive to private investors, can we justify spending the taxpayer's money to foster these ventures? As foreign nations rediscover the essential conditions within their own countries to attract foreign capital, it is inconceivable that American investors will overlook profitable opportunties to make private investments, and thereby keep these matters in less-frictional private hands.

The budget is unbalanced. The economic report states that taxes on individuals and business are still too high and urges the postponement of the scheduled tax reductions. Yet all these proposals for new and expanded expenditures are found among the recommendations.

A number of proposals have been put forward to finance projects outside of the debt limit. Thus, there is discussion of an "independent authority" to raise the capital for one program. Other groups were quick to take their cue and are urging similar propositions for financing outside of the debt limit.

Incurring debt for capital expenditures in the case of individuals, business, and government may be justified at times, but we should avoid complicating our budget and debt statistics by making it appear that the debt is smaller than it actually is.

AREA DEVELOPMENT

We hope that the joint committee also will examine the program for area development. It has been suggested that special tax amortization benefits be provided for new defense facilities located in surplus labor areas. This, like other proposals, of course, has a strong humanitarian appeal, but it also could lead to the uneconomic location and allocation of resources. The same question must be raised in regard to placing Government contracts in labor surplus areas. Similarly, our stockpiling program seems to have taken on an aspect of subsidy or relief.

The Government's procurement and defense planning programs should have a sound economic base. The Government as buyer should act like any other prudent buyer, that is, obtain the best possible products at the lowest possible price, with due regard, of course, for national security issues.

A contrary approach tends to raise the cost of defense expenditures and makes it more difficult to balance the budget. Such contrary approach also may furnish a mere temporary prop which will lead only to greater and greater pressures for more and more artificial and uneconomic supports on an ever-widening front. Our economy may be able to absorb these uneconomic steps already taken, but we must be on guard lest this become an accepted way of life—particularly in a world of tensions and cold war, in which we must make our human and other resources go as far as possible.

For these reasons we strongly recommend that the joint committee provide us with straightforward economic analysis of these problems.

MINIMUM WAGE

What the economic report has to say on lifting the minimum wage is significant. A year ago the administration expressed a preference for a higher minimum wage, but said then that the timing was bad. Now, owing to recovery, the timing is found appropriate (p. 58). Does this mean that a new higher minimum is good only when it has little or no effect?

Why 90 cents an hour? Why not 85 cents or $1.05—as some have said—$1.25? Somehow the President has discerned (but just how, we are not told) that 90 cents is the safe maximum; that "a higher minimum might well cause lower production and substantial unemployment in several industries. * * * It would probably bring generally higher prices in its wake. Such effects would make the gains of covered workers illusory, and they would lower the standard of living of uncovered low-wage workers." This, we feel, is an effective statement of the self-defeating characteristics of any minimum wage legislation. The expansion of coverage of the act to more occupations and industries may bar more workers from jobs or force them to overcrowd the remaining uncovered jobs and depress wages there.

Again, minimum-wage legislation has a strong humanitarian appeal, but what moral right does the Government have to bar a worker from employment unless he can find an employer willing and able to pay him 90 cents an hour, or $1, or $1.25 an hour? And why, incidentally, does our Government have different minimum-wage laws fixing highly different wages under at least three different programs: (1) the Fair Labor Standards Act, (2) the Walsh-Healey Act, and (3) the Davis-Bacon Act?

These laws are not self-enforcing. A substantial battery of unproductive Government workers must be employed to administer these laws: Bureau chiefs, subchiefs, department heads, division heads, subdivision heads, lawyers, accountants, economists, public administrators, stenographers, typists, file clerks, charwomen, sweepers, janitors, and on and on in Washington and scattered throughout numerous field offices. The joint committee could perform a valuable service by taking a good solid look at this matter as it considers the minimum wage recommendation.

STRENGTHENING OUR FEDERAL SYSTEM OF GOVERNMENT

The President's Economic Report contains a significant but short analysis of the financial position of State and local government. It makes a number of suggestions on updating State and local "outmoded tax-rate and debt limits."

Today the gross debt of State and local governments stands at about $38 billion, as against $20 billion in 1939, and $17 billion in 1929. In 1929 and 1939 their debts were equal to 16.5 percent and 22 percent of our total gross national product, respectively. But today they represent only 11 percent of our gross national product.

At the same time the National Government debt, however, has greatly risen relative to the growth of our economy as shown by the accompanying tabulation (pp. 63 and 115).

	National debt	Gross national product	National debt as percent of gross national product
	Billions	*Billions*	
1929	$16.9	$103.8	16
1939	45.9	91.1	50
1954	278.9	356.0	78

In spite of this showing, however, the Economic Report recommends increased expenditures for many programs which traditionally have been handled at the State and local level and for many expenditures for many new such programs. The National Government is asked to assume a great responsibility for local public education. Once the National Government embarks on a subsidy or grant-in-aid program in this field powerful pressure will be generated for continuous expansion. Local communities may shy away from assuming their responsibility, hoping and expecting that the National Government will take over. The mere fact that such a program is under discussion, probably will slow down local efforts all over the country. And yet the National Treasury must go right into these local communities to collect the revenue which it will pass back to them, minus the usual brokerage fee "charged" by Washington.

A further real danger, of course, rises in the possibility of ultimate control of the content of education. The Supreme Court said, "It is hardly lack of due process for the Government to regulate that which it subsidizes" (*Wickard* v. *Filburn*, 1942). Even though such a program starts only with "construction" aids, the distinction between construction, teaching aids and teachers' salaries will be ambiguous and nebulous. The National Government has already written a number of textbooks widely used in the public schools. It does not take much imagination to see the day ahead when, in the rush to complete the work of a congressional session, a rider or a proviso will be attached to a public education appropriation bill requiring that certain courses be taught, or certain views be expounded or that certain textbooks be utilized. Indeed, in this session one Member of the House introduced a resolution to create a commission to write a textbook on communism for our schools (Congression Record, Jan. 31, p. A519). To help obviate the foregoing danger, it is only foir to add, this Member of the House wants to give every citizen a chance to review and object to the content of the textbook and every Member of Congress is expected to review it before voting upon it (p. A521). If this procedure were followed in every case, bureaucratic control of education might be minimized and most efforts at textbook writing by the National Government might die aborning.

Freedom depends on the dispersal of power and it is better to have 48 (or 1,000 times 48) local school administrations and educational experiments than to have education controlled from centralized Washington bureaus. To say that nothing of this kind is now contemplated is not enough.

While the President in his special message on school needs (February 8, 1955) discusses the foregoing point and is thoroughly aware of it, he neverthless said:

"But too many teachers are underpaid and overworked and, in consequence, too few young men and women join their ranks. Here is a shortage, less obvious but *ultimately more dangerous*, than the classroom shortage." [Italic added.]

It will not be difficult for either those who want more United States Treasury money or for those who want to shape and influence the curriculum of our local community schools to latch on to the foregoing statement and demand United States Treasury financing of teachers' salaries. It is the duty of a statesman to know what he is doing and to look ahead.

One of the unique features and great sources of strength in the American economy has been the innumerable sources of initiative. Our Federal system of government with its separate governmental units, National, State, and local, its checks and balances, has been part of this strength. However great the need for more funds for education may be demonstrated to be, we must always recognize that we have other long-range considerations that must also be kept in focus.

DELINQUENCY OF JUVENILES

In early years it was assumed that parents were responsible for the behavior of their offspring. The church has also endeavored to help build integrity, honesty, and moral fiber. Yet, here in 1955 we find that it is proposed that appropriations by taxpayers be made via the United States Treasury to make grants to the States to help them to control juvenile delinquency.

If the National Government assumes responsibility for the delinquency of juveniles, it must, of course, have the power and authority to execute its responsibility. That power and authority must go with responsibility is an elementary proposition—almost a truism. This is shown most clearly in the case of the National Government's responsibility for national security. To carry out this responsibility the Government commandeers the lives of our young men, and every young man is liable without his consent to compulsory military service.

No doubt at the head of the juvenile delinquency bureau sitting in Washington we would have a super saint, with antidelinquent blood in his veins, exuding virtue in every breath and with every heartbeat. Just why juvenile delinquency in St. Paul, or St. Mary, or St. Joseph, or St. Peter is a problem for our National Government is not made clear, although all of us are most certainly against juveniles who are delinquents. There is a vast difference between nationwide problems and national problems. Defense, international relations, etc., are obviously national problems. Fire control and juvenile delinquency are nationwide problems, but scarcely national problems.

Most of the welfare programs begin in a modest way. Frequently they are started by appropriations to a congressional committee or bureau merely for research on the problem. Enthusiasts and zealots are hired to do the research. Staff documents may be published, even without review of a congressional committee. But in the public mind "the Government report" is identified with the congressional committee under which the staff was recruited, and by which it may or may not have been directed.

The problem grows and grows in publicity and it is easy for the bureau to find a politician before too long to introduce a bill for an initial "modest" grant-in-aid program or a program directed by some national bureau.

Furthermore, grant-in-aid programs can and often do warp State and local expenditures. The "aided" programs grow at the expense of the unaided.

A significant example of this trend is the field of individual health. While the present administration has gone quite far in recommending a flood of health programs, the New York Times (February 3, 1955) in a lead editorial nevertheless, enumerates a whole series of health features which it regrets that the President failed to mention in his health message of January 31—a message covering a broad range of expanded and new programs.

UNEMPLOYMENT INSURANCE

After the adoption of our so-called Federal-State systems of unemployment insurance, frequent attempts were made to nationalize the entire program. When this failed, attempts were made to establish "Federal standards" for the State laws.

The Economic Report, while it does not urge congressional action in this area, attempts to tell the States what they should do, rather than permit a multitude of experiments at the State level (pp. 55–57).

Thus, the report recommends uniform duration of benefit payments for every eligible worker regardless of how long he has held a job.

Many States have assumed that there are some workers who perhaps are fairly well attached to the labor market but who, because of substantially less than standard qualifying wages, should, nevertheless, not be wholly excluded from getting assistance.

In Michigan, for example, an employee who has worked some, in at least 14 weeks, is entitled to some benefits, but the number of benefit weeks rises in a definite 2 to 3 ratio to the number of weeks of work up to the 26-week maximum. Should Michigan pay unemployment compensation for 6 months to employees who work only 3 months? Or, should only workers who are employed 52 weeks be eligible for the "uniform duration" of 26 weeks' benefits?

Again, the Economic Report recommends that the benefit should be equal to 50 percent of the unemployed worker's "regular weekly wages." When the combined social security and withholding tax was nonexistent or small, this formula seemed fairly appropriate. But today under this formula a 50-percent benefit of regular wages would be substantially more than 50 percent of regular take-home pay, and it must be remembered that the benefits are tax free, and the unemployed worker avoids numerous expenses such as transportation, outside lunch, work clothes, etc. This recommendation, furthermore, would favor the single worker and discriminate against the worker with family responsibility. Are not the States in better position to determine these matters?

The Economic Report states that the District of Columbia unemployment compensation laws should be drafted so as to be "a model" for the States. Just what there is about the economy of the District of Columbia where our chief product is words, that would make a system of unemployment compensation adapted to its conditions, appropriate for North Dakota, or Michigan, or New Jersey, is not clear. When Congress acts as the legislative body for the District of Columbia, it rarely pretends to be setting a national pattern. If it were, then the citizens in the other States should be disfranchised as in the District of Columbia.

CONCLUSIONS

Every new program, every new bureau and every new function adds to the burdens of overworked Members of the Congress. These members serve in a sense as the board of directors of the national governmental phases of our society.

These programs and functions have grown and grown to the point that probably only a handful of "members of the board" could make a passing grade in an examination of the statutes, regulations, programs, organization and operation of even 5 percent of the bureaus or programs for which they vote and to which they make appropriations from year to year.

Does this make for sound government? Why are Members of the Congress so persistently anxious to add to their overload of work and responsibility—a responsibility which in all frankness they would have to admit of being incapable of discharging in the sense in which we think of the responsibility of a board of directors in a private business, a church or a charity?

Thus, in conclusion as we see it, the Economic Report seems to be based on high-grade understanding of the power of monetary and fiscal policies in governing the stability and growth of our economy.

Extraneous matters appear to be included in the report, matters which are better handled elsewhere—if they must be made to be national issues.

While many fine things are said on the importance of State and local government, the report recommends many steps which, in fact, would reduce their responsibility and their financial capacity to meet their own needs in their own way.

OXFORD, ENGLAND, *February 10, 1955.*

GROVER W. ENSLEY,
Staff Director, Congress of the United States,
Washington, D. C.

DEAR SIR: Thank you for your letter of January 31 and I am looking forward to receiving the complete report you mention.

Meanwhile, I enclose a copy of text which is the post mortem you ask for.

Yours sincerely,

COLIN CLARK.

In two articles in the Manchester Guardian of November 19 and 26, 1953, followed up by an address to a meeting of businessmen in New York, called by the National Industrial Conference Board of January 21, 1954, I made some predictions about an American recession, which have been the subject of a good deal of discussion. I think it will be seen, on examining the evidence, that my predictions, while by no means infallible came a good deal nearer to the truth than most of the rival forecasts current a year ago, and particularly those of the opposition speaker at the National Industrial Conference Board meeting, Professor Woytinsky.

The following were the essential passages in the two addresses. (I have not altered the text at all, except to correct some grammatical defects in my own spoken word, the amendments being indicated by brackets.)

Professor Woytinsky said: "The volume of economic activities by the end of 1954 may be close to the trend line, as indicated by its growth in 1951–52. This would bring the gross national product to \$380–\$385 at an annual rate, personal income close to \$300 billion, industrial production index to approximately 250 (as compared with the present level of close to 230), and the index of manufacturing production to approximately 260 (as compared with its current value of 240–245).

This is my tentative answer to the question—"1954: Depression, Recession, Recovery?"

Quoting the production index numbers on the old base, he anticipated production now to be well above the closing months of 1953. Gross national product stood at 355½ billion in the third quarter of 1954, and personal income at 286 billion.

My statement was: "The worst months, in my opinion, will come more likely in August and September, rather than the second quarter. * * *

"If Congress cuts expenditure, forces up tax rates, refuses tax remissions, the situation at the latter part of the year may get out of control; whereas really prompt action may put it, within a few months, within control. [If Congress follows] the intermediate course of letting tax revenue melt away and the deficits build up [and you then] ask me to predict as closely as I can what will happen, that will probably cause things to run down fairly rapidly until the third quarter of the year, and then start a slow upturn. * * * Any long period depression is out of the question. If you are taking a view 2 or 3 years ahead, as General Motors are, then I think you can be very optimistic. What I do see is quite a short, sharp depression and recovery, which, if wisely handled, may be as rapid as the depression which caused it."

I think that this has been more nearly correct.

I had predicted in the earlier statement that the fall would be similar to the 1949 recession. On that occasion, gross national product (seasonally adjusted at annual rate) fell from a maximum of 267 billion in the fourth quarter of 1948 to a minimum of 255½ billion in the fourth quarter of 1949. On this occasion the fall has been from a maximum of 369.9 billion in the second quarter 1953 to a minimum (so far) of 355.5 billion, third quarter of 1954.

The fall in gross national product, and the rise in budget deficit, have been rather less than I thought they would be. I anticipated that the budget deficit, calculated on a basis of accruing tax revenue, for the worst quarter, might be at a rate as high as 20 billion per annum. Though it will not be as high as this, it will be well above the previous year; we do not yet have the accruing tax liability figures for the third quarter, to complete the calculation. * * *

CONNECTICUT GENERAL LIFE INSURANCE CO.,
Hartford, Conn., February 14, 1955.

Hon. PAUL H. DOUGLAS,
United States Senate, Washington, D. C.

DEAR SENATOR DOUGLAS: The enclosed statement is submitted to the Joint Committee on the Economic Report in response to your invitation addressed to Mr. Meyer Kestnbaum, chairman of the Committee for Economic Development.

It is a source of regret to us that no qualified officer of CED is able to appear in person before the joint committee at this time. We have a keen interest in the work of the joint commitee, partly because its area of study so closely parallels that of CED's research and policy committee. Members of CED have appeared before the joint committee on many occasions, all of them pleasant and, we believe, constructive.

I hope that the brief statement enclosed will be helpful in the current deliberations of the joint committee. This statement largely concerns itself with CED's conclusions. There are certain observations and editorial comment which are the personal views of the writer and do not necessarily reflect the views of CED.

Sincerely yours,

FRAZAR B. WILDE,
Chairman, Research and Policy Committee,
Committee for Economic Development.

STATEMENT OF FRAZAR B WILDE, CHAIRMAN, RESEARCH AND POLICY COMMITTEE, CED, AND PRESIDENT, CONNECTICUT GENERAL LIFE INSURANCE CO.

To a large extent the propositions of this very lucid economic report are in accord with Committee for Economic Development policies.[1] We share the economic report's enthusiasm for the success of the policies that guided the economy through 1953 and 1954.

---

[1] The Committee for Economic Development is a private, nonpolitical organization of businessmen and educators formed to study and report on the problems of achieving and maintaining a high level of employment and production within a free economy. Its research and policy committee issues from time to time statements on national policy containing recommendations for action which, in the committee's judgment, will contribute to maintaining productive employment and a rising standard of living. A list of members of the CED research and policy committee is attached.

A year ago in testimony before this committee, our diagnosis of the economy led us to caution equally against drift and against precipitate action. We placed our reliance on a flexible monetary policy and on moderate tax reduction with emphasis on increasing incentives as a means of supplementing automatic stabilizers in the job of keeping the economy stable. As the President's report fully appreciates, these measures were no substitute for sustained confidence on the part of the public and the business community. But the fact that the administration was not indifferent and yet was not stampeded into the use of more drastic measures tended to strengthen confidence, particularly in the business community; and the confidence of business and businessmen makes for confidence on the part of the employees and the public generally.

While there is much reason for satisfaction in view of this record it would be reckless to draw the conclusion that the business cycle has been tamed. Happily, while accenting the progress that has been made, the report stops short of this conclusion.

There are at least three reasons for not being too complacent about our accomplishment:

First, it is questionable whether the economy in 1953–54 was subjected to really strong forces making for depression. The President's report identifies inventory adjustments in the wake of the Korean war as the primary brake on economic activity. This brake was supplemented by a fairly sharp drop in Government buying for defense. As a result of these downward forces our stabilizing machinery was set in motion. The machinery performed very well, but it did not have to cope with strong downward movements in plant and equipment outlays or in residential construction which were relatively stable or increasing. The year 1954 probably did not provide a serious enough test to warrant giving our present stabilizing machinery an unlimited guaranty for the future.

Second, no two economic adjustments are exactly the same. Because the decisions taken this time turned out to be right does not mean that the same decisions will be right next time. The country must always have ready stabilizing measures appropriate to the occasion. Each situation we face will prove in some way unique. Therefore, success in maintaining stability will in large measure depend on the versatility of stabilizing machinery.

Finally, of course, we must be ready to act in time. The success of the past 2 years clearly shows that timing is all important in maintaining stability. The record on this score in 1954 was very good.

It is important to realize that successful timing depends less on ability to forecast the future than it does on being ready, willing, and able to set stabilizing machinery in motion when the economic indicators clearly call for it. If we could rely on economic forecasting to tell accurately what is in store in the months ahead, there would be no trouble in knowing when to act and the degree of action needed. But forecasting is, at best, an uncertain servant. We are faced with the necessity of being ready to act promptly in situations that have not been foreseen.

Forecasting does have a part to play in the quest for stability, but it should never be master of our actions. We run great risks in tying policy closely to forecasts, and the President rightfully sounds many notes of caution in his report about the uncertainties and pitfalls of prognostication. The emphasis is better put on strengthening the automatic stabilizers in our economy. This provides insurance of two kinds: insurance against the dangers inherent in misreading the economic future, and insurance against an administration that might not be quite so ready, willing, and able to act as this one has been.

None of this is to deny the heartening progress that has been made. We have made progress along the road to stability. We cannot, however, take economic stability for granted. Neither can we take economic growth for granted. At different times it may be appropriate to place more emphasis on one than on the other. But we cannot call either problem "solved." We haven't licked the business cycle yet. We haven't achieved pushbutton economic growth.

Turning from the past to the present, the report recognizes—and properly so—that in times like these, the Government must be prepared to throw its weight against too much inflation as against too much deflation. The report rightly warns that economic recovery must not be jeopardized by too much speculation. It is equally prudent to say, as the report does, that Government must remain ready to deal with any setback that may develop.

The underlying strength of the current recovery certainly makes sensible the Government's refusal now "to impart an immediate upward thrust to general economic activity." While too much and too early is as dangerous as too little too late, the retreat from "active ease" to an easy money policy and the recent offer in exchange of a long-term Government security seem appropriate and consistent actions at this time.

The 33 specific recommendations in the report cannot be discussed in detail here. Many of these recommendations, however, are in line with positions CED has taken in the past. Others, such as the Government's plans for improving the Nation's highway system—an important subject for economic and military reasons and for the continued development of the mode of living in this country—are currently under study in CED. Without doubt, a comprehensive, long-range program for the improvement of the highway system will be a very valuable contribution to our economy. Still others we have not yet had a chance to explore.

Of particular interest to us are the numerous suggestions the report makes for strengthening the automatic stabilizers in our economy and otherwise increasing our insulation against depression. CED presented a comprehensive program to this same end last year in its policy statement, "Defense Against Recession."

The report's recommendations for extending unemployment insurance to State and local government employees and to firms employing fewer than four persons have our agreement. So do the recommendations for revising upward the duration and amount of unemployment insurance benefits. In some cases, however, unjustified drains upon the funds could be reduced by better administration and by reconsideration of eligibility rules. These benefits are, of course, paid for nonproduction. Every inducement should be made for the individual to seek work. Conserving the funds in these ways will offset, at least in part, the increased costs resulting from higher benefits and longer benefit periods. An extension of Federal old-age and survivors insurance to Federal personnel would also be consistent with CED's program.

We believe with the report that State ad local tax-rate and debt-limiting statutes should be reviewed, with an eye to relaxing unnecessary barriers to local investment when circumstances clearly call for action. Similarly the Federal debt limit should not be allowed to prevent the Government from pursuing an orderly debt-management program or from carrying out an effective antirecession policy. Governments need flexibility to meet the changes in our economy.

An up-to-date reserve of plans for Federal public-works projects, as well as the establishment of a revolving fund to aid States and municipalities in planning a backlog of construction projects is clearly desirable.

Finally, the report's request for great latitude for the President in the exercise of his power to vary, in the light of economic conditions, the terms on which home mortgages are underwritten by the Federal Government is prudent counsel. This authority should be promptly granted.

The fact that the Government is making these recommendations at a time when the economic outlook is buoyant is encouraging. The very existence of ready reseves against recession is an added source of confidence that serious recession will be avoided in the future.

The report's recommendation to postpone the lowering of the corporate income tax and of excises, scheduled for April 1, is currently being studied by a CED committee. We plan to have a statement on the subject ready before April 1. The report's recommendations involving changes in the tax rates imposed on corporation income from foreign sources are generally consistent with our position that the tax system should encourage foreign investment, although the CED took no position on the specific proposals contained in the report.

The CED, last fall, recommended a gradual and selective reduction in tariffs along the general lines proposed by the President and reviewed in this report. We are also on record as favoring equitable standards for the valuation of imported goods for customs purposes.

Finally, let me repeat that of all the things that Government can do to help a growing and successful economy, the greatest is to stimulate confidence and encourage a favorable climate. Intangibles can be just as real and just as important as other elements in our search for growth and stability. Government can do a great deal to shape the environment and the psychology which breeds success. The Government needs to continue its practice of encouraging maximum cooperation among labor, management, and capital.

A friendly, constructive atmosphere not only makes for pleasant living in a country, but establishes an environment where men and women enjoy their work better, where management is more apt to recommend expansion and development of new products and new business, and capital is willing to invest its share to the end that we may ward off the enemy and at the same time enjoy an increased standard of living.

COMMITTEE FOR ECONOMIC DEVELOPMENT, RESEARCH AND POLICY COMMITTEE

STATEMENT OF HENRY G. RITER, 3D, PRESIDENT OF THE NATIONAL ASSOCIATION OF MANUFACTURERS

The basic economic philosophy set forth in the Economic Report of the President, January 20, 1955, is one which the National Association of Manufacturers can heartily endorse. Although there may be some difference of opinion on specific measures for implementing this philosophy, the President has clearly reaffirmed our historic reliance on free competitive individual enterprise as the driving and guiding force in our economy. We believe that the great potential growth depicted in the report will be realized if—and only if—this basic faith continues to guide our Government and our people.

THE CURRENT ECONOMIC OUTLOOK

The President summarizes his analysis of economic developments in 1954, and prospects for 1955, in the following words:

"* * * the mild recession of last year was arrested and a new phase of economic expansion got under way before the year closed. The vigor of the recent recovery taken in conjunction with the investment and expenditure plans already set in motion, suggests that economic expansion will continue during coming months. It holds out the promise that we shall achieve a high and satisfactory level of employment and production within the current year."

This conclusion is in close agreement with our own views. Signs are multiplying that we are well on our way upward, and that the contraction of last year was only a transient episode. The present mood of both consumers and businessmen is such as to sustain a high and rising rate of economic activity.

Consumers, it is clear, have not felt either the need or the desire to curtail their expenditures. There has been no wave of fear leading to large-scale postponement of buying. It is true that consumers are becoming more discriminating but business regards this as a stimulating challenge rather than as cause for alarm.

I can assure the committee that the business community views the immediate future with high optimism. Businessmen confidently anticipate economic growth and, what is more important, they are preparing for growth. Business is investing in new plant and equipment to meet the expanded demand expected in the future. Despite the tapering off of defense spending last year—and the decline in the need for the specialized plant and machinery used in producing defense goods—total expenditures on plant and equipment remain at very high levels. Business is preparing many new products and new services, which will enrich our lives in the future. These business preparations for future growth are in themselves a stimulant to our prosperity in the present.

In viewing the course of the economy in 1954, what we find disturbing is not the slight economic contraction which occurred, but the eager haste in certain quarters outside Government to proclaim an emergency and to urge adoption of drastic measures to counteract the recession. Many of the measures proposed were such as to weaken the forces making for economic growth, by departing from our normal reliance on individual incentives and competitive markets.

This economic nervousness—this willingness to abandon the ship at the first alarm—is a most distressing phenomenon. I trust that cool heads will continue to prevail over this type of counsel, as they did in 1954.

STAGNANT PROFITS

Although the immediate business outlook is generally good, there is one aspect of it which should cause some concern. That is the fact that business profits have not participated in the growth of the economy in recent years.

Figures in the statistical appendix to the President's report indicate that profits after taxes have remained within a narrow range of $1 billion for the last 7 years, while all other facets of our economy have experienced a substantial growth in the same period.[1] In particular, total corporate sales increased by more than 30 percent between 1948 and 1954, but total corporate profits in 1954 were actually lower than they were in 1948. Thus corporations have been compelled to produce and sell about one-third more in the way of goods and services, with no increase whatever in profits. It is as though an employee had to work harder and harder to keep up with the growth of his company, but never got any more pay for it.

By contrast the disposable income of individuals—including wages, salaries, and other forms of personal income after taxes—increased by 35 percent during the same period. Clearly it is in the area of business profits, rather than of consumer incomes, that economic difficulties are to be foreseen.

Since profits play a major role in supplying funds for new plants and equipment—thus helping create jobs—as well as providing incentive for production, their stagnation over a 7-year period is genuine cause for concern. This record discredits any contention that further cost increases or tax increases can or should be absorbed out of profits. On the contrary, it demonstrates the pressing necessity for corporate tax reduction.

LONG-TERM GROWTH

The President announces that his intention this year is to concentrate on "basic policies for long-term economic growth" rather than to "seek to impart an immediate upward thrust to general economic activity." This is economic statesmanship and vision of the highest order.

The subject of long-term growth is much emphasized in current statements by all schools of economic thought, and rightly so. Yet this objective is some-

[1] These figures apply to profits after taxes, adjusted for inventory valuation. If the adjustment for inventory valuation is not made, corporate profits after tax show a drop between 1948 and 1954 of over $2 billion. (See p. 189 of the report.)

times interpreted as meaning that we must never, in our upward progress, fall below a precalculated mathematical trend line. It is too often argued that even the slightest or most temporary setback is evidence that we have failed in our objective of long-term growth, and that desperate remedies are called for.

Since we live in a society of free individuals we must accept the fact that the actions of freemen are not predictable to the last degree of mathematical precision. We can know, in general, that one type of economic climate will encourage individuals to behave in ways which lead to economic expansion. We can be sure that other kinds of economic policies will discourage enterprise and frustrate growth. But, if we want to control behavior with no margin of uncertainty whatever, we must deal with slaves or robots and not free human beings.

If every minor economic fluctuation is regarded as an excuse for abandoning the basic policies which promote growth, we would never lack for such excuses. We would be in the position of a hypochondriac, who never has time to live fully, since he is always busy caring for imaginary or trifling ailments. Our long-term goals will require some strenuous exertions. Let's not abandon them and take to our beds every time some minor ailment occurs.

Incidentally, business firms are tending more and more to base their investment plans on the long-term outlook, and then to ignore temporary shifts in the wind in carrying out those plans. They have learned the futility of attempting to revise their policies with every minor drop in the rate of economic activity. It would be most unfortunate if government were persuaded to adopt the opposite procedure and to regard every economic fluctuation as a signal to reverse all its basic economic policies.

BASIC PRINCIPLES

We are especially pleased that the President has chosen to present, as the very first of his "basic economic tenets," the proposition that "* * * competitive markets, rather than government directives, are as a rule the most efficient instruments for organizing production and consumption."

Attempts to control prices and wages by administrative rulings are both impractical and pernicious. They cannot prevent inflation if the basic fiscal and monetary causes of inflation are present. Furthermore, as our experience demonstrates, direct controls impede production and block the free flow of goods. One form of direct control breeds another—price controls lead to wage controls and at a later stage they make rationing inescapable. They lead logically to a situation where all economic decisions have to be made by Government agencies—rather than by the firms and individuals who are closest to the problems and have the most at stake in reaching a correct solution.

The imposition of direct controls—or even the threat of their imposition—can only be a roadblock to the attainment of our future economic goals. Such direct economic controls should be permently renounced as a proper function of government.

The second "basic economic tenet" of the President is also, in our view, a happy choice: "* * * a free economy has great capacity to generate jobs and incomes if a feeling of confidence in the economic future is widely shared by investors, workers, businessmen, farmers, and consumers."

This emphasis on the central importance of confidence reappears frequently in the report, and might be described as its keynote. This theme is indeed worthy of emphasis at the present time, when we are being urged from some quarters that the economic outlook is a gloomy one and that only drastic measures, even though they may involve departure from our free-enterprise principles, can save us. But it should be obvious that our economy can remain dynamic only if we retain confidence in ourselves and in our institutions.

Of course this emphasis on confidence does not mean that we, or the President, advocates a Pollyanna attitude that all will be well and we need not be vigilant. It would be absurd to pretend that a rosy future is in store for us no matter what policies we pursue or what mistakes we make. There are serious dangers ahead and they had better be faced. But, when all is said and done, these dangers do not arise from the possibility that our free competitive enterprise system will be inadequate for our future needs. Rather they arise from the possibility that the free competitive system will be undermined and impeded in its operation, either through misunderstanding or through sabotage.

As we see it, there are four chief dangers of this type threatening us currently:

1. The danger that the monopolistic power of labor unions will be used to push labor costs to an unworkable level. This could undermine our prosperity by jamming the machinery of production and distribution. Raising wage costs can restrict employment, just as the raising of prices can reduce the sale of goods.

2. The danger that deliberate monetary expansion will be used in an attempt to offset the restrictive effects of monopolistic wage rises. This is the policy of continuous inflation, advocated by certain thoughtless persons as a means of preventing unemployment. It would destroy the value of our money and wipe out our accumulated savings.

3. The danger that we will, as settled policy, rely on Government spending to take up any slack in employment. Such a policy would be an invitation to labor unions to present all sorts of impractical demands, knowing that the Government would assume responsibility for employing any workers who were thereby priced "out of the market" for their services.

4. The danger that the tax burden will prove so heavy, or so unduly concentrated on certain particular types of income, that it will seriously impede future investment. Our economic growth, as projected in the President's report, will require a great and continuous flow of capital into plant, machinery, tools, and all the other things needed in production. This flow of capital can only come out of people's savings, and what is taxed away cannot be saved or invested.

FUTURE TAX REDUCTIONS

It is encouraging to see that the administration recognizes the destructive effects of our present heavy tax burden. The President states that:

"It should, nevertheless, be recognized that present taxes are still a heavy burden. Lower taxes would tend to encourage work, promote more efficient business practices, and create more jobs through new investments. Fortunately, with our economy continuing to expand, we can look forward to larger Federal revenues from existing tax rates. This, together with further economies in expenditure, should make possible next year another step in the reduction of taxes. Congress might then consider enacting a general, though modest, reduction in taxes and, at the same time, continue the program which was begun last year of reducing barriers to the free flow of funds into risk-taking and job-creating investments."

The recognition that economic growth will provide a margin for tax reduction is in close accord with this association's thinking on the subject. We have estimated that our potential growth over the next 5 years will, if economic developments permit its attainment, make possible tax reduction totaling $9 billion.

But I had better explain that this does not mean that the $9 billion margin for tax reduction will be available for Congress to distribute in any way it pleases. The assumed rate of economic growth on which the calculation is based cannot simply be taken for granted. Unless we have a tax reduction specifically designed to correct the growth-limiting features of our present tax structure, there may be no opportunity for any tax cut.

We believe that the $9 billion margin must be used, over the next 5 years, to cut the rate of corporate-income taxation and to reduce the degree of graduation in the personal income-tax rates. If our plan is followed, it will be possible to lower both the top rate of corporate tax and the top rate of individual tax to a uniform level of 35 percent at the end of 5 years. First things must come first, and the primary task is to correct the gross discriminations which, over the years, have crept into our tax system. These discriminations are roadblocks to growth, and unless progress is made in eliminating them we will not have the margin for tax reduction that growth can provide.

GOVERNMENT COMPETITION WITH BUSINESS

The business community is especially appreciative of the reiteration, in this report, of the President's determination to reduce the degree of Government competition with private business. This is stated in the following words:

"The Government also made progress in redrawing the line separating private and public enterprise. Steps were taken to dispose of numreous enterprises for which public operation was inefficient or of doubtful advantage. Simultaneously, the Government increased the amount of its contracting with private firms for necessary services and facilities—as an alternative to producing them itself, often at higher cost to the taxpayer. To hasten the economic development of our water resources, and yet restrict Federal participation to what others are incapable of accomplishing, the partnership principle of Federal cooperation with local interests, public or private, was launched."

We applaud both this view and the steps the administration has taken, and is taking, to implement it. The notion that the Government should enter fields of productive activity in which private interests stand ready to provide what is needed is a most pernicious one. Especially dangerous is the belief that such Government enterprieses can provide a yardstik for judging the performance of privately-owned enterprises in the same field—as though a tax-supported activity can be compared with one which must continuously justify its existence by paying its own way.

THE QUEST FOR SECURITY

The President's report sets forth as one of the proper functions of Government the strengthening of the floor of security for individuals and families in our industrialized society" (p. 6). The measures recommended under this heading include: extension of the coverage of unemployment insurance, increases in the amount and duration of benefits under the unemployment insurance system, and some further extension of the Federal old-age and survivors insurance system.

Economic security is a legitimate aspiration and a desirable objective. But serious question must be raised as to whether individual and family security would in fact be increased by such extension of governmental social welfare programs.

The OASI system, for example, is still an unproven social experiment. To pretend otherwise is to encourage false hopes of security which may be cruelly disappointing. We lack any adequate information on the ultimate cost of the program, on the willingness and ability of employed people to pay those costs, and of the effect of the program on the all-important process of private saving.

How far does the OASI program go toward the socialization of saving, and what will be the result on investment for our growing needs? What will its effects be on the initiative and self-reliance of our population? What will be the effect of such a program on the value of our dollar and hence on the value of the future benefits it promises?

Because uncertainty exists on these and other questions, we must decry the tendency toward continuous and indiscriminate expansion of Government-sponsored retirement insurance. Although the original objective of OASI was to provide a basic-subsistence minimum at retirement, recent revisions have placed the amount of benefits consideraby above this level for many participants. In our opinion, this will impair the incentive for individuals to provide for their own old-age security by their own savings.

Thoughtful people must also feel reservations in regard to recent tendencies in the field of unemployment insurance. The original objectives of the program were to encourage business in its efforts to stabilize employment, and to pay limited benefits to those who have become unemployed through no fault of their own and who stand ready to accept a job if offered. But these objectives have sometimes been lost sight of by eager reformers who have wanted to make the program a panacea for unemployment.

As it stands, the unemployment-compensation system is administered by the States. We regard this decentralization as desirable, since each State is able to adapt the details of its program to its own needs. In addition, decentralization offers opportunities for comparison and evaluation of results. Frankly we are disturbed at the presumption, indicated in the President's report, that the Federal Government can and should recommend general standards of benefits and coverage to all the States. From this it is only a short step to the imposition of such general standards by Federal statute.

The real road to security lies in the expansion of our free-enterprise economy, so as to increase production and to provide continually more opportunities for employment. Government social-insurance programs can at best be only a palliative and at worst they can be destructive of the real foundations of security.

In conclusion, I wish to state that, in my judgment, the administration has placed a correct interpretation on its responsibilities under the Employment Act of 1946. I am reassured that the President has resisted pleas to have his Council set up in advance a statistical model of how the economy may be expected to act in 1955, and to derive from the model mechanical solutions to the problems it predicts. Economic models of this type have a way of predicting deflationary gaps which never materialize—as witness our experience with them in 1945 and 1946. Centralized planning, based on presumed governmental clairvoyance, is the opposite of our traditional reliance on freedom of individual action.

DEPARTMENT OF COMMERCE,
BUREAU OF THE CENSUS,
Washington 25, D. C., February 21, 1955.

Mr. GROVER W. ENSLEY,
Staff Director, Joint Committee on the Economic Report,
House of Representatives, Washington, D. C.

DEAR MR. ENSLEY: I regret this delay in replying to your letter of December 21, relating to the recruitment of enumerators for the collection of current employment statistics.

In general, I do not believe that the practice of seeking enumerators initially through party referral sources has impaired the adequacy and accuracy of current employment statistics. Likewise, I do not believe there is need for concern currently over the problem of delay in making vitally needed replacements, although such delays will inevitably occur occasionally.

Over a period of many years the Census Bureau has learned how to deal with the problems implied by this type of recruitment system. Persons recommended are subject to a qualifying test given by the Bureau to screen out unsuitable applicants. If no suitable person who wants the job proves to be available through this channel, the supervisor looks to other sources. As a matter of fact, of the 859 individuals added from July 1, 1953, to December 31, 1954, to the Current Population Survey staff, almost entirely enumerators, only 281 or about one-third were actually referred by political sources.

Safeguards as to adequacy and accuracy of data have been built into the system of collecting the data. Questions are formulated in such a way as to call for specific, factual information in the answers. Interviewers are given careful training when they first come on the job and refresher training each month thereafter. Completed questionnaires are reviewed before tabulation, and any apparent discrepancies are brought to the attention of the interviewers. Supervisors periodically observe the work of interviewers. The work of each interviewer is systematically and regularly rechecked by actual reinterview of a small sample of households. The results of the reinterviews are carefully analyzed in Washington to assist in the interpretation of the results, as well as in the development of improvements in the survey. This is a major part of the research program to aid us in developing improved survey procedures which will reduce still further the possibility that the views or biases of the interviewers might affect the survey results.

In view of those built-in safeguards and the continuing effort to introduce improvements in procedures where our checks indicate defects, it is my judgment that the political affiliations or views of our interviewers have not biased the monthly estimates, and it is my opinion that it is possible to maintain the statistical quality of the current employment statistics program under the present referral system. I do not mean to imply that problems do not arise in particular situations from time to time, but the machinery exists for resolving these difficulties without impairment of the soundness of the results. While it is recognized that some problems would arise under this or any other system of recruiting a widely scattered staff of part-time workers at a very modest rate of pay, it is my view that action by your committee to change current procedures is not required under present circumstances.

I hope that this information will bring about a clearer understanding of the problem of recruitment of interviewers. If we can be of any further assistance, please let us know.

Sincerely yours,

ROBERT W. BURGESS,
Director, Bureau of the Census.

THE WHITE HOUSE.

To the Congress of the United States:

Our unity as a nation is sustained by free communication of thought and by easy transportation of people and goods. The ceaseless flow of information throughout the Republic is matched by individual and commercial movement over a vast system of interconnected highways criss-crossing the country and joining at our national borders with friendly neighbors to the North and South.

Together the uniting forces of our communication and transportation systems are dynamic elements in the very name we bear—United States. Without them, we would be a mere alliance of many separate parts.

The Nation's highway system is a gigantic enterprise, one of our largest items of capital investment. Generations have gone into its building. Three million three hundred and sixty-six thousand miles of roads, traveled by 58 million motor vehicles, comprise it. The replacement cost of its drainage and bridge and tunnel works is incalculable. One in every seven Americans gains his livelihood and supports his family out of it. But in large part, the network is inadequate for the Nation's growing needs.

In recognition of this, the governors, in July of last year at my request, began a study of both the problem and methods by which the Federal Government might assist the States in its solution. I appointed in September the President's Advisory Committee on a National Highway Program, headed by Lucius D. Clay, to work with the governors and to propose a plan of action for submission to the Congress. At the same time, a committee representing departments and agencies of the National Government was organized to conduct studies coordinated with the other two groups.

All three were confronted with inescapable evidence that action, comprehensive and quick and forwardlooking, is needed.

First: Each year more than 36,000 people are killed and more than a million injured on the highways. To the home, where the trafiic aftermath of an accident on an unsafe road is a gap in the family circle, the monetary worth of preventing that death cannot be reckoned. But reliable estimates place the measurable economic cost of the highway accident toll to the Nation at more than $4.3 billion a year.

Second: The physical condition of the present road net increases the cost of vehicle operation, according to many estimates, by as much as 1 cent per mile of vehicle travel. At the present rate of travel, this totals more than $5 billion a year. The cost is not borne by the individual vehicle operator alone. It pyramids into higher expense of doing the Nation's business. Increased highway transportation costs, passed on through each step in the distribution of goods, are paid ultimately by the individual consumer.

Third: In case of an atomic attack on our key cities, the road net must permit quick evacuation of target areas, mobilization of defense forces and maintenance of every essential economic function. But the present system in critical areas would be the breeder of a deadly congestion within hours of an attack.

Fourth: Our gross national product, about $357 billion in 1954, is estimated to reach over $500 billion in 1965 when our population will exceed 180 million and, according to other estimates, will travel in 81 million vehicles 814 billion vehicle-miles that year. Unless the present rate of highway improvement and development is increased, existing traffic jams only faintly foreshadow those of 10 years hence.

To correct these deficiencies is an obligation of Goverment at every level. The highway system is a public enterprise. As the owner and operator, the various levels of Government have a responsibility for management that promotes the economy of the Nation and properly serves the individual user. In the case of the Federal Government, moreover, expenditures on a highway program are a return to the highway user of the taxes which he pays in connection with his use of the highways.

Congress has recognized the national interest in the principal roads by authorizing two Federal-aid systems, selected cooperatively by the States, local units and the Bureau of Public Roads.

The Federal-aid primary system as of July 1, 1954, consisted of 234,407 miles, connecting all the principal cities, county seats, ports, manufacturing areas and other traffic generating centers.

In 1944 the Congress approved the Federal-aid secondary system, which on July 1, 1954, totalled 482,972 miles, referred to as farm-to-market roads—important feeders linking farms, factories, distribution outlets and smaller communities with the primary system.

Because some sections of the primary system, from the viewpoint of national interest are more important than others, the Congress in 1944 authorized the selection of a special network, not to exceed 40,000 miles in length, which would connect by routes, as direct as practicable, the principal metropolitan areas, cities and industrial centers, serve the national defense, and connect with routes of continental importance in the Dominion of Canada and the Republic of Mexico.

This national system of interstate highways, although it embraces only 1.2 percent of total road mileage, joins 42 State capital cities and 90 percent of all cities over 50,000 population. It carries more than a seventh of all traffic, a fifth of the rural traffic, serves 65 percent of the urban and 45 percent of the rural population. Approximately 37,600 miles have been designated to date. This system and its mileage are presently included within the Federal-aid primary system.

In addition to these systems, the Federal Government has the principal, and in many cases the sole, responsibility for roads that cross or provide access to federally owned land—more than one-fifth the Nation's area.

Of all these, the interstate system must be given top priority in construction planning. But at the current rate of development, the interstate network would not reach even a reasonable level of extent and efficiency in half a century. State highway departments cannot effectively meet the need. Adequate right-of-way to assure control of access; grade separation structures; relocation and realignment of present highways; all these, done on the necessary scale within an integrated system, exceed their collective capacity.

If we have a congested and unsafe and inadequate system, how then can we improve it so that 10 years from now it will be fitted to the Nation's requirements?

A realistic answer must be based on a study of all phases of highway financing including a study of the costs of completing the several systems of highways, made by the Bureau of Public Roads in cooperation with the State highway departments and local units of Government. This study, made at the direction of the 83d Congress in the 1954 Federal-aid Highway Act, is the most comprehensive of its kind ever undertaken.

Its estimates of need show that a 10-year construction program to modernize all our roads and streets will require expenditure of $101 billion by all levels of government.

The preliminary 10-year totals of needs by road systems are—

	Billions
Interstate (urban $11 billion, rural $12 billion)	$23
Federal-aid primary (urban $10 billion, rural $20 billion)	30
Federal-aid secondary (entirely rural)	15
Sub-total of Federal-aid systems (urban $21 billion, rural $47 billion)	68
Other roads and streets (urban $16 billion, rural $17 billion)	33
Total of needs (urban $37 billion, rural $64 billion)	101

The Governors' Conference and the President's Advisory Committee are agreed that the Federal share of the needed construction program should be about 30 percent of the total, leaving to State and local units responsibility to finance the remainder.

The obvious responsibility to be accepted by the Federal Government, in addition to the existing Federal interest in our 3,366,000-mile network of highways, is the development of the interstate system with its most essential urban arterial connections.

In its report, the Advisory Committee recommends:

1. That the Federal Government assume principal responsibility for the cost of a modern interstate network to be completed by 1964 to include the most essential urban arterial connections; at an annual average cost of $2.5 billion for the 10-year period.

2. That Federal contributions to primary and secondary road systems, now at the rate authorized by the 1954 act of approximately $525 million annually, be continued.

3. That Federal funds for that portion of the Federal-aid systems in urban areas not on the interstate system, now approximately $75 million annually, be continued.

4. That Federal funds for forest highways be continued at the present $22.5 million per year rate.

Under these proposals, the total Federal expenditures through the 10-year period would be—

	Billions
Interstate system	$25.000
Federal-aid primary and secondary	5.250
Federal-aid urban	.750
Forest highways	.225
Total	31,255

The extension of necessary highways in the Territories and highway maintenance and improvement in national parks, on Indian lands and on other public lands of the United States will continue to be treated in the budget for these particular subjects.

A sound Federal highway program, I believe, can and should stand on its own feet, with highway users providing the total dollars necessary for improvement and new construction. Financing of interstate and Federal-aid systems should be based on the planned use of increasing revenues from present gas and diesel oil taxes, augmented in limited instance with tolls.

I am inclined to the view that it is sounder to finance this program by special bond issues, to be paid off by the above-mentioned revenues which will be collected during the useful life of the roads and pledged to this purpose, rather than by an increase in general revenue obligations.

At this time, I am forwarding for use by the Congress in its deliberations the report to the President made by the President's Advisory Committee on a national highway program. This study of the entire highway traffic problem and presentation of a detailed solution for its remedy is an analytical review of the major elements in a most complex situation. In addition, the Congress will have available the study made by the Bureau of Public Roads at the direction of the 83d Congress.

These two documents together constitute a most exhaustive examination of the national highway system, its problems and their remedies. Inescapably, the vastness of the highway enterprise fosters varieties of proposals which must be resolved into a national highway pattern. The two reports, however, should generate recognition of the urgency that presses upon us; approval of a general program that will give us a modern safe highway system; realization of the rewards for prompt and comprehensive action. They provide a solid foundation for a sound program.

DWIGHT D. EISENHOWER.

THE WHITE HOUSE, *February 22, 1955.*

(Whereupon, at 11:50 a. m., Wednesday, February 16, 1955, the committee adjourned, subject to call of the Chair.)
