However, Alia warned that not only was the future important but also the present. Thus, for example great care was needed to ensure that the plans for the increase in real income of the people would be fulfilled and also taking into account the need to reduce the differences in the standard of living between agricultural workers.

The following analysis of the economic problems arising from the 1965 and 1966 system rule changes will attempt to show that from a purely economic point of view the decentralization measures of 1966, however moderate, militated against increased efficiency. On the other hand, the PLA's goals of greater control and maintainance of

<sup>65</sup> *Ibid.*

<sup>66</sup> *Ibid.*

<sup>67</sup> *Ibid.*

power in Albania evidently required a decentralization of economic decision-making power. These points will be amplified after a detailed discussion of the actual management problems encountered.

It is perhaps surprising given the PLA's emphasis on ideological and central planning that there should be accounts in the Albanian press in 1967 complaining about widespread private and thus illegal economic activity. In one report Durrë's workers are criticized for failing to denounce "the embezzlers and misusers of socialist property".<sup>68</sup> Another article<sup>69</sup> argues that base party organizations should intensify the class struggle against workers who behave 'as if they were landowners, artisans, and workers in private service, middlemen in the distribution sphere, entrepreneurs for other work etc.' It points out that in Pogradec, Elbasan and Shkodër, among other places, many people were realizing large incomes from orchards in which they were employing others. They were further accused of holding stock until the price was at its highest before selling. The article also indicates that there were a number of private handicraftsmen acting as clothes-buyer, tailors and carpenters among other things without a trade licence. Even worse it is stated that many people employed by the state spent their day at work resting so they could slave at night to earn income illegally. By 1959 most artisans had been brought into co-operatives but this apparently did not prevent them from cheating and failing to declare income. Finally, it is disclosed that there were also private entrepreneurs carrying out repairs and construction work at factory sites, houses and schools. The example is given of two such entrepreneurs who were engaged by a collective farm in Lushnje to build a place of culture for 800,000 leks—the official exchange rate at that time was 50 leks to one dollar. These private builders were allegedly obtaining their resources through bribery and corruption, and were being given their commissions by state or collective employed directors who were behind in meeting their plans. The article concluded that the above problems were not economic but ideological, that bourgeois thoughts from the past were the cause, and if worker persuasion could not solve the problem harsher punishment would have to be used.

The existence of problems such as these in the Albanian economy in March 1967 is clear evidence that the PLA's ideological campaign, which it will be recalled had begun with workers plan discussions in the middle of 1965, was not having the desired impact.

Such predictable problems as the poor quality and shortages of consumer goods<sup>70</sup> and the failure of enterprises to fulfill assortment plans while overfulfilling the plan for global output<sup>71</sup> were also reported. Discontent was expressed with the quality of packaging and content of export goods.<sup>72</sup> The existence of problems in the transport sector is evidenced by the disclosure<sup>73</sup> that state owned trucks and cars were being used for picnics and excursions and the transportation of workers' relatives to various unplanned destinations, and also by the fact that trucks had been discovered travelling on planned routes without any cargo, the drivers being unaware of this. The

<sup>72</sup> *Bashkimi*, September 27, 1967, p. 2.

<sup>73</sup> *Bashkimi*, October 27, 1967, p. 1.

existence of more unusual disfunctions was revealed in an analysis of the Albanian statistical system<sup>74</sup> which may be summarised as follows.

In 1966 two changes had been made in the Albanian statistical system. First, it was decided that 80 per cent of the statistics submitted by the enterprises to the central authorities were unnecessary and consequently eliminated. Second, in order to save the time of experts in the Executive Committees of the people's councils, the ministries and the Directorate of Statistics, it was decided that statistics would henceforth only be sent to one department in each organ. A surprisingly large number of problems had arisen in connection with this apparently simple aspect of the reform. Jakubini argues that insufficient care had been taken to explain to all concerned that along with the reductions in statistical reporting it was "necessary to eradicate and condemn the erroneous concepts of those who overrate records". This was even more necessary now as there had been certain instances of actual increases in data collection. There were also cases of people asking for statistics, when according to the guidelines of the Directorate of Statistics they did not have the right to do so and were thus breaking the law. A typical example concerns the collection of total output statistics by the executive committees and ministries whereas it is stipulated that enterprises should prepare these statistics every three months, some higher organs were demanding them to be submitted monthly. Jakubini points out that in addition to being illegal, this practice also reflected an undesirable stress on globalism when concentration on the quantity and quality of individual goods was necessary. There was also evidence of globalism in the construction and transport sectors although here it was merely undesirable not illegal. Finally, it was indicated that statistics were often being submitted late and sometimes even sent to the wrong place.

The *de facto* decentralization of investment decisions was by far the most critical of these problems from an ideological viewpoint. As part of the 1966 changes in economic planning it has been decided to place enterprise funds for investment and construction under the jurisdiction of the ministries and Executive Committees of the people's councils. These bodies would then be able to determine the precise distribution of funds among alternative projects without the projects being subjected to state bank control.<sup>75</sup> In making this decision the PLA leadership was evidently unaware of the importance of bank control in the classic Soviet model; namely, that—theoretically at any rate—it provides a check on the extent to which subordinate financial units in the hierarchy are carrying out the duties assigned to them. However, as important as it is to have a check on the activity of ministries and Executive Committees in a centralized model it cannot compare with the problems caused by its removal from a decentralized system. In other words, if there is a decentralization of economic decision-making power within the policy, planning and administrative hierarchy—as there was in Albania in 1966—and the authorities do not want this decentralization to spread into the primary economic units then a check on the activity of the regional authorities is necessary.

<sup>74</sup> I. Jakubini, "For a Better Understanding of the Simplification of Statistics", *Ekonomia popullore*, No. 3/1967, pp. 16-33.

<sup>75</sup> Bushkimi, July 25, 1968, pp. 2-3 and *Ekonomia popullore*, No. 2, 1966, pp. 14-27.

While it may be argued that in a centrally administered system, the regional authorities normally have no incentive to relax their control over enterprise directors, the Albanian case is complicated by the ideological campaigns. If a member of a people's council Executive Committee is expected to be ideologically pure it might be in his best interests to spend his time organizing revolutionary meetings of workers, and allow the enterprise director under his jurisdiction—who probably knows more about the economics of the situation anyway—to determine how best to allocate investment funds. From the director's point of view this newly gained power will help him fulfill his plans and thus gain the attendant bonuses. According to official estimates decentralised—illegal—investment accounted for more than 1 per cent of total investment in the Albanian economy in 1968, which may have been no more than the tip of the iceberg. Thus it can be argued that the ideological campaigns led directly to the least desired disfunction possible in a socialist economy—the weakening of the state plan. Articles<sup>76</sup> in the Albanian press in 1968 complained of enterprises embarking on illegal construction projects before the end of the plan period and, being unable to complete them, presenting the planners with a *fait accompli* for the allocation of funds to complete the projects in the next plan period.

The official reaction to decentralised investment was understandably violent although precise details of punishment for offenders have not been published. However, it is clear that the authorities did not associate the problem with the ideological campaigns in the manner argued above. Rather, it was assumed that vestiges of the past and other alien ideologies were to blame, the implication being that the campaigns had not yielded the expected outcomes in terms of political education of the majority of cadres. In the event there has been no further mention of decentralized investment in the Albanian press and the fact that the leadership felt confident in 1970 to embark on a further decentralization—discussed below—suggests that the problem was somehow solved, probably through the reimposition of bank control.

It has already been suggested that the decentralization measures of 1966 may have militated against increased efficiency of resource allocation in the Albanian economy. Since the decentralization of economic decision-making power in a centrally-administered system is generally responsible for greater information flows with the possibility for increased use of commodity-money relations and thus improved efficiency the contention that in Albania the outcome might be expected to differ requires explanation. It was noted above that the Soviet system of plan indicators was not fully adopted in Albania until 1959, fourteen years after the PLA's ascent to power. This delay was not caused by the authorities' unwillingness to centralize the economic system; on the contrary, there were insufficient trained economists to man such a system. Similarly it is doubtful whether the number of qualified cadres necessary to effectively decentralize was present in 1965. Thus, had the PLA acted from a purely economic point of view, they would have kept the country's experts concentrated at the centre until the education system had produced sufficient new

<sup>76</sup> For example, Bashkimi, July 25, 1968, pp. 2-3.

cadres to spread throughout the economy. But it has already been argued that the PLA's goals are not related to neoclassical economics and that the new system rules would be more likely to lead to desired outcomes than the classical Soviet model. Nonetheless, the disfunctions noted above suggested that the new system was not fulfilling the objectives of increased party control at all levels and rapid economic growth rates completely. To be sure, as the discussion in Sections III and IV indicates, the Fourth Five-Year Plan was overfulfilled in most sectors, but this was probably due more to massive capital inflows from China than the efficacy of the planning system.

The two areas in which the system rules might again be changed without difficulty but with the possibility of improved outcomes were the complexity of the indicator system and the distribution of decision-making power between the ministries and the Executive Committees. A reduction in the number of indicators requiring hierarchial approval would ease the pressure on the inexperienced cadres, while a limitation on the number of enterprises under ministerial control to those the production of which represented priority sectors would possibly facilitate economic growth by reducing the burden of non-priority planning hitherto placed on the ministries. That changes along these lines were imminent was indicated when the Ninth Plenum of the PLA Central Committee—convened towards the end of 1969—called for a thorough the re-examination of the planning methodology with a view to improving its “scientific content”.

#### *E. The 1970 Reorganization of the Albanian Planning System*

This part analyses of the changes made in 1970 and their likely impact on the Albanian planning system of the 'seventies. The reorganization of the planning system was announced by Hysni Kapo in his report to the Tenth Plenum of the Central Committee of the PLA in June 1970.<sup>77</sup> He gave the major aims of the changes as being to “do away with routine and raise the work of management to a scientific basis” and to further improve the nature of worker participation in the planning system. On the first point, he did not provide much amplification merely noting that as many workers and cadres as possible must become thoroughly acquainted with the economic laws of socialism, thus providing confirmation of the existence of the cadre education problem suggested above. With respect to worker participation, he argued that the participation of the workers in planning was being stifled by excessive centralization of decision-making on economic issues which could best be resolved at the district level. Thus, whilst the reorganization of 1966 had proved helpful in this regard, it was necessary to expand the competence of the base even further. Kapo also argued that proposals made by workers regarding the productive activity of the enterprise were not finding their way into the plans due to excessive red-tape in the hierarchy. This problem could only be overcome if more enterprises were placed under the control of the Executive Committee of the local people's council and if the number of plan indicators facing the enterprise was reduced and their quality raised.

In terms of a redistribution of economic decision-making power, the 1970 reform appears to have been far-reaching. In 1960 only 20

<sup>77</sup> *Information Bulletin of the CC of the PLA*, No. 3, 1970, pp. 25-75.

percent of enterprises were under the jurisdiction of the Executive Committees. This number had grown to 40 per cent in 1969—accounting for 30 percent of total industrial production—and 80 percent in 1971.<sup>78</sup> (The percentage share in production of these enterprises is not known, but given the small average size of firms, the share is still unlikely to be large).

As to the planning process, this still begins with the PLA which sets the broad outlines for each five year planning period. These guidelines pass from the State Planning Commission via either the ministries or the people's councils to the enterprise. It is within the enterprise that the bulk of the detailed draft planning is carried out. This process is considered in more detail below, suffice it to say that the individual plans of the primary economic units then pass back into the hierarchy to the State Planning Commission, again via the ministry or Executive Committee. It is the task of the State Planning Commission to amend the individual plans in such a way that a single balanced plan for the economy is obtained. When this has been achieved, the plan becomes law and the enterprise receives its tasks for the coming five years. These plan targets are further disaggregated annually, the process of compilation being essentially the same.

At the enterprise level, the drawing up of annual plans begins in July of the pre-plan year.<sup>79</sup> At plant and enterprise levels, commissions of planning are set up, composed mainly of workers. At the brigade level, work groups are established. These commissions and groups analyse the performance of the enterprise over the first six months of the base year with a view to determining possible levels of production for the remainder of the year. This data is then used by the planning commission, in conjunction with the enterprise director, to draw up a set of plan proposals to be put before the work collective. It should be noted that the five-year plan is also taken into account in this procedure.

The next step in the process involves "the organization of ideological and propagandistic work with the workers for the drawing-up of the project-plan". The trade union and party organizations in the enterprise use wall-posters and emulation notice boards to encourage workers to make proposals about ways in which the tasks of the firm may be carried out more successfully. These proposals are then all checked for their likely contributions to productivity, etc. On the basis of the original plan proposals of the commissions and work groups, and the proposals made by workers, the project-plan is drawn up. This plan is then brought before a mass meeting of workers again and, when approved, is sent to the relevant higher authority within the state administration. Following the drafting of the national plan by the State Planning Commission the plan for each enterprise finds its way back down the hierarchy. The final plan is now brought before the meeting of the worker collective and explained to it, particular attention being paid to a discussion of any changes which had to be made by the superior organs.

It must be re-emphasised that the foregoing scenario is designed specifically for the motivation of enterprise workers, the PLA hoping

<sup>78</sup> H. Banja, J. Fullani and H. Papaorgji, *Probleme të organizimit e të drejtimit të ekonomisë popullore në R.P.Sh.* ("Problems of Organizing and Managing the People's Economy in the P.R.A."), Tirana, 1973, p. 326.

<sup>79</sup> Planning at enterprise level is discussed in detail in P. Xhuvani, J. Gorica, E. Sejko and P. Bollano; *Organizimi, planifikimi i veprimtarisë ekonomiko-produese të ndërmarrjeve industriale* ("The Organization and Planning of the Economic-Productive Activity of Industrial Enterprises"), Tirana, 1973.

that it can mobilize the workers to press for higher plan targets than would normally be acceptable to management. Indeed, in complete contrast to the reforms which have taken place elsewhere in Eastern Europe, the position of the Albanian enterprise director has continually deteriorated. Materially, he has suffered several cut-backs of salary, the latest on April 1, 1976.<sup>80</sup> In terms of power, his authority over the activity of his enterprise has been diminished by a change in the Albanian concept of one-man management. Thus, whereas this term had previously been rendered in Albanian as *udheheqje unike*, a literal translation of the Russian *edinonachalie*, one-man management, this has now become *drejtim unik*, 'single guidance', the term always being appended with statements such as 'under the leadership of the enterprise party organization! However, his responsibility for the enterprise's achievements in terms of its plan, remains complete. Finally, the use by the PLA of worker participation and workers' control schemes has meant that the director is now under pressure from both the state hierarchy above and the workers' organizations below. It has already been mentioned that in 1968, enterprise directors benefited from a *de facto* decentralization probably caused by the zealotry of the ideological campaigns and the removal of bank control over investments. Now it appears that this gain has been removed the director has lost most of the decision-making power he ever had.

A phrase often encountered in the Albanian literature surrounding the present planning system is that it has increased markedly the "initiative" of the primary economic units in the planning process.<sup>81</sup> On the basis of such remarks it might be supposed that there has been a decentralization of decision-making power to the enterprise in the manner of other East European reforms. However, as an examination of Appendix II shows the notion of increased initiative could really only be applied meaningfully to the worker participation schemes, specifically in their ideological aspects. The enterprise has only the power to approve plan 8/(c) which deals with the measures to be taken for the exploitation of internal reserves, clearly an area of involvement for worker participation groups and the resident party organization. It should be noted that the planning branch of the enterprise is a management organ not to be confused with the workers' planning commissions discussed earlier.

In terms of further simplification of the planning system, the number of indicators in the plan can be seen from the table to be only 36. This is significant compared with the 77 indicators used prior to 1970, but it is difficult to imagine what the removed 41 indicators referred to, let alone speculate about the nature of the original pre-1966 550 plan indicators. At the macroeconomic level, the planning procedures remain as they were in 1959. Thus, the major method of plan formation remains the "method of balances" and as recently as August 1976, a well-known Albanian economist felt obliged to write that balances were still not being drawn up correctly and for all sectors of the economy. Ideological considerations preclude any discussion of optimal planning of the Albanian economy, mathematical techniques being used only at enterprise level for a discussion of which see Section IV—and at the centre attempts are

<sup>80</sup> Zeri i popullit, 1/4/1976, p. 1.

<sup>81</sup> For example, H. Banja *et al.*, *op. cit.*, pp. 229-245.

being made to compile an input-putout table.<sup>82</sup> However, the table does not appear to have been completed yet and it is noticeable that, after a period of apparent enthusiasm in 1971 and 1972, the number of articles on mathematical economics appearing in the Albanian literature is diminishing. This may be linked to the dismissal of certain economic ministers discussed below and in Section IV.

On the basis of the foregoing discussion it seems reasonable to conclude that the changes made to the Albanian planning system since 1965 have, in economic terms, been concerned with simplification and marginal adjustment rather than radical change. More generally, they have clearly been designed to improve the PLA's control over the economy and increase pressure on enterprise management. At no stage has the notion that economic decision-making should be decentralized to the enterprise been entertained in public although Enver Hoxha, in his report to the Seventh Congress of the PLA in November 1976 accused former State Planning Commission Chairman Abdyl Këllezhi of striving:

\* \* \* in every way to distort the principles of our socialist planning, in order to divest it of its socialist content and to set our economy on the road of revisionist self-management. This hostile, anti-Marxist activity was severely and strongly dealt with by the Party and prevented from finding any field in which it could operate.<sup>83</sup>

In the same report, Hoxha also provides evidence that the planning system is still not functioning as effectively as he would wish but that the PLA has realized the importance of bank control as a check on the system:

By strengthening their dynamic control by means of money, the financial and banking organs must become a barrier to any action which runs counter to the discipline of the plan and financial discipline.<sup>84</sup>

If the suggestion to decentralize economic decision-making was a major factor in convincing the PLA to purge Këllezhi then it can be confidently concluded that the Albanian economic system will not see any reforms of the type initiated elsewhere in Eastern Europe while Enver Hoxha remains First Secretary of the PLA.

#### *F. The Special Case of Collective Agriculture*

The economic activity of Albanian state agricultural enterprises is planned in much the same way as that of industrial enterprises and thus it but remains for this section to consider the internal organization of, and the planning of activity for the cooperative sector of Albanian agriculture.

The management of an agricultural cooperative differs from that of a state enterprise in that the principle of one-man management—however influenced by local party organ participation—is replaced by “collegiality” so that the day-to-day administration of the cooperative in the collective responsibility of a management board comprising the director, one or more deputy directors and certain senior staff.<sup>85</sup>

<sup>82</sup> *Probleme ekonomike*, No. 1, 1973, pp. 55-76.

<sup>83</sup> Enver Hoxha, *Report Submitted to the Seventh Congress of the PLA*, Tirana, 1976, p. 68.

<sup>84</sup> *Ibid.*, p. 70.

<sup>85</sup> A. Kallapodhi, N. Dumani and K. Kote, *Bazat e ekonomisë dhe organizimit të bujqesisë socialiste* (“The Basis of the Economics and Organization of Socialist Agriculture”), Tirana, 1971, p. 523.

Whereas the principle of democratic centralism is officially the sole management criterion in state enterprises, in the cooperative it is supplemented by the concept of "internal cooperativist democracy" whereby the management of the cooperative is elected by the imposition of procurement quotas, supplemented by the advice of the local PLA and Executive Committee and accountable to, its members.<sup>86</sup>

Up to 1971 the income of members of cooperatives were a combination of payments in cash and in kind as a labour-day divided and the produce of their household plots.<sup>87</sup> The plot had been diminished several times under PLA pressure in the last ten years, on each occasion the government offsetting the income foregone by increases in agricultural procurement prices, reductions in the prices of goods bought by farmers and, most recently, the payment of state pensions to eligible farm members. The increment in procurement prices was not accompanied by a rise in retail products (which overall have slightly fallen) and the difference has been subsidised 27 mn.leks in the three years 1967-69<sup>88</sup> and "hundreds of millions" in the six years 1970-75.<sup>89</sup>

In 1971 the system of collective remuneration was brought in line with practice elsewhere in Eastern Europe by the introduction of monthly advances, aggregating 70-80 percent of the labour-day dividend, the remainder to be paid at the end of the year to the extent that the plan is fulfilled.<sup>90</sup> More importantly, that year (on July 15) a new form of collective was introduced: The 'higher-type agricultural cooperative'<sup>91</sup> is an ingenious solution to an ideological problem of some importance to the PLA.

Soviet ideology during the Stalin era required that the mechanization of collective agriculture be undertaken via state-owned machine and tractor stations (MTS) because the transfer of capital goods from state to group ownership would represent ideological retrogression.

The PLA has never changed its position on this issue and has always criticized the USSR harshly for abolishing the MTS. Of course, the provision of machinery was never the sole MTS function in the Soviet Union or Albania. In both it was responsible for agricultural procurement, it had to assist in the collectivization drive and, perhaps most important in Albania, the MTS was charged with spreading the PLA's message among the peasants. Hence for the PLA the MTS remains an indispensable unit of organization in agriculture.

On the other hand as can be seen from the discussion in Section III, plan fulfillment has always been a problem in Albanian agriculture and increased capital investment in the cooperative sector was essential if crop yields were to be raised to a satisfactory level. The ideological considerations just described meant that investment in the cooperatives could only take place on the basis of internal accumulation, short-term state aid and long-term bank credits. Thus

<sup>86</sup> *Ibid.*, pp. 520-521.

<sup>87</sup> *Financat e ndërmarrjeve dhe degëve të ekonomisë popullore* ("The Finance of Enterprises and Branches of the People's Economy"). Tirana, 1972, Part II, p. 130.

<sup>88</sup> *Ibid.*, p. 116.

<sup>89</sup> *Albania Today*, No. 1, 1976, p. 20.

<sup>90</sup> *Financat e ndërmarrjeve . . .*, loc. cit.

<sup>91</sup> *Gazeta zyrtare*, 8/1971.

in 1970 in comparison with state farms, food grain yield was only 85 percent, cow milk yield 47 per cent, the level of mechanization was 64 per cent and the volume of annual investment, 60 per cent.<sup>92</sup> But it is clear from these figures—although the former Minister of Agriculture, Piro Dodbiba, did not choose to draw the conclusion—that in grain and milk production, the cooperatives were achieving higher levels of output per unit of mechanization and investment than the state farms.

The higher-type cooperative continues to receive short-term state aid but long-term bank credit has been replaced by direct investment out of the state budget. The state becomes a part-owner of the cooperative to the extent of its investment in it. In this way the ideological standing of the investment remains unaffected. Remuneration of members is also by a method intermediate between those for cooperatives and state farms. Thus, workers in the higher-type cooperatives are paid 90 percent of their wages, determined by planned norms, fortnightly and the remainder at the end of the year provided the plan has been fulfilled.<sup>93</sup> The difference between this system and that operative for ordinary cooperatives is that in the latter case payment is based on labour-days where in the case of the higher-type cooperative, wages are tied to the fulfillment of the production plan, which is no longer determined internally but, as with state farms, as part of the state plan.<sup>94</sup>

The provision of machinery for the higher-type cooperative provides a further example of ideological ingenuity. Whereas the state farm owns its machinery and the average cooperative is one of several being serviced by an MTS, each higher-type cooperative has the exclusive services of an MTS. Thus, the agricultural machinery remains *de jure* state owned but in terms of availability to the cooperative there has been a *de facto* transfer of control.

The aim of the PLA with respect to agricultural organization is the conversion of all ordinary cooperatives into higher-type cooperatives and ultimately the complete elimination of group and private ownership. However, for the moment at least, members of higher-type cooperatives are still entitled to a private plot. The prerequisite for transition from ordinary to higher-type cooperative status has been and continues to be "economic strength", thus the cooperatives must, in some undefined sense, be ready for ideological advancement.<sup>95</sup> By 1976, higher-type cooperatives occupied 23 percent of the arable land and produced 25 percent of the grain, 40 percent of sunflowers and more than half the rice and cotton produced by the cooperative.<sup>96</sup> No higher-type cooperatives have as yet been transformed into state farms, nor has a clear transition mechanism been defined. As Enver Hoxha put it in 1971:

Life, the revolutionary practice of our socialist construction, will show us later the other stages through which this process will have to pass. It will indicate the measures that should be taken to gradually eliminate those differences which exist today between these two forms of socialist property.<sup>97</sup>

### III. OVERALL ECONOMIC PERFORMANCE\*

The present section deals exclusively with the inputs of labour, capital and technology to the Albanian economy and the main results of each Five-Year Plan. As already mentioned in Section I, the paucity of documentation—not least the lack of capital of output aggregates—preclude the application of any sophisticated statistical method of analysis. Similarly no attempt is made to evaluate changes in consumption during the period of central planning, but two relevant tables are added at the end of the Section. Table III-8 cites retail prices under food rationing, ended on January 1, 1956, and in 1970. The latter are shown against comparable prices in the Kosovo Autonomous Province of Yugoslavia, in part amplification of the discussion in Section I. Table III-9 sets out the official series on the consumption and accumulation funds: in the sixties the size of the former rose 88 percent. Although the trend of factor price relatives seems to conflict with statements on the decline in retail prices, they can be made compatible by the existence of price subsidies. An article in *Albania Today*, No. 1, 1976, p. 20, for example, reported that hundreds of millions of leks were paid as subsidies in 1970-75 because farm procurement prices exceed retail prices and that 140 mn leks had been paid over the same period in subsidies to industrial production.

#### A. Manpower Policy

The vast increase in the Albanian population described in Section I has posed, and will continue to pose fundamental problems of job-creation. The central planning mechanism discussed in the foregoing Section II had its solution as a prime aim. It was in emulation of the Soviet model that the First Five-year Plan (1950-55) promoted migration from rural occupations to staff new mines and factories, most of which were situated in a few of the larger towns or with settlements which were later classified as urban. The cancellation of major projects after Stalin's death reduced job-creation while the migration to towns continued, for there neither was nor is any legal direction of unskilled labour in Albania.<sup>98</sup> Urban unemployment became serious in 1955-56, exacerbated by the nationalization of trade and handicrafts, and a campaign was instituted to send "idlers" to the villages, then still uncollectivized and where a little extra under-employment in almost totally labour-intensive farming would result in stretching food supplied among the rural population, rather than require the specific upkeep of unemployed in towns. As Table III-4 (discussed further in C below) shows, the industrial output increment between 1950 and 1955 was based more on new manpower than on productivity, and the non-farm labour force increased from 75,700 to 122,000.

The Second Five-Year Plan (1956-60) resumed the industrialization drive, although in a different form, notably with an export orientation, based on the exploitation of local resources and in somewhat smaller units than previously. A recent analysis identified 1954-60 as the peak period for rural migration to the towns.<sup>99</sup> The outflow was controlled

\*This section was prepared and written by Michael Kaser. See end of section for tables related to section.  
<sup>98</sup> The reverse is the case: socialist enterprises compete with each other for labour. Thus *Bashkimi*, June 13, 1970 criticized the "many enterprise directors" who recruited workers without informing the cooperative farm or village enterprise where they worked.

<sup>99</sup> I. Rama, *Kruga e paritet*, No. 5, 1975, pp. 36-45.

and both investment and work organization were more effective. The 179 per cent rise in global industrial output was contributed to by a 70 per cent increase in productivity, the labour intake thus being 64 per cent, confirmed by a rise in industrial employment (including nonmanual workers who do not figure in the numerator of the labour productivity division) from 49,800 to 70,900 between 1955 and 1960 (alternative figures are used in Table III-4). Collectivization reduced the outflow from rural areas, partly because farmers wanted to register as members so as to retain a right to the dividend (which at the time was calculated on the basis of rent for land brought in to the cooperative as well as on the current labour contribution), and because labour requirements on the new cooperatives rose at least for an initial period as new common services and structures had to be built (a central administrative office, barns and stables, clubs) as well as increased social service facilities (schools, health centres) and roads.

Mechanization has been very slow to come in Albania and even though the official statistics show a rise in the number of tractors from 285 in 1950 to 8,185 in 1973,<sup>1</sup> photographs of leading farms and brigades in the agricultural monthly *Bugjë sia socialiste*, continue to this day to be of manual methods. Although editorial preference for honouring labour would favour such processes for illustration, the processes shown are usually such that they would not be undertaken by hand if machines were available. A further reason for the slowing of the migrant flow was the reduced requirements of industry. Faced with a complete stop to trade with the USSR (see "Trade and Aid in the Albanian Economy" in this volume) and a severe curtailment of that with other members of Comecon (with which Albania was severed at the end of 1961), 'make do and mend' became the order of the day. As Section IV shows the principal branch of industrial expansion in the 1961-65 Plan was the engineering industry, predominantly making spare parts for the equipment previously imported from the states which imposed an embargo. These tended to be more labour-intensive than the completely new factories put up in the fifties, so that some migration from farming was required and encouraged. Employment in state industry in 1965 was 86,000 (or 83,000 on the series used in Table III-4). This was exactly the same (22,400 against 21,000 as in the preceding five years.<sup>2</sup>

By the end of that plan period, rural areas were beginning to reap the reward of improved postwar health services and the natural increment for that plan period and the next was about enough for agricultural needs. The non-farm sector from 1966 to 1975 (a period of two Five-Year Plans with more modest industrial targets—50-54 per cent planned in 1966-70 and 61-66 per cent in 1971-75), managed with urban manpower (increasing the female participation rate) and with some labour-saving investment and rationalization. From 66,500 in 1965 industrial employment rose to 133,600 in 1970 and 161,000 in 1973. No figure has since been published.

With 1975, however, came a reversal of the village-urban flow and to utilize manpower in rural areas a new 'back to the village' campaign was launched: new factories were to be sited in rural zones to utilize local manpower without the need for social infrastructure invest-

<sup>1</sup> *80 vjet . . .*, p. 129.

<sup>2</sup> The 1960 industrial employment figure was revised from 70,885 in the 1965 Yearbook to 66,460 in that for 1967-68 and in *80 vjet . . .* as annual averages and to 64,421 as the end-year total in that for 1969-70.

ment in the towns.<sup>3</sup> By the next year it was possible to contend that there was excess manpower in the towns while villages were short of labour.<sup>4</sup>

Government publicity to foster the return flow placed stress on the increase in amenities in the countryside. Complete electrification, i.e., a power supply to every village was declared in 1971 and shops, housing, schools, health services and entertainment were said to be the equal of those to be found in towns.<sup>5</sup> It was observed that a number of those who lead the 'return to the village' movement did not settle there themselves: they were chided for not appreciating that villages had the same facilities as the towns,<sup>6</sup> but opportunities are more limited than in the towns. Thus a report on the Durrës district questioned the teaching of arts subjects in rural schools and demanded that they adopt a curriculum directed towards farming.<sup>7</sup>

Furthermore, there was a certain drift from collective farming into the private sector, both as collective-farm members devoted more attention to their household plots or to their own livestock<sup>8</sup> (a widespread reaction wherever collectivization is in force), undertook side-line activities in the village,<sup>9</sup> sold their produce in relatively distant towns (a revival of such commerce was particularly noted in 1976<sup>10</sup>) or set themselves up in urban small business.<sup>11</sup> Labour exchanges were established to bring order into the cross-movements of migration, but their function was said to be misunderstood and their operation 'bureaucratic': they were reportedly too concerned with employment in urban areas, where there was surplus labour. No manpower requirements had been properly established (according to the same report, of mid-1976) and labour exchanges should, it was argued, devote time to analysing which jobs, traditionally done by men, should be transferred to women.<sup>12</sup>

The place of female labour in rural manpower policy has been much to the fore in recent public discussion. On the one hand, the return to the village campaign has been partly directed towards young women. In 1975 some girls (many against the advice of their parents) settled from the town of Kavaja in villages. 'Now that they have overcome their initial difficulties they are completely happy'.<sup>13</sup> Much of the youth recruitment for agricultural or transport construction is on a temporary basis and (as the closing remarks of Section I observed) at least partly intended to break down traditional constraints on occupational or social mobility (e.g. to reduce the dominant role of the male generally and the subordination of the wife in particular).

Especial attention has been paid to training women as their customary relegation to unskilled tasks remains tolerated: 'they are allocated dirty, menial jobs because they are not considered good enough for specialist training, but this decision is taken without giving them even a chance to show what they can do'.<sup>14</sup> Women are

rarely given positions of responsibility (only 1 in 100 cooperative-farm chairmen are women). the Albanian Women's Union noted in its report in 1975<sup>15</sup> and in the more backward regions, such as the Mati district, women are employed to carry goods within (and even beyond) the enterprise, when animals or vans should be used.<sup>16</sup>

Hoxha made a notable gesture to raise the status of women, notably in farming, in replacing in 1976 the male Ministers of Agriculture and of Education by women each from the field and neither with no previous experience of government office (one was a cooperative-farm chairman, the other a school teacher).

That move was consonant with an embrace of egalitarianism which had striking effect in 1976 in a reduction of upper salaries (those above 900 leks a month were cut on a scale running from 4 to 25 per cent). The average salary was thereby cut to just double the average wage (1976), whereas in 1967 it had been 2½ times the average wage. Within wage-scales the spread between the highest and the lowest grade was considered too wide even at a mere two-thirds (in 1967) and the lower wages (and guaranteed dividends of collective farmers) were raised in the 1976 wage reform.

The Report of the Chairman of the Council of Ministers, Mehmet Shehu, to the VII Party Congress in November 1976<sup>17</sup> observed that the monthly salary of a director of a state enterprise was that year only 70 per cent above that of a manual worker and that that of a director in a ministry was only double a worker's pay. The skill differential among workers had been cut to something like 1:1.5 or 1:1.65 according to branch. The egalitarian pay policy links with official pressure on white-collar workers to engage in manual labour for approximately 30 days each year, as fulfilment of the ideological aim to assimilate work by hand and by brain.

That general policy has had a specific manpower allocation aspect in campaigns to diminish white-collar employment, as demanded by the Party Central Committee in its "Open Letter" of March 4, 1966, to which reference has been made in the context of management in Section II, where the consequences of that requirement are fully considered.<sup>18</sup>

As Table I-3 shows, the reduction of the central administration made little effect on the share of white-collar personnel in state employment. By 1973 they constituted 23 per cent, against 24 per cent in 1960.

### B. Policy on Material Inputs

The corollary of a policy of labour intensity for the production of goods, as opposed both to capital-intensity or the generation of "non-productive" services, has been the economy drive for materials (*regjimi i kursimit*). Two features are reserved for analysis in the ensuing sections. The article, "Trade and Aid in the Albanian Economy" (in this volume) points out how the rupture of Albanian commercial relations with its former partners in Comecon and the government's unwillingness to intensify the modest trade with the West brought many domestic shortages. Section IV looks in detail at

<sup>15</sup> *Zëri i popullit*, February 14, 1976.

<sup>16</sup> H. Canamei, *Bashkimi*, June 29, 1976.

<sup>17</sup> *Zëri i popullit*, November 5, 1976.

<sup>18</sup> See p. II 22 above.

the provision of spare parts and components to meet the shortfall in imports. In the present context, amplifying the discussion of the previous Section, the issue is the policy of "taut" planning, i.e. of reducing to a minimum the inventories, intermediate goods, justified by the period of production and reducing wherever practicable the authorised volume of inputs per unit of production ("technical input norms"). The consequences have been shortages at all levels of fabrication and distribution, which could, by halting output for lack of supplies have created bottlenecks in deliveries of current goods or led to an underutilization of the principal scarce factor, capital assets, the cost of which exceed the increment in production elsewhere due to lower inputs per unit of output. Although on Albanian calculations along these lines seem to have been published, the ambition of production targets in relation to inputs provided at the available technology was potent in the severe underfulfillment of the 1971-75 Plan.

A peak of campaigns for economy was begun in 1972, the Plan having been enacted at the end of the previous year. Thus the Party newspaper in February castigated four of the main towns for excess consumption of electricity (running at an average of 10 percent greater than planned, with 20 mn kWh said to have been consumed "without real need" during 1971 in "offices and workshops"). Civil servants and factory administrations said to be careless about waste in their offices or plant and farmers were taken to task for keeping lights on in cattle sheds.<sup>19</sup> An editorial later in the year called for stricter control (*forcuar disiplinën*) over technical input norms for building materials, especially those in short supply: where norms had been sanctioned only "provisionally", prompt verification of actual needs was required.<sup>20</sup>

Frugality had always been praised: an article in the Party monthly in 1970 had observed that it was not a sign of poverty or weakness but, as Marx termed it, "a saving of time". The inculcation of the economic use of resources should hence not be by a single campaign, but a cooperative action by all, for which each saw his interest in the consequential growth of output, which should be continuously respected.<sup>21</sup>

It came to be realised that so far as household consumption was concerned, the low prices charged for public utilities—intended to assure access to them by the poorest—conduced to waste.<sup>22</sup> For industrial consumers conditions of intermittent supply of inputs generated informal arrangements well-known in the Soviet Union—of "barter" agreements outside plan contracts between enterprises and the employment of "fixers". This was denounced as "liberalism" (one of the designations then being used for actions in governmental disfavour) and the need emphasised the conclusion and exact fulfillment of plan contracts.<sup>23</sup> Such "liberalism" in the infringement of plan provisions was "nothing but anarchosyndicalism", claimed the Party journal, although the imposition on enterprises of input norms and other

<sup>23</sup> *Bashkimi*, March 19, 1974.

indexes which were infeasible smacked of its antonym, "bureaucratism".<sup>24</sup> The need to chart a careful course between the two extremes was stressed in the context of input-output relations on many occasions. A well-known economist pointed to the bottlenecks caused by a deviation from a planned output needed as a further input,<sup>25</sup> while the Minister of Finance looked at the aspect of excess consumption of intermediate goods, notably in the increment of stocks above those authorized in a "taut plan".<sup>26</sup> The failure of producer-goods enterprises to meet the technical quality or performance parameters of customers could also nullify the input-output relationships planned,<sup>27</sup> just as similar short-comings by consumer-good enterprises led to the accumulation inventories in the retail sector which are unsaleable (similar in effect to excess ordering by retailers, also seen as prevalent, at least in some districts).<sup>28</sup>

### C. Production Results

The technique to assess the success of combining a superfluity of labour with an exiguity of producers goods is readily to hand, but production-function analysis requiring time series well beyond those which Albanian statistics offer. The absence of manpower data beyond 1960 and published capital stock returns preclude the application of any statistical measurement. The only aggregative output series free duplication arising from organizational characteristics (such as vitiate gross social product and its origin components) which has regularly appeared is net material product (NMP). As noted in Appendix I (section A), the Laspeyres formula, spliced for changes in price-base, would tend to exaggerate increments in comparison with a Paasche weighting, but the dynamism of the official series in Table III.1 is not unrealistic. At 1971 prices NMP per head of population would have been 1,192 leks or \$95 at the 12.50 lek rate as used in Section I above.) If GDP exceeded NMP in 1950 by the same ratio as Table I.1 estimates for 1970, i.e. by 27 per cent, GDP per head would have been some \$120. Although this can be only an order of the broadest magnitude, the transformation of Albania from an economic level of the really poor to one of intermediate development cannot be gainsaid. As Table IV.15 shows, industry and handicrafts contributed not much more than one tenth of NMP on the eve of the First Five-Year Plan, say \$13 mn at 1971 prices or a mere \$10 per head.<sup>29</sup> If the 1980 target is exactly fulfilled, NMP will have risen 9-fold since long-run planning began and, in 1971, prices just exceed \$1 bn. At a projected mid-1980 population of 2,721,000,<sup>30</sup> this would furnish \$385 per head or—assuming again an unchanged relative contribution of 'non-productive' services—of some \$490.

Five-Year Plans have not however been systematically fulfilled and Albania has the worst record in East Europe of failure to achieve its long-term targets. The record is set out in Table III.2, but the causes are chiefly exogenous.

<sup>24</sup> *Rruga e partisë*, No. 11, 1973, pp. 21-30.

<sup>27</sup> *Bashkimi*, November 12, 1975.

<sup>28</sup> J. Mihali, *ibid.*, June 19, 1976.

<sup>29</sup> Applying the breakdown of NMP by industrial origin in Table IV-15 to the lek value for 1990 NMP in Table III-1 in 1971 prices shows industry to have generated 160 mn leks. At 1970 dollars this would have been \$12.8 mn.

<sup>30</sup> Projection as used for Table I-4.

The First Five-Year Plan (1951-55) was drawn up when other countries in Comecon (which Albania had joined soon after its establishment in 1949) were revising their producer-goods targets upward. The directive to seek self-sufficiency in "heavy industry" was of Soviet origin, and, having just dissociated itself from Yugoslav tutelage under Soviet sponsorship, the Albanian government was responsive to the call. By 1953, when in the U.S.S.R. the administration succeeding Stalin declared itself for more priority to the consumer and workers rioted in East Berlin, the pressure to devote resources to high-cost capital projects was relaxed also in Albania. The Çerrik oil refinery and the Mati Hydroelectric Plant were postponed to the next plan period and the project for a steel smelter at Elbasan was shelved, not to be revived until the plan for 1971-75. The 1953 review also revealed the weakness of the Albanian fuel base, and prime attention was transferred from exploiting its poor quality coal to seeking more oil, a prospecting shift which soon yielded concrete benefits in striking a gusher of lower-sulphur content in 1957.<sup>31</sup>

The move from coal to oil was also a feature of Soviet energy policy after Stalin's death. Although Albania kept up its net fuel exports (crude oil sales rose from 67,200 to 123,700 tons, whereas coke imports increased only from 2,203 to 4,700 tons), the shortfall in its energy targets was a major factor in the general industrial underfulfillment.<sup>32</sup> Agricultural policy was also revised; concessions to the peasantry in 1953 included an abolition of grain delivery obligations in the highlands, a halving of quotas elsewhere, the exemption of farmers without livestock from meat or wool deliveries (which they had had to furnish from sales of their crops, on which quotas were already levied) and in 1955 state procurement prices were raised. Both relaxations corresponded to those undertaken in the U.S.S.R., but came too late to salvage hope of achieving the high target (unrealistic as it may have been in the first place) for farm output. A vast disparity between plan and achievement was also shown for transport, but this was partly due to abandoning a railway scheme to link the Memalia coalfield with the port of Vlore (never since revived because of the substitution of oil).

The concessions to farming and Soviet advice to concentrate on the export of fruit and vegetables induced the PLA to put ambitious 1960 goals for what was then the largest contributor to national product. The extent of melioration work in the littoral also led to high hopes of early returns—23,300 had been affected in 1945-50, 30,400 in 1951-55 and 38,300 in 1956-60. Unfortunately return drainage was neglected and salination reduced expected crop yields until corrective works were undertaken. In the event, farm output gained only 26 percent in 1956-60 against a plan which at its maximum revision was for a 77 percent increment.

Industry on the other hand made a much better showing than the Second Five-Year Plan envisaged, the rise being reported as 118 percent against a target of 92 percent. Much of the greater output must have been due to Soviet credit deliveries of industrial equipment and

<sup>31</sup> The technical characteristics of Albanian crude (as opened up after 1925 by a private firm, Società Italiana Miniere di Selenizza (i.e. Selenic®) the Italian State Railways and a forerunner of ENI, the Azienda Italiana Petroli Albania) required refining in special equipment in Bari (M. Magini, *L'Italia e il petrolio tra storia e cronologia*, Rome, 1978, pp. 27, 45).

<sup>32</sup> See *Economic Survey of Europe in 1960*, chapter VI, p. 9.

a calculation published in 1959 put output by installations of Soviet provenance at 25 percent of global industrial production.<sup>33</sup> The U.S.S.R. had supplied 90 percent of the plant for the oil industry and of the lorry park, and 65 percent of agricultural machinery (82 percent of tractors). In no earlier or later quinquennium was investment so dynamic, the rise reportedly being 86 percent over the period (Table III.2) and the share of accumulation in NMP utilized rising from a mean of 25.6 percent in the First Five-Year Plan period to 27.0 percent in the Second (Table III.3). It was also the period of the fastest rise in net industrial output per man. As Table III.4 shows, it gained 67 percent between 1955 and 1960, against one of only 12 percent in the previous five years and 17 percent in the next. The 1965-70 period, though better than its preceding, showed only a 26 percent improvement.

The gain was certainly due to the capital intensity which was supported by Soviet-assisted imports, and which was signified by the return of urban dwellers to the villages. Mention has been made of that policy change in A above. Addressing the IV Congress of the Albanian Women's Union in October 1955, Enver Hoxha called for the return to the villages of "the thousands of Tirana citizens who are idle for one reason or another."<sup>34</sup>

The severance of Albania from Comecon and the rupture of diplomatic relations with the U.S.S.R. at the end of 1961 terminated the reliance on capital good imports and a new period of labour intensity was begun. In the 1961-65 Plan period, the industrial labour force increased by one quarter (25.3 per cent, as Table III.4 indicates), but the output plan was seriously underfulfilled (by 9 per cent, as Table III.2 shows).

Collectivisation (completed in 1965-66 in the highlands, but by 1960 in the more productive lowlands)<sup>35</sup> was not a significant factor in the underfulfillment 75 per cent of the 1965 target for agricultural output, but rather the transfer of manpower into non-farm employment. Although Chinese assistance met some of the more acute shortages and contributed some capital equipment, it was in no position to make substantial assistance available after the change of plan when the "Great Leap Forward" was halted. Its distance as an ally, the withdrawal of the Soviet submarine base at Vlorë and tension with its neighbours<sup>36</sup> evoked a major defence effort and the share of accumulation, of which much of the increment must have been military hardware, rose to 28.8 per cent (Table III.3).

The Fourth Five-Year Plan began under equally inauspicious conditions, but caused by domestic, rather than external, political factors. The Central Committee's Open Letter of 1966, to which reference has already been made, cannot but have induced difficulties at the enterprise level. As Section II describes, the years 1965-66 marked the transition from a Soviet-type of planning and management to a specifically Albanian practice, in which ideological and moral outcomes ranked higher than economic results. The detailed survey of industry in Section IV puts the opening of the phase of 'the scientific technical revolution' in 1967.

<sup>33</sup> H. Banja, *Ekonomia popullore*, No. 6, 1959.

<sup>34</sup> Cited in *Economic Survey of Europe* in 1960, Ch. VI, p. 8.

<sup>35</sup> Collective output as a percentage of total global farm output was 66 in 1960 and 77 in 1970 (30 vjet . . . , p. 104).

<sup>36</sup> The state of war with Greece, dating from 1950, remained in force and the strength of relations with Yugoslavia were the inverse of Albania's relations with China.

In the event, industrial-production structure was much improved. Net output more than doubled, whereas global output rose by 83 per cent: duplication of material inputs was reduced by 13 per cent, indicating more in-factory production and hence a higher ratio of value-added per unit of sales. The 83 per cent rise in the aggregate value of sales was well above the 50 to 54 per cent increment specified in the Plan and the Albanian government had good reason for self-congratulation in the industrial sphere.

Agriculture by contrast, was less successful in relation to the objectives posed. A large ploughing-up campaign brought in more arable land, but the hopes that farm output would rise almost as rapidly as was expected for industry went unfulfilled, although the 28 per cent increment reported was not unhealthy. Melioration work covered 43,774 ha in 1966-70 (against 24,992 in 1961-65), of which 11,398 was new land. Despite the rise in arable area, the acreage per tractor HP available fell by 1970 to 825 hectares (against 1,545 in 1960).<sup>37</sup>

The pattern of the ensuing Plan, for 1971-75, remained ambitious, for (as Table III.2 shows) global industrial output was to increase by 61-66 per cent and agricultural output to grow even faster, at 65-69 per cent. Industrial output, as Section IV describes in more detail, decelerated in the later years of the Plan (see Table IV.16) and by 1975 the annual rise was a mere 4 per cent. Overall, the rise for the five years was 52 per cent in global terms, but no data can yet be compiled on a net basis. Farm output showed a one-third increment, valuable in itself, and by 1976 self-sufficiency in grain was achieved.

The policy disputes which rent the Party leadership since 1971 have already been discussed at various points above and in Section IV, but it was not until October 1975, when the three ministers with economic portfolios were dismissed that the struggle within the PLA demonstrated major differences on economic policy. The denunciation at the Seventh Party Congress in November 1976 of those dismissed for 'sabotaging' the oil industry and for favouring self-management indicated that both issues of economic performance and of management were involved.

The current Five-Year Plan poses more modest industrial growth targets than under any previous long-term plan (41 to 44 per cent) and, though the annual plan for 1976 was for only 4.5 per cent, that for 1977, at 8.9 per cent, indicated a stepping-up of industrial expansion. The farm output target of a 38-41 per cent rise by 1980 was almost as large, but 1976 showed a bumper crop, global agricultural output being 30 per cent up thereby, as just noted, reaching the self-sufficiency in grain. As Table III.5 shows, although much has been done in some crops to raise yields over the past quarter-century, they remain low by European standards, except for grain. The time series on agricultural credit ends too early to describe recent changes in policy towards farmers, but funding seems to have reached a peak at the turn of the decade, with lower levels registered for the early 'seventies (Table III-6).

#### *D. The Dispersion of Development*

Little changed economically from the Turkish period as it was on the eve of the Second World War, Albania as a whole was an under-developed country; some regions, however, had benefitted from such

<sup>37</sup> *Ibid.*, p. 129.

impetus far more than others. In 1938 the towns of Tirana, Korça and Shkodër and their surrounding areas generated 43 percent of the combined output of industry and agriculture of the country, whereas the five least developed regions (Dibra, Elbasan, Fier, Kukës and Mat), which comprised triple the population of the three most developed regions, produced a mere 14 per cent. The disproportion was still more severe if industry and handicrafts are taken separately: the three best off, together with Berat and Durrës, with 35 percent of the population, produced 80 percent of national output, while only 0.5 percent was produced in the six most backward regions (Gramsh, Kukës, Librazhd, Mat, Permët and Tepelenë) which had .16 percent of the country's inhabitants.<sup>38</sup>

In the first twenty years of planned economic development, industry was predominantly established in and near towns where a beginning had been made before the Liberation, including under the Italian occupation. Thus, by 1967, Tirana, Berat, Durrës, Elbasan, Fier, Korça, Shkodër and Vlorë regions produced 45 percent of all engineering goods and 62 percent of glass and ceramic ware. Durrës alone produced 12 percent of total gross industrial output, Fier 7.8 percent and Elbasan 7.6 percent.<sup>39</sup> Some concentration of industrial investment in the capital, Tirana, was inevitable, and, being the major centre of population, has, not unreasonably, been made the main centre of 'light' industry; half of the region's gross industrial output in 1975 was of foods and other consumer's goods. Similarly, the chief port, Durrës, and the principal towns of each group of the Albanian population (the Geg Shkodër and the Tosk, Korça), were fairly equally developed, the Elbasan, the main 'mixed' town—so much so that its dialect was seen before the War as the basis of a unified language—was transformed from the sleepest of Turkish-type market towns to a centre of large-scale industry, of which the metallurgical combine stated in 1975 was the biggest single contributor, based upon the iron-nickel ores in the vicinity, which were opened up on a larger scale in the sixties. Vlorë received its postwar development (1973 output was 43 times that of 1938)<sup>40</sup> from the location there, until 1962, of a substantial submarine base, and munitions and military-support enterprises. have remained its backbone when isolation from its sole ally, China, led to a considerable expansion of domestic defence facilities. The town and port remain closed to all foreign visitors, because of its military orientation, but the town of Vlorë, which in 1973 produced 7.9 per cent of national industrial output, also had a number of plants in the chemical (calcined soda, polyvinyl chloride and pharmaceuticals), electrical (light blubs and incandescent tubes), oil, cement and food-processing sectors. It was gradually regaining (as Table III.7 shows) its share at the start of industrialization.

The expansion of the extractive sector, either to supply this industrial growth of as exports, particularly copper, iron, nickel, oil and building materials fostered some dispersion; Albanian statistics of gross industrial output include mining and quarrying. Thus the eight most industrialized regions named above produced only 28 percent of building materials, in 1967, although some regions remained

<sup>38</sup> E. Luci, *Economia popullore*, No. 1, 1970, pp. 54-59.

<sup>39</sup> *Ibid.*

<sup>40</sup> *Zëri i popullit*, March 23, 1974, cited this as output of the town, which produced 69 per cent of the region of that name.

without much of either mining or manufacturing.<sup>41</sup> Dibra, Kukës, Librazhd, Mat, Puka and Tepelenë were on that list, which differs from those at the bottom of the pre-war ranking by the promotion of Elbasan, to the metallurgical combine of which reference has already been made, and of Fier, where a nitrate ammonia works was an introduction which led local industrialization. Ten years after that date, Librazhd will have moved into the more developed group with the extension of the 'Elbasan-Librazhd Industrial Complex' covering three other towns, Qërrik (previously developed as the national centre for oil refining and petrochemicals), Peqini and Prrenjasin. By 1972 the Complex was producing about 30 percent of the country's industrial output, not only in ferrous metallurgy but locomotive-building (for the lengthening railway network) and cement-making and prefabrication.<sup>42</sup>

The scant progress made by the Mat region has some political significance. The Mati tribe was that of King Zog, highlanders of a tradition of fierce autonomy. One of the first major projects of the fifties was a substantial hydroelectric station and in the "seventies the railway was pushed north to open it up to modern communications. But no significant manufacturing was set up and the Party Leader, Enver Hoxha, took the occasion of attending a meeting of the Regional Party Committee in February 1972 of a policy statement that building new enterprises could often be replaced by the merger of small workshops, which could be thereby rendered more efficient and require fewer managerial and clerical staff per unit of output.<sup>43</sup>

His statement was followed (in a journal published in February 1973<sup>44</sup>) by an analysis of the economies of scale, e.g. that engineering enterprises with an annual output of 50 to 100 mn leks showed a labour productivity ranging from 1.5 to 2.5 times the mean of those with an output of only 2 mn leks. But the study did show that in Albanian magnitudes a fairly high level of concentration had been reached. In 1972 enterprises within the administration of the Ministry of Industry and Mining which employed over 500 staff (constituting 42 percent of those enterprises) produced three-quarters of industrial output; those of that size under the Ministry of Construction (30 percent of those enterprises) undertook four-fifths of building work, by value.

The contrary policy conclusion was, nevertheless, reached in an article which appeared later that year. In Korça region, it noted, there were eleven abandoned small power stations, already in disrepair since the villages they supplied had been linked into the national grid. The need for electricity remained so deficitary that local stations were still needed and every effort was called for to put such small stations back on stream, for the capacity already in them could furnish about 35 percent of the region's requirements.

Among the industrial projects for the Sixth Five-Year Plan are a hydroelectric station at Fierza, the completion of units at the Elbasan metallurgical works, a ferro-chrome refinery at Burrel and a copper refinery at Laç. Melioration work in Velipoja and Karavasta and irrigation in Mallkastra are, with further reservoir construction in the mountains the main construction objectives in agriculture. The rail-

## IV. THE DEVELOPMENT OF INDUSTRY\*

A. *Albanian Industrial Development Prior to 1965*

This paper analyzes the attempts made by the Albanian Party of Labour to industrialise the Albanian economy since 1945. The discussion is divided into two parts which reflect the distinct phases of the industrialization drive. During the first phase from 1945 to around 1965 the only discernable feature of an industrial development strategy is the stated determination to increase the share of heavy industrial output in total industrial production at the expense of other sectors of the economy. Albania's reliance on material aid from first, the Soviet Union, and then, China, led to unplanned variations in rates of growth of Albanian industrial output, being determined as much by external as internal factors. The formulation of a strategy conceived as the eventual application of the 'scientific technical revolution' in 1967 opened the second phase to which the remainder of this paper is devoted.

Prior to World War II, Albania was the most backward country in Europe, with per capita industrial production at about \$8.<sup>45</sup> There were only 150 industrial enterprises in the country, and, of these almost half employed fewer than ten workers. The total contribution of industrial production to net material product was only 4.4 percent in 1938. Wartime damage to the infrastructure (roads, bridges, and dwellings) was heavy, but raw materials production capacity was enlarged: oil and chrome increased, and, the extraction of natural gas, copper, iron and manganese was begun. Consequently, when the PLA—or as it was then known, the Communist Party of Albania—came to power, it saw the establishment of manufacturing industry as the key to modernization of the Albanian economy. On the question of industrialization, the PLA's ideology was fully in accordance with the prevailing Marxist-Leninist doctrine, namely that socialism can not be built without a strong industrial sector, and that this branch must be developed as rapidly as possible. Thus, at the first Congress of the C.P.A., which was held, in November 1948, it was decided that the Party's:

... fundamental economic objective was to raise the country from its profound backwardness, through a vigorous development of the forces of production.

The essence of this task was the socialist industrialization, and the electrification of the country. The absolute necessity for industrialization was dictated by the need to create an entirely new material-technical base for the people's economy. . . . Socialist industrialization had to be carried out at a rapid rate, within the shortest possible time so as to overcome the backwardness inherited from the past, to ensure the independent development of the economy, and, to achieve an appreciable rise in the material and cultural level of the working masses.<sup>46</sup>

Whereas foreign aid to finance the industrialization drive had initially come from Yugoslavia, the break in relations between Tirana and Belgrade in 1948 led to the signing of the first economic agreement between Albania and the Soviet Union.<sup>47</sup> The extent of aid may be gauged from the 60 percent excess of imports over exports during 1951-58, most of the capital goods going to industry. At the end of

\*This section was prepared and written by Adi Schnytzer. See end of section for tables related to section.

<sup>45</sup> V. Misja, *Ekonomia popullore*, Jan.-Feb. 1965, p. 20.

<sup>47</sup> N. C. Pano, *The People's Republic of Albania*, Baltimore, 1968, p. 84.

that period, a quarter of gross industrial output was being generated by machinery supplied by the U.S.S.R. The PLA had set ambitious targets at its Second Congress for the First-Five Year Plan (1951-55). The average annual rate of growth of total industrial production was planned to be 27.7 percent, comprising an increase in the production of means of production of 31 per cent per annum, and an average annual increase of 26.5 percent in the output of consumer goods.<sup>48</sup> The priority sectors during this period were mining, food and light industry, Albania's rich mineral reserves amounting for the huge projected increases in producer-good output.<sup>49</sup>

At the Fifth Plenum of the Central Committee of the PLA—convened on March 1, 1953, several days before Stalin's death—it was disclosed that the economic plan for 1952 had only been "realized in general".<sup>50</sup> The greatest failures occurred in agriculture. Thus, as the planned increases in agricultural activity had not been forthcoming, raw materials required for the industrial sector were in short supply and the industrial plans were doomed to failure with the consequent implications for the output of consumer goods.<sup>51</sup> Under these circumstances, the decision of the Fifth Plenum to increase plan targets for 1953 was surprising. On the other hand, it must be recalled that the plans of other Comecon countries were also revised upwards as a consequence of a meeting of Party leaders at Hollohaza, and, while Albania's First Five Year Plan targets were not ratified until March, 1952, it is possible that the upward revisions were brought about as a result of further Soviet pressure.<sup>52</sup>

Whilst the death of Stalin and Malenkov's New Course, and a consequent reduction in aid, were probably influential in changing Albanian economic policy, a realignment of priorities in planning in favour of agriculture and consumption were probably inevitable; in any event, ideologically inspired plans would have little meaning if they could never be fulfilled and would ultimately have been damaging by prolonging the vicious circle of shortages into which they had plunged the Albanian economy. The de-emphasis of industrialization was heralded at the Eighth Plenum of the Central Committee of the PLA on December 24th 1953. The distribution of investment was altered so that the majority went to agriculture and more than had done so previously to the production of consumer goods. The time horizon for the construction of some projects was extended, while other plant projects were cancelled; the arrears of grain and other agricultural product quotas for the period, 1949-52 were cancelled, the tax burden on the agricultural community was lightened, and retail prices of domestically produced farm implements were decreased.<sup>53</sup>

Given the irrationality of the pre-1954 targets for industrial production, it is perhaps a reflection of the relative success of the December 1953 measures that over the Five-Year Period, 1951-55, global industrial production increased at an average annual rate of 22.8 percent, as against the 27.7 percent originally planned, while the rate

<sup>48</sup> B. Bardhoshi, *Probleme te planifikimit dhe te zhvillimit te ekonomise se planifikuar ne R. P. Sh.* ("Problems of Planning and Development of the Planned Economy of the People's Republic of Albania"), Tirana 1965, p. 129.

<sup>52</sup> M. C. Kaser, *Comecon*, London 1967, 2nd edition, p. 49.

<sup>53</sup> *History . . .*, p. 382.

of growth of consumer goods output at 24.3 percent was greater than the 20.7 percent average annual increase in producer goods production.<sup>54</sup>

The major directives of the Second Five-Year Plan (1956-60) approved at the Third Congress of the PLA were modest compared with those of the First Five-Year Plan, although it was again intended that group A production would increase at a more rapid rate than the production of consumer goods. Thus, global industrial production was to increase at an average annual rate of 14 percent of which 14.8 percent group A and 13.5 percent group B.<sup>55</sup>

In direct contrast to the first two years of the First Five Year Plan, 1956, and particularly 1957, were good years of the Albanian economy. In the latter year, global industrial production rose by 26 percent and global agricultural production by 15 percent. Possibly, on the basis of these successes, there was an upward revision of plan targets in February 1958. The official reason for the changes was the discovery of "internal accumulation and reserves".<sup>56</sup> Thus, the target for the average annual rate of growth for the global industrial output was raised from 14 percent to 17.5 percent over the Five-Year period, the new rates for group A and group B respectively becoming 20 percent and 15.8 percent.<sup>57</sup>

In his address to the Fourth Congress of the PLA, it is not surprising that Mehmet Shehu compared the results of the Second Five-Year Plan to the targets set by the Third Congress for, while these were largely overfulfilled, the levels anticipated in 1958 were not attained. The global industrial production increase at an average annual rate of 16.9 percent, means of production 18 percent, and consumer goods output 16 percent.<sup>58</sup>

It should be noted that by February 1961 when the Fourth Congress convened Albanian relations with the Soviet Union had deteriorated almost to the point of rupture. The conflict between Albania and the Soviet Union had become public in 1960 at the Peking World Federation of Trade Unions meeting, when for the first time Albania openly supported China in its arguments against the Soviet Union.<sup>59</sup> Diplomatic relations between the Soviet Union and Albania were finally severed on December 3rd 1961. In the intervening period, credits of about \$132 million which had been promised to Albania for the Third Five-Year Plan by Comecon members were cancelled, Soviet experts left Albania, the Soviet naval base at Vlore was dismantled, and China provided \$123 million in aid and credits to replace those withdrawn by the Soviet Union and its allies.<sup>60</sup>

Several factors which probably determined the direction of Albanian involvement in the Sino-Soviet dispute should be noted. From an ideological point of view it is clear that the Albanian leadership was disturbed by Khrushchev's denunciation of Stalin, Hoxha believing that the framework established by Stalin for socialist construction represented the only validly Marxist-Leninist line. On the other hand, Soviet rapprochement with Yugoslavia in the late fifties may have

appeared to Tirana to pose a threat to Albanian independence and Hoxha had already demonstrated his nationalistic tendencies in the dispute with Xoxe and Tito. Aside from these more compelling motivations to seek an alliance with China, other considerations should be noted. The PLA leadership's desire for independence in policy determination would undoubtedly be better catered for by China than the U.S.S.R. Further, while China could scarcely be expected to be as lavish with aid as the Soviet Union had been, the small size of the Albanian economy made it likely that the drain on China's resources would likewise be small. From a purely political standpoint, the popularity of the Albanian regime might well be raised by appeals to anti-slav feelings among the population, and the fact that the PLA had come to power without direct Soviet intervention, suggested that Soviet influence in the country would not be necessary to keep the Party in power. There is certainly evidence to suggest that the reverse might be true, in respect of Hoxha himself. According to Pano, the "Soviets . . . appear to have been involved in the preparation of an armed uprising by disaffected elements within Albania".<sup>61</sup>

An assessment of the implications of withdrawal of Soviet aid and Comecon's subsequent boycott on the performance of the Albanian industry over the period of the Third Five-Year Plan (1961-65) is complex.<sup>62</sup>

The Fourth Congress ratified a planned increase in global industrial production of 52 percent over the period. Group A output being planned to increase by 54 percent and Group B output by 50 percent.<sup>63</sup>

When the Soviet Union announced that all projected credits would be rescinded, the PLA convened a Plenum of its central committee which on July 1, 1961, issued a decision entitled, "On measures which must be taken for the further strengthening of the regime of the economy."<sup>64</sup> The essence of this document lies in its appeal to all Albanians to economize wherever possible; ministries were asked to make sure that unplanned losses within enterprises did not occur, workers were exhorted to use their equipment with the utmost care, and to think of ways in which capital might be raised in production. It was stressed that the volume of exports would have to rise if Albania were to be able to buy the machines and equipment from abroad which it needed. This was probably the first statement issued by the PLA which indicated that the economic situation was clearly going to be affected by the change in alliance from the Soviet Union to China. It has been claimed that as a consequence of cost reduction methods employed in 1961, 1700 million leks were saved. This figure represents 6 percent of the state budget for 1961.<sup>65</sup> Further, the plan for industrial production was overfulfilled by 5 percent and agricultural output rose by 22 percent over 1960 (which had however been a rather bad year).<sup>66</sup>

External pressure on the Albanian economy grew in 1962 when several Eastern European states cancelled promised credits.<sup>67</sup> However

<sup>67</sup> *Ibid.*, p. 504.

it seems that the major problem faced by the Albanian economy was technological rather than financial. No country in Europe had fewer experts than Albania in 1962. Further, the massive education drive undertaken after World War II was severely hampered when Albanian students in Comecon countries were forced to return home, their scholarships rescinded. This, together with the fact that foreign experts had left the country, and the Chinese had insufficient qualified cadres to replace them—the failure of the Great Leap Forward cannot have helped—meant that Albania was forced into a situation of “relying on its own resources.” This aspect of Albania’s development strategy is considered in more detail in the next part of this paper. In aggregate terms, the Third Five-Year Plan was a failure. The continuing priority for industry may be judged by the 98 percent increment reached by industry under the Plan with global agricultural output increasing by a mere 22 percent over the period, (the plan having called for an increase of 72 percent).<sup>68</sup> The plan for the increase in real income of the population also fell short of expectations.<sup>69</sup>

Notwithstanding Albanian industry’s failure to meet all targets, scrutiny of the evidence indicates that a 98 percent industrial achievement was remarkable, given that of the increase in agricultural output, 22 percent could be attributed to 1961 alone. This is particularly important in the Albanian context, since operating under close to ‘autarkic’ conditions, it was agriculture which had to supply many of the inputs to industry. On the other hand, it is equally possible that the sharp drop in rates of growth in the agricultural sector was caused by a shift in labour from that sector into industry in an attempt to meet the industrial plan as a first priority. Thus, while the absence of Soviet aid was to some extent responsible for Albania’s economic problems, against this must be weighed the benefits of independence in policy making which the PLA had won, even though these might only become more evident in the long term.

In general terms, it is possible to characterize the period up to 1965 as one of rapid, but erratic growth for the Albanian economy. Particularly, it should be noted that all three Five-Year Plans were revised in midstream either as a consequence of external factors, or following realizations that the original plan had been too ambitious. Industrial development proceeded in a similar direction, and, although high growth rates were achieved in all sectors, the relative weight of heavy industrial output in the total did not change significantly between 1950 and 1965. The relevant figures are given in Tables IV-1 and IV-2.

Several reasons may be advanced for the failure of the Albanian government to achieve its stated aim of heavy industrialization at all costs up to 1965. Firstly, it is possible that Soviet plant and equipment installed in Albania contributed to the development of food and light industry, and some extractive industries rather than mineral processing or capital good manufacturing industries. This would follow from Khrushchev’s oft expressed desire for the conversion of the Balkans into the “garden of Eastern Europe”. Secondly, although Albanian leaders and economists stressed—and continue to stress—the need to develop heavy industry at a more rapid rate than

<sup>68</sup> *D.K.*, Vol. V, pp. 207-8.

<sup>69</sup> *History . . .*, p. 532.

any other sector throughout the period of socialist construction, a specific strategy for the implementation of this goal was never put forward. Finally the chronic lack of expert managers and technicians as well as qualified workers, meant that it would be easier to achieve significant expansion in those areas of industry—such as food and handicraft—which had always existed in Albania, and did not demand the manipulation of modern technology.

It seems reasonable to argue that the failure of the heavy industrialization programme made the Albanian leadership aware that the “law of priority of the production of the means of production” may be an economic goal, but certainly does not represent a development strategy. The strategy implied by the “scientific-technical revolution”, the tactics for its implementation, and some of the known outcomes will be considered in detail after a discussion of some of the attempts made to improve the organization of the engineering industry in 1965.

### B. Engineering

Towards the end of 1965, articles in the Albanian press<sup>70</sup> began urging the engineering industry to increase the quantity and quality of its production by concentrating its capital stock, and specializing in its production to make gains from economies of scale, and to develop such links as were possible between enterprises in the industry to facilitate cooperation in production. Although there is no evidence that these measures were taken at the time—and some to the contrary judging by the events of 1967—it is important to note that the tactics of concentration, specialization and cooperation were to prove important weapons in the attempted implementation of the “scientific-technical revolution”.

The Albanian engineering industry is concerned with the production and repair of machine spare parts, various tools and equipment and some consumer goods. In 1967, 40 percent of its output came from Tirana.<sup>71</sup>

At that time, the industry employed about 12,000 people.<sup>72</sup> This represents about 12 percent of total employment in industry in Albania. The industry shared many of the problems common to the rest of the economy, such as emphasis on global indicators at the expense of assortment, considerable resource waste, loss of time due to delays in obtaining inputs and generally poor coordination of the production process.<sup>73</sup> It is this latter problem, namely the allocation of resources in the industry—including labour, which appears to be most typical of the situation in industry as a whole.<sup>74</sup> Technical inefficiency is a good example. Thus, the quality of output is prejudiced as early as the input phase, by the fact that poor quality raw materials, or what is perhaps worse, steel of indeterminate quality i.e. steel whose quality has not been documented is provided to the enterprise.<sup>75</sup> The next contribution to inefficiency and poor quality arises because the majority of the production processes of the industry have not

<sup>70</sup> See, for example, *Bashkimi*, 2/7/1965, pp. 2-3.

<sup>71</sup> V. L. Gjeci and A. Progri, *Ekonomia Popullore*, July-Aug. 1967, pp. 32-43.

<sup>72</sup> *Zëri i popullit*, 6/5/1967, pp. 2-3.

<sup>73</sup> *Zëri i popullit*, 6/9/1967, p. 3.

<sup>74</sup> Albanian manpower planning is discussed in Section III above.

<sup>75</sup> *Zëri i popullit*, 6/9/1967, p. 3.

been set out in detailed technological charts, but rather, goods are produced with reference to an existing sample. Under these circumstances, it would be almost impossible to ensure the standardization of output. Some measure of the extent of this particular problem is given by the fact that of the 330 items produced in quantities greater than 100 units per year at one of the largest plants in Tirana, operational or pending technological charts and accurate drawings of the final products existed for only 35. When the output is finally produced very little of it undergoes the thermal or galvanic processing necessary to increase its life.<sup>76</sup>

The Third Plenum of the Central Committee of the PLA was convened on October 13th 1967.<sup>77</sup> The speakers at the Plenum stressed the importance of a thorough reorganization of the engineering industry, conceding that earlier attempts had failed, and outlined, for the first time a precise development strategy for Albanian industry. Albania's conflicts with first Yugoslavia and then the Soviet Union, were cited as important reasons why the PLA should make every attempt to ensure that Albania's economic development took place with the greatest possible reliance on the country's natural resources, and that the Albanian economy should one day be self-sufficient. There seems little doubt that Albania's natural resource endowment was a crucial factor in convincing the PLA leadership that economic independence was a real possibility. It was decided that three branches of industry should be given priority, and developed as rapidly as possible—the electrical, chemical and engineering industries.

The decision to use electricity as the economy's major source of energy was determined by the fact that Albania is a mountainous country with many rivers providing an ideal basis for hydroelectric sites. Thus, while the construction of power stations involves high initial investment, running costs are low, and a large proportion of the construction costs would probably be borne by China. Further, the use of electricity would allow Albania to concentrate on oil production largely for export purposes, thus potentially covering the running costs out of foreign exchange earnings. Finally, from an ideological standpoint, the plan to provide every Albanian village with electricity—a goal achieved in 1971—provided the PLA with a focal point for mass mobilization drives, and concurred with Lenin's stress on electrification in the Soviet Union.

The importance of the chemical industry in the "scientific-technical revolution" is also affected by natural resource endowments. The extraction and processing for final use—both domestically and externally—of minerals requires the application of chemical-intensive technology, the chemical inputs often being available as part of the same resource base. Thus, as is the case for electricity, once the initial investment required for the construction of the relevant plants has been financed—again using aid from China—the processes can be maintained domestically. The potential cost saving for industry promised by the use of organic synthetics such as plastic also provided an incentive to develop a strong chemical industry.

From the viewpoint of comparative advantage, the development of electrical and chemical industry in Albania might be arguably justified—although the PLA is clearly not concerned with trade as a means

<sup>76</sup> *Zëri i popullit*, 12/8/1967, p. 3.

<sup>77</sup> For the published proceedings see *D.K.*, Vol. V, pp. 349-372.

of ensuring economic efficiency. Thus, the drive for economic independence necessitated high priority in an industry unlikely to be suited to Albanian conditions from a purely economic angle. The motivation for giving the engineering industry priority is clear; namely if Albania can produce all the spare parts needed to service her current capital stock and, eventually produce the majority of additions to that stock she will have achieved economic independence in the industrial sphere. It may be mentioned in passing that self-sufficiency in agriculture has always been a goal of the Albanian authorities.<sup>78</sup> Given the marked scope for increases in agricultural productivity, the development of the engineering industry is of relevance in this context as well.

It should be noted that the Albanian notion of self-sufficiency for the engineering industry implies heavy reliance on existing levels of technology. While it has been stressed that world advances in scientific research should be made known to Albanian planners, the insistence that such advances should be incorporated into new plant using largely domestically available facilities seems unrealistic. This point is amplified after a more detailed consideration of the concepts of concentration, specialization and cooperation in the context of developments following the Third Plenum.

The uncoordinated nature of the engineering industry's development prior to 1967 is made clear by the fact that, at that time, the industry consisted of three large enterprises in Tirana and a series of small workshops located throughout the country. Further, the output of the industry was not highly specialized, the volume of production of the engineering industry representing only 61 percent of the total output of the goods it produced in 1966.<sup>79</sup>

Thus, it is not surprising that the first element in the reorganization of the industry was to be the concentration of its capital stock—mainly machine-cutting equipment—in a small number of enterprises to make gains from economies of scale.

It is interesting to note that the above-mentioned attempts made in 1965, to concentrate machine-cutting equipment in a small number of plants, were resisted by enterprises directors who allegedly wanted as many machines around them as possible, even if they were not in use, and—perhaps with some justification—feared that once the machine left the enterprise no one would know what happened to it.<sup>80</sup> However, following the Third Plenum, the concentration of metal-cutting equipment led to the establishment of several new enterprises, and the expansion of some already in existence. Thus, because machines which had previously been unused due to the lack of qualified workers were reallocated more rationally, the capacity of the engineering industry was increased without significant additional investment, or, a reduction in the production of other sectors.<sup>81</sup>

The second feature of the reorganized engineering industry, which could only come about as a consequence of concentration, was to be specialization of production. Thus, attempts would be made to avoid "unnecessary duplication in production,"<sup>82</sup> and to obtain the benefits of mass production wherever demand warranted it. The more common

<sup>78</sup> See Section III for a note on Albanian agriculture.

<sup>79</sup> M. Papajorgji and E. Luci, *Mbi disa probleme të përgendrimit, specializimit e kooperimit në industri*, ("On Some Problems of Concentration, Specialization and Cooperation in Industry"), Tirana, 1968, p. 143.

<sup>80</sup> T. A. dani, *Rruga e Partisë*, 11/1965, pp. 68-75.

<sup>81</sup> *Bashkimi*, 22/2/1969, pp. 1-5.

<sup>82</sup> *Ibid.*

use of continuous production lines was expected to reduce costs due to time lost in the setting up of machinery, or changing tools where production had previously been organized on a handicraft basis. Finally, it should be noted that specialization was only to be applied to the education of cadres with care. Thus, Gambeta<sup>83</sup> notes the risk of producing "professional idiots" and explains that both technical progress and socialism require polytechnization in the training of cadres.

The third step in the reorganization of the engineering industry required increased cooperation between enterprises. This meant that whenever certain goods could only be produced with capacity located in different enterprises, the relevant enterprises would enter into contractual agreements occupying a special place in the state plan. Thus, for example, a machine producing plant may make arrangements for the use of thermal processing or galvanizing equipment necessary for its production, but only available at a nearby enterprise with the required equipment not operating at full capacity.

Finally, the "scientific-technical revolution" laid great stress on the maximal exploitation of capacity in the engineering industry. According to PLA Central Committee Secretary Xhafer Spahiu, this could only be achieved if the "Party, Government and economic organs" made particular note of the following:

The maximum exploitation of inventoried machinery and mechanisms. Because there are various enterprises which do not utilize all their available machinery.

The elimination of bottlenecks through partial reconstruction of various lines, units and machinery aggregates so as to harmonize the productive capacity of various technological processes within the enterprise.

The improved utilization of calendar time by increasing the amount of actual working time between repairs. To this end, three-shift working of repair squads should be tried, as well as the preparation in advance of those spare parts which are more often damaged.

The reduction of construction time and the mastering of the productive capacity of new projects is also of great importance in this direction.

In addition, other ways and possibilities should be found and studied, according to the concrete conditions in each and every enterprise or branch of the economy.<sup>84</sup>

From the above discussion it follows that the most important feature of the reorganization of the engineering industry was an attempt to increase technical efficiency and levels of output by concentration, specialization, and cooperation without a heavy investment program. This was made possible by the extent of underutilization of capacity due to *ad hoc* allocation, and lack of skilled workers up to 1967. On the other hand, the engineering industry was not capable of producing sophisticated capital equipment, and only had the plant capable of producing spare parts and other simple metal products. Thus, while the long term aim of economic independence would be made possible by the import of more machinery than Albania could then—or for that matter now—afford in the short term, it was decided to attempt to become self-sufficient in spare parts production as a first step.

The problem of integrating world advances in technology into Albanian production processes has already been mentioned. The "scientific-technical revolution" attempted to take it into account with a call for improvements in the organization of technological research

<sup>83</sup> *Zëri i popullit*, 19/4/1968, p. 3.

<sup>84</sup> *Bashkimi*, 22/2/1969, pp. 1-5.

in the country, particularly at enterprise level. Problems of technical progress are dealt with in enterprises by the technological and design bureau, and any laboratories in their jurisdiction. The way in which the work of the bureau is carried out in the Tractor Spare Parts Factory has been cited in the press as an example for all to follow. In this plant

... the engineers, technicians and workers of the technological and design bureaus go down to the production units and consult with the production workers before starting to plan and to establish the production technology for any given part. Later on the planners follow up the application of the technological process decided upon throughout the experimental stage and also during the stage of actual production. In this way the engineers and other workers of the bureau are in continual touch with every phase of studying, planning and experimenting and production. In addition to facilitating and speeding up planning and to avoiding or minimizing possible mistakes, this method of working also helps safeguard the cadres from the dangers of technocracy and helps to forge close links between planning and production workers and vice versa. This method also helps to raise the technical standard of the workers, thus implementing Comrade Enver's teaching that "practice aid theory and theory aids and guides practice".<sup>85</sup>

This emphasis on cadre-worker relations was part of the broader ideological movement sweeping Albania at the time—and discussed in section II—and was not indigenous to the "scientific-technical revolution".

### C. The Advent of Mathematics

From an ideological point of view, perhaps the most surprising product of the "scientific-technical revolution", was the introduction of mathematical economics into the armory of the Albanian planners techniques. However, a close examination of the ways in which these techniques are used by the Albanian planners, reveals that at no stage are the concepts of marginal economics being used. Although a detailed discussion of this topic would be beyond the scope of this paper, one example from the area of linear programming will be illustrative of the general practice.<sup>86</sup> The problem to be solved is the determination of the optional product-mix for a firm producing several outputs using a variety of fixed and variable inputs. It may be formulated as follows:

$$\text{Max. } \sum_{i=1}^n P_i X_i \quad (1)$$

$$\text{St. } A_i \leq X_i \leq B_i \quad (2)$$

$$\sum_{i=1}^n \sum_{j=1}^m C_{ij} X_i \leq C_j \quad (3)$$

$$\sum_{i=1}^n \sum_{k=1}^L d_{ik} X_i \leq D_k \quad (4)$$

$$\sum_{i=1}^n W_i X_i \leq W \quad (5)$$

$$\pi \leq \sum_{i=1}^n \pi_i X_i \quad (6)$$

$$0 \leq X_i \quad (7)$$

<sup>85</sup> *Ibid.*

<sup>86</sup> V. Kedhi and E. Luçi, *Programimi linear në probemat ekonomike* ("Linear Programming in Economic Problems"), Tirana, 1970.

where  $X_i$  is the quantity of the  $i$ th product

$P_i$  is the retail price of good  $i$ , net of retail mark up, i.e. cost plus turnover tax.

$A_i, B_i$  are respectively, the lower and upper limits on the production of good  $i$  set by the planners,

$C_{ij}$  is the number of machine-hours required for the production of a unit of good  $i$  when machine  $J$  is in use,

$C_j$  is the capacity constraint, expressed in machine-hours, on the operation of the  $J$ th machine,

$d_{ik}$  is the quantity of the  $k$ th variable non-labour input, expressed in the appropriate physical terms, required for the production of one unit of good  $i$ ,

$D_k$  is the total available quantity of variable non-labour input  $k$ ,

$w_i$  is the wage cost incurred in the production of a unit of good  $i$ ,

$W$  is the enterprises planned wage fund,

$\pi_i$  is the profit deriving from the (assumed guaranteed) disposal of a unit of good  $i$ ,

and  $\pi$  is total planned enterprise profit.

Prior to a consideration of the advantages and disadvantages appending the use of the above computation, the special place accorded labour in the model should be noted. Thus, whereas other inputs are treated as heterogeneous and their use measured in physical units, labour is assumed to be homogeneous and wages are used in preference to labour time. It should also be noted that, probably for ideological reasons, the objective function represents revenue rather than profit. From a macroeconomic viewpoint, the solution of the above problem by an Albanian enterprise cannot yield tangible benefits since the allocation of resources to the enterprise has been predetermined without considering the opportunity cost of using them elsewhere. Further, the output-mix arising from the solution is rendered arbitrary in macroeconomic efficiency terms by the arbitrary nature of the  $P_i$ ; in particular their turnover tax component.

At enterprise level, the model provides significant advantages over the likely outcomes in a situation where mathematical optimization is not used. First, the enterprise is provided with a means for testing the feasibility of the plan in terms of the indicators in the model. Thus, if the enterprise director can assume that all the necessary input will be delivered on time—not very likely—and that his world is linear—in this case, more likely then, if the solution to the program yields a set of non-negative  $X_i$ , his production plan is feasible. If not, he can indicate this to the planners and perhaps arrange for appropriate adjustments. Second, the formulation of the problem is unlikely to conflict with the optimization of bonus-receipts by management and the workers, since, according to the law on the enterprise special fund,<sup>87</sup> equal weighting is given to the fulfillment of production, cost-reduction and profit plans in the distribution of bonuses. Further, the emphasis in Albania since 1965 has been on a continual replacement of material by moral incentives. (A discussion of this problem is beyond the scope of this paper, see, however, section II.)

Finally, it should be noted that the concept of duality has had only limited coverage in the Albanian mathematical economics

<sup>87</sup> *Përmbledhëse e Përgjithshme e legjislacionit në fuqi të R. P. Sh. [1945-71]*, ("A general Collection of Legislation in Force in the P.R.A. [1945-71]"), Tirana, 1971, p. 426.

literature. When linear programming is explained from a purely mathematical angle, the existence of a dual problem for every primal is acknowledged. However, the economic interpretation of programmes always excludes mention of duality, for ideological reasons. Authors in the field invariably include a section on the use of mathematics in their papers, explaining that economic problems can only be solved within the framework of the PLA's conception of laws of political economy, and that the introduction of shadow costs, or other concepts of marginal economics represents a return to capitalism—as in the rest of Eastern Europe—and makes economic science a slave of mathematics.

#### D. The "Scientific-Technical" Revolution

Prior to a consideration of the performance of Albanian industry as a whole since the formulation of the "scientific-technical revolution" an examination of performance by the three priority industries will prove useful in highlighting some of the predictable advantages and disadvantages of the development strategy discussed earlier in this paper. Some figures for the output of the electrical, chemical and engineering industries are given in tables IV-3, IV-4 and IV-5.

It is not surprising that the industry facing the most difficulties since 1967 has been the engineering industry, representing the most ambitious part of the industrialization program. By 1973, the industry had raised the output of spare parts by 310 per cent over 1965,<sup>88</sup> and the proportion of domestic production to imports has risen as shown in table IV-6. According to the indicators of the Sixth Five-Year Plan (1976-80), Albania will be 95 per cent self-sufficient in spare parts by 1980.<sup>89</sup> Given that the engineering industry fulfilled its target of doubling output during the Fifth Five-Year Plan period (1971-75),<sup>90</sup> it is possible that the planned proportions in table IV-6 were met or even exceeded.

However, notwithstanding the unambiguous success of the industry in terms of increased levels of output and import substitution, efficiency remains a problem. Thus in 1970 one of the largest enterprises in the industry lost an estimated 8 per cent of its production through unexcused worker absenteeism while still fulfilling its production plan 100.3 per cent.<sup>91</sup> Further, in 1971, the industry as a whole failed to meet its plan for labour-time, 11 per cent of the deficit occurring for the same reason.<sup>92</sup> Perhaps the most general indicator of this problem is global output per man in the industry computed at current prices. Between 1967, the first year of the "scientific-technical revolution", and 1971, the figure actually fell from 35,300 leks per man to 27,324 leks per man.<sup>93</sup> Global output per man for the whole of industry is shown in table IV-7. On the other hand, while output per man in the engineering industry remains below the level of other sectors—probably as a consequence of expertise problems and mis-allocation of labour with concomitant disguised unemployment—the

<sup>88</sup> A. Këllezi, *Probleme Ekonomike*, 3/1974, pp. 3-20.

<sup>89</sup> M. Shehu, *Report to the Seventh Congress of the PLA*, Tirana, 1976, p. 48.

<sup>90</sup> *Ibid.*, p. 17. It should be noted that this statement is contradicted by the figures in table 17, but by a very small margin.

<sup>91</sup> P. Bollano, *Probleme të drejtimit të prodhimit socialist* ("Problems of Managing Socialist Production"), Tirana, 1972, p. 123.

<sup>92</sup> B. Xhaja and O. Murati, *Probleme të ekonomisë dhe të organizimit në Industrinë mekanike*, ("Problems of Economics and Organization in the Engineering Industry"), Tirana, 1974, p. 29.

<sup>93</sup> *Vjetari statistikor*, 1967-8 and 1971-2.

share of the industry's production in global industrial output rose from 5.7 percent to 9.8 per cent between 1965 and 1970,<sup>94</sup> while the percentage of total capital investment in machines and equipment rose by a smaller amount, from 36.7 percent in 1961-1965 to 38.6 percent in 1966-1969.<sup>95</sup> This is probably accounted for by the increased production made possible by concentration of capital and an improved use of capacity.

The relative scarcity of detailed statistics precludes a complete assessment of the degree of success of the "scientific-technical revolution" in quantitative terms. However, some useful conclusions may be drawn on the basis of general indicators. From table IV-2, it is clear that between 1965 and 1973 the contribution of heavy industry in general, and the engineering industry in particular, increased markedly the latter's weight in global industrial production rising from 5.7 percent to 12.9 percent. Tables IV-8 to IV-14 give some indication of the increases in levels of output achieved by other sectors of industry while table IV-15 shows the composition of net material product by sector for several years up to 1973. From these tables it is clear that the rates of growth achieved by the various sectors of industry, have been high enough to allow the Albanian economy to enter the 'seventies with industry accounting for more of net material product than agriculture. What is more interesting about these figures, from the viewpoint of the PLA's industrial development strategy, is that the publication of these statistics comes to an almost complete halt with the figures for 1973. An analysis of the available data on industrial plans and their fulfillment in recent years indicates that there was a significant slow-down in industrial growth rates between 1974 and 1976. The available data are summarized in tables IV-16 and IV-17.

The reasons for the reduced industrial output targets in 1974, 1975 and 1976 and the failure to achieve the level of output demanded by the Fifth Five-Year Plan are not clear. The Western press has often reported rumours of a crisis in relations between Albania and China with a consequent reduction in Chinese aid. However, neither Albanian nor Chinese sources provide any evidence to support this contention having, on the contrary denied the existence of strained relations between the two countries. Further, the target of a 9.3 percent growth rate for global industrial production in the 1977 state plan,<sup>96</sup> suggests that the cause of the difficulties has been removed. Since 1973 and 1974 were, broadly speaking, years of 'moderate' ascendancy in the Chinese leadership and given that this faction of the Chinese Communist Party is even stronger today, Albania's relations with China are unlikely to have altered sufficiently to suggest that they are important in explaining a slow-down in Albanian industry.

<sup>94</sup> Table 2.

<sup>95</sup> *Ekonomia e industrisë në R.P.Sh.* ("The Economics of Industry in P.R.A."), Tirana, 1972, Vol. II, p. 337.

<sup>96</sup> *Zëri i popullit*, /12/1976.

An alternative hypothesis which is superficially appealing may also be dismissed; namely, that the dramatic increase in world oil prices towards the end of 1973 made the import of producer goods more difficult for Albania, as it has indeed done for many underdeveloped countries. This explanation is not suitable because the world prices of manufactured goods did not rise as rapidly in 1974 as the prices of Albania's major exports, oil, chromium, copper and agricultural produce. Thus, on the basis of the Oil Crisis Albanian industry should have benefited if not remained unaffected.

The most likely cause of Albania's difficulties appears to involve in some way, the purging of such important figures as the Chairman of the State Planning Commission and the Ministers of Defence, Industry and Mining, and Commerce. In his report to the Seventh Congress of the PLA, Premier Shehu <sup>97</sup> denounced the purge victims as traitors involved in a conspiracy with "foreign revisionists" against Albania. More specifically, Shehu accused <sup>98</sup> former Chairman of the State Planning Commission Kellezi, former Minister of Industry and Mining Theodhosi "and others in the economic sector" of sabotaging the oil industry while Hoxha in his report <sup>99</sup> blamed those purged for the failure to complete certain construction projects as well as the shortfalls in the plans of the oil, chromium, copper, coal, bread grain and industrial crop sectors. Referring to the oil industry,<sup>1</sup> Hoxha charged Kellezi and Theodhosi with using "refined methods to disorient exploration" and mismanage the industry and with preventing the exploitation of new sources of oil and gas as using "barbaric" methods for the exploitation of existing wells.

The extent to which these accusations are fully grounded may never be known. However, it is possible that a split occurred within the PLA over industrial policy in the early seventies, the recent purges representing a victory for the Hoxha faction of the party. The grounds for such a split would almost certainly have been disagreement over the policy of self-reliance, the defeated faction perhaps arguing that it would be in Albania's interest to follow China's lead in opening its doors to the West. Foreign borrowing from Western Europe or the United States to finance industrialization might then be one of the economic outcomes of the change in foreign policy.

If this hypothesis is correct, it follows that those arguing the position—and in the leading economic positions—would call for an easing of tension in the plans for industry, the 1975 and 1976 plans indicating that they were, for a time, in the ascendancy. Whether this was or was not the case, one thing remains clear; the extent to which Enver Hoxha's policies in general, and the goal of self-sufficiency for industry in particular, are carried on after his death will be determined largely by the degree to which the Albanian economy is standing on its own feet when he leaves it.

## APPENDIX I

## ESTIMATION OF MAIN NATIONAL-ACCOUNTING AGGREGATES

A. *The Publication of Albanian Statistics*

Of all East European countries, Albania publishes the smallest volume of economic statistics. It was the last member of Comecon to issue a Statistical Yearbook (in 1958), but until 1966 the abstracts bore comparison (though more modest in scope) with those published elsewhere in East Europe. From then until 1972 the volumes both become progressively smaller and were issued only biennially. No volume had appeared since that titled 1971-1972, but the latter was supplemented in certain details issued and series extended to 1973 in a publication of the General Directorate of Statistics, *30 vjet Shqipëri Socialiste* (30 Years of Socialist Albania) in 1974. It is not clear whether the practice of publishing yearbooks has ceased or merely been held up by political problems.

The methodology of statistical compilation and calculation has, on the other hand, been discussed in detail in two textbooks published by the Faculty of Economics at the University of Tirana in 1971, *Statistika ekonomike* and *Statistika e industrisë*. Four points from these books are relevant to a reconstruction of the unpublished series of net material product.

(1) 'National income, viz net material product (NMP), is defined (as elsewhere in Eastern Europe) as the difference between Global Social Product and material outlays including depreciation. As is usual in national accounting, three accounts are drawn up. "NMP produced" is established by industrial origin in enterprise-wholesale prices, viz not including turnover tax, and is computed by summation of the output of all non-farm production units at those prices and subtracting the total of expenses incurred by such units;<sup>1a</sup> net agricultural output is added from separate calculations (see (4) below) but the net contribution of trade does not incorporate the price differential on foreign trade (balance in domestic prices of the profit on imports against the loss on exports due to the overvaluation of the lek). The second account, of "NMP utilized" is the aggregate of the consumption and accumulation funds and exceeds the NMP produced by the value of the import surplus. The third account of "NMP distributed" is the summation of the wage fund for workers in the sphere of production, turnover tax, profit "in all its forms" and social security premia.

(2) The value of NMP in leks has never been published. The indices of NMP in 'comparable prices' are generally available, calculated as a Laspeyres formula (base-year prices weights)<sup>2</sup> unless otherwise stated, i.e.

$$\frac{\Sigma p_1 q_0}{\Sigma p_0 q_0}$$

(3) Global industrial production is generally given in enterprise wholesale prices of the first year of the relevant five-year plan, since a new set of such prices is established every five years. Thus values for 1971/75 are expressed in 1971 prices, which were effectively also current prices. For the computation of the index of global production 'in comparable prices' a price index is calculated, also using a Laspeyres formula, the price index thus obtained being used to splice to the index of production for previous years expressed in the previous.<sup>3</sup> This disregards the effect of the high growth rates experienced by the Albanian economy on weighting, and it must be accepted that the index as published considerably overstates growth as it would be shown on a Paasche formula (end-year price weights).

(4) The calculation of global agricultural production is calculated as the sum of outputs of crop and of livestock production by the General Directorate of Statistics (physical outputs at average prices), thus grossing in fodder consumption of livestock.<sup>4</sup>

B. *A Reconstruction of Material Product*

As just stated, NMP is not officially published in absolute terms in any of its three accounts, but NMP produced (*e ardhura kombetare te realizur*) can be reconstructed from statements of its industrial component via its share in global social product (GSP).

<sup>1a</sup> *Statistika ekonomike*, Tirana, 1972, pp. 407-14.

<sup>2</sup> *Ibid.*, p. 148.

<sup>3</sup> *Statistika e industrisë*, Tirana, 1971, pp. 107-9.

<sup>4</sup> *Statistika ekonomike*, pp. 191-3.

Global industrial production in 1970 and 1971 prices was stated to have amounted to 7,104 mn leks<sup>5</sup> and to have represented 52 per cent of GSP,<sup>6</sup> from which a GSP of 13,662 mn leks may be inferred. As outlays including depreciation were 50 per cent of GSP,<sup>7</sup> an NMP of 6,830 mn leks may be deduced for 1970 and extended by the index of growth under the Five-year Plan to a value of 9,426 mn lek in 1975.

An approximate value of gross material product (GMP) can be reconstructed from the published share of depreciation in material outlays in industry, viz. 8.43 per cent in 1959<sup>8</sup> and 9.3 per cent in 1969.<sup>9</sup> These shares were used as if they applied to all material outlays (there being no published data on the value of the fixed capital stock, either in toto or for industry),<sup>10</sup> but it may be noted that the ratio in the Yugoslav Autonomous province of Kosovo (neighbouring Albania and inhabited principally by Albanians with broadly similar economic resources) was 9.4 per cent in 1970.<sup>11</sup> Hence, as material outlays were 6,831 mn in 1970, depreciation was 635 leks and GMP produced was 7,466 mn leks. A check on the depreciation estimate may be found in its correspondence with an estimate made by one of the authors in 1967 with respect to that year, of 620 mn leks.<sup>12</sup>

"NMP utilized" (*e ardhura kombëtare e përduror*) exceeds NMP produced by the excess of imports over exports (the balance of trade) and it is general east European practice for an import surplus to be valued at import prices. It can no longer be assumed that NMP produced includes the foreign trade price differential (*preisausgleich* in the German term, usually applied).<sup>13</sup> As no foreign trade aggregates have been released since those for 1967, it was not possible to build up an estimate from NMP produced but some indicators of the composition of the consumption and accumulation funds were available to make an attempt at reconstructing NMP utilized. Data on the percentage distribution of these funds have only been published for the average of 1966-70,<sup>14</sup> the series being wholly absent from the biennial yearbooks of the period (1967-68, 1969-70 and 1971-2). The only reference which might be interpreted as being to 1970 appeared in a book published in 1971 and was of the order of magnitude of the 1966-70 mean.<sup>15</sup>

The major constituent of personal consumption is retail sales less purchases by institutions. The 3,881 mn lk sales of 1970 were reduced by 8.5 per cent for institutional buying<sup>16</sup> to yield an estimated purchase by households of 3,550 mn leks. Auto-consumption (non-monetized consumption) of household was 30 per cent of total personal consumption,<sup>17</sup> such that it would readily be computed as 1,780 mn leks. Other household purchases were put at 10 per cent of retail sales and autoconsumption. Social consumption was 11.9 per cent of the consumption fund and was similarly computed at 706 mn leks and the consumption fund as 5,930 mn.

A check on the magnitude of the material outlays in social consumption reconstruction was made by the summation of budget expenditure in 1970 on administration (85 mn leks) on defense (475 mn leks), on education and culture (554 mn leks) and on health services (261 mn leks),<sup>18</sup> viz a total of 1,375 mn lek, of which something like half would be material outlays and half non-productive services. No Albanian indicator of the latter relationship exists, but the ratio in the Soviet Union in 1964 as calculated by Becker, is 46 to 54 per cent (see Appendix Table I). Application of the Soviet percentage to an outlay of 1,375 mn lek would give 633 mn lek for an outlay that does not include amortization changes on housing etc, (for which the residual of 70 mn leks could speculatively be suggested).

<sup>5</sup> 30 vjet *Shqipteri socialistë*, 1974, Tirana, 1974 (hereafter *30 vjet . . .*), p. 55.

<sup>6</sup> M. Shehu, Report to the 7th Party Congress (*Rruga e Partisë*, No. 12, 1976, p. 15).

<sup>7</sup> *Statistika ekonomike*, p. 422.

<sup>8</sup> *Regjimi i kursimit: metodë e drejtimit të ekonomisë socialiste*, Tirana, 1960, p. 16.

<sup>9</sup> *Financat e ndërmarrjeve industriale minerale dhe të ndërtimit*, Tirana, 1971, p. 88.

<sup>10</sup> Approximately half fixed capital would be in industry in 1970 since 47 per cent of aggregate capital expenditure 1951-68 had been in industry (*Ekonomia popullore*, 1/1970, p. 31).

<sup>11</sup> *Statistike godisnjak SFRJ*, 1976, Table 204-3 (material outlays were 2,952 mn dinars and depreciation 307 mb dinars).

<sup>12</sup> M. Kaser 'Albania' in P. Wiles (ed.) *The Prediction of Communist Economic Performance*, Cambridge, 1971, p. 93.

<sup>13</sup> M. Kaser, in P. Deane (ed.) *Studies in Social and Financial Accounting*, London, 1961, p. 162.

<sup>14</sup> *30 vjet . . .*, p. 189.

<sup>15</sup> *Statistike ekonomike, op. cit.*, p. 434 stated that social consumption was between 10 and 11 per cent of the consumption fund; *30 vjet . . .*, p. 189, put the average for 1966-70 at 11.9 per cent.

<sup>16</sup> Sales from *30 vjet . . .*, p. 178; analogous Soviet share of institutional buying from A. S. Becker, *Soviet National Income 1958-1964*, Berkeley and Los Angeles, 1969, p. 332. Becker's ratio (p. 159) was also used for 'other household purchases'.

<sup>17</sup> *Statistike ekonomike*, p. 434.

<sup>18</sup> *30 vjet . . .* pp. 190, 193.

The accumulation fund is chiefly investment. State investment in 1970 was 2,207 mn lek of which 77.5 percent was 'productive' (viz. 1,710 mn leks) and 22.5 percent 'non-productive' (497 mn leks).<sup>19</sup> Cooperative farm investment added 16.4 percent during 1966-70 and 12.1 percent during 1971-75 to compose socialist-sector investment,<sup>20</sup> and a 14 percent ratio was used for 1970, viz 310 mn leks. The value of private investment (which would have been almost all in housing) was derived from the average ratio in 1966-70 and 1971-73 of private to state housebuilding in dwelling units (62,596 against 50,222, or 1:1.25)<sup>21</sup> and state investment in housing (193 mn leks in 1970<sup>22</sup>), viz. 240 mn leks. Arbitrarily allocating some 15 per cent of cooperative-farm investment to non-productive projects (clubs, cinemas, reading-rooms, cafeterias etc.), viz 46 mn leks, fixed investment was shown to be composed of the following:

[Millions of leks at 1971 prices]

	Productive	Non-productive	Total
State.....	1,710	497	2,207
Cooperative.....	264	46	310
Private.....		240	240
Total.....	1,974	783	2,757

"Non-productive" fixed investment was 25.0 percent of all fixed investment in 1966-70;<sup>23</sup> the above estimate showed 28 percent. 'other investment' in 1966-70 bore a ratio of 29.7 per cent to all fixed investment which would show just under 820 mn leks for this outlay, which includes inventory accumulation, net increment in unfinished construction and military hardware. In the U.S.S.R. (see Appendix Table I) in 1964, 69 per cent of expenditure on defense and internal security was attributable to material outlays: were the same ratio to have ruled in Albania in 1970, 330 mn lek of the "other investment" would be attributable to military goods (of which an arbitrary 50 mn was counted as 'consumables' and the remainder as military hardware), leaving 490 mn leks as increments in stocks and uncompleted construction. The two funds were estimated and are shown in Appendix Table II. The NMP utilized (9,230 mn leks) exceeds NMP produced (6,830 mn leks) by 2,400 mn leks.

### C. NMP Deflators

Global industrial and agricultural production together have been stated in 1956 prices as 21,072 mn old leks (2,107 mn new leks) for 1950 and 62,340 mn old leks (6,234 mn new leks) for 1960<sup>24</sup> and in 1971 prices at 2,158 mn new leks and 5,230 mn new leks respectively. Hence 1956 prices (1971=100) were 98 in 1950 and 119 in 1960. The rise of 20 percent may be attributed to the increase in agricultural prices relative to industrial over 1950-60.

Global agricultural production in 1960/1 was 26,674 mn old leks (2,667 mn new leks) and global industrial production in 1960 31,970 mn old leks (3,197 mn new leks), both in 1960 prices.<sup>25</sup> Combined output was 5,864 mn new leks, showing a price index weighted by 1960 global outputs, for 1956 (1960=100) of 106 and 1960 (1971=100) of 112. Prices have thus declined as follows on 1960 weights:

1956=119  
1960=112  
1971=100

As mid-period weights form the best deflator ("inflator" on Albanian trends) this series was used for the national accounts.

<sup>19</sup> 30 vjet . . . , p. 155 (that the data referred to state investment only is evident by comparison with p. 147):

<sup>20</sup> 30 vjet . . . , p. 148.

<sup>21</sup> 30 vjet . . . , p. 156.

<sup>22</sup> By difference: 1966-70 in 1971 prices in 30 vjet . . . , p. 151 1966-69 in 1961 prices in *Vjetari statistikoi, 1969-70*, p. 81. multiplied by a price index (1961 prices being 12 per cent above 1971 prices see section C).

<sup>23</sup> 30 vjet . . . , p. 189: these data are in 1971 prices, because the identical table appears in O. Gjiriti, *Mbi mirëqenien e punonjësve të qytetit e të fshatit*, Tirana, 1973, p. 53, as in those prices.

## D. SNA Account

The extension of the frontier of production to aggregates defined in the United Nations System of National Accounts (SNA) presented severe difficulties because of the sparsity of Albanian statistics on financial services, the personal service industries and the private "non-productive" sector. A considerable number of Albanians engaged in cooperative farms or state enterprises undertake a side-line occupation, despite frequent criticism in the press,<sup>26</sup> but at the valuation of such activity can only a guess can be made. Very few private professional services are permitted; all churches and mosques were closed in 1967 so that no incomes arise from religious or charitable foundations and the legal and health services operate within the socialist sector.

Subtraction of material outlays counted for NMP (700 mn leks) from government financed non-productive activities (1,375 mn leks as calculated in B above) yielded budget provision (675 mn leks) but of financial services only interest paid to depositors in the savings banks has been published. This was 6.2 mn new leks in 1970 on a mean balance due to depositors of 294.6 mn or 2.1 percent. A 2.5 percent rate of interest, conventionally taken to cover the cost of banking services, was applied to an estimate of loans outstanding to cooperative farms (computed as new loans over the previous five years, including a remarkable issue of loans to private farmers in 1966-7) viz. 303.5 mn new leks, i.e. 7.6 mn new leks. To formulate an order of magnitude, use of banking services by government and by state enterprises was assumed to be ten times private and cooperative use, making a banking service of 165 mn leks. Insurance services would have been more modest (25 mn leks were allowed) but personal services from state and cooperative enterprises were put at 200 mn leks. A very rough total of 390 mn leks was thus shown for the autonomously financed non-productive sector.

Private services were still more speculative. An estimate of Soviet GNP showed them at 1 percent of retail sales in 1964 and Albanian provision was put at the same ratio, viz 1 percent of 3,550 mn leks rounded up to 40 mn leks. Because rent (paid and imputed) would be broadly related to wages, salaries and personal farm incomes, the ratio of 2.5 per cent to retail sales for the U.S.S.R.<sup>27</sup> was applied for rent, rounded up to 90 mn leks.

A total of 1,200 mn leks for non-productive services was thus built up (rounding from the 1,195 mn shown).

### 1. INTRODUCTION

The growth rate of Bulgarian production, while remaining high by the standards of both Eastern and Western Europe, has been gradually declining over the last decade. This is attributable partly to lower agricultural growth rates and partly to the difficulties inherent in moving from an extensive to an intensive growth path. Bulgaria has found it difficult to raise labour productivity fast enough and to absorb new technology. The high accumulation rate has kept the capital stock growing rapidly, but the productivity of this capital has been falling.

While production has been growing slower than hoped for, consumption, especially in the period 1971-5, has grown faster than planned. This followed the launching of a program in December 1972 to raise the standard of living. The unplanned and widening gap between production and consumption has been bridged by credits from Western capital markets. In the second half of the 1970's, the main problem facing the authorities is how to restore balance in the economy. The July 1976 Central Committee Plenum of the Bulgarian Communist Party may represent a turning point in these efforts. A regime of strict economy was launched and numbers of administrative personnel reduced. Production is planned to rise faster than consumption for the rest of the decade.

The slow growth rate of agricultural production in the years since 1966-7 presents a marked contrast to the successes of this sector in the early 1960's. It is of concern to the authorities for two main reasons: agricultural production's crucial roles in raising the standard of living and in foreign trade. Bulgaria is increasingly short of fuel and mineral resources. An expansion of agricultural exports would give it the means to pay for its raw materials and the freedom to choose between alternative suppliers of machinery and manufactures. The

stagnation of agricultural exports means that necessary imports must be financed increasingly by sales of Bulgarian machinery and manufactures, which can generally only be sold within the CMEA, and in particular in the USSR. Thus Bulgaria's political ties with the USSR are matched by an increasing economic dependence.

In the face of their economic problems, the Bulgarian authorities have displayed considerable imagination in seeking solutions. In general, they have sought organizational changes rather than systemic reform. In industry, they have experimented with a variety of forms of combining enterprises, culminating in the most recent remarkable attempt to reorganize the economy on the basis of national economic complexes. Experiments in vertical and horizontal integration in agriculture seem more soundly based in practical experience. The success of some of the organizational forms pioneered can be seen from their adoption by a number of other socialist countries. The approach to agriculture seems relatively undogmatic and the good harvests of 1975 and 1976 may indicate that it has been successful in restoring growth rates.

## 2. THE SOURCES OF GROWTH

Table 1 shows the contribution of various factors of production to growth in the non-agricultural sectors of material production in post-war Bulgaria. It represents an attempt to sort out the influences of intensive and extensive factors over this period. Before analyzing the results, it is appropriate to describe the methodology of the table.

TABLE 1.—SOURCES OF GROWTH OF NET MATERIAL PRODUCT

[In percent]

5-yr plan	1st, 1948-52	2d, 1953-57	3d, 1958-60	4th (1), 1960-65	4th (2), 1960-65	5th, 1966-70	6th, 1971-74

Annual growth rate of:							
Labour productivity.....	1.2	4.6	5.4	4.6	4.0	9.3	4.7
Capital productivity.....		-3.2	6.5	-7.4	-10.6	-2.6	-4.0
Material productivity.....	4.2	-2.5	.8	-3.1	-3.8	2.7	-6

Sources: The data in this table are based on an unpublished official Bulgarian source, except for the 6th-plan period which came from Statisticheski Godishniki, 1971 and 1975. The methodology of the table is described in the text. Net Material Product is defined to exclude the agricultural and forestry sectors, since production in these sectors is strongly influenced by the productivity of land and by the weather in any given year. Growth of net material product is measured in 1957 prices for the first three-plan periods. For the 4th period it is measured in both 1957 prices and 1962 prices, while for the 5th and 6th plans 1962 prices are used. For the first five-plan periods changes in labor inputs are measured in terms of people occupied (zaeti litsa) while for the 6th period workers and employees are used. Capital inputs are measured in terms of productive fixed capital (osnovni fondove) at full initial cost. Material inputs are measured as the difference between social product and net material product in each sector. The prices used are those used for net material product as described above. Calculations are based on 6 sectors of material production: industry, construction, transport, communications, trade, and other. For the 1st-plan period, and for all calculations of material productivity, the transport and communications sectors were lumped together.

Extensive growth is defined here as growth due to the increased application of some factor of production without any variation in the average productivity of that factor. Intensive growth is that due to increased productivity of some factor. The first part of the table treats the extensive and intensive contributions of labour to the growth process. In each of the plan periods, the actual growth in constant prices of net material product is compared to the increase in the total labour force in all sectors under consideration. Thus, for example, between the years 1970 and 1974, the growth in the labour force employed in the non-agricultural sectors of material production was 32.3% of the growth of net material product in those sectors. During this period, however, the rate of growth in the labour force was not equal in all sectors. In some periods the labour force grew relatively faster in those sectors with high average labour productivity and in others it grew faster in those with low productivity. The second step of the calculation was to calculate the increase in net material product due to reallocating labour among the various sectors while retaining the average productivity of those sectors at the start of the period. Thus in the period 1970 to 1974, the concentration of labour in the more productive sectors<sup>1</sup> contributed to 5.8 percent of the growth of net material product. The residual growth is attributed to labour productivity.

Similar calculations for capital and material productivity are also presented in table 1. The capital stock in each period is considered to be the stock of basic production funds evaluated at full initial cost. Even in the absence of significant inflation in the costs of construction, this method probably overstates the increase in capital stock during a given period since it does not take into account the depreciation of the stock. Material inputs are calculated as the difference between social product and net material product in the given year. Social product is the sum of the gross output of all enterprises and economic organizations.<sup>2</sup> However, there has been a considerable amount of merging of enterprises<sup>3</sup> (the total number of industrial enterprises fell from 2305 in 1952 to 2261 in 1968, even after massive industrialization) and, in the last ten years, of redefinition of economic organizations. This may have had an impact on the volume of social product. If this has happened, it will have resulted in an overestimation of improvements in material productivity.

One final caveat relates to the use of official growth indexes of national income. Since factor productivity in these calculations is arrived at as a residual, an overestimation of growth rates of national income will have a magnified effect in overestimating the contribution of factor productivity. This problem is, however, probably not too severe in the estimates of Table 1. Much of the difference between official estimates and western reestimates of Bulgarian national income can be traced to differing weights for agriculture. Agriculture is excluded in the calculations of Table 1. As far as industrial growth rates are concerned, the most significant overestimations in the official

<sup>1</sup> Table 1 shows the result of reallocating labour among six sectors of material production. Calculation based on twenty-one sectors (i.e. with industry divided into sixteen sectors) did not significantly alter the contribution of reallocation to growth.

<sup>2</sup> See "Statisticheski Godishnik," 1975, p. 109.

<sup>3</sup> B. Ilev, "Stopanskata smetka na durzhavnite stopanski obedinenia," Sofia, 1972 p. 33.

data refer to the 1950's; in the 1960's there is considerable agreement between the statistics.

The clearest result from Table 1 is that there has been a gradual shift from the extensive to the intensive application of labour. The contribution of labour productivity to growth has been rising over the period, although the growth rate of labour productivity has remained at about 5 percent since 1952. At the same time the productivity of capital has been in steady decline, except for the Third Five Year Plan period (1958-60). This was the period of the Great Leap Forward and the Table shows clearly its peculiar nature. Being a period of mass mobilization, the contribution of the increase in the labour force to growth rose while the contribution of labour productivity fell. At the same time, the additional inputs of labour allowed both capital and material inputs to be used more effectively and their productivity rose. The effects of the Great Leap on national income growth were so marked, that despite the increased mobilization of labour, the absolute rise in labour productivity was higher in this period than in either the preceding or succeeding plans. This phenomenon, however, may be illusory, in the sense that if labour inputs were calculated in terms of man-hours rather than persons employed, productivity may have declined.

The long-term declining trend in capital productivity may be compared to the shares of capital going to capital deepening and capital broadening.<sup>4</sup> From the start of the 1960's about 70 percent of the increase in the capital stock has been devoted to increasing the amount of capital per person employed. The data seem to imply that capital deepening is proceeding too fast in Bulgaria. It is possible that there is significant overinvestment and that the marginal productivity of investment is very small or even negative. The problem may be that the workforce is not capable of assimilating higher levels of technology at such a rate.

The table shows how the remarkable performance of the Great Leap Forward was followed by a worsening of all indicators in the Fourth Five Year Plan period (1961-65). This may be related to the stresses caused by the Great Leap itself and also to the decreased effectiveness of the traditional instruments of central planning. By 1965, changes were introduced in the system of economic management which led to sharply improved labour, capital and material productivity in the course of the Fifth Plan period (1966-70). Observers questioned the need for an economic reform in Bulgaria in the mid 1960's on the grounds that an economy so underdeveloped could still achieve high growth rates under the traditional central planning system.<sup>5</sup> The analysis here, however, implies that in the early 1960's Bulgaria was having serious problems in maintaining growth and that the reforms of the mid-1960's were a considerable success.

Unfortunately, the gains of the Fifth Five Year Plan period do not appear to have persisted into the 1970's. The growth rates of all indicators are lower in the period 1970 to 1974 than in previous years. The increase in labour productivity is down on the 1966-70 period but remains respectable at 4.7 percent a year. However, the declining productivity of the capital stock must be a cause for concern. While

<sup>4</sup> Capital broadening is defined as equipping a larger labour force with capital at the same capital-labour ratio. Capital deepening is the increase in the average capital-labour ratio. Table 1 also contains an item for the reallocation of capital towards those sectors with higher capital-labour ratios.

<sup>5</sup> See, for example, J. F. Brown, "Bulgaria under Communist Rule," New York, 1970 p. 160-1.

campaigns in the 1970's have been centered on the concept of "social labour productivity," many of the specific programs and actions have aimed directly at raising capital and material productivity.

### 3. ECONOMIC STRATEGY: THE SIXTH AND SEVENTH FIVE YEAR PLAN

Bulgaria's Sixth Five Year Plan (1971-5) aimed at further intensive economic growth.<sup>6</sup> This involved an emphasis on the concentration and specialization of production, an increased share of investment for the reconstruction and modernization of existing installations and an increase in labor productivity. In December 1972, a program for raising the standard of living was launched which became a major determinant of economic strategy. The Five Year Plan's emphasis on labour productivity was heightened with the March 1974 National Party Conference which dealt mainly with this subject. Another goal of the Sixth Plan was the most efficient use of raw and semi-processed materials in short supply. The Plan placed a broader emphasis on local raw materials and the utilization of all components of ores and deposits.

The late 1960's and early 1970's were characterized by a belief that modern technology was the key to solving Bulgaria's economic problems. It was maintained that the application of computers could raise productivity and coordinate supplies and production efficiently. Thus, in the Sixth Plan stress was laid on the introduction of Automated Management Systems, the establishment of okrüg (county) computing centers and even computing centres on the Agro-Industrial Complexes. This approach was described by one observer as "computopia". A similar emphasis was laid on the rapid integration of new technology into production. Research institutes were intended to concentrate on applying foreign discoveries to production processes and enterprises to mastering new processes rapidly.

Industries singled out for special attention in the Sixth Five Year Plan were oil refining, ferrous metallurgy, chemicals and rubber, building materials and machine building. Emphasis on oil refining and petrochemicals appears in retrospect to have been a mistake. Bulgaria possesses little domestic oil and natural gas and must import its requirements from the USSR. While the increase in the price of oil could not have been forecast, perhaps the emergence of excess world capacity in the petrochemical sector could have been. Stress on the production of building materials was intended to ease some of the supply problems of the building industry. The machine building sector in Bulgaria caters largely to the CMEA market. Bulgaria is possibly the strongest adherent within the CMEA of the system of specialization agreements. This form of planned complementarity has allowed Bulgaria to create a large export-oriented machine building industry which it would otherwise have found prohibitively difficult. The development of ferrous metallurgy is seen as the basis for the machine building sector and as an important input to the construction sector.

In the construction sector, the Sixth Plan aimed at the introduction of industrial methods. The increased use of prefabricated units would

<sup>6</sup> T. Zhivkov, "Otecheten doklad na TsK na BKP pred desetitia kongres na partiata," Sofia 1971.

allow the productivity of construction workers to be raised. This would serve to "overcome the discrepancy between the volume of construction and the capacity of the construction industry"<sup>7</sup> which had led during the Fifth Plan period to a sharp increase in the volume of unfinished construction. The Sixth Plan also aimed at improving the coordination between investors, constructors and suppliers. In this respect it was intended to make the construction enterprise responsible for the quality of work performed and the prompt commissioning of the project.

The structure of capital investment is one of the clearest indicators of the priorities of the authorities. Table 2 shows how this structure of capital investment has varied with time. In 1960, Bulgaria was still engaged in the Great Leap Forward and this is reflected in the structure of that year's investment. Most noteworthy is the extremely high share of investment in agriculture that characterized this period. Investment in agriculture remained at about its 1960 level throughout the 1960's, but its percentage share fell as total investment grew. The data for 1965 show how much of the incremental investment during the Fourth Five Year Plan (1961-5) was channelled into industry. Between 1965 and 1970, there was little change in structure except a further stagnation in investment in agriculture and an increase in the share of transport. During the 1970's, the share of industry in total investment has declined. The sectors to benefit from this decline are construction, where efforts have been made to increase mechanization in order to overcome the industry's chronic inefficiency, agriculture, to revive the growth in output that halted in 1966-7, and transport and communications. The share of non-productive investment in the total has also risen from 23.8 percent in 1970 to 24.8 percent in 1974.

Table 3 shows the structure of investment in industry. In the 1970's, the most important branch of industry is the machine-building and metal-working branch. This has accounted for about 20 percent of all investment in industry. The second branch in importance is the chemical industry. The actual share of this branch fluctuates from year to year as large projects are inaugurated. After the chemical industry comes power generation followed by the food industry. This last industry received large investments in the Great Leap Forward,

<sup>7</sup> U.S. Department of Commerce, "Overseas Business Reports," OBR74-14, "Summary of the Sixth Bulgarian Five-Year Plan, 1971-5", June 1974.

but its importance has gradually declined. Two sectors which have gained in importance during the 1970's are the building material industry and the forage industry (which is under the rubric "other").

In presenting the Seventh Five Year Plan, a number of criticisms of the fulfillment of the Sixth Plan were made.<sup>8</sup> Apart from the failure of some sectors to fulfill output targets, insufficient attention was paid by some ministries and State Economic Associations to raising productivity, reducing material expenditures and improving the quality of production. A considerable expansion of the volume of construction had been allowed to occur and many important projects had not been commissioned on time. Serious shortcomings were reported in the supply of goods and services to the population and the housing shortage remained acute. It was also reported that "in certain places narrow-minded bureaucratic methods and parochial trends in resolving problems were manifested".

The basic tasks of the Seventh Five Year Plan (1976–80) remain similar to those of the Sixth. However, among the various targets there have been some shifts of emphasis. The main direction remains the "intensification of economic growth". This is to be achieved by the rapid introduction of the achievements of science and technology, the modernization and reorganization of the economy, rapid growth in productivity and efficiency and improved quality. Raising the standard of living also retains its priority.

The Plan states some general principles about the sectors to be developed. Most rapid growth is to take place in those sectors with good long-term prospects. Efforts will be made to utilize existing production capacities fully, to concentrate and specialize production, modernize and reconstruct existing installations and build large and efficient new production capacities. The authorities will try to concentrate production in units of optimal capacity specializing in the production of assemblies and components. The Plan calls for preference to be given to the production of goods needing relatively small quantities of raw and other materials, power, labour inputs and capital

<sup>8</sup> See Rabotnichesko Delo, February 23, 1976.

investment. It is not clear how this instruction can be applied literally, but its aim and connection with the regime of savings is clear.

The Seventh Plan provides for capital investment of 30.7 billion leva, compared to about 21 billion in the previous five years. It is intended that new factories will only be constructed when it is impossible to reconstruct, modernize or expand existing ones. 53.0 percent of capital investment is scheduled for reconstruction and modernization, 15.3 percent for expansion of existing plants and 31.7 percent for new construction. The share for reconstruction and modernization is sharply higher than the 35 percent scheduled in the Sixth Plan. This target was, however, considerably underfulfilled.

At the National Party Conference of March 1974, Zhivkov pointed out that Bulgaria was producing too many things, a little of each.<sup>9</sup> A decisive cut in the number of products was essential. This reduction will be carried out in step with bilateral and multilateral CMEA programs. The Plan envisages an intensified exchange of manufactured consumer goods, with imported consumer goods rising from about 7 percent of domestic consumption (1972) to about 20 percent in 1980. Bulgaria will also concentrate on the production of components for assembly in other socialist countries (primarily the USSR) and this should be facilitated by increased plan coordination. By 1980, 30 percent of exports to the USSR are expected to consist of such specialised production.

During the Seventh Plan period, enterprises will normally be expected to meet their increased production targets using the same amount of labour or less. A number of techniques will be applied to raise labour productivity. Soviet methods for the "scientific organization of labour" will be applied, changes will be made in labour norms and studies will be undertaken to utilize working time more efficiently. The authorities hope to reduce labour turnover, diminish the numbers of administrative personnel and attract pensioners, students and housewives into the labour force. Changes will also be made in the wage system. These will be designed to stimulate an improvement in the quality of labour supplied, and to increase the role of the basic wage in total remuneration.

Efforts to save material inputs will be pursued and the Plan provides for a reduction in the average turnover period of working capital by about ten days. Stricter observance of norms for the consumption of materials will be promoted. Stockpiling reserves above the normal level will be prohibited, but in practice, this may depend on improvements in the supply system. It is hoped to reduce production costs by 10 to 12 percent during the Plan period. This target compares with reductions scheduled in the Sixth Plan of 7.1 percent for industry, 5 percent for State Farms and 3.9 percent for transport. Bulgaria will participate in the joint exploitation of raw materials in other socialist countries in order to secure supplies. To ensure better use of the existing capital stock, plants will normally be expected to operate for six or seven days a week while the labour force enjoys a five day week. The shiftwork factor is expected to rise by 10 percent.

Real income in the 1976-80 period is to rise by about 4 percent a year. This is lower than in the previous five years, when the rate was 5.8 percent, and in the Eighth and Ninth Plan periods the rate is

<sup>9</sup> Radio Free Europe Research (hereafter RFER), Situation Report No. 8 of July 15, 1974.

expected to be 4.5 to 6 percent.<sup>10</sup> The achievement of "scientific norms for consumption" has been postponed beyond 1980. Efforts will be made to improve the structure of the supply of consumer goods after some serious deficiencies during the Sixth Plan. The Plan states that the raising of the standard of living is not only a social question but should also serve to increase productivity and economic efficiency.

The development of industrial branches producing mass consumer goods is to be accelerated and thus the growth rates of groups A and B are to be brought closer together. Industrial production is planned to increase by 55 percent and efforts are to be made to improve the quality of production. The latter may be increasingly necessary as Bulgarian enterprises supply more components for the industries of other socialist countries. If the Bulgarian authorities intend such production to become a major source of growth, it will become important that Bulgarian products establish a reasonable quality record.<sup>11</sup> Within industrial production, the shares of machine building, electronics, metallurgy, chemicals and electric power are expected to rise.

Machine building output is expected to double. This sector's share in total exports rose from 29 percent in 1970 to 41 percent in 1975 and is expected to reach 50 percent in 1980. Within the CMEA, Bulgaria specializes in the production of factory handling and lifting gear (produced by SEA "Balkankar") and certain kind of agricultural machinery. In addition, bilateral specialization agreements with the USSR account for the production of motor vehicle components, telephone equipment, electronics and other products. In the Seventh Plan period, production of heavy trucks, buses, tractors and ships is to be expanded. Particular attention will be paid to producing that agricultural machinery needed to resolve some of Bulgaria's own agricultural problems. Thus, emphasis has been placed on equipment for fodder processing, technological systems for the industrial cultivation of tobacco, vegetables, grapes, and fruits, and small-scale equipment for private plots.

After the difficulties with the raw material base during the Sixth Five Year Plan, particular efforts in this sector are to be made in the Seventh Plan period. Electric power production will rise by 50 percent compared with 30 percent in the previous five years. By 1980, 20 percent of all electric power should come from atomic power stations. Bulgaria's connections with the CMEA power grid will be expanded. Coal production is to rise at an accelerated rate and more use be made of secondary power sources within industry. There will be an intensified search for offshore oil and gas.

The country's two ferrous metallurgy bases, the "Lenin" and "Kremikovtsi" plants, are both to be reconstructed and modernized by 1980. The "Lenin" plant dates back to the early 1950's and the "Kremikovtsi" plant to the early 1960's. Preparations will also be made for a "third metallurgical base". This will be located on the coast where it can be supplied cheaply with imported fuel and ore. This is in contrast to the situation at Kremikovtsi where the local fuel and ore deposits proved poor and the transport costs for imported inputs are very high. The production of the chemical industry is to rise by 80

<sup>10</sup> RFER, Background Report No. 59 of March 11, 1976.

<sup>11</sup> Complaints from the USSR about the quality of some Bulgarian products were mentioned by Zhivkov at the National Party Conference. See RFER, Background Report No. 8 of July 15, 1974.

percent. Emphasis will be on production of fertilizers, polymers, synthetic fibers and rubber. The microbiological industry is to be developed to solve the problem of a lack of protein for livestock breeding.

The system of economic management has been undergoing a certain recentralization in the 1970's. This process will probably continue in the second half of the decade. The Plan calls for an enhancement of the role of central planning. National economic complexes and industrial branches will be expected to work on the basis of full cost accounting. Another target is an improvement in the system of material supply. This is essential if surplus stockpiling by enterprises is to be reduced. However, it has proven elusive in the past. One improvement that has been suggested is the increased use of supply from catalogs rather than on the basis of the supply plan.

Agricultural production is expected to rise by 20 percent and labour productivity by 40 percent. Investment in the National Agro-Industrial Complex will come to 5.7 billion leva or 18.6 percent of all capital investment (this compares to a share of 18.8 percent for agriculture and the food industry alone in 1971-4). After the severe drought of 1974, renewed attention is to be paid to irrigation. A further 200,000 has. are to be irrigated and irrigation systems on a similar area to be modernized and reconstructed. The major thrust of agricultural policy is to be increased livestock breeding. Numbers of animals are to increase, especially cows. This will need a strengthening of the fodder base. Private plots are to receive additional encouragement and support as a reserve for increased agricultural production and especially livestock production.

#### 4. NATIONAL INCOME

Despite impressive growth rates since the Second World War, Bulgaria remains one of the poorest countries of Europe. The 1975 World Bank Atlas shows GNP per capita in current dollars rising from \$1,450 in 1972 to \$1,590 in 1973 and \$1,770 in 1974.<sup>12</sup> The figures place Bulgaria rather ahead of Portugal and behind Spain and Greece in a ranking of European countries. Other, more conscientious, estimates by Alton show GNP per capita in terms of 1972 dollars rising from \$1,404 in 1970 to \$1,662 in 1975.<sup>13</sup> This last figure is equivalent to a 1975 per capita income of \$2,116 in 1975 dollars.<sup>14</sup> In a ranking of East European CMEA member countries, this places Bulgaria at the bottom. Alton's figures show Bulgaria slipping behind Romania over the 1970-75 period as a consequence of the remarkable growth rates in the latter country.

Measures of national income for East European countries are notoriously subject to error. This is a result of well-known problems of basic data, irrational price systems and exchange rates, and inadequate information about the methodology underlying official estimates. These problems are compounded when examining the growth of national income, since in an economy undergoing rapid structural transformation, a change in the weighting of sectors may have a marked effect on aggregate growth rates. This caveat should be born in mind in the subsequent discussion.

<sup>12</sup> World Bank Atlas, Washington, D.C. 1975 p. 29.

<sup>13</sup> T. P. Alton and Associates: "Economic Growth in Eastern Europe, 1965-75" and revisions, I.W. International, New York, 1976.

<sup>14</sup> Using the implicit U.S. GNP deflator.

The official Bulgarian index for national income is shown in Table 4. It shows the growth rate of net material product picking up from an annual rate of 6.7 percent in the Fourth Five Year Plan period (1961-65) to a rate of 8.7 percent in the Fifth Plan period (1966-70). In the years 1971-5 the growth rate declines to 7.8 percent a year. In 1976 the reported growth rate was 7 percent. Alton's recalculated index is shown in Table 5. His project records a faster growth rate of 6.9 percent in the Fourth Plan period<sup>15</sup> with a decline to 5.2 percent in 1965-70 and to 4.7 percent in the Sixth Five Year Plan. He shows a 4.6 percent growth in 1976.

1976.....	15,289.0								

Note: Between 1970 and 1971, national income was reported to have grown by 7.1 percent i.e. to about 122,275 million leva. However, certain changes in the definition of national income were made in 1971 and new prices came into effect. Row 1971a is calculated from unpublished official Bulgaria data and shows 1971 national income using 1970 coverage of national income and 1970 prices. Data for transport and communications in 1960 and 1965 include only that part connected with material production. In later years the full output of the sector is included.

Source: T. P. Alton & Associates, "Economic Growth in Eastern Europe, 1965-75" (and revisions), L. W. International New York, 1976.

<sup>15</sup> Not shown in Table 5. This figure comes from another study of the same project: E. M. Bass: "Bulgarian GNP by Sectors of Origin, 1950, 1955, 1960-74." L.W. International, New York 1975 p. 2.

There are two major differences between the official estimates and Alton's. Alton's estimates are on a GNP basis and this includes various services excluded from the official index. If national income produced in these sectors were excluded from the Alton index, the annual growth rate in 1965-70 would be raised to 5.4 percent and in 1970-75 to 4.8 percent.<sup>16</sup> More important in explaining the differences between the two indexes is the weighting of the various sectors. In 1968 agriculture has a weight of 29.23 percent in the Alton index, or 33.44 percent of the material production sectors. In the official index in 1968, the weight of agriculture is 19.37 percent. In the Alton index the ratio of agriculture to industry is 1:1.14 while in the official index it is 1:2.83. As a result, the Alton index is much more heavily influenced by the performance of the agricultural sector than is the official index. The rapid growth of agricultural production in the years 1960-65 leads to Alton's index recording a faster rate of national income growth than does the official index. In the Fifth Plan period (1966-70), industry growth accelerated while agricultural performance was disappointing. Thus, the official index shows an increased national income growth rate for this period, while Alton records a declining growth rate. In the Sixth Plan period (1971-75), both indexes record slower rates of growth. The decline is more marked in the official index than in Alton's because agricultural performance has improved in the 1970's.

Agriculture is extremely important as a source of inputs for industry. Shortfalls in agricultural production have a marked impact on industrial production in the subsequent year. This can be seen clearly in Table 4. After recording nominal industrial growth rates of 11.6 percent annually in the Fifth Plan period (1966-70) industrial production in 1971 rose at the respectable rate of 9.1 percent. Agricultural production that year declined and consequently industrial growth in 1972 fell to 7.9 percent. Good harvests in 1972 and 1973 allowed industrial production to rise by 9.0 percent in 1973 and 10.2 percent in 1974. However, in 1974 the country suffered a severe drought and agricultural production fell again. This brought the industrial growth rate in 1975 down to a disappointing 6.4 percent, the lowest rate since 1962. Some recovery in the industrial growth rate is reported for 1976, and the record harvests of 1975 and 1976 make a good industrial performance in 1977 probable.

The construction sector has behaved erratically during the 1970's. In the period 1965-70, the net material product of the construction industry grew by 13.4 percent a year. This reflects massive investment made possible by large assistance from the USSR in the early 1960's and Western credits later and corresponded to an accumulation rate of as much as 33.2 percent of utilized national income in 1969. In 1970 such assistance ceased and it became necessary to begin to repay the credits received. The construction sector took the brunt of the adjustment to this new situation, and in 1971 and 1972 growth rates of only 4 percent were recorded by this industry. Production, however, picked up in 1973 and 1974 as the balance of payment's constraint slackened.

Table 6<sup>17</sup> shows that for each year of the Sixth Five Year Plan (1971-75), utilized national income was greater than produced national

<sup>16</sup> Other adjustments would also have to be made to make the two indexes methodologically compatible.

<sup>17</sup> Table 6 presents one methodological problem: the identity of the item "undistributed part" of net material product. Throughout most of the 1960's and 1970's, this item has been negative, in other words has gone to increase domestic expenditure. The most likely explanation is that it is a combination of statistical discrepancy and hidden reserves which have failed to be included in the accumulation fund. If so, it would be the opposite of the item "losses".

income. From 1970 to 1974, produced national income rose by 24.4 percent while utilized national income rose by 36.1 percent. Whereas in 1970 domestic expenditure (which is equal to utilized national income) was 51 million leva less than production, by 1974 it was 1169 million leva greater than production. In 1975 the gap was probably even greater although no data on the accumulation fund have been published yet.

TABLE 6.—NET MATERIAL PRODUCT (PRODUCED AND CONSUMED)

[In millions of leva, current prices :]

Year	National income produced (1)	Balance of foreign trade and credits (2)	Losses (3)	National income for distribution (4)	Undistributed part (5)	Utilized national income (6)	Accumulation fund (7)	Consumption fund (8)
1960.....	4,488.8	97.6	32.8	4,553.6	90.4	4,463.2	1,222.3	3,240.9
1965.....	6,635.6	52.9	80.8	6,607.7	-137.2	6,744.9	1,916.8	4,828.1
1970.....	10,527.4	-174.9	129.4	10,223.1	-252.9	10,476.0	3,059.7	7,416.3
1971.....	10,411.0	77.0	114.0	10,375.0	-61.0	10,436.0	2,462.0	7,974.0
1972.....	11,242.0	115.0	129.0	11,228.0	-350.0	11,578.0	3,088.0	8,490.0

Note: columns (1)+(2)-(3)=(4); (4)-(5)=(6)=(7)+(8). 1960, 1965, and 1970 figures come from an unpublished official Bulgarian source. National income produced for 1971-74 are from Statisticheski Godishniki, various issues, for 1975 from U.N., Monthly Bulletin of Statistics, February 1977, p. 205. for 1976, estimated from the plan fulfillment report, Rabotnichesko Delo, Feb. 3, 1977. Balance of foreign trade and credits for 1971-76 is estimated. Unpublished official Bulgarian data for 1960 to 1970 show the relationship: Balance equals  $-41.1+22.4t-1.758B$ , where  $t$  is time in years ( $t(1960)=0$ ) and  $B$  the foreign trade balance in millions of valuta leva. This relationship is assumed to continue until 1976. Incidentally, the equation implies an average rate of 1.76 domestic leva per foreign trade lev during the 1960s. Losses for 1974-76 are estimated. Unpublished official Bulgarian data for 1960 to 1970 show the relationship: Losses equal  $-83.5-7.8t+0.0272$  NIP where  $t$  is time in years ( $t(1960)=0$ ) and NIP is national income produced. The accumulation and consumption funds for 1971 and 1972 come from U.N., Monthly Bulletin of Statistics, February 1977, p. 191. The consumption fund for 1974 was given by BTA on Dec. 3, 1975, data for 1975 and 1976 are based on plan fulfillment reports. The accumulation fund for 1973 and 1974 and the consumption fund for 1973 are based on data from Statisticheski Godishniki, 1975, p. 112 and assumes no change in prices. Columns 4, 5, and 6 are sums and residuals. There is some problem in identifying the undistributed part of national income. It may indicate a statistical discrepancy. For a discussion of the differences between produced and utilized national income see E. Mateev, "Balans na narodnoto stopanstvo", 3d ed., Sofia, 1972, pp. 201-205, 248-250, and A. I. Petrov, ed., "Statistika stran-chlenov SEV", Moscow, 1973, p. 253.

The increasing gap between production and expenditure in the course of the Sixth Five Year Plan was largely unplanned. In no year was the target for produced national income met and for the five years as a whole, the increase in national income produced was 46 percent, at the bottom of the targetted 45 to 50 percent range. Both consumption and accumulation, however, consistently grew faster than planned. Investment over the five years was scheduled to grow by 5.5 percent a year, but the growth rate achieved was 6.5 percent. Real income per worker rose by 6.1 percent per year compared to the target rate of 4.5 to 5.5 percent. Retail turnover grew by 7.9 percent against the target of 6.8 percent.<sup>18</sup> The overinvestment failed to bring about a subsequent accelerated rise in production because much of it served to increase the stock of unfinished construction. On the consumption side, increases in purchasing power rose faster than the supply of goods and services.<sup>19</sup>

The growing gap between production and consumption has been filled by increasing trade deficits. In 1975, the deficit reached 694

<sup>18</sup> Le Courier des Pays de l'Est, April 1976.

<sup>19</sup> See "Partekongress in Bulgarien", Neue Zürcher Zeitung, March 30, 1976.

million valuta leva which is estimated to be equivalent to 1516 million leva in domestic currency. These trade deficits were almost entirely with Western countries and were financed by an impressive accumulation of debt.<sup>20</sup> These deficits reached a peak in the second quarter of 1975. Since then, imports from the west have fallen and the gap narrowed.

In a centrally-planned economy it is possible to correct balance of payments disequilibria by direct administrative instructions to foreign trade enterprises to reduce imports. However, it is also necessary to introduce some form of domestic stabilization policy otherwise the shortage of imports may disrupt production, reduce the volume of investment sharply, or lead to consumer demand rapidly overtaking supply. Bulgaria introduced a policy of domestic restraint in 1973, but the succession of similarly sounding decrees since then imply that the policy has been insufficiently tight. A more severe stabilization effort was introduced in July 1976 and it is possible that this will lead to the required adjustment. The data of Table 6, however, show how large an adjustment is necessary.

The trade deficit of the early 1970's will probably have to be reversed during the late 1970's. A reasonable assumption might be that in 1980 Bulgaria will need to run a trade surplus of about 500 million domestic leva. If the further assumption is made that losses of national income are about compensated by an inflow under the item "undistributed part," utilized national income will equal produced national income minus the trade surplus. If produced national income grows as planned, it will amount to 20719 million leva in 1980 (1975 national income increased by 45 percent). Utilized national income will reach 20219 million leva. The growth rate of produced national income over the Seventh Five Year Plan will be 7.7 percent a year while that of utilized national income will only be 5.0 percent a year. If the Accumulation Fund is brought down to 26 percent of utilized national income by 1980, this will imply an annual growth rate of this item of only 0.3 percent.

##### 5. STABILIZATION POLICIES

The preoccupations of the Bulgarian authorities concerning economic policy have remained unchanged over the period 1973 to 1977. The underlying concern has been to reduce waste, to reduce stocks of unfinished construction and to introduce a regime of strict economy. These efforts have been directed to increasing the volume of produced national income and reducing the amount of non-productive accumulation. An additional instrument to restore balance to the national economy would be the restraint of personal consumption. However, in December 1972, a special program was launched for raising living standards. The program appears to have been designed and launched before the authorities realized the extent of economic imbalance. In any case, the authorities have not made major efforts to moderate the growth of personal consumption. This may have been in accordance with a theory that rising living standards would themselves bring about a growth of labour productivity adequate to fill the gap between supply and demand, or simply because of the prestige embodied in the consumption program.

<sup>20</sup> See Section 13, below:

The call for strict economy was made in 1973. In July 1973, national programs were introduced in six sectors to save raw materials. This was supplemented later in the year by a national emulation campaign launched by workers in Plovdiv to reduce the use of material inputs. The second goal of the program was to reduce the length of time needed for commissioning investment projects and thus reduce the backlog of construction inherited from 1971-2.

These efforts were only partially successful. It was reported in 1973 that of 65 surveyed enterprises, 56 remained behind-hand in their commissioning of fixed capital.<sup>21</sup> 1974 was declared a "Year of Shock Work" in honor of the thirtieth anniversary of Communist rule and a successful effort was made to concentrate resources on commissioning projects already started. In March 1974, a number of current problems were aired at the National Party Conference. Stress was placed again on the waste of raw materials. It was noted, for example, that the Bulgarian machine building industry wasted 10 to 20 percent more metal than its U.S., U.K. or Canadian counterparts.<sup>22</sup> Another criticism made was the poor quality of many Bulgarian goods. This made exporting more difficult and led domestically to the accumulation of unsaleable stocks. Following the National Party Conference, in July 1974 a policy of reducing the numbers of managerial and office personnel was announced, and a temporary ban on new recruitment imposed.<sup>23</sup> On August 4, 1974 a Decree on Saving Materials, Fuel and Power was issued. This called for the drawing up of a comprehensive national savings program by the end of 1974.

While these measures were clearly steps in the right direction, they do not appear to have been pursued with sufficient determination. Thus in 1975, despite further calls for concentrating investment resources on commissioning already started projects, the backlog of construction grew again. In July 1975, a new Decree on the Use of Scrap Materials was issued, implying that the Decree of August 1974 had failed to bring about dramatic results. Some data were given for the low level of scrap utilization in Bulgaria. Only 23 percent of paper was collected for recycling compared to 50 and 40 percent in West and East Germany respectively. Only 26 percent of metal was produced from scrap compared to 37 percent in West Germany and 42 percent in Japan.<sup>24</sup> These deficiencies were attributed to poor organization, lack of capacity and the absence of a comprehensive program for collection.

The efforts of the authorities to rebalance the domestic economy throughout 1973, 1974, 1975 and the first part of 1976 were inadequate. The economy gave an impression of drifting while huge external debts piled up and consumer purchasing power ran ahead of supplies. The share of construction in new projects in the first half of 1976 remained at the same level as during the first half of 1975.<sup>25</sup> In these circumstances, a Central Committee Plenum was called in July 1976 to launch a decisive attack on "shortcomings that have been hampering production for many years".<sup>26</sup> In his report, Zhivkov called for the application of "Leninist principles of administration and management." He identified the squandering of resources on unfinished

<sup>21</sup> RFER, Background Report No. 8 of July 15, 1974.

<sup>22</sup> Ibid.

<sup>24</sup> RFER, Situation Report No. 23 of August 6, 1975.

<sup>25</sup> "Bulgaria: Economic Performance Criticized," *Business Eastern Europe*, August 27, 1976.

<sup>26</sup> *Rabotnichesko Delo*, July 30, 1976.

investment projects, poor quality goods piling up in warehouses, low levels of production efficiency and the waste of materials, financial resources and time as being the major problem areas. In response he announced a number of new programs for more efficient use of raw and other materials, for the full utilization of secondary raw materials (i.e. scrap), a reduction in the number of unfinished construction projects, an acceleration of the turnover of financial resources, a reduction in subsidies, financial losses and agricultural production costs, a reduction in the volume of substandard production, the rationalization of the management apparatus and the efficient use of transport.

In the subsequent months, a number of concrete steps have been taken to implement the decisions of the July 1976 Plenum. In August 1976, the Council of Ministers adopted various programs to accelerate the turnover of financial resources and to reduce the volume of unfinished construction.<sup>27</sup> On October 1, 1976 the speed limit was reduced to 80 kmph. Most dramatic was a decision to cut numbers of managerial and administrative personnel.<sup>28</sup> While an earlier program to do this in July 1974 had clearly proved ineffectual, the new decision talked of reducing administrative personnel by 15 to 30 percent.<sup>29</sup>

The stabilization program of the July 1976 Plenum has a good chance of success. For the first time in the 1970's it represents a mobilization of the entire party apparatus to solve some of the problems of waste and overinvestment. One pointer to the severity of the program is the fact that in the 1977 Plan, produced national income is scheduled to rise by 8.2 percent while utilized national income will only grow by 4.5 percent.<sup>30</sup> If this low growth rate is achieved, bearing in mind that most targets for consumption and accumulation have been overfulfilled in the 1970's, it will be a sign that Bulgaria is capable of balancing internal supply and demand and perhaps even of running export surpluses by the end of the decade.

## 6. LABOR

Bulgaria was traditionally a labour-surplus agricultural economy and yet, throughout most of the 1960's and the 1970's, many articles in the press talk about the labour shortage. This is all the more strange when countries at a similar level of development, such as Spain, Portugal, Greece and Yugoslavia, are suffering from high levels of unemployment and export large quantities of labor to Western Europe. Despite this, a real labour shortage is perceived in Bulgaria, which stems from a combination of supply constraints and exceptional demand, the latter being a product of both the economic system and the growth strategy of the country.

Unemployment was effectively eliminated in Bulgaria during the Great Leap Forward. This was achieved by the mass mobilization of labour for capital construction projects and by adapting the crop structure to take better account of the available agricultural labour.<sup>31</sup>

In addition, the cumulative effects of the extensive growth strategy of the 1950's was to create a large, but low productivity, industrial labour force. From that point (1960) on, a labour shortage was felt in Bulgaria. The virtual absence of open or disguised unemployment meant that additional labour could only be employed in one sector if released from another. The structure of economic incentives, however, was such as to encourage a hoarding of labour. Reserves of labour in an enterprise allowed the management greater flexibility in fulfilling plans. The real returns on making small-scale mechanization or reorganizing production to release labour were too small to encourage these processes. The labour shortage in Bulgaria is thus a consequence of Holzman's "overfull employment planning".

The labour shortage is felt in all sectors. In 1975, demand for labour was estimated to be 2 percent greater than supply in industry, 2.9 percent in construction and 4.4 percent in transport.<sup>32</sup> During the harvest season, there is a particularly severe shortage in agriculture and some 150,000 extra people are mobilized to participate in harvest brigades. Another sector where the shortage is one of unskilled labour is the construction industry. In 1974, in particular, there was an extensive campaign to encourage people to participate in finishing projects in time for the thirtieth anniversary of Communist power.<sup>33</sup> Labour shortages have also been felt in the retail trade network, particularly in connection with the transition to a five day week.

The watchword of the 1970's has been "social labour productivity", and raising this productivity has been at the center of the authorities' attention. The importance attached to labour productivity clearly indicates the efforts of the authorities to achieve intensive growth. The use of campaigns, such as the "counter planning" movement and initiatives to save raw materials, has been more widespread in the 1970's than in the 1960's. This may reflect an attempt to change the attitude of the worker to his work and achieve higher labour productivity by ideological means. There are good reasons for such an approach in Bulgaria. The change of the society from a predominantly agricultural to an industrial one has been so rapid that most workers are only one generation or less removed from agriculture. Industrial socialization has only achieved a small foothold in the working class, and such campaigns may be the most effective way to bring socialization about. The quality of the labour force may now be a major factor retarding growth in Bulgaria. The complexity of capital investment may be increasing faster than the technical qualifications of the labour force and this may be leading to the declining marginal productivity of capital.

In addition to the systemic reasons why Bulgaria should feel a labour shortage, there have been objective factors causing the supply of labour to dry up. Firstly, the rate of increase of population of

<sup>32</sup> Ikonicheski Zhivot, No. 16/1975, quoted in ABSEES No. 4/1975 Item No. 395.

<sup>33</sup> This campaign was not greeted by universal acclaim. "The building sites were swarming with people: students, soldiers, employees of ministries and departments, people from different professions and from different ranks of the administrative hierarchy. They put on workers' clothes and became building workers for days, weeks, or months. I am not naive, and it is difficult for me to claim that this transformation is easy, that all these people left their offices and desks and went to the building projects filled with enthusiasm and a terrific longing for manual labour. No, comrades! There have been people, perhaps even many people, who went there out of discipline, because they were embarrassed to face their colleagues, guided by the feeling that this is necessary for the fatherland and that they cannot do otherwise. There may have been people who were unwilling, and it is even possible that our government may have been now and then the subject of some kind 'Bulgarian-style' blessing \* \* \*." Todor Zhivkov, Radio Sofia September 6 1974 (Translated by FBIS)

working age (15 to 64 years) has dropped sharply over recent years and is now one of the lowest in Eastern Europe. During the Seventh Plan Period (1975-80), this potential labour force will grow at a rate of 0.3 percent annually, about the same rate as Czechoslovakia and lower than all other East European countries except Hungary.<sup>34</sup> Bulgaria will probably retain its penultimate position during succeeding plan periods. Of course, the pronatalist policies of the authorities cannot be expected to have any effect on this figure until the 1990's. The second source of growth in Bulgaria has been the migration from low productivity agriculture to high productivity industry. This source has been diminishing as the relative sizes of the agricultural and industrial labour forces changed and as labour productivity in agriculture rose. In 1952, a movement of 1 percent of the agricultural labour force into industry increased industrial employment by 6.6 percent. In 1974, the same transfer would increase employment by only 0.9 percent. In 1952, one worker in industry produced 4.9 times as much national income as one worker in agriculture. By 1973, the former only produced 2.3 times as much. The third source has been the increasing participation of women in the labour force. This share has risen from 32.1 percent in 1960 to 46.4 percent in 1973. However, it seems probable that the ceiling has been reached. The efforts of the authorities to attract more women into the labour force may conflict with their efforts to raise the birthrate. One Bulgarian source foresees a decline in the female share of the labour force to 45.7 percent in 1985 and 44.7 percent in 2000.<sup>35</sup>

As a further factor causing a labour shortage, the reduction in the working week may be mentioned.<sup>36</sup> The number of holidays, leave-days and weekend days for industrial workers has risen from 74 in 1965 to 82 in 1970 and 99 in 1974.

The authorities see three main sources for increasing the supply of labour: pensioners, students and women. The problems involved in the increased participation of the last group have already been noted above. One approach that is being tried is to reduce the time spent by the average woman in domestic work, which was reported to be 4 hours a day.<sup>37</sup> Encouraging pensioners to continue working seems a real possibility. The retirement age in Bulgaria is relatively low (55 for women and 60 for men) and of the 1.7 million pensioners it was reported that only 9 percent work.<sup>38</sup> To attract pensioners back to work, the financial incentives have been improved considerably. Large numbers of students are employed during the summer in harvest brigades and during the rest of the year in construction work. Both students and pensioners are being looked to as a means of relieving the shortage of retail trade workers. An agency has been established in Sofia for mobilizing student labour.

Efforts have been made to reduce the numbers of administrative personnel and to place the workers thus freed into more productive employment. In recent years, the number of people in administrative positions has risen much faster than those directly involved in production. In industry alone, the numbers of directly productive workers.

<sup>36</sup> See sec. 11.

<sup>37</sup> Rabotnichesko Delo, Apr. 25, 1974, quoted in ABSEES No. 3/1974, item No. 437.

<sup>38</sup> Ibid.

and employees rose by 33.6 percent between 1965 and 1974. Over the same period, the numbers of workers and employees outside direct production increased 66.7 percent. Administrative-managerial personnel in Bulgaria represent 13.5 percent of the total labour force, compared with only 6 to 7 percent in the other socialist countries, according to one Bulgarian source.<sup>39</sup> Various campaigns have been waged to reduce the numbers of such personnel. For example, in July 1974 a temporary ban was imposed on the hiring of managerial and office personnel. In August 1976, a decree cutting the numbers of such personnel was issued, which may lead to a reduction of 15 to 30 percent.<sup>39a</sup>

One further factor influencing the supply of manpower may be mentioned. That is labour migration. The shortage of workers in Bulgaria led to the signing of an agreement with Egypt in 1972 for the import of labour. This agreement was never implemented, but an agreement with Yugoslavia in 1973 did bring Yugoslav construction workers to Bulgaria. Migrant labour from Yugoslavia has been used in the harvest for several years, in particular for fruit picking in Western Bulgaria. While Bulgaria has thus imported some labour, it has also exported labour, primarily to the USSR, but also to a lesser extent to Czechoslovakia and East Germany. Some 6,000 workers are employed in three Bulgarian lumber enterprises in the Komi ASSR;<sup>40</sup> about 4,000 other workers were reported to be employed in 1973 in construction work in various Soviet republics, at the Kursk Magnetic Anomaly and on the Orenburg Gas Pipeline. 10,000 people represents rather less than 0.3 percent of the total number of workers and employees employed in Bulgaria.

The full use is not necessarily made of what labour is available. In 1975, it was estimated that the equivalent of 170,000 man-years were wasted in industry alone.<sup>41</sup> Of this time, some 50 percent was due to poor coordination of production plans and 12 percent to shortages of raw and other materials. Thus much of the waste of time must be attributed to the poor organization of production. Other figures supporting this showed that workers engaged in material production spent 70 percent of their working time in effective labour in 1971.<sup>42</sup> This figure represented an increase from 62 percent in 1965 and it was hoped to raise the figure to 76 percent in 1975 and 83 percent by 1980.

Other problems include labour discipline, turnover and the level of qualifications. There have been repeated complaints about absenteeism, unpunctuality and the use of working hours for personal business. Labour turnover is high; in 1974, 10.7 percent of the industrial work force and 21.6 percent of those employed in construction changed their jobs.<sup>43</sup> Of the total labour force, some 46.7 percent were unskilled in 1975<sup>44</sup> and it was estimated that about 20 percent of specialists were employed in work that did not utilize their qualifications.<sup>45</sup>

<sup>45</sup> Problemi na Truda, No. 7/1973, quoted in ABSEES No. 2/1974 item No. 449.

To combat some of these phenomena, a "counterplanning" campaign was launched in December 1971 which has remained in force ever since. This movement was described by Zhivkov as a successful Bulgarian initiative, which has "enjoyed a favorable response in a number of fraternal countries".<sup>46</sup> The concept of counterplans (or supplementary plans) goes back at least to Stalin's First Five Year Plan. Under this system, the Central Planning Commission would issue enterprises with their plans. Then the workers would spontaneously pledge to achieve much higher targets. These counterplans would then be incorporated in the National Plan. Such a system of mobilization has been associated historically with phases of extensive growth. The Bulgarian initiative consists in adapting the system to tackle problems associated with intensive development.

The counterplans are part of a socialist emulation movement to raise the efficiency and quality of production. The working collectives pledge to achieve savings in the use of resources, a better use of scrap and waste and higher quality indicators.<sup>47</sup> These targets are ones that are difficult to incorporate into the incentive structure for socialist enterprises. Thus, the responsibility for their fulfillment is taken over by the trade unions which rely on moral rather than material stimuli.

An extension of this emulation campaign is "emulation on a contractual basis". Under this system various collectives link their counterplans so higher production can be achieved. In this form of contractual counterplanning special emphasis is placed on the quality and timeliness of mutual deliveries. It was reported that 72,000 brigades, shifts and other collectives had signed such emulation contracts in 1974.<sup>48</sup> The movement has also extended to the conclusion of contracts with enterprises abroad.

Some abuses of the counterplanning system were noted by Zhivkov at the National Party Conference in March 1974.<sup>49</sup> The abuses appeared to consist of the manipulation of counterplanning targets and regular targets to alter the distribution of bonuses. These, in some cases, had removed the incentives for workers to establish such counterplans.

Material stimuli have been used too to encourage saving labour and raising the quality of production. From 1974, any economy in the wage fund resulting from reducing the number of workers below planned remains at the disposal of the collective. Similarly, 40 percent of the economy in the use of materials, fuel, etc. compared with the state plan and 50 percent of any additional income from producing better quality products than provided for in the plan remain with the collective.<sup>50</sup>

## 7. ECONOMIC MANAGEMENT

Since the realization in the early 1960's that there were serious shortcomings in the traditional system of central planning, there has been an continued search for new methods of economic management. The seminal article of the Soviet Professor Liberman was republished in Bulgaria in 1962 where it awoke sympathetic discussions and some

<sup>46</sup> Quoted in RFER, Background Report No. 8 of July 15, 1974.

<sup>47</sup> I. Shpatov. "Vsenarodnoe sotsialisticheskoe sorevnovanie v Bolgarii" in B. A. Yurin, ed.,: "Sotsialisticheskoe sorevnovanie v stranakh bratskogo sohdruzhestva: Sbornik statei," Moscow, 1975 pp. 10-25.

<sup>49</sup> See RFER, Background Report No. 8 of July 15, 1974.

<sup>50</sup> Shpatov, *op. cit.*

experiments. However, the proposal that the market become the principal regulator of economic activity was buried by 1965, and since that time the main search has been for more effective administrative structures of management. The advocates of market socialism have left a certain legacy to subsequent mutations of the economic mechanism, in the form of a more rational price system, an increased use of contracts to coordinate inter-enterprise relations, a substantial replacement of compulsory administrative controls by financial levers and the strengthening of cost accounting, and thus the autonomy of economic organizations. Despite this, the main thrust of reform has been to experiment with redistributing autonomy and control among the enterprises themselves, large trusts, known as State Economic Associations (SEA), and most recently, National Economic Complexes. As with the reorganization of agricultural administration, Bulgaria has shown a certain amount of originality in this reform.

The attempt to create a new management structure has been an attempt to tackle three interrelated problems. The first is how to improve coordination between productive units. This problem is one of what happens at the "interstices" of the economic system and how to prevent autarkic behavior by the enterprise or other unit. The second problem is that of reaping the economies of scale without suffering the diseconomies. There has been a prolonged campaign for specialization and concentration of production, although, if achieved, it might increase the problems of coordination of supply. The third area of attention is that of the effective use of modern science and technology to raise quality, labor productivity and the productivity of materials. These issues are likely to remain preoccupations of the Bulgarian authorities for the foreseeable future.

The first attempt to solve these problems by reorganizing the system of management can be dated to the Decree of the Council of Ministers on the Application and Development of the "New System of Management of the National Economy" of November 6, 1968. This created the SEA as a management body for a group of enterprises in the same sector.<sup>51</sup> Under this system, the enterprise remained the basic unit of the economy; it continued to operate on the basis of cost accounting and consequently retained its own bank account, made contracts with other State enterprises and made payments to the State Budget. The SEA was in charge of distributing plan targets among its member enterprises and assisting them in sales, supply, the introduction of new technology, etc. It was constituted as an independent economic unit supported by the contributions of its members. In practice it turned out that this kind of body was not sufficiently integrated into the system. From the viewpoint of the enterprise the SEA appeared irrelevant because it had neither the authority to influence the enterprises behavior once it had distributed the plan target, nor the financial means to assist the enterprises.

The system of management was consequently changed in 1970.<sup>52</sup> The new system in effect turned the enterprises into branches of SEAs and this was further emphasized when the regulating documents were amended in 1972.<sup>53</sup>

<sup>51</sup> Earlier decrees in 1965 and 1967 first introduced the SEA, but they remained experimental until 1968. See B. Ilev, "Stopanskata smetka na Dürzhavnite stopanski obedinenia, Sofia," 1972, p. 64.

<sup>52</sup> See the "Normativni aktove za prilozhenie na ikonomicheski mekhanizum prez perioda 1971-1975," in Dürzhaven Vestnik No. 98 of December 11, 1970.

<sup>53</sup> See Dürzhaven Vestnik, No. 4 of January 12, 1973.

The principle behind the new system was that the SEA should be the basic unit of the economy. The regulating documents provided for various degrees of financial and legal autonomy for the branches of SEAs. The SEA administration received its plan targets and norms directly from the central authorities. It operated on the basis of full cost accounting and conducted an exchange with other SEAs. From the viewpoint of the enterprise, the SEA administration replaced the central authorities. The SEA administration converted the plan target it had received into targets for individual enterprises. While the SEA as a whole had to fulfill certain norms (such as return on fixed assets) in its activity, the SEA administration could differentiate these norms enterprise by enterprise. The latter were placed on a system of internal cost accounting applying the norms and prices specified by the SEA administration. The new system concentrated the financial resources at the level of the SEA administration, which was thus able to control the introduction of new technology and the reorganization of production processes.

At the end of 1970, when the SEA was made the basic form of the economy, the existing 97 SEAs were amalgamated into 64 larger SEAs with an average of 27 branches and 17,000 productive personnel each.<sup>54</sup> There was an average of about five SEAs under each branch ministry.

The main problem that emerged from this new structure was its rigidity, in that it imposed the same form of management on each branch of the economy, irrespective of the needs or technological level of the branch. Thus it is not certain that the optimal management system for a specialized producer of metal-cutting machinery (SEA "ZMM") is the same as the optimal system for the tourist industry. Another difficulty was that the reform only eliminated the problem of enterprise autarky at the cost of creating SEA autarky. Problems of coordination persisted since, although there were fewer units to be coordinated, the remaining units were more inward-looking and more in the nature of empires.

The need for additional flexibility made it necessary to amend the regulations in February 1974.<sup>55</sup> This provided for a variety of organizational forms in addition to the SEA. Such forms included State Economic Combines, United Economic Enterprises, State Economic Complexes and Territorial Industrial-Agricultural Complexes. Later in 1974, the wider rights and responsibilities of the branch ministries were mentioned during Zhivkov's speech to the National Party Conference. In some sectors, branch ministries were becoming State economic bureaus for managing the system of economic, scientific and other organizations in the branch. Thus in some branches, some of the functions of the SEAs were transferred to the Ministry.

The clearest example of one form of organization envisaged in this metamorphosis of the management system was provided by the reorganization of the chemical industry in 1975.<sup>56</sup> This provided for four of the seven SEAs in the sector to be reorganized into eleven autonomous economic combines and one united economic enterprise, all under the direct control of the Ministry. The united economic enterprise was placed in charge of oil and gas extraction and the exploitation

<sup>54</sup> See B. Ilev, *op. cit.*, pp. 49-51.

<sup>55</sup> Decree of the Council of Ministers, No. 13 of February 28, 1974 in *Dürzhaven Vestnik* No. 27 of April 5 1974. See RFER, Situation Report No. 13 of May 9, 1974.

<sup>56</sup> See RFER, Situation Report No. 25 of September 10, 1975, which quotes A. Pankov, *Ikonomicheskii Zhivot*, No. 33 of August 13, 1975.

of the U.S.S.R.-Bulgaria gas pipeline. The eleven combines were formed from the dismantlement of the SEAs in charge of the Devnia Chemical works, petrochemicals, heavy chemicals and organics. The combines are each attached to one basic plant whose management looks after production, planning, financing and accounting for the whole combine, material supply and sales. The combines may have their own bank accounts, have the right to conclude contracts and are responsible for plan fulfillment. The subdivisions or peripheral plants of the combines have varying degrees of autonomy. The Ministry is responsible for technical development, investment policy, concentration and specialization of production and foreign economic relations. A major aim of the new system is to encourage the amalgamation and rationalization of small plants. The reform will also serve to reduce the degree of monopoly in Bulgarian industry. Whereas SEAs were organized to include an entire branch, the reorganized chemical industry, for example, contains three synthetic fiber combines.

The latest mutation of the Bulgarian management system has been the establishment of National Economic Complexes. This form of organization was first signalled in Zhivkov's speech to the December 1972 Plenum. In it he noted: "Our economy is a complicated dynamic system with many subsystems. A great part of these subsystems form objectively existing economic complexes."<sup>57</sup> It was widely expected that the first of these subsystems to be given an organizational form would be the National Agro-Industrial Complex. The formation of this unit was foreseen early in 1973 when it was expected to comprise agriculture, the food industry and possibly various industries providing agricultural inputs, such as agricultural machine building, fertilizers and agricultural chemicals. In fact, the first national economic complex to be created was the National Transport Complex which came into being on January 1, 1974. This was followed by the National Construction Complex on April 1, 1974. The National Agro-Industrial Complex was created by a decision of the Council of Ministers on August 5, 1976 (although without comprising any machine building or chemical industries) and the National Trade, Tourism and Public Services Complex was set up in January 1977.<sup>58</sup> In the basic regulations for economic organizations during the Seventh Five-Year Plan,<sup>59</sup> national economic complexes are described as the "basic structural units of the national economy."

The creation of these complexes appears to be a Bulgarian innovation. Their purpose seems to be to improve the coordination of their subordinated economic organizations. In the construction sector, the coordination of supplies of building materials with the schedule for construction has been a problem for many years. In agriculture, one of the main problems has been to integrate processing enterprises with the farms and coordinate supplies from the latter with production capacity in the former.

The various complexes are subordinate to a branch ministry: the Ministry of Transport, the Ministry of Construction and Architecture, the Ministry of Agriculture and the Food Industry and the Ministry

<sup>57</sup> T. Zhivkov: "Za posledovatelno izpūlnenie resheniata na desetiia kongres na BKP za povishavane zhiznenoto ravnishie na naroda," Sofia, 1972, p. 146.

<sup>58</sup> A National Cultural Complex was established in 1974. The reorganized chemical industry, described above, has also been referred to as a national economic complex, see *Rabotnichesko Delo*, September 23, 1976.

<sup>59</sup> *Dürzhaven Vestnik* Nos. 100 and 101 of December 30 and 31, 1975. Noted in RFER, Situation Report No. 3 of January 28, 1976.

of Domestic Trade and Public Services, respectively. The Ministry has a dual role being at the same time a state organ and an economic organization. The complex is normally expected to be self-supporting, receiving funds from the State Budget only in special cases. As a result, the volume of the State Budget has been reduced and expenditures on the economy from this source planned for 1976 and 1977 were below the 1975 level. The complex as a whole operates on the basis of full cost accounting. The Ministry decides how much autonomy to give subordinate units and whether they should work on a full or internal cost accounting basis. The Ministry for each complex decides on the degree of independence of its subordinate units. It may redistribute the net income and accumulation funds of the organizations under it. The complex as a whole receives plan instructions and norms and the Ministry distributes the tasks among its subordinate organizations and may differentiate the norms.

Within each complex, under the Ministry, is a Council on which sit representatives of the Ministry and the subordinate units of the complex and representatives of other Ministries and public organizations involved in the complex's activities. Under the Council come the economic organizations comprising the complex. In the National Transport Complex,<sup>60</sup> these organizations consist of the State Economic Associations managing railroad, air and water transport and the Directorates in charge of roads, canals and ports. In the National Construction Complex<sup>61</sup> come the various State Economic Associations in the building materials industry and regional directorates for construction and architecture. The National Agro-Industrial Complex<sup>62</sup> has two subordinate levels. Below the Ministry come the State Economic Associations in the food processing and fodder industries, the various Scientific Production Associations, the Industrial Agricultural Associations and the regional Agricultural Administrations. Below these are the combines, amalgamated enterprises, scientific-production complexes, industrial-agricultural complexes and agro-industrial complexes. A problem arose with the establishment of the National Trade, Tourism and Public Services Complex.<sup>63</sup> Some organizations in retail trade such as the State Economic Associations "Rodopa" (meat) and "Bulgarplod" (fruit) were already subordinate to the National Agro-Industrial Complex. These have been made subordinate to both complexes. In addition, a number of organizations in the new complex have hitherto been managed by the State Committee for Tourism and the Central Cooperative Union. These organizations will remain subordinate to the latter two bodies but will also receive administrative instructions from the Ministry for Domestic Trade and Public Services.

How this new system will work in practice it is too early to tell. Certain problems seem evident. The dual function of the Ministries, which are expected to behave as both administrative state bodies and profitable economic units at the same time, seems likely to create difficulties. Similarly the dual subordination of some organizations may prove to

<sup>60</sup> RFER. Situation Report No. 2, January 17, 1974.

<sup>62</sup> Rabotnichesko Delo, September 23, 1976.

<sup>63</sup> Rabotnichesko Delo, February 2, 1977.

be an excuse for ignoring the instructions of both superiors. A third criticism is that the Bulgarian economy has been subject to too much organizational change over the past ten years. At the start of the Sixth Plan it was recognized that enterprises must expect norms and targets to be stable for long periods if the planning horizon is to be extended. Over the last few years, however, the organizational environment has changed so frequently that enterprise managers must be wary about making commitments. Some positive points are also to be noted. Firstly, the degree of experimentation and the hybrid system evolved indicate that the Bulgarian authorities are more concerned to establish practical solutions than intellectually neat ones. Secondly, the coexistence at present of a variety of organizational forms means that effective reforms can be established by testing rather than by a priori reasoning. The system of the early 1970's, which reorganized the whole non-agricultural economy on the basis of State Economic Associations, was intellectually satisfying; however, it did not provide for the diversity that characterizes the economies of the real world. One final conclusion is clear: that relations between enterprise, association, complex, and ministry have not reached their final form in Bulgaria.

#### 8. AGRICULTURAL PRODUCTION

The period 1956 to 1966 was one of steady growth in Bulgarian agriculture. Both the official gross output index and the index recalculated by Alton<sup>64</sup> show an increase of 90 percent over the period. This growth can be attributed to a more rational approach to agricultural problems following the April 1956 Plenum and the 1958-60 Great Leap Forward and the sharp increase in capital investment in agriculture during the latter period. The crop structure was changed to accord with Bulgaria's comparative advantage within the CMEA and agricultural procurement prices were raised decisively. Agricultural growth in Bulgaria during the first part of the 1960's was a considerable success.

The years 1966 and 1967 represented a high point in Bulgarian agriculture. Whereas annual growth rates of gross production in the preceding decade were in the region of 7 percent, since then the average growth rate has been only just over 2 percent. Production fell back in 1968 and 1969 and only reached the 1967 level again in 1970. In 1972 there was a further increase of 8 percent on the 1970 level, but production stagnated at that point for two further years. In 1975 and 1976 production rose by 7.5 and 3.1 percent respectively. In view of the increasing volume of inputs into agriculture, the growth rate of net agricultural production has been even lower since 1966-67. Alton's estimates show the 1966-67 level only slightly surpassed in 1972 and 1973, a relapse in 1974, when Bulgaria was hit by a severe drought, and resumed growth in 1975 and 1976. (See table 5.)

The slow rate of agricultural growth in the 1970's must be a matter of concern to the authorities. While agriculture no longer occupies the overwhelmingly important place in national income that it once did, its role in economic development is still crucial. There are two reasons

<sup>64</sup> G. Lazarek and W. Znayenko: "Bulgarian Agricultural Production, Output, Expenses, Gross and Net Product and Productivity, 1939 and 1948-67," Riverside Research Institute, New York, 1970.

for this. Firstly, agricultural products are Bulgaria's main source of hard goods exports. These give Bulgaria the power to buy easily from the West, subsidize exports of industrial products to other CMEA countries and consequently increase its room for manoeuvre. The decline in the growth rate of agricultural production has turned Bulgaria from a net exporter of hard goods into a net importer. The second reason for the strategic importance of agriculture lies in the authorities' program to raise the standard of living. Targets for the consumption of various foodstuffs have been set, and these targets have only been reached for vegetable oils and flour (an inferior good). Consumption of meat, milk, fruit and vegetables in 1975 was only 50 to 60 percent of the target, and fruit consumption in 1975 was actually 20 percent below the 1970 level. Increased agricultural production is thus the key to in raising the standard of living.

Table 7 shows average crop production and yields during the Fourth, Fifth and Sixth Five Year Plan Periods. The success story over this period has been grain production. In 1962, Zhivkov announced that the main problem in agriculture was the supply of bread grains. In 1974 this problem was declared solved. Bulgaria had changed over the period from a sporadic importer of grain to a small net exporter.<sup>65</sup> The focus of attention has now shifted from bread grains to the fodder problem.

Shortages of fodder plagued Bulgarian agriculture during the 1960's, and, as Table 8 shows, resulted in a decrease in numbers of cattle and pigs.

<sup>65</sup> Despite this, Bulgaria imported 300,000 tons of grain from the USSR under the clearing agreement in 1974, following the drought. B.T.A., October 29, 1976, 1848 GMT.

Sources: Statisticheskii Godishniki, 1974 and 1975. Data for Jan. 1, 1976 and 1977, from plan fulfillment reports. 1980 target from November 1973 Central Committee Plenum, see RFER, Background Report No. 1 of Feb. 8, 1974.

The chronic shortage of fodder is combined with unstable yields and poor organization of supplies. This has the effect that large numbers of livestock are slaughtered when there is a poor fodder harvest, and inadequate fodder supplies in general keep down the productivity of surviving animals. In November 1973, a program was launched to increase the population of farm animals to a level adequate to provide meat supplies for domestic consumption. The targets for livestock numbers in 1980 were based on the targets for meat consumption in that year. It seems unlikely that these ambitious targets will be met, but there has certainly been progress in livestock raising since 1974, and it is possible that by 1980 the cattle population will pass 2 million and the pig population 5 million.

The task of ensuring adequate fodder production and supply has been entrusted to the SEA "Grain and Fodder Industry" which was created from two separate SEAs in August 1975.<sup>66</sup> By combining the management of grain and fodder in this way, it is hoped to facilitate the switching of the bread grain area to forage grain and other forage crops. In 1960, 33.3 percent of the sown area was under breadgrains, 28.4 percent under forage grains and 19.7 percent under other fodder crops. By 1970, the area under breadgrains was down to 28.5 percent, that under forage grains up to 31.7 percent and that under other fodder slightly lower at 18.7 percent. The marked efforts to increase fodder production, especially silage, in the early 1970's resulted in a sharp switch from the now adequate breadgrains into other fodder crops. By 1974, the share of the former had fallen to 23.9 percent and that of the latter had risen to 23.1 percent; the share of forage grains was also higher at 32.4 percent.

From July 1, 1976, the SEA purchased all fodder produced by the public sector, leaving farms only with normed amounts for sowing and feeding to livestock. From August 1, 1976, it became responsible for supplying the farms regularly with combined fodder, fodder grains and protein-bioconcentrates. Problems still persist in the quality of fodder,<sup>67</sup> its collection, storage, transportation and delivery. In

<sup>66</sup> See RFER, Situation Report No. 20, of July 22, 1976.

<sup>67</sup> In 1975, 400,000 tons of concentrated fodder, or about one-sixth of the total had to be destroyed because of poor quality. See Rabortnichesko Delo, June 9, 1976, quoted in ABSEES No. 4/1976 item No. 317.

addition, farmers were criticised for irrational feeding methods that wasted scarce fodder. In 1976, the plan for fodder production remained unfulfilled and the director of SEA "Grains and Fodder Industry" was relieved of his post.

While average yields for grain and forage crops rose fairly steadily from the Fourth to the Fifth and Sixth Plan Periods, this was less true for technical crops, fruits and vegetables. For these crops, the stagnation or decline of yields from the late 1960's is most marked. These items include many of Bulgaria's major export commodities such as tomatoes, apples, plums and grapes (in the form of both fruit and wine), so the poor production results have had a severe impact on foreign trade. There has also been an impact on domestic consumption. Shortages of fruit and vegetables were noted particularly in 1974, and in 1975, consumption of fruits was 20 percent below the 1970 level. One report lamented that Bulgaria, "the classic country of horticulture", now imported onions, potatoes, cabbages and a number of other vegetables.<sup>68</sup>

Bulgaria has few reserves of agricultural land left. The area of cultivated land is gradually declining and fell by about 3 percent between 1960 and 1974. Over that period, the area of uncultivated meadows and pastures, mainly in the mountain areas was increased by 50 percent, but this too has shown some tendency to decline during the 1970's. Some 22 percent of arable land (or 1.1 million has.) was irrigated in 1974. This figure was about 100,000 has. higher than in 1970 and about 200,000 has. higher than in 1965. The rate of expansion of the irrigated area is to rise in the Seventh Five Year Plan period, and the area should be increased by 200,000 has. by 1980. Much of the present irrigation system is primitive and a further 200,000 has. are to be modernized over the same period.

The average annual decrease in the agricultural labour force was 4.1 percent between 1960 and 1965, 3.9 percent in the next five years and 3.6 percent between 1970 and 1974. This extensive migration from agriculture has resulted in the aging of the agricultural labour force. In 1976, only 9 percent of the agricultural labour force was in the 16 to 25 year age group (compared with 22 percent in industry), and 30 percent were over 55, (compared with 8.6 percent in industry).<sup>69</sup> The authorities are taking measures to raise the quality of those who remain and to encourage them to stay. Particular stress has been placed on raising the status and remuneration of "mechanizers", and most agricultural youth is encouraged to choose this profession. Pensions, wages and retirement conditions have gradually been raised for agricultural workers and peasants. This has virtually eliminated the gap between rural and urban incomes. However, it may be necessary for agricultural remuneration to be higher than that in industry, if the lure of urban life is to be counteracted.

Plowing, harrowing, sowing and the harvesting of wheat and sunflowers have been over 99 percent mechanized. In 1974, corn harvesting was 91 percent mechanized and sugar beet 84 percent. The main areas where basic mechanization still has an important role to play are the cultivation and harvesting of fruit, vegetables and tobacco, and in loading and unloading. Agriculture continues to suffer from an acute

<sup>68</sup> *Rabotnichesko Delo*, February 22, 1974, quoted in ABSEES No. 3/1974 item No. 393.

<sup>69</sup> *Trud*, February 17, 1976, quoted in ABSEES No. 3/1976 item No. 314.

transport shortage, especially during the harvest. In addition, much agricultural machinery is outdated. To combat this, in November 1973, the amortization period for such machinery was shortened. A rather puzzling feature of agriculture in the 1970's has been the reduction in fertilizer application. This fell from about 13.4 kg/da in 1970 to 12.0 kg/da in 1974, despite an increase being provided for in the plan. This was accompanied by increasing production and increasing exports of fertilizer. The current five year plan calls for a doubling of fertilizer application by the end of the decade.

Most agricultural procurement prices have remained unchanged since 1967. Exceptions include prices of meat and milk, which were raised in 1974, and essential oils, which were increased in 1975. Stable procurement prices have been matched by generally rising agricultural production costs.<sup>70</sup> This has squeezed profits and retarded investment in the sector. Changes in the level of production costs are shown in Table 9. On average, these show costs remaining stable between 1960 and 1965, increasing about 15 percent in the next five years and a further 15 percent in the next four years. The main reason seems to have been that increased labour costs were not offset by increases in labour productivity, substantial as that was. This reasoning appears to be supported by the fact that the increased costs have been fastest for the least mechanized lines of production.

The increases in costs of production have led to a decline in profitability.<sup>71</sup> In 1975 average profitability was estimated at 20 to 22 percent (of capital stock?) which was considered insufficient to ensure normal capital investment.<sup>72</sup> Double this amount is considered to be necessary to provide adequate investment. Another source argues that if agriculture is to grow fast enough to solve the problem of food consumption, it would be necessary to increase the volume of state financed investment.<sup>73</sup> Another approach might be to raise procure-

ment prices sharply, but this would result in a new burden on the state budget if retail food prices are to stay unchanged. It does seem clear, however, that some method of transferring additional resources to agriculture is called for to raise growth rates and so increase exports and meet the food consumption targets.

## 9. AGRICULTURAL ORGANIZATION

Bulgarian agriculture in the early 1970's appears to be a laboratory for experiments in new forms of horizontal and vertical integration. The first Agro-Industrial Complexes (AIC) were created at the end of the 1960's by merging groups of cooperative and state farms with local agricultural processing plants into units averaging 40,000 hectares, and were introduced generally throughout Bulgaria in 1970-71. Experiments have also been made since 1972 in the further vertical integration of agriculture with processing industries. In October 1976, a new form of national management of agriculture, the National Agro-Industrial Complex was introduced. Bulgarian experiments in forms of agricultural organization have been imaginative, and some are being adopted by other socialist countries. Most notable has been the echoing of Bulgarian experiments in Soviet Moldavia and the subsequent decision to increase the degree of horizontal and vertical integration in agriculture throughout the Soviet Union.<sup>74</sup>

The first AICs were created in 1968 in the regions of Vratsa, Mezdra and Ivaylovgrad. AIC Vratsa was formed by uniting seven cooperative farms totalling 38,700 hectares and AIC Mezdra from ten cooperative farms with an area of 31,100 hectares. The financial and technical results of these mergers were considered satisfactory, with the AIC Mezdra showing a large profit compared to previous losses of its constituent farms.<sup>75</sup> Subsequently, the establishment of the AIC as the basic organizational form for Bulgarian agriculture was announced at a Plenum of Central Committee of the BCP in April 1970. AICs were to be the basis for concentration and specialization in agriculture, through first horizontal and then vertical integration, much as State Economic Associations had been made the basic form of industrial organization in 1968. The complete reorganization of agriculture on the basis of the AIC appears to be regarded as a success by the Bulgarian authorities. At a further Party Plenum on agricultural problems held in November 1973, the creation of AICs was held to have been "unconditionally justified"<sup>76</sup> and it was consequently decided to retain it for the future.

The creation of AICs, according to the decisions of the April 1970 Plenum, was to be based on five principles:

- (1) Voluntary adhesion by existing farms.
- (2) Scientific study of the advantages.
- (3) Preservation of some autonomy by member farms.
- (4) Territorial unity.
- (5) Democratic management.

There is some doubt about how operative these principles were in the rapid division of the country into 170 AICs. The speed with which

<sup>74</sup> See A. Giroux: "L'organisation de l'agro-industrie en URSS," *Le Courrier des Pays de l'Est*, July/August 1976, pp. 3-15.

<sup>75</sup> Z. Andreev: "Konzentration in der Bulgarischen Wirtschaft," *Oesterreichische Osthefte* No. 3/1975, pp. 233-244.

<sup>76</sup> RFER, Background Report No. 1 of February 8, 1974.

the reorganization took place casts doubt on the depth of the scientific study that was made in each case. Similarly it may be asked how the principle of voluntary adhesion was reconciled with the need for territorial unity. In the reorganization it appears that the principle of territorial unity was paramount.

The most interesting issue is the question of the degree of autonomy preserved by the constituent state and cooperative farms forming the AICs. Of the 172 AICs existing at the start of 1973, 92 were formed solely from cooperative farms, 16 solely from state farms and 64 from a mixture of state and cooperative farms.<sup>77</sup> The distinction between state and cooperative property has been seen as anachronistic and plans call for their gradual merger into "all-national property." In line with this idea, on January 1, 1972, one AIC (AIC Purvenets, Plovdiv okrüg) dissolved its constituent farms and changed its system of management from a territorial system (i.e., through constituent farms) to a branch system (by type of activity). By early 1973, the constituent farms had abandoned their autonomy in 15 AICs, and by the end of 1975 the total had reached 83. At a Central Committee Plenum in February 1975, a decision on the suspension of the legal and economic independence of the constituent farms was adopted, but the transition to a branch organization was phased over the period 1976-80.<sup>78</sup> There has been some opposition to the dismemberment of cooperative farms, possibly because the members of the richer farms may expect some temporary cut in income as they merge their accounts with weaker farms. One economist pointed out that the transformation from cooperative to "all-national property" was not being accomplished by the "further development or raising of [the former] to a higher level of maturity" but by "simple and direct liquidation." He noted further that in Bulgaria, cooperative property has by no means exhausted all its possibilities and that any attempt to underestimate its significance would be harmful.<sup>79</sup> It seems certain that the differences between state and cooperative property will continue to disappear, although possibly at a slower rate.

As noted, the degree of independence of the constituent farms has varied from AIC to AIC and over time. In the earliest form of AIC, the farm retained full control over the day-to-day production process, with the AIC administration in charge of planning, most capital investment and the provision of certain services. As the constituent farms have been dissolved, the management of production has been placed on a branch basis. For example, on the AIC "Vit" (Pleven okrüg), there are five directorates: livestock, crops, mechanization, the agrochemical center and the economic directorate.<sup>80</sup> Under each directorate come a number of specialized branches in charge of one line of production, for example, grain crops. Below the branch is constituted the brigade, which may have 100 to 200 workers. The brigade operates on the basis of internal cost accounting. Finally the brigade is divided into zvena or links, each consisting of 15 to 25 workers.

<sup>77</sup> I. I. Mogan, "Vzaimootnosheniia agrarno-promyshlennykh kompleksov s biudzhedom v Bolgarskoĭ Narodnoi Respublike," *Finansy SSSR*, No. 5/1975, pp. 78-9.

<sup>78</sup> *Pravda*, September 14, 1976.

<sup>79</sup> L. Giulmezov in *Ikonomicheska Misul* No. 3/1975, quoted by RFER, Situation Report No. 5 of February 26, 1976.

<sup>80</sup> *Ekonomicheskaia Gazeta*, No. 51/1976.

The main organ for realizing the fifth principle listed above, democratic management, is the delegate assembly. This normally meets twice a year to hear a report on activity from the management and to discuss the plan for the next period. In addition it approves a two-year mandate for the AIC Council.<sup>81</sup> This consists of elected representatives and the directors of all farms and enterprises within the AIC. It normally meets monthly and appoints an operative bureau to look after day-to-day business. The Chairman of the AIC is appointed by the Council for a two-year term and is responsible to it.

The creation of AICs has been accompanied by various changes in the technology of production. The changes represent the concentration of production into fewer units with a consequent leap in the size of production units and a specialization of activities among farms. Crops are now typically grown in large fields of several square miles and susceptible to mechanized cultivation. The scale of such fields (800-1000 hectares for wheat, 500 hectares for cotton, etc.) is large even by U.S. standards, let alone West European. Similarly, livestock breeding is increasingly concentrated in large units where industrial methods can be introduced. Early in 1976, there were 11 enterprises for fattening calves with 3,000 to 11,000 calves each, 13 broiler farms for chicken meat with several million chickens each, 9 enterprises for eggs with about 100,000 hens each and 18 pig farms with 32,000 to 100,000 pigs each.<sup>82</sup> This increasing scale of production seems to be designed to raise labour productivity rather than the productivity of any other factor.

The specialization between farms is based on a study of natural conditions and optimal crops for each area. Similarly livestock enterprises are located to minimize transport costs either from the fodder supply or to the market. Thus by 1980, 60 percent of the wheat will be grown in 10 of the 28 okrŭgs, 56 percent of the sunflower in 8 okrŭgs and beans will be concentrated in 4 okrŭgs in North East Bulgaria. Similarly, 10 okrŭgs will raise 65 percent of the pigs and 13 okrŭgs 80 percent of the hens.<sup>83</sup> This specialization of farms has both advantages and drawbacks. Since the new larger units are less autarkic than the old smaller ones, a better structure of production can be achieved. On the other hand, the specialized farms may prove inflexible in adapting to climate and market variations.

The creation of AICs and in particular the changes in the organization of production seem to reflect an approach that sees large-scale production as the panacea to the problems of Bulgarian agriculture. It is possible that this is being taken too far. As the scale of fields and livestock breeding enterprises increase, transport costs begin to grow at an increasing rate and start to become the dominant item among production costs. Overcoming this problem requires considerable investment in means of transport and heavy machinery. It would seem more sensible to make the transition to larger units gradually as such equipment becomes available. In the case of livestock breeding, it is far from certain that increasing the scale of production is beneficial. As herd sizes increase, yields fall and the incidence of disease rises. Technological progress can work both ways, and some-

<sup>81</sup> Pravda, September 14, 1976.

<sup>82</sup> RFER, Background Report No. 34 of February 14, 1977.

<sup>83</sup> Rabolnichesko Delo, September 23, 1976.

times can turn a smaller scale of production into the optimum. The thrust in Bulgaria is entirely one way.

This criticism is directed to the agro-technical methods adopted, not to the concept of the AIC itself. In fact, one significant advantage of the AIC is the flexibility with it can choose between various techniques of production. This is because it separates the central management unit from the brigade level production unit. Thus a variety of scales of production are possible at the brigade level, while the management system may remain unchanged. This is in contrast to the farming system in most Western countries where the farmer-owner must combine the functions of manager and organizer of production.

The other side of this advantage is the danger that the management will be too remote from the actual production. The management can only operate efficiently if it receives adequate information and can process it properly. However, in establishing information channels it may clog up the system in bureaucracy and paperwork. An advantage of the AIC in this respect may be, however, that it economizes on relatively scarce administrative talent. Reports have indicated that the creation of AICs has released numbers of administrative personnel for work in direct production.

The AIC provides opportunities for more stable financial relationships. The Bulgarian authorities have considered the possibility of applying a differential rent to cooperative farms to compensate for differences in soil fertility. The creation of larger units which pool funds makes this problem less acute and should lead to some equalization of agricultural incomes. The added financial stability of the farms also facilitates longer term planning.

The establishment of enormous agro-industrial complexes was only the first step in the transformation of the management of Bulgarian agriculture. This step mainly consisted of horizontal integration among farms. The next move has been vertical integration with the processing industry and a variety of forms have been experimented with.

The first stage of the process of vertical integration goes back to 1968 with the fusion of the Ministries of Agriculture and the Food Industry. The early period can be described as one of increasing coordination between the farms and the processors. This coordination was achieved by the increasing use of contracts between the two units. The processing enterprises were allowed to vary premia depending on the quality and dates of deliveries. A step forward in this process of coordination was taken at the start of 1973, when the conditions under which the two parties entered into contracts were equalized in favour of the farms. Previously only the farms were, in practice, subject to sanctions for violating their contracts. At the same time, State Economic Associations in the processing industry became able to finance investments on farms to improve supplies and farms to finance investment in processing enterprises. Contracts have gradually been concluded for longer periods, thus giving each party more assurance about the viability of any investment.

The next step in vertical integration consisted of the merging of a number of agro-industrial complexes and sugar-refining plants into "industrial-agricultural complexes" (IAC).<sup>84</sup> This amalgamation took

<sup>84</sup> RFER, Situation Report No. 28 of November 4, 1976.

place early in 1973 and the constituent farms on the complexes were dissolved. The SEA "Bulgarian Sugar" was rechristened an "Industrial-Agricultural Association" with seven sugar factories and their seven associated IACs under its jurisdiction and a further IAC in charge of seed production. The area of the average IAC is rather larger than that of the average AIC (47,000 hectares as opposed to 24,000 hectares). Agricultural production concentrates on the sugar beet needed by the processing plants, but the beet is grown in rotation with fodder. The fodder, together with by-products from the sugar industry form the basis for cattle breeding on the complexes.

The sugar factories and IACs represent the only examples of this form of organization and must still be described as experimental. The problems that have arisen in the first four years of operation seem to relate more to the industrial side than the agricultural side. In some cases the farms have been obliged to find temporary storage for their harvested beet as the factories failed to provide adequate facilities for contracted deliveries. These difficulties may be only adjustment problems following the adoption of a new management system. Another problem may be inherent in the subordination of the farms to the processing enterprises. This may make the crop structure of the farms much less flexible and, as economic conditions change, allow an inoptimal crop structure to develop.

Another form of vertical integration is the "Scientific-Productional Association" (SPA). These were first established in 1974, on the instructions of the November 1973 Plenum, and were planned for branches of agriculture which have a high degree of specialization and are engaged in mass production, and where international standards can be or have been reached.<sup>85</sup> The first two established in 1974 were for poultry and pig breeding. Three more have since been set up, for cattle and sheep breeding, veterinary medicine and seeds and plants. These SPAs appear to be mainly aimed at industrial methods of production with the rapid introduction of new technology.

Distinct from the Scientific-Productional Associations are the "Scientific-Productional Complexes." The first of these was also set up in 1974 in response to the November 1973 Plenum. This was described as a "scientific-productional viticultural and wine-producing complex" based on the town of Septemvri in Pazardzhik okrüg.<sup>86</sup> It was formed from the Septemvri AIC and parts of neighboring AICs, the Vinprom enterprise in Pazardzhik and a scientific institute in Septemvri. The complex was placed under the control of the SEA "Vinprom." It operates under the same economic regulations as the various sugar IACs mentioned earlier. The main difference between the two forms of organization, however, appears to be that whereas the IACs are based on a processing plant, the Scientific-Productional Complexes are centered on a scientific institute.

In March 1976, four further Scientific-Productional Complexes were established, which came into operation during the course of the year. These included two more viticulture and wine-producing complexes, one for maize production, based on the research institute at Knezha, and one based on Plovdiv for fruit and vegetables. At the start of 1977 a sixth complex was established at Kazanlık for attar of roses, other

<sup>85</sup> RFER, Background Report No. 1 of February 8, 1974.

<sup>86</sup> Dürzhaven Vestnik, No. 25 of March 29, 1974, see RFER, Situation Report No. 12 of May 2, 1974.

essential oils and medicinal plants. A feature of these complexes is that the principle of territorial unity has been abandoned. For example, the fruit and vegetable complex based on Plovdiv was formed from two existing AICs (Novi Krichim and Pürvenets) but with satellite plots on other AICs in Pazardzhik, Khaskovo and Stara Zagora okrúgs. It incorporates local canning factories and a number of scientific institutes. It is intended that the complex will gradually expand to include all cultivation, processing and marketing of fruit and vegetables in Bulgarian Thrace (i.e. South Eastern Bulgaria).<sup>87</sup> It is possible that this form of complex presages the reorganization of agriculture on the basis of specialized regional complexes with a patchwork of fields. However, such speculation is probably premature.

The final form of vertical integration to be discussed here is the series of experiments in Silistra okrúg. In March 1974, it was announced that the six AICs in the Silistra okrúg had been merged into one AIC and one IAC.<sup>88</sup> The autonomy of the constituent state and cooperative farms was abolished. The Silistra AIC was put in control of all grain and livestock production in the okrúg, while the IAC controlled fruit and vegetable growing and processing. From the start of 1976, the AIC and IAC were merged into one enormous AIC extending over the entire okrúg,<sup>89</sup> covering 170,000 hectares (590 square miles) and employing 19,000 people. The Bulgarian authorities are attracting foreign technology to help develop the complex and raise production by a factor of three over the next ten years.<sup>90</sup> Contracts have been signed with U.S. and Danish companies.

At the top of the agricultural hierarchy in Bulgaria comes the National Agro-Industrial Complex, which was set up in August 1976. The organization of national economic complexes has been described above. Its imminent creation was announced in December 1972, but a number of problems appear to have delayed it. One problem may have been the organizational capacity of the Ministry of Agriculture and the Food Industry to exercise detailed control over a sector producing 29 percent of national income, 32 percent of exports and 45 percent of goods on the domestic market. As finally established, the National Agro-Industrial Complex has 200 autonomous organizations including 13 State Economic Associations, 5 Scientific Production Associations, Scientific Production Complexes, 144 Agro-Industrial Complexes, Agricultural Departments in each of the 28 okrúg administrations, agricultural institutes, research units, colleges and newspapers. As yet, little can be said about how the complex can be made to function as a unit. Another reason for the delay in its establishment may have been a dispute about its extent. For foodstuffs and drinks, the complex covers the entire production cycle from the soil to the consumer. For most technical crops, the processing industries are outside the complex. At one time, there was a proposal to include all suppliers of agricultural inputs in the complex, such as producers of agricultural machinery and agricultural chemicals. In practice, most of these were left outside, except for the

<sup>87</sup> RFER, Situation Report No. 2 of January 21, 1977.

<sup>88</sup> Dürzhaven Vestnik, No. 28 of April 9, 1974.

<sup>89</sup> The creation of a complex covering an entire okrúg is reminiscent of an incident during the Bulgarian Great Leap Forward. On December 7, 1958, Rabotnichesko Delo announced that the whole of Botevgrad okrúg had been turned into one huge collective farm, to be known as "Botevgradska komuna." This was the nearest Bulgaria got to forming Chinese-type communes, and the report was denied the next day. See J. F. Brown, *op. cit.*, p. 88.

<sup>90</sup> D. Lascelles, "Merging Agriculture With Industry," *Financial Times*, March 2, 1976.

organization for repairing agricultural machinery and for the supply of agro-chemical services.

Bulgaria in the 1970's remains the scene of a variety of exceptionally interesting experiments in agricultural organization. Two motives seem to lie behind this experimentation. The first is the aim to increase the rate of application of modern technology to agriculture and then bring yields and productivity up to the best levels in the world.<sup>91</sup> The second is to improve the coordination between the various economic agents. It is an open question whether organizational changes will be adequate to improve the relations between the farm, the suppliers of its inputs and the processors of its output. Bulgaria is relying on such changes and a system of contracts and planned deliveries to solve a problem which is usually solved by the market in Western economies. The problem of coordinating fodder supply with livestock breeding seems a case when the establishment of a market might be a solution.

The ideological framework of Bulgarian agriculture is the same as in the other East European countries (except Poland and Yugoslavia). The Bulgarian authorities are displaying high degree of imagination within that framework to the solution of common problems. Some of the experiments in agricultural integration have already been successful and others look promising. Thus it can be expected that considerable use may be made of Bulgarian experience in the remaining CMEA countries over the next few years.

#### 10. PERSONAL PLOTS

In their efforts to revive flagging agricultural production, the Bulgarian authorities have launched a major effort to encourage production on personal plots. While these plots have generally been supported by the central authorities since the late 1950's, local authorities have often hindered the development of their full potential for both ideological reasons and because of conflicts between the demands of the socialized and private sectors. A campaign to encourage the "all-round utilization" and development of personal plots was launched with Decree No. 61 of the Council of Ministers of November 13, 1973.<sup>92</sup>

The area of personal plots was laid down in 1957 and confirmed in the Model Cooperative Farm Statute of 1967. Plots can be up to 0.2 hectare in intensively cultivated areas and up to 0.5 hectare in grain

<sup>91</sup> In the table below Bulgarian yields for some major crops are expressed as a percentage of the yields of some of the most efficient producers in the world and within the CMEA.

<sup>92</sup> RFER, Background Report No. 1, Jan. 3, 1974.

regions. In mountain regions an additional 0.5 hectare of land unsuitable for mechanical cultivation can also be allocated. Plots are permanent to encourage the farmer to invest in improvements and they may be cultivated collectively. Restrictions on the numbers of livestock that may be held privately were lifted in 1971. Income from private plots is officially treated as labour income<sup>93</sup> and thus not subject to the sanctions and taxes levied on speculative and unearned income.

Evidence of continued official support of personal plots is contained in a letter of 1975 from Todor Zhivkov to all Party committees, where he states that it is "not a question of revising our general line in the sphere of agrarian policy", but one "of skillfully making use of different forms of production and of all sources for increasing rural production".<sup>94</sup> Efforts have also been made to overcome any ideological scruples connected with such farming. One article in the Party monthly<sup>95</sup> argued that the cultivation of personal plots was merely another form of socialist production, since the farmer cannot hire labour, work is done according to a plan and plots are controlled by the agro-industrial complex, the land cannot be inherited or leased and the plots do not provide the basic source of income for their cultivator.

In 1973 personal plots accounted for 12.8 percent of arable land, 9 percent farmed by collective farm members and 3.8 percent by workers and employees. Of their area, 10.4 percent was under orchards and 7.4 percent under natural pastures, rather higher shares than for the socialized sector. Of their sown area, 80.1 percent was under fodder crops and 11.8 percent under vegetables and potatoes. Yields for most of the important fodder and vegetable crops were somewhat below those for the socialized sector. This is accounted for by the more marginal nature of the land involved and the lower level of inputs, these factors being only partially compensated by the more intensive application of labour. At the start of 1974, personal plots accounted for 19.3 percent of Bulgaria's cattle (26.1 percent of milch cows), 84.4 percent of buffaloes, 20.1 percent of pigs, 38.7 percent of sheep, 98.7 percent of goats, 45.0 percent of poultry and 81.2 percent of bees. 31.9 percent of all meat was purchased from the private sector, 22.1 percent of all milk and 48.6 percent of eggs. Production of milk and eggs per animal in the private sector was about half that of the socialized sector.

The above figures clearly show the importance of the personal plots in Bulgarian agriculture as a whole and in particular in livestock production. The low yields of milk (1020 litres of milk per milch cow in the private sector as against 2699 litres in the socialized sector) and of eggs (86 per layer as against 188) indicate the potential for raising production in this sector. The low yields are attributable to the inadequate supplies of fodder and the unimproved breeds in the private sector. The performance of personal plots in 1973 was poor,<sup>96</sup> with the numbers of livestock reduced (especially pigs and sheep) and the volume of deliveries of animal products down. In addition,

<sup>93</sup> RFER, Background Report No. 32 of November 21, 1975.

<sup>94</sup> P. Stamov, *Rabotnicheskoto Delo*, Nov. 11, 1975, quoted in *ibid.*

<sup>95</sup> *Partien Zhivot*, No. 10/1974, quoted in ABSEES No. 1/1975 item No. 342.

<sup>96</sup> *Ibid.* and *Rabotnicheskoto Delo*, Nov. 2, 1973 quoted in ABSEES No. 2/1974 item No. 416.

excessive zeal in closing small orchards and vegetable gardens in an effort to concentrate production resulted in a shortage of fruits and vegetables in 1973.<sup>97</sup> This decline in production was the main reason for Decree No. 61 of November 13, 1973 which increased assistance and improved work conditions on personal plots, and called for the elimination of economic and administrative obstacles to the development of production on the plots.

Under the Decree, the main responsibility for the central control of personal plots has been assumed by the Central Cooperative Union (CCU). This organization is responsible for supplying inputs to the plots and for purchasing their output. Previously, farmers might produce livestock products and fodder under contract to SEA "Rodopa" and fruit and vegetables for the use of the farmer's family only. Under the Decree, they are encouraged to expand production of other products for sale under contract to the CCU. Contracts are to contain reciprocal obligations, the CCU being required to supply certain inputs and the farmer to sell a certain volume of produce. Okrug councils are encouraged to draw up plans with detailed provisions for production, purchasing and marketing on personal plots.<sup>98</sup> In addition to these administrative measures, steps to increase the supply of inputs and to raise incentives may be noted.

The Decree provides for the amount of land made available for personal plots to be increased. Plots no longer used should be worked again and land made available to people (mainly retired people) if they enter into contracts to supply agricultural products to state procurement organizations.<sup>99</sup> For each cow or buffalo cow on a personal plot, the local agro-industrial complex will make available 0.1 hectare of land sown with alfalfa. Local councils are to decide on sowing low productivity land with fodder and attaching these to personal plots. In addition, for 1974, the CCU agreed to make 250,000 tonnes of fodder available to the private sector on a contractual basis in exchange for livestock.<sup>1</sup> Shepherds and herdsmen are to be paid by the state and their services made available to private farmers for a small fee. The CCU and local councils are committed to establishing more purchasing and reception points for the production of personal plots, especially in the more remote areas. Poor organization of the procurement of such products was believed to have been a major hindrance to the development of production in the past.<sup>2</sup> From the start of 1974, loans of up to 2,000 leva have been made available to private farmers at 3 percent for five years for the purchase of animals, the construction or repair of byres and stables and other projects connected with livestock breeding.<sup>3</sup> Providing the loans are connected with livestock breeding, the farmer may obtain two or more loans. Other measures include efforts to improve breeds on personal plots, assistance in planting orchards and vegetable gardens and the procurement of animals by the CCU from the socialized sector and their resale at subsidized prices to the private sector for fattening.

<sup>97</sup> RFER, Background Report No. 12 of May 2, 1974.

<sup>98</sup> Rabortnichesko Delo, Jan. 6, 1974, quoted in ABSEES No. 2/1974 item No. 418.

<sup>99</sup> Zhivotnovudstvo No. 8/1974, quoted in ABSEES No. 1/1975 item No. 343.

<sup>1</sup> Planovo Stopanstvo No. 1/1974 quoted in ABSEES No. 3/1974 item No. 391.

<sup>3</sup> Kooperativno Selo, Jan. 29, 1974, quoted in ABSEES No. 3/1974 item No. 396.

The first incentive introduced to encourage the development of production on personal plots was an increase in procurement prices and premia for deliveries of fruits, vegetables and animal products by private farmers to the levels enjoyed by the socialized sector. Income tax on income from sales to state procurement organizations was waived from January 1, 1974. Farmers signing contracts to deliver animals and animal products also became eligible for pensions, with deliveries of 1,500 leva or more being equivalent to one year's work.<sup>4</sup> Such deliveries must be from the farmer's personal plot and he must have put in at least 100 days work on the state or cooperative farm during the year to be eligible for the pension. Time spent breeding animals is considered to be "socially useful labour" time.

The 1974 Plan called for 510,000 pigs, 20,000 cows, 20,000 calves and 264,000 sheep to be fattened on personal plots under contract with the CCU.<sup>5</sup> Over a two year period, the number of pigs on such plots was to rise by 500,000, that of cows by 150,000, of poultry by 4 million and of sheep by 1.5 million.<sup>6</sup> In the event, the number of cattle on personal plots rose by 33,000 in 1974 and that of pigs by 480,000. The number of sheep fell by 41,000 and the number of poultry rose by only 31,000. Procurement of meat from personal plots was to rise 73 percent in 1974, that of milk by 50 percent, of eggs by 12 percent and fruit and vegetables by 24 percent. At the end of 1975,<sup>7</sup> it was announced that meat production on these plots had risen three times and milk production two-and-a-half times over the previous two years. 1975 procurement plans from personal plots were also announced as having been considerably overfulfilled.<sup>8</sup> Against a meat target of 73,600 tons, 112,000 tons were purchased, for milk 105,000 tons against 76,000 tons and for vegetables 375,000 tons, 2,000 more than planned.

While the potential for increasing production from personal plots is considerable, it entails certain problems. The new battery of incentives introduced by Decree No. 61 of November 13, 1973 has encouraged speculative activity of a type not wished by the framers of the decree.<sup>9</sup> For example, a number of workers, teachers and employees appear to have left their jobs to set up farms of 200 to 300 pigs, 10 cows or several thousand poultry. Groups of citizens have formed livestock cooperatives with hired herdsmen. Machinery and fodder belonging to agro-industrial complexes are being used by private farmers without payment.<sup>10</sup> Pigs have been sold by cooperative farms to the CCU at 2.50 leva per kilogram. The CCU has sold the pigs to private farmers at 1.50 leva per kilogram, and the latter have sold them back to the cooperative farms. Thus the private farmers and cooperative farms have made 1.00 leva per kilogram without the pig having moved.

While such abuses are upsetting to local officials, it appears that the central authorities do not consider that they vitiate the program

<sup>4</sup> Compare the average income on a cooperative farm in 1972 of 1,213 leva. See RFER, Background Report No. 34 of October 31, 1974.

of increasing production on personal plots. It will not be possible to evaluate the success of the program until full production data for 1975 are available. In no year, unfortunately, are comprehensive data published for procurement from the private sector. At the start of 1976,<sup>11</sup> D. Minchev, the deputy president of the CCU announced that purchases from personal plots during the Seventh Five Year Plan Period (1976-80) would be much greater than in previous years. He pointed to a number of difficulties still to be overcome, principal among which were shortages of fodder, of abattoirs, of transport and of cold storage facilities.

## 11. THE STANDARD OF LIVING

At the Central Committee Plenum of December 1972, a program to raise the standard of living of the population in the period 1973-80 was announced. The adoption of such a programme represented a commitment by the authorities to treat consumption as a goal rather than a residual. A similar policy was also adopted by some of the other socialist countries in the early 1970's. To some extent the new policy reflected a changed attitude to economic causation. Whereas previously it had been argued that increases in production were a precondition for increases in consumption, this argument was turned around and higher consumption levels were seen as necessary for increased labour productivity. Some additional factors may be noted in this connection. The need for increased consumption as a basis for higher labour productivity reflects the switch from extensive to intensive growth. With intensive growth, the quality of the labor force becomes more important, and a higher standard of living is probably a precondition for a higher quality labour force. In addition, a policy of producing tomorrow the jam consumed today depends on being able to finance the gap with resources from abroad. Conveniently, Western capital markets opened up as this policy was adopted.

As has been shown, consumption did rise very fast in Bulgaria during the first half of the 1970's. It outpaced production and its growth rate was clearly unsustainable. In January 1976, another Central Committee Plenum approved "Theses on the Further Fulfillment of the December Program to Raise the Standard of Living of the Population During the Seventh Five Year Plan Period and up to 1990." These were discussed at the XI Party Congress and adopted. They showed little change in direction from the December 1972 Program, but some slowing down in growth rates of the standard of living in the period up to 1980. While the growth in the standard of living remains formally the major objective of the authorities, the need to restore balance in the domestic economy will probably have higher priority in the first years of the Seventh Five Year Plan Period.

In his speech to the December 1972 Plenum, Zhivkov established a number of consumption targets for 1975 and 1980.<sup>12</sup> For food consumption these targets were based on "scientifically calculated norms." For other goods and services the norms were described as "rational." The establishment of such targets represented a new departure for planning in Bulgaria, since it clearly laid down objectives, rather than

<sup>11</sup> *Rabotnichesko Delo*, February 1, 1976, quoted in ABSEES No. 3/1976 item No. 315.

<sup>12</sup> See T. Zhivkov: "Za posledovatelno izpúlnenie resheniata na desetitia kongres na BKP za povishavane zhiznenoto ravnishte na naroda," Sofia, 1972.

aiming at raising current levels indiscriminately. The figures in Table 10 show that in 1970, consumption in Bulgaria was about 70 percent of the norm for most foodstuffs and about 40 percent for a number of industrial goods. The program called for the level of foodstuff consumption in 1975 to be brought up to about 80 percent of the norm and for industrial goods to about 55 percent. In fact, the food target was underfulfilled (73 percent of the norm) but the industrial goods target was overfulfilled (about 60 percent of the norm). In 1972 the food target for 1980 was set at about 99 percent of the norm, but at the XI Congress the figure was reduced to about 90 percent. For non-food goods the 1980 target was originally placed at about 82 percent of the norm and then revised downwards slightly. The difficulties in achieving the targets for food consumption reflect the problems of the agricultural sector.

Sources: The December 1972 program; the Theses on the Standard of Living, 1976; RFER, Background Report No 59 of Mar. 11, 1976, corrected.

Another aspect of the standard of living that was tackled at the December 1972 Plenum was the question of wages. The minimum wage was raised from 65 to 80 leva a month in 1973 and is planned to reach 90 leva a month by 1980. The increase in the minimum wage reduced the differential between average and minimum wages from 2:1 in 1972 to 1.74:1 in 1973. This is considered too low a ratio, and so during the Seventh Plan period the authorities intend to increase average wages to 170 leva and thus restore the ratio to 1.89:1. New wage scales are to be introduced which will emphasize uniformity across branches of the economy, overcome "uravniovka" (levelling), encourage workers to improve their qualifications and give more importance to the basic wage. This latter was expected to rise from 65 percent of total earnings in 1971 to 80 percent in 1975.<sup>13</sup> Other targets are to reduce the gap between agricultural and non-agricultural incomes and increase earnings from personal plots.

<sup>13</sup> A. Evgeniev: "The Rise in Living Standards in Bulgaria: Some Problems," International Labour Review, July 1974.

The Bulgarian authorities have been concerned to increase the birth rate. One side of this policy has been to make the termination of pregnancy more difficult but the other has been the establishment of positive incentives for increased births. The policy has been to encourage the births of second and third children in particular and to discourage further children. This policy is reflected in the cash grants paid at children's births which were raised in 1975 to 100 leva for the first child, 250 leva for the second, 500 leva for the third and 100 leva again for the fourth and subsequent children. Similarly, in 1973, the period of maternity leave was lengthened, but with second and third children favored. Apart from these benefits related to the birth itself, the thrust of policy is that eventually the State will take over all financial costs related to bringing up the next generation. Thus economic considerations should cease to play a role in determining family size. The 1976 Theses on the Standard of Living aim to achieve this by 1990.

Between 1956 and 1971 the normal work week remained unchanged at 46 hours spread over six days.<sup>14</sup> One of the achievements of the Sixth Plan has been the introduction of a general five-day 42½ hour week. This transition was announced in Zhivkov's speech to the December 1972 Plenum. It was the subject of a Decree issued in March 1973 calling for its gradual introduction between 1973 and 1975, for all workers except those employed in agriculture, health and education. In 1971 only 10 percent of the working population were on the 42½ hour five-day week,<sup>15</sup> this having been introduced experimentally in two okrŭgs. By December 1, 1973 about 40 percent of the working population were on this system, and by March 1, 1974 about 60 percent<sup>16</sup> in twenty out of twenty-eight okrŭgs. There was then a hiatus in the transition and in Sofia a temporary return to the six day week, especially in the retail trade sector.<sup>17</sup> By May 1, 1975, some 65 percent of the working population were on the five day week.<sup>18</sup> The transition of all workers outside the sectors mentioned above was originally scheduled for 1975<sup>19</sup> but actually too, place on July 1, 1976.<sup>20</sup> At the December 1972 Plenum, it was hoped to establish a 40 hour week by 1980, but this target has been abandoned in the January 1976 Theses.<sup>21</sup>

## 12. FOREIGN TRADE

Bulgaria's balance of payments during the 1960's was characterized by a substantial trade deficit in most years. This deficit was particularly marked in 1963-64, when Bulgaria imported much equipment on credit from the U.S.S.R. for the Kremikovtzi metallurgical plant, and in 1966-68, when Bulgaria imported much equipment from Western Europe on credit for projects connected with the Fifth Five Year Plan. In 1965, between these periods, the deficit was almost reduced to zero, and in 1969 Bulgaria ran a trade surplus. On invisible account, Bulgaria is probably in substantial surplus, as its earnings

<sup>14</sup> See "Bolgarskaia piatidnevka," *Ekonomicheskaia Gazeta*, No. 33/1975.

<sup>15</sup> *Ibid.*

<sup>16</sup> *Rabotnichesko Delo*, March 30, 1974, quoted in ABSEES No. 3/1974 item No. 438.

<sup>21</sup> RFER, Background Report No. 59 of March 11, 1976.

from tourism should outweigh interest payments on loans and net transport and insurance payments. The invisible surplus has not normally offset the trade deficit, so Bulgaria was a substantial capital importer during much of the 1960's, as befits a developing country.

By 1970, repayments on a number of loans contracted from the U.S.S.R. in the early 1960's fell due, probably causing some bunching in debt service. In addition, it is probable that the U.S.S.R. lent Bulgaria shorter term convertible currency to repay some of its borrowing from the West in 1966-68.<sup>22</sup> Thus Bulgaria entered the 1970's with a need to run a current account surplus for a few years to meet debt service payments. As Table 11 shows, a (record) trade surplus of 202.2 million valuta leva was achieved in 1970. As the 1970's progressed, domestic consumption rose faster than domestic production. This led to the erosion of the trade surplus, although the current account probably remained in much larger surplus. The easing of conditions on Western capital markets allowed Bulgaria to borrow heavily and its suppliers to offer favorable credit terms. The rate of import picked up especially from mid-1973 and in 1974 and 1975 record trade deficits were recorded. By mid-1975, the alarming rate of borrowing led the authorities to cut back on imports, especially from the industrial West. This reduction, together with a substantial increase in exports, served to cut the 1976 trade deficit to less than a third of the previous year's level. For the rest of the 1970's, it may be necessary to continue to run a trade surplus in order to service the debt accumulated and to fulfill the CMEA plan for investments in raw material sources in the U.S.S.R.<sup>23</sup>

Sources: Statisticheski Godishniki, 1973 and 1975 Statisticheski Izvestiia, November 1976, and Plan Fulfillment Reports.

The growth rate of export volume has undergone a secular decline over the last 15 years. This decline corresponds to the gradual decline in growth rates of national income and the lower rates of agricultural growth since 1967. In the Fourth Plan Period (1961-65), the annual growth rate of exports was 15.5 per cent, in the next five years 12.6 per cent and in the period 1971-75, 10.0 per cent. During the 1960's, imports grew more slowly than exports, but in the 1970's the reverse has been true. In the Sixth Plan Period the average growth rate of import volume has been 14.3 per cent, and in 1974 the growth rate reached 21.9 percent.

<sup>22</sup> See section 13, below.

<sup>23</sup> It was reported that Bulgaria invested 90.3 million leva in the U.S.S.R. in 1975 and a further 277.2 million were planned for 1976. Journal of Commerce, March 31, 1976.

The large share of Bulgarian trade conducted with other members of the CMEA has prevented sharp movements in foreign trade prices. The increases in world prices of raw materials and world inflation in general had a small effect on import and export prices in 1973 and a larger one in 1974. In 1975, the changed CMEA prices had an effect. The commodity structure of Bulgaria's trade has meant that the effects of the price changes on the terms of trade have been smaller than for many other countries. The decline in the terms of trade was only 1.1 per cent in 1974 and 1.9 per cent in 1975. Over the period 1970-75, the decline has been 3.8 per cent.

Among the CMEA countries, only Mongolia conducts a higher share of its trade with other CMEA members than does Bulgaria. This fidelity is particularly striking in terms of the share of the U.S.S.R., which normally accounts for over 50 per cent of both exports and imports. The Bulgarian authorities consider integration in the socialist bloc and, in particular, integration in the U.S.S.R. as essential for the Bulgarian economy. In any case, the integration has reached such a high level that it would prove painful for Bulgaria to disentangle itself. Its industry has been created either to satisfy domestic needs or in planned complementarity with other East European or Soviet industries, and would find it prohibitively difficult to compete on open world markets. In the U.S.S.R. it has an assured supply of the raw materials lacking at home, and it can pay for these with otherwise unsaleable products. Bulgaria's economic dependence on the U.S.S.R. is thus particularly great. If the raw material flow from the U.S.S.R. were restricted, the domestic economy would not be able to sell enough in the West to pay for alternative supplies. This dependence has furthermore been increasing with time.

By and large, it can be said that Bulgarian machinery and equipment and industrial consumer goods are marketable only within the CMEA. The other groups shown in Table 14 are probably competitive in the West. Of Bulgaria's exports to the West, about 80 per cent consist of food and agricultural raw materials, minerals, and metals, and only 7 per cent of machinery and equipment.<sup>24</sup> Unfortunately, as a result of the industrialization strategy, it is the production of the former group that is growing more rapidly. Competitive goods, particularly those of agricultural origin, are subject to supply constraints and are falling as a share of total exports. Table 15 shows the virtual stagnation of real exports of agricultural origin during the 1970's. The difficulty of finding competitive industrial goods to export for convertible currency probably explains the increase in fertilizer exports in 1973-75, at the expense of reduced domestic consumption.

Source: Statisticheski Godishniki, 1973 and 1975.

In 1970, 29.0 per cent of Bulgarian exports consisted of machinery and equipment. By 1975 this figure had risen to 40.7 per cent and the Plan for 1980 is 50 per cent. These shares are extremely high for a country with such a low per capita income as Bulgaria. In fact, the 1975 share was higher than for any other CMEA country except East Germany and Czechoslovakia. This is made possible by the enthusiastic participation of Bulgaria in intra-CEMA specialization. In 1971, some 37 per cent of Bulgaria's machinery exports consisted of such specialized production<sup>25</sup> and over the period 1971-74, between 7.3 per cent and 8.0 per cent of the total output of the machine building industry was specialized and coordinated with production in other socialist countries.<sup>26</sup> At the center of this specialization is SEA "Balkankar" which produces forklift trucks, lifting gear, cranes, hoists and batteries. This enterprise exports over three-quarters of its production, and 70 per cent of its output goes to the socialist countries. It alone accounts for 11 per cent of Bulgarian exports.<sup>27</sup> The second specialty is agricultural machinery and the third electronic calculators. Bulgaria also exports ships under specialization agreements.

Probably more important than CEMA specialization agreements are bilateral agreements with the U.S.S.R. Thus, for example, Bulgaria constructs components for the Soviet automobile and computer industries.<sup>28</sup> The Bulgarian authorities see a considerable future in producing components for Soviet enterprises under subcontract. To this end, the Bulgarian and Soviet Five Year and annual plans have been coordinated and integrated. Such integration allows Bulgaria to produce items in very large production runs for a protected market. These economies of scale, it is hoped, will significantly lower costs of production and allow an increased rate of economic growth. "Bulgaria and the Soviet Union," according to Todov Zhivkov "will act as a single body which breathes through the same lungs and is nourished by the same bloodstream."<sup>29</sup> How far this integration will be pursued remains an open question.

While traditional forms of trade account for the vast bulk of Bulgaria's trade with the West, the Bulgarian authorities set store by the deepening of other types of commercial relations. While they are keen to develop joint ventures and other forms of industrial and

<sup>29</sup> *Rabotnichesko Delo*, September 20, 1973, quoted in RFER, Background Report, No.4 of May 20, 1974.

economic cooperation with Western firms, they have been rather more cautious and less accommodating than some other CEMA countries. By the end of September 1975, Bulgaria had long-term economic, industrial and technical agreements in force with some sixteen West European countries. These framework agreements were supplemented in 1974 by a Decree Regulating Foreign Economic Cooperation<sup>30</sup> and by the establishment of a Committee on Foreign Economic Relations in August 1974.<sup>31</sup> At the start of 1974, when some eight long-term cooperation agreements had been signed with industrial countries, it was estimated that only 2 to 3 per cent of Bulgaria's exports to the countries involved were based on such agreements.<sup>32</sup> However, the Bulgarian authorities believe that these agreements have considerable potential in attracting a continuous flow of up-to-date technology, in utilizing the marketing ability of the Western partner and in mobilizing medium-term capital inflows which involve relatively painless amortization through buy-back provisions. In view of the advantages of such deals to the Bulgarian authorities, imports to Bulgaria covered by these arrangements may prove more resistant than normal commercial imports, should a policy of retrenchment of imports from the West be adopted.

The Bulgarian authorities have remained adamant that industrial cooperation ventures with foreign parties within Bulgaria be based on contractual rights and obligations and exclude any foreign ownership or joint stock company. While Western businessmen often seek the same form of equity participation in joint ventures in centrally planned economies that they have in market economies, it seems unlikely that such participation in a country with Bulgaria's economic and social system offers any additional protection to the investor than does a carefully drawn-up contract. The Decree provides that in such cooperation agreements, the foreign partner is assured of his share in the profits (or more strictly speaking, economic effect) of the venture in proportion to his contribution.

In addition, the Bulgarian authorities commit themselves to ensure that such ventures are allocated necessary material and labour resources, either in the annual plan or, if the plan has already been adopted, from reserves. The Decree specifies that "payments between the parties are made totally or in part in goods and services mutually supplied or in means obtained from the fulfillment of the agreement". It is thus the intention that as far as possible the agreements should not cause any burden on the balance of payments, but should themselves generate the means needed to repay the foreign partner.

The areas that the Bulgarians see as having the the most potential for industrial cooperation are:<sup>33</sup>

1. Machine building and metallurgy:
  - (a) Improvement of conventional metal-cutting machines.
  - (b) Mechanical handling equipment.
  - (c) Agricultural and food machinery industry.

<sup>30</sup> Decree No.1196 of June 12, 1974 see D. Karastoyanov: "Industrial Cooperation of Bulgaria with Countries having Different Economic and Social Systems." UNCTAD/TSC/23, GE75-52184 of December 9, 1975.

<sup>31</sup> See RFER, Background Report No. 25 of August 22, 1974.

<sup>32</sup> M. Daskalov in *Novo Vreme* No. 1/74, quoted in RFER, Background Report No. 4 of February 7, 1974.

<sup>33</sup> Karastoyanov, *op. cit.*

2. Electronics and electrical engineering:
  - (a) Integral circuits in the production of computers.
  - (b) Automation of processes in the electronic and electrical engineering industries.
  - (c) Industrial electrical engineering.
  - (d) Large capacity equipment for energy production.
  - (e) Radio electronics and household appliances.
3. Chemical industry:
  - (a) Oil-processing and petrochemical industry.
  - (b) Synthetics for the light, chemical and pharmaceutical industries.
  - (c) Cellulose and paper industry.
  - (d) Mineral fertilizers and agricultural chemicals.
4. Light industry:
  - (a) Expansion of production of basic consumer goods.
  - (b) Improvement of technological level of the branch.
  - (c) Rationalized use of raw materials.
5. Agriculture:
  - (a) Setting agriculture on an industrial basis.
  - (b) Establishment of optimal size and technical structure of units.
  - (c) Introduction of new methods.
6. Other:
  - (a) Rationalization of construction.
  - (b) Modernization of communication.
  - (c) Development of tourism.

It is clear that the types of economic cooperation agreements favoured by the Bulgarian authorities are of a long-term nature and are such that the Western partner can not expect to generate rapid profits. The idea that a joint venture in a socialized country is a means of penetrating the market of that country is not fully valid. There may arise considerable problems from sales within Bulgaria since the profits generated from such sales are strongly dependent on the severely distorted domestic price structure. Even when profits have been generated on the domestic Bulgarian market, the question of remittances arises. While these problems may be dealt with in framing the contract setting up the venture, they indicate that such ventures are more likely to be successful from the point of view of the Western partner if production is directed towards exports. One intriguing possibility is that joint ventures in Bulgaria might be a means by which Western companies can achieve significant sales on the Soviet market. It will be noted that many of the areas listed above, in which Bulgaria wishes to encourage cooperation ventures, are in these sectors which Bulgaria has been assigned under the CMEA specialization agreements. The specialization agreements provide an assured market in the other socialist countries and it might be possible for a Western firm to expand its economic contacts, in particular with the Soviet Union, by investing in a joint venture in Bulgaria.

### 13. DEBT

At the end of 1970, Bulgaria's gross debt to the West was probably about \$500 million. The greater part of this debt consisted of supplier's credits contracted in the period 1964-67. The remainder was

in the form of unpublicized bank-to-bank borrowings.<sup>34</sup> Bulgaria's first venture on the syndicated Eurodollar credit market took place in 1972 when it borrowed \$25 million. Borrowing became much heavier in 1973, with publicized Eurocurrency borrowings reaching \$115 million and large credit lines being made available by foreign suppliers. By the end of 1973 Bulgaria's gross indebtedness was estimated to have reached \$1.0 billion.<sup>35</sup> At the end of subsequent years, the debt was estimated to have reached \$1.7 billion for 1974 and \$2.4 billion for 1975.<sup>36</sup> During 1976, the growth rate was probably somewhat less and the end year total may have been about \$2.9 billion.<sup>37</sup>

Bulgaria's indebtedness is fairly large for a country of its size. At the end of 1975 it probably represented about 13 percent of GNP. Since only about 20 percent of Bulgaria's exports to go to non-socialist countries, the ratio of debt to such exports is extremely high—3.2 times as much in 1975.<sup>38</sup> This figure is the highest for any CMEA member country. At a rate of 6 percent, annual interest on a debt of \$2.4 billion comes to \$150 million, which compares with 1975 exports to non-socialist countries of \$940 million. Despite this, Bulgaria's credit rating remains good. Both major Eurocurrency borrowings in 1976 were oversubscribed;<sup>39</sup> and interest rate spreads above LIBOR are rather worse than for the German Democratic Republic, but better than for Poland.

The reasonable credit rating can be attributed to two factors. Firstly, a high percentage of its exports to both East and West consists of hard goods. While it has had problems with the EEC's Common Agricultural Policy, it normally would have little difficulty in selling on Western markets exports diverted from the CMEA. Secondly, the Soviet Union is believed to stand behind Bulgaria's debt to a greater degree than for that of most other CMEA members. According to Rae of Lloyds Bank, Bulgaria "is so closely identified with the Soviet Union that any Bulgarian borrowing is considered a USSR risk."<sup>40</sup>

2. IBRD. "Borrowings in International Capital Markets," various issues.

From past experience, this confidence is not misplaced. On at least two occasions in the last twenty years, the USSR is reported to have helped Bulgaria overcome debt-servicing problems. The first occasion was during the Great Leap Forward of 1958-60<sup>41</sup> and the second was in 1967-8.<sup>42</sup> This hard currency assistance was in addition to the normal credits granted Bulgaria by the USSR. In 1976, rumors of further Soviet hard currency aid to Bulgaria have been reported.<sup>43</sup>

On the two previous occasions when Bulgaria suffered debt-servicing difficulties, the problems were caused by excessive suppliers' credits. During the 1970's, Bulgaria has increasingly made use of direct bank-to-bank borrowing. The proportion of its debt held by West European banks is second only to Hungary among the CMEA countries. The Bulgarian authorities are trying to follow the Hungarian policy of raising money directly from banks in order to allow their importers to pay cash.<sup>44</sup> This is believed to be more advantageous, since the additional cost of such credit is more than compensated by the lower cash price. Another result of this policy is the relatively small volume a Bulgarian "à forfait" paper available for discount in Western Europe. Estimates towards the end of 1976 were that only about \$300 million of such paper was being held, compared with \$800 million for Czechoslovakia, \$1,500 million for the German Democratic Republic, \$1,000 million for Romania and \$2,200 million for Poland.<sup>45</sup>

Almost half of Bulgaria's trade deficit in the years 1973-1976 was accounted for by trade with West Germany. The German authorities

<sup>45</sup> "A Forfait Trends" East West Markets, November 15, 1976.

have published their current account balance with Bulgaria showing a net (German) surplus of DM100 million in 1973, DM500 million in 1974 and DM700 million in 1975.<sup>46</sup> These surpluses were covered by German suppliers' credits, money borrowed from German banks and Eurodollar borrowings. A Bulgarian request for a \$250 million subsidized credit from West Germany was turned down in mid-1975.<sup>47</sup> Other countries have been more forthcoming about credit lines. In June 1974, Mitsui and Compay and twelve other Japanese firms granted a credit of \$100 million at 6.5 percent, in addition to two Eurocurrency credits of \$50 million total from other Japanese banks. In February 1976, it was reported that Japan expected to extend \$200 million credit to Bulgaria for the purchase of Japanese goods between April 1976 and March 1978.<sup>48</sup> In May 1975, Austria granted Bulgaria a credit of \$120 million for use in the period 1976-80.<sup>49</sup> In September 1976 the United Kingdom granted a credit of £80 million similar to previous Italian and French credits. In addition to these suppliers' credits, Bulgaria has also received credits of \$150 million and \$160 million from Iran in 1973 and 1976.<sup>50</sup>

For 1975 the German Bundesbank reported the net extension by German banks of DM320 million in short-term credit to Bulgaria.<sup>51</sup> This represented a new departure for Bulgarian borrowing and it has persisted in 1976. Market sources believe that the Bulgarian bankers are trying to gain expertise in the short end of the market.<sup>52</sup> Since the Eurocurrency market was fairly liquid in 1976, there were favourable opportunities for such short-term borrowings.

The information on Bulgaria's convertible currency debt is quite insufficient to predict future debt servicing problems. In particular, little is known about the time profile of repayments. Bulgaria's publicized Eurocurrency borrowings have been similar to Hungary's. The repayment schedule for the latter shows a bulge in payments around 1980<sup>53</sup> and it is probable that Bulgaria's repayments do so too. Next to nothing, however, is known about the profile of the remaining debt. What can be said, though, is that Bulgaria can have little access to credits of maturity, over say, 15 years and most of its borrowings are likely to be in the four to seven year range. This means it will soon become necessary to refinance existing debt. This may be difficult if the volume of debt continues to rise or the capital markets become much less liquid. The signs are that since mid-1975, the Bulgarian authorities have made efforts to reduce the demand for new credits. However, the volume of credit to be refinanced in any case is such that Bulgarian prosperity is now dependent to some extent on the cooperativeness of Western capital markets.

# CZECHOSLOVAK ECONOMY IN THE SEVENTIES\*

BY VACLAV HOLESOVSKY\*\*

## CONTENTS

	Page
I. Economic Performance.....	699
II. Domestic Economy and Foreign Trade.....	707
III. Institutional Aspects: The Economic System.....	713
IV. Future Prospects.....	718

Commenting on the human-rights "Charter 1977," Dr. Jiří Hájek, former Czechoslovak Minister of Foreign Affairs, now a dissident, warned in January 1977 against expecting a re-enactment of the year 1968. Historian by training, he chose, in the interview with an American reporter, to lean on the history-does-not-repeat-itself adage.<sup>1</sup>

However, a survey of recent economic developments in Czechoslovakia suggests that the nothing-new-under-the-sun view of history also deserves a hearing. A certain number of elements in the economic situation, factual as well as symptomatic, have surfaced over the last two or three years, bearing a remarkable similarity to the early sixties, a period of stress and crisis which ushered into the economic-reform movement. It is conceivable that these elements might lead to a revival of economic reformism. It is even conceivable that they might recombine with other elements of change in the spiritual climate and morale of the country, replacements in political personnel, and events abroad, so that a new variation on the 1968 pattern cannot be entirely excluded. The purpose of the present survey is to provide such general prognostication and speculation with an informative survey sketched from the side of economic analysis.

Similarities with the economic past concern primarily the sequence of a series of "good years," years of stable growth in total output as well as in civilian consumption, followed by the necessity to adjust internal economic structure and performance to external shocks. The two phases of this sequence have their accompaniment in official and unofficial attitudes toward the economic system. While it was possible to live with its dysfunctional features as long as the external environment followed a predictable course, they have become a matter of concern when it was once more realized that they represented a serious extra obstacle to swift and successful adjustment.

This interdependence between economic events on the one hand and concern with the economic system on the other needs to be pointed out at the outset since, in the formal organization of the study, the two aspects are treated more or less separately. To keep in line with the internal logic of the two-phase sequence and the interdependence

\*This research was supported in part by a grant from the Research Council of the University of Massachusetts, Amherst.

<sup>1</sup> The New York Times, January 20, 1977.

between events and systemic concerns, we devote the first two parts to the "event side" of recent developments, and the third part to the systemic and institutional aspects. The fourth part concludes with a brief consideration of prospects for the nearest future.

## I. ECONOMIC PERFORMANCE

It has become more and more customary among economists analyzing the Czechoslovak economy in the West to use official statistical data without cautioning the readers as to their significance in regard to index coverage, weighting of components, and adjustments for price and quality changes. Scholars have been increasingly willing to go along with the assumption that official statistics have become trustworthy enough to deserve being presented without warning. The first observation that needs to be made here is that a reliable statistical picture of the overall economic performance of Czechoslovakia is still not readily available. Thus, whenever we have no choice and do use official data, we do so on an as-if basis, lending somewhat greater credence to the direction of change, or changes in the rate of change, rather than to numerical values as such.

### 1. Growth Performance, 1970-1975

In recent years, economic research in Czechoslovakia started to prepare estimates of national income and product aggregates cast in terms of Western concepts. These are used for purposes of comparative analysis.<sup>2</sup> Officially, global performance continues to be measured in terms of traditional Soviet concepts of "social product" (which aggregates intermediate and final uses of output, hence contains duplications besides replacements of depreciated fixed capital) and "national income" (which omits, just as the "social product" does, value added in the service sector).<sup>3</sup> Alternative estimates, based on accepted Western aggregation methodology and Czechoslovak specific time series concerning quantitative output data, are available from the Research Project on National Income in East Central Europe (Thad P. Alton, director), and are referred to below as the "Alton data." The two sets of statistics are presented side by side in Table 1, together with implicit data on year-to-year changes in labor productivity and crude estimates of incremental capital/output ratios.

The informative value of the two sets of data can be roughly gauged if one considers the following points. As a rule, if official data are meant to be used as approximations of the growth of GNP they must be seen as an overstatement because of the omission, in their coverage, of the usually slow-growing service sector. Another overstatement may be due to impurities in price weights, their constancy being undermined by prices of new products reflecting to an undetermined extent an inflationary movement.<sup>4</sup> There is also a possible upward bias in statistical reporting. In the category of circumstantial evidence, one might question the plausibility of high and sustained year-

<sup>2</sup> Cf., e.g., Josef Goldman, "Makroekonomická analýza a prognóza," Prague, Academia, 1975, p. 55, 57; "Politická ekonomie, 1975," No. 10, p. 43.

<sup>3</sup> See U.S. Congress, "Reorientation and Commercial Relations of the Economies of Eastern Europe," Washington, 1974, pp. 253-254.

<sup>4</sup> Prices of investment articles have been reported to grow 8 percent annually, and in 1976 were double or triple of their 1964 level. ("Hospodářské noviny, 1976," No. 38.)

to-year changes in labor productivity ranging, according to official data, between 4 and 5.5 percent p.a. When achieved by market-capitalist countries, e.g., by West Germany, France, Austria, or Japan, such productivity gains have hardly ever been accompanied by complaints about efficiency and competitiveness in export markets, which have been loud and sustained in the case of Czechoslovakia.

The Alton data, on the other hand, may contain elements of understatement, mainly because of their reliance on the published, and therefore incomplete and possibly unrepresentative, sample of quantitative series of industrial output. In other words, in the case of some fast growing series, which the Alton index does not register, the secrecy motive may be stronger than the impulse to boast. This hypothesis, suggested by George Staller, the author of industrial indexes in the Alton publications, seems to find support in the curious divergence in the rate of change shown by the two sources in 1975. While Alton's data indicate a slowdown in the rate of growth, official data show an acceleration. As we shall see, this is also the year of increasingly frequent references to the importance of unspecified priority outputs.<sup>5</sup>

Within industry, by far the fastest growing branches were those of chemicals and machinery construction. These grew, according to official sources, by 61 and 50 percent from 1970 to 1975, whereas industry as a whole grew by 38 percent only.<sup>6</sup> Besides industry, two

<sup>5</sup> Unfortunately for the cited hypothesis, the respective indexes of industrial output do not show parallel divergence: there is increase in the year-to-year change in the official and in the Alton index. Only in 1976 does Alton's index register a slowdown, but the official index was not published in time for comparison. The complete series of the industrial output indexes are as follows (1970=100):

	1971	1972	1973	1974	1975	1976
Official.....	106.7	114.0	121.8	129.0	138.0	-----

<sup>6</sup> "Statistická ročenka, 1976," p. 232.

other economic sectors deserve special mention. Construction increased its output at least as much as industry, if not somewhat more. Agricultural output in 1975 was 8 percent higher than in 1970 and 27.2 percent higher than in 1965 (Alton data), a performance which brought Czechoslovakia nearer to desired selfsufficiency with respect to a number of food items. The performance of agriculture and construction finds its reflection in the development of living standards.

## 2. Personal Civilian Consumption and Living Levels

Personal consumption has also been on the increase over the period under consideration, although it grew more slowly than total output, in conformity with the Soviet-type pattern. Lacking alternative estimates with respect to consumption, we are using only official data as indicators of developments (see Table 2). In the period immediately following the 1969 authoritarian restoration, the decision was made to block in one blow inflationary pressures that had developed in the course of the first two years of the economic reform 1967-68, and were reinforced, from the supply side, by a slump in growth rates of GNP (from 4.3 and 4.5 percent in 1967 and 1968 down to 1.8, 2.2, and 3.5 percent in 1969-1971, according to Alton data). Hence the limited sales and other consumption spending in 1970.

TABLE 2.—CZECHOSLOVAKIA: PERSONAL CONSUMPTION INDICATORS, 1966-75

[Year-to-year changes in percent]

	1967	1968	1969	1970	1971	1972	1973	1974	1975

Source: "Statisticka' ročenka, 1976," pp. 22-23 122, and 412.

After that, the regime started to pay attention again to personal consumption, even at the cost of a transitory increase in foreign indebtedness. This concern tended to be interpreted by the population in a cynical spirit as part of measures pursuing political stabilization. It has continued to be perceived in that sense, as witness the eloquent comments of the Czech writer Václav Havel in his open letter to the Premier:

By nailing a man's whole attention to the floor of his mere consumer interests, it is hoped to render him incapable of appreciating the ever-increasing degree of his spiritual, political and moral degradation. Reducing him to a simple vessel for the ideals of a primitive consumer society is supposed to turn him into pliable material for complex manipulation.<sup>7</sup>

The decline in the rate of growth of personal consumption in 1975, coming after four "good years," is one of the symptoms of difficulties related to worsened terms of trade and other economic shocks to be discussed in Part II.

<sup>7</sup> "Encounter, 45," No. 3 (September 1975), p. 18.

One of the noteworthy structural features of changing income distribution has been the higher-than-average growth of per capita incomes of the farm population. This was a continuation of the long-term trend of progressive rural-urban equalization. This trend has been the result of a deliberate policy, accentuated in the years 1963-67, after it was realized that the rural exodus into industry was endangering the very maintenance of hitherto attained levels of agricultural production. From 1966 to 1971, net wages in industry increased 4.1 percent annually on the average, while net compensation of collective farmers rose by 8.6 percent annually.<sup>8</sup> Preferential development in agriculture has continued since then to the point where statistics show average incomes (including income in kind) of collective farmers to have reached, by 1973, parity with white-collar incomes, where the public is convinced that the highest standard of living today exists in the village, and the government begins to be concerned about inflationary effects of farm incomes, and their power of attraction which might lead, at least theoretically, to a reverse mobility of labor into agriculture.<sup>9</sup>

The improvement in living standards of the rural households is reflected also in the structure of their spending and rate of acquisition of consumer durables. The composition of cash spending of collective farm households changed, in the course of recent ten years, as follows (in percent):

	1963	1974
Food and drinks.....	33.6	26.7
Manufactured articles.....	31.3	36.4
Services.....	9.2	9.6
Saving deposits.....	13.8	16.1
Other.....	12.1	11.2

Source: "Plánované hospodárství, 1976," No. 5, p. 42.

The proportion of households owning various types of consumer durables, while generally increasing, has increased relatively faster in villages than in towns, and in households of collective farmers faster than in those of workers and white-collar employees, contributing to a growing homogeneity of life styles. For a selected number of durable assets, the proportion of households owning them has changed as follows:

Households	Collective farmers		Workers		White-collar employees	
	1967	1973	1967	1973	1967	1973
Items:						
Refrigerator.....	40.0	79.5	45.7	81.3	66.1	93.0
Vacuum cleaner.....	28.7	57.2	48.0	68.0	74.8	85.2
Automobile.....	10.2	29.5	10.4	23.1	21.6	41.1
Television set.....	55.8	91.0	73.1	91.2	82.4	95.6
Tape recorder.....	3.1	13.3	4.9	16.8	7.4	26.7

Source: "Plánované hospodárství, 1976," No. 5, p. 45.

<sup>8</sup> "Plánované hospodárství, 1975," No. 7, p. 39.

<sup>9</sup> *Ibid.*, pp. 42-45.

This is, without exaggeration, a most remarkable development in the pattern of living standards, that has surely contributed indirectly to improving the performance of the agricultural sectors.

Another area of considerable achievement has been housing construction. In the late 'sixties, the housing deficit amounted, according to official estimates, to some 500,000 dwelling units. In 1971-1975, the number of newly constructed dwelling units was almost 614,000,<sup>10</sup> enough to accommodate practically all households—about 11 percent of their total—who had been forced to double up in single apartments at the beginning of the decade. Thus, the traditionally depressing analyses of the housing situation might finally have been made obsolete or, putting it more cautiously, the housing shortage made substantially less acute.<sup>11</sup>

The doubtless improvement in measurable material living standards seems to have had a corollary in more flexible responses of supply to demand in retail trade, or at least with an increased concern for customers' satisfaction. The relative saturation of basic demand can be gauged from the fact that consumers could afford to be choosier and indulge in a certain amount of fickle fashion demand, particularly with respect to shoes, textiles, household equipment, etc. Retail trade organization did apparently succeed in anticipating certain major structural changes in demand in placing orders with the production sector ahead of time, especially in the category of furniture and items of infant and child care.<sup>12</sup> Imports were resorted to in order to satisfy demand for radio sets and exotic fruit. The weakest spot in the food category has remained domestic fruit and fresh vegetables. Among manufactured articles, increasing shortages have developed in bicycles, tape recorders, and sewing and washing machines,<sup>13</sup> possibly in connection with reordered priorities in metal-using branches of manufacturing, to be discussed below. The choice of articles in special distribution centers catering to the "upper 200 families," the inconspicuously labelled "Supply Service" ("Dodávková služba"), operating out of sight of the population is known to have been more than adequate.

As for the comparison of living levels in Czechoslovakia with those in other CMEA countries, it is generally recognized that they have been recently at par, or slightly behind those in the German Democratic Republic which count as being the highest. Comparison with the West is frequently undertaken by choosing Austria which seems to be the most natural candidate for comparison. Czechoslovak living levels are certainly the lower ones, but it is difficult to say with precision by how much lower. A Czechoslovak study, undertaken in the mid-sixties, arrived at the conclusion that, in 1960, real wages in Austria and Czechoslovakia were almost identical, while by 1965

<sup>10</sup> "Hospodářské noviny, 1976," No. 15, p. 9.

<sup>11</sup> Cf. the discussion of the housing situation up to 1971-1972 in Jan Adam, "Housing Policy in European Socialist Countries: The Czechoslovak experience," in Franz-Lothar Altmann, ed., "Jahrbuch der Wirtschaft Osteuropas," vol. 6, Günter Olzog Verlag, Munich, 1975, pp. 231-251.

<sup>12</sup> This reflected an extraordinary increase in birth rates, in raised financial assistance to large families and young couples (in 1973), and expanded personal loans to newlyweds (by 35.4 percent in 1973). See "Plánované hospodářství, 1976", No. 10, p. 26.

<sup>13</sup> For a detailed survey of developments in retail trade see "Plánované hospodářství, 1976", No. 10, pp. 25-33.

Austria was 12 percent ahead.<sup>14</sup> This is not entirely consistent with another study of comparative levels of living in Czechoslovakia and in France. According to this study, in 1964, real wages were 2.3 times, personal consumption per capita (whether with or without publicly financed transfers) 2.4 times, and personal consumption per capita and per work hour 2.64 times higher in France.<sup>15</sup> For 1973, B. Korda estimates Austrian real wages to be at least twice as high as real wages in Czechoslovakia.<sup>16</sup> According to my calculations, in 1960, personal consumption per capita in Western countries exceeded the Czechoslovak level by a factor ranging from 1.18 to 2.63 (for the U.S.) with the exception of Italy.<sup>17</sup> Since following the period of early sixties personal consumption has not grown any faster in Czechoslovakia than in most Western countries, the gap in measurable living levels has surely not narrowed to any significant extent.

### 3. Investments and Dynamic Efficiency

The development of personal consumption needs to be evaluated also in relation to overall growth rates of output, to answer the question of how much the population received in return for its work effort. This way of viewing consumption amounts to a simultaneous evaluation of the economy's efficiency in generating growth, insofar as the consumption statistic is correlated with the development of investments and thereby with the growth of the capital stock. One of the simplest, and at the same time most revelatory indicators of the consumption pay-off of the population and the dynamic efficiency are the relative shares of consumption and investment in the total product.

The highest available estimate of the investment share in the gross national product of Czechoslovakia is that by T. P. Alton who supplies the figure of 29.9 percent for 1950 and 41.3 percent for 1967.<sup>18</sup> This is roughly one third higher than estimates made by researchers in Czechoslovakia.<sup>19</sup> Assuming this relative divergence to have remained constant, to the estimate from the Czechoslovak source for 1973 (i.e., 35.6 percent) there would correspond an Alton estimate of 47.6 percent. If this were true, it would be an utterly unprecedented figure, not ever encountered anywhere in the world. (Although the Czechoslovak source cited in footnote 19 sets the Polish investment share in GNP for 1973 at 46.7 percent!)

It would be rash to dismiss these high estimates offhand just because they sound so unbelievable. Their informative value depends crucially on the degree of trust one is willing to put in the fundamental benchmark estimates for 1955 and 1956; prepared by the

<sup>14</sup> As cited by O. Křín in "The Economies of Austria and Czechoslovakia," paper presented at the American Economic Association meeting, Atlantic City, September, 1976, MS, p. 15.

<sup>15</sup> See Ivan Štrup, "Srovnání životní úrovně a finální efektivnosti výroby v ČSSR a ve Francii," "Politická ekonomie, 1968," No. 2, pp. 112-129. Taking into account differences in the amount of time needed for shopping and various types of queuing would bring, according to the author, the differentials up to a triple or more of Czechoslovak levels.

<sup>16</sup> B. Korda, "A Decade of Economic Growth in Czechoslovakia (1962-73)," "Soviet Studies, 18," No. 6, (Oct. 1976), p. 514.

<sup>17</sup> Václav Holešovský, "Personal Consumption in Czechoslovakia, Hungary and Poland," "Slavic Review, 14," No. 4 (December 1965), pp. 632-633. It seemed clear that these estimates represent a lower limit, similar to those of M. Ernst for West Germany, as cited by Terence E. Byrne in "Levels of Consumption in Eastern Europe," U.S. Congress, "Economic Development in Eastern Europe," Washington, 1970, pp. 300-301.

<sup>18</sup> See U.S. Congress, "Economic Developments, 1970," p. 59.

<sup>19</sup> See "Plánované hospodářství, 1975," No. 10, p. 43.

Research Project on National Income, from which the later estimates were derived. The benchmark estimates were calculated in terms of adjusted factor costs, and presented in two variants, as follows:<sup>20</sup>

Gross investment as percent of GNP:

Variant I:	
1955.....	33.5
1956.....	39.0
Variant II:	
1955.....	30.8
1956.....	35.9

In those estimates, original data at given market prices, generally understating the value of producer goods, were revalued in terms of hypothetical prices reflecting more closely a factor-cost valuation of the individual final-use components of GNP. It is not known how Czechoslovak researchers, referred to in footnote 19, have handled this particular valuation problem. B. Korda is of the opinion that a figure of 35 percent in 1973 may well be an underestimate, citing in support a Soviet author dealing with this question in parallel Soviet circumstances.<sup>21</sup> It seem safe to conclude that a realistic figure would fall today somewhere between the low estimate of 35 percent and the high of some 47 percent, which is extraordinary enough.

Whatever the specific figures of the investment share may be in any single year, Czechoslovak sources register a progressive increase of the gross investment share in GNP:

1950.....	20.9
1955.....	23.0
1960.....	30.7
1965.....	30.7
1970.....	32.3
1973.....	35.6

Source: "Plánované hospodářství, 1975," No. 10, p. 43.

This is an arithmetic corollary of gross investment increasing faster than the GNP, and the economic corollary of increments to the stock of producer goods not being able to produce commensurate increments to aggregate output without encroaching upon the proportion of non-investment uses. This is the classic Soviet-type pattern of growth marked by a capital-for-labor substitution which, although raising labor productivity, raises the productive efficiency of capital and total factor productivity so little that a given target rate of growth requires a higher rate of growth of the capital stock and investments. The low rate of increase of productive efficiency of capital is due to a combination of a slow infusion of technical progress embodied in new producer goods, and systemic disabilities concerning effective utilization of new productive assets, independently of their quality.

One systemic disability consists in the tendency to ignore labor supply which limits the volume of usable new capital stock. At any given moment, there are some objective limits to the utilizable volume

<sup>20</sup> Thad P. Alton and assoc., "Czechoslovak National Income and Product, 1947-48 and 1955-1956," Columbia University Press, New York, 1962, pp. 68 and 70. The two variants differ by the treatment of residential rent in personal consumption.

<sup>21</sup> More rational prices would increase the rate of investment by at least ten points (not percent), according to A. Vainshtein, "Narodnyi dokhod Rossii i SSSR," Moscow, 1969, p. 147, cited in B. Korda, op.cit., p. 509n.

of new productive assets, given by the number of workers available to fill the associated vacancies. There would not be any such limits if the economic system were always ready to retire enough old assets, and thus releasing the requiring number of workers as a supplement to natural labor increments, so that the arbitrarily chosen volume of new assets would be fully staffed. Otherwise, the limit is determined, among other, by economic rationality advising against retiring assets before their economically useful life has run out. In Czechoslovak circumstances, the limit is set by the economic irrationality of keeping old assets in service beyond their economically useful life.

In recent years, new productive assets have to some extent remained understaffed. Thus, in 1976, investments in industry created 13,000 13,000 new vacancies beyond the number that could be filled, and demand for labor in new capacities has made it impossible to fill about 200,000 vacancies created by attrition in old capacities.<sup>22</sup> The difficulty with adequate recruitment for new capacities can be appreciated if one considers that annual increments to the labor force in industry were, in 1971-75, only 0.7 percent on the average, while the stock of machinery was growing by 7.4 percent.<sup>23</sup>

Supplementary labor could be obtained if industry were willing to liquidate more than the 1 or 2 percent of productive assets it has been retiring annually until now.<sup>24</sup> However, there is little hope for improvement as long as the bulk of investments is directed into new plants, and old capacities see their output assignments go up without being able to count on receiving new machinery needed for replacement and expansion. Another motivation working against more substantial liquidations of old assets may be distrust of new capacities because of the notoriously long time it takes to make them work smoothly after installation; hence the need to keep the old stock in reserve. Another obstacle is a reluctance to cause massive lay-offs and dismissals through closing of facilities, in view of insufficient institutional arrangements, say, of the Swedish types, facilitating labor mobility. It is in connection with the liquidation imperative that, in mid-1976, the government strengthened the hand of management by enabling it to dismiss workers more easily.<sup>25</sup> The danger of continued inefficiency through this type of over-investment, is likely to grow, considering that employment is expected to increase by only 80,000 from 1976 to 1980. (The increase was about 200,000 in 1971-75).

Under these conditions, stretching the number of workdays per year by three, or inviting Vietnamese workers, in addition to the relatively minute proportion of foreign labor (around 20,000 out of 7.4 million),<sup>26</sup> seem like inconsequential actions born from despair. The system's directors could regain a new freedom of maneuver with respect to final uses of output only if they succeeded to maintain the accustomed growth rates while reducing the share of investments. This can be achieved only by means of raising the rate of growth of total factor productivity, which speeds technological innovation. However, according to the econometric study undertaken by Oldrich, Kým, the long-term trend in the Czechoslovak economy has been

<sup>22</sup> "Plánované hospodárství, 1976," No. 9, p. 30.

<sup>23</sup> *Loc. cit.*

<sup>24</sup> *Loc. cit.*

<sup>25</sup> "Hospodářské noviny, 1976," No. 21, p. 1.

<sup>26</sup> "Czechoslovakia's Importing Vietnamese Workers," *The New York Times*, April 25, 1976; "Statistická ročenka, 1976," p. 108.

a declining one—of almost half percent annually, so that the growth rate of total factor productivity in the mid-sixties was down to some percent p.a., not enough to keep growth rates up without claiming an increasing proportion of output for investments. (In contrast, Austrian data yield an estimate of total factor productivity growing from 1.3 percent in the early 'sixties to over 5 percent in the seventies.)<sup>27</sup>

This is where the effort in research and development, and the absorption capacity of innovation by the economic system, become important. In 1971-75, Czechoslovakia has been devoting, among the CMEA countries, the highest proportion of its national income to research and development (3.8 percent) and was a source of a net outflow of technical documentation to the other CMEA countries.<sup>28</sup> However, the tautness of plans has continued to maintain an atmosphere of rush to meet schedules dictated by foreign trade contracts or by the mechanical chronology or reporting fulfillment of planned indicators, and to prevent authentic planning, which would include a continuous, even if organically irregular, incorporation of new technologies. Short-run tactics assuring the fulfillment of tasks by means of "collective and individual self-sacrifice bordering on heroism" continue to prevail over long term innovation strategies.<sup>29</sup>

## II. DOMESTIC ECONOMY AND FOREIGN TRADE

Czechoslovak foreign trade, and through foreign trade the entire domestic economy, found themselves by the mid-seventies under the simultaneous impact of several adverse factors: Western recession reducing demand for Czechoslovak commodities, as well as their prices; increase in the cost of oil from Soviet as well as non-Soviet sources; projects designed within the framework of the 1971 "Complex Program" of the CMEA reaching the stage of implementation; these projects, together with planned growth rates, placing increased demands upon imports of fuels, investments into expansion of power plants and coal output, as well as imports of advanced machinery from the West. The resultant of all these factors working in combination has been a tendency for the volume of trade with the CMEA countries to expand and a related tendency for the trade balance with the West to deteriorate and for Czechoslovak indebtedness from cumulated trade deficits to increase. While the economy has apparently survived this situation through 1976 without any dramatic crisis, signs of strain and disruptions have been multiplying.

Czechoslovak terms of trade had a gently deteriorating tendency since the early sixties.<sup>30</sup> Soviet authors kept bringing up more or less obliquely the price disadvantage of the Soviet Union with respect to its raw material customers, such as Czechoslovakia, but only in 1974 did the Soviet Union follow through by deeds, raising prices of its

<sup>27</sup> O. Křín, *op. cit.*, p. 14.

<sup>28</sup> In 1971-75, 8,000 pieces of documentation were supplied by Czechoslovakia to the rest of CMEA, and 6,000 pieces went in the opposite direction. "Hospodářské noviny, 1976," No. 30, p. 4:

<sup>29</sup> "Hospodářské noviny, 1976," No. 6, p. 7.

<sup>30</sup> See Paul Marer, "Postwar Pricing and Price Patterns in Socialist Foreign Trade (1946-1971)", IDRC, Indiana University, Bloomington, 1972, p. 75.

exports articles, especially oil, and thereby worsening Czechoslovak-Soviet terms of trade by some 20 percent or more.<sup>31</sup>

It is important to underscore the interdependence of some of these factors, in particular the implementation of new projects and increase of exports to the Soviet Union and the pressure on imports from the West, under conditions where the possibilities of earning enough foreign exchange by expanding exports to the West are being undermined. The situation is well illustrated by the case of the construction of new capacities for the production of large-diameter pipes for Soviet oil pipelines, precision pipes for nuclear energy projects, etc. The protocol concerning this order was signed between the Soviet and Czechoslovak governments on August 21, 1975(!), bringing a new and unexpected element into the preparation of the plan for 1976, based on the project for the sixth five-year plan (1976-1980) which, by that time, was finished. The project consists in the expansion of output capacity in five enterprises of the Association Ferrous Metallurgy (*Hutnictví Železa*). The report, signed by the general directors of the association, states:

Expansion of these capacities \* \* \* represents an extraordinarily demanding task, not only because of its considerable scope, short terms scheduled for the preparation and the construction itself, but also because of the demanding technology of stainless steel pipes \* \* \*. Construction of these capacities will require costs which, as of today, amount to about 36 percent of the total volume of investments earmarked for enterprises of the association Ferrous Metallurgy \* \* \*. A substantial part of budgeted costs represents the cost of installations imported from abroad (they amount to about 50 percent of total cost \* \* \*).

Because of these weighty facts all construction projects of this program \* \* \* have been entered as mandatory tasks (závazné úkoly) of the state plan \* \* \*. The government of the CSSR, endeavoring to create the necessary prerequisites for securing the technical and economic preparation and the construction work itself, consented to a great number of exceptions concerning regulations of project documentation and its realization \* \* \*.

There also were problems with supply conditions \* \* \*. At the time when demands \* \* \* were made known, construction and domestic machine tool enterprises were mostly loaded to full capacity by demands originating in other high-priority programs \* \* \*.<sup>32</sup>

Analogous situations have apparently developed elsewhere, as witness the following statement by Zdeněk Půček, Minister of metallurgy and heavy machinery construction:

We have a number of other problems that we are in the process of solving, particularly in securing extraordinarily demanding export tasks for the USSR, the CMEA countries and capitalist states. It is primarily a question of securing exports of chemical installations for the Soviet Union, where we have to expand our own capacities and secure necessary internal and international subcontracting (*kooperace*).<sup>33</sup>

The minister advises to judge positive production results of the year 1976 soberly, mainly because "planned targets for 1976 do not as yet fully reflect the burden of requirements connected with structural transformations laid out for the coming years of the sixth five-year plan. This concerns primarily the proportions between exports and investments \* \* \*."<sup>34</sup> According to the plan for 1977, exports to the

<sup>31</sup> Martin J. Kohn, "Developments in Soviet-Eastern European Terms of Trade, 1971-1975," in U.S. Congress, "Soviet Economy in a New Perspective," p. 77. Claims for damages due to failure to fulfill the terms of contracts may be a significant element aggravating the terms of trade. It may be of interest to note that 41 percent of all penalties in 1975 and 45 percent in 1973 were paid to socialist countries, although these filed only 28 percent of the total number of claims. ("Hospodářské noviny, 1976," No. 36, p. 5.)

<sup>32</sup> "Hospodářské noviny, 1976," No. 21, p. 9.

<sup>33</sup> "Hospodářské noviny, 1976," No. 39, p. 9.

<sup>34</sup> *Ibid.*

Soviet Union of articles of "exceptional importance" are to increase, compared to 1976, by 29 percent, to capitalist states by 43.5 percent, and for mandatory construction projects by 31 percent.<sup>35</sup>

This quantum leap in demands placed upon the Czechoslovak economy is reminiscent of the periods of early fifties, and then again early sixties. In the early fifties, upward revisions of the production and investment tasks of the first five-year plan (1949-1954) were a function of export demands on the part of the Soviet Union. To quote a Czech economic-history treatise.

For Czechoslovakia, the treaty with the Soviet Union for 1950-1955 was the most important one. These agreements raised the demands upon Czechoslovak heavy industry, in particular upon the production of heavy machinery and equipment \* \* \*. These articles were highly material-intensive and necessitated the construction of new capacities, or a reconstruction of existing ones.<sup>36</sup>

Part of this upward revision were production tasks for armaments which quadrupled in the years 1950-52,<sup>37</sup> and increased sevenfold in the period 1948-53.<sup>38</sup>

In the period of early sixties, the element of raised export requirements was also present, in combination with the imposed need to make abruptly important changes in the structure of productive capacity. Discussing the crisis that ensued, President A. Novotny is quoted to have said: "We did not know that the new military technology would be so expensive as to become a burden to the whole national economy."<sup>39</sup> The importance of this element has been confirmed in subsequent scholarly analyses citing changes in conditions of trade with socialist countries, which had included also "conditions of Czechoslovak exports of classic military technology."<sup>40</sup> Contemporary sources reached this degree of explicitness concerning the current situation, but the armaments component might be guessed at from the juxtaposition of explicit references to pipelines, chemical and other programs, with cryptic references to deliveries of "extraordinary importance."

In the immediate, there were some limited possibilities for coping with the balance of payments problems in the short run. As regards the rising oil bills presented by the Soviet Union, Czechoslovakia was able to cushion their import in 1975 by drawing on its holdings of convertible rubles accumulated for balance-of-payments surpluses with the Soviet Union in 1972-1974.<sup>41</sup> To some extent, it could raise the price of its own exports.<sup>42</sup> As regards trade deficits with the world outside CMEA, Czechoslovakia had a certain leeway in being able to afford increasing its indebtedness, more so than any other CMEA country. Its net indebtedness to the West at the end of 1974 was the lowest among CMEA countries, both absolutely (0.7 billion dollars)

Rezníček, et al., "Základy hospodářské politiky KSČ," Prague, Svoboda, 1973.

<sup>41</sup> "Hospodářské noviny, 1976," No. 10; Statistická ročenka, 1976, p. 429.

<sup>42</sup> Thus, while exporting just about the same volume of shoes to the Soviet Union in 1975 as in 1974 (27.8 and 27.6 million pairs respectively), Czechoslovakia earned almost 50 percent more in devisa crowns in the later year. See "Statistická ročenka, 1976," pp. 438 and 446.

and as ratio to hard currency exports (0.4); by the end of 1975, these figures jumped to 1.2 billion dollars and 0.7—still only about one half the figures of the next bigger debtors, Bulgaria, Romania, and Hungary, and way below those of Poland, East Germany, and the Soviet Union.<sup>43</sup>

It may be asked what had enabled Czechoslovakia to control its level of indebtedness so much better than her CMEA partners. At this point one cannot go beyond stating what is implied in the figures: the government apparently took Polonius' policy strictures to heart—"neither a borrower nor a lender be." (The major exceptions have been heavy export surpluses with Iraq and Syria after 1969, and with Lebanon after 1972, and those may have been financed by other means than ordinary commercial credits.) It accords with this principle that the government should try and continue using the Western credit valve sparingly. In the fact of reduced earnings from Western exports in 1975, Czechoslovakia has been trying to slow down the rate of imports from the West. It is not clear from the figures alone to what extent the loss of hard-currency export earnings has been caused by the diversion of potential exports to the West toward the the CMEA market, but the data in Table 3 suggest a direct connection between the slump of the real volume of trade with the West, surge of exports to CMEA, and barely any change in real imports overall, from 1974 to 1975.

TABLE 3.—CZECHOSLOVAK FOREIGN TRADE, SELECTED DATA, 1970-75

[In billion devisa crowns]

	1970	1971	1972	1973	1974	1975
Imports, total.....	26.6	28.9	30.9	35.8	44.0	50.7
Soviet Union.....	8.7	9.8	10.3	11.7	12.0	16.3
Other socialist countries.....	9.8	10.3	11.6	12.7	16.6	19.1
Advanced capitalist countries.....	6.5	7.1	7.2	9.0	12.2	12.5
Less developed countries.....	1.6	1.7	1.9	2.3	3.2	2.8

Source: "Statistická ročenka, 1976," p. 426 (figures may not add up to totals because of rounding).

In the longer run, the disequilibrating forces acting upon the balance of payments can be countered only by substantial adjustments of a structural order, such as would reduce import requirements and raise productivity in export-oriented sectors of the economy. There also is the most drastic alternative of them all: reducing the most import-intensive lines of production working for exports. The consequent cuts in export earnings would thereby be made bearable by a simultaneous reduction of import requirements, and the released production factors

<sup>43</sup> Based on estimates made at the Chase Manhattan Bank.

would have to be reoriented toward product lines drawing on domestic supply of inputs, labor-intensive services, or subcontracting with Western firms. This kind of radical solution is, of course, out of the question at a moment when enforced CMEA trade contracts command exactly the opposite: an exacerbation of import-intensive export activity. The other long term remedies of a structural sort would require a speedy reversal of tendencies that have their roots in inefficiencies nurtured by the established economic system.

Two most conspicuous and often written about inefficiencies characterizing the Czechoslovak economy have been the high material and fuel consumption per unit of final real output. Czechoslovak rates have been estimated to lie between 1.5 and 2 times higher than corresponding rates in West European countries.<sup>44</sup> This fact has worked adversely both on import requirements of raw materials and fuels, and on export earnings: the high material consumption is reflected in the excessively great weight, by current world standards, of Czechoslovak machinery, and low prices per kilogram of engineering items realized on Western markets.

Among the chronic obstacles to sustained expansion of exports to the West one keeps coming across complaints about terms of deliveries, availability of spare parts, and servicing. The few big export hits, such as the water-jet loom or the leather-softening machine Molissa, have apparently been exceptions, not harbingers of a basic upturn in Czechoslovak export capabilities.

The preferred remedies that are being applied, or contemplated, have so far shied away from fundamental systemic changes. Improvements have been sought by methods acting directly upon behavior of enterprises. The specialization drive within the CMEA has registered an increasing annual number of multilateral specialization agreements. In machine building, 21 agreements were concluded between 1971-1974, covering 4,470 items (of which about one half concerned ball-bearings); in 1975 alone, the number of agreements rose to 33, covering over 2,000 items, and for 1976, 54 agreements were under preparation.<sup>45</sup> It remains to be seen whether this formal activity will result in increasing the comparatively low rate of specialization and trade-integration of Czechoslovakia with the other CMEA countries. (An interesting study has shown that the degree of intra-branch integration of Czechoslovakia within CMEA is substantially lower than that of the Netherlands, as well as other countries, within the Common Market.<sup>46</sup>

<sup>44</sup> "Politická ekonomie, 1975," No. 2, pp. 99-100, and Plánované hospodářství, 1975, No. 1, 88-89.

<sup>45</sup> "Hospodářské noviny," No. 14, 1976.

<sup>46</sup> The ratios of the net trade balance to total trade turnover for commodity groups within industrial branches were estimated to have been as follows:

	1965	1972
1.a Czechoslovakia/rest of the world.....	0.4470	0.4296.
1.b The Netherlands/rest of the world.....	.3150	.2832
2.a Czechoslovakia/CMEA.....	.4861	.4664
2.b The Netherlands/EEC.....	.3701	.3165.

NOTE.—For 1968, ratios analogous to line 2.b were, for Belgium 0.330, France 0.310, German Federal Republic 0.350, and Italy 0.373. (See: Karel Dyba, "Measurement of the Process of Intra-branch Specialization in Foreign Trade and in Production," "Politická ekonomie, 1975," No. 2, pp. 150-151.

For economically advanced small and middle-size countries, an overall increase in specialization should be reflected in the increase of their share in world trade. While this has been the case for CMEA countries undergoing industrialization, and EEC countries in general, Czechoslovakia's share in world trade has not changed from 1950,<sup>47</sup> a *prima facie* sign of falling short of attainable possibilities.

A large part of the export problem of Czechoslovakia has been repeatedly diagnosed as due to a lagging rate of innovation, not merely in production methods but in product quality and design. This is the same general cause we cited earlier as lying at the root of the comparatively low efficiency of investments in generating growth. "Joint projects" with the West seem to have been more written about than put to a real test. Rather than using them to stimulate exports, there has been concern with merely balancing imports and exports associated with joint projects,<sup>48</sup> though more flexible arrangements were announced for 1976. Managerial cadres have been cool to such ventures because of personal security considerations, taking them to be "politically not affordable" (*politicky neúnosne*).<sup>49</sup> With respect to joint projects, one manager assessed the situation in the following words: "Speaking globally, we have been putting patches upon patches."<sup>50</sup>

The other source of technical innovation, purchase of licenses from abroad, has been somewhat cultivated, though not at any impressively increasing rate,<sup>51</sup> and their practical utilization has been "marginal," "nonprofessional," and "ineffective," according to the Minister of General Machinery Construction.<sup>52</sup> Domestically, the regime introduced exact monitoring of new products from the point of view of world technical standards and potential economic returns. (New products have accounted for 12-13 percent of total output; of this percent about one third corresponded to world technical parameters, of which in turn only one third was also economically advantageous).<sup>53</sup> Disincentives, intended to discourage continued production of outmoded or high-cost items, have been applied in the form of reduced prices of such items paid to producing enterprises.<sup>54</sup> Price supplements and downward adjustments of prices, intended to stimulate production for exports and to discourage demand for imported

<sup>47</sup> "Plánované hospodárství, 1975," No. 9, p. 88.

<sup>48</sup> "Hospodářské noviny," No. 5, p. 4.

<sup>49</sup> "Hospodářské noviny, 1976," No. 44, p. 8.

<sup>50</sup> "Celkově to flukujeme." *Ibid.*, p. 9.

<sup>51</sup> The following tabulation gives an idea of the absolute extent of license contracts:

	1973	1974	1975
Number of contracts:			
Currently in force.....	303.0	356.0	376.0
Concluded in a given year.....	29.0	34.0	46.0
Payments for licenses (in million devisa crowns):			
Total.....	280.1	323.2	258.3
For licenses bought in a given year.....	15.4	37.6	36.3

(Source: "Statistická ročenka, 1976," p. 135.)

<sup>52</sup> "Hospodářské noviny, 1976," No. 29, p. 1. The purpose of licences has been frustrated since 'it is becoming a rule that product innovation is associated with claims for higher imports from the capitalist world, higher cost calculation, but export possibilities to exacting markets remain problematical.' *Loc. cit.* See also *ibid.*, No. 41, p. 4.

<sup>53</sup> "Statistická ročenka, 1976," p. 135.

<sup>54</sup> "Hospodářské noviny," No. 7, p. 1.

articles, have been in force as a carry-over from the 1967 reforms, but this practice was to be discontinued in 1977 as ineffectual.<sup>55</sup>

Technical intelligentsia has been generally a target of exhortations, carried in tones of respectful courtship, as exemplified by the speech by the Premier Lubomír Štrougal on "The Task of the Scientific-Technical Intelligentsia after the 15th Congress of the CP," made on September 29, 1976.<sup>56</sup> The complex of planning documents for the sixth five-year plan (1976-1980) contains, as a separate part, an implementation plan of the tasks of technical development. The innovation consists in setting up, as planned, the full chain of stages leading from basic research, through applied research, design of projects, their technical documentation, down to mass production and marketing. As a supplementary component, a new type of "coordination plan" will chart activities across administrative boundaries of sectoral ministries, so as to streamline the passage of ideas from the drawing board to the assembly line.<sup>57</sup> However, it is not the center that is to be in charge of managing the innovation effort. That is to be the task of the intermediate rung of economic administration. One has not ceased, in recent years, to stress the need to "strengthen the middle management," i.e., the "associations," to use the Soviet term,<sup>58</sup> and their "general directors." As we shall see, the single major systemic reform introduced in the first half of the seventies also concerned the structure of these associations.

All these approaches to raising the rate of technical innovation and efficiency, and thereby the export viability of the economy, have one feature in common: they are based on the principle of trying to determine economic behavior by means of direct administrative measures, rather than by relying on managerial incentives forming part of some built-in automatism of the economic system. However, from about 1975, it is possible to register a slow crescendo of pronouncements critical of the economic system of centrally administered planning, reestablished after 1969/70. In the aforementioned speech, Premier Štrougal seemed to have implicitly endorsed this new tide of reformism by declaring:

For the time being, we continue to busy ourselves primarily with isolated tasks which, although useful in themselves, cannot bring about a general progress in the technical niveau of production, to speed up the turnover of production programs, and contribute to a better utilization of the stock of capital. We cannot, after all, reconcile ourselves to good ideas not being applied, among others, because of certain shortcomings in the existing system of management and material incentives that stand in the way.

We have to seek solutions to these problems, both on the conceptual and operational planes, given the great economic losses involved which, in their consequences, undermine people's trust, their attitude toward work, and their initiative.<sup>59</sup>

### III. INSTITUTIONAL ASPECTS: THE ECONOMIC SYSTEM

Surveying the situation back at the start of the 'seventies, it seemed advisable to suspend one's judgment as to the extent to which the economic reform measures of the years 1967-1968 would be

<sup>55</sup> "Plánované hospodářství, 1976," No. 5, p. 17.

<sup>56</sup> "Hospodářské noviny, 1976," No. 42 (supplement).

<sup>57</sup> "Plánované hospodářství, 1975," No. 4, p. 23.

<sup>58</sup> The local term is "economic production units," which sounds as peculiar in Czech as in translation (výrobně hospodářské jednotky," or VHJ).

<sup>59</sup> "Hospodářské noviny, 1976," No. 42, supplement, p. 9.

liquidated.<sup>60</sup> It was clear that, after Gustav Husák's restoration of the authoritarian régime, the economic reform would not be continued in the direction of the original "target solution," which amounted to a market-type state capitalism, guided by econometric forecasting tools of indicative planning, opened up to foreign competitive imports, possibly with elements of employees' participation in management, and surely with trade unions returned to their role as autonomous interest organizations of labor. However, it seemed improbable, since it was so patently unreasonable, that the unwieldy apparatus of central planning would be fully resurrected, after experience had shown that the economy can easily do without, to put it with minimalist understatement.

Nevertheless, the resurrection did take place, more thorough than was thought possible. It was carried out in the name of "reinforcing the planning element" in the economic system. For five years, articles and pronouncements on the operation of the system were being turned out carrying the stamp of official apologetics of centralism, again written in the deadpan insipid prose reminiscent of the dark 'fifties. The system of material balances, restricted by 1968 to 3-5 items, was expanded again. It covered 380 items in the last five-year plan, and a further extension to 590 items was foreseen for the 1976-1980 plan.<sup>61</sup> Parallel to the revival of material balances, a system of distributing points in charge of allocating rationed commodities, known as "gesce" (gestions), was reconstituted from scratch—it had been completely phased out by 1967.<sup>62</sup> Old-style success indicators, reducible to the "gross value of output," were returned to their earlier pre-eminent status.

A potentially significant change was introduced in the structure of "associations." According to arrangements introduced in 1965, "associations" (výrobně hospodářské jednotky) existed in two basic types. One category consisted of "associations" represented by one large enterprise corresponding to an industrial branch (oborovy podnik), and another category had the governing body of the association (its "general directorate," *generalni reditelstvi*) assume selected functions for the organizationally subordinate enterprises without these enterprises losing their independent economic and legal identity (the "trust" form). These two basic forms were supplemented in 1974 by a third form, that of a "concern" (koncern), which allowed for a much tighter integration of the subordinate enterprises into a single economic and legal unit. The purpose was to strengthen the intermediate tier of management, make it into an effective "transmission belt" of planning functions between the center and the enterprises, eliminate duplications of operations by enterprises, and articulate more rationally overhead functions, such as research and development, and guidance of technological innovations.<sup>63</sup> The measure

<sup>60</sup> See V. Holešovsky, "Planning and Market in the Czechoslovak Reform" in Morris Bornstein, ed., "Plan and Market: Economic Reform in Eastern Europe," Yale University Press, New Haven, 1973, pp. 313-314, 340-345.

<sup>61</sup> "Plánované hospodářství, 1975," No. 11, p. 7. However, the source refers to these balances as used in calculations for planning purposes, and leaves it vague what part of items covered have been subject to actual allocation via centralized rationing.

<sup>62</sup> Gustav Svěrák, "Application of Gestions and Perspectives of their Development," "Plánované hospodářství, 1976," No. 10, pp. 57-63. The significant feature of this system is that organs in charge of material distribution are not necessarily central ministries; they may be located at the level of "associations" who are major producers or importers of a given article.

<sup>63</sup> "Organization of the Production and Technological Base," supplement to "Hospodářská noviny," No. 42, 1974.

seems to have been adopted in imitation of a similar 1973 reorganization in the Soviet Union, but not much has been heard since about its actual implementation.

The relatively favorable statistical record of the system's economic performance in the years 1969–1975 would seem to have conclusively vindicated the view according to which the 1967 economic reform was an unnecessary overreaction to the recession of 1962/63. This has been the thesis of Dr. Kurt Rozsypal whose group stood in unsuccessful opposition, during the sixties, to economists led by Ota Šik, and who has become the senior quasi-scholarly spokesman of reconstituted centralism in the seventies. According to Rozsypal's views, central planning, cured of its worst rigidities, such as prevailed in Czechoslovakia after 1958, and then again after 1970, has been a perfectly viable system. The fateful recession of 1962/63 was not to be attributed to the character of the system as such, but to specific policy mistakes (such as permitting an overextension of decentralized investment demand which developed around 1960) or shocks originating outside the system (such as collapse of trade with China, weather catastrophies, etc.). The resumption of economic expansion after recentralizing measures in 1964–65, and sustained growth after the end of market-oriented reformism in 1969, seem to support the anti-reformist position.

However, the issue was never, "Does the system work?" but "How efficiently does it work, compared to possible alternatives?" From that point of view, recentralization of the seventies put back on the agenda complaints about many of the well-known malfunctions that the 1967 system seemed to be about to start eliminating,<sup>64</sup> as well as about those with respect to which the reform was not long enough in effect to be able to tell whether it would have been beneficial or not (see preceding section). The crisis of 1962/63 was surely not entirely, or not even principally, caused by internal shortcomings of the system, but it served as a welcome pretext of dramatic proportions for turning attention to these durable sources of inefficiency. This time, it is the accumulation of difficulties in the foreign trade area, again of exogenous origin, which have revived official interest in more fundamental changes of the system. The phrase about "reinforcing the element of planning" has long disappeared. It was replaced by references to the open-ended character of the system and the need for continuity of its improvements. The term "reform," though, remains taboo. Instead, it has become fashionable to speak of "conceptuality" (*koncepčnost*) in the design of the required, but still unspecified improvements. The signs have multiplied throughout 1976, suggesting that "this is where we came in," twelve years earlier.

Ideas of the (or *an*) economic reform have led an underground or unofficial life throughout the period of recentralization. Despite the departure of major reformist figures into exile, and domestic purge of some of the most creative economists, work on themes implicitly related to reforms has continued. Thus, a research team led by Josef Goldman has concentrated on studies in the area of macroeconomic projections, forecasting and regulation, topics which make sense only

<sup>64</sup> A certain amount of statistical evidence to that effect was collected by B. Korda in the cited article, p. 518–519, and accords with the impressions of direct participants as to a perceptible pick-up in economic activism during the two years of the reform.

in the framework of indicative planning.<sup>65</sup> Besides such initiatives of individual scholars, some interest in the design of possible reform measures has originated with higher places, as evidenced by "research project No. VIII-2-2," assigned a few years ago to the Economic Institute of the Czechoslovak Academy of Sciences as part of the State Plan of Basic Research. The project, completed in 1975, investigated theoretical foundations of the planning system, and the results were intended to serve as basis for practical proposals to be worked out at the applied research level.<sup>66</sup> Official sponsorship precluded all political overtones and electrifying intellectual fervor that characterized the reform movement of the sixties, but, judging from a published report, the results were, technically, a respectable, and even improved version of the earlier reform conceptions, although the character of a coherent global vision was missing.

Parallel to that work, the editorial board of the journal *Politická ekonomie* organized in April 1975, just as eleven years earlier, a great panel discussions on problems of raising economic efficiency, with literal echoes of the 'sixties (e.g., "What is in the interest of the economy as a whole, must be equally advantageous for enterprises.")<sup>67</sup> Although the discussion ranged far and wide over all the familiar problems associated with centralized planning, its focus was on the need to give the system of incentives a new structure. In the period of recentralization, incentives seemed to work heavily in the direction of encouraging tax fraud, falsification of accounts, outright stealing, phony employment contracts, arrangements for lucrative outside advisory jobs, and all types of corruption.<sup>68</sup> This power of material incentives, now dissipated in unintended channels, should be harnessed again, many feel, to serve enterprise performance. In the conclusions of the panel debate organized by *Politická ekonomie* we read:

It turns out that we still did not succeed in finding an effective instrument able to eliminate negative phenomena in the behavior of the enterprise sector, in particular dissimulation of reserves, and efforts to soften up the plans. Short time horizon in decision making and evaluating enterprise performance is another serious shortcoming. There exist different views as to the possibilities of liquidating these shortcomings. The majority of economists are of the opinion that the principal route is to be sought in raising the role of profit, the profit being the most synthetic (nejkomplexnější) indicator of economic efficiency of enterprise activities, and further in strengthening the linkages between profits, movements of personal incomes, and investment activities.<sup>69</sup>

Despite these stirrings of reformist theorizing, spokesmen of governmental places give no indication of imminent broadly conceived reforms. For the rest of the 'seventies, one counts on "experimental testing of new elements in the area of planning."<sup>70</sup> It is obvious that the overwhelming influence of conservative centralizers, installed in key positions after 1969, stands in the way of a consequent, integral reform. Ivan Cima, an official of the Central Planning Commission

sums up his evaluation of the preliminary work on reform options as follows:

The chosen approach for raising the quality of the planning system was unquestionably correct but the fulfillment of its requirements has been very difficult. It turned out that a truly critical analysis of the existing state of affairs has been a particularly complicated task, and so was the very organization and evaluation [of that analysis], which is the basic prerequisite and starting point for improving the system as a whole and its individual components.<sup>71</sup>

The author is forced to conclude that, "in a number of directions, the necessary search for optimal solutions is still awaiting us."

In the meantime, the problem of internal systemic changes raises the problem of coordination of national plans of individual CMEA countries. The Seventeenth CMEA Session recommended the creation of divisions concerning economic planning, with special attention to economic integration. For the time being, an attitude of temporizing seems to prevail. Each individual country continues to go it alone in contemplating systemic changes. Only "in a long-range outlook is it necessary to count with mutually coordinated interventions of a more complex type into national systems of planning."<sup>72</sup>

Recently, the influence of internal planning systems of CMEA countries upon each other has largely consisted in transmitting elements of chaos. Earlier, we have cited testimony concerning Soviet rush orders, necessitating neglect of regulations and revamping of specific production plans in the course of execution of a given annual plan. It has become a regular occurrence every year for a large portion of export tasks to remain for too long in the form of an unspecified global sum, a fact that "extraordinarily impeded the preparation and recalculation of the plan (but, naturally, also the preparation of exports on the production and commercial sides)."<sup>73</sup> Czechoslovakia, in turn, has been a course of analogous problems for others, because Czechoslovak users of imported articles "developed the custom, over the years, to specify their needs at a later date (after the conclusion of negotiations concerning annual trade protocols and the allocation of foreign-exchange quotas)."<sup>74</sup> Delays in specification of export orders combine with the quarterly chronology of performance indicators to create classic cases of "storming." Thus, in 1976, over one third of machinery exports to CMEA markets were completed in the last sixth of the first quarter, though for individual firms the proportion may reach from two thirds up to 90 percent.<sup>75</sup>

Under these conditions, the issue of desirable systematic reforms is becoming, by force of circumstances, a matter of increasing concern to all CMEA countries simultaneously, though to the Soviet Union probably the least. It seems clear that a smooth and continuous flow of trade orders and production for exports can take place only when state trading organs, operating as a rule by annual spasmodic jerks,

<sup>73</sup> Zdeněk Sedivý, Deputy Chief of the State Planning Commission, "External Economic Relations," "Hospodářské noviny, 1976," No. 32, p. 3.

<sup>74</sup> *Ibid.*

<sup>75</sup> "Hospodářské noviny, 1976," No. 22, p. 2. This particular source of the typical "seasonal" movement of centrally planned economies exists in addition to ordinary internal reasons which lead many enterprises to fulfilling more than one half of their monthly output in the last third of the month. The loss of working time due to inferior organization of work is estimated, for the Czech part of the country, at 20-30 percent of available working time. ("Plánované hospodářství, 1975," No. 4, p. 76.)

have their role reduced in favor of direct dealings between production units involved. The logic of the problem leads to solutions calling for radical decentralization.

The publication in the Czechoslovak planning journal of an original article, unusually rich in content and unconventional ideas, written by a Polish writer, assumes under given circumstances an exceptional significance. The author, Antoni Marszalek, gives great publicity to the work of Marian Guzek,<sup>76</sup> and his advocacy of indicative planning as a way out of the planning confusion of centralism. The crucial passage is worth quoting in extenso, and serve as a suitable conclusion to our survey of the situation with respect to systematic changes. Having pointed out the close interdependence between internal planning systems and the problem of international coordination, Marszalek concludes that, ultimately, only practical adoption of indicative planning at the level of supra-national organs of CMEA, as proposed by Guzek, promises a solution of the international coordination problem:

Despite the resistance of those who might defend the view according to which directive planning is characteristic for all planning in a socialist economy, it is much rather probable that the introduction of indicative planning in the CMEA would raise the effectiveness of the influence exerted by this body upon economic decisions in member countries (without having to replace "recommendations" by "resolutions," the implementation of which is a supremely complicated matter). However, in order to make optimal utilization of the advantages of indicative planning at the international level possible, it is necessary to strive for an extensive utilization of commodity and money relations, both with respect to mechanisms governing economic activities within countries, and with respect to international relations. Besides, the process of improving planning processes is made enormously more difficult if it does not go hand in hand with the utilization of advantages of the socialist market.<sup>77</sup>

It is highly probable that, whoever was responsible for the publication of this article in the Czechoslovak journal, was printing a piece by an author from a "fraternal country" in order to get around the domestic censorship, and using its message pro domo.

#### IV. FUTURE PROSPECTS

Having weathered the early years of the decade relatively well, Czechoslovak economy has entered a period of unsettling circumstances. Severely worsened terms of trade with the outside world mean less output available for domestic uses if imports were to grow at pre-1975 rates. But then, reduction of imports would also mean slower rates of growth, particularly if they cut into productivity-enhancing imports of Western producer goods, and result in still lower availabilities for domestic uses. Continuation of high and increasing investment quotas, due to systemic reasons and to projects connected with current trade requirements and capital exports for CMEA joint projects, are also bound to make further increases in consumption more problematic.

It is not clear whether the cumulative effects of the various pressures will produce a crisis or only a protracted strain. The régime intends to alleviate the difficulties, first, by means of a systematic program of

<sup>77</sup> Antoni Marszalek, "Common Planning—New Form of Cooperation between the CMEA Countries," "Plánované hospodárství, 1975," No. 12, p. 67.

increasing the economy of fuel and energy utilization.<sup>78</sup> Beyond that, most measures aiming at increasing productivity, and thereby countering the worsened terms of trade, as well as obviating high investment requirements, touch upon the problem of the "inert core" of the recentralized planning system. The need for changes is generating fear of changes. Postponement of changes is likely to make the need for changes more acute. In the meantime, official statements betray tension and worry concerning the ability of administrative measures to prevent eventual "bottleneck multipliers" from rippling through the economy and escalating into a wave of crisis proportions.

Its place in the world, its place in Europe, and its place in Germany has always been the main preoccupation of the GDR (German Democratic Republic) leadership. In securing this place it made great strides during the first half decade of the 1970's. It has gained the sought for recognition from the great majority of the world's governments and has been admitted into the United Nations, and these trappings of acceptance seem to have been of great importance to the GDR. It has developed diplomatic relations with its European neighbors to the south and west and has been an active participant in the Helsinki Conference. And it has established a *modus vivendi* through the Basic Contract of 1972 with the bigger and richer part of Germany, the FRG (Federal Republic of Germany). This notwithstanding, its ambiguous relations with its German ex-sister state are still the chief constraint on and determinant of its economic policy.

The policy of *Abgrenzung*, of cutting itself off, of stressing its separateness as a socialist state rather than its Germanness, has been its driving force ever since the post-Ulbricht regime came to power. But ambiguity still remains. It is the West, the FRG, which still refuses to bury the hope of an eventual end to the *Grenze*, the border, between the Germanies. Thus for the FRG (and through it the Common Market as a whole) the eastern border of West Germany for customs purposes lies along the Oder-Neisse, the eastern border of the GDR, and not on the Elbe, the eastern border of the FRG. GDR goods can move into the Common Market without being subject to the market's external duty. This fiction, which brings some tangible benefits to the GDR, has not been affected by the treaties between the two Germanies which recognized the separateness of the two states. This sweet pill—the benefit of the GDR has been estimated at

\*Research for this paper was carried out while author was visiting at the University of Pennsylvania, on leave from the Hebrew University, Jerusalem. He is grateful to J. Van Brabant, V. Holesovsky and C. Wittich who have read the first draft of this paper and made numerous detailed comments: to P. Marer, who has kept supplying him with material, and to M. Feshbach, who has let him use the FDAD library facilities. Most of the data on which the analysis of foreign trade is based were provided by Jan Vanous. Much of the remaining data originates from various works of the Berlin Deutsches Wirtschaft Institute. I am very grateful for this help.

some DM 500 in 1970, over 25 per cent of the value of export to the FRG that year<sup>1</sup>—has its bitter side too. It encourages trade with the FRG and dependence on the object of Abgrenzung. The advantages of the ties to FRG are too great to forego: the share of FRG trade as a proportion of trade with the West or total trade fell slightly till 1965, but has been rising since (Table 1). One way of belittling this trade has been by under-reporting it, by not recognizing the various revaluations of the DM in GDR statistics and by fictionally keeping the DM on par with the GDR Mark.<sup>2</sup>

TABLE 1.—GDR TRADE WITH FRG, THE WEST, AND TOTAL TRADE, SELECTED YEARS

	1960	1965	1970	1974	1975
FRG data (DM, million):					
Exports to FRG.....	1,122.4	1,260.4	1,996.0	3,252.4	3,351.0
Imports from FRG.....	959.5	1,206.1	2,415.1	3,670.8	3,922.4
Balance of trade.....	162.9	54.3	-419.5	-418.4	-571.4
GDR data (SDR, <sup>1</sup> million):					
Exports to FRG as reported.....	241.3	294.0	449.6	716.7	(*)
Imports from FRG as reported.....	213.8	263.5	514.7	711.2	(*)
Balance of trade as reported.....	27.5	30.5	-65.1	5.5	(*)
Exports to FRG, corrected.....	241.3	308.7	517.6	1,020.4	(*)
Imports from FRG, corrected.....	213.8	276.7	592.6	1,012.5	(*)
Share of trade with FRG (percent):					
Exports to FRG in exports to West.....	45.1	39.9	43.3	44.6	(*)
Imports from FRG in imports from West.....	37.3	36.3	39.9	31.9	(*)
Exports to FRG in total exports.....	10.9	10.1	11.3	14.1	(*)
Imports from FRG in total imports.....	9.2	9.2	12.2	12.7	(*)

<sup>2</sup> Data not available.

Sources: CMEA-FORTRAM by Jan Vanous, and statistical yearbook, 1976, p. 262f. FRG data—Thalheim, 1976, p. 32. Data on trade with FRG include trade with West Berlin.

The FRG need not compete with the GDR; the GDR cannot help but feel that it is taking part in an unending economic race with its Western sister, a race on whose outcome the very stability of the GDR may depend. The higher standard of living of the West is there for anyone to see, either on television or through the numerous West German visitors, another fruit of the treaties between the two Germanies. The GDR cannot permit its consumers to believe that they are falling too far behind in their consumption standards. Hence the great stress in any speech of the leadership on the many elements of social consumption, of the state financing private consumption by heavy subsidies, and on the stability of consumers' prices while inflation rages in the West. Hence also the dilemma: do we put everything into investments to be able to overtake the FRG and then increase consumption? This seems to have been Ulbricht's policy in the 1960's. But can we delay consumption that long, or need we raise consumption now? And shall we not then start to trail even farther behind the FRG in the future?

<sup>1</sup> R. Biskup's estimates, reported by *The Economist*, 6 November 1976, p. 70.

<sup>2</sup> Another point has been the systematic tendency of the GDR to report trade with the FRG as balanced, while FRG reports a large FRG surplus; the use made of the swing, the automatic lending facility in the trade agreement between the countries, makes it quite clear that the FRG's figures are correct. On the other hand, GDR deficits with other Western countries are greater in GDR statistics than in mirror statistics. The explanation which would make most sense is that some of the GDR's exports to the FRG get re-exported to other Western countries, but it could also be that the GDR manages to use FRG swing facilities for some imports from third countries.

It will be seen below that there is some doubt regarding the GDR's actual performance during the previous FYP (five year plan), in spite of official claims of great successes. Might it be that the leadership is afraid to admit failures because of the the fear of comparisons with the West? Is part of the disaffection, illustrated by the mass applications for emigration to the West (e.g., *New York Times*, 24 October 1976), the result of economic advance that is much slower than claimed?

The basic insecurity of the GDR shows also in its relations with the block and the USSR. Though it has the highest living standards of all the members of CMEA—slightly ahead of Czechoslovakia and far ahead of the Soviet Union itself, one suspects that if need be the Soviets would be ready to support consumption in the GDR, rather than weaken the morale in the block's westernmost shopping window: when CMEA terms of trade deteriorated for the GDR in 1975, the USSR allowed it to run up a sizable deficit.<sup>3</sup> Here its potential weakness gives the GDR strength and leverage. The same insecurity also creates a desire to strengthen the political and economic union between CMEA countries, a desire to lean heavily on the USSR. The reflection of this factor can be seen strongly in the GDR's foreign trade. Now, there are also strong economic grounds for a major producer of machinery, the soft good that has few outlets in the West, to secure CMEA markets—and primary supplies—through CMEA machinery. But political reasons transcend economics here.

Now to some internal characteristics. More and more eastern European countries have been meeting the labor constraints lately. The GDR had their experience many years ago. Its population, at 17 million against 60 million for the FRG, has been declining slowly since 1968. It is a war-scarred population, where many cohorts have been thinned by war casualties and made unbalanced, female heavy,<sup>4</sup> and many war-time or post-war cohorts were small from the start. The mass emigration to the FRG in the late 1950's has further depleted the population. The actual working population has been growing, partly because of the influx of new cohorts to the labor force, replacing those most badly mauled by the war.<sup>5</sup> With the capital-labor ratio constantly rising, substitution of capital for labor, or an intensive development strategy, has been a condition for growth for many years: STE (Soviet-type economies) have not so far found an efficient way of handling this process of capital deepening.

Some of the factors listed above have been with the GDR from its start. Systemic change has affected it in many ways which have been novel and unique to it. After Czechoslovakia's brief encounter with its Libermanist reforms in 1959 to 1962, the GDR embarked along on its own NES (New Economic System of Planning and Management) in 1963/64, which it discarded at the end of the '60s when the economy returned to the traditional STE fold. The opening part of this paper is concerned with the background to the rejection of reform, and with the experiences and developments of the first half of the 1970's.

<sup>3</sup> Of over 1,500m VM (Valuta Mark), over 350 million transferable Rubles.

<sup>4</sup> This applies to all pre-1930 cohorts (*Statistical Yearbook 1975*, p. 389). As it regards the population at large, this imbalance has been in decline: 57.5 percent females in 1946, 54.9 in 1960, 53.9 in 1970 and 53.6 in 1974 (*Statistical Yearbook, 1975*, p. 1).

<sup>5</sup> The working population has increased by 2 percent since 1970.

A topic which receives significant attention is the comparison between the performance of the economy under the NES reform regime and after it. Most Western economists are prejudiced in favor of market economies, and I am no exception. I would therefore have expected, all other things being equal, a reformed STE, with more market elements in its system, to do no worse than a highly centralized one. On the face of it we have in the GDR a rebuttal of this prejudice. Performance by all published indicators of output growth was slightly better during 1971-75, when the system reverted to centralism, in spite of the severe difficulties which hit it on the foreign economic front midway in the plan. The commentator can choose among three alternatives: he can admit that his prejudices are unfounded, which is a very hard thing to do; he can try to explain away the system changes; or he can try to examine closely the various published series and find in them biases which might lead to this paradoxical outcome. It is the third path I intent to take: there are indications that the 1971-75 figures are indeed upward biased, unlike those of 1965-70.

A correct reading of the East German recent growth record is of importance not only for the better understanding of the success of its economic system in the past. It is also an indispensable foundation for a critical look at the prospects of the Fifth FYP, 1976-80. It can also explain in part why, in spite of the respectable performance of the previous five years, the new plan is more conservative than the claimed accomplishments of the previous five years would have warranted.

The plan of this paper is as follows: section A anchors the system changes of 1970/71 and the conception of the 1971/75 FYP in the events of 1969/70 and provides the main outlines of the plan and its implementation. Section B surveys the economic scene in mid-decade, and the background to the 1976/80 FYP which section C describes and evaluates. Thus section A is mainly historical, section B is heavy on data analysis, and section C is a mixture of the two, except that its history is replaced by crystal gazing.

## A. THE EVENTS OF 1971-1975

### *I. The Background to the 1971-75 FYP*

The economic system which evolved in the GDR between 1964 and 1970, the New Economic System of Planning and Managing the National Economy (NES) has been described elsewhere,<sup>6</sup> and only its bare outlines will be given below. It is, however, important to note that the last two years of NES, 1969-70, differed significantly from previous years. In these two years the long-standing strategy of slack plans was given up in favor of fairly ambitious growth plans that were to transform the structure of the economy. The desire to build a more modern economy, giving precedence to technologically advanced products in such fields as electronics, chemicals, instrumentation and machine tools led to two changes in the direction of the economy. First, the planned increase in the volume of investment was raised,

<sup>6</sup> See, among others, Keren (1973b), Granick (1975), Leptin (n.d.), Leptin and Melzer (1976). For German sources—see Mitzscherling et al. (1971 and 1974), Leptin (1968), Mitzscherling (1972), and others.

without cutting down of planned increases of consumption, and the actual increase in 1969 was by 50 percent higher than in any previous year in the '60s (Keren, 1973b, Table 4). Secondly, a sharp differentiation was put between the treatment provided to those products receiving special attention, mostly the so-called structure determining products,<sup>7</sup> and all other products. The former, which included some intermediates in short supply in addition to the growth foci mentioned above, were to receive the primary attention of the planning hierarchy, while the planning of the remaining products was to be largely devolved to lower bodies in the hierarchy, such as associations<sup>8</sup> or even large enterprises. A strict priority system was set up to permit planning and plan implementation of these structure determining products to receive precedence over other products (Keren, 1973b, p. 574f.).

Did all this conflict with the conception of NES? Not really. NES did not aim at supplanting a plan with a market. Neither did it aim at decentralization for its own sake. What NES wanted to achieve was an orderly division of decision-making between upper and lower rungs in the hierarchy, so as to leave the top leadership sufficient time to make considered, knowledgeable decisions on the really important issues, and let lower echelons make derivative decisions on lesser issues.<sup>9</sup>

By 1968, when the new strategy for 1969/70 was being put into effect, NES had changed considerably the allocative mechanism in the GDR. The material supply system was most affected. Strict rationing of funded goods was limited to a very small number of commodities, and the expressed aim was to eliminate it entirely. Material balancing was largely devolved to associations and large enterprises, with SPC (the State Planning Commission) getting out of it altogether and the industrial ministries administering a very small number of balances. Much of inter-enterprise flow of semi-manufactures was organized bilaterally and in contracts, partly long-term "cooperation" contracts. In the production plan detail was reduced: the number of plan positions and other planning indicators fell sharply. Both in the plan and in the incentive structure a stress was put on deliveries, rather than production. Furthermore, profits became the main success criterion, and the weights of discretionary and variable bonuses in income was raised (Keren, 1973b).

The way by which priority planning, planning with structure determining products, affected the system was to divide the economy into two spheres, a highly centralized priority sphere, and a radically devolved remainder.<sup>10</sup> The effects of this were:

*Production planning.*—the number of plan positions, i.e., the detail of the centralized plan, was apparently further reduced.<sup>11</sup>

*Supply system.*—the number of centrally allocated, funded goods declined. Though I am not aware of numerical data on the division of balancing functions between the various levels of the hierarchy, there is little doubt that most of the balancing work was devolved to associations and enterprises, as in the last years for which we have

<sup>7</sup> Cf. Granick (1975), p. 146 and fn. 29: a list of priority products was never released.

<sup>8</sup> Vereinigungen volkseigene Betriebe, VVB. Cf. Keren (1973b).

<sup>9</sup> Keren, 1973b, pp. 557 and 564. Granick sees it in a similar light: 197c, p. 161f (in spite of his footnote 58, p. 161).

<sup>10</sup> This is not accepted by all students of the scene; some, cf. Erdmann (1968) saw in it the end of NES. Keren (1974) tries to reconcile the two views. The strongest published evidence that devolution in the GDR had by 1970 been very advanced can be found in Granick (1975).

<sup>11</sup> From 176 in 1967 and over 800 in per-NES days (Keren, 1973, Table 1). No details are known of the number of balances in 1968-70.

quantitative information (Keren, 1973, Table 1). Direct contracting between enterprises increased in importance, long-term contracts were encouraged and received a degree of priority in balances,<sup>12</sup> and balancing organs who did not honor them were even subject to paying indemnities to the parties (though we have no evidence on the actual implementation of this provision).

*The incentive system.*—profits were given greater importance than before, in that even export profits were to be included in profits.<sup>13</sup> Bonuses were to depend not, as in the past, on annually planned profits, but on their increase over the previous year (Gesetzblatt, 1968, pt. II, No. 67, p. 490-93), a provision that was intended to weaken some of the ill effects of the ratchet principle.

*Price formation.*—the price reform had ended in 1967 and had produced a price system in which disparities in the profit rate on turnover were lower than before. Now a scheme of dynamic price adjustments was instituted by which prices were to be equated continuously to costs plus profits, with profitability tied to total employed capital. The administration of price adjustment was to be largely in the hands of associations and enterprises (Gesetzblatt, 1968, pt. II, No. 67, p. 499f; Keren, 1973a and 1973b).

Whether this system of a closely centralized priority system within an economy relatively uncoordinated from the center was feasible in conjunction with prices that were not free to react to shortages, hence help in the allocation process, is a subject for speculation. In the tensions imposed by the taut 1969 and 1970 plans (Keren, 1973b, sec. D; Gamarnikov, 1974) it did not work, particularly since on top of tensions rooted in policy came those imposed by extremely harsh winters in both years which in themselves overtaxed the insufficient energy sector. Since priorities were apparently enforced quite harshly<sup>14</sup> shortages were concentrated in other areas. Though priority given to a product was to be extended to all its chains of suppliers, this did not work (Keren, 1973, p. 574) and it was in raw materials, semi-manufactures—castings, pumps and the like, and parts—that bottlenecks were encountered, and particularly so in the energy sector. Unplanned stocks accumulated, both of materials—because of supply problems, and of unfinished investment—because of an oversplintering of investment projects started.<sup>15</sup> A substantial deficit in foreign payments was also piled up.<sup>16</sup> Furthermore, there were signs of a certain breakdown of planning discipline: the usual practice in STE is to overallocate production targets, i.e., each ministry, association, usually creates reserves for itself by imposing on its subordinates higher production targets than it receives from its superiors.<sup>17</sup> We hear complaints that in 1970 in the GDR the opposite has occurred, and that even for some priority items only 95 percent of production targets were further allocated among subordinates (Keren, 1973b p, 581). Why organs in the hierarchy did not choose to fully protect themselves in the accepted

<sup>12</sup> That this must have been of some importance is paradoxically supported by post-NES decisions of the Contract Court, which had to stress that balances have priority, temporal as well as legal, over contracts (W-31/73, 1 Aug. 1973). This need not have been stressed had the previous practice not been different.

<sup>13</sup> I.e., for the purpose of calculating profits exports were valued at the price they actually fetched abroad, converted into GDR Marks according to conversion coefficients differentiated by commodity and currency (Keren 1976, p. 130).

<sup>14</sup> Cf. the 1970 semi annual plan fulfilment report (ND, 24 July 1970, p. 3).

<sup>15</sup> The GDR publishes no statistics on unfinished investment. As to other stocks these can be recomputed from data on the internal use of the net material product (NMP): see section B, below.

<sup>16</sup> See section B, below, for details.

<sup>17</sup> See, e.g., Levine (195).

way is not clear: the slacker atmosphere of previous years may have led them to believe that above-plan supplies would be forthcoming. Nevertheless, it is clear that such a symptom of breach of discipline must have been worrisome to the leadership and must have played a role in the decision to recentralize and impose tougher discipline.

One thing did not happen in 1970: in spite of the reported delays in contract fulfilments, bottlenecks and shortage of intermediate loss of output during the cold winter months, there was no decline in the reported rate of growth of output over previous years. NMP increased in both 1969 and 1970 by 5.2 percent, against 5.4 and 5.1 percent respectively in 1967 and 1968. This can be partly explained by a widespread resort to overtime (Keren (1973b), p. 580); further factors, related to measurement biases, are discussed in section B below.

To these internally propelled events, which set the stage for the principal decisions for 1971-75, were added two external events. One was the Polish riots of the autumn of 1970, which brought the downfall of Gomulka. These led to a reassessment of the position of the consumer's place in development policy. The other was the replacement of Ulbricht by Honecker, probably related to foreign policy issues, possibly also to the failure of the 1969/70 strategy (Keren, 1974). This latter event made new departures, radical changes in policy, much easier.

#### OPTIONS FOR THE 71-75 FYP

The bottlenecks and tensions of 1969/70 must have led to a down-scaling of the rate of smooth and stable growth the GDR economy was expected to be capable of providing in the near future. Total resources were to grow less than was intended before. The Polish disturbances which culminated in the toppling of Gomulka, and possibly the desire of the new leadership to gain popularity, gave precedence to satisfying consumers. Furthermore, the large import surplus of 1970 had to be balanced by a considerable increase in exports: it is unlikely that the huge loans taken later were planned at this early date. As seen in late 1970 and early 1971, these two demands preempted much of the expectedly rather small increase in output, and not much was to be left for investments. As to those investments that were available, a large chunk was needed to extend the bottleneck intermediates supplying sectors, particularly energy, and to complete previously started projects. Only when these tasks were well on their way would there be any freedom for a new conception of a growth policy to reassert itself.

Seen from this angle, GDR planners did not have much leeway in formulating their new FYP, at least not for the first stages. Still another element was imposed on them, a need for recentralization, at least for the interim period till the most serious bottlenecks were removed: where the price system is rigidly centralized, there is no alternative to a centralized allocation and rationing mechanism when significant imbalances exist. This still left an opening to a return to an NES-type regime once the imbalances were removed.

A third element on which a decision was to be made was the degree of pressure to apply to the economy. Soviet lore does not support a relaxation of the economy-wide effort just because of some bottle-

necks (Hunter, 1961; Levine, 1961). But here these were widespread, and there was a good ground for saying that tautness caused them (though it is also possible to content that it was priority *cum* planlessness that was to blame). Although the 1971 plan was not as a whole fulfilled, the targets set seemed, in view of past results, to have been realistic. Thus the impression one gets is of a decision, for the start at least, to adopt plans that are not overly taut.

## II. 1971 to 1975: Plan and Implementation

The key slogan of the 1971/75 FYP was retrenchment: slower growth, lower investment, lower balance of trade deficits.<sup>18</sup> At the same time, the rate of growth of consumption was, for the first time in a FYP, to exceed that of investment.

The overall growth targets seemed reasonable: NMP was to grow<sup>19</sup> by 4.9 percent annually, i.e., below the 5.2 annual rate achieved during 1966/70. Marketable industrial output<sup>20</sup> was to grow by 6.0 percent against 6.5 percent annually. The same applied to expenditure plans: retail sales were to grow by 4.1 percent annually against 4.6 during 66/70, and fixed investments by 2.3 percent.<sup>21</sup> Thus planned investment growth underwent the sharpest cutback from the 9.7 percent average 1966–70 rate. Two items were to increase: exports (to socialist countries), by 10–11 percent against 8.1 percent, and inventory investment by unspecified rates; both these items can be viewed as provisions for flexibility, providers of physical reserves and importable reserves and these, too, specify caution.

Of no less interest is the change in structural strategy, both short and long term, and this can be seen in both investment plans and in the changing structure of industrial output over time, as brought out by reading the FYP and the 1971 (and 1972) annual plans in conjunction. Of the reduced volume of investment, more was to be spent on the bottleneck sectors of energy and intermediate supplies on the one hand, and on residential house building on the other. In other words, investments embodied a short term aim and a longer term one, and both meant a new direction compared to the 1969/70 trend: instead of developing technologically advanced leading sectors, we have a short term attempt to overcome the dislocations created as a result of that strategy, and a longer term mark of the commitment to raising the standards of life. When one compares the growth rates of industrial output planned for 1971 with those left for the remainder of the FYP on the one hand to growth rates in 1970 on the other, one sees the following: the Ministry for Coal and Energy (previously Ministry for Primary Materials Industry) was to double its rate of

<sup>18</sup> See Table 9. It seems that even the growth rate of NMP by 27 percent, which appeared in the final version of the plan (FYP 71/75, p. 2) was higher than actually intended at the time, and was put in so as to keep the target at the mean of the 26–28 range of the FYP Directives (1971). Evidence to this is the pattern of planned growth provided in the plan: slow at the start, faster towards the end, with a 5.5 percent growth for 1975, a rate never attained in the '60s. It seems that to keep the total up at 27 percent the underfulfilled half percent of 1971 was just added to the 1975 total.

<sup>19</sup> See Tables 2 and 9 for these targets and for 1966/70 fulfilments.

<sup>20</sup> Industrielle Warenproduktion.

<sup>21</sup> Compared to the level of 1970. The investment target is stated in terms of the total volume planned over the FYP, rather as annual targets or as a target for 1975, as for all other items in the plan. In Table 9 below, which shows the increase in volume, growth of investments is greater than that of consumption. This is, however, misleading, because of the extremely rapid increase in investments during the 1966–70 period, at an annual rate close to 10 percent, would have meant that even if investments were to be maintained at their 1970 level their volume over 1971/75 would have been 21 percent above the volume during the previous quinquennial, so that an increase of 29 percent meant a very small increase above the 1970 level, an average growth of 2.3 percent (i.e., the figure in the text and in Table 2). ■

growth of output in 1971 and then keep expanding at an equal rate; the Ministry of Processing Machinery and Vehicle Production, which is responsible for many engineering enterprises that produce semi-manufactures and parts, was to increase its rate of growth in 1971 but reduce it later on. The Chemical and Electrotechnic and Electronic Industries' plans had an opposite temporal pattern; light industry and heavy machine building—a slowly accelerating pattern.<sup>22</sup>

#### SYSTEM CHANGES

In the plan itself there are few indications of the recentralization which was gathering momentum during 1971. There has, in fact, been no outright declaration of a shift in policy, no denunciation of NES, which is why there has been no unanimous agreement on the fact of the demise of NES.<sup>23</sup> There are a few references in the FYP Directives (1971) to the need for plan discipline, a few changes of hallowed phrases, such as from "planning and managing the national economy" to "managing and planning" the same.<sup>24</sup> Other changes were in the way the system was referred to. The Economic System of Socialism, the appellation which had replaced NES ever since 1967, is rarely mentioned in the latter half of 1971. Instead we meet the Economic System. The signs of change are in the host of legislation, which differs significantly from that of NES. Indeed, a draft batch of system regulations, published for public discussion in the spring of 1970,<sup>25</sup> which already had a somewhat stricter spirit than the 1968 batch,<sup>26</sup> was allowed to die by neglect.<sup>27</sup> The principal changes which the new legislation introduced were as follows:

*Production planning.*—The degree of detail in the plan increased significantly. The number of plan positions grew to 800 (Keren, 1973, Table 1), and SPC and other central state organs were responsible for balancing all of them.<sup>28</sup> Previously there were under 200, and two-thirds were balanced by associations and enterprises. Monthly targets were introduced (later replaced by quarterly ones), and the detail of the employment plan grew (Keren, 1973, Table 2). Investment planning, in particular, was highly centralized, both in the decisions on whether to launch projects, and in the control of the material composition of each project.<sup>29</sup>

*Material supply.*—There was a reversal of the trend of devolution of balances: SPC, which had not dealt with balancing since 1963, and the industrial ministries and other central state organs who had been responsible for some 500 balances in 1967 received the responsibility for 300 and 500 balances, respectively. As for the remainder, as against the stress for *eigenverantwortung*, "self-responsibility," of the balancer, a stress was put now on the hierarchical nature of the "balancing pyramid," of devolved balances being assortment

<sup>22</sup> The above is based on P. Mitzschelling, "DDR Wirtschaft 1971 bis 1976," (DIW-WB, 22/71, p. 155).

<sup>23</sup> English sources are Gamarnikov (1974), Keren (1973b, 1974), Leptin (1975), and Leptin and Metzger (1976). Naor (1973) disputes the change, and Granick (1975, who says he is taking a middle position, does in fact agree that the shift has taken place. In German, see Erdmann (1971), Beyer (1971), Mitzscherling (1972).

<sup>24</sup> A change that was apparently hastily introduced, because the English edition of the directives has the old version (FYP Directives, 1971-75, p. 20).

<sup>25</sup> (W. No. 18/1970 of 29 April 1970, Beilage; W. No. 19-20/1970 of 7 May 1970).

<sup>26</sup> (GBI, 1968, pt. I, no. 9, p. 223 ff., and pt. II, no. 67).

<sup>27</sup> Cf. Leptin (n.d.), p. 48 f.

<sup>28</sup> Brass and Steeger (1975, p. 1378) indicate that by 1975 this number had not changed.

<sup>29</sup> Gesetzblatt, 1971, pt. II, no. 1, p. 1 ff.

balances, of superiors being responsible for checking subordinates' balancing work.<sup>30</sup>

Rationing, in the guise of renamed Bilanzanteile, balance shares, i.e., the old Kontingente or fondy, which nearly disappeared in NES, reappeared openly, with special ordinances and mention in textbooks.<sup>31</sup>

*Incentives.*—The first step taken was to dethrone profits. This was done in a two-pronged action. First, profits were redefined: profits attained in violation of plans were not regarded as profits and were to be taxed away. This made profits to be what the superiors wanted them to be.<sup>32</sup> Next, marketable output (Warenproduktion) was put on par with profits as a principal success indicator. A progressively smaller part of bonuses was made dependent on profits. A plethora of physical indicators arose, and many statements can be found to the effect that no individual indicator can measure effectiveness.<sup>33</sup> If, to the senior manager, profits used to be a principal constraint,<sup>34</sup> it appears that physical indicators have now taken their place.

*Prices.*—It is most unlikely that the system of self administered, eigenverantwortlich (with own responsibility) price adjustment enacted in 1968<sup>35</sup> was working as designed during 1969/70: its delegated administrators lacked the proper incentives for that (Keren, 1973a). At the end of 1970, the first decree which charted the undoing of NES effectively recentralized price administration. By the decree, price reductions were to be a new part of the state plan, imposed on ministries, who were to disaggregate them to associations and so on.<sup>36</sup> We have no evidence on the working of the centralized price reduction scheme, but the situation since 1970 has changed. Then price reductions due to technological improvements were foreseen, whereas the price rises for imports of 1973–75 required mostly price increases, and these do not fit into the envisaged scheme.

There was, however, no general retreat from the principles of price fixing as determined in 1968. In one subsidiary direction there was even progress: the capital tax of 6 percent on all employed capital was to be applied equally to all industrial branches (with few exceptions) rather than at multiple rates as before.

There is really no dispute over the direction of the system changes. The argument is over their extent and over their durability. Was NES really completely undone? Were there changes there to stay, or was a return to NES envisaged? I believe that this post-1970 system has less to distinguish it from the system of the neighboring countries than from the pre-1970 regime, but only a study on the lines of Granick (1975) of Poland, Czechoslovakia, and the GDR can establish the true facts. As for durability—by not repudiating NES (and this would have been too much of a slap at Ulbricht's face when the changeover took place, and may not have really been necessary), the options for a return to a NES-like system have been retained. As will

<sup>30</sup> Gesetzblatt, pt. II, p. 578 ff. Cf. also Brass and Steeger (1975), who claim that central balances in 1975 covered 55 percent of industrial output, which makes clear that the aim still is to cover as much as possible in the central balances.

<sup>36</sup> (G B1, 1970, pt. II, no. 101, p. 749).

be seen below, these options have not been used, and for reasons to be discussed below seem to be less and less likely to be exercised in the foreseeable future.

#### THE IMPLEMENTATION OF THE 71/75 FYP

The figures of Table 2 tell some of the events of the past half-decade.<sup>37</sup> Section B below will subject some of these figures to closer scrutiny. They do, nonetheless, help to show the general flow of the half decade.

*Environment.*—There were two unforeseen factors which influenced the outcome of the FYP. One was favorable, the apparent rapid growth in the three mid years of the plan, 1972–74. The other was unfavorable, the sharp deterioration of terms of trade after 1973, affecting trade with the nonsocialist world in 1974 and with CMEA too in 1975.

The 1971–75 FYP started off slowly in 1971. In actual fact, 1971 was out before the final enactment of the FYP, so that the relatively poor results of the plan could be incorporated into the finally published version.<sup>38</sup> 1971 suffered from poor rainfall, which affected agricultural crops adversely. Furthermore, the change in direction, with higher stress on consumers' goods—and the plan was changed in January 1971 to increase further the share of consumers' goods—required the transfer of resources, which was apparently accompanied by friction and losses unforeseen by planners. These two came on top of the bottlenecks created in 1969/70. The shift in policy can be seen in Table 2 in the greater planned increase in retail sales than in investment, and in NMP planned to rise faster than both. Foreign trade did not develop as planned: imports were supposed to remain constant, but increased, exports—to grow much more than they did. The result was a trade deficit with the west only slightly smaller than in 1970 (Table 13).

With 1972 started the run of three good years. The average reported annual rate of growth of NMP in these years was 5.9 percent, quite a remarkable rate, as will be argued in section B. In 1972 and 1974 the weather was favorable, which led to high agricultural output; and no exceptional attempts were made to keep the trade deficit from mounting. With the worst overcome and the realignment of output in favor of a higher growth of consumption goods sectors completed, the additional degree of freedom granted by the decision to borrow abroad may have provided the inflexible GDR system with easier growth possibilities. Another factor that may have helped was the resort to extensive overtime work.<sup>39</sup> It should be noticed that retail supplies kept pace with the increase in money incomes: when overtime was used to overfulfill plans, care was taken to increase the availability of goods as well as income and money.<sup>40</sup>

Consumption, or retail sales, did not only grow above the annual plan levels; these latter were already higher than the long term targets (Table 2). With fixed investments the opposite was the case: except for 1971 and 1972, when investments were to decline or grow slowly and the targets were in actuality surpassed, targets were

<sup>37</sup> This section draws heavily on P. Mitzscherling (DIW-WB, 5-6/72, 5/73 and 4/74); and on D. Cornelsen (DIW-WB, 6/75 and 5/76).

<sup>38</sup> See footnote 18.

<sup>39</sup> The substantial difference between planned and actual disposable money income in 1972 and 1974 (and also in 1971) may have been partly caused by overtime. Cf. DIW-WB 5/73, 4/74, and 6/75.

<sup>40</sup> Cf. Portes (1974 and 1976). See also B below: it is quite likely that the increased volume of retail sales hides some price changes.

<sup>2</sup> Signifies poor weather conditions (weather conditions in 1973 were mixed).

<sup>3</sup> Annual plans, various years.

<sup>4</sup> Fiscal year plan target 1976-80 (1976).

<sup>5</sup> Target was raised in January 1971. Produziertes Nationaleinkommen, Statistical Yearbook, 1976,

p. 13.

<sup>6</sup> Industrielle Warenproduktion, plan fulfillment reports, various years.

<sup>7</sup> Arbeitsproduktivität in der Industrie (ministerially directed industry only); plan fulfillment reports (preliminary figures on Warenproduktion per employee, the units in which plan data are stated; final data exist for Bruttoproduktion per employee only, and are invariably lower: 4.9, 4.2 5.7, 6.0, 5.3 for 1971-75).

<sup>8</sup> Investitionen, Statistical Yearbook 1976, p. 41.

<sup>9</sup> Einzelhandel Umsatz, Statistical Yearbook, 1976, p. 251.

<sup>10</sup> Nettogeldeinnahmen der Beilkerung, Statistical Yearbook 1976, p. 310.

sharply increased in the latter annual plans and, in turn, were underfulfilled. Thus when the leadership felt that there were signs that the economy had in it a greater growth potential than expected, resources were to be diverted into investments; but such shifts are not easy to accomplish within a short period of time.

Another shift in policy, which can be seen in the planned utilization of output, is in the planned increase of the import surplus in 1973 and 1974. In the former, retail sales and investments were to rise faster than NMP, and in the latter at about the same rate. As a result the trade deficit with the West rose to over \$800M in 1973 (Table 13).

1974 was the last of the good years. It was also the first to follow the drastic increases of oil and other raw material prices during and following the last quarter of 1973 (which was not envisaged when the 1974 plan was being drafted and not taken seriously into consideration when it was enacted). As it turned out, 1974 was the year of fastest growth since the 1950's and a year in which the trade deficit with the West mounted again, rising to nearly \$900M. In addition, the GDR had her first ever deficit, one of over \$150 million, with the developing countries.<sup>41</sup> Rough calculations show that in real terms nonsocialist imports rose by only 3 percent above the 1973 level, and exports increased by some 13 percent; but the overall real volume of imports and exports increased at about the same rate of over 8 percent. Thus the attempts at rectifying the deficit were not pursued with too much zeal in 1974; the aim may have been not to disrupt the impressive record of the 25th year of the GDR.

The change in directions and fortunes came in 1975. The pressures which were to mold the 1976-80 FYP were already felt (see B below) and the need for new capacities to increase exports led to some priority to investments, not in the published plan but in the implement version. The amount of overtime was apparently reduced to allow the consumption goods output to be cut (DIW-WB 5/76), and this, joined by a dry summer and possibly the attempt to change the structure of output in favor of investments goods led to the underfulfillment of the NMP target. Though industrial production increased as planned, the internal use of resources had to be cut: the real volume of exports grew by more than imports (7.8 against 5.0 percent—Statistical Yearbook, 1976, p. 264)—which did not save the deficit from growing even further. Both investment and retail sales fell below the target, but retail sales took the brunt of the decline (with disposable money income also rising below plan, but by a lesser amount).

## B. THE ECONOMY BETWEEN THE PLANS: THE ENVIRONMENT OF 1975/76

### I. *The Outcome of the 1971-76 FYP*

#### OVERALL GROWTH

Table 3 presents several alternative measures of total GDR products since 1965. In column 1 is the official produced national income or net material product (NMP) series, in constant 1967 Marks.<sup>41a</sup>

<sup>41</sup> Due mainly to higher prices and volume of oil—much of it in trade with Iraq (Statistical Yearbook, 1976, p. 272).

<sup>41a</sup> Mark is the current name of the GDR currency. It differs from the Valuta Mark (VM), the unit used in foreign trade statistics. The FRG currency is referred to by its initials, DM.

The other series are western recomputations of total product: column 2 is the West Berlin based German Institute of Economic Research (DIW) gross domestic product (GDP) series, also in 1967 Marks; column 3 is the GNP series in U.S. Dollars, constructed by the CIA, and column 4—a similar series, an index, by Alton et al.

<sup>1</sup> Produziertes Nationaleinkommen, Statistical Yearbook, 1976, p. 13.

<sup>2</sup> Bruttosozialprodukt, Wilkens, 1976.

<sup>3</sup> CIA, 1976.

<sup>4</sup> Alton, 1976. Corrected information supplied Mar. 3, 1977.

<sup>δ</sup> Estimated according to past deviation of GDP from NMP. Mean deviation-average absolute deviation of actual from mean rate of growth, normalized by the average rate of growth

$$MD = \frac{1}{\bar{g}} \sum_{t=1}^5 |g_t - \bar{g}|$$

where  $g_t$  is rate of growth in period  $t$ , and  $\bar{g}$  the average rate of growth over the fiscal year plan.

Note: NA—not available.

Two distinct questions can be asked about total product growth: first, how does the GDR leadership view the outcome of economic activity over the FYP? The second is, what are the level and rate of growth of total product that we should use for comparisons with other countries or over time? In the first case it is obviously the GDR statistical series we should use, while in the second we should examine all available series for what they can offer. Both questions are of interest, but the second will be taken up first.

*Rate of growth of product.*—The average annual growth rate of total product varies between 4.8 and 5.4 percent over the five-year span for three of the series, 3.5 percent for the Alton series. The differences between all \* \* \* series but the latter are thus immaterial. The annual rate of growth common to the three series, which amounts to some 5 percent per capita \* \* \* since there has been no significant change in population (or labor force), is respectable by any standard of comparison. Furthermore, all \* \* \* series show a higher rate of growth in the first half of the 1970's than in the second half of the 1960's, i.e., the highly centralized later period has an edge, if only a

narrow one, over the reform period of the sixties in total growth (though not in total factor productivity growth—see Table 8). By all these measures performance during 1971–75 has been very satisfactory. There is, however, one major defect with all GDR and other socialist aggregate countries' statistics which affect all three series and which may lead us to conclude that all series overstate performance during the '70s. The (well known) problem lies with the poor separation between quantity and price changes in statistics, due to a lack of separation of power between statisticians and the management hierarchy. A price creep is introduced whenever a new product is added in production and its constant price used in output statistics is fixed at a level that is too high relatively to the older products. There is ample evidence that the practice exists, in general, and in the GDR too.<sup>42</sup>

There is, however, reason to believe that there has been an acceleration of hidden price changes in the '70s. First, there is a theoretical point: the incentives to producers to try to raise the value of their output (and profits) depends critically on the basis on which their performance is evaluated and rewarded. If plans were, indeed, slack before 1969, and if there was no incentive to overfulfill such targets as profits, as is ably argued by Granick, and if, in addition, the main rewards were tied to physical tasks such as the introduction of some new technology or the timely implementation of contracts, whose fulfillment would not be affected by price changes,<sup>43</sup> there would be less of an incentive to raise prices by introducing sham new products in the pre-1969 period than later on. With greater tautness, i.e., greater difficulty of fulfilling the basic total output and profits targets, and with a stronger weight attached in the bonus regulations to these indicators (cf. section A), the incentives are much stronger. Evidence for greater tautness during the '70s then up to 1969 is contained in Appendix A.

Furthermore, the highest echelons in the state and party apparatus have an interest in plan fulfillment. Thus at times of hard to fulfill plans their policing of hidden price rises is only half-hearted. It will be seen below that there is evidence that some hidden price rises were planned from above, so to say. And lastly, import prices were much more stable in the '60s.

None of the three series is unaffected by these hidden price rises. The GDR series, because there is no independent statistical check on prices, once a product has been approved as new by the production hierarchy. The DIW series, because it is based in its entirety on GDR official fixed price data (though they have tried to introduce a correction for price changes—see below). The CIA series, which apparently is based on GDR quantitative data, is least affected: in fact, it may have a downward bias, because of the delay in adding new commodities to the list, even though the initial selection may be biased by the inclusion of fast growers. The physical series, however, include some value series for machinery and other heterogeneous commodities, and these are the very industries that are usually the main offenders. The only series whose overall rate of growth is substantially lower than that of the official series is the Alton series.

<sup>42</sup> Cf. (Bornstein, 1976), and bibliography in fn. 12 in that paper. For the GDR see DIW-WB No. 5-6/72 p. 48 and No. 12/76, p. 113; Frankfurter Allgemeiner Zeitung, 20 Jan. 1975.)

<sup>43</sup> Cf. Granick (1975), p. 199 ff.

But this series too, in its later version (given in the Table) shows higher growth in the later period. Unfortunately this series cannot serve as an independent check, because their original figures for the 1970's for the most important sector of industry were rejected by Alton, and new figures based on GDR data substituted. Hopefully a future reworking of this series will furnish new data.<sup>44</sup>

There is some indirect evidence on these price changes. But first—why did price rises have to be hidden? On November 19, 1971 there appeared a communique from the Politbureau and the Council of Ministers entitled "Measures for the Stability of Consumers' Prices." It promised that (1) during the 1971-75 FYP there must be no increases of consumers' goods prices; (2) that the plan has to assure the supply of the population with goods in the low and middle price groups; (3) it names various ministers and the Workers and Peasants-Inspectorate to police the enforcement of prices and price fixing regulations; (4) it issues a strict warning against enterprises fixing prices which counter the law, or trying price manipulations (ND, November 19, 1971, p. 1). Were these measures an attempt to calm the populace by telling them that price rises will be stopped (perhaps a belated effect of the Polish riots of the previous year)? Or was it, as Granick suggests, just a way of telling enterprises that changing the bill of goods to raise profits was against the rules of the new game? (Granick, 1975, p. 224). Whatever the initial cause, the very clear provisions of the communique tied the hands of the government: it was not that average prices were to be held, but that no prices were to be raised. Thus if any consumers' prices had to be raised, the rise had to be hidden.

There are two indirect bodies of evidence on price rises. New budgetary material for the previous 3 years hints that at some times at least a substantial part of increased consumers sales was due to higher prices rather than to higher quantities. Table 4, which extends a table constructed by Vortmann and Ruban (DIW-WB 45/76) and based on their approach, tells the story. Budget fulfilment reports which provide a breakdown of taxes and subsidies make possible the calculation of retail sales to consumers at producers' prices. This is based on the assumption that the turnover tax is now largely levied on consumers' goods.<sup>45</sup> When we look at the rate of change of sales at retail and producers' prices, we find the following: for foodstuffs sales at enterprise prices increased by about 0.5 percent faster than retail sales. Since prices of a relatively fixed basket of foodstuffs are not so easy to change surreptitiously, the real volume must correspond to sales at retail prices, and higher enterprise prices must indicate rising costs which led to high subsidies. Now, these higher costs were as likely to afflict the production of industrial goods, though technical progress should be faster here. However, here we find that for these goods sales at producers' prices rose less, in 1975 much less, than retail sales. The implication is that the volume of sales is better represented by sales at producers' prices, and the difference in the two rates represents price rises, most likely by the introduction of

<sup>44</sup> See Alton et al., 1976, p. 21 for calculation and explanation.

<sup>45</sup> Produktionsgebundene Abgabe. Since the price reform of 1964-67 and the reform of enterprise taxation which introduced a uniform 6 percent capital and a differentiated profits tax which syphons off any remaining profits not designed for any of the enterprise funds, there has been no reason for maintaining any turnover taxes on producers' goods. But see discussion below.

TABLE 4.—RETAIL SALES AT CONSUMERS' AND PRODUCERS' PRICES,<sup>1</sup> 1973-74

I. BILLION MARK (CURRENT PRICES)				
	1973	1974	1975	
Total retail sales.....	74.6	79.2	81.9	
Subsidies to foodstuffs and industrial goods.....	+7.4	+7.9	+8.4	
Turnover taxes.....	-25.8	-27.9	-30.3

new, higher priced goods.<sup>46</sup> The objection might be that high increases in productivity can also be taken up by increases in turnover taxes. To this there are two replies. One is that the net profits tax can do this just as well, and in all decrees it is indeed this tax which should change in response to cost changes. The receipts of this tax did indeed rise sharply, but there are no indications that there has been a wide-scale reduction of enterprise prices. The other is the size of the increase in these tax receipts, faster than is justified by increases in productivity during a year when the trend of increasing raw material prices has been accelerating sharply.

The additional body of evidence is from the periodic purchasing power studies of the GDR Mark, which are performed from time to time by the Berlin DIW. Collated with information on price movements in the FRG, these purchasing power parities provide an implicit GDR price index with FRG weights.<sup>47</sup> Now, this is not the true price index which we are after, but it does indicate that prices were not as fixed as implied by the official price index, as well as the NMP consumption price deflator. Table 5 brings the relevant information: whereas the official cost of living index shows hardly a change, the FRG weighted one shows slight change. This may indicate that prices of some goods, particularly those whose weight is higher in the

<sup>46</sup> It is interesting that in the list of retail prices reported in the Statistisches Jahrbuch der DDR 1975, the only price changes since 1970 are in 13 out of 24 industrial goods and in an alcoholic beverage. In all the 5 cases of price increases, there is a claim of a change or an improvement in the product; the alcohol is the only exception. For only one of the eight commodities whose prices have been reduced does such an explanation appear (p. 303).

<sup>47</sup> See Appendix B.

higher consumption FRG basket, which may therefore represent higher income households, have increased in price. It may be thought that this price creep is not shown in the consumers' price index because of the narrow coverage of that index. That this is not so is shown by a comparison between the consumers' price index and a domestically used NMP deflator for retail sales available for those years when the latter index was reported both in fixed and current prices: as can be seen, this index, too, shows fixity for the 1960-1967 period, though prices then should show some change (Table 6).

Now the implied price changes are really negligible when compared to price changes in the West. But they do give some indication that the growth rate of all series based on the official product series, and, as claimed above, all series depend on it in part, exaggerate the growth of GDR output. Table 7 is based on a recent DIW study comparing GDR and FRG national incomes. It presents GDR GDP under two assumptions: one, that prices did not rise, as claimed in GDR indices; second, that prices of consumers' goods increased annually on the average by 1.5 per cent and investment goods by 2.5 per cent.<sup>47a</sup> The latter they consider to be the most extreme view tenable of GDR price changes and the GNP estimate for 1974 associated with it is, consequently, the smallest one compared to 1967. This:

<sup>47a</sup> (Wilkens, 1976a, p. 113n). Support for the assumption of unrecorded price rises for investment goods can be found in (WW, 7/75, p. 1005, which lists results of, appropriately, surveys that show investment price rises for, apparently typical, basic chemical installations of some 3.5 percent annually, and a range of between a 4 percent annual decline and a 14 percent increase.

TABLE 7.—GDR GDP AT FIXED 1967 PRICES, 1967 AND 1974 (MARK, IN BILLION)

	1967	1974	
		Variant A <sup>1</sup>	Variant B <sup>2</sup>
Sector of origin:			
Agriculture and forestry.....	13.7	15.6	15.1
Industry and construction.....	71.6	108.4	94.4

Annual rate of growth (percent).....		5.3	3.7

<sup>1</sup> Assumes no hidden price rises.

<sup>2</sup> Assumes the following price rises: In agricultural and forestry products, 0.5 percent; industry and construction, 2 percent; trade and transport, 1.5 percent per annum on the average.

<sup>3</sup> Unallocated subsidies and capital repairs.

Sources: Wilkens 1976b, p. 160. Assumptions of price changes: Wilkens 1976a, p. 113.

estimate implies an average annual growth of GNP—that of NMP would be very similar—of 3.5 per cent instead of 5.3 per cent. The truth, they seem to imply, is somewhat nearer the official figure, say 4.5 per cent between 1967 and 1973, which is still quite respectable.

This does not yet provide us with a comparison between price rises in NES times and in the 1970's. The data in Table 5 indicate a higher rise in the '70s than in the '60s, but the '60s include both NES and pre-NES years. However, the calculations based on pensioners' baskets even show a decline in prices between 1966 and 1969. Further evidence can be gleaned from the purchasing power estimates for wage earners' families at the beginning of 1966 which used only GDR weights. There is little theoretical justification for using them in the fashion outlined in Appendix B. If we disregard theory and do, nonetheless, use the estimates we find the following: a price rise of 1.2–1.6 per cent in 1960–1966; stable prices in 1966 to 1969; price rises of 1.3 to 1.5 per cent between 1969 and 1973—all at annual rates. This may be an indication that prices during the main part of NES were indeed stable, and that the rises and overstatement of growth does indeed belong mainly to pre- and post-NES years. One should, however, bear in mind all the caveats: first comes the theoretical one, i.e., there is a question of what exactly these implied indices represent. Next, the statistical accuracy of the purchasing power parity estimates themselves: we have no data on the accuracy of the estimates, and a shift, e.g., raising to 1.10 the 1969 estimate for pensioners, could change the ranking of price changes in the two periods.

The final estimates of the growth of NMP are presented in Table 8. In addition to official data and those based on the low estimate of Wilkens (Table 7), there are compromise estimates. The latter assume that total price changes were in between the official no change and the 11.4 percent between 1967 and 1974 which is Wilkens' extreme estimate, but limits the change to the period starting in 1969. This provides us with a 0.9 percent unrecorded price rise, by which all growth data from 1969 on were deflated. The resulting rate of growth is 4.9 percent p.a. for 1965–70, 4.5 percent p.a. for 1970–71, i.e., a slight deceleration in the post-NES era. The growth rates of GDP would be lower by 1–2 tenths of one percent.

TABLE 8.—GROWTH OF OUTPUT, INPUTS, AND FACTOR PRODUCTIVITY, 1965-70, 1970-75

	[Annual averages, percent]				
	NMP	Labor	Capital	Factor productivity	
				$\alpha=0.3$	$\alpha=0.5$

Low estimate.....	3.8	.06	5.8	2.1	.9
Compromise.....	4.5	.06	5.8	2.8	1.6

Sources: NMP: official figures—see table 3. All other figures based on table 7, which implies, according to variant B, a price creep of 1.5 percent per annum. The low estimate deducts this percentage from the annual growth figures of 1970-75. The compromise figure assumes an average real growth of 4.5 percent per annum, but divides the implied price rise over only 6 of the 7 years, 1968 to 1974, which implies a price rise of 0.9 percent per annum. This price rise has been imputed for the years 1969-75, and the growth rate for these years has been correspondingly reduced. The results of this are given in the lines entitled "corrected figures" for 1965-70, "compromise" for 1970-75. Labor: Statistical Yearbook, 1976, p. 15; Labor in productive branches. Capital: Statistical Yearbook, 1976, p. 4; Capital in productive branches. Factor productivity: Rate of growth of NMP minus rate of growth of labor times  $(1-\alpha)$  minus rate of growth of capital times  $\alpha$ , where  $\alpha$  is the capital elasticity of NMP.

It should be remembered that this rate of growth of output was attained with hardly any growth of labor inputs: total employment, which is now around the 8 million mark, increased by under  $\frac{1}{2}$  percent during 1971-75, by under  $\frac{1}{4}$  percent during the previous FYP. Employment in the productive sphere did not change in any perceptible manner (Statistical Yearbook 1976, p. 15). Capital stock grew by 4.3 percent annually in the economy at large, by 5.8 percent annually in the productive branches, as against 3.5 and 4.9 percent between 1965 and 1970 (Statistical Yearbook 1976, p. 14). Attempts at the estimation of the rise in factor productivity under the various assumptions are presented in Table 8. Since we have no information on the share of labor and capital in output, two different assumptions on the capital elasticity of GDR NMP were tried, 30 and 50 percent. Under the former, which should be nearer the truth, total factor productivity rose by nearly 3 percent per annum in the 'seventies, by nearly 3.5 percent in the late 'sixties. Official NMP figures would put the rates closer together and nearer 4 percent. The same calculations cannot be made for GDP, since the DIW series does not extend to 1975. A rough estimate by analogy with past years of the 1975 GDP, would make for a growth of factor productivity, assuming official estimates of price stability and a 0.3 capital elasticity, of 3.6 percent, i.e., nearly identical with the growth of factor productivity in the productive sphere. Under all other assumptions regarding price changes results would also be almost identical with those for NMP. With the higher capital elasticity factor productivity in the economy at large would show a slightly faster rate of growth.

All this, however, is not really relevant for the examination of the outcome through the eyes of the GDR leadership. For them the only relevant measure of growth is the official NMP series, and though they may be aware of unrecorded price rises it is unlikely that they have ever quantified them and are clearly aware of the relation between them and the product series.

Bare growth data are not all: were the FYP targets fulfilled? Table 9 presents some of the relevant data. Resources available to the economy, viewed either as NMP or industrial output, increased

by more than the plan prescribed; in the previous 66/70 plan they were closer to the minimum targets. On the utilization side we find significant overfulfilment of both retail sales targets and investment, i.e., of both major local absorption items, by more than the NMP target was overfulfilled. On public consumption and inventory investment targets we have no information, but even gross underfulfilment of these—which is unlikely—would not have saved total local uses from having been in excess of plans by a wider margin than NMP. What gave way was the export surplus: the original plan envisaged exports to rise much faster than imports to regain equilibrium of foreign payments. The real volume of exports did indeed rise faster than imports (55 as against just over 40 percent): there may have been sufficient reserves in the plan for this surplus to have sufficed, had there not been the radical deterioration in the terms of trade. In the event this deterioration meant that the balance of payments at the end of the period was worse than at its beginning. These issues are more fully discussed below.

## II. Developments on the Foreign Economic Front

### THE STRUCTURE OF FOREIGN TRADE

Table 10 summarizes the data which have been reconstructed on the structure of foreign trade by major currency area.<sup>48</sup> The third part of the Table highlights the basic constancy of flows of trade. As is well known, machinery is the principal export of the GDR. The balances in Part I of the Table show that the GDR has a machinery export surplus with both CMEA and the less developed countries—both non-CMEA socialist countries and the developing countries of Asia, Africa, and Latin America. As for OECD countries—here GDR is a

<sup>48</sup> The data come from the data bank compiled by Jan Vanous as part of his CMEA Fortram research project into the foreign trade of STE. To my knowledge no comparable data are available from other sources.

net importer of machinery. The GDR is a net importer of primary products—raw materials and food—with all currency areas. It is a net exporter of manufactured consumers' goods, again to all currency areas. There have also been some changes:

**CMEA.**—The structure of exports has not changed much, though the share of machinery has risen somewhat, and the share of consumers goods exports has declined since 1970. The rise in primaries in 1975, after a long fall, is due to higher prices that year. As for imports—here there is a substantial rise in machinery, reversed in 1975 only because of the sharp rise in primaries' prices, a decline in primaries (volume-wise only in 1975), and stability (or slow increase) in consumers' goods. One gets the impression that since the GDR was not able to

repay with primary exports its primary imports, it had to agree to import increasing amounts of "soft" goods, machinery and consumers' goods: its net exports of these items to CMEA countries have stayed stable or even declined somewhat till 1973. It is possible that CMEA cooperation machinery was used to implement this exchange. This trend was reversed in 1974.

*The West.*—In both exports and imports there is a decline in the volume-share of primaries and an increase in machinery, over time, marked in 1975 by the rise in the relative price of the former in terms of the latter. The share of consumers' goods in imports has been increasing until 1974, while in exports it has been steady. The break in policy in 1975, discussed in the following section, can be seen in the shift to higher exports and lower imports of consumers' goods, an increase in both exports and imports of machinery: this is a reflection of the renewed accent on investment rather than consumption in the use of resources.

The next section argues that consumers' goods are apparently slated to be especially prominent in the growth of exports to the West, so that the spurt in machinery exports in 1975 to the West—and data here are based on preliminary information—may represent the export of some machinery previously prepared to be installed at home. Some of the background to the plans for the 76–80 FYP can be seen in Table 11, which analyzes the development of machinery exports for those years for which we have information. The "structure determining" phase put the stress on electronics rather than on the more traditional sectors of engineering. We see, indeed, that the output of electronics and electrotechnical industries grew faster than any other industry during 1970–75, though much slower than planned (Table 17). Output grew much faster than that of engineering industries. The experience with exports was different: exports of electronic and electrical equipment grew less than those of other engineering industries, while the traditional engineering exports grew fastest. This is particularly true for exports to CMEA countries, where electric and electronic exports grew at half the rate of the traditional engineering export industries. Exports to the West grew faster but the West is a much smaller market for engineering products. Furthermore, consumers' goods exports, or to be more precise, exports of light traditional engineering products, grew at about the same rate as those of advanced electronic equipment (classified under the "other electronic products" heading). And again, CMEA countries bought a smaller share of the latter and increased their purchases by a lower rate than those of the more traditional goods. Might it be that the CMEA partners did not want the East German electronic equipment, and preferred to take their heavy machinery from their more advanced comrades? And that for advanced equipment they preferred suppliers farther to the West? This hypothesis would mean that the change in development policy (see below) was imposed by the unwillingness of other CMEA members to let the GDR preempt for itself the fastest growing industries. The facts cited above give some support to this: it seems that it was not shortage of supply which held down growth in electronics, because exports to the West grew. As for supply—until 1972 electronics plans were underfulfilled. In 1972 they were overfulfilled, but in later years the sights were reduced and lower targets were fixed for this industry.

## THE FOREIGN TRADE CONSTRAINT

The little official information published on the terms of trade of the GDR is summarized in Table 12. The data are highly aggregated, and terms of trade by trading area and by commodity can be inferred only indirectly, by comparison with other countries' data.

TABLE 12.—GDR FOREIGN TRADE: INDICES OF VALUE, QUANTUM, PRICE, AND TERMS OF TRADE, 1970-75

Key to symbols: V—value in VM at current prices; Q—value at constant prices; P—implicit price deflator. Terms of trade: the quotient of export and import price deflators.

Sources: Statistical Yearbook 1976; Q-p. 264; V-p. 265; P=V÷Q.

Three facts do, however, stand out. First, the price level of trade in general and of exports and imports was stable from 1970 to 1972. During 1973 there was a sharp price rise in trade with the West, which affected prices of both exports and imports and continued with double strength into 1974. And last, in 1974 prices started rising in trade with CMEA and the other socialist countries, and this rise accelerated during 1975. What we know of the new pricing agreements in CMEA assures us that this climb will continue until at least 1979, mirroring the earlier rises in the capitalist price level.

Any attempts to divide price rises between trade with socialist and non-socialist countries is highly conjectural and should be accepted for the guess it is. Estimates by Jan Vanous show terms of trade with the non-socialist world deteriorated by some 10 percent in 1973, with import prices rising nearly 20 percent, export prices by close to 10 percent. In 1974 there was a further deterioration in trade with the West by some 9 percent, with import prices rising to nearly 160, export prices to over 130. Deterioration continued in 1975 to altogether 20 percent below the 1970 level. Terms of trade with socialist countries deteriorated by some 9 percent till 1974, by another 6 percent on 1975, altogether by 10 percent, with prices of imports rising to nearly 130, those of exports to 115.

A rough shot can be made at the real loss suffered by the GDR as a consequence of these changes in the terms of trade. Since all information on trade we have is regarding commodity exports and imports, it would be proper to calculate the weight of exports and imports in NMP rather than GNP (or GDP). There is information that the effective exchange rate between 1963 and 1967 was 1.5M to a Valuta Mark (VM) (Nattland, 1972, Mitzseherling et al., 1974, p. 271). Since all information we have on the GDR is at 1967 prices, we can use the fixed price data to calculate the share of exports and imports in NMP at 1967 prices. In 1970 exports were just over 19b VM, i.e., some 29b M, imports over 20bVM, or 30.5b M. NMP was 109b M (Table 3), which makes exports 27 and imports 28 percent of NMP. By 1975 exports at constant prices rose 50 percent to about 44b M in 1967 Marks, imports 43 percent to the same real level. At 1967 prices NMP rose to 142b M, so that the share of exports and imports was about 31 percent each. Without any change in relative prices exports would have equalled imports and trade would have been balanced. Import prices have, however, risen by 36 percent since 1970, those of exports only by 18 percent; hence, to balance imports quantity-wise, exports would have to rise by another 15 percent.<sup>49</sup> These 15 percent of exports are nearly 5 percent of NMP, nearly 4 percent of GNP: this is the degree of damage done to the GDR economy by the deteriorating terms of trade. Without any other changes in the price level on western markets we know that prices on CMEA markets are going to adjust to the present western prices by the end of the decade. Assuming that the total deterioration in terms of trade will amount to 20 percent,<sup>50</sup> the damage by 1980

<sup>49</sup> 15.7, to be more precise:  $136.3 \div 117.8 = 1.157$ . This number will be recognized as the reciprocal of the terms of trade figure for 1975: see Table 12.

<sup>50</sup> An examination of the breakdown of volume and price indices in trade with non-socialist and socialist countries for various commodity categories gives few clues to future price developments: through future CMEA prices are to be based on today's prices in trade with the west, the composition of trade with the two groups varies too much for the totals to bear sufficient information. However, one item that is highly likely to increase substantially in price is Soviet oil. Assuming that this will raise prices of raw material imports by another 33 percent by 1980, we get a deterioration of terms of trade with the socialist countries to 77 (1970=100), below the non-socialist level for 1975 (which is estimated at 79).

will be over 6 percent of NMP if the ratio of imports in NMP does not change. In the past foreign trade increased at a rate 60 percent faster than NMP.<sup>51</sup> If this continues into the future, and NMP rises 2 percent, the planned level for 1980, imports should rise by over 40 percent to some 35 percent of NMP, and the damage in terms of growth of exports will amount to 7 percent of the 1980 NMP. This is how much of the 1980 NMP will have to be diverted from domestic absorption just to account for the deterioration of the terms of trade.

These losses from the price rises of imports are much higher than those for most other. This is because the GDR's foreign trade may be more complementary in nature than that of other STE. Compared to other CMEA countries the GDR has fewer raw materials to exchange for imported raw materials. In fact, it has in general a very narrow and dwindling raw materials base.

The calculations above give a rough guide of the losses suffered through changes in the terms of trade. They do not give the whole picture of the pressures foreign trade will exert on the economy. This is because balancing accounts in 1980 is not sufficient: there are debts which financed past deficits. What are GDR plans with regard to these debts? Are they to be refinanced? To be increased, or to be slowly repaid? On this we have no official statement. Let us assume that the GDR leadership wants these debts to remain at their present level in 1980, and that only additional deficits amassed during the first two years of the present FYP are to be repaid during the final two years.

In this rough calculation Table 13 may be of help. Only two of the currency blocks need concern us in this calculation, the West and CMEA. It will be seen that the problem is relevant for trade with the West alone. Since the increase in debt (1976 entry in lines 6 or 7 minus 1970 entry in line 5) is about equal to the deficit it seems that in the past interest payments were covered by invisible credit items,<sup>51a</sup> and we may assume the same will happen to the larger future interest payments. Thus all we have to take account of is the annual deficit of 840m SDR, which by assumption is to decline linearly to zero by 1978, with the additional debt of 840m SDR (1976: 560m and 1977: 280m SDR) being repaid in 1979 (one third) and 1980 (two thirds). This adds exports of 560m SDR, or roughly 3.5b Marks of 1967, i.e., another two percent of 1980 NMP.

The GDR had a surplus of over 1.2b SDR with CMEA over the five years 1971-75. This positive balance is, however, misleading and for two reasons. First is the services balance: since most trade with the USSR goes via Poland, there is a fairly substantial negative transportation item which has to be settled with this eastern neighbor. It is possible that tourism from that country, which has increased in the past, has also added a net positive item, but on the whole the positive trade balance of nearly 0.5b SDR with Poland can be assumed to finance a negative services balance. The second is GDR participation in joint investment projects in other CMEA territories, mainly in energy and raw material projects in the USSR. This participation, which is in the nature of a long term loan, amounted to 3.2b Marks

<sup>51</sup> NMP elasticity of foreign trade was about 1.6 (Keren, 1976).

<sup>51a</sup> Fairly substantial transfers are made annually by the FRG: See S. Kupper, H. Lambrecht and G. Ollig, *Handelspartner DDR—Innerdeutsche Wirtschaftsbeziehungen*, Baden-Baden: Nomos Verlag, 1975, pp. 328ff.

<sup>1</sup> Cumulative 1970-75, or balance beginning 1976.<sup>2</sup> Sum of trade balance, 1970-75.<sup>3</sup> Net indebtedness equals gross indebtedness minus foreign exchange deposits in Western banks.

in the past FYP, and is planned to rise to 8b Marks in the coming FYP. To convert the 3.2b Mark into SDR, we may observe that export prices of GDR exports to the USSR have increased by roughly 10 percent by 1974 (Kohn, 1976): assuming that on the average they were 5 percent above the 1967 level, we can increase the VM/M rate by a like proportion to 0.7. Thus we arrive at 530m SDR: this more or less wipes out the surplus on the balance of trade with CMEA.

If we transform the planned participation of 8b Mark over the 1976-80 FYP to annual rates, assuming a fixed proportion of NMP over the years, the 1980 rate would amount to about 2b Mark, over 1 percent of the NMP planned for 1980. Summing up all the required increases in exports, 7 percent to balance trade at the worsened terms of trade, 2 percent to keep the deficit at the present level and 1 percent for investments in CMEA projects, altogether 10 percent of 1980 NMP will be used up by increased exports. Any smaller room for increasing the exports surplus means an increase in indebtedness; any larger share, a reduction of indebtedness over the level at the beginning of 1976.<sup>52</sup>

### III. The Structure of Economic Activity

A growing share of industry, a declining share of agriculture, and a nearly constant share of "productive services" (Table 14)<sup>53</sup> characterize structural changes over time. Construction had its share increase rapidly during the '60s, and decline somewhat during the 1970's: here the faster increase in residential construction was balanced

<sup>52</sup> The level of indebtedness to the West at the end of 1976 was higher by \$1b than the figure given in Table 13 for the beginning of the year, i.e. almost double the increase assumed above.<sup>53</sup> i.e., those included in NMP.

Source: Statistical Yearbook 1976, p. 36.

by a slower increase in investments, which trailed slightly behind the growth of NMP. The share of agriculture has been on a continuous decline.

As for inputs—here the picture is slightly more complex: the share of capital in industry has been increasing constantly (Table 15), while the share of employment in industry has been stable (Table 16). Construction has increased its share of both capital and labor, rapidly in the '60s, more slowly in the latest quinquennial. Agriculture has been losing labor rapidly—at a rate of 2 or even 3 percent annually, and substituting capital for it. The service branches, non-productive, and also productive and non-productive together, have been gaining labor, but losing their share of capital: productive services on their own have been maintaining or even slightly increasing their share of both factors.

A look at the structure of industry gives a better indication of the policy choice. The classification of industry in all tables (Tables 15, 17, 18) has been into basic industry, which includes all extractive branches as well as electric energy; chemicals and electrical engineering—the main beneficiaries of the structural drive; other engineering branches—the traditional foci of relative advantage; light and food industries—consumers' goods producers, and building materials. Now, the share of basic industry in output (Table 14) has been falling, though its share in both capital (Table 15) and employment (Table 18) has been nearly constant. This seems to be a reflection of the gradual exhaustion of natural resources in the GDR. The share of chemicals and electrical engineering has been increasing in output, capital (since the mid-60's), and employment, and other engineering branches have held a nearly constant share of output and factors since 1965—their slight increase in weight occurred mainly before that date: the relative position of the new vs. old growth foci characterizes the main conception of development policy during the latter part of NES, whose

Sources: Statistical Yearbook 1976, p. 107, idem., 1975, pp. 128, 112, 127, 109. Employment series in industry by the post 1969 classification of industry were extrapolated backward by means of indexes of gross output and productivity, using the 1974 employment structure as an anchor. The sum of the resulting series declines in the past less than other employment series, throwing some doubt on its use as a guide to the actual numbers employed. It is hoped that the structure of employment in it may still be fairly reliable.

reversal may be in store for the coming FYP. The share of consumers' goods branches has been declining, though this decline has been slowing down: during the last FYP capital share in these branches has been declining by less than before, and, as a result, the decline of the share of output has also been slower. Here we see the result of the greater stress on consumption in that plan. The development of building materials mirrors that of the construction industry.

### C. THE 1976-80 PLAN

This section is divided into several subsections. The first discusses the overall growth target, given the expected growth of resources. The next, the structure of resource use—consumption, investment, and foreign trade. The third, the industrial composition of output. The information gleaned from the fulfillment report on the first year of the FYP, 1976, (ND, 22-23 Jan. 1977) will be used in all of these. The final section discusses the expected evolution of the system and the likelihood (or lack of it) of reforms.

### I. Growth Targets and Their Feasibility

The FYP for 1976-80 was promulgated in mid-December, 1976 (ND, 17 Dec. 1976). The NMP growth target, as stated in the published plan (FYP 76-80, 1976) was put at 27.9 percent, in the lower end of the range of 27 to 30 given by the draft FYP Directives (1976) (see Table 9). Industrial output was to rise by 34 percent, coinciding with the lower end of the directives' range of 34 to 36 percent.<sup>54</sup> Are these targets attainable? A first stab at an answer to these questions will be based on the analysis of the experience in the '71-75 FYP (section B.I, above).

Growth of inputs: Stoph, the Chairman of the Council of Ministers, in his presentation of the FYP to the People's Chamber (ND, 16 Dec. 1976, p. 4) mentions an increase of 350,000 in employment. The Plan Directives (1976, p. 23) give a somewhat lower listing of additional employment of 300,000,<sup>55</sup> and this is also the estimate of the Berlin DIW (WB 23/76, 10 June 1976): though total population is to decline to just over 16.5 million, from the 16.8 million level at the end of 1975,<sup>56</sup> the number of those in working age should increase by over 500,000, i.e., by over 5%. This is because the cohorts affected by the Second World War are leaving the work force and younger cohorts of post-war vintage are joining it.

Some effects of this phenomenon can be seen in Table 16: the number of males in the labor force, much smaller than that of females in 1960, is coming close to catching up with females by 1975. It is the small number of males which characterizes cohorts mauled badly by the war. Total population in the working age also started increasing around 1970 (Table 16). The participation rate is in a state of flux: going down for men, up for women, as the Table shows. The reason may be a genuine increase in female participation, coupled with a decline in the number of pension age males, many of whom continue to work. The DIW estimate expects participation rates to fall, due to longer study periods and a smaller number of pensioners, many of whom, as said above, continue to be employed. It is likely that any differences in employment hinge on the behavior of the participation rate. In any case, employment is slated to rise by between 3.5 and 4.4 percent, or between 0.7 and 0.9 percent per annum. Of the increase, close to 200,000 are planned to be employed in the productive economy:<sup>57</sup> this is a growth of some 3 percent over the FYP, 0.6 percent annually.

*Capital.*—The FYP does not mention the capital accumulation target: this has to be inferred from the investment target. Assuming an eighteen months' average gap between investment expenditure and commissioning of new capital, we find that to raise capital by 110 billion M over the previous FYP, 171 billion M were invested between

<sup>54</sup> See below some questions regarding the meaning of these targets in view of the fulfillment of the 1976 plan  
<sup>55</sup> And those employment targets which are mentioned in the enacted plan (FYP) 1976-80, 1976) agree with the Directives. See also footnote 57.

<sup>56</sup> The Foreign Demographic Analysis Division of the U.S. Department of Commerce (Baldwin, 1976) has three alternative estimates for 1980, based on different birth rate assumptions. The lowest estimate gives a decline of only 200,000.

<sup>57</sup> (FYP Directives, 1976, p. 23 and FYP 1976-80, 1976, Sec. II)—130,000 in industry, 36,000 in construction, 23,000 in other productive branches. 110,000 are to go to the non-productive sphere; there is no mention of the expected decline in agricultural employment. The differing pronouncements on employment in the Directives and in Stoph's speech may indicate a tightening of plans in this sphere between the beginning of 1976 (when the draft Directives were published) and its end. Alternatively, Stoph may have wanted to emphasize the reserves of 60,000 employees which existed in the plan, though this would have been unusual practice.

1969 and 1974;<sup>58</sup> in other words, total retirement of capital was some 61 b M, some 13 percent of the value of capital in 1970. Using the same assumptions for 1976-80 and spreading the targeted investments of 234 billion M at an even growth rate over the FYP, we get a gross increase in capital stock of 216 billion M, or a net increase of 141 billion M,<sup>59</sup> nearly a quarter above the 1975 stock, an annual growth of 4.5 percent (against an actual growth of 4.3 percent rate during 1971-75). Thus the capital stock in the productive sphere could grow by 6 percent, as against 5.8 percent per annum in the previous period.

Taking these figures on the growth of inputs, adding in an annual improvement in productivity of 2.8 percent (attained by conservative estimate over 1971-75—Table 8) and assuming a capital elasticity of 0.3, we get an annual growth projection of 5.0 percent, or quinquennial growth a shade below the FYP target of 27.9 percent.<sup>60</sup> If there are nevertheless serious doubts about the possibility of fulfilling the target, it is because of the fewer degrees of freedom the 1976-80 plan has, particularly with respect to foreign borrowing. Hence exports, both to CMEA and the West, have to increase substantially, investments have to grow to enable the growth target to have a chance of fulfillment, and less will remain for consumption. And then, a consumption fund reserve is needed for a flexible incentive system that will lead to the assumed high labor inputs.

Will the plan be fulfilled? Does the GDR leadership expect it to be fulfilled? The 1976 target, of an NMP growth of 5.3 percent, was drastically underfulfilled at 3.7 percent, the lowest rate since 1963. The drought was blamed for this underfulfillment, but it seems that other things must also have gone awry. It is quite possible that with less flexibility in plan implementation, with foreign trade less of a safety valve than before, the rate of productivity growth will be lower in the second half of the '70s, and the growth target will not be fulfilled.

There is an unusual element in the new FYP, in that the underfulfilled 1976 targets have not been corrected: in the previous FYP (enacted at the end of 1971), the target given for 1971 was not the original target but the (lower) one actually attained. In 1976, the original (unfulfilled) target was retained in the FYP for 1976, even though impending underfulfillment must have been clear to the leadership. The NMP and industrial output growth targets in the annual plan for 1977 published together with the FYP, equal neither the targets given in the FYP for that year, nor the growth required for the level foreseen for the end of 1977 to be attained (i.e., original targets plus underfulfillment from 1976). In fact, the industrial output target is even lower than that in the FYP. This may be related to the new counter-planning method (see below), but it makes it quite difficult to comprehend what the FYP targets this time mean.

## *II. Resource Use. The End of Priority to Consumption*

"The main task \* \* \* [remains] further to improve the material and cultural standard of living of the people by the achievement

<sup>58</sup> 50 percent of years' and 100 percent of mid-years' investments.

<sup>59</sup> Total FYP investment, growing annually at 5.2 percent rate above the 40 million M invested in 1975, leads to some 76b investment in 1980 and half-1979, which will be commissioned after 1980. To this are added investments in 1975 and half-1974, 75 billion M, 13 percent of capital in 1975, are subtracted as retirals.

<sup>60</sup> A similar calculation would give a 4.6 percent annual growth rate for GDP, 25 percent over the FYP.

of a rapid rate of development of socialist production" (FYP Directives, 1976, p. 9; italics by MK). In other words, consumption is still the "main task," and maintains this nickname by which it has been referred to since 1971, except that it is now to be made subject to the growth of the material base. Thus investment is to increase by 5.3 percent annually (see above) while retail sales are to increase by 4 percent<sup>61</sup> and total consumption, i.e., private plus public consumption, by just over 4 percent.<sup>62</sup> This is a reversal of the 1971-75 FYP: retail sales are to rise by the target rate of 1971-75, but by nearly one percent annually below the actually claimed achievement.<sup>63</sup> Total consumption rose by 30 percent over the previous FYP, 5.3 percent annually; the reduction in growth rate is by over one percent annually. Investments in 1975 were 22 percent higher than in 1970; by 1980 they are to increase by 27.9 percent.<sup>64</sup> The pressures of events on the foreign front led to the shift of emphasis. But as will be seen below, the pressure on the economy is still great: the nearness of the FRG did not permit nominal consumption growth to be trimmed much further.

Since all plans relate to the productive sphere, and since the export surplus too has to be in goods produced in the material sphere, implied domestic material absorption in 1980 should be compared to the growth target of NMP, to find the value of resources freed for exports in 1980. The problem is that for this net investment has to be estimated, investment in inventories added, so as to find the increase in accumulation. Rough calculations show an increase of accumulation by 27 percent between 1975 and 1980.<sup>65</sup> Total local absorption, weighted at 1975 domestically utilized NMP weights, is to increase by 23.5 percent, i.e., by between 4 and 5 percent less than NMP. The analysis of section B.II showed that to keep the external debt at its present level an additional diversion of 10 percent of 1980 NMP was required. With only 4-5 percent forthcoming, external debt will continue to pile up. The results of 1976, when debt increased by over \$1b, bear this out.

This analysis throws some further light on the prospects for the global growth targets (section C.I). Is it that the constraints on consumption and investments, which led to fixing these targets at the middle or upper end of the Directives' range (Table 9) led to a plan that was known to be unbalanced? Or was the decision to further increase borrowing a conscious one? In any case, either of three alternatives, or a combination of them all, seems possible: (i) a continued increase of indebtedness to the West, possibly also to the USSR; (ii) if this is impossible, a cut-down of investments, leading to growth problems; or (iii) a cut-down of consumption, possibly by means of higher prices. In the latter two cases plan targets may

<sup>61</sup> Nominally, but consumers' prices are again promised not to be changed (FYP 1976-80, 1976, section I).

<sup>62</sup> Over the FYP—retail sales are to rise by 21.5 percent, total consumption by 22.5 and net disposable income by 21.4 percent.

<sup>63</sup> See discussion of price rises in section B.

<sup>64</sup> See footnote 59. At annual rates, the increase is from 4.1 to 5.25 percent.

<sup>65</sup> A series of accumulation, found in Mitzscherling et al. (1974, p. 354) shows that the difference between gross investment and net investment in fixed assets in the accumulation series is some 75% of depreciation in the material sphere (Statistical Yearbook 1975 and 1976, p. 37). Depreciation itself is about 4.7 percent of capital stock in the productive branches. Since the latter is to increase by 6 percent per annum by assumption (see above), or by 33.8 percent till 1980, the difference has been increased by that rate and deducted from gross investment in 1980 to arrive at net fixed investment of 34.4 billion M. Inventory investment may increase by the growth rate of NMP, i.e., by 27.9 percent to 5.8b M. Altogether accumulation is to rise to just over 40 on M, billi.e., by over 27.5 percent above the 1975 level of 31.5b Mar.

ostensibly be fulfilled, because of hidden price rises, as in the former FYP period.

### III. The Industrial Structure of Output

While industrial output as a whole is to grow at a slower rate than during the past, i.e., by 3 percent over the FYP, 6 percent annually (Table 9), the internal structure of this increase continues some trends and starts new ones. Old trends are continued with the decline in the share of basic materials industries and light industries (Table 19). The former decline is a reflection of the diminishing raw materials reserves. Lignite production has been on the decline for several years, and the increase in the output of the ministry of coal and energy must be mainly in electric energy. The increase in metallurgy is mainly in processing of imported materials. In the extraction of raw materials the main increase comes from potash. Thus the dependence of the GDR on imported materials is to increase in the future. Light industries are to expand at a slightly slower rate than in the previous FYP, but at a rate that exceeds that of the growth of retail sales: apparently a substantial part of this growth is to be exported.<sup>66</sup>

TABLE 19.—THE STRUCTURE OF INDUSTRIAL OUTPUT, 1975 AND 1980

<sup>1</sup> Industrielle Warenproduktion.

<sup>2</sup> Coal and energy, ores, metallurgy, and potash, geology.

<sup>3</sup> Heavy machine building and installations, machine tools and processing machines, general machine building, agricultural machines and vehicle construction.

<sup>4</sup> Light industry, glass and ceramics, locally directed industry and food industry.

Sources: 1975—Statistical Yearbook 1976, p. 107. 1980—based on 1975 and target rates of growth from FYP 1976–80 (1976), pt. IV; except for geology—estimated at 0.5b mark for 1980.

The new focal industries, chemicals and electronics and electrical engineering, are to grow at the same rate as the traditional engineering industries: this is a change from recent trends. In the previous FYP chemicals grew by 48 and electrical industries by 55 percent, whereas the other engineering industries grew by only 37 percent. Part of the background to this shift back into older and tried fields of relative advantage has been explored in the discussion of the structure of

<sup>66</sup> A word of caution: the output targets are gross, i.e., materials going through several changes of fabrication are counted several times. Nevertheless, the differences in the targets are sufficient to make the comparison valid. Cf. also (DIW-WB No. 8/76).

foreign trade in section B. A DIW study of the chemical industry comes up with similar shortcomings in that industry: the GDR has not been overly successful in expanding the newer branches of the industry, and some processes and products which are nearly obsolete in the West, e.g., the use of calcium carbide as a basis for organic chemical and the production of viscose yarn are still expanding (DIW-WB No. 49/76, p. 458f). Thus the relative upgrading of the more traditional engineering industries may be taken as a sign of dissatisfaction with the progress of the newer fields.

While industry is slightly to decelerate against past rates of growth (Table 9), construction is to grow at past speeds. This is because of the acceleration of investment, and of residential housing construction. The targets for the latter are set at over 35 percent above the fulfillment for 1971-75 for new apartments (550,000 as against 400,000) and at about the same number for modernized ones (200,000) (DIW-WB No. 27/75 and Statistical Yearbook, 1976, p. 157). This is somewhat of an anachronism in a plan which has down-graded consumption. The housing plan is part of a longer term plan running to 1990 and unveiled in the spring of 1975. It is in effect a commitment which precedes the preparation of the published FYP. And the commitment is not cheap: by the DIW calculations it is to raise total outlays on housing from 13 to 20 percent of all investment (DIW-WB No. 27/75).<sup>67</sup> If the commitment looks too heavy in subsequent years, the share of renewed and modernized apartments, which require lower investments, may be increased, thus keeping within the general promise of 750,000 apartments, but at a lower cost.

#### *IV. The System. A Projection to 1980*

If the 1960's were a decade of experimentation, of diversity, of many different paths in the wide fields of the STE, the 1970's seem to witness a return to orthodoxy, to tried ways, to emulation of Soviet example. There may be a political background to this and a personal one too, in the case of the GDR. Ulbricht was closely identified with NES, and may have seen in its success his crowning achievement, the justification of the separate socialist German state, which has created its own way, the best way, to an efficient and more humane socialist society. Honecker had never been associated with economic matters before he came to power. One of the several reasons why the Soviets pushed him forward, pushing Ulbricht out, may have been this very flaunting of the German separate and better way of doing things economic. The failure of the last phase of NES may have given them their opportunity. Thus Honecker came to power on a platform, so to say, of emulating the Soviet experience and way of doing things.

In the GDR case there may be another political factor: no other regime felt itself threatened by Czechoslovak events as the East Germans. It is quite possible that any slogan of separate ways may look like a thin edge of a wedge which may take on Czechoslovak proportions.

<sup>67</sup> Stoph, in his presentation of the FYP speed gave a figure of 55 billion Mark for the "complex" costs of the housing program, i.e., taking all ancillary investments and possibly also costs of investments in additional infrastructure. This is closer to 25 percent of the total investment target. He may, however, have included all housing costs including investment costs, such as maintenance subsidies not covered by rent payments, and then his figure bears no comparison to previous ones (ND, 16 Dec. 1976).

But there seem to be economic grounds for equalizing systems across CMEA countries for the developed countries of the block. There was "anarchy" on the capitalist markets during the early '70s, with rising prices first complicating accounting and pricing, then the jump in oil and raw material prices opening a gaping hole in international payments, and last—a recession which limits demand for GDR goods just at the time when foreign exchange is most badly needed. All this has underscored the greater stability of CMEA markets and the lesser costs of the GDR's dependence on its CMEA partners, who may also change prices, but at a much slower rate than the West.

What the GDR needs from its partners is raw materials in exchange for machinery and manufactured consumers' goods. There is a basic difference in the way such exchanges are viewed from the point of view of the two sellers, that of machinery and that of raw materials. It is not only that raw materials are hard goods, relatively underpriced in CMEA markets and with ready alternative markets in the West, quite unlike machinery. It is also that the producer of machinery, whose production takes time, is interested in long-term commitments both to buy the final output, the machines, and to supply the necessary raw materials. This is why coordination of plans is more important to the GDR than to the primary exporters. Furthermore, to coordinate the building of new capacity, to see to it that complementary output is undertaken, rather than production of substitutes which may supplant it in CMEA markets, the machinery of CMEA is more important to the industrial West of the member countries than to the others. But coordination and division of runs of output between the member countries often means joint production or "cooperation." These require joint decisions, which become more and more difficult when systems, and criteria for decision-making, differ.<sup>68</sup>

This is not to say that there will be no drive for reform. It is only that there are additional barriers to any new attempt at a *Libermanesque* experimentation that did not exist in the early 1960's. Furthermore, that reform will be much more readily undertaken if it is imported from the East.

How effective is the coordination and cooperation through the machinery of CMEA, the dovetailing of FYPs and annual plans, is impossible to say. We have no statistics on this and any pronouncements are highly suspect. If, as is quite likely, the machinery of coordination does not work successfully, pressures for new departures will build up. If it works well, the need for going in harness will be reinforced.

It is quite clear that the need for outside coordination of the plan has added complexity to the process of plan construction. To stress the precedence of tasks which involve foreign CMEA partners, a special part dealing with international cooperation has been added to the plan document.<sup>69</sup>

The plan document in itself has become an ever heavier one. One of the hallmarks of the post-NES regime has been an addiction to

<sup>68</sup> A report of a Czechoslovak-GDR committee on joint ventures in machine tools shows that even small differences like the inclusion of export profits in the unitary enterprise profit in the GDR but not in Czechoslovakia, the different way of allocating overhead costs, etc. may complicate cooperation (W, 42/74, October, p. 10).

<sup>69</sup> Cf. FYP 1976-80 (1976, Sec. III).

codification. NES was open-ended, experimented with new forms, sought new solutions. The regime of the 1970's wanted to establish stability. 1971 saw the first Planning Methods for the 1972 Plan (1971), 1972 brought new Planning Methods for the 1973 Plan, which were followed a year later by the Planning Methods for 1973 (1974). The latter were published as corrections to the previous document, but the corrections were of the same order of magnitude, page-wise, as the original. Another correction was added for the 1975 Plan (Planning Methods for 1975 (1974)). In 1975 there followed a Planning Order and a Skeleton Guideline to codify planning and allocation practices. But codification has also brought changes, namely an increase in the number of plan indicators, in the detail of the plan. The head of the Economic Research Institute of the State Planning Commission, Steeger, who described the Planning Order as a step which draws the GDR planning system closer to the Soviet one, also criticized its draft for including too wide a nomenclature of " \* \* \* 120 state plan indicators for the FYP, and 135 state plan indicators for the annual plans \* \* \* that is 27 more indicators for the annual plan than for 1974" (quoted in Erdmann, 1976, p. 13). Erdmann shows that in general there has been a tendency for an increase in the number of indicators in each of the years 1974, 1975, and 1976 (Erdmann, 1976, p. 23). He quotes a complaint from an enterprise that "To complement the Planning Order and Skeleton Guideline we received branch-specific regulations of altogether 136 pages. The draft plan prepared on this basis had \* \* \* 491 pages \* \* \* to which have to be added \* \* \* balancing documents and the plan for materials and energy which comprehends another 453 pages. Herewith we have reached \* \* \* a quantity which is absolutely novel in our planning practices. Our draft plan for 1975, for comparison, consisted of 306 pages and \* \* \* for 1971 of only 260 pages." The complaint continues, counting the thousands of individual data—over 15000 altogether, 2000 alone for the energy plan. And the forms were not ready on time, so that electronic data processing was impossible (Erdmann, 1976, p. 47f). The increasing detail, with very few complaints against it getting into the press, is another sign that there are no attempts in the offing for renewed devolution. The codification and attempts at stability of methodology are easily understood when it is remembered that any new methodology must take quite some time to master: one reason for creating these stable long term planning orders is " \* \* \* to further reduce the labor expenditure in the plan preparation" (quoted from W-25/72, 21 June 1972, by Erdmann, 1976, p. 9).

Another reason for stability of planning procedures is the "ratchet" effect or its fear. The ratchet, the expectation that any information transmitted to superiors in planning documents or by actual production, may be used to raise enterprise targets, has always led to hiding "reserves," to understating true capacities and overstating needs. There have therefore been many calls for the improvement of long term planning, for making the FYP the basis for annual plans and for the stability of targets imposed by superiors (Brass and Steeger, 1975), coupled with incentives to enterprises to overbid these targets and reveal their true capacities. In fact, the first such scheme in the GDR dates back to 1964 (Keren, 1972b, p. 565). The present scheme

of counter-planning is based on the Soviet model which has been described by e.g., Berliner (1976) and analyzed by Weitzman (1976) and many others: the GDR scheme is no different, in that it provides for higher bonuses and increases in the wage fund for targets which are fulfilled after having been raised above the original control figures or even (as in the 1975 plan)—above the final annual plan target, provided the commitment to the higher target came by mid-February of the plan year (G B1 1974, pt. I, no. 63, 20 Dec. 1974), than if the original plan is overfulfilled. Now any scheme like this can work properly only if it is known that targets imposed in the future are not affected by these overbids, and ostensibly a prior fixing of targets, e.g., for the duration of a FYP, can do the trick. But this disregards unforeseen circumstances under which need for additional supplies of some commodities above the original plan may arise.<sup>70</sup> Will then the planners not increase producers' targets, and will they then not be guided in these increases by all the information in their hands regarding the enterprises capabilities? If not, what alternatives are there in the system, where prices are inoperative, to equalize supply to demand? For 1974, when counter-planning had been in vogue for some time, we still have complaints of the ratchet in action (Erdmann, 1976, p. 41). This notwithstanding, the GDR press is full of reports on the working of the counter-plan, giving the impression that heavy pressure is used to get enterprises actually to raise their targets. This, too, is contrary to the spirit of the scheme, and is not likely to lead to the disappearance of the fear of the ratchet.

During NES days an attempt was made to use a single or predominant success criterion, profits. This has never become the reality under NES (Keren, 1972b; Granick, 1975). But now there are claims that no single success criterion can exist, that a proliferation of criteria, of an increasing number of criteria, is unavoidable, even beneficial. The Planning Order (1975) carries a long nomenclature of "complex proofs of effectiveness for enterprises" and other organs: 12 groups of indicators are listed, some of them subdivided. They run from labor productivity (2 indicators) and freeing of labor force for other enterprises through profitability, to the production of output of a higher quality (Erdmann, 1976, p. 28f). The weighting of all these indicators for any particular enterprise cannot but be highly arbitrary. But these are really old and quite familiar problems.

*Pricing.*—In pricing the "who" and the "how" were affected in different manners by the system change. The how, the principles, did not change much; the who did. The circumstances, the environment in which prices were to be fixed, changed dramatically, and some old price forms long forgotten, fixed planning prices, returned.

The decentralization in price fixing rules is very pronounced. The attempt at devolution, at letting associations and enterprises fix prices, "self responsibility", with the principal checks coming from the buyers who had the right to go over the calculations, could not work well. In particular, since in the pressurized sellers' market of 1969-70, prices must have been of little concern to the buyers. With the deemphasis of profits concern with prices can only have declined.

<sup>70</sup> Cf. Steeger, W. No. 6/75, Mark 1975, p. 14-15, in JPRS-IEA No. 1304, p. 15.

The first regulation which reversed NES put pricing in the hands of the Price Office and the tip of the directive pyramid to be centrally planned (Keren, 1973b, p. 585f). An Order of May 1972 describes in detail the long and arduous way any new price has to take up the ladder of the hierarchy—maintaining inter alia role of the principal buyer, as a party to the process and additional check (GBI 1972, pt. II, no. 24, pp. 257ff).

The main principle of price setting did not change: the 1964–67 reform set prices with profits related to average production costs. Since 1968 profits were to be related to the capital stock tied up in the production of the good. These were the “Fondsbezogene Preise,” prices related to the capital fund. These prices were to be introduced without raising prices. That is, wherever profits were equal to or higher than required, capital related prices were introduced, and a dynamic price adjustment scheme was to keep prices always closely in line with costs, the latter including the profits margin proportional to the capital stock (Keren, 1973b, p. 568). A 1972 order on pricing of new products has the same provisions: the rules by which prices are calculated are uniform for an enterprise or a product group. Any new product would have its price calculated in accordance with these rules. If, however, costs decline or capital is spared and the profits rates for a product group rise above the profits normative (of apparently 12 percent), the responsible organ must take steps to have pricing rules for this group changed, and apply capital fund related prices (GBI 1972, pt. II, no. 67, p. 751f).

There is, however, also a qualitative change: there is much more concern with relative prices. This is felt in particular with new products, which have to have their “value in use” examined, and whose prices cannot exceed prices of other products of equal value in use. New products with higher use value or with an equal use value but lower costs present problems: how is the newly created surplus to be divided between buyer and seller? The obvious answer is that they have to be divided, but how was not clear at first (Reiher and Schwabe, 1976, pp. 979ff; W-19/75, 17 Sept. 1975, p. 18—from JPRS 66941). The rules of division—70 percent to the manufacturer—were determined in a 1976 decree (GBI, pt. I, No. 24/1976, 13 July, pp. 317–321 in JPRS-IEA No. 1523, p. 43). Administrative bodies are, however, inherently poor in establishing the “use value” of any commodity, so that the price which evolves will clearly be affected by those who press hardest, and these are most likely to be the producing enterprise.

The main event on the price front in the 1976–80 period is the new round of price adjustment which was started on 1 Jan. 1976. These were forced not by cost reduction but by cost rises caused by steep rises in import prices, mainly of raw materials throughout the past FYP but most severely during 1974 and 1975. The new CMEA agreement, which substituted an annual price change for a five-year one, ensures the continuation of this trend with fairly steep further rises in the prices of oil and other basic commodities during the coming FYP.

Price increases for the beginning of 1976 were decreed in mid-1975. These were to affect the whole gamut of raw materials, imported as well as domestic—oil and other energy bearers as well as metal ores, metals and even local potash and its products. The interesting fact

about these changes is the insistence on changing relative costs of various materials: from a relation of 1:9:1.2 in the prices of lignite brickettes to natural gas and heating oil, the price ratios were changed to 1:2.2:2.2,<sup>71</sup> and the price difference between copper and aluminum was increased by nearly 50% (Schmidt, 1975, p. 14).

What is significant is that enterprises are encouraged to accept the new relative prices as scarcity prices and to try to reduce costs at these prices. A familiar dichotomy arises here: in their output decision they are expected to follow exogenously given demand and plan targets, but in their input decisions enterprises should obey prices.

It is not only imported goods whose prices have been raised: domestically produced minerals like potash had prices increased "to cover \* \* \* the actual expenses of the national economy in the coming years, taking into account the worsening geological conditions or growing difficulties in the extraction of mined raw material" (Damm, 1975, p. 11). Here the aim is to encourage the production of these materials: "up to now enterprise losses \* \* \* inhibited the stronger upgrading \* \* \*" of some of these materials (Damm, 1975, p. 11; Sindermann, ND 6/7 Dec. 1975, p. 5). This cannot be a once-and-for-all correction: in the mining of the principal domestic energy source, lignite, the ratio of the overburden is to rise by 15% in 1980 and by a third by 1990, so that a gradual relative price rise is in store. Further price rises for user industries of these products were planned for the beginning of 1977.

The mechanics of the new price creep are as follows: user enterprises whose costs rise because of the 1976 price hikes, are not to be financially disadvantaged. They are to be compensated by a reduction in their net profits tax GB1, 1976, pt. I, no. 7, pp. 130-31; from JPRS, IEA, no. 1448). Later on, at the start of another plan year, their own prices are going to be adjusted, and so on. (W 15/75, 23 July 1975; from JPRS-IEA no. 1362). It seems, however, that only those commodity groups most affected by the rises in energy prices will be affected by this round of price changes.<sup>72</sup> There are indications that costs of capital, and hence depreciation, are wildly out of line, since investment costs have risen substantially since the price reform.<sup>73</sup> This, however, would indicate that a complete overhaul of the price system, was necessary, and this does not seem to be contemplated.

One other element in the price system is the return of the fixed planning prices. These had been absent since early NES days. The unchanging planning prices were based on 1955 enterprise prices and were anachronistic even then, no thorough price reform having taken place in the GDR since war days.<sup>74</sup> Under NES, with the stress on marketed rather than produced output, effective exchange prices were used for planning purposes rather than fixed prices, and the new set of fixed 1967 prices was used for statistical purposes only. All enterprise plans were expressed at current prices.<sup>75</sup> For the

<sup>71</sup> (Schmidt, 1975). The units are not stated in the source: prices are apparently per BTU.

<sup>72</sup> A source mentions, in addition to energy, raw materials and other materials "selected industrial products" (WW 2/67; from JPRS-IEA no. 1453).

<sup>73</sup> The costs of chemical installations are said to have risen by 50 percent since the price reform of 1964-67 and those of some others by up to 4 times (WW, 7/75, p. 105).

<sup>74</sup> See Stolper (1960) for a discussion of these prices.

<sup>75</sup> Or current and previous year's prices.

period of the new FYP January 1, 1975 enterprise prices are to be used for the monitoring of some indicators, particularly labor productivity. Three reasons come to mind why the plan prices have been reinstated: prices in the GDR are sure to be changing appreciably over the FYP period, and the 1967 prices are already out of date. Another reason may be that with increasing centralization and closer supervision the bureaucrats feel this is a tool which can be of use, hoping that its ill effect—i.e., the existence of another alternative for weighting output, an alternative which will be far out of line with relative cost—may be avoided. And lastly, the Soviets use such prices, and a convergence to the Soviet way of doing things is a policy objective (see above).

This should not be taken to say that the system has returned to the pre-1964 pattern, without any imprints of NES days. Times have changed. The political climate is different and must have some effect on the economic system, and technological changes in data processing make the operation of the modern and complex economy under a centralized system possible, where it might have collapsed under the old abacus days. NES has left its marks, too: possibly in a new breed of cadres and a different career system (Granick, 1975), and in certain features of the incentive system. The unitary enterprise profit statement, which comprises exports profits as well as profits from local sales is still there. So is the fairly uniform capital stock tax. But little has remained of the conception of keeping prices as close as possible to costs by continual adjustment—the present steps of price changes seem to be more of a stage in a familiar once-and-for-all price adjustment. Little remains of the belief that some sort of a division of decision-making is possible, given a proper and relatively simple incentive system and suitable prices, which may save the top of the hierarchy from getting involved in small as well as large problems. In all this the spirit of older times has triumphed.

## APPENDIX A

### THE TAUTNESS OF ANNUAL PLANS

A fuller discussion on the meaning and measurement of tautness of plans can be found in (Keren, 1973b). A few words on the subject need, however, be said here too.

A fulfilled plan does not prove that a plan was slack, i.e., realistic and conservative. Nor does an unfulfilled plan prove that a plan was taut and overambitious. When we say that a plan is taut we mean that under normal circumstances, without extreme efforts, it would be unlikely to be fulfilled, and vice versa for a slack plan. But to know what an economy is capable of achieving under "normal circumstances" requires more knowledge of it than we possess. Hence a surrogate is needed. The one used in Table A-1 (and also in Table 4 in Keren, 1973b) is rate of growth actually attained in the past for any given variable. Two different past actual rates are presented:  $a_0$  is the previous year's rate of growth,

whereas  $a_1$  is an average of the three past years' growth rate: the former may be overly affected by events particular to any given year. The reader should note that all series but one are in fixed prices: the series on retail sales, or production of goods for retail sales, is available only at current prices.<sup>77</sup>

TABLE A-1.—INDICATORS OF TAUTNESS  
[In percentage increases]

	NMP <sup>1</sup>			Industrial output <sup>1,2</sup>			Investment <sup>1,3</sup>			Retail sales <sup>3</sup>		
	$a_0$	$a_1$	p	$a_0$	$a_1$	p	$a_0$	$a_1$	p	$a_0$	$a_1$	$p^b$
1968.....	5.4	5.0	5.4	7.5	6.5	6.4	9.2	8.6	10.7	3.9	4.1	3.9
1969.....	5.1	5.1	6.0	5.0	6.2	7.0	10.3	8.9	11.0	4.9	4.1	4.7
1970.....	5.2	5.2	6.3	7.5	6.7	8.0	15.4	11.6	11.4	6.0	4.9	4.3
1971.....	5.2	5.2	4.9	6.4	6.3	5.6	7.3	11.0	-1.5	4.3	5.1	4.2
1972.....	4.5	5.0	4.6	5.5	6.5	5.5	.6	7.6	2.0	3.9	4.7	4.0
1973.....	5.7	5.1	5.7	7.2	6.4	6.5	3.9	3.9	9.0	6.0	4.7	6.2
1974.....	5.5	5.2	5.4	6.8	6.5	6.7	8.0	4.1	5.3	5.8	5.2	4.8
1975.....	6.3	5.8	5.5	7.4	7.2	6.3	3.8	5.2	4.4	6.1	6.0	4.6
1976.....	5.0	5.6	5.3	6.4	6.5	6.0	4.1	5.3	6.5	3.6	5.2	4.0

Note:  $a_0$ —Actual, previous year's rate of increase;  $a_1$ —actual, average of previous 3 yr rate of increase; p—planned increase for current year;  $p^b$ —Warenfonds, production of goods for retail sales.

<sup>1</sup> Fixed 1967 prices.

<sup>2</sup> Industrielle Warenproduktion.

<sup>3</sup> Current prices.

<sup>b</sup> Targets were increased early in plan year above this level.

For the pre-1971 years the tautness of 1969 and 1970 is clear: production targets, both NMP and industrial output, were to increase substantially faster than in the past. As for the use of resources—in 1969 investments were to increase somewhat faster, without a decline in consumption. 1970 was basically the continuation of 1969 trends.

All 1971 targets, on the other hand, were below the potential, so it seems. If they were not fulfilled, there were special circumstances, i.e., bottlenecks and a need for switching of resources, which make for present growth capacity to be below what was achieved in the past. For 1972 to 1974 the plans for output lie both in the range of the two indicators, justifying, perhaps, the East German appellation of "tense but realistic" plans. For the 1972 and 1974 the same is true for the resource use indicators. 1973 is somewhat more taut, with both investment and retail sales to grow faster than in the past (and than NMP), and this plan was, indeed, underfulfilled. For 1975 the sights are, again, lowered, with all targets below past levels, except for investment, which is within the range of the past. 1976, the first year of the new FYP (but whose targets were enacted before the directives of the FYP were published), shows relatively slack targets for NMP and industrial output, but a substantial increase in the investment target, i.e., a shift in resources which may require even more slack to succeed.

To sum up: the main difference between planning strategy under the post-Ulbricht regime and its predecessor is that in 1971-75 we have no wild targets. We may have some which are on the high side, but no repetition of the wishful thinking which raised the targets for 1969-70. Was Sindermann, the then Chairman of the Council of Ministers, referring to the latter when he introduced the 1975 plan: "The targets of the national economic plan for 1975 take account of the real possibilities and conditions in our country. Wishful thinking is foreign to us in this plan" (W-52/74, 4 Dec. 1974, p. 2). One sees during this period more discussion of the problems of how much to pressure the economy, not only in leaders' speeches (e.g. Honecker, W-45/73, 7 Nov. 1973), but also in more down to earth discussions on criteria for demanding but realistic plans "to which Soviet Economists refer as taut plans."<sup>78</sup> A brief treatment of the problems of tautness, with some elements of uncertainty touched upon can be found in Matho and Schilling (1975, p. 1317).

<sup>77</sup> A consumers' price index, which could be used to deflate this series, is available (see Table 6). It is, however, not thought to be reliable and the Yearbook itself claims that it should not be used for deflation (Statistical Yearbook 1975, p. 294).

<sup>78</sup> D. Weger (W-48/73, 28 Nov. 1973, p. 10). Though best past value and statistical series are used in plan preparation and defense, one must beware of them, he says, because much depends on the starting level, which may be aut or even "soft."

## APPENDIX B

## ON THE USE OF PURCHASING POWER PARITIES FOR CALCULATING PRICE INDICES

In what follows, subscript E will refer to the GRD, W to the FRG; superscripts 1 and 2 to two time periods.

The DIW has from time to time (mid-1960, the beginning of 1966, mid-1969 and the beginning of 1973) measured the relative purchasing power of the GDR Mark compared to the DM. The weights used in comparison were based on the consumption baskets of two types of families, four member wage earners' and two member pensioners' families, using for each both GDR and FRG consumption patterns. Thus for each point of time we may have as many as four<sup>79</sup> different purchasing power parities. Those calculations which use western (FRG) weights can be used in conjunction with West German price indices to construct a sort of a GDR price index with western weights.

Let  $E_{W^1}$  and  $E_{W^2}$  be two such calculations, each showing the cost in East German Marks of a basket whose value is 1 DM, and  $I_{W/W}$  a FRG price index with FRG weights. Then

$$E_{W^1} = \frac{\sum p E^1 q_{W^1}}{\sum p W^2 q_{W^1}} \quad E_{W^2} = \frac{\sum p E^2 q_{W^2}}{\sum p W^2 q_{W^2}}$$

$$I_{W/W} = \frac{\sum p W^2 q_{W^*}}{\sum p W^1 q_{W^*}}$$

where  $p$  is a price vector and  $q$  is the quantity weight where the superscripts ',', \* serve to distinguish the weights used in the three indices.

Assuming  $q_{W^1} = q_{W^2} = q_{W^*} = q_W$ , then  $I_{E/W}$  the GDR price index with FRB weights can be constructed as follows:

$$I_{E/W} = \frac{E_{W^2} I_{W/W}}{E_{W^1}} = \frac{\frac{\sum p E^2 q_W \sum p W^2 q_W}{\sum p W^2 q_W \sum p W^1 q_W}}{\frac{\sum p E^1 q_W}{\sum p W^1 q_W}} = \frac{\sum p E^2 q_W}{\sum p E^1 q_W}$$

The meaning of these assumptions is as follows: first, that the FRG relevant consumption basket has not changed substantially between the two points of time; second, that the basket used in the construction of price index is similar to that of the representative families, used in comparing purchasing power parities.

$I_{E/W}$  can then be used as a proxy for  $I_{E/E'}$ , the GDR basket with GDR weights, if  $q_E$  does not differ too much from  $q_W$ . This assumption is not borne out by the facts: Table B-1 shows how the purchasing power comparison is affected by the weights used

$$\left( E_{E^t} = \frac{\sum p E^t q_E}{\sum p W^t q_E}, t = 1, 2 \right):$$

TABLE B-1.—COST IN GDR MARKS OF A BASKET COSTING 1 DM

	4-member wage earners' families		2-member pensioners' families	
	$E^1_{IN}$	$E^1_E$	$E^2_{IN}$	$E^2_E$
Mid-1960.....	1.33	1.30	(1)	(1)

## I. INTRODUCTION

Hungary is a small country whose population of 10½ million (294 per square mile) has been growing at only 0.4 percent p.a. over the last decade. It is poor in natural resources, with only large deposits of bauxite and some natural gas, uranium, and recently discovered copper. It is therefore a transforming economy, heavily dependent on foreign trade.<sup>1</sup> Hungary is at a middle level of economic development among the East European countries, standing with Poland between the more industrialized GDR and Czechoslovakia and the faster-growing but still lower-income Romania and Bulgaria. It has no special geopolitical or strategic role, and its foreign policy, though intelligent and sophisticated in implementation, clearly follows the lead of the USSR in all major respects.

What, then, is important or noteworthy about Hungary? Its politics, since the extraordinarily violent uprising in 1956, have shown an equally remarkable consolidation and stability under the leadership of Janos Kadar (see Gati, 1974, and Robinson, 1973). In those two decades Kadar has achieved a degree of political legitimacy and broad-based authority perhaps unique among the CMEA countries. His "alliance policy" has attempted to reconcile the interests and claims of workers and peasants, Communist Party members and the non-Party majority, focussing them on the goals of steadily rising living standards and modernization, while wholeheartedly accepting the primacy of the Soviet Union in Hungary's international orientation. This political context is essential to any interpretation of the most distinctive feature of the Hungarian economy: the "economic reforms" of 1968, which replaced central physical allocation and obligatory plan targets with "economic regulators".

The reforms and the "new economic mechanism" which they introduced gave Hungary an economic system significantly different from the other countries of Eastern Europe, combining state ownership of the means of production with economic planning, but without the command system of allocation used to implement the plans elsewhere. Instead, the plan was to be the framework for a "guided market" allocation system. The economy would be run by macroeconomic management, credit policy, taxes and subsidies, exchange rates, etc., all operating on a profit-based incentive system for enterprises. Direct, operative intervention by the central authorities into enterprise affairs was to be exceptional, undertaken only to deal with specific disequilibria which would not respond quickly enough to the economic regulators. And the regulators themselves were to be as uniform as possible at the micro level, so that with a more rational and flexible price system, all firms would face similar conditions, and profit would properly measure their performance. It would thus provide an appropriate basis for increases in the remuneration of both workers and

<sup>1</sup> Estimates of the ratio of exports to national income vary widely, depending on the exchange rates and concept of national income used. For 1975, if we take total exports in dollars converted to forints at the tourist rate and divided by the Hungarian figure for GDP at current prices, we get 31.6 percent. If instead we start with exports in transferable rubles and in dollars for the two separate "clearing areas" and convert at the "foreign trade multiplier" rates, we get 47.3 percent of GDP. And if we take total exports in dollars valued at the dollar foreign trade multiplier, divided by net material product (NMP), we obtain 67.2 percent. Finally, SE 75, p. 57, gives the following data for exports as a share of GDP at current domestic prices: 20.7 percent in 1960, 29.0 percent in 1965, 30.7 percent in 1970, and 42.8 percent in 1975 (the price reform of 1968 would seriously affect any comparison of 1965 and 1970).

managers, as well as for the allocation of funds for new investment. Although the changeover to the new system occurred simultaneously in all these areas, there were "brakes", intended to be short-run tactical measures to deal with the problems of transition, but without compromising any principles of the long-run strategy. Thus many price controls, differentiated taxes and subsidies, and administrative restrictions were to be removed as rapidly as possible.

In this paper I shall discuss how far the reformers' conception has been realised in practice and evaluate the economy's performance under the new system, comparing 1968-1975 (and within this; the Fourth Five Year Plan period, 1971-75) with 1961-1967.<sup>2</sup> This evaluation will be primarily in terms of the authorities' own goals and their expressed priorities among them. It will also consider the environment in which the reforms have unfolded; how the environment, economic performance, and political conditions have affected the system itself; and how priorities and policies appear to have altered as revealed by the authorities' actions. In particular, some observers have identified the Central Committee plenum of November 1972 as a major reverse for the reformers, beginning a backwards movement which culminated in the dismissal in March 1974 of Central Committee Secretary Rezső Nyers, the chief architect of the reforms from 1964 onwards. It will therefore be necessary to interpret very carefully the events of 1971-74, so as to draw what lessons we can and to give some basis for predicting how the system will develop henceforth. I then discuss actual and probable changes during 1976-80 in the environment, policies, and the system and assess the prospects of the economy to 1980. Finally, I attempt to draw some generalizations from the Hungarian experience.

## II. THE ECONOMIC REFORMS OF 1968

### 1. *Motives for Change*

I have myself previously analysed the background to the Hungarian economic reforms, the measures themselves, and changes through 1971 (Portes, 1970, 1971, 1972, 1973). There is indeed a very substantial body of excellent English-language literature of various vintages, by both Western and Hungarian authors; a selection is given in the References.<sup>3</sup> I shall therefore omit details and provide here only a brief historical setting, the motives for reform, and the basic features of the 1968 system.

On one fundamental point of interpretation I should make my position clear at the outset. I do not believe that the causes of the Hungarian reforms are to be found in the political sphere. Rather, I take

<sup>2</sup> Although I shall refer occasionally to output and productivity performance in agriculture, this paper otherwise omits any substantive discussion of the agricultural sector or the rural sphere more generally. This is due to limitations of both space and the author's knowledge, but the reader will recognize that an understanding of the agricultural sector is important for a more complete picture of consumer goods supply, the labor market, income distribution, prices and the political climate.

<sup>3</sup> Among the more comprehensive Western studies, particularly important are Balassa (1970, 1973), Granick (1975), Hare (1976 a, b), Marer and Pall (1971), Robinson (1973), and Wiles (1974); and from the Hungarian literature, Friss (1969) and Gado (1972). In general, I have not cited the voluminous Hungarian-language material except for data sources and to establish specific points, partly because anyone competent in the language is likely to be familiar with this material already. Many important papers by Hungarian authors can be found in the English-Russian journal of the Hungarian Academy of Sciences, *Acta Oeconomica*, and there are various sources of translations. I have also omitted all diacritical marks from Hungarian words and names.

the economic motives to have been primary. The reforms would never have been undertaken if the economic difficulties discussed below had not been perceived by the authorities, rightly or wrongly, as threatening their entire economic policy and the political equilibrium based on it, and as problems whose solutions could not be found within the old command economy framework. That the relative stability of Hungarian politics and unity of the political leadership was a *necessary* condition for the economic reforms is undeniable. But the reforms involved clear political risks, partly because they did in fact generate some political tensions, not all of which were foreseen. Thus I regard domestic and external political conditions throughout as constraints on the economic reforms, delineating the range of acceptable changes. The reforms were not a byproduct of a power struggle in the leadership, nor of ideological shifts, nor a reflection of changing weights of various interest groups (technocrats, managers, intellectuals, industrial workers, regions, etc.), nor the expression of some spontaneous upsurge of pressure for greater democracy and decentralization. They were a pragmatic response to a complex of related economic problems, and their main objective was to create the conditions for balanced economic growth with steady increases in living standards.

The history of postwar Hungarian economic policy and the means by which it has been implemented falls into clearly defined periods. Nationalization was virtually complete by 1950. From then until the end of 1956, the direction of production was highly centralized. All-embracing central physical allocation of commodities, centrally determined and highly detailed current production plans, and total central control over investment guided the economy in natura. All this was in the service of a few simple policy goals: the maximum rate of growth of industry, with primary emphasis on heavy industry, and a correspondingly high saving ratio; and an attempt at a form of autarchy, which in practice meant import substitution for a wide range of basic industrial goods. The development strategy and planning methods were fundamentally those which had been used in the Soviet Union since the late 1920s. Although these policies brought quantitative results, they were carried to extremes. In early 1957, many steps were taken to correct the major faults of the system, introducing partial decentralization of the command economy mechanism. Binding plan targets, fixed prices, and central physical allocation remained, but all were more or less rationalized, and many decisions which had previously been taken by the ministries were left to the enterprises. In economic policy, there was a move towards a more balanced growth path, with a greater role for foreign trade and more emphasis on increasing consumption.

Increased pressure on the economy in 1959–60 (an investment boom and recollectivization of agriculture) brought uncoordinated, piecemeal recentralization. The authorities tried to decentralize again in the industrial reorganization of 1963, by delegating short-run decisions from the ministries to newly created large enterprises and trusts. But with no real change in the command mechanism, even the large new units saw little advantage in asserting any independence. They turned to the ministries for “tutelage”, and when pressure on the economy again increased in 1964–65, the ministries fully resumed their direction of the enterprises.

By 1964, the authorities found that the rate of growth of national income was falling, and they were unable to raise living standards at the rate they thought necessary. Plans were over-optimistic, and the planners themselves were so overwhelmed by details that they could not properly plan structural changes. Five related groups of problems faced the economy:

(a) *Foreign trade.*—The early attempts at autarchy had merely increased the economy's dependence on imported materials. It was therefore necessary to expand exports. But the structure of trade was unsatisfactory—Hungarian machinery was of poor quality, acceptable only to other Comecon countries, and Hungarian trade with the West was mainly an exchange of agricultural goods for raw materials. The balance of trade deficit was rising steadily throughout the period 1962–64, and the hard currency deficit was dangerously high in 1964. Thus Hungary could not import enough advanced Western machinery, nor could competition from imports be used to prod domestic producers into improving quality. Exports were insufficiently specialized, so there was no opportunity for long production runs and economies of scale. The distorted domestic price system hindered rationalization of the trade structure.

(b) *The labour market and productivity.*—Hungary was running out of labour to transfer from agriculture into industry and exhausting the possibilities for increasing participation rates. To compensate for falling growth rates of industrial employment by increasing capital inputs even faster would quickly run into diminishing returns, so more rapid technical progress was essential. The planners thought also of stimulating productivity by improving the incentive system.

(c) *Matching the structure of supply to that of demand* at the disaggregated level was particularly difficult for the Hungarian economy in the early 1960's.—This was evident in foreign trade, on consumer goods markets and in inter-enterprise relationships. The quality and variety of output were poor. More fundamentally, the objective of satisfying demand was neglected in the enterprises' choice of production programmes, and the planners were unable to solve the problem with directives from above. One manifestation of the problem was excessive stockbuilding, and even with large and rapidly growing stocks, there were still shortages of material inputs (often disrupting production) and of consumer goods. Throughout the production structure there was evidence of the planners' poor choices of industries to expand and goods to produce. Structural change was required, but there were no meaningful prices to guide it.

(d) *Investment.*—There was substantial excess demand for investment goods from 1959 on, with consequent dispersal of resources and delayed completions. Projects were poorly prepared and executed, so incorrect technical choices and large cost over-runs were common. Replacement and modernization were neglected in favour of new plants.

(e) *Innovation and technical progress.*—The planners saw dynamic inefficiency in terms of rising incremental capital-output ratios and slow growth of labour productivity. They thought that

initiative at the enterprise level, fostered by market pressures on enterprises to raise efficiency, and utilizing more direct enterprise contacts and cooperation with foreign suppliers of advanced technology, could generate the technical progress needed to compensate for slower growth of the labour force.

Thus the authorities believed that changes in the structure of the economy and the goals of economic policy required changes in the economic mechanism: better planning; a more flexible system of short-run management of the economy; better incentives, information and criteria for choice; and more direct relationships between foreign trade and domestic production. Concern for the uses of output, especially consumption and exports, was replacing the previous emphasis on growth of output.

Partial decentralization within the basic command system had been tried in 1957, and a technocratic rationalization of that system, even with some of the mathematical planning techniques which Hungarian economists were pioneering (Kornai, 1975) did not seem promising. The reformers therefore sought to construct a complete and internally consistent guided market system, elaborating it in great detail over three years and introducing a comprehensive set of measures en bloc in 1968. With equal care, they tried to prepare the population, the party apparatus, and the economic administration for the changeover. Although there was extensive public debate on various aspects of the new system, and there were clearly differences in the Party leadership, after the Central Committee decided in May 1966 to go ahead, public unity prevailed.

## *2. The New Economic Mechanism*

The decrees and regulations governing the new economic mechanism cover thousands of pages, and the literature on it cited above is itself extensive. Here, therefore, the briefest possible summary is appropriate. Plan targets became primarily indicative, "binding" on ministries but no longer a basis for commodity allocation or incentives. The annual plans still prescribed specific measures in credit policy, price policy, state investment projects, etc. But the emphasis was to shift towards the five-year plans as guides for enterprise and branch ministry actions, and long-term "central development programmes" for state investment policy (e.g., the programmes for development of the public vehicles industry, petrochemicals, the aluminum industry, etc.). Physical allocation was virtually eliminated, as was "control by the forint" (detailed credit control according to the input and output plans). They were replaced by horizontal direct relations between enterprises in a highly regulated market. Part of the regulation was the price control apparatus. Although there was a complete reform of producer prices, bringing them much nearer to costs (and, as it transpired, not too far from equilibrium), and considerable freedom for price changes was introduced, many prices remained centrally fixed or subject to maxima, and the National Materials and Price Office disposed of many techniques for indirect price control. The consumer price structure remained basically unchanged, though there was some unification of turnover tax rates and again, substantial scope for enterprises to change the prices of goods not regarded as basic necessities.

Producers and users were in principle to be free to import or export as they chose (some with newly granted direct export or import rights, the rest through foreign trade enterprises operating on commission), with foreign prices converted directly into domestic prices by separate uniform ruble and dollar exchange rates. In practice there were various informal constraints on foreign trade decisions, as well as extensive tariffs and export subsidies, but the previous complete separation of foreign and domestic markets was eliminated.

Enterprise incentives were made dependent on profits, which through a complicated tax system were broken down into four parts: tax; a reserve fund; a "sharing" fund (for bonuses); and a development fund (which, augmented by a part of amortization funds, together with credits, was to finance enterprise investment, a substantial part of which was to be decentralized). Although the tax system did prescribe the breakdown of profits between the funds, and the marginal rates of taxation were high (especially on the sharing fund), nevertheless both the sharing and development funds varied directly with total profits, and the remuneration of both managers and workers varied with the sharing fund. Incorporated in this taxation system was a version of "average wage control", which in effect reduced the post-tax sharing fund *pari passu* with any increase in the average wage paid by the enterprise.

Finally, a substantial part of the administrative authority over enterprises which did remain was redistributed, away from the Planning Office and branch ministries to the banks, the Materials and Price Office, and the functional ministries (Finance, Labour, Foreign Trade). Their decisions were often in fact taken in interdepartmental (interministerial) committees. The branch ministries were to continue to exercise "ownership" rights—in particular, appointing managers—as well as to prepare sectoral development plans. But their operative intervention into enterprise decisions was to cease. The industrial structure, however, remained almost unchanged, still with the high degree of concentration created in the 1963 reorganization. As before 1968, there were about 800 state industrial enterprises and 800 industrial cooperatives, the former producing well over 90% of industrial output. The state enterprises average 2000 employees each, and in 1968, almost 50 had over 5000 employees each. There are however no industrial associations of the type familiar elsewhere in Eastern Europe.

There were two basic motives behind the use of the formidable array of "economic regulators." First, the authorities only trust the unregulated market, working through the profit motive, within rather narrow limits. They use planning not merely to deal with classical causes of market failure but also to retain central control over the broad features of structural change, foreign economic relations, income distribution, the allocation between public and private needs, and macroeconomic equilibrium. The objectives of the reforms were to bring greater efficiency, more innovation and initiative, and the like, but not at the cost of surrendering central authority in these key areas of economic policy. The authorities' goals as discussed below were in some cases clearly unattainable in an unregulated market.

Second, there were the regulators initially conceived of as "brakes" on the otherwise too abrupt transition to the new mechanism. Two

decades under the command system had generated behaviour patterns and structural disequilibria with which the market could not cope, at least for some time. Some residual command authority, price and average wage controls, differentiation between enterprises of some taxes and subsidies, constraints on enterprise freedom to dispose of their profits, to move into new lines of production—all these were motivated by the “legacies” of the old system. The previous pattern of prices, production, and use had been distorted, and the reformers did not believe they could remove the distortions before these had been properly revealed by the new system itself. Great disparities between enterprises in efficiency might be signalled by the subsidies needed to keep them afloat—but without the subsidies, the required structural change would be disruptive to both economic and political equilibrium. There were other legacies: the monopolistic industrial structure, which again was left untouched partly because a stable organizational environment was thought necessary for the transition, partly because it was unclear how much deconcentration was desirable; the existing group of managers, trained in the command system and often hesitant to take the risky decisions essential to any proper use of their new autonomy; enterprise defense mechanisms (such as materials hoarding) developed under physical allocation and taut planning; and general “concealment of reserves” for fear of the “ratchet effect,” i.e. the setting of next period’s plan as an increasing function of this period’s performance.

### *3. The Authorities’ Goals*

Janos Kadar has always taken domestic and external political considerations as co-ordinate and coequal. His most important goals have always been to maintain the leading role in the society of a unified Party and to maintain the primacy of the USSR and Hungary’s other CMEA partners in her political and economic relations. It was hoped that the reforms would promote the former by improving the functioning of the economy and its capacity to satisfy the population’s needs, while no fundamental conflict was seen between the new mechanism and Hungary’s participation in CMEA (and there was some hope that other CMEA countries might imitate the Hungarian reforms).

Both these objectives excluded from discussion any version whatsoever of workers’ self-management. The workers’ councils which arose spontaneously in 1956 had challenged Party authority; and the Soviet Union’s strong antipathy to workers’ control was clear. In any case, the Hungarian authorities were sufficiently concerned about inflation that they had no desire to follow the Yugoslav example. None of this was taken to rule out seeking some “industrial democracy” through expanding the role of the trade unions.

Next in the order of priorities was full employment. Before 1968, the phrase “greater mobility of labor” appeared frequently in the reform discussions. But it had undesirable connotations for workers (later, the planners would complain about excessive labor turnover), and at all levels, the great majority rejected the view that “slack in the labour market” was necessary for the proper operation of the new system. Indeed, Granick (1975) has built a far-reaching critique

of the new system on the hypothesis that the reformers went so far as to commit themselves to total job security, in the sense that no job could be eliminated if the incumbent were unwilling to be transferred elsewhere, regardless of how many vacancies might be available. I dispute this argument in Sec. III.3, below, but there can be no doubt of the importance of the full employment objective.

Only slightly less weight was given to the goals of controlling consumer price inflation and raising the rate of growth of living standards. One could in fact argue that public opinion was more sensitive to price increases than to the unlikely event of unemployment. There appeared to be a "perverse" money illusion (Portes, 1972, p. 642), and the planners therefore were afraid that the population would react sharply to price increases, even if real incomes kept rising at the previous rate or better. On consumption, they hoped to do better than the record of the early 1960s, and in particular to raise the lowest real incomes more rapidly, with special efforts to improve minimum housing standards. Services were seen as the main area in which provisions should be expanded.

All these goals were so important as to approach the status of inviolable constraints. The specific intentions behind the reforms were however the object of the exercise, after all. Thus points (a)–(e) in II.1 above were criteria for judging the performance of the economy. The planners stressed structural change, modernization, and balance of payments equilibrium, especially on hard currency markets. To achieve these they were willing to emphasize incentives and the motivation of greater efficiency and initiative, even at some sacrifice in egalitarianism of the income distribution. They thought that profits could play the key role here, and they underestimated both the public's sensitivity to distributional changes and the extent to which the "brakes" might distort the performance-rewarding function of profits.

### III. DEVELOPMENTS, 1968–75

#### 1. *Changes in the Environment*<sup>4</sup>

Just as the initial discrete change in the economic system was not a consequence of any single discrete change in the environment facing the economy, so no single event could have been expected to bring back the command system—except perhaps a sudden diktat from the USSR. Many observers did indeed conjecture that the Soviet response to events in Czechoslovakia in 1968 would convey precisely this signal to the Hungarians. But Hungary had carefully avoided the Czechoslovakian excesses, and the Soviet Union knew Kadar's priorities to be as we described them above. Thus despite superficial similarities between the two cases, the convulsions next door never seriously threatened the development of the reforms. Nor did the disturbances in Poland in December 1970 and Gierek's accession to power have any direct impact on Hungary, except insofar as they may have made the Hungarian leadership more sensitive to the importance of the urban blue collar workers and their real incomes (see III.3 below).

<sup>4</sup> "Environment" refers here and below to all the exogenously given circumstances in which economic policy and the economic system operate—"exogenous" meaning outside the control of the authorities during the relevant time period.

A more identifiable effect can be seen in the Hungarian response to changes in CMEA economic relations, especially the promulgation of the Complex Programme in the summer of 1971. For it then became clear to all but the convinced optimists that Hungary's major trading partners were not going to make any major switch to direct, flexible interenterprise negotiations; that although a ritual bow was made to monetary reform and some form of currency convertibility in the bloc, they had in fact been tabled sine die; and that no decentralization, but rather centrally determined specialization in production was all that could be expected, as well as the assurance of continued raw material supplies (at the cost of some Hungarian investment in its partners' extractive operations). Moreover, whereas in 1965-67 the atmosphere of economic reform elsewhere in Eastern Europe had favored the Hungarian reformers' conception that their own reforms would develop further after 1968 in harmony with their partners', by the early 1970's this too was evidently a false hope.

Other international events were equally important. The Soviet rapprochement with the U.S. and rapid growth of their economic relations from 1972 until the beginning of 1975 significantly loosened the constraint which Hungary had felt on its own economic relations with the West. Thus, having borrowed \$75m. in public bond issues and syndicated Euromarket loans in 1971, Hungary had further large public borrowings of \$70m. in 1972 and \$90m. in 1973 (Table 36), even before the oil price increase hit the balance of trade. Until the Stevenson and Jackson-Vanik amendments led the Soviet Union to abrogate the US-USSR Trade Agreement, Hungary was also hoping for MFN treatment from the US; but although it has no emigration problem, Hungary could not adopt Romania's independent line and make its own separate deal with America—another example of Kadar's deference to Soviet sensibilities. Further unfavourable developments in Hungary's trade with the advanced industrial countries came with the enlargement of the EEC, which made even more of Hungary's major trading partners join those which already applied the common external tariff to her; and with the Western recession which began in 1974, adversely affecting Hungarian exports.

The most important external development, of course, was the rapid rise in world prices of raw materials during 1973-74, especially the price of oil. Hungary's terms of trade deteriorated drastically (Tables 29, 30, discussed in III.2 below), first with the West and LDCs (1973-74), then in CMEA (1974-75). Meanwhile the absolute price levels were moving so quickly and unpredictably that policies for dealing with them were purely ad hoc for some time (see below). Both the inflationary impact of the rising price levels and the real income consequences of the terms of trade deterioration were central features of the period from 1973 onwards.

Internally, the major environmental change was fully expected by the planners, because it was demographic. The labour force had been growing rapidly in 1967-70 (SE 75, pp. 2-3), a "demographic wave" from the ban on abortions in the period 15 years before, but the ban had lasted only four years. Policies geared to absorb the bulge had to be replaced by policies to deal with virtually no labour force growth at all.

## 2. Performance

The data themselves tell much of the story here, though they require some interpretation, and there are certain important points on which the evidence is unavailable or unclear. Overall, there was no slackening in the dynamism of economic growth, acceleration of real income increases, rather good control of inflation in the circumstances, but lack of effective control over investment, whose effects (with the terms of trade decline) give a mixed picture in the balance of trade.

Turning to the tables, we note immediately in Table 1 that our comparisons between 1961-67 and 1968-75 will be affected by the fact that 1966-67 were the years of fastest NMP growth during the entire period 1961-75 (see the discussion in Portes, 1971). Nevertheless, the overall growth rate of NMP during the period under the reforms is up by about 1 percent, although growth rates in both agriculture and industry are slightly down from 1961-67. After the reforms, industrial growth fell off initially (see also Table 14), but then picked up substantially. The series for agriculture shows the effects of the serious floods in 1970 and the weather in 1974-75 as well. On the side of uses of NMP, the growth rate of personal consumption is clearly up, that of total net accumulation (including stocks and unfinished investment) down, but that of fixed assets up considerably. This immediately suggests that stock accumulation has fallen, and Table 2 clearly shows considerable improvement in this respect after 1968. Even in 1971 and 1974, the share of inventory accumulation in NMPD<sup>5</sup> was less than the average for the pre-reform period. In these years, however, increases in uncompleted investment also take an unusually high share of NMPD; and these are years of exceptionally large import surpluses.

Tables 1 and 2 already reveal, underneath the rather steady growth of NMP, an unevenness in the pattern of expansion. We get a fairly clear and consistent picture of the sequence of macroeconomic developments from them and the tables on investment (7), industrial output and employment (14-16), agricultural output (17), prices (23-25), incomes (20-21), trade (26-27) and the terms of trade (29-30). Growth fell off in 1968, as the expansion led by fixed investment and stockbuilding in 1966-67 gave way to a cautious adaptation to the new system. But stockbuilding remained high, and industrial employment grew rapidly despite the slowdown in output growth. The authorities responded with a squeeze on working capital credit for 1969, and inventory accumulation fell sharply, so that although final demand (consumption and fixed investment) held up, producers were forced to export, and the trade balance swung strongly into surplus. Nevertheless, industrial output growth slackened further while employment continued to expand, so output per man in industry stagnated.

1970 was a turning point. Led by enterprise spending out of their "decentralized" development funds and efforts to complete projects in the Third FYP, investment continued the growth which began in 1969 (when substantial increases in socialist sector outlays had been partly offset by a fall in private house building). Industrial output.

<sup>5</sup> Net material product distributed, or domestic utilization.

responded, all of the 8+ percent growth coming from productivity increase.<sup>6</sup> But with the disastrous harvest and the rise in investment, the balance of trade went significantly into deficit.

The signs of disequilibrium should have been apparent, but the planners waited: perhaps because they were making various rationalizing changes in the "economic regulators" at the beginning of the Fourth FYP, which might have been expected to reduce the pressure, and they were reluctant to intervene directly; perhaps because they were inexperienced in macroeconomic management, or the new system was not sending them the proper signals. By the time they did act in autumn 1971 (see below), considerable damage had been done to both the economy and the prospects for any further decentralization. After a 22 percent increase in accumulation in 1970, it rose a further 27 percent in 1971. Both inventories and the stock of unfinished investment rose sharply, and the trade deficit reached unprecedented proportions. Controls on incomes held up, but there was extra pressure of demand on consumer prices, whose rise over the year reached 2 percent for the first time.

The cutback of fixed investment in 1972-73 and the restoration of equilibrium are apparent in the data. But in 1973-74 it was politically necessary to raise real incomes more rapidly than before (see below); and in the second year both investment and stockbuilding<sup>7</sup> increased strongly. These pressures combined with a deterioration of 15 percent from 1973 to 1974 in Hungary's terms of trade with dollar markets, so the import surplus on these markets was immense. World price increases were also affecting the domestic price system, despite large budget subsidies. In 1975, CMEA prices began to reflect the world price changes, and the terms of trade in ruble clearing relations fell by 9 percent and in dollar clearing relations by a further 7½ percent. Thus with consecutive weak performances in agriculture in 1974-75, even the sharp reduction in stockbuilding and improvement in investment completions could not prevent further deterioration of the balance of trade, concentrated in 1975 on ruble clearing markets. The end of the Fourth FYP saw the economy in difficult circumstances. And it is evident that the major weakness in macroeconomic policy over the period was the inability to control (perhaps even to forecast) investment, not just in industry but throughout the economy.

Closer examination of individual areas reveals considerably more of the performance characteristics relevant to any assessment of the reforms. Tables 3 and 4 on GDP give a picture similar to that in Tables 1 and 2, except that the share of capital formation appears substantially higher in the GDP accounts; and in addition to the faster overall growth in the post-reform period, we see some of the desired shift towards services in 1971-74. Related to this is the rise in the share of trade (distributive services) in NMP produced, seen in Table 5. Not surprisingly, Table 6 shows that the growth of fixed capital stock accelerated in all sectors. And with capital stock in industry growing at 8 percent, the industrial labour force at only 1 percent, and

<sup>6</sup> Demonstrating that the poor performance of productivity in 1968-69 was partly the natural concomitant of a falloff in demand, partly the consequence of the centrally-decreed reduction in the work week from 43 to 44 hours, effected in 1968-69 (compare the output per man hour data in Table 16).

<sup>7</sup> This was said to be partly the result of enterprise hedging against foreign price increases.

value added in industry at 7 percent (Tables 14–15), it is clear that any reasonable weights would give a fairly healthy rate of growth of total factor productivity in industry (and some improvement over 1961–67). We have already discussed the wide fluctuations in investment around a strongly rising trend apparent in Table 7, and they seem to have been at least as pronounced as in the decade prior to the reforms. It is notable that the pattern of fluctuations was broadly similar across sectors, except the occasionally divergent movements of total and socialist sector investment suggest that the private sector (mainly private housebuilding) behaved somewhat differently. The relative importance of the stock of uncompleted investment (Table 8) is greatest in 1971–72 and 1974 and lowest at the end of each FYP, as expected, and again this measure shows some deterioration of performance after 1967.

The distribution of investment decision authority shown in Table 9 gives a much greater role to decentralized investment than the actual extent of independent enterprise decision-making would justify, because supplementary finance from the budget and banks for enterprise investment projects gives the authorities a considerable voice in these decisions. The cutback in the share of “large state investments” in 1970 and the shift of “group investments” to the enterprise sphere in 1971 were largely formal reclassifications associated with changes in the investment financing system. It may however be significant that state investment projects appear to have contributed less than proportionately to the overall stabilization of investment in 1972–73; despite the postponement of some large state projects, the main cutback seems to have been in the enterprise sphere. Conversely, the expansion of investment in 1974 appears to have been led by the enterprises.

The structure of investment in the socialist sector (Table 10) shows a clear shift away from industry to the communal sector, services and infrastructure. The share of agriculture also fell significantly after 1971. Within industry (Table 11), mining’s share fell sharply and metallurgy was also down, while building materials, chemicals, light industry and food processing all increased their shares in the total. This was little help to the hard-pressed building materials industry, which was unable to raise its growth rate (Table 12), falling way below a planned output increase of 55 percent in the Fourth FYP. But electronics and chemicals maintained rapid expansion, and transport equipment grew faster in the Fourth FYP (the public vehicles development programme), while mining and some of the traditional branches of engineering did relatively poorly—as planned. The composition of machinery investment (Table 13) shows some shift towards imported machinery in the Fourth FYP, but some of this may be due to price effects, and the increase in the share of machinery imported from non-socialist countries shows nothing like the dramatic shift which took place in Poland. The Hungarian growth strategy has not been based on very large-scale machinery imports from the West.

Table 14 shows that value added in industry grew faster than gross output from 1968 onwards, suggesting an improvement in efficiency (less intermediate use). The reverse characterizes agricultural production (Table 17), but labour continued to move out of agriculture

throughout the period (agricultural employment fell by 12 percent in 1971-75), and the age-sex structure of the labour force in the cooperatives has deteriorated somewhat further, so the performance of gross output is in fact rather good (up 18 percent from 1966-70 to 1971-75). Table 18 indicates the effort to improve incentives to agriculture by raising state procurement prices, which increased much faster than the CPI (Table 23), and indeed faster overall than the free market prices.

Table 19 reveals one of the key forces operating during the period. The rate of increase of money wages clearly rose after 1968, but "average wage control" was very effective, and not until 1973 did wages move up sharply. This reflected a centrally-decreed, all-round wage increase for manual workers in industry, a political response to the stagnation of real wages in 1971-72. In 1968-70, money wages rose 11.6 percent in state industry while the CPI rose 2.4 percent; in 1971-72, money wages rose 8.6 percent while the CPI rose 5.0 percent. Tables 20 and 21 tell a similar story about real incomes, while Table 22 shows that the relative income position of workers deteriorated further in 1971-73, following a long-established trend which reversed only in 1974-75, when further centrally-decreed wage increases were granted. All this must be seen in the context of higher expectations, of course. 1970 was a particularly good year for real incomes, and indeed all these tables show a significant rise in the rate of growth of real incomes, comparing 1968-75 with 1961-67.

Moreover, econometric work on the consumption goods market in Hungary suggests that households were able to spend their incomes and were not forced by excess demand to save more than they desired (Portes and Winter, 1977). Only 1974-75 appears to be a period of possible repressed inflation, which is of course highly plausible in view of the story above. The behaviour of consumer prices in Table 23 also testifies to considerable success in controlling open inflation (see the discussion in Wiles, 1974, and Portes, 1977a). The rate of increase clearly rose from 1972, but it was still hardly excessive: 2.9 percent p.a. in 1972-75 (3.3 percent on the retail price index—SE 75, p. 299) is not bad, nor indeed is 2.0 percent for 1968-75. In no year before 1976 was the planned increase in the CPI exceeded. There is nevertheless some degree of flexibility in the system, as suggested by the differential rates of price increase between commodity groups.

The authorities themselves change some of the consumer prices in the fixed price category from time to time, attempting to improve the price structure. They try to prepare the population carefully for any significant increases<sup>8</sup> and to compensate with money income changes for any serious distributional effects.<sup>9</sup> But it has been estimated that centrally decreed price changes added (net) a total of only 2 percent to the CPI from 1968 to the beginning of 1975; by 1974, the fixed prices (then covering 18 percent of retail turnover) were 8 percent up on 1968, while the free prices (then covering 28 percent of retail turnover) were up 20 percent.<sup>10</sup>

<sup>8</sup> With infinitely more care and political sensitivity—and correspondingly better results—than in Poland.  
<sup>9</sup> These may have been quite important. The results of Muellbauer (1976) suggest that by 1970, the Hungarian consumer price structure was less egalitarian than that of the U.K.

<sup>10</sup> The prices subject to maxima (30% of turnover) behaved like fixed prices, while those subject to limits seem to have moved much more freely; see Marton, *Acta Oeconomica* 14 (1975), 399-413. Further evidence suggesting little or no repressed inflation is that for fresh produce, free market and state retail prices rose at the same rate (5½ percent p.a.) in 1968-75 (SE 75, p. 299), and there was no significant difference between the two price levels.

Producer prices also rose only slowly (Tables 24-25), until a far-reaching central price revision in 1975, followed by some further revisions in 1976 (see Hare, 1976a). Note again that the time path of prices differed considerably between industries even before 1975, suggesting some true flexibility; for example, there appears to be evidence of demand effects (investment pressure) for building materials in 1971-72 and engineering in 1972. Given the successful control of money wages and fairly rapid growth of productivity, it is reasonable to suppose that the main pressure on prices on the cost side came from foreign prices. Although the authorities revalued the foreign trade multipliers to follow the devaluation of the dollar from 1971 onwards (Table 32), they did not take account of the rate of inflation on foreign markets.

Thus the dollar value of the forint rose 45.3 percent from 1971 to 1 January 1976, but the overall price index of Hungary's imports from dollar clearing countries rose by 66.5 percent from 1971 to 1975 (KSE 75, p. 412). Similarly, the forint's value in transferable rubles rose 14.2 percent in 1976, but already by 1975, import prices from ruble clearing countries had risen by 32.2 percent from 1971. It is interesting to note that the difference in each case, about 20 percent, is precisely the overall price increase for socialist industry from 1971 to 1975 (Table 24). In 1973-74, however, the authorities attempted to insulate domestic prices completely, using import subsidies and export taxes.

We have already referred to the trade figures and terms of trade in Tables 26, 27, 29 and 30. It should be noted that except for 1971, the balance with advanced capitalist countries showed an encouraging underlying trend until 1974-75. Indeed, if we deflate exports to dollar-clearing countries by the relevant price indices (KSE 75, pp. 412, 415), we find that their volume grew at 9.7 percent p.a. 1961-67 and 12.3 percent p.a. 1968-75 (14.1 percent p.a. 1971-75). The corresponding figures for imports are 11.1 percent, 11.6 percent, and 11.2 percent respectively. This does suggest some improvement in the ability to sell outside CMEA, but the terms of trade effect dominates. Depending on what estimate we take of the share of trade in Hungarian national income, we could get a fairly wide range for the total terms of trade loss to the Hungarian economy from 1972 to 1975, but a central estimate must be around 6 percent of national income (15 percent of 40 percent, say). That is precisely the share of the import surplus in NMPD in 1975 (Table 2). We should note, however, that the terms of trade with non-socialist countries had in 1974 merely returned to the level of 1960; the intervening improvement had of course been gradual, but the drop took place over only two years, and then continued in 1975.

The commodity structure of trade with socialist countries shows remarkably little change over time, except the recent increase in the share of fuel in imports. With non-socialist countries, there is some increase in the share of machinery in exports, as desired, and a fall in the share of agricultural products, as well as an increase in the share of fuel in imports (Table 28). These data are of course affected by price changes.

The "Balance of Payments with GATT Countries" (Table 33) is of interest mainly because it is so difficult to get any such information

from Eastern European countries, but the country coverage reduces its usefulness. The figure for "investment income" may nevertheless be a good guide to the interest Hungary pays on her hard currency debt; a net debt of around \$2000 million in 1975 at 8%, say, gives precisely the figure in the table. But "other current payments" are rather obscure. Nevertheless, the current account balance is a fair reflection of turning points and orders of magnitude, and it does show how serious the position had become in 1975. The reserve figures in Table 34 are remarkable primarily for the steady rate at which they rose until 1976, almost regardless of the trade position (although the largest increase was in fact in the year of largest trade surplus). The overall debt picture is given by Tables 35 and 36, to which we shall return later. So far, Hungary has had no difficulty whatsoever in financing its hard currency current account deficits.

In my view, any overall judgment of the performance of the economic system as it actually operated in 1968-75, attempting to allow for the effects of the environment and of macroeconomic policy, must be positive.<sup>11</sup> The system itself did not during the period move in the originally desired directions; we discuss this below. But on balance, the economy coped rather well with the conflicting pressures on it, and the authorities have little reason to regret their decision, now over a decade ago, to introduce the new economic mechanism.

Those who had hoped that Hungary would become an example of the market socialism elaborated in the theoretical literature of the 1940s may be disappointed, and the long-run viability and efficacy of the existing system may be questioned. For 1968-75, however, in terms of the goals in II.3 above, performance has been good. And if one were to pose the question, how would the economy have performed had Hungary instead adapted its economic system in the direction followed by (say) the GDR, there is little doubt that the authorities' answer would and should favour the new system, insofar as any such counterfactual hypothesis can be evaluated.

The Party has maintained domestic political control, with some difficult periods, but considerable flexibility in recognizing and dealing with tensions related to the economy (see below). A striking recent example of their political sophistication and the degree of their popular support was their ability to implement without incident a 30% increase in the price of meat in summer 1976,<sup>12</sup> just after the Polish authorities had so dramatically failed in a similar effort. There have been no serious splits in the Party, although problems associated with the economic reforms have claimed some political victims. Externally, there have been no public manifestations of Soviet displeasure at any point. Although there is room for conjecture about the Soviet role in the decisions taken by the Central Committee in November 1972 and the personnel changes of March 1974,

<sup>11</sup> For a rather skeptical evaluation, see Granick (1973; 1975). I believe he gives insufficient weight to social and political constraints, to the independent role of macroeconomic forces, and to the economic problems which would be generated by moving significantly further towards a free market system in Hungary. I also dispute his evaluation of the actual performance data, but he was working with data going only through 1971.

<sup>12</sup> Indeed, they have effected a series of consumer price adjustments, mainly since 1973, without incident: They had initially been very cautious in this respect, recalling the strong public reaction against poorly handled consumer price increases in January 1966 (see Portes, 1972), and the consumer price changes on 1 January 1968 actually lowered the overall price level. But the recent price changes have been carefully prepared, with some money income compensation to those most seriously affected. The successful meat price increase in 1976 is the more remarkable since fresh produce prices were also soaring just at that time, because of the drought.

there is no firm evidence except Brezhnev's strong support for Kadar's policies in a visit to Budapest in December 1972.

There has been no sign of unemployment. Average wage control and the cut in the working week provided incentives to hire the unusually large number of new entrants to the labour force in 1968-69,<sup>13</sup> and enterprises making losses have not been allowed simply to fold up or discharge large numbers of workers. The problems here have been those of a tight labour market (as foreshadowed in Hamermesh and Portes, 1972). In particular, the planners themselves and some observers have found the level of labor turnover excessive. There has been considerable competition for labor, especially for skilled labor and in the Budapest area. On the other hand, the numbers do not seem high by international standards: total separations recorded annually, as a percentage of the labor force (socialist sector), peaked at just over 35% in 1969-70, as did those quitting to take other jobs, at about 22% of total employment.<sup>14</sup> These figures then fell to 32% and 16½% by 1973, and of course some of this must represent movement into more suitable jobs (the planners often appear to believe that all turnover is "wasteful").

Income and price controls have clearly been successful on the macroeconomic side. Whatever distortions average wage control may have imposed on the allocation of labor must be of secondary importance compared to its key role here. Since money wage increases did not exceed productivity growth, the main pressure on prices from costs has come through import price increases. These were neutralized with subsidies in 1973-74, but the planners then decided that real incomes would have to bear some of the economy's loss on the terms of trade (real consumption nevertheless grew slightly faster during 1968-75 than before, as originally intended). Thus the CPI rose 9% in 1975-76, having gone up only 13% over the previous seven years. This was probably sensible, given that it has proved politically feasible.

On the other hand, the reluctance to revalue the forint sufficiently to compensate for the overall rate of inflation abroad has resulted to a quite unnecessary extent in direct intervention with subsidies and export taxes, then producer price increases. The argument, said to have been put by the Ministry of Foreign Trade, that any further revaluation would harm the hard currency balance of trade, was surely wrong. As Wiles (1974) has said, the original decision to set the rate at 60 Ft/\$ in 1968 was even then a massive devaluation, contrary to the views of some Hungarian economists who wanted a still lower ("marginal") rate. The hard currency balance was duly improving until investment got out of control, and when investment was restrained, it immediately went back into surplus. Given the composition of hard currency imports, the price elasticity of demand cannot be large, and the main obstacle to expanding hard currency exports has been not price but rather quality, availability,<sup>15</sup> poor marketing, and quantitative restrictions applied by importers. Further devaluation

<sup>13</sup> Hiring a worker whose wage was below the enterprise average allowed raising the wages of those already employed without incurring tax liability.

<sup>14</sup> SE 72, p. 118, SE 74, p. 120.

<sup>15</sup> Many enterprises have regarded hard currency exports as a residual, to be considered, no matter how profitable, only after all demands from the home market and CMEA have been met. Some official statements did encourage this view, but policies have now changed, and the official line is now quite the opposite (see Sec. IV. 2).

was therefore unlikely to improve the balance of trade, but certain to exert strong inflationary pressure, given the high trade dependence. Finally, the supposed argument for letting the forint effectively depreciate with respect to hard currencies is an argument *against* letting it depreciate with respect to the ruble, yet as we saw, the effective devaluation (measured against import prices) has been about the same in both cases.

This important policy decision was therefore wrong, and it initially motivated a wide range of product- and enterprise-specific taxes and subsidies, then affected adversely both the price level and the price structure. It would have been impossible to insulate the economy from the terms of trade deterioration even under the old system (see Portes, 1977a), when foreign and domestic markets were formally separated by the "price equalization account"; but there was no reason why the new system, any more than the old, should suffer from any purely imported inflation. This is however what happened, and it is the more regrettable given the good record in controlling money incomes.

The main internal source of inflationary pressure was excess demand for investment goods. This is apparent in the prices of building materials and construction, and it was also one of the forces on the demand side of the labor market. It probably resulted in some generalized excess demand in inter-enterprise trade, but this is not clear (we commented above that there was no evidence of excess aggregate demand for consumer goods at the retail level, except perhaps in 1974-75). The main point, however, is that investment was poorly coordinated and regulated, completion times did not improve, and the balance of trade suffered. It is hard to judge whether the new system has been significantly worse than the old in this respect. One might however conjecture that the extent of decentralization of investment decisions makes little difference so long as neither ministries nor enterprises actually suffer any consequences from overinvesting, choosing bad projects, and not executing projects expeditiously. Despite the original hopes and intentions of the reforms, the central authorities were not properly restrained, and enterprises have been rescued financially when the profits they projected have not materialized (Timar, 1975, p. 101).

Achievements are difficult to judge on the important criteria of improving the match between the structures of supply and demand, efficiency, and innovation. The ability to dispense almost entirely with physical allocation controls is itself a strong positive sign,<sup>16</sup> as is the much better record on stock accumulation, and there is testimony that the availability of materials and spare parts improved somewhat.<sup>17</sup> The underlying trend in the balance of trade appears to have been favorable, if we try to allow for the macroeconomic disequilibrium (excessive investment) in 1970-71 and the terms of

<sup>16</sup> Oddly, however, the quarterly and annual "storming" or "plan cycles" which were associated with plan targets and allocation quotas seem to have persisted. They are apparent in the monthly data for construction completions and for the sales of socialist industry (SHK 1976/11, pp. 40, 23), and for the latter, although the pattern is strongest in export sales (where the plan cycles of CMEA partners might be partly at fault), it is also visible in all other categories of sales.

<sup>17</sup> On stock accumulation, see Table 2, and note that the value of stocks in state industry at current prices rose at 8.6% p.a. from end-1968 to end-1975, while gross value of output at constant prices rose at 6.0% p.a. and producer prices at 3.5% p.a. (Tables 14 and 24, SY 68, pp. 130-31, SE 75, p. 154). Thus stocks actually rose slower than output, in strong contrast to the period before 1968.

trade deterioration in 1974-75 (note that the economy did not begin to adjust to the latter, in the sense of transferring resources into the balance of trade, until late 1975). The planners believe that the industrial structure is moving in the right directions at the aggregative level of industrial branches, and that the rate of introduction of new products has increased. There has however been much criticism of lags in introducing new processes and in discontinuing production of obsolescent goods (see below). Much of the clearly identifiable modernization has come through the "central development programs" in key sectors, and there has been little or no progress towards more competition on the domestic market and the enterprise initiative which it was supposed to foster. Industrial cooperation agreements with Western firms have been a progressive influence, but while numerous they have mostly been very small-scale. The lack of competitive pressures has meant that the enterprises are less interested in them than are the central authorities, who see them as vehicles of technology transfer, the more important because balance of payments constraints preclude large-scale imports of Western machinery (see Marer, 1976, Hewett, 1975, and Radice, 1975).

### 3. *The Development of the System: Policy Changes*

Thus the economy not only expanded dynamically in 1968-75 (and quality-corrected indexes would probably show an even better record), but the authorities also had reason to be satisfied on most of their main desiderata, although there was obviously considerable scope for further improvement. They made one major macroeconomic policy error during the period (the exchange rate), they lost control of investment in 1970-71, and the economy suffered a severe terms of trade deterioration. These were not, however, sufficient reasons for stopping the further development of the reforms as originally projected, as they clearly did from November 1972 onwards. Indeed, the major foreign price changes came after the key decision, and investment had already been successfully stabilized before it. The fundamental issue determining policy has rather been income distribution and the discontents of the urban, blue-collar working class. It was decided not to go any further in removing the "brakes"—instead, to tighten them somewhat—because developments in incomes had generated serious tensions among workers, and any loosening of the brakes would have both exacerbated this problem and compounded it with employment insecurity. Writing in early 1972, both Wiles and I stressed this set of issues (Portes, 1973, pp. 383-386, and Wiles, 1974), but we did not forecast how quickly they would become the dominant considerations, nor how far-reaching would be their inhibiting effects on the reforms. But as Wiles put it, the basic problem was that "the reform . . . left out the proletariat (p. 140)." The Central Committee plenum of November 1972 was forced to remedy this omission.<sup>18</sup>

The sequence of events is important in any interpretation. Up to 1971, there was little change in the system. An egregious mistake in the enterprise incentive system, which had given managers profit-

<sup>18</sup> As we see below, the problem was and still is not only the situation of manual workers relative to other groups, but also distributional tensions *within* the "proletariat", indeed within other socioeconomic groups (e.g. managers, peasants) as well.

related bonuses ten to twenty times greater than those of manual workers (with the size of total distributions varying inversely with the workers' average wage), created great resentment and was corrected at the end of 1969. Otherwise, some of the brakes were progressively removed—in particular, the export subsidy system became more uniform and average wage control was refined as part of a set of changes in the economic regulators introduced with the Fourth FYP (see Gado, 1972). As late as May 1971, Prime Minister Jenő Fock was willing to argue at a Trade Union Congress for “allowing the reform to work better and more effectively”, and to say that “the brakes . . . must be released.”<sup>19</sup>

By October 1971, however, Fock was stressing the role of the “central control bodies”, calling attitudes like those he had expressed five months before “well-intentioned impatience [which] often fails to take account of the situation as it really is.”<sup>20</sup> The actions taken at that time, however, were limited almost entirely to restoring balance on the investment goods market and in foreign trade. An authoritative commentary on Fock's October speech stressed that he was not announcing any changes in economic policy or the economic system, that there would be “no decrease in independence”, only recognition of necessary delays in the program of developing the reforms, and that the object of the exercise was merely to restore equilibrium (which should not be seen as an “investment freeze”).<sup>21</sup>

There had however been a campaign in the press from autumn 1970 onwards against various “abuses” of the freedoms allowed by the new system. Moonlighting, real estate speculation, country houses at Balaton, high earnings of private artisans and of agricultural cooperatives allowed to expand into industrial production,<sup>22</sup> “profiteering”, “moneygrubbing”, and “materialism”—all offended the sensibilities of the working class and their representatives. Action against these peripheral but highly visible phenomena was feasible with little cost to the principles of the reforms. Thus in the second half of 1971, moonlighting and the ancillary activities of the agricultural cooperatives were restricted, new limits on real estate ownership and new taxes on land transactions and private rentals were imposed, and taxation of private artisans and traders became more progressive. At that time, however, it was clear that the authorities were “reluctant to respond to the complaints in ways which they feel might contradict the spirit of the reforms. They firmly believe that incentives and wider differentials are compatible with socialism, indeed necessary for their model to function more effectively . . . They have belatedly recognized, however, that political support for the reforms requires a substantial share of the goods to be seen to go to the working class, and that profits become more identified with social benefit . . . One may nevertheless doubt whether [the 1971 measures] will allow more than a temporary respite (Portes, 1973, p. 386).” In the event, “temporary” meant only a year.

At the Trade Union Congress to which Fock had advocated relaxing the brakes, there were clear pressures from the delegates for all-

<sup>19</sup> Nepszava 8 May 1971.

<sup>20</sup> Nepszabadsag 23 October 1971.

<sup>21</sup> I. Foldes, in Nepszabadsag 26 October 1971.

<sup>22</sup> The large state enterprises' inflexibility and lack of competitiveness or attention to market needs allowed great scope for profitable activities to the private and cooperative sectors.

round wage increases. We cited above data on real wages showing the sharp deceleration in 1971-72 in state industry—the contrast with the previous few years, especially 1970, was too abrupt, and was already perceived in spring 1971; the position steadily grew worse and in commenting on the decisions of the November 1972 plenum, a *Nepszabadsag* editorial actually claimed that real wages in industry had declined since 1970.<sup>23</sup> Whether or not it accords with the data, this was undoubtedly what the workers felt (the “perverse money illusion”). Another major source of discontent was inter-enterprise earnings differentials. The more profitable enterprises really were able to pay more, yet the obvious distortions in the price system and tremendous volume of subsidies (which came to 54.5% of total enterprise profits in state industry in 1972),<sup>24</sup> highly differentiated between enterprises, made this dependence of earnings on “profitability” appear unjustified to those who were not doing well out of it. And for the most part, these were the most sensitive group politically, the workers at the largest state industrial enterprises, which were also in general the least “profitable”.<sup>25</sup> The problems of these large firms and their workers were stressed in the press throughout 1971-72.<sup>26</sup> And there were other distributional tensions, all to the disadvantage of manual workers in the state sector: the peasants, the self-employed, and workers in cooperatives<sup>27</sup> were all doing relatively well.<sup>28</sup>

Finally, all discussion of “removing the brakes”, “eliminating unprofitable production”, and “restructuring” was understood by workers in unprofitable plants or enterprises as a scarcely veiled threat to their jobs. Fock had said in May 1971 and reiterated in October 1971 that subsidies to weak firms producing outdated goods should be reduced, that perhaps some of them would have to be closed down, that ministries should help to “regroup” labour, and that the Party and government would have to deal with the political consequences. In the budget speech in December 1971, the Minister of Finance discussed cutting down unprofitable production, and *Nepszabadsag*'s economic commentator dealt with the topic at length at the end of the year, saying that the reforms had revealed what production should be discontinued, and that the Council of Ministers had prepared measures to deal with the problem.<sup>29</sup> He returned to the topic in August 1972 with a distinctly more interventionist tone, but another writer stressed several weeks later how difficult it was politically to “rationalize” in large firms because of the fear of unemployment.<sup>30</sup>

Meanwhile, Nyers appears to have been taking a different line, praising the results of the reforms and arguing that, in consonance

<sup>23</sup> *Nepszabadsag* 17 November 1972.

<sup>24</sup> *SE* 72, p. 186. These included export subsidies, price subsidies for domestic sales, and direct lump-sum production subsidies to unprofitable enterprises.

<sup>25</sup> Thus Sandor Gaspar, TUC General Secretary and Politburo member, while still arguing for wage differentiation in *Nepszabadsag* 24 April 1971, criticized in his speech to the Congress the “exaggerated” dependence of wages on profits (*Nepszabadsag* 5 May 1971).

<sup>26</sup> See for example the article by L. Rozsa in *Nepszabadsag* 29 October 1972.

<sup>27</sup> Especially in construction, where the average wage in state enterprises rose 19.6 percent from 1967 to 1971, while the average wage in cooperative enterprises rose 35.1 percent (*SE* 72, p. 115).

<sup>28</sup> On these distributional problems, see Timar (1975, pp. 154-163). A detailed and overwhelmingly convincing statistical picture of the extent to which the relative position of manual workers had deteriorated from 1967 to 1972 is given in *A családi jövedelmek színvonala és szorodása 1972-ben* (The level and dispersion of family incomes in 1972), Budapest, CSO, 1975 (see especially the summary tables on pp. 25-28).

<sup>29</sup> *Nepszabadsag* 21 December and 31 December 1971.

<sup>30</sup> I. Foldes, *Nepszabadsag* 27 August 1972, and E. Soter, *Nepszabadsag* 6 October 1972.

with its principles, *the enterprises* should be responsible for eliminating unprofitable production.<sup>31</sup> He was doubtless expressing his view of the conclusions of a group of committees set up in autumn 1971 to evaluate the reforms, which had prepared their critique (the first phase) by spring 1972 and were to propose recommendations by autumn 1972. The critique appears to have been summarized by Bela Csikos-Nagy (Director of the National Materials and Price Office) in an article which appeared in September.<sup>32</sup> His line (and we do not know how far it represented the committees' conclusion) was that the "economic reforms' guiding principles have not been implemented consistently", i.e., he argued even at that stage for releasing the brakes: increasing market pressure by removing some price controls, subsidies, tariffs, and taxes, and using tighter monetary regulation to control investment. His major concessions were to the special problems faced by some large firms and the need to devote more financial resources to central wage policy.

Yet in the event, the latter were the main measures taken by the November 1972 plenum. The committees' reports were not published. Nyers and his allies had lost the argument, and Kadar came down decisively for the workers, as he saw it. In his speech to the plenum, he stressed the relative drop in the position of industrial workers, argued that equality had to take precedence over efficiency, and criticized petit-bourgeois excesses.<sup>33</sup> The plenum scheduled for March 1973 an 8% increase in money wages for manual workers in state industry, to be met out of central funds; it decided that the ministries should put under continuous special consideration and review the problems of the fifty largest industrial enterprises, specifying however that for all but eight to ten, "economic means" (i.e. indirect "regulators") should be sufficient to deal with their difficulties (these special cases—in the event, only six—would require direct central intervention to effect "restructuring"); and it increased the powers of the planning and price control bodies.

The general policies of the 1968 reforms were however reaffirmed. There followed in early 1973 a new decree on "unjustified profits", which was in effect a tightening of the price control regulations, and new measures for closer regulation of enterprise investment. The Central Committee plenum in June 1973 set up a new inter-ministerial State Planning Committee, and the National Planning Office became its "working arm" (which seems to have brought a more operative role for the NPO, especially in regard to investment). And by November 1973, a Central Committee plenum could establish that the resolutions of the previous November were being properly implemented, and the political situation was much calmer.<sup>34</sup> A political commentator wrote that the November 1972 plenum had "reestablished the dialectical equilibrium between economics and politics", but he stressed that "the effects of the [1968] reforms have been basically positive", and problems would be solved on this basis, "not by a return to the old system."<sup>35</sup>

<sup>31</sup> Nepszabadsag 6 February 1972 and 30 April 1972.

<sup>32</sup> Kozgazdasagi Szemle, September 1972.

<sup>34</sup> Nepszabadsag 30 November 1973.

<sup>35</sup> I. Fozsgay, Tarsadalmi Szemle, November 1973.

There has been little further recentralization since 1973, and this is itself remarkable in view of the extremely unfavorable impact from the foreign sector in 1974-75. So, I believe, is the relative restraint of the measures taken in 1972-73. The fundamental success of the reforms is demonstrated by their resistance to a powerful set of forces, any of which alone might have brought back central physical allocation, obligatory plan targets and incentives based on them, and all else associated with the "standard system" of command planning (as refined, perhaps, by the GDR). If Kadar judged the measures of 1972-73 to be politically essential, one's inclination must be to ask who else could possibly be a better judge.

Certain aspects of the story are still not clear. There had been no personnel changes in November 1972, yet 16 months later, *after* political equilibrium had been restored, Rezső Nyers was replaced as the Party's chief economic official (after eleven years in that post) by Károly Németh. Pragmatic and able, not strongly "conservative", Németh had doubtless been on the winning side in November 1972, but he did not have Nyers's economic background. A year later, at the Party Congress in March 1975, Nyers lost his seat in the Politburo as well. Then in May 1975, Jenő Fock was replaced as Prime Minister, and in July 1975 Deputy Prime Minister Matyas Tímár moved over to become President of the National Bank; both had held their posts since April 1967. Thus the three men who had been most closely associated with the economic reforms from the outset were no longer in positions of power. There is no clear evidence that economic problems motivated these changes, or even political difficulties on the scale of autumn 1972, although the tone of a report on the "situation of the working class" at the March 1974 plenum suggested some continuing worker discontent with the economic mechanism. Perhaps the old team simply were getting tired or stale; more plausibly, the balance at the top of the Party may have shifted just enough to require some visible sacrifices by Kadar of those most closely identified with the original conception of the reforms. But there were no observable major economic policy changes after November 1972 which can be associated with these personnel changes.<sup>36</sup>

An alternative explanation might be external pressures. Kadar had in November 1972 warned against any "conceit" in comparing Hungary's economic system with those of other CMEA countries; the State Planning Committee set up in June 1973 appeared to be a direct copy of its Soviet counterpart; and the leader of 23 March 1974 in *Nepszabadság* by its new editor (for many years the Central Committee secretary responsible for international affairs) suggested that Hungary had much to learn from the other socialist countries. This article evaluated the economic mechanism favorably, but criticized "practical work", in particular "delays" in recognizing serious problems and dealing with them. All this is weak evidence for concluding either that the majority in the leadership were unhappy about progress in the economy after November 1972 (against the testimony both from the press and the data indicating improvements in 1973), or that the fraternal socialist countries demanded the removal of

<sup>36</sup> A few import quotas introduced at the beginning of 1975 in response to the balance of trade problem indicate some inclination to use more direct intervention, given the increased pressure on the economy, but hardly a policy change (*Nepszabadság* 3 March 1975).

Nyers. Kadar would certainly react if the Soviet Union had reason to be concerned about internal political developments in Hungary, but whereas this was clearly the case in autumn 1972, there were no such strong signs in 1974-75.

The overall lesson of the story is that while economic problems motivated the Hungarian economic reforms, political forces severely constrain their scope and development. The decision not to release the brakes any further, but rather to recentralize somewhat, was not primarily due to pressure on the economy, either from excess demand generated by overinvestment or unrealistically high growth targets, or from the unfavourable world market developments in 1974-75 (although the pressures of adjustment to the latter would probably be sufficient to preclude any significant decentralization in 1976-80).

Rather, the decision expressed clear priorities for the goals of a politically acceptable income distribution and a minimum rate of increase of living standards for all major groups in the population, with special concern for industrial manual workers. To view the distributional problem as a simple conflict between incentives and efficiency on the one hand and egalitarianism on the other would be mistaken, however. The income differentiation which was taking place was not differentiation according to work, and this was too apparent to all concerned; and the corrective measures had little to do with incentives. The authorities are quite willing to encourage motivation by self-interest, but they have not yet been able to translate this into an effective and socially acceptable incentive system, partly because of the deficiencies of the price system.

The full employment goal also played an important role, but I cannot accept the argument of Granick (1975) that this requires a sellers' market, which is in turn the fundamental barrier to greater microeconomic efficiency (on the latter point, he follows Kornai, 1971 and 1972). First, the authorities have not accepted the extreme version of absolute job security; they have intervened directly to restructure enterprises in difficulty (including six of the largest firms in the economy), and this has involved substantial transferring of workers. They were not willing simply to let these enterprises go bankrupt and allow the market to reallocate, and I find their response not only politically but also economically sensible. There has of course been extensive protection of high-cost enterprises with subsidies, tariffs, etc., and this has impaired the usefulness of profits as an incentive and a channel for allocation of investment funds. But the correct response here would be to try to rationalize the subsidy structure, while giving direct "adjustment assistance" to enterprises which need it—not to create excess supply by deflation.<sup>37</sup>

Enterprises do not in general feel any strong effects of competition, but this is due to the high industrial concentration and lack of competition from imports (undervalued exchange rate and some direct restrictions). Finally, I do not agree that there has been substantial excess demand on all markets throughout the reform period. There undoubtedly was for investment goods in 1970-71, perhaps again in 1974-75, and for consumption goods in 1974-75; but conversely, there

<sup>37</sup> Nor can they simply let enterprises discontinue all "unprofitable" production, given that many such goods may actually be quite essential and costly to import.

were signs of excess supply in 1969 and again in some areas in 1976.

The stress on income distribution, living standards, and employment has however clearly been to the detriment of the price structure, incentives, innovation, and the balance of trade. We consider in Section IV what we can expect during the current Fifth FYP in this light.

#### IV. PROSPECTS, 1976-1980

##### 1. *Changes in the Environment*

The clearest change in the circumstances facing the Hungarian economy from the Fourth FYP to the Fifth is the substantial amount of hard currency debt accumulated during the Fourth FYP period (Table 35). The net debt was only a few hundred million dollars at the beginning of 1971, but by the end of 1975, we estimate it was slightly over \$2,000 m. (Table 35). This nets out \$840 m. of deposits with Western banks, which are used partly as transactions balances; they are presumably included in the reserve figure in Table 34, which suggests Hungary was holding almost as much again in gold and securities. Of the \$2870 m. gross, \$170 m. were Western government-guaranteed export credits, \$380 m. medium- and long-term Eurocurrency loans, \$216 m. bonds, and the remaining \$2,100 m. were short-term debts in the Euromarket. In 1976, Hungary's gross liabilities in the Euromarket were increasing at \$250 m. per quarter during the first three quarters.

Interest payments alone on the net debt must currently be running at over \$200 m. p.a., close to 15 percent of hard currency exports. The short-term debt is rolled over; scheduled repayments of principal on the longer-term Euromarket debt are bunched in 1979-81, \$200 m. in each of the first two years and \$300 m. in the third. If the hard currency current balance is in equilibrium by then, and conditions in international capital markets are favorable, refinancing should not be too difficult. But if the trade deficit persists, with a continuously increasing debt, refinancing might pose problems. It is however quite unlikely that Hungary could by the end of the FYP be running a hard currency trade surplus sufficient to meet interest payments and pay off principal falling due (for a comprehensive discussion of East European debt problems, see Portes, 1977b).

The existing debt carries a substantial burden of interest payments and would appear to require a rapid shift into a hard currency trade surplus, to be maintained for some time. Moreover, terms of trade with the West, demand on Western markets, and the future availability of Western loans have all become more difficult to forecast, and this too would motivate a conservative policy. Terms of trade in CMEA are easier to predict, given that prices now follow world prices on a five-year moving average, and for Hungary, changes over the next few years will be unfavorable, as the oil price increase works through.<sup>38</sup> Centripetal forces within CMEA will be strong, as the smaller countries are forced to restrict their imports from outside the bloc and become even more dependent on the USSR for raw material supplies.

Internally, a significant favorable development is the discovery of fairly large copper reserves. Although they are rather deep, the

<sup>38</sup> Thus the price Hungary pays for Soviet oil rose 23 percent on 1st January 1977.

planners are hoping for output of 100,000 tons by 1980, which would be a great help to the balance of trade. The main resource constraints are the labour supply, which is expected to remain constant throughout this FYP, and a capital stock deficiency resulting from long neglect of investment in infrastructure.

It is not clear how much the planners have learned about macro-economic management in a decentralized system from their errors in 1969, 1971, and 1974. It may be that the environment in which they operate does not allow them a sufficient range of policy instruments. This was from the outset a potential danger, given that neither income tax nor commodity taxation could be used to adjust the balance of aggregate demand and supply. Thus to deflate, they have tended to use direct controls on the volume of credit, which in the first instance hit inter-enterprise demand. The credit squeeze which began in the second half of 1975 and extended into 1976 seems to have done just that, and although it had the desired effect on the balance of trade, output growth fell sharply.

Finally, an important change in the circumstances facing the planners is the greater expectations created by the faster growth of real incomes and consumption in recent years. The shift was by no means as dramatic as the contrast in Poland between 1971-75 and the previous period, but it was certainly perceptible, and it limits the planners' room for maneuver.

## *2. Priorities and Policies*

As seen at the beginning of the Fifth FYP, the relative emphasis on various goals had changed somewhat over the preceding eight years. Stability of the income distribution and improvement of the hard currency balance of trade had gained in importance, while the rate of inflation had lost, as the population and the planners had managed to cope with 2 to 4 percent *p.a.* over the 1971-75 FYP. Efficiency in the sense of shaking out the production structure has been supplanted to some extent by efficiency in the old sense of "mobilizing reserves". Here the "reserves" lie in the internal organization and management structure for key decisions, the coordination of the productive process, and economy in energy and raw material use.

The FYP itself reflects increased uncertainty about world market developments, insofar as it is more detailed and concrete in specifying the progress of the economy up to mid-1977 than from then until 1980. The usual aggregative goals are set for the whole period, as seen in Table 37; but investment plans are much less elaborate than has been customary in the past. No new "central development programs" are proposed; rather, the Plan stresses proper completion of those currently under way (aluminum, petrochemicals, public vehicles, computerization, natural gas, industrialized building techniques). The planned rate of growth of investment is below that of 1971-75, but above that of consumption, so the share of accumulation will rise. Within this, infrastructure will be stressed, and housing will receive special priority.

The macroeconomic targets are generally somewhat more modest than actual achievements in 1971-75, and they show clearly the planners' intentions to adjust during the period to the deterioration

of the terms of trade. We recall that as of 1975, there had been very little adjustment, and the economy was running an import surplus of roughly the same magnitude as its loss on the terms of trade in 1974-75.<sup>39</sup> The planners anticipated an 8 percent improvement from 1976 to 1980 in the terms of trade on dollar markets (as well as a revival of demand) from 1975, but CMEA prices will be moving through 1978-79 towards those prevailing in the West in 1973-74. Consequently, they project that adjustment will require that NMP distributed domestically should grow about 1.2 percent p.a. slower than NMP produced, and the growth rates of personal consumption and per capita real incomes should fall by about 1 percent from those of 1971-75 (the share of consumption in NMPD is to fall from 75.6 percent in 1971-75 to 74 percent in 1976-80).

This strategy raises two questions: will it be possible to effect the required shift in foreign trade, to restrain imports and expand exports sufficiently to meet the hypothesized transfer of resources into the foreign sector? And if so, will the resulting decline in the rate of increase of living standards bring it below the minimum politically supportable rate? Discussion of the foreign trade plans seems to take as given the Hungarian economy's high elasticity of demand for imports with respect to domestic output,<sup>40</sup> and policy shows a much stronger, more conscious export-orientation than before. To avoid excessive stress in public on the geographical orientation of Hungary's exports, the planners speak in terms of expanding production of "convertible goods," i.e. those which can be sold on any market, rather than emphasizing the difference in the quality standards of hard currency and CMEA markets.

The fact remains that the planners are trying to move away from treating hard currency exports as a residual, and they say they are switching from restriction of hard currency imports (which they tried in 1972 and 1975), which is very difficult in view of their composition (Table 28), to a dynamic expansion of exports to the West. The plan projects an increase in exports to dollar-clearing markets of 60 percent (in volume, i.e., at constant prices) over the five years, a rate of 9.9 percent p.a. This seems ambitious, but the corresponding figure for 1971-75 was in fact 10.1 percent p.a. The more ambitious target is actually the restriction of the growth of imports from dollar-clearing markets to only 40 percent (again, in volume) over the period, i.e., 7.0 percent p.a., as against the 8.3 percent p.a. recorded in 1971-75.

Whether the real income increases projected in the Plan will be sufficient to maintain political equilibrium is a question which an outside observer must hesitate to answer. The population are conscious of the advantages which political stability and the general orientation of economic policy have brought in recent years, and they know that developments in the world economy have been unfavorable to Hungary. But they will also have observed the exercise of power by the workers in Poland in regard to policy on consumption. They will

<sup>39</sup> It might be argued that Hungary, like all other non-OPEC countries, should expect to carry indefinitely some part of the collective deficit corresponding to OPEC's surplus (for this purpose, include the USSR with OPEC). The planners do not see it that way: CMEA practices do not include provisions for long-term trade deficits, i.e. regularized long-term lending; and at least publicly, Hungary maintains that it wishes progressively to repay its hard currency debts, rather than to accumulate more in the longer run.

<sup>40</sup> During 1971-75, NMP at constant prices grew at 6.2 percent p.a. while imports at constant prices grew at 14.8 percent p.a.—thus the elasticity of the text was 2.4.

have to give their leaders the benefit of the doubt, reasoning much more explicitly than in the past that they are getting the most that is feasible in the circumstances.

### 3. *The Economic System*

The economic system as it now operates and as it can be foreseen to the end of the decade is, in its essentials, very similar to that originally introduced in 1968. This was not, of course, the reformers' intention, but we have seen how events have frustrated the conception of a decade ago that the brakes could progressively be released, so that the economy would increasingly be regulated by market forces. As a leading strategist among the reformers has recently said, in the medium run there is "hardly a possibility of further decentralization."<sup>41</sup>

There has in principle been some loss of enterprise independence, some increase in the "tutelage" exercised by branch ministries and in the control over investment by the NPO. This is not based on obligatory plan targets, and it is not clear how much difference it will make in practice. The price structure is not likely to be significantly less flexible than in 1968-75, but the existing scope of free price determination will not widen. There will be further attempts, led from the center, to bring consumer and producer price structures closer together and closer to costs. Nevertheless, the informational content of prices is unlikely to improve significantly.

The main areas of more direct intervention and control by the authorities will be in investment and the labor market. Some shift from enterprise-financed to central-financed investment has been effected<sup>42</sup> by reducing total enterprise profits (in the 1975-76 price revisions) and by raising the average rate of profits taxation (the marginal rate has however been reduced, with the objective of increasing incentives). The previous restriction on the allocation of profits between the development and sharing funds has been removed, but increases in profit distribution to workers continue to be heavily taxed, so it is unclear what the effect of this will be.<sup>43</sup> A substantial part of bank credits for investment has been set aside for a special competition between enterprises, which are to propose projects generating "convertible exports".

In the labor market, inter-enterprise wage differentials should be reduced by a revision of the basic wage tariff structure which raises the lower limits for each job category.<sup>44</sup> The ratio of administrative employees to manual workers in socialist industry had been rising steadily, from 9.5 percent in 1965 to 12.7 percent in 1976 (SE 75, p. 141), and despairing of indirect measures, the authorities imposed a ban on hiring for all administrative posts from the beginning of 1976. This has been relaxed from the beginning of 1977 to allow replacement of workers who leave, but no expansion in the number of posts; it is

<sup>41</sup> J. Bognar, Valosag, February 1977.

<sup>42</sup> The share of state investment is expected to rise from about 45 percent in the Fourth FYP (Table 9) to somewhat over 50 percent in the Fifth FYP.

<sup>43</sup> "Average wage control" will in some areas be replaced by other forms of regulation of wages; but there is no reason to believe that these will give any less central control over money incomes and wage cost inflationary pressures.

<sup>44</sup> Magyar Hirlap 15 December 1976, Nepszava 14-15 January 1977.

nevertheless an example of the willingness to use direct controls when necessary. A similar example, with considerable political and economic justification, is a set of new measures providing for the "redirection" of labor "released" from their jobs—i.e., made redundant. In our view, the authorities are serious about restructuring and the elimination of high-cost production, but they recognize that this will have to be implemented by direct central intervention.<sup>45</sup>

Managerial incentives, like wages, will be less directly tied to enterprise profits. The intention is to encourage longer-run horizons for managers, by evaluating their performance on the basis of an assessment of the overall development of the enterprise by the ministry. This of course carries the potential for serious restriction of enterprise independence, but it is too early to say how the evaluation will be implemented in practice. The converse, however, is that there will be less pressure for subsidies to keep up profits and thereby protect the incomes of managers and workers.

Overall, the main weaknesses of the system are the poor informational content of prices, for both investment and foreign trade decisions, and the absence of internally generated innovation. Despite sticky prices, short-run allocation is basically market-determined, with some degree of informal rationing by producers<sup>46</sup> and central restrictions on purchases and inventories of certain materials, but we see little prospect of any significant extension of central allocation. At present, the commodity allocation system is slightly less restrictive than it was in 1968. But the problems of creating an efficient, flexible, and dynamic "capital market" in a system of state ownership have not been solved. They are of course related to equally fundamental problems in the incentive structure and price system, and we foresee little progress here in the medium term. Nor can Hungary try to solve the innovation problem with the Polish strategy of 1972–75, importing vast quantities of Western equipment and technology, because of the balance of payments constraint and already substantial volume of hard currency debt. The planners have stressed "industrial cooperation agreements" with Western firms to try to get around the balance of payments constraint, but domestic enterprises have not taken the initiative here (again, incentive problems), and the large number of such agreements overstates their significance to the economy.

Thus the Hungarian "new economic mechanism" is now firmly established, despite strong pressures which might have been expected to push the economic system back into the form which other CMEA countries have maintained. Seven years ago, I concluded an evaluation of the reforms by saying, "There is little prospect of recentralization (Portes, 1970, p. 313)." There has been a limited extension of central intervention, but the reader may judge whether this may in good part have been a natural consequence (as in other economies) of strong forces in the international economy to which Hungary, because of its high foreign trade dependence, is especially vulnerable. I do think that a similar conclusion is justified at the present time.

<sup>45</sup> It is intended that 362 plants should be closed in 1976–80, of which the majority will be small, inefficient engineering plants (T. Nemeslaki, Minister for Metallurgy and Engineering—and former Deputy General Secretary of the Trade Union Council—in Magyar Hírlap, 10 October 1976).

<sup>46</sup> Both this and price control are easier, the smaller the number of enterprises, and there is no reason to expect any significant deconcentration.

Subject to obvious qualifications regarding the political environment—and we cannot ignore that both Brezhnev and Kadar (not to mention Tito) are likely to retire from the political scene by 1980—the Hungarian economic system will continue to be the pragmatic, somewhat inconsistent mix of market and administrative allocation which has been maintained since 1968.

#### 4. *Conclusions*

I should hesitate to draw from the Hungarian experience any lessons or generalizations to be extended to other East European countries. The 1968 reforms were unique in conception and implementation, and even now no other country is likely to follow the Hungarian example. A brief summary of the most important points to emerge from the analysis above may be useful, however.

(a) The performance of the economy has improved under the new system, despite the exhaustion of labor reserves, serious adverse changes on external markets (both CMEA and non-CMEA), a major macroeconomic policy error (the exchange rate), and continuing inability to control investment. It seems doubtful that the old command system, however rationalized, could have performed as well in the circumstances.

(b) Further development of the system in line with the original conception was halted in 1972 primarily because of distributional tensions and the deterioration of the position of industrial blue collar workers, for which the reforms appeared to be responsible. The pressures of excessive investment in 1970–71 and deterioration of the terms of trade in 1974–75, as well as resistance to market-oriented decentralization in CMEA, were contributory factors, but not decisive. The distributional problem was not a matter of efficiency versus egalitarianism, however, and a more consistent development of the price and incentive systems, coupled with more sensitive central intervention in reorganizing the structure of production, might have avoided the tensions which led to the November 1972 plenum. Whether the model towards which the reforms were originally directed could have been viable in the external environment, as it developed, does in any case seem questionable. But it was not killed by excess demand.

(c) The political constraints on the economic system seem to have been primarily domestic, rather than imposed from abroad. Conversely, economic decentralization has not entailed any significant political decentralization or loss of authority for the Party. Although overt political and social control has become much less restrictive, there has been no development of pluralism in political life. The population has accepted this situation, and the tensions visible elsewhere in Eastern Europe have not been manifested in Hungary. It is difficult to judge how much this may be due to rising living standards, a less bureaucratic atmosphere in economic life, the bitter experience of 1956, Kadar's political acumen, or Hungarian pragmatism and sophistication.

(d) The main feature of the current FYP is not any systemic change; but rather the attempt to adjust to external pressures on the economy: a hard currency trade deficit, exacerbated by a substantial volume of hard currency debt; and falling terms of trade in CMEA, exacer-

bated by commitments to invest in raw material extraction in other CMEA countries. These pressures are to be met by expanding exports rather than restricting imports, i.e. continuing to increase foreign trade dependence, while somewhat increasing the share of trade with hard currency markets. The outstanding questions are whether exports can in fact be increased as rapidly as planned, and how the population will react to the necessary fall in the rate of growth of consumption. The authorities seem to realize there may be advantages, especially in these adverse circumstances, to maintaining systemic stability. But even on optimistic hypotheses, the pressure on the Hungarian economy in the foreseeable future will be severe, and the uncertainties surrounding any predictions about the system, and especially its foreign economic relations, are correspondingly great.

TABLE 4.—GDP AND GNP  
[Annual percentage changes, at constant prices of 1968]

	Material output	Services	Total GDP	Real GNP, Alton recalculation
1971.....	6.5	10.3	6.9	4.9
1972.....	5.0	6.5	5.2	2.5
1973.....	7.5	6.4	7.4	5.4
1974.....	7.3	6.8	7.3	3.2
1961-65.....	4.5	4.0	4.4	NA
1966-70.....	6.6	3.9	6.3	3.0
1971-74.....	6.6	7.5	6.7	4.0

Notes: 1. Current and constant price data for 1974 (SE 74, p. 79) imply that the GDP deflator increased at 2 percent per annum in the period 1968-74. 2. Growth rates for FYP periods calculated as compound rate from base year (immediately preceding 1st year of period) to final year.

Sources: For 1960, 1965, 1970, 1973, 1974, SE 74, p. 79; for 1972, SE 73, p. 75; for 1971, SE 72, p. 73.

Alton's recalculation and methodology are given in Alton (1976). Although Alton (1974) gives a GNP index going back to 1950, we do not cite from this the growth rate over 1961-1965, because the more recent figures differ considerably from those calculated by Alton (1974) for the period over which they overlap. Thus Alton (1974) gives a growth rate of 4.3 percent per annum for the period from 1967 to 1972, while Alton (1976) gives only 2.1 percent per annum for the same period; Alton (1974) gives growth rates of 6.6 percent and 4.1 percent for GNP in 1971 and 1972, respectively, which are much more like the official series than Alton (1976).

1968-75.....	(5.1) 5.3	(3.4) 3.5

<sup>1</sup> Includes income in kind from social services, etc.<sup>2</sup> Net per capita earnings from employment deflated by consumer price index.

\* Not available.

Note: Growth rates for FYP periods calculated as compound rate from base year (immediately preceding 1st year of period) to final year; same procedure for longer periods, but rates from fitted exponential trends also given in parentheses.

Sources: For 1961-65, 1966-70, 1971-75, and 1968-75, SE 75, p. 313; for 1961-67, 1968-75, SE 74, pp. 365-366, SE 75, p. 313; for 1976, Nepszabadsag, Feb. 13, 1977.

TABLE 21.—PER CAPITA INCOME AND CONSUMPTION EXPENDITURE

[Annual percentage change]

	Money disposable income, per capita	Real disposable income, per capita	Real consumption expenditure, per capita
1961-67.....	(5.6) 5.7	(5.2) 5.1	(4.9) 5.1
1968.....	7.8	8.2	6.0
1969.....	8.9	7.4	6.0
1970.....	9.9	8.4	8.2
1971.....	7.4	5.3	6.2
1972.....	6.9	3.9	4.7
1973.....	9.3	5.8	4.9
1974.....	9.5	7.5	7.1
1975.....	8.5	4.5	3.9
1968-75.....	(8.1) 8.5	(6.0) 6.4	(5.8) 5.9
1961-65.....	5.0	4.6	4.4
1966-70.....	8.2	8.0	6.8
1971-75.....	8.3	5.4	5.3

Notes: Real income is money income deflated by CPI. Growth rates for FYP periods calculated as compound rate for base year (immediately preceding 1st year of period) to final year; same procedure for longer periods, but rates from fitted exponential trends also given in parentheses.

Source: Rudcenko (1976) p. 27, cols (2), (7), deflated by midyear population data.

TABLE 22.—RELATIVE PER CAPITA INCOMES

[Working class equals 100]

	Total	Working class	Cooperative peasantry	Dual-income group	Nonphysical workers	Pensioners, etc.
1970.....	106.3	100	106.4	110.1	133.6	73.4
1971.....	107.4	100	107.8	110.7	137.4	75.6
1972.....	107.6	100	109.1	112.0	137.4	76.2
1973.....	107.4	100	110.6	114.0	133.8	79.1
1974.....	106.3	100	109.0	113.2	129.8	79.0
1975.....	105.7	100	108.3	112.9	129.3	79.4

Notes: "Dual Income" households are those which receive both nonagricultural and agricultural incomes. Statistical classifications changed during the period 1965-75, so it is impossible to derive a consistent series for the whole period from published CSO sources. A recent article in the party monthly, however, does give data for 1965-75 on a different classification from that in our table (J. Balint, Tarsadalmi Szemle April 1976). Taking "working class" per capita income as 100, this shows "peasant" incomes starting at 93 in 1965, going to 102 in 1968, 104 in 1970, peaking at 107 in 1973, then coming down to 105 in 1974 and 104 in 1975.

Source: SE 75, p. 314.

TABLE 37.—4TH AND 5TH FYP (1971-75 AND 1976-80)

[Annual percentage changes]

	4th FYP		5th FYP plan
	Plan	Actual	
National income (NMP) produced	5.4-5.7	6.2	5.4-5.7
In industry	6.7	7.7	6.7-7.0
In agriculture	3.0	3.9	2.7
NMP distributed	5.4-5.7	5.2	4.2-4.6
Consumption	5.2-5.4	5.1	NA
Investment	5.5	5.6	5.9-6.2
Industrial output	5.7-6.0	6.4	5.9-6.2
Industrial productivity	NA	6.1	6.2
Agricultural output	2.8-3.0	3.3	3.2-3.4
Personal consumption	NA	5.0	3.9-4.2
Real income per capita	4.6-4.9	4.6	3.4-3.7
Real wage	3.0-3.3	3.3	2.7-3.0
Consumer price index	NA	2.8	3.5
Investment in Socialist sector	6.5	8.6	4.6-4.7
Export volume	7.1	10.8	8.9-9.2
Ruble relations	7.4	11.5	7.3-7.7
Dollar relations	6.2	10.1	9.9-10.5
Import volume	7.4	9.0	6.3-6.7
Ruble relations	8.4	9.7	5.7-6.2
Dollar relations	5.2	8.3	6.3-7.0

Note: All magnitudes are in real terms. Industrial output is gross value of output at constant prices, and the corresponding productivity concept is used (output per man). Investment in NMP distributed is total net accumulation. Agricultural production is gross output, and annual growth rates are calculated comparing total output for the 5-year period with that for the preceding 5-year period; the same procedure is used for growth rates of investment in the Socialist sector. The data on actual export and import volumes for the 4th FYP do not accord with those derived by deflating data in table 27 by price changes in table 31, but we cannot explain the discrepancy.

### I. FROM THE 1970 RIOTS TO THE 1976 PRICE INCREASE CRISIS

The December 1970 workers' riots were followed by a change in the party and government leadership. A "new political style" appeared.<sup>1</sup> A new development strategy was introduced which, among other things, involved modifications in the Plan for 1971-75. Promises were made about rapid increases in the standard of living. Changes in the system of planning and management of the economy were envisaged.<sup>2</sup> After a period of political and economic stagnation of the late 1960's, the changes seemed very promising, particularly in the economic sphere, and, indeed, the performance of the economy was very impressive in terms of rates of growth of net material product (official data) and gross national product (Western calculations) and their stability (see Table I).

However, by 1975 some economic difficulties had become apparent and in 1976 the prevailing mood of the population changed. Optimism gave place to a widely spread feeling of disappointment and frustration, irritation and, finally, almost the same pessimism as that which had characterized the last years of Gomulka's leadership. The announcement of price increases of a few basic foodstuffs by Premier Piotr Jaroszewicz on June 24, 1976 triggered off strikes and slow-down in production throughout the industry. The country was brought to the brink of new serious riots which were only avoided by the prompt

\*The author wishes to acknowledge, with thanks, research grants from the American Council of Learned Societies (1974), the Canada Council (1975) and the Ford Foundation (1975) which made it possible for him to visit Poland twice (1974 and 1976) and to collect research materials on which this paper has been based.

Note: DNMP  $\pm$  foreign trade balance = NNMP (national income for distribution in Marxist terminology). GNP calculated according to the Western methodology.

withdrawal of the price increase bill and the promise of a thorough discussion of this matter with various groups in the society.

Ex post, it is easy to find the reasons why this particular decision encountered such reaction. Gomulka had been forced to resign over the price increases in 1970 and the first decision of the new leadership was to cancel them. Moreover, the new leaders wished to capitalize on this action. They kept reminding the population that the prices of basic foodstuffs were constant and this fact was presented as a great achievement and an essential part of the programme for the improvement in the standard of living. After the prolonged period during which the constancy of prices of basic foodstuffs was used in this way for propaganda reasons, a change in the policy had to create a particularly strong impact. As Gomulka's price increases had been introduced just before Christmas, the new leaders concentrated their attention on the proper timing. The end of June seemed safe. The students had left the universities and the workers should be thinking about their summer holidays.

The leaders did not, however, realize that they had waited too long. Instead of introducing the price changes gradually earlier, at the time when considerable increases in personal incomes were taking place and the mood of the population was optimistic about future improvements in the standard of living, the proposed increases in prices were to be effected in one large dose at the time when the new economic difficulties had already become known to the population. Shortages of many consumption goods, above all extremely severe shortages of meat, made obvious to everyone that the progress had not been as great as the leaders were claiming. The population was also aware that the 1976-80 Plan envisaged more moderate increases in personal incomes than those which had taken place in 1971-75 (the planned average annual rate of growth of money incomes of the

population is 5.5 per cent for 1976–80, as compared with 7.7 per cent planned and 13.7 per cent actual rate for 1971–75). In this situation the opposition to the price increases appeared as the defence of the improvements in the standard of living which had been accepted as one of the conditions of the so-called “social contract” between the Party leadership and the population, to which Gierek was referring so often.

Two lessons from the June 1976 price crisis are important for the analysis of the Polish economy in the 1970's. The first lesson is that the workers fully realize their strength and are not prepared to accept any new sacrifices in terms of their standard of living. In this respect the leaders have no freedom of manoeuvre any more. The second lesson is that the leaders have insulated themselves from the population and have very little understanding of its moods. This is perhaps partly the result of the system in which the currently accepted party line is sent from the top down to the local Party and government units and whenever information is requested a reflection of the accepted view goes back to the leaders. In other words, the leaders receive what the lower echelons of bureaucrats know they would like to hear, a typical feature of every bureaucratic machine.

## II: GOMULKA'S LEGACY

In order to appreciate fully the problems with which the new leadership had to cope, it is necessary to examine briefly the long-run performance of the Polish economy since the adoption of the Soviet-type system of planning and management and the introduction of the Six-Year Plan in 1950. According to the official statistics the average annual rates of growth of domestic net material product (the “produced national income” in the Marxist terminology) declined from 9.7 per cent during the first industrialization drive effected under the Stalinist system in 1950–55, to 7.7 per cent during the first three years of Gomulka's leadership in 1956–58, when some bold systemic changes were made; to 5.9 per cent in 1959–67, the years when Gomulka was firmly in power; and finally, to 5.7 per cent in the last three years of his leadership in 1968–70. There was a similar decline in the average rates of growth of industrial product, accumulation, fixed capital investment, total consumption and personal consumption. The average annual increase in per capita total consumption outlays during the last three years of Gomulka's power was 4.2 per cent and that of personal consumption outlays was 3.8 per cent, while the real wage in the socialist sector increased on average by 1.6 per cent (see Table II).

Already by the middle of the 1960's it became clear that the strategy of economic development, which had been followed until then, could not be expected to give satisfactory results in the future.<sup>3</sup> This was the so-called strategy of extensive development which in Poland, as in other East European countries, followed closely the Soviet example.<sup>4</sup> The process of growth depended on the increases in the

quantity of inputs rather than on the increases in their productivity.<sup>5</sup> Large increases in employment outside agriculture were obtained by increasing the labour participation ratios, particularly that of women, internal migration from rural to urban areas and from small towns to the centres of industrial activity, and by a very high rate of commuting from the rural areas of the so-called double-occupation group (farmer-worker).<sup>6</sup> Large directly productive investments in industry were secured by high ratios of accumulation in the net material product, i.e. by allowing only moderate increases in consumption, and by severe restrictions imposed on investment in housing and the socio-economic infrastructure.<sup>7</sup> The increases in labour productivity were achieved as the result of heavy investment outlays. The ratio of capital to labour was increasing and the productivity of capital was declining (see Table III). The ratio of the rates of growth of net material product to the rates of growth of investment declined between 1961-65 and 1966-70 in the economy as a whole and in all main sectors, except in construction and commerce (see Table IV).

The system of economic planning and management was geared to this strategy. After a pioneering theoretical discussion and some experiments with certain features of market socialism in 1956-58, there was a return to the traditional Soviet model with only relatively few modifications, which included, above all, individual agriculture (since the decollectivization which took place in 1956). This system, highly centralized and depending mainly on administrative commands, could enforce a high degree of the mobilization of resources and their

concentration in a few selected areas, but it was not able to ensure their efficient use.<sup>8</sup>

As the result of the interaction of this development strategy and the system of planning and management a certain industrial structure had been created which was adjusted to the extensive pattern of development (a high proportion of producers' goods in total output) and a relatively limited role of international trade.<sup>9</sup> This industrial structure, which had been created during the 1950's, was rapidly becoming obsolete. It had an adverse effect on the expansion of exports and on profitability of foreign trade. It hampered the possibility of supplying the domestic market with consumption goods and maintaining equilibrium in that market. It was not conducive to the generation of technological innovations and to the utilization of the results of research and development.<sup>10</sup>

Although attempts were made in the 1960's to change the structure in order to bring it closer to the structure of the advanced countries in Western Europe, no success was achieved because "the administrative system of centralized management, which was based on the directives of the annual plans, was consolidating the existing structure,

petrifying the extensive methods and preventing full utilization of the created productive capacity." <sup>11</sup>

The situation became difficult because in Poland, as in other East European countries at that time, a vicious circle appeared.<sup>12</sup> In order to effect a switch from the extensive to the intensive pattern of growth, it was necessary to reform the system of management and planning, to introduce more realistic prices, and more effective incentives. The economic reforms require, however, a reduction in the investment drive in order to remove, or at least to reduce, the undesirable pressures which are usually associated with very high levels of investment. In addition, it is necessary to prepare some reserves, to reduce the degree to which the market is a sellers' market and to secure sufficient supplies of consumption goods, without which even the theoretically best system of incentives becomes useless.

At the same time it was, however, impossible to introduce an intensive pattern of growth without some changes in the inherited industrial structure, which was geared to the extensive pattern and created a serious obstacle for the change to the intensive strategy. The relative importance of those branches of industry in which increases in labour productivity could only be achieved at the cost of heavy investment had to be reduced. The industrial structure demanded adjustment to the requirements of international specialization and trade in order to take full advantage of the economies of scale and specialization. Those enterprises and industries which were making losses persistently and were subsidized at the expense of the rest of the economy, had to be reorganized or eliminated.<sup>13</sup> Old and inefficient equipment and machines had to be replaced and modern processes introduced.<sup>14</sup>

A reconstruction of this nature usually requires a large volume of investment. In order to effect it within a relatively short period of time and on a significant scale, it was necessary to increase the share of accumulation in national income. A new investment drive would, however, be incompatible with the requirement of reducing the pressures within the economy and increasing consumption, without which a successful reform could not be introduced. Hence the vicious circle.<sup>15</sup>

Gomulka's group gave priority to the structural changes, to be effected as the result of a new investment drive. The Third Five-Year Plan (1966-70) was designed for this purpose. The impact of this policy, and of the vicious circle itself, could have been mitigated by giving priority to the expansion of industries with relatively low capital intensity. Although there was a decline in the share of "fuel and power" group of industries from 34.4 per cent in 1961-65 to 26.6 per cent in 1966-70, the majority of industrial investment funds were

Fallenbuchl, "From the Extensive to the Intensive Strategy of Economic Development in the Soviet Union and Eastern Europe," a paper presented at the Annual Meeting of the Michigan Academy of Arts, Sciences and Letters, April 1970, Working Papers, The Department of Economics, University of Windsor (mimeographed) and "The Strategy of Development and Gierek's Economic Manoeuvre," loc. cit.

still allocated to the relatively capital intensive industries. Some 56.2 per cent of these funds were allocated to the industries with the capital-labour ratio of 300,000 zlotys in 1970, including 16.6 per cent to those with the ratio above 990,000 zlotys. These ratios were clearly above the average of 227,900 zlotys for the total industry (see Table V). Instead of a switch to the intensive pattern which had been envisaged by the Plan,<sup>16</sup> there was an even greater dependence on the extensive factors and a further decline in the rates of growth. (See Tables I, II, and III). The Fifth Party Congress, which was held in 1968, attempted to find the ways and means of breaking away from the vicious circle. Again, the priority was given to structural changes, although some modifications of the system of planning and management were to take place.<sup>17</sup> The main stress was put on "selective development", i.e. on the development of certain selected branches of industry and groups of commodities in which Poland was expected to become one of the major producers and the exports were to reach the highest world standards as to the quality and technological sophistication.

Unfortunately, an excessively large number of industries and enterprises were selected and designated as specializing in production for export.<sup>18</sup> Moreover, the selection was made on the basis of the decisions of the central authorities without the benefit of properly operating signals of the international market and correctly calculated opportunity costs. The existing system of planning and management, together with price distortions, made a fully rational choice impossible. In addition, the possibility of restricting consumption in order to increase the investment drive was over-estimated. Instead of an improvement, there was a further reduction in the rates of growth of net material product and industrial product in the last three years of Gomulka's leadership (see Table I). With lower rates of growth and increased capital intensity the rates of accumulation were raised to 28.5 percent of the national net material product (the "allocated national income" in the Marxist terminology) in 1968, 27.3 percent in 1969 and 27.9 percent in 1970 (see Table XI). In official statistics the accumulation ratios are downward biased because of relatively low prices of investment goods in comparison with prices of consumption goods. The actual rates of accumulation must have been even higher. As the national net material product was considerably below the domestic net material product in those three years (26.1 billion zlotys in 1968, 22.6 billion in 1969 and 25.3 billion in 1970, or 3.57 percent, 3.00 percent and 3.20 percent of the level of domestic net material product), i.e. there was an excess of exports over imports, the size of the residual which was available for consumption was severely limited. These accumulation rates, which were even higher than those during the Stalinist industrialization drive (28.1 percent in 1951, 23.3 percent in 1952 and 22.5 percent in 1953), again exceeded the optimum rate and the share of net material product which was left for consumption

Source: GUS, Rocznik statystyczny przemysłu 1973, (Statistical Yearbook of Industry), Warsaw 1973, pp. 266, 267, 283; Rocznik statystyczny 1966, p. 171.

declined to a politically dangerous level. There was a repetition of the situation which had taken place in the first half of the 1950's.<sup>19</sup>

Most of the difficulties which appeared in the 1960's had their roots in the policies of the early 1950's. Gomulka was not responsible for them. He, however, delayed coping with them. This was particularly clearly seen in the case of systemic reforms as he withdrew the changes which had been introduced in the early years of his leadership. The same happened, however, with the modernization and restructuring of the economy and with opening it up. All these tasks were not dealt with and the solution of the problems was simply shifted to the 1970's. This was Gomulka's legacy.

### III: GIEREK'S NEW ECONOMIC STRATEGY

At first it looked that the riots in December 1970 destroyed the possibility of breaking away from the vicious circle in the moment when the time was running short.<sup>20</sup>

The new leadership introduced immediately some measures which could show rapid improvements in the standard of living. The increase in the prices of food was canceled, while the reduction in the prices of consumption goods of the industrial origin was maintained. The official index of "goods and services bought by the population" increased by only 0.4 percent in 1971 and recorded no increase in 1972. This was made possible, despite considerable increases in the prices of foods in the market places (7.6 and 4.0 percent) because of relatively limited increases in the prices of food in socialist trade and restaurants, etc. in 1971 and a decline of these two sets of prices in 1972, and because of a reduction in non-food consumption goods by -2.8 and -0.1 percent respectively (see Table VI).

The unpopular new system of incentive bonuses was withdrawn. The wages and pension for the lowest income brackets were increased. The official index of real monthly wage in the socialist economy (without apprentices) increased by 5.7 percent in 1971 and 6.4 percent in 1972 (see Table VII). The proportion of average pensions and welfare payments to the average wage in the socialist sector increased to 51.5 percent (the highest proportion in the post-war period) but declined to 50.2 percent in 1972 as the result of a rapid increase in wages (see Table VI).

In agriculture the prices for obligatory deliveries and for contracted purchases were increased in 1971 (see Table VIII) and obligatory deliveries abolished as from January 1st, 1972. National health insurance was extended to cover all agricultural population, financial contributions by farmers were reduced and the progression in taxes, which had been heavily biased against larger farms, was eliminated. The ratio of prices for the products sold and for the goods and services bought by the agricultural population improved by 10.2 percent in 1971 and a further 3.8 percent in 1972 (see Table IX).

As the result of all these measures net real incomes of the population increased by 9.2 percent in 1971 and 12.3 percent in 1972 and

net real incomes of agricultural population by 9.3 percent and 9.9 percent (see Table X). Improvements in the standard of living, together with a very dynamic political activity and appeals to national interest, patriotic duty and self-interest of various groups, stabilized the political situation.

The second line of measures included the formulation of a new development strategy and the appointment of a "Joint Party-State Commission on the Modernization of the Functioning of the System of the Economy and the State." The basic premise of the new strategy was that in order to escape from the vicious circle both investment and consumption must grow at the same time. Investments must be sufficiently large to restructure the economy, to modernize its productive capacity and to build a viable export sector. This task could, however, again be frustrated by the lack of incentives. Significant increases in consumption were, therefore, needed to stimulate increases in labour productivity and to secure support from the population for the new leadership. This policy was possible only if considerable import of capital could be secured. As large borrowing of capital could only be effected from the West, a rapid expansion of import from that direction was implied.

The usual negative difference between the national net material product (NNMP or the "national income for distribution" in Marxist terminology) and the domestic net material product (DNMP or the "produced national income") was reduced from -25.3 billion zlotys in 1970 to -13.6 billion in 1971, or from 3.20 percent to 1.59 percent of DNMP. The difference between the two represents the balance of trade. When there is an excess of exports over imports NNMP is smaller than DNMP, i.e. there is a smaller volume of goods for allocation into consumption and investment than that which has been produced within the country. When imports exceed exports it is possible to allocate for consumption and investment a larger volume of goods than that which has been produced.

The difference became positive in 1972 and it grew from 2.6 billion zloty (0.27 percent of DNMP) in that year to 35.5 billion (3.39 percent) in 1973, 56.7 billion (4.90 percent) in 1974 and 85.0 billion (6.74 percent) in 1975 (see Table XI). In constant 1971 prices imports increased by 15.5 percent per year on average between 1971-75, as compared with the average rates of growth of 10.0 percent in 1961-65 and 9.0 percent in 1966-70. The average rate of growth of export in constant prices was much more moderate (10.8 percent) and was actually lower than that in 1961-65 (11.2 percent) and slightly more than 1 percent point higher than in 1966-70 (9.5 percent) (see Table XII).

## NOTES

Domestic net material product = "produced income" in Marxist terminology.

National net material product = "national income for distribution" in Marxist terminology.

Domestic NMP ± balance on current account of the balance of payments = national NMP.

The balance of trade, as reported in the Polish statistical publications does not correspond to the import or export of capital as the balance of all invisible items should also be taken into consideration and that balance is unavailable. The overall excess of imports over exports increased, however, very rapidly during that period (from 239.6 million zld in 1970 to 7,198.1 million in 1974 and 7,490.0 million in 1975). The adverse balance of trade with the advanced countries in the West had a decisive role. It was almost equal to the total deficit in 1972 and 1973 and exceeded it slightly in 1973 and quite considerably in 1975 (see Table XIII). There may be some distortions in the official statistics concerning the shares of CMEA and non-CMEA trade because the intra-bloc prices differ from the world prices. Nevertheless, the relative importance of the deficit in trade with the advanced countries in comparison with the total trade deficit would still remain of approximately the same scale. There is, therefore, ample evidence that this part of the strategy has, indeed, been followed. It became possible to increase both investment and consumption because of a conscious decision to import foreign capital, mostly from the West, although the actual level of foreign borrowing probably exceeded the level which had been envisaged originally. There is, however, no information on this point.

The second feature of Gierek's new strategy is the belief that increases in real wages would lead to increases in labour productivity if only the right system of incentives is devised. To the extent to which the financial incentives which are offered to the workers may improve the discipline of work and the morale of the labour force, and incentives offered to the management may increase the efficiency with which the plants operate, this policy should have some positive

results. However, this approach seems to disregard the possibility that labour productivity depends perhaps less on the amount of efforts by the workers than on the structure of production, the volume and quality of capital and on methods of production.

There was rapid increase in total and personal consumption outlays (the average rates of growth in 1971-75 were 8.7 and 8.5 respectively). These rates were sufficiently high to secure 7.7 and 7.5 average rates of growth of per capita total and personal consumption. The rate of growth of average real wage in the socialist sector was 7.2 per cent (see Tables II and VII). It should be noted, however, that financial incentives in agriculture were on the whole much less strong than in the rest of the economy. The average rate of growth of net real income of agricultural population was 4.2 per cent in 1971-75 as compared with 10.9 for the total population. The gap was even larger in comparison with the average rate of growth of net real income from work of the total population which was 11.5 per cent (see Table X).

The improvement in the standard of living which was actually achieved in 1971-75 exceeded that which had been planned originally. The rate of growth of real wages was 7.2 percent in 1971-75, while the planned rate was 3.4 percent (2.1 percent the actual rate in 1966-70); the actual rate of growth of real income of agricultural population was 4.2 percent, as compared with the planned rate of 3.4 percent (0.2 percent the actual rate in 1966-70); and the actual rate of growth of money incomes of the population was 13.7 percent as compared with 7.7 percent planned (7.8 percent the actual rate in 1966-70).<sup>21</sup>

The situation got out of control, creating a considerable inflationary pressure in the market for the consumption good.<sup>22</sup>

In support of the policy of improving the standard of living a doctrine was formulated that "consumption must become the engine of growth" and that priority should be given to social development over narrowly understood economic growth.<sup>23</sup> A number of measures in the field of social policy supplemented increases in wages and attempts were made to prepare foundations for a more dynamic expansion of socio-economic infrastructure.

In addition to material incentives, various political and psychological measures were also used in order to accelerate the growth of labour productivity. Some attempts were made to involve wider segments of the population in the process of economic decisionmaking. The appeals for the support by the population, for the production of an extra output, and for greater efforts became an essential part of the strategy.

While material incentives and political and psychological pressures and inducements were expected to increase labour productivity, large investment outlays were depended upon for the modernization

of machines and equipment and for the restructuring of the economy, in a way which would increase the efficiency of capital. Here again the actual performance exceeded the plan and investment expanded on an exceedingly wide front. The completion of many projects had to be postponed for lack of complementary domestic factors, even when the essential capital goods were imported.<sup>24</sup> An important part of the programme was the creation of a modern export sector which would not only be able to finance the necessary import but which would also help to achieve economies of scale and, therefore, a reduction in costs in some priority industries.<sup>25</sup>

Import of machines and transport equipment (SITC classification 7) represented 34.5 percent of the total import in current prices in 1971, 38.7 percent in 1972, 40.8 percent in 1973, 38.5 percent in 1974 and 37.7 percent in 1975. Special efforts were made to obtain most modern machines and equipment of the highest technological level from the leading producers. As the result, the share of machines and transport equipment imported from the advanced countries in the West, whenever possible on a credit basis and often together with licences and cooperation agreements, increased from 22.1 percent of the total import of this group of commodities in 1971, to 32.3 percent in 1972, 38.5 percent in 1973, 43.8 percent in 1974 and 50.1 percent in 1975 (see Table XIV).

The proportion of total import which was allocated for investment (accumulation) increased from 16.9 percent in 1970 and 16.8 percent in 1971 to 21.5 percent in 1972 and to above 25 percent in 1973 and 1974. During the same period the proportion of import allocated for consumption increased only in the first two years after the 1970 riots (from 15.7 percent in 1970 to 17.8 percent in 1971 and 1972) and quite substantially declined afterwards (15.1 percent in 1973 and 13.0 percent in 1974) (see Table XV).

During the first two years during which the new strategy was in operation Poland purchased 57 licences or more than one fourth of all licences (205) which were purchased between the end of W.W. II and 1972.<sup>26</sup> It seems that in effect these large doses of the transfer of Western technology embodied in imported machines and equipment and in purchased licences, have been accepted as a substitute for systemic reform. This is true for all CMEA countries, including the Soviet Union,<sup>27</sup> but in Poland this policy has been applied on a much larger scale.

The complete scenario of the new strategy was probably as follows. As the result of increased real wages and other material incentives connected with substantial increases in consumption and the modernization and restructuring of the economy, very high rates of growth of national product would be achieved. This would be an intensive pattern of development. Expected limitations on the growth of the

supply of inputs (particularly of labour, which would be growing at rapidly declining rates, but also capital and raw materials) would not provide a barrier to growth of output, as the process would depend, to an increasing degree, on improvements in the productivity of these inputs.

In this situation, Western credits could be repaid easily by expanding exports of modern, highly sophisticated and efficiently produced industrial goods. They would be produced in new or modernized plants, utilizing the most modern Western technology and according to the Western standards. They would not, therefore, encounter any difficulties in the Western markets. Because of the high rates of growth achieved as the result of increased efficiency it would be possible to secure the excess of exports over imports, necessary to repay the loans, without hampering the possibility of continuous increases in both the standard of living and the domestically financed investments.

A crucial point in this scenario is the question whether the transfer of Western technology, modernization and restructuring of the economy and increased material incentives, made possible by heavy borrowing from the West, could, indeed, give these results without some bold systemic reforms. It seems that the importance of this factor has been somewhat downplayed.

#### IV. GIEREK'S SYSTEMIC REFORMS

The Soviet-type economic system was introduced in Poland in the late 1940's. It was in operation in its Stalinist form until 1956, although a serious crisis had already appeared in 1953–1954. In October 1956 a lengthy process of economic reforms began. The objective has always been the same: to increase the overall efficiency of the economy without destroying its socialist nature, which in practice meant without inviting disapproval by the Soviet Union and pressure for the withdrawal of the "new model."

Dr. J. G. Zielinski, the top Western authority on Polish reforms, divides the history of this process into five stages: (1) the move "towards a grand design" in 1956–58, when an attempt was made to introduce the "guided market," or "market-parametric" model; (2) the "intermediate period" in 1959–64, when "much of the initial impetus of reforms was dissipated and some reversions to old methods of planning and management occurred"; (3) the "period of gradual improvement" in 1965–68, a new wave of reforms of pragmatic nature

rather than based on some theoretical concept; it was envisaged as a long gradual process of partial improvements which would be introduced first on a limited scale as experiments; (4) an "abortive effort to reform" in 1968-70, which was announced by the Fifth Party Congress (November 1968) as a "comprehensive and internally consistent system of planning and management" and which was never introduced on a full scale because of the 1970 riots; and (5) Gierek's reforms introduced after 1971.<sup>28</sup>

This most recent attempt was based on the following seven assumptions: (1) every strategy of development requires a different system of planning and management<sup>29</sup> and the obsolete and ineffective methods of the "steering of the economy" can act as "a barrier to the achievement of the objectives of socio-economic development if they are not changed on time";<sup>30</sup> (2) a search for a "new model" of the economy has been rejected and replaced by the concept of a continuous "perfecting of the existing economic system and adjusting the institutional and instrumental solutions to the changing strategical goals";<sup>31</sup> (3) all partial changes should be consistent among themselves and with the comprehensive improvements in the system as a whole; (4) all changes should be introduced on a limited scale first as experiments and their results should be carefully studied and, if necessary, they should be modified to eliminate any adverse effects; (5) it is necessary "to strengthen and to increase the accuracy and effectiveness of central planning and central allocation of resources"; this implies that "in all those matters which are important for the directions of the development of the country and the fulfilment of production targets in respect of economic growth and the standard of living the central management must be strengthened"; at the same time, however, there must be "widening of the autonomy of industrial associations, industrial complexes and enterprises \* \* \*," creating greater possibilities for "the initiative of their managements and workers in respect of both the fulfilment of production target and, above all, the utilization of all reserves";<sup>32</sup> (6) a system of economic parameters, determined by the central planners, rather than direct commands will be used "to steer" the economic units to make decisions in the desired direction; it is, therefore, not a market socialist model, but the central planning-parametric model";<sup>33</sup> (7) the scale of the management units of economic activity should be increased and there should be closer links between production, research and development, and marketing.

It is important that the systemic changes have been accepted as a policy variable, or, in the words of the distinguished Polish economist, J. Pajestka, that it has been realized that "if the socialist society wishes to determine consciously its development, the task of moulding the system of functioning of the economy is not less essential than the

planning of material economic processes.<sup>34</sup> This approach is close to the modern Western theory of comparative economic systems.<sup>35</sup> It implies flexibility and it may remove systemic changes from the domain of dogma. However, it ignores the danger that a continuous process of changes and experiments can create a considerable degree in instability, and that some changes may be either irreversible or could only be reversed at the danger of creating some serious economic or even political disturbances. In its gradual, pragmatic, and experimental approach the new reforms are closer to those of the "intermediate period" of the early 1960's than to those of the late 1950's or the late 1960's.

The parametric system of steering appears to be very scientific but the planners may have great difficulties with establishing the right parameters in practice. These are basically arbitrary decisions which can lead to serious mistakes. There is no guarantee that the decisions as to the directions of economic development will be more successful than those of the 1950's, except that the planners are now more sophisticated and experienced than at that time. Central planners' priorities and not the market signals will shape up the new industrial structure "from above", i.e., from overall decisions as to the proportions among various sectors of the economy, and not "from below", from the micro-decisions to the sectoral proportions and the rates of growth. There is some inconsistency between the objective of strengthening the central planning and granting more autonomy to the economic units.

The solution involves the creation of the so-called "big economic organizations" (WOG) composed of the associations of enterprises, industrial complexes and some large multi-plant enterprises. Some planning and some decision-making processes in connection with the day-to-day operations, and to a certain extent some powers in respect of investments from the big economic organizations' own investment funds or credits, were indeed transferred closer to the actual production units. On the other hand, the managers of individual enterprises which were included in these organizations lost practically all their autonomy to the management of the larger units. As the big economic organizations combine the production units together with the research and development institutes and, in many cases, also with the internal and foreign trade organizations, the new organization should be more flexible, and should make the production units more sensitive to the availability of new products and new technologies, and more responsive to the domestic and foreign demand. However, the objective of increasing the powers of the central planning authorities in respect of some main directions of development, rates of growth and improvements in the standard of living implies that in practice the management autonomy of the big economic organizations can be seriously restricted. As all their decisions have some impact on the rates of growth and the standard of living, it was clear from the very beginning that the central authorities would be intervening in practically all matters. To some extent the reforms were really not much more than changes in the industrial organization combined with granting a greater degree of autonomy to the management of larger units, which re-

<sup>34</sup> J. Pajestka, "Doskonalenie funkcionowania gospodarki."

<sup>35</sup> E. Neuberger and W. Duffy, *Comparative Economic Systems: A Decision-Making Approach*, Boston: Allyn & Bacon, 1976.

semble modern corporations in the West in their composition, scale and methods of management, but which have to follow the central planners' orders.<sup>36</sup>

The new system can move beyond being a set of organizational changes only if the big economic organizations will really act as economic enterprises and not as units of public administration. They have been asked to accept two criteria for their activity: (1) the added production, (i.e. value added) and (2) profit. Added production is defined as the difference between the gross sold production, corrected for the turnover tax or subsidies, less all material costs without amortization and repayment of investments, credits and interest payments. It represents the economic organization's contribution to the formation of national income. It is expected that with the help of taxes and subsidies the effect of external factors beyond the control of the organization can be excluded and the "purified" value represent results due to the efforts of the management and workers of a given economic organization. At the same time, by linking the rate of growth (or the level) of the wage to the movements (or level) of the "purified" added production, maximization of the organization's contribution to national income becomes in the material interest of all its employees. Profit becomes the source of repayment of credit and of the creation of various funds, including the managerial bonus fund. In this way, the management is expected to have a financial interest in the maximization of profit. The priority has, however, been given to the added production. Its division into profit and wages has been removed from the jurisdiction of the management. Its amount is calculated with the help of a parameter which is fixed by the central authorities at a different level for every big economic organization, taking into consideration its particular situation.<sup>37</sup>

In this way profit has lost its economic meaning as it is a fixed proportion of the added value of production. The warning given by some leading Polish mathematical economists, for example by Professor W. Trzeciakowski and Dr. A. Legatowicz, that the maximization of the added production would not necessarily result in the optimal allocation of resources,<sup>38</sup> was ignored and the danger of wrong decision as to the substitution between labour and capital, and of undesirable employment and wage movements, was expected to be averted by the use of the so-called long-term normative parameters. These normatives originally included: (1) the relation of the growth (or the level) of the wage fund to the added production (normatives R or U); (2) the limit of the tax-free part of profit for the creation of the enterprise funds; (3) the relation of the managerial bonus fund to the profit (normative N); and (4) the participation of the economic organization in the improvement of foreign trade (normative D). All these normatives are individualized in order to separate the part of added production resulting from the efforts of the economic organization from that created as the result of conditions beyond its control (this part may be positive or negative).

In addition to the determination of the normatives for all economic organizations, the central authorities have also at their disposal two

<sup>36</sup> Pajestka, op. cit.

<sup>37</sup> Ibid.

<sup>38</sup> J. Mujzel, "Problemy motywacji" (The Problems of Motivation), *Zycie gospodarcze*, No. 5, 1975, p. 11:

groups of variable general parameters which determine the conditions for the economy as a whole. The first group is composed of the parameters which are supposed to inform the economic organizations about the state of general economic activity (the macroeconomic balance of the economy), sectoral pressures, and relative scarcities of commodities and factors. They include prices, the rate of interest, rates of amortization, foreign exchange coefficients, and others.

The second group is composed of the so-called "supporting general parameters" which include (1) "subject subsidies", offered in order to encourage production of commodities which would otherwise be rejected by the economic organizations as uneconomical; (2) price equalization subsidies and taxes on exports and imports, to compensate the economic organizations for the differences between the domestic and foreign trade prices, or to eliminate extra benefits resulting from these differences; and (3) export taxes and import tariffs and similar measures which may be introduced from time to time in order to cope with special problems.

Finally, the centre can use obligatory targets and limits in the form of direct commands. From the beginning, obligatory targets were envisaged for unprofitable production and for the production for high priority investments or exports. Direct commands were also to be applied for the most important investments and in foreign trade (import and export quotas). The big economic organizations were authorized to apply direct commands in their relations with the individual enterprises which belong to them, if they preferred this method rather than indirect economic measures.<sup>39</sup>

The system was introduced gradually. In the middle of 1972 some 35 big economic organizations were selected as the so-called "initiating economic units" (18 associations of enterprises, 4 industrial complexes and 2 large multi-plant enterprises). As from January 1, 1973, 16 of these units started to operate under the new principles. At the end of that year there were already 28 initiating units which were responsible for 20 per cent of the total industrial output of the country.<sup>40</sup> In 1974 there were 68 initiating organizations in industry alone which were responsible for 44.7 per cent of sold output and 38.5 per cent of employment. In 1975 there were 125 big economic organizations, including 110 in industry which produced 67.7 per cent of sold output of the socialist industry and were responsible for 61.0 per cent of industrial employment. In addition, all state-owned enterprises of internal trade and restaurants under the jurisdiction of the Ministry of Internal Trade and Services, consumers' and producers' cooperatives, 2 construction organizations, 2 transport organizations and 3 foreign trade organizations worked according to the new system. It was expected that in 1976 the initiating organizations in industry would be responsible for about 80 per cent of the output of the socialist industry and 75 per cent of its employment.<sup>41</sup>

This rapid widening of the system took place because of the favourable results of the first initiating units. During the period 1973-75

they achieved higher rates of growth and, on the whole, more favourable economic results than the rest of the socialist industry. They achieved higher rates of growth of labour productivity with lower increases in the average wages, but they also had higher rates of growth of employment. They also were able to produce more for export to the advanced Western countries and for the domestic consumption market.<sup>42</sup> It is, however, important to remember that the most efficient organizations, with the most modern capital equipment and best management, were selected for the experiment and that they enjoyed priority in respect of imported machines and investment in general during that period. The "great experiment" was, therefore, somewhat less "scientific" in practice than it had been envisaged at first.

It is also interesting to note that the particularly good results were achieved during the first year of the operation of the system. The added production of the initiating organizations in industry increased by 31.6 per cent in 1973, 23.4 per cent in 1974 and 18.4 per cent in 1975. In the same years the wage fund of these organizations increased by 19.6, 16.1 and 13.1 per cent. The increase in added production per one per cent increase in the wage fund declined from 1.6 in 1973 to 1.4 in 1974 and remained at that level in 1975.<sup>43</sup>

In the opinion of at least some Polish economists the first successes, particularly those achieved in the first year, were connected with the removal of some obvious waste and relatively easy organizational improvements, better utilization of existing productive capacities and labour, and the elimination of excessive stocks and other "reserves".<sup>44</sup> In a way they can be regarded as a measure of the degree of inefficiency which had accumulated under the old system.

From the beginning there was a conflict between the elements of the new system and the principles of annual planning, the importance of which was never reduced despite the original proposals of the Joint Party-State Committee. So long as the targets of the annual plan had to be fulfilled, the semi-automatic mechanism of the parametric system could not work. As one manager told the author, already in 1974 the situation was such that, on one hand, the manager was asked to follow the "rules of the game," to maximize the added production value added, but, on the other hand, he was given quantitative annual targets and was receiving from time to time "informal" instructions from the central authorities demanding him to produce this or that "in the public interest." At the same time the workers were demanding improvements in the standard of living and in working conditions which were not consistent with the "financial rules of the game," while the local party authorities were exerting pressure on him to do anything in order to avoid the danger of a strike or riots, as many local party officials had lost their jobs as the result of the 1970 riots.

There was also a conflict between the new system and the rigid price controls based on the decision to keep prices relatively stable for social and political reasons. In this way one of the potentially

<sup>42</sup> Pińkowski, *op. cit.*, p. 598.

<sup>43</sup> G. U.S., *Rocznik statystyczny 1976* (Statistical Yearbook 1976), Warsaw 1976, p. 179; Gliński and Topiński, *op. cit.*, p. 542.

<sup>44</sup> B. Gliński, "WOG a koordynacja branżowa" (The Big Economic Organization and the Coordinating Within an Industry), *Życie gospodarcze*, No. 20, 1976, p. 11; Mujżel, *op. cit.*, p. 11.

most powerful instruments of the parametric system was almost switched off.

The conflicts between the new system and the annual plan targets and price controls reduced the effectiveness of the system from the time it was introduced. They became, however, particularly serious later, when some unforeseen developments made the operation of the system very difficult anyway.

In the second half of 1974 certain changes appeared in the environment within which the new system operated. Two of them were particularly important: (1) strong inflation in the world markets, which drastically increased the prices of not only raw materials but also of the capital goods needed for the continuation of investment projects which had already been started, or had to be made in some complementary fields in order to utilize fully the previously undertaken investments; and (2) an excessively high rate of growth, resulting mainly from the utilization of traditional methods of planning and management together with the new development strategy, the new social policy and the new political dynamism. Both created serious shortages and pressures in the economy and had an effect on the functioning of the initiating organizations.<sup>45</sup>

In order to induce the industrial organizations to produce for export, the new system included the principle of calculating the value of the added production sold in the export markets at the so-called "prices of realization" which, with the help of foreign exchange coefficients differentiated between the CMEA and other regions, were directly related to the actual prices received in foreign currencies. This was a very important provision from the point of view of opening up the economy, creating of a viable export sector, and raising the efficiency of the economy as a whole. Inflationary increases in the prices obtained in the export markets expanded value added ("added production") and, therefore, the wage and other funds available to the economic organizations and made it impossible to separate the expansion which was caused by improvements in products and in marketing from the results of a change in the environment. Inflationary increases in the prices of imports had some impact on the costs of production despite greatly increased price equalization subsidies and were responsible for some increases in the domestic prices (there was a general upward revision of the prices of producers' goods as from January 1, 1975). Again, in some industries the increases in value added were achieved as the result of the price increases and it was difficult to separate them from those which were the result of the efforts by the big economic organizations.

There was a combination of three factors in operation: (1) the inflationary pressures transmitted from the world markets despite various insulating layers in the centrally planned economies;<sup>46</sup> (2) the policy of increasing wages and the standard of living; and (3) the very high rates of investment. As the result, inflationary pressures and shortages were created throughout the economy. Highly concentrated, and often monopolistic, economic organizations in industry, internal trade and services were operating in a strong sellers' market and were

<sup>45</sup> Gliński and Topinski, *op. cit.*, p. 542.

<sup>46</sup> Z. M. Fallenbüchl, E. Neuberger and L. Tyson, "East European Reactions to International Commodity Inflation" in this volume, *supra*.

able to accumulate considerable funds rapidly. At the same time they became less sensitive to the parameters.

Instinctively the authorities moved back towards greater centralization in the decision-making process, restriction of the autonomy of the big economic organizations and increased reliance on direct commands. The normatives were lowered, despite the previous assurances that they would remain constant for a relatively long period. A number of supplementary parameters were introduced. For example an export tax was imposed in order to take away from the economic organizations the inflationary profit (the price above 7-9 per cent is taxed at an 85 per cent rate). There were also increases in the rates of the turnover tax. A number of additional quantitative targets and limits were introduced in the form of direct commands. The funds at the disposal of the economic organizations were frozen and reduced by transferring them to some reserve funds established at the central administrative level of the industrial ministries.<sup>47</sup> As it is difficult to distinguish in practices between the gains which were the result of improved economic activity of the organizations and those resulting from a change in the environment, in many cases the efforts to increase efficiency were penalized.

It is significant that as soon as there was an unfavourable change in the environment there was an increase in the use of direct commands and intervention by the central authorities in the affairs of the big economic organizations which considerably reduced their autonomy, which had never been great. The system tried to encourage the big economic organizations to eliminate excessive reserves, to use fully their capacities and the labour force, and to declare their real needs and possibilities. This was the purpose of the enterprise funds which it was profitable for the organizations to increase. The obligatory transfer of the funds to the industrial administrations and their freezing there, created a credibility crisis and must have had an adverse effect on the willingness of the organizations to build these funds in the future. Similarly, the introduction of some supplementary parameters with retroactive effect must have undermined the confidence of the economic organizations in the new system. How can anybody expect them to play the game when its rules are changed *ex post*?

The reforms attempted to introduce central planning parameters as a substitute for the market forces. Under the double impact of the externally and domestically generated inflationary pressures the elaborate and complicated but, at the same time, relatively inflexible system of normatives and general parameters collapsed. The return to the old command methods of administration is perhaps only a temporary policy. Those economists, who seem to be committed to the parametric system, although often critical of some of its particular features, for example Professor J. Mujzel, who is undoubtedly one of the top experts on systemic changes in Poland, advocate the necessity of returning to it as soon as possible.<sup>48</sup> It is, however, doubtful whether, after the system has lost its credibility, it can operate satis-

<sup>47</sup> Mujzel, *op. cit.*, p. 11; Głinski and Topinski, *op. cit.*, pp. 543-544.

<sup>48</sup> See, for example, J. Mujzel, "Narzędzia kierowania i struktura WOG" (The Steering Instruments and the Structure of the Big Economic Organizations), *Zycie gospodarcze*, No. 11, 1975, p. 11.

factorily in the future at all, even to the limited extent to which it operated in the first year after its introduction.

As the new system was introduced, on a limited scale, at the beginning of 1973 and was already considerably restricted by 1975, it is doubtful that it was able to contribute much to the successes of the first three or four years under the new leadership.

#### V. THE PERFORMANCE OF THE POLISH ECONOMY IN 1971-75

The growth performance of the Polish economy during the five year plan period 1971-75 was very impressive. The average growth rate of GNP, calculated by the Western experts, was 7.38 per cent, as compared with 4.16 per cent average in the preceding five year period. Although there was a declining trend within the period from one year to another, the fluctuations of the annual rates were relatively small and the coefficient of variation ( $\sigma/x$ ) was considerably lower in 1971-75 than in 1966-70 (see Table I). According to the official statistics the average rate of growth of the domestic net material product (the "produced national income") was higher than in any other period since 1950 and so were the average rates of growth of accumulation, fixed capital investment and total and personal consumption outlays. On the per capita basis the official data on total consumption and personal consumption also show the highest average rates since 1950, and the average real wage increase was the second highest after that of the brief period of economic reforms and reduced pace of industrialization in 1956-58, when the wages moved up from a very low level of the early 1950's (see Table II).

The average rate of growth of labour productivity, calculated as the net material product per person employed in the national economy, exceeded the average rate of growth of fixed capital per employee, which implied some improvement of the "effectiveness of capital", or that part of the increase in labour productivity (net material product per employee) which could not be explained by the increase in capital per worker. An increase in labour productivity which can be attributed to an increase in capital per worker is regarded by the Polish economists as being caused by "extensive factors" (an increase in the quantity of capital) and only that part of the rate of growth of labour productivity which is above the rate of growth of capital per worker is accepted as being attributable to "intensive factors" (increase in the productivity of capital).

The rate of growth of the effectiveness of capital was positive again in 1971-75 (it had been negative in 1966-70, as fixed capital per worker was growing faster than labour productivity), although it was still the second lowest rate since 1951 (see Table III).

These are the official statistics and the approximate method currently used in Poland to calculate the relative importance of the extensive and the intensive factors in the process of growth. They are the statistics which are studied by the planners and form a basis for their policy decisions. Taking the averages for 1971-75 into consideration, the leaders could congratulate themselves. The economy not only achieved high rates of growth but there was some evidence that intensive factors had again begun to play a positive role, although still much more modest than in the advanced Western countries, or

even in Poland before 1966. And yet, the rate of growth of the effectiveness of capital exceeded 3 per cent only in two years (1972 and 1973) and there was a declining trend from the high 1972 rate of 3.7 percent to -1.1 percent in 1975 (see Table III). In other words, whatever improvement in this respect took place it was rather short-lived. The rate of growth of the effectiveness of capital declined in the last year of the period below the average for 1966-70, although it compared somewhat more favourably with the average for that period when calculated as a percentage of the rate of growth of net material product and, even more so, as a percentage of the rate of growth of labour productivity (the net material product per employee).

These figures could support a hypothesis that the particularly good performance during the period 1971-75 was due to a recovery from the stagnation of the late 1960's, that it was caused by the new dynamic economic and social policy, the response of the workers to special appeals and increased material incentives, and the support which the population in general was prepared to grant to the new leadership because of the visible signs of improvement in the standard of living. This was particularly clearly seen in agriculture. The performance of that sector was very impressive during the first two years. The improvement was probably in response to the considerably increased prices of agricultural products, with the prices of inputs bought by the farmers remaining approximately constant, and to other material and non-material incentives, new social welfare measures, and a general liberalization associated with the "new agricultural policy", which included the abolishment of compulsory deliveries as from January 1, 1972.

The utilization of "shallow reserves" and the improvements in material and non-material incentives must have had a considerable impact on the sharp acceleration of the rates of growth as from the beginning of 1971. These measures were probably responsible for the relatively high rates of the effectiveness of capital (see Table III). The highest rate (3.2 percent) appeared in 1972, i.e. before the new economic and financial system was introduced, and the second highest (3.1 percent) in 1973 when it was operating on a limited, experimental scale. The systemic changes could not, therefore, have any impact at that time, although taking into consideration their limited nature and scope, and the shortness of the period during which they operated, it is doubtful that they could have any significant impact later.

The high rates of growth of the net material product, particularly during the years 1972-74, were most likely caused by the operation of two extensive factors and the new strategy of development in general. There were very rapid increases in employment in the national economy (material production) and, as agriculture was losing the labour force in four out of five years and the decline was greater than it had been envisaged, even more rapid increases in employment occurred outside agriculture (see Table XVI). In the two years when these increases were relatively moderate (1971 and 1975) the rates of growth of net material product were also lower than in the three years with the high rates of growth of employment. Particularly big increases in employment occurred in construction in these three years. Although the official sectoral rates of growth are affected by price distortions,

they can be taken, with caution, as a rough indicator of changes in the pace of growth within each sector. Construction recorded particularly high rates of growth during these three years. These extremely high rates were closely connected with the second extensive factor, namely, a very rapid increase in gross fixed capital (in constant 1971 prices). As the result, the capital-output ratio was rapidly increasing in the national economy as a whole, but this acceleration was particularly strong in construction and industry.

It seems that the main reason for the high rates of growth of net material product was an investment boom, associated with large increases in employment outside of agriculture. The average rates of growth of both accumulation and fixed capital investment in 1971-75 were the highest in the entire period since 1950 (see Table II). Despite a very serious neglect of the socio-economic infrastructure in the past and the existence of enormous backlogs, particularly but not exclusively in housing, the proportion of total investment which was allocated for this purpose (the so-called "non-productive investments") declined to 21.3 percent, well below the proportion which had been allocated during the preceding two five year periods (28.6 percent in 1961-65 and 21.3 percent in 1966-70). The share of investment allocated to housing and the so-called "communal economy" (i.e. urban and rural social infrastructure) alone, which represent a part of the total non-productive investments, declined to 17.2 percent as compared with 21.7 percent in 1961-65 and 19.1 percent in 1966-70 (see Table XVII).

In other words, not only the proportion of accumulation in the national net material product and the rate of net material product and the rate of overall investment moved to the highest levels since 1950, but the share of "non-productive" investment declined even further in order to achieve the highest possible level of directly productive investment. This is very surprising because the relative underdevelopment of the infrastructure, and the acute shortage of housing has been recognized by the Polish economists for years as not only a

factor effectively reducing the quality of life and creating serious social problems and political pressures, but also as one of the reasons for relatively low productivity of labour. The investment policy during the early 1950's and the early 1960's was criticized *ex post* not only because the excessively high rates of growth were attempted but also because not enough resources were allocated for the development of infrastructure, on the grounds that such decisions could have had an adverse effect on the rates of growth of the economy in the long-run.<sup>49</sup>

There was also a reduction in the share of agriculture in total investment in comparison with 1966-70 and, slightly, also 1961-65, despite the fact that the importance of agriculture for the long-run growth of the economy had been recognized. The same happened to the share of commerce, while the share of transportation and communications increased only slightly in 1971-75 in comparison with the preceding five year period. All these sectors have either direct or indirect effect on the standard of living and the quality of life, the improvements in which were accepted by Gierek as top priorities and the main goals of the socio-economic development.<sup>50</sup>

It was the share of investment allocated to industry and to construction that increased rapidly in comparison with the two preceding periods. Industry received 43.8 percent of all investment outlays, as compared with 39.4 percent during the last Gomulka's five year period and 40.2 percent in 1961-65. The share of the construction industry increased from 3.1 percent in 1961-65 to 4.0 percent in 1966-70 to 5.1 percent in 1971-75 (see Table XVII).

In its overall rate of investment and in the structure of investment allocations among the major sectors of the economy this was almost just another orthodox Stalinist investment drive, undertaken within the basically orthodox system of central planning and management. Using Janos Kornai's dichotomy this was a typical case of "rush" and not that of "harmonic growth", with all its well known seriously adverse consequences.<sup>51</sup> With the pressures which this drive must have created, it is not surprising that there could not have been any significant systemic reforms, that the central-planning parametric system collapsed, strong inflationary pressures were generated within the economy and serious shortages appeared. It was as though the past unhappy experience with this type of policy had suddenly been forgotten.

The excessively high rate of investment, particularly in industry, was partly the result of the fact that investment got out of control. This happened not because of an increased degree of autonomy of economic organizations, but because there was a general expansionary attitude "at all levels of the administrative structure" which had its basis in "the accumulated needs, the full extent of which \* \* \* [had been noticed] more clearly and within a sharper focus after 1970."<sup>52</sup> There also seemed to appear a tendency for what may be referred to as "the multi-centre direction of the economy" with the Central Planning Commission, The Central Committee and the Presidium of the Council of Ministers each making its own decision in response to

<sup>49</sup> Fallénbuchl, "Some Structural Aspects" and "The Communist Pattern of Industrialization."

<sup>50</sup> "Program na miare społecznych możliwości i potrzeb" (The Programme According to the Social Possibilities and Needs), *Gospodarka planowa*, No. 1, 1972.

<sup>51</sup> J. Kornai, "Rush Versus Harmonic Growth," Amsterdam-London: North-Holland, 1972.

<sup>52</sup> Rakowski, *op. cit.*

different pressures from local party and state authorities, the industrial branch ministries and lobbying by various managers of economic organizations. The local authorities and the managers have learned that the "rules of the parametric game" are dead and that they can achieve more by their close political or private contacts and influence with one of the three centres in order to "hook on to the plan", i.e. to get an initial approval for the allocation of investment funds for a new project, or foreign exchange for the import of some new machines, on the basis of unrealistically low estimates, knowing well that once the project is included in the plan it will subsequently receive all that is needed for its completion.<sup>53</sup> As the result of this situation the investment and import plans were continuously revised upward not only at the time of the preparation of the annual plans but also during their implementation. Not surprisingly, the investment plan for 1971-75 was exceeded by about 25 percent and the total investment outlays in constant 1971 prices increased by 91 percent in comparison with the preceding period.<sup>54</sup>

Earlier excessive investment drives collapsed within two or three years after they had been launched.<sup>55</sup> This time it lasted longer because of the import of foreign capital. This was probably the reason why the new leadership selected again the same path of heavy investment concentrated to a great extent in industry. They must have expected that the Western credits would reduce the degree of inflationary pressure, remove bottlenecks and keep in check the adverse consequence on the standard of living. The import of foreign capital did perform this function. There was a large import of investment goods, but they represented only a fraction of all investment goods which the programme required. Various complementary investment goods had to be produced domestically in order to utilize fully the imported investment goods. The share of imported goods increased from 11.0 percent of all goods needed to satisfy the requirement of accumulation (fixed capital investment and inventories) in 1966-70 to 17.0 percent in 1971-75. For machines and equipment alone this proportion increased from 36 percent to 47 percent. It declined, however, to 34 percent already in 1975.<sup>56</sup>

The difference between the national net material product (the "distributed national income") and the domestic net material product (the "produced national income") was equal to 9.30 percent of the accumulation fund in 1973, 12.30 percent in 1974 and 16.68 percent in 1975 (see Table XI). This difference, which represents the difference between import and export of goods, helped to achieve the very large share of accumulation in the domestic net period which reached 31.6 percent in 1972, 35.2 percent in 1973, 38 percent in 1974 and 37.8 percent in 1975. It could not, however, prevent the appearance of serious disturbances in the process of growth.

## VI. THE SOURCES OF PRESENT DIFFICULTIES

If the above interpretation of the reasons for the impressive growth performance in the early 1970's is correct, then the same factors which explain the high growth rates during the period also provide an explanation for the difficulties which started to appear in 1974 and become particularly clearly visible in 1976. Gierek's policy of direct appeals to the workers and the managers of economic organizations for some extra work in the form of the so-called "additional tasks" was quite successful in utilizing "shallow reserves" in the first two or three years of its application. When, however, in 1974 the links between wages and bonuses and the financial results achieved by the economic organizations were weakened, as the result of freezing the funds at the disposal of these organizations, the interest of the managers shifted away from the long-run improvement in efficiency to the short-term gains in production. Instead of trying to follow the "rules of the game," which were designed to increase efficiency, they preferred to assume some "additional tasks" of quantitative nature. These tasks, widely publicized as responses to the leader's appeals, were usually selected because they were easy to fulfill. Various monetary and non-monetary rewards were obtained in this way for efforts which were often distorting the structure of production and reducing the overall efficiency of the economy. While stocks of some commodities accumulated, shortages of others appeared.

As the result of the fulfilment of these various tasks the role of the expansion of gross industrial output as a goal of economic activity increased relatively to that of the reduction in costs and the maximization of value added. Gierek's appeals contributed, therefore, to further weakening of the criteria for increased efficiency and diverted attention away from those decisions which attempted to solve long-run problems, but which would remain unnoticed and unrewarded for the time being, to immediate quantitative gains in output. In this way this policy contributed to the difficulties which appeared in the years 1974-76.

The decision to improve the standard of living to a significant extent and to accelerate investment for modernization and restructuring of the economy was obviously successful during the first years and was very promising for the future. Unfortunately, increases in both were allowed to get out of control. The "new political style" more sensitive to various political and social pressures, a rapid increase in employment and the high level of economic activity associated with the big investment drive resulted in more rapid increases in money incomes of the population than those which had been planned for 1971-75. Nominal money incomes of the population increased from 473.4 billion zlotys to 883.0 billion, or by 409.6 billion, while the planned increase was only about 120 billion zlotys.<sup>57</sup> Increases in prices were relatively limited, although there are reasons to believe that the official index understates them, among other reasons, because of the methods by which prices are determined for real and apparent "new products." According to the official statistics real wages increased by 41.5 percent and the real income of the agricultural population by 23.8 percent between 1970 and 1975.

<sup>57</sup> Marzewski, *op. cit.*, pp. 55-61.

The planned increases for the period were 17 to 18 percent and 18 to 19 percent respectively.<sup>58</sup> An excess demand appeared in the domestic market for consumption goods and services.<sup>59</sup>

Disequilibrium was particularly great in the market for basic foodstuffs. The political decision to keep prices unchanged, induced additional demand for the relatively cheap commodities the supply of which had never been satisfactory. At the same time difficulties appeared on the supply side. They were partly caused by unfavourable weather conditions. The weather was not, however, the only cause for these difficulties. There was the adverse effect of the shortages of agricultural producer goods and of the lack of a sufficiently developed agricultural infrastructure, both the results of the past policy of neglecting agriculture, discriminating against the individual farmers in the supply of producer goods and creating instability as to the future of private farming. Bureaucratic interference with farming did not end in 1971 and it was often responsible for the waste of inputs or outputs.

Particularly strong adverse effect on the supply of agricultural products was exerted by an inept price and income policy. Considerable increases in incentives took place during the first two years of the five-year period (a drastic increase in the prices paid for contracted purchases in 1971 and the elimination of obligatory deliveries in 1972). This was the right move and it was very successful. Agriculture responded by significant increases in marketed production, particularly that of animal production. The myth that obligatory deliveries are necessary to keep a high level of marketed agricultural production and to prevent farmers from increasing their own consumption of their produce collapsed. Real consumption on the farm declined every year from 1971 to 1975 with an average annual rate of decline of -3.6 percent for the period as a whole (see Table X). Total marketed agricultural production increased by 10.1 percent in 1972 (the second highest annual rate since 1951) and 9.6 percent in 1973 (the fourth highest rate). Even more impressive was the response of the marketed animal production, which increased by 17.9 percent in 1972 (the highest rate since 1951) and by 9.7 percent in 1973 (the fifth highest rate) (see Table XVIII).

After 1971 the prices for contracted purchases of grains declined in 1972, increased to the 1971 level in 1973 and were below that level in the last two years of the five-year plan period, despite the bad weather conditions which pressed the free market prices to the levels exceeding the 1971 level (see Table VIII). The index of the relation between the prices sold and bought by agricultural population increased by only relatively moderate rates in 1972-75 (see Table IX). The plan envisaged a slightly larger increase in the real income of agricultural population than in real wages in order to reduce the gap between nonagricultural and agricultural incomes. The actual increase in the real income of agricultural population was not much greater than half of the increase in real wages (see above). The relative difference seems more important than the improvement in the absolute terms and there has been "an excessive outflow of young people from agriculture which resulted in losses in agricultural output."<sup>60</sup>

Source: GUS, Rocznik statystyczny 1972, p. 249; 1976, p. 229.

At least partly the increases in money incomes of the population were caused by the excessive rate of investment. Actual employment outside agriculture increased by 1,815,000 people, while the planned increase was 1,592,000 (the difference of 223,000). Over 80 percent of the unplanned increase was absorbed by the unplanned increase in employment in construction (354,000 actual, 168,000 planned and 186,000 unplanned increase). Average monthly wage in construction increased by over 59 percent and that in industry by 56 percent between 1970 and 1975.<sup>61</sup> One project alone, the construction of the new gigantic steel mill "Katowice," the largest investment project which has ever been undertaken in Poland represents 1,064 construction sites which employed 16,000 workers in 1974 and the number was expected to reach 25,000 in 1975. The decision to build this complex not gradually by stages, as for example a new steel mill of similar dimensions had been built in France at Dunkerque, but by the parallel construction of all its component divisions in one concentrated effort over the period of 54 months, taxed the productive capacities of the engineering and building enterprises to the limits<sup>62</sup> and must have created enormous inflationary pressures throughout the economy.

<sup>61</sup> M. Kabai, "Bariera zatrudnienia" (The Employment Barrier), *Zycie gospodarcze*, No. 41, 1975, p. 1 and *Rocznik statystyczny* 1976, p. 109.

<sup>62</sup> L. Froelich, "Nowa Huta do kwadratu" (Twice the Size of Nowa Huta), *Zycie gospodarcze*, No. 1, 1975, p. 10.

Because of the excessively "wide investment front" the authorities attempted to limit total investment in 1975 to 498 billion zlotys, which was about 150 percent higher than the volume of investment envisaged in the 1971-75 Plan for that year. In order to achieve this objective the Plan for 1975 reduced to a minimum the number of new projects which were to be started and gave priority to the completion of the most important investment projects which had been started earlier.<sup>63</sup> Despite these measures the actual amount of investment was 529.6 billion zlotys in constant 1971 prices.

This domestically generated inflationary situation was overimposed on the pressures and disturbances transferred from the world markets, despite various insulating layers of systemic nature and policies applied to strengthen the insulation of the economy from the impact of world stagflation.<sup>64</sup> It seems, however, that even in the absence of the pressures from outside the economy would have entered into serious difficulties, mostly because of an excessive rate of investment and the lack of sufficiently significant switch from the extensive to intensive pattern of development. The following assessment of the situation at the beginning of 1977 by the Chairman of the State Planning Commission supports this view:

Stresses and difficulties, with which we are faced at present, appeared against the background of a rapid pace of development, wide [investment] front and high rates of social and economic changes in the country, unfavourable climatic conditions for the growth of agricultural production in the last years and, since the middle of 1974, adverse conditions in international trade with the capitalist countries. These conditions are characterized by considerable increases in the prices of imported raw materials and equipment, as well as by the effects of an economic recession in the West, which has resulted in the limitation of our export of many raw materials and finished products. The cause for the stresses and difficulties included also deficiencies and shortcomings in the economic activity which expressed themselves in the excessive enlargement of the investment front in the lack of discipline in connection with employment and wages, in the insufficient utilization of existing production possibilities and raw materials, as well as in insufficient efforts to improve the quality of production.<sup>65</sup>

The appearance of the difficulties caused by the excessive rate of investment was delayed by the policy of borrowing foreign capital on a relatively large scale. This policy made the concurrent increase in investment and in the standard of living possible and it contributed, therefore, to the achievement of high rates of growth. By 1975 it became necessary, however, to control the rapidly increasing indebtedness of the country. Hard currency indebtedness increased from \$4.4 billion at the end of 1974 to \$7.1 billion at the end of 1975.<sup>66</sup> Poland had to start to repay these loans and to meet commitments in connection with its share in the financing of investment projects in the Soviet Union which it had undertaken in order to secure the supply of raw materials from these projects in the future.<sup>67</sup> The original plan was to move gradually from the negative to the positive balance of trade, over a long period, with the help of new Western credits which would cushion the pressure created by the repayment of earlier credits and commitments to the Soviet Union under the CMEA agreements.<sup>68</sup>

<sup>68</sup> J. Olszewski, "Strategia rozwoju i kierowanie handlem zagranicznym" (The Strategy of Developing and Steering of International Trade), *Handel zagraniczny*, No. 11, 1975, p. 5.

It seems that later a political decision was made to eliminate the trade deficit already before the end of the new five-year plan for 1976–80. From a factor which facilitated greatly the expansion of the economy in the first half of the 1970's, the import of foreign capital has now changed into another reason for the appearance of the difficulties.

Similarly, the transfer of technology from the West on a relatively large scale, in the form of the most advanced machines and licences, contributed to the achievement of the high rates of growth. As, however, it was accepted, together with the import of foreign capital, as a substitute for the systemic reforms, it has also become partly responsible for the present situation.

The big investment drive, import of foreign capital and transfer of modern technology from the West appear to be the main reasons for the high rates of growth of production and improvements in the standard of living in 1971–75. It was only too easy to accept the early successes as the proof that these three aspects of the new development strategy, together with the improvement in incentives, the "new political style," and the appeals to patriotism and self-interest, would be sufficient to effect an escape from the vicious circle without any far reaching systemic changes. It is possible, however, that this neglect of reforms has endangered the entire scenario. The role of intensive factors has still remained rather limited. The period of great increases in both labour and capital has passed. Increases in employment will be considerably smaller from now on. It may not be possible to expand further imports of foreign capital and, with the slower rates of growth, high rates of growth of investment would require the share of accumulation in national income which might be politically unacceptable. Shortages in the consumption market reduce the possibility of further substantial increases in the standard of living and limit the potential role of material incentives in the stimulation of growth and in the expansion of its intensive pattern.

The lack of systemic changes made it also difficult to select the efficient investment projects in connection with the expansion of the export sector. Although some improvements in the system of planning and management of foreign trade have taken place, the foreign trade machine is still relatively rigid and not very suitable for a dynamic expansion of exports to the West. These factors make the repayments of the Western credits more difficult than it was anticipated. An additional difficulty is provided by the fact that priority expansion was taking place in the electrical and mechanical industry which received 23.5 percent of all industrial investment in 1971–75 but was responsible for only 17.6 percent of total industrial export to the West, while the food industry, which received only 10.6 percent of total industrial investments contributes 15.5 percent of industrial exports to the West. In this situation a very large proportion of export to the West must be contributed by the fuel industry (coal), the further development of which is heavily capital intensive (see Tables XVII and V).

The understanding of all these difficulties is necessary for the discussion of the Plan for 1976–80 and its chances of success.

## VII. THE PLAN FOR 1976-80 AND GIEREK'S NEW ECONOMIC MANOEUVRE

The Seventh Party Congress, which was held in December, 1975, approved an outline of the Plan for 1976-80. The final version of the new five year plan and the annual plan for 1977 were together presented at the Fifth Plenary Meeting of the Central Committee held on December 1-2, 1976. The two plans were subsequently jointly discussed and duly approved by the Sejm (parliament). However, there was a considerable difference in the atmosphere in which the outline and the final version were discussed. The outline was unveiled in generally optimistic and self-congratulating speeches. The discussion of the final version was somewhat more grave.

Simple assurances that the new development strategy, presented as an unqualified success, would be continued during the next five years, were now supplemented by the presentation of a set of policies designed to eliminate the difficulties which had appeared at the end of the 1971-75 plan period. It became fashionable to talk about a "new economic manoeuvre" which, by analogy to Gierek's manoeuvre of 1971-72, was to be launched in order to solve the problems and to push the economy ahead to new successes.

In his speech at the Fifth Plenary Meeting of the Central Committee, Gierek repeated his commitment to the continuation of his strategy of increasing the economic potential of the country together with continuous improvements in the standard of living.<sup>69</sup> It seems, however, to be a performance of "Hamlet" without the prince of Denmark. The essential part of this strategy, as applied in 1971-75, was borrowing of foreign capital. The average rate of growth of the domestic net material product (the "produced national income") was 9.8 percent. Because of the borrowing of foreign capital, which resulted in an excess of import over export, the average rate of growth of the national net material product (the "allocated national income") reached 12.0 percent (see Table II). For 1976-80 the two rates are planned to be 7 and 4.8 percent respectively, with an excess of export over import being responsible for the difference. Instead of borrowing, a positive balance of trade is envisaged in order to repay loans and to meet various commitments undertaken under the CMEA agreements. It means that instead of an average of 12.0 percent, which could be allocated to increasing investment and consumption, only 4.8 percent will be available. This changes the essence of the strategy.

In order to secure a part of the increases in net material product available for domestic use for improvements in consumption "the main stress \* \* \* will be concentrated on better and further utilization of existing productive capacity" and improvements in labour productivity. Moreover, as has been stressed by Gierek, while in 1971-75 the achieved increases in labour productivity were the result of increased capital-labour ratio, in 1977-80 they will have to depend on "better organization of work".<sup>70</sup> The stress is, therefore, on the

<sup>69</sup> E. Gierek, "O konsekwentną realizację społeczno-ekonomicznego programu VII Zjazdu PZPR, o wyższą efektywność gospodarowania" (For the Fulfilment of the Socio-economic Programme of the Seventh Congress of the Polish United Workers Party Concerning Increasing Effectiveness of Economic Activity), *Nowe drogi*, No. 12, 1976, p. 16.

<sup>70</sup> *Ibid.*, p. 19.

quality of inputs and outputs and on increased effectiveness of economic processes.

In this situation systemic reforms should become an integral part of the strategy. Indeed Gierek mentioned in his speech that the improvements in the quality of economic processes should be supported by "further perfecting of the system of functioning the economy at all levels" and that "it will be necessary to combine to a greater extent administrative methods with economic-financial methods, which stimulate initiative of the staff of the enterprises and strengthen the feeling of responsibility for the activities which are undertaken."<sup>71</sup>

This obviously is only a lip service. No serious systemic reforms are envisaged for the period 1976-80. For the time being there seems to be no return even to the limited reforms which had been started in the first years of the decade. At least in 1977 the "new economic and financial system" will remain inoperative, the autonomy of the great economic organizations (WOG) will continue to be seriously limited and the use of command directives rather than the parametric steering will still be retained.

This seems to be a very severe limitation imposed on the strategy of development. While the borrowing of foreign capital and large doses of imported foreign technology were accepted as a substitute for reforms during the first half of the decade, considerable increases in the productivity of inputs are now expected to occur with an outflow of capital (a positive balance on current account), a drastic reduction in the import of foreign technology embodied in machines and equipment and this task is expected to be achieved still without reforming the system. It is doubtful whether this is a viable strategy.

The extensive factors of growth will not be able to play the same role as in the past. The labour force increased by 1,486 thousand in 1966-70 and by 1,815 thousand in 1971-75. The increase in 1976-80 is expected to be 1,100 thousand. Out of this total only 600 thousand will be available for the socialist sector (industry, construction, socialist agriculture, transport, communications, etc.). The badly neglected services and handicrafts are expected to receive 300 thousand people and an attempt will be made to attract 200 thousand to individual agriculture. In this situation employment in industry will be able to increase only by 170 thousand workers, which is almost four times less than the number by which industrial employment increased in 1971-75, and employment in construction is expected to decline. In order to achieve the planned increase in industrial output by 48 to 50 percent, the plan assumes an increase in labour productivity of 45 percent in industry and 50 percent in construction.<sup>72</sup> In 1971-75 gross industrial output per worker increased by 43.8 percent and construction output by 49.3 percent with very large increases in investment.

The targets of the new plan concerning increases in labour productivity are described as taut and possible to achieve only because of the enlargement and modernization of productive capacities, which took place in the preceding five year period, improved qualification of workers and a wider application of the system of rational

<sup>71</sup> *Ibid.*, p. 22.

<sup>72</sup> Wrzaszczyk, *op. cit.*, p. 15.

economic decisions.<sup>73</sup> It is, however, because it is difficult to utilize efficiently existing productive capacities and skills of workers, and to make rational economic decisions, in the traditional Soviet-type economies that the systemic reforms are important.

The labour force is not the only factor which will have to be economized in the current five year plan. It will also be difficult to obtain capital. The ratio of investment to net material product was reduced from 31.7 percent in 1975 to 28.8 percent in 1976. The plan for 1977 envisages the ratio of 27.4 percent and the five year plan expects a gradual reduction to 26.0 percent by 1980. Priority will, therefore, be given to those investments which have already been started, or which are of complementary nature, to investments "with lower capital intensity but great importance for the complex of the national economy, projects of an optimum size and high effectiveness of production."<sup>74</sup>

Again, it will be difficult to achieve these objectives without a considerable improvement in the investment processes which requires some bold systemic reforms. This is a very important point as the efficiency of investment will probably have a decisive importance for the success of the plan. For 1977 the planned share of investment is 27.4 percent and the rate of growth of domestic net material product 5.7 percent. This implies a marginal capital-output ratio of 4.81 percent. If the same ratio is applied to the whole period 1976-80, the achievement of the planned rate of growth of domestic net material product (7.0) would require an average share of investment of 33.7 percent and not the share of 27.1 percent which seems to be assumed in the plan. In other words, without a drastic reduction in the capital-output ratio in 1978-80 either the rate of growth of net material product would be considerably below the target rate (5.6 percent rather than 7.0 percent), or the share of investment would have to be increased, and the possibility of improving consumption would, therefore, disappear.

Similarly, the plan has been built on the assumption of significant reduction in the costs of production. In industry costs are expected to decline on average by 9.6 percent (as compared with 3 percent reduction in 1971-75) and in construction by 2.7 percent. As has been pointed out by the Chairman of the Planning Commission, "the results of the current five year period will depend, to a considerable extent, on the achievement of decisive progress in economizing fuels, energy and materials in every productive unit."<sup>75</sup> This would hardly be possible without the introduction of real economic calculations which require some far going reforms of planning and management.<sup>76</sup>

Because of the difficulties which appeared in 1974-76 it became, however, necessary to concentrate all efforts first on the short-run objective of the elimination of economic disequilibrium and ensuring a "harmonious development."<sup>77</sup> Indeed, it has been recognized that without a new economic manoeuvre it would not be possible to fulfil

<sup>73</sup> *Ibid.*, pp. 15-16.

<sup>74</sup> Gierek, *op. cit.*, p. 18.

<sup>75</sup> Wrzaszczyk, *op. cit.*, p. 16.

<sup>76</sup> This view is similar to that expressed by deputy J. Zablocki, vice-chairman of the parliamentary group "Znak", during the debate on the new five year plan in Sejm on December 17, 1976 (see the Sejm records).

<sup>77</sup> Gierek, *op. cit.*, p. 16.

“the goals and basic targets which were set by the Seventh Party Congress.”<sup>78</sup>

The plans of industrial production for 1977 were changed to increase the output of consumption goods for the domestic market. The enterprises were again encouraged to accept some “additional tasks” over and above the plan targets (in the fourth quarter of 1976 alone the value of the above-the-plan output of industrial goods for the domestic market represented 10 billion zloty).<sup>79</sup> As has been pointed out above, this is a dangerous policy which substitutes gross output for value added as an effective success indicator and results in short-run achievements at the expense of long-run tasks, particularly in the field of increased efficiency.

In 1976, 8 million tons of grain and fees were imported and the import was expected to continue for another year. The decision was also made to import “considerable quantities” of meat and animal fats. An important immediate task is the rebuilding of livestock, particularly the stock of hogs which declined by 3 million in 1976, and to ensure an expansion of the domestic production of feeds. More favourable prices have been offered to the farmers and attempts are made to make individual farming more attractive for young people.

The short-run measures are supplemented by the expansion of industrial inputs for agriculture and improvement in the agricultural infrastructure. A great stress is placed on the expansion of agricultural production in order to reduce the import of agricultural products in the subsequent years. The plan envisages an increase in gross agricultural production by 16 to 19 percent between 1975 and 1980, including 20 to 23 percent increase in crops and 13 to 16 percent in animal production. The fulfilment of the plan in this sector remains, however, a sensitive problem.<sup>80</sup>

Despite the increase in the prices paid to the farmers, the prices of basic foodstuffs charged to the population remain below the cost level. The total amount of budgetary subsidies for the food sector (the relevant part of agriculture and food industry) was 140 billion zloty in 1975, 170 billion in 1976 and it is expected to reach 205 billion in 1977 (about 12 percent of the domestic net material product, or about 70 percent of an average price paid by the population for these items).<sup>81</sup> Although there have been some statements about the necessity of introducing a flexible price policy,<sup>82</sup> any changes in this field are apparently still regarded as politically dangerous.

Finally, the decision was made to add 50,000 accommodations to the target of 1,525,000 accommodations which had been set by the Seventh Party Congress.<sup>83</sup>

In this way three areas have been granted priority: (1) agriculture and the whole food producing complex; (2) production of manufactured consumption goods and services; and (3) housing. Changes in the plan required modifications in the investment plan for 1976-1980. A number of projects were eliminated and some of the already ap-

<sup>79</sup> Gierek, *op. cit.*, p. 16.

<sup>80</sup> Wrzaszczyk, *op. cit.*, p. 11.

<sup>81</sup> *Ibid.*, p. 9.

<sup>82</sup> See, for example, S. Chelstowski, “Elastyczna polityka cen” (A Flexible Price Policy), *Zycie gospodarcze*, No. 33, 1976, pp. 1-2.

<sup>83</sup> Wrzaszczyk, *op. cit.*, p. 13 and S. Chelstowski, “Gospodarka 1976-1980” (The Economy in 1976-1980), *Zycie gospodarcze*, No. 51/52, 1975, p. 2.

proved projects were delayed or their construction was slowed down. In the place of the projects which had lost their priority, some new projects were introduced. They included, however, not only investments in agriculture, the agricultural machine industry, which clearly correspond to the list of priorities, but also investments in coal mining, energy and in metallurgical industry, the latter explicitly made "in order to accelerate a reduction in import from capitalist countries."<sup>84</sup> In order to include the additional targets in housing and to expand the production of manufactured goods for the domestic market the total amount of investment for 1967-80 was further increased. The Seventh Congress approved the sum of 2,640 billion zloty (about 37 to 40 percent above the total volume of investment in 1971-75). At the new prices of investment goods, which have been introduced since the Congress took place, this amount is equal to 3,120 billion zloty. It was increased, as the result of changes introduced at the Fifth Plenary Meeting, to 3,207 billion zloty.

The above changes in the investment plan provide some important insights. First of all, the final version of the plan is more consumption oriented than its preliminary draft. To this extent the leadership is responding to economic and political pressures which appeared particularly in 1976.

Second, despite all the statements about investment discipline, the necessity to keep investments limited in order to reduce pressures and to shift to a "harmonious development" and dependence on "intensive factors," some additional investment projects were simply added to the existing programme. This decision shows a lack of determination and suggests that some further increases in investment will likely take place during the implementation of the plan. It is the traditional reaction of the central planners who are faced with some unexpected difficulties to increase investment with the resulting adverse effects on consumption. The decision also suggests that the plan will remain to be very "taut," pressures will not be eliminated and some serious disturbances in its implementation may be expected.

Third, the final version of the plan implies an increased degree of import substitution. It envisages a reduction in the dependence on imported grain and feeds, as soon as it would be possible, but also a reduction of import of metallurgical products by 40 percent during the plan period.<sup>85</sup>

This last change in the investment plan reinforces the overall strategy of the plan. It is definitely a more inward looking plan than the plan for 1971-75. It envisages not only a reduction in the import of various raw materials but also in the import of foreign technology embodied in machines. While total industrial production is planned to increase by 48 to 50 percent, the output of the engineering industry is expected to increase by 66 percent and that of the chemical industry by 65 percent. The share of these two branches of industry is expected to increase from 35 percent of total industrial output to 39 percent in 1980. It is expected that domestic production of machines will be responsible for 74 percent of the investment demand in 1980, as compared with 66 percent in 1975.<sup>86</sup>

<sup>84</sup> Wrzaszczyk, *op. cit.*, p. 13.

<sup>85</sup> *Ibid.*, p. 9.

<sup>86</sup> *Ibid.*, p. 11.

It is a serious mistake to attempt to enforce autarky in respect of machines and equipment in a country of Poland's size and level of development. This would be a dangerous policy for any country in the second half of the twentieth century. The planners probably assume that a discrete, once and for all increase in the level of technology was all that the economy needed. They seem to believe that they have modernized industrial productive capacity to such an extent that further import of foreign technology on a large scale is unnecessary. It is, however, the very nature of modern technological progress that it is a continuous process.<sup>87</sup> There is no point of transferring a particular level of technology, by importing machines and equipment or licenses, unless it is going to be continuously improved upon and advanced. Machines, equipment, component parts and materials from various countries must often be used for best results. There is also the problem of the economics of scale in both production and research and development. For many processes even the largest countries cannot provide a sufficient market without export.

It was one of Gierek's greatest achievements, an essential part of his new development strategy and one of the main reasons for the successes of that strategy, that he opened the Polish economy to the West, particularly in respect of the import of machines. Under the combined impact of the economic disturbances in the world economy, stresses created, above all, by the excessive rates of investment and, probably, political pressures from the Soviet Union, this part of the strategy is now going to be modified.

### VIII. ECONOMIC AND POLITICAL INSTABILITY

There is no doubt that the Polish economy faces some serious difficulties. The situation is, however, far from catastrophic. According to the calculations of the Chase Manhattan Bank (as of December 1976), Poland's total hard currency indebtedness at the end of 1975 was 7.6 billion dollars. The ratio of net indebtedness to the volume of hard currency export was 2.1 as compared with the ratio of net debt to total exports of, for example, 6.0 for Mexico, 3.2 for Turkey, 3.1 for Chile and 2.6 for Argentina and Peru. Moreover, some loans were advanced for the expansion of the mining of coal, copper or sulphur and are directly or indirectly secured by the export of these commodities. Some other loans were secured by the export of parts and other products which are manufactured under industrial cooperation agreements or other arrangements which facilitate their placing in the Western markets.

After two and half decades of basically autarkic policies the country was opened up, to a much larger extent, to trade with the West. The heavily protected and subsidized industry experiences, quite naturally, considerable difficulties in competing in the world markets. It requires more time to strengthen its position, to acquire experience, to find viable lines of specialization. The economy started to benefit from the import of Western technology and from international contacts without which scientific and technological research cannot expand.

<sup>87</sup> This problem has been discussed by the author in Fallenbuchl, "Recent Economic Developments in Eastern Europe."

All these tasks should be easier now because, as the result of the developments in 1971-75, some restructuring of industry, modernization and enlargement of productive capacity, and improvements in skills and experience took place. However, these changes did not go deep enough and they should be continued to give full results. The present situation requires a slower pace to eliminate excessive pressures; further borrowing of foreign capital in order to reduce the adverse impact of excessively rapid repayments of debts and to maintain the policy of expanding investment and improving the standard of living; expansion of the pro-export production, not according to a priori decisions of the central planners but "from below" by responding to foreign demand and profitable opportunities detected by the enterprises; opening up of the economy to an even greater extent and slow and gradual integration with the world economy. A realistic and "outward looking" development plan and some bold systematic changes seem necessary at this stage in order to effect a switch from the "extensive" to an "intensive" pattern of development.

Unfortunately, the plan for 1976-80 goes in the opposite direction. It is a "taut" plan. Some new pressures will undoubtedly appear making the achievement of the relatively moderate improvements in the standard of living difficult. It is an "inward looking" plan which intends to expand import substitution. It is an impatient plan. It envisages an increase in export by 75 percent and a drastic reduction of the increase in import to 26 percent in order to move from a heavy negative balance on current account to a positive balance before the end of the plan period, although such policy may easily choke the growth of the economy and further endanger the fulfilment of the investment and improvement of standard of living tasks. It is an unrealistic plan in its expectations as to the possibility of achieving the rate of growth of export to the West of 14 percent per annum with a considerable increase in the share of machines and equipment in that export.<sup>88</sup> It is finally, a disappointing plan because of its neglect of systemic reforms which are necessary for the fulfilment of its main objectives.

It is, therefore, possible that the Polish economy may encounter very serious difficulties during the second half of the decade with a considerable adverse pressure on the standard of living.<sup>89</sup>

If this would indeed happen, then a very high degree of economic and political instability could be created. Any really serious political outburst in Poland may, however, easily assume international dimensions and may become a danger to peace. It is, therefore, in the interest of the Soviet Union not to discourage some far-going economic reforms in Poland. These reforms are absolutely necessary in order to avoid a serious crisis. It is also in the interest of the Soviet Union not to insist on the fulfillment by Poland of her obligations in connection with the financing of investments in the Soviet Union under the CMEA agreements, as these commitments create an excessive burden for the Polish economy at a very difficult moment. On the contrary, the Soviet Union should continue to grant some additional loans and to encourage Poland to apply for new credits in the West.

<sup>88</sup> Wrzaszczyk, *op. cit.*, p. 14.

<sup>89</sup> Some comments on the long-run prospects of the Polish economy have been presented by the author in Z. M. Fallenbuchi, "Poland in the Last Quarter of the Twentieth Century," *Slavic Review*, v. 34, No. 4, 1975, pp. 775-781.

It seems that in order to avoid the emergence of a potentially dangerous and explosive situation in the middle of Europe, it is also very much in the interest of the West to continue the present policy of trade liberalization towards Poland, to advance additional loans, and to expand scientific and technical exchange, with perhaps a subtle encouragement for the rapid introduction of some significant economic reforms and a greater degree of rationality of the plans in that country.

# ROMANIA'S FOREIGN TRADE: AN OVERVIEW

### I. INTRODUCTION

The structure of the foreign trade of any country is the resultant of many complex forces, which can be conveniently studied, as a preliminary to determining their quantitative impact, by first classifying them into three broad groups of explanatory variables: environmental, systemic, and policy-derived.

The first group can be subdivided into factors belonging to the *initial* and those belonging to the *contemporary* environment, a distinction requiring an *a priori* definition of the period of analysis. If we wish to analyze Romanian foreign trade in the 1970's, for example, we may take the relative under-investment in agriculture of the fifties and sixties and its consequences for the stock of fixed and human capital in this sector as components of the initial environment. If, on the other hand, our concern were with foreign trade in the entire period 1960 to 1975, we should consider the capital stock in agriculture for this entire span of years as subject to policy choices and no longer as completely exogenous. Clearly, in any event, the policies and system features of one period shape the initial environment of the next, and hence the relative comparative advantage of the different goods produced therein.

The principal factors in the contemporary environment of Romania that affect foreign-trade decisions include 1) membership in CMEA, 2) the dominant position of the USSR in CMEA, 3) the preferences—autarkic proclivities, political slant on trade—of the Soviet Union and of the other fellow-members of CMEA, 4) world prices and their lagged adaptation *cum* adjustments in intra-CMEA transactions, 5) Western income levels (e.g., the slump in demand for Romanian goods occasioned by the European recession of 1974–1975), and 6) world political conditions (*détente*, the state of USSR-China relations, the special relations of Albania and Yugoslavia with Romania, and so forth). Besides these external conditions, the contemporary environment also encompasses the weather and the other “states of nature” that influence agricultural output and hence trade in farm products.

\*Professor of economics, Yale University.

The system, viewed as a set of rules and institutionalized ways of managing economic affairs, influences trade outcomes in a variety of ways. The monopoly of foreign trade in all socialist countries and the varying degrees of centralization that attend it make for a greater or smaller degree of isolation of socialized enterprises both from their foreign suppliers and clients. Whatever might be the preferences of the planners for domestically produced over externally supplied goods, isolation causes many items not to be traded by reason of the lack of information concerning their availability or the demand existing for them abroad. Failure also often results when the bureaucratic difficulty of acquiring products from or selling them to foreign enterprises is too great for producers to overcome. We would therefore expect that large, sustained requirements or demands will be more easily transacted in such a system than small, sporadic ones.

The system determines whose preferences (defined as elements of the contemporary environment) will prevail in making decisions on foreign trade. In Romania basic decisions on the volume and structure of trade are made by the Council of Ministers. In the 1960's, implementation of basic policies was carried out and disaggregated decisions were made chiefly by the Ministry of Foreign Trade and by thirty-seven foreign-trade enterprises.<sup>1</sup> In 1970 some devolution of responsibilities in the area of foreign trade took place. Thirty-two out of the thirty-seven foreign-trade enterprises were detached from the Ministry of Foreign Trade and subordinated either to a production centrale (roughly equivalent elsewhere in Eastern Europe to an "association") or to a branch ministry.<sup>2</sup> According to David Granick, by 1973 there were seventy-six Romanian organizations authorized to engage in foreign-trade operations, of which at least twenty-one were individual centrale.<sup>3</sup> However this may have looked on paper, the actual autonomy of these sub-ministerial bodies was narrowly circumscribed. Because payments to centrale for exports, for example, were based on the official exchange rate or on a constant multiple of this rate, and 95 percent of the profits or losses arising from transactions were syphoned into or paid by the budget, centrale had no incentive and could not be relied on to give preference in directing their export sales to countries whose currencies were critically needed to balance accounts and to steer sales away from countries with which Romania was running an inconvertible surplus. To manage the balance of payments efficiently the planners in the central apparatus had to approve many decisions on the composition and direction of trade that they had little manpower or time to make themselves. Some of these decisions then devolved on the branch ministries. But the latter also tried to minimize their bureaucratic burden by giving preference to long-term agreements over ad hoc deals that absorbed too much of their very limited decision-making resources.<sup>4</sup> Thus the system, uncomfortably posited between the extremes of centralization and decentralization, and suffering from some of the disadvan-

<sup>1</sup> Some of these enterprises were specialized in import or export (e.g., Masinimport and Masinexport), whereas others carried out both imports and exports (e.g., Mineratimport-export, which exported goods valued at 188.8 million lei and imported goods valued at 563.4 million lei in 1966, according to official statistics).

<sup>2</sup> David E. Granick, "Enterprise Guidance in Eastern Europe: A Comparison of Four Socialist Economies" (Princeton: Princeton University Press, 1975), p. 82.

<sup>3</sup> *Ibid.*

<sup>4</sup> *Ibid.*, p. 84.

tages of both, had the effect of pressing trade into the well-worn grooves of long-term contractual arrangements, which, other things equal, biased decisions in favor of transactions with other centralized economies at the expense of deals with free-market agents. As we saw earlier, the isolation of enterprises from their suppliers and their clients abroad—to the extent that producers had any say at all in foreign-trade decisions—reinforced this bureaucratic bias.

The foreign-trade policies issuing from the Council of Ministers derived in large part from the industrialization campaign on which Romania has been bent these last thirty years. But they also exerted an independent protectionist influence to the extent that the implicit prices placed on domestically produced goods, including intermediate products and equipment, were higher than if these goods had been imported. Similarly, the prestige of exporting machinery and equipment has been so high in the eyes of the planners that such exports have probably been pushed farther than the policy of industrialization—had it been neutral with respect to trade—would have warranted.

Section II below describes the main links between industrialization and foreign trade. Section III analyzes the geographic distribution of Romania's trade among the Soviet Union and the rest of CMEA, other socialist countries, the developed Western world, and the developing nations. The paper concludes with a detailed discussion, in section IV, of some of the problems Romania has encountered in reducing the deficit in her machinery trade. This last section makes it evident that policies shaping the micro-structure of trade cannot be mechanically deduced either from Romania's general industrialization policy or from the environmental forces that constrain its implementation.

## II. INDUSTRIALIZATION AND FOREIGN TRADE

According to official statistics, Romania's net material product (NMP) grew at an average rate of 9 percent per year both from 1960 to 1965 and from 1965 to 1973.<sup>5</sup> An index of Gross National Product reconstructed by Thad Alton and his associates from sectoral data shows a rate of growth of 5 percent per year in the first period and 6 percent in the second.<sup>6</sup> The sizable difference between the two measures of aggregate performance is due in part to the inclusion in the Alton index of slow-growing services excluded from official NMP and the greater weight given to the farm sector, which expanded at a very sluggish pace during this period. (The net output of agriculture was virtually constant from 1960 to 1970, then shot up by 9.8 percent per year from 1970 to 1973.) From 1960 to 1972, industry grew at 12.6 percent per year according to the official index of gross output and at 10 percent per year according to the reconstructed Alton index of value added in industry, with only a slight retardation perceptible between the first five and the last seven or eight years of the entire period.<sup>7</sup> According to official estimates, NMP and gross industrial

Alton, "Economic Growth and Resource Allocation in Eastern Europe," in "Reorientation and Commercial Relations of the Economies of Eastern Europe," A Compendium of Papers presented to the Joint Economic Committee, 93rd Congress, 2nd Session (Washington, D.C.: Government Printing Office, 1974), pp. 274-75.

<sup>7</sup> *Ibid.* and A. S. 1975, p. 90.

output continued their rapid progress from 1973 to 1975 at rates slightly in excess of those recorded in the early 1970's (13.8 percent from 1973 to 1975 as against 11.8 percent from 1970 to 1972). The independent Alton measure of GNP, which is more sensitive to fluctuations in farm output than the official NMP, grew at a rate of 5.6 percent from 1973 to 1975, a shade below the performance of 1965-1973. The rate of growth of value added in industry was about the same, according to this measure, as in the preceding period.<sup>8</sup>

Foreign trade turnover (imports plus exports) valued in current *devisă* prices kept pace with industrial output, rising by 11 percent per year from 1960 to 1972. No indexes of prices in Romanian trade have been released for this entire period. According to a unit-value index prepared by the Romanian Ministry of Foreign Trade, export prices rose and import prices dropped by about 3 percent from 1960 to 1966.<sup>9</sup> Hungarian export prices were more or less constant and import prices rose by perhaps one percent per year from 1966 to 1972. The evolution of Romanian prices was probably much the same. For the entire period 1960 to 1972, therefore, it is unlikely that the growth of the current-value of foreign trade significantly overstates the real momentum of the sector. From 1972 to 1975 however, prices rose rapidly in the world market and, from 1975 on, in the CMEA market as well. The increases in the current value of foreign trade were officially estimated at 38.9 percent in 1973, 38.3 percent in 1974 and 6.6 percent in 1975. When deflated by an index based on Hungarian indices for four commodity groups in trade with the dollar and ruble areas, aggregated according to the approximate shares of these groups and areas in Romanian imports and exports, these very large percentage increases in current value are reduced to 14 percent in 1973 (exports: 17 percent, imports 10 percent), 12 percent in 1974 (exports 8 percent, imports 19 percent), and a bare 1 percent in 1975 (resulting from a 3 percent increase in exports and a 1.5 percent decline in imports). However approximative the price indexes on which these deflated figures are based, it is manifest that the growth rate of trade slackened appreciably in the period 1973-1975 (from an average of 11.2 percent for total trade turnover from 1960 to 1972 in current prices, which remained fairly stable in the period, down to 6.7 percent for the years 1972-1975). Imports in this more recent period probably did not keep up with industrial production.

In general, however, the forward momentum developed by the Romanian economy in the first half of the 1960's was maintained into the 1970s. The economy, as in the past, was propelled by the rapid expansion of industry and construction, which pulled the remaining sectors, with the exception of agriculture, in its wake. It is only in the period 1971-1974 that the large investments allotted to the farm sector in the 1960's began to pay off.<sup>10</sup>

<sup>8</sup> A. S. 1975, pp. 57, 93; "Revistă economică," no. 5 (1976), p. 4; and Thad P. Alton, et al., *Economic Growth in Eastern Europe 1965-1975*, Occasional Papers of the Research Project on National Income in East Central Europe, no. OP-50 (New York: L. W. International Financial Research, Inc., 1976), p. 11.

<sup>9</sup> Official Romanian statistics.

<sup>10</sup> The farm sector, since collectivization was completed in 1962, remains backward. A comparison of the value of production per hectare in different CMEA countries shows that Romania lags appreciably behind Bulgaria and Hungary in this respect. The ratio of productivity per laborer in agriculture to productivity per laborer in industry turns out to be much lower in Romania than in any other East European country (22 percent in 1972, compared to 30 percent in Poland and 47 percent in Bulgaria). "Revistă economică," no. 16 (1974), p. 16.

Growth, again as in the past, was pressed forward by very high rates of capital accumulation, officially estimated, in relation to NMP, at 25.5 percent in 1961–1965, 29.5 percent in 1966–1970 and 34.1 percent in 1971–1975.<sup>11</sup> The fixed assets in industry rose by 12.7 and employment by 5.0 percent per year from 1966 to 1973. With any reasonable weights we might use to combine capital and labor, we find that total factor productivity increased by 4.5–5.5 percent per year if we use the official data on net material product arising in industry and at 2–2.5 percent if we use Alton's estimates. In either case, the growth of productivity was on a high level and showed but a slight retardation, compared to the performance of the early 1960s.<sup>12</sup> Real wages of employees in state enterprises and (non-agricultural) co-operatives, according to the official index which is subject to some upward bias due to the use of an index of retail prices as a deflator which may underestimate the full extent of price increases in the retail market, rose by 3.6 percent per year in the period 1970 to 1975, on a par with the previous five years but below the record growth of 4.1 percent per year achieved in the period 1960–1965.<sup>13</sup> The real incomes of collective farmers (from their work on the collective and on their private plots) inched up by 1 percent per year in the period 1965 to 1970, then increased by 10.7 percent per year from 1970 to 1975 according to recently released official estimates, the difference between the two periods reflecting the significant improvement in farm performance of the early 1970's. It should also be kept in mind that the absolute population engaged in agriculture has been declining (at the rate of nearly 5 percent per year from 1970 to 1975, or nearly twice the rate of the 1960's), so that large numbers of exfarmers are now acceding to the higher levels of living enjoyed by urban dwellers.

Dramatic changes have taken place in the commodity structure of Romania's foreign trade in the course of industrialization.<sup>14</sup> Until the early 1960's, Romania was a net exporter of raw materials and foodstuffs and a net importer of manufactures. By 1973 it was exporting a slightly larger volume of manufactures, including chemicals, than it was importing; but, like all East European members of CMEA, it was running a very large deficit in industrial raw materials. This deficit was paid for, in the main, with exports of processed and unprocessed agricultural products. It is instructive to examine this transformation in greater detail on the basis of the breakdown of trade into nine commodity groups according to the official CMEA nomenclature.

From 1960 to 1973, total imports and total exports both expanded at an average rate slightly in excess of 10 percent per year. Imports of fuels, mineral raw materials, and metals (group 2 of the CMEA nomenclature) during this same period increased (fairly regularly) at an average rate of 8.9 percent,<sup>15</sup> while exports of these materials rose

<sup>11</sup> A. S. 1976, p. 53.

<sup>12</sup> Cf. the data in John Michael Montias, "Economic Development in Communist Rumania" (Cambridge, Mass.: The MIT Press, 1967), p. 56.

<sup>13</sup> A. S. 1976, p. 76.

<sup>14</sup> Unless otherwise indicated, reference is to the value of foreign-trade aggregates in current *devisă* prices.  
<sup>15</sup> Note that this rate of increase was slightly less than that of the Alton index of industrial output and roughly a third less than the official index of net output. An index of exogenous materials consumed in industry, in which imported materials were given a preponderant weight, lagged substantially behind our independently constructed index of industrial output for the benchmark years 1950, 1955, 1958, and 1963 (Montias, "Economic Development in Communist Rumania," p. 56).

(less regularly) at nearly half this rate (4.7 percent per year). Exports of petroleum products, which amounted to two-thirds of the value of these raw-material and semifabricated exports in 1960, had fallen to a third by 1972. They stagnated at or fell below 1960 levels until the price windfall of 1973.<sup>16</sup> In sum, the net deficit in the raw materials and metals group increased at a rate of over 4 percent per year from 1960 to 1973. Much the same evolution may be observed in the case of trade in raw materials used in light industry—group 5, including cotton, wool, leather hides, and sundry agricultural raw materials other than foodstuffs. The 1960 surplus was converted into a growing deficit, which rose at nearly 4 percent per year in the period 1960 to 1973. It is interesting to note that imports of raw materials for light industry increased at an average of 9.1 percent per year from 1960 to 1973, a rate only slightly inferior to the officially recorded rate of growth of light industry (group B) in the period.<sup>17</sup>

Exports of raw materials for the production of foodstuffs (group 7) increased very irregularly, owing to fluctuations in harvest yields and in the size of animal herds. Over the entire period 1960 to 1973, they grew at an average rate of 5.5 percent, hitting a first peak in 1967 which was only surpassed in 1973.<sup>18</sup> Exports of processed foodstuffs (group 8) rose both more rapidly (11.5 percent per year) and much more steadily<sup>19</sup> than exports of raw materials for the production of foodstuffs. Even the high average rate of increase for this group was exceeded by the growth rate for exports of chemicals (19.5 percent per year), manufactured consumer goods (20.7 percent per year), and machinery and equipment (14.0 percent). Imports of manufactured goods expanded quite a bit more slowly than exports, averaging about 9 percent per year for chemicals and consumer goods, and 11 percent for both machinery and processed foodstuffs.

Since 1972–1973, the net supply of “hard goods” (raw materials, semifabricates, and foodstuffs) turned from a trade surplus of about one billion lei (166 million dollars) to deficits of 538 million lei in 1974 and 1.5 billion lei in 1975 (roughly 340 and 980 million lei respectively at 1971 prices).<sup>20</sup> In this recent period, exports of raw materials for the foodstuff industry stagnated, fluctuating around 1 billion lei in 1971 prices, but processed foodstuffs, including meat and meat products, rose from less than a billion lei in 1972 to 2 billion in 1973 and 2.9 billion in 1974 (all at estimated 1971 prices). They then receded to 2.1 billion lei in 1975, a poor year for agriculture due to extensive floods. If it had not been for much higher exports of processed foodstuffs in these last years, the deficit in hard goods caused by steadily rising imports and declining exports of raw materials for heavy industry would have been much worse than it turned out to be.

<sup>16</sup> The petroleum industry, spearheaded by its oil-refining sector, expanded at approximately 4 percent per year from 1966 to 1972, but domestic requirements must have increased at an even faster rate.

<sup>17</sup> The textile industry grew at approximately 11 percent per year during the period. This rate of expansion is meaningful on the reasonable assumption that prices of raw materials for light industry, expressed in foreign-exchange lei, were roughly on the same level at the beginning and end of the period.

<sup>18</sup> The coefficient of variation of this estimate was equal to 40 percent, denoting a good deal of irregularity.

<sup>19</sup> The coefficient of variation of this estimate was less than 5 percent.

<sup>20</sup> Current values of imports and exports of foodstuffs (both raw and processed) were deflated by indexes of Hungarian foreign-trade prices (Központi Statisztikai Hivatal, Külkereskedelmi statisztikai évkönyv, Budapest: 1975), pp. 410–12; Statisztikai havi közlemények, no. 3/4 [1975]: 92). These indexes distinguish, for both imports and exports, trade in rubles and trade in “dollars and other accounts.” I assumed, for the purpose of these rough calculations, that the ruble area coincided with CMEA and the rest of the world with “dollars and other accounts.” To the extent that Romania’s trade with CMEA was actually carried on in dollar accounts (as in the case of certain transactions in foodstuffs), this assumption leads to an underestimation of price increases in trade with CMEA in the period 1973–1975.

Over the last fifteen years, the trends in trade and domestic production can be summarized very simply. By and large, domestic consumption expanded faster than domestic output for the products of the less rapidly growing sectors including mining and agriculture; it expanded more slowly than output for the more rapidly growing sectors including machine-building, chemicals, and manufactured consumer goods, the disparity between the two rates being much greater for consumer goods than for machines and chemicals in heavy demand in a period of overall rapid expansion. Manufactured foodstuffs proved to be something of an exception, their exports expanding at a rapid pace despite the under-average growth of their domestic output (6.4 percent per year from 1960 to 1974 according to the official index).

This last exception notwithstanding, the generalization may be upheld that foreign trade has tended to reduce substantially the disparities in the growth of consumption in different sectors that would have occurred if domestic output had been the only source of supply. Insofar as these outcomes resulted from planning decisions, the strategy revealed by these observations consisted in importing enough raw materials and semifabricates, as a supplement to domestic inputs, to satisfy the needs of a very rapidly growing manufacturing industry and in using exports of manufactured products to pay for as large a proportion as possible of the import bill. In the sphere of consumer goods, trade was used to smooth out exogenous fluctuations in supplies (particularly in foodstuffs) and, by keeping the rate of increase in household consumption lower than it would have been in the absence of trade, to generate resources for growth. The rapid growth of exports of foodstuffs in the face of sluggish progress in farm output was of course rendered possible by the steep rates of investment that depressed the domestic consumption of foodstuffs and made them available for export.<sup>21</sup>

### III. THE GEOGRAPHIC ORIENTATION OF ROMANIA'S TRADE

To implement the strategy of trade outlined at the end of the last section, a country must find partners willing to run accommodating surpluses or deficits in the appropriate commodity groups. For Romania, the choice of partners—and the possibilities of carrying out its strategy—was influenced by the following considerations.

(1) The Romanians wanted to import equipment of the highest quality and of the most modern types, principally available in the Western industrialized economies.

(2) Their manufactures were not of sufficient quality to pay for more than a fraction of their imports from the advanced Western countries.

(3) They were less discriminating in their specifications concerning imported consumer goods and were therefore willing to import mediocre-quality goods in this group from CMEA and their socialist partners.

(4) Their possibilities of trading manufactured exports for raw-material imports with CMEA members other than the USSR

<sup>21</sup> The widespread meat shortages of the second half of 1975, which are said to have touched off popular disturbances in Romanian provincial centers, were probably caused at least in part by this export drive.

were severely restricted by the efforts of their partners to accomplish the same ends for themselves.

(5) Short- and medium-term commercial and private-bank credits, long-term official credits (including IMF), and earnings from tourism facilitated Romanian imports from industrialized market economies and made it possible for Romania to run deficits in merchandise trade with these partners.

The data in table 1 show the geographic distribution of Romania's trade that took place after 1960.

† Minor differences between sums for each year and their totals are due to rounding error.

Note: CMEA includes Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, Poland, Romania, and the U.S.S.R. together with Mongolia since 1962 and Cuba since 1972. "Other Socialist countries" are Albania, China, North Korea, North Vietnam, Yugoslavia, and Cuba in 1966 and 1971. Advanced capitalist countries comprise all of non-Socialist Europe plus the United States, Canada, Japan, and Australia. Developing countries are all other countries not listed above including New Zealand and Israel. A minor revision of the CMEA (CTN) classification took place in 1971. Figures available for both the old and the revised classifications for 1970 show that its effect was to raise exports of machinery by 1 percent and imports by 2 percent at the expense of division II. Trade in foodstuffs (division III) was also increased by less than 1-percent as a result of the removal of tobacco from division II and its transfer to III. The data in the table for 1960 and 1966 correspond to the old and for 1971 and 1973 to the revised classification.

Trade with developed capitalist countries in 1973 is based on a breakdown which appears to omit 603,000,000 lei of exports to and 321,000,000 lei of imports from these countries.

Sources: 1960 and 1966: Ministerul Comertului Exterior, Dezvoltarea comerțului exterior al R. S. Romania 1960-66 (Bucharest: 1967), pp. 45-55; 1971 and 1973: official statistics.

The most dramatic and politically significant change has been the rise in the share of "developed capitalist countries" (market developed countries or MDC's) in Romania's imports of machinery. In 1960 this share amounted to 25.7 percent, already up from 9.5 percent in 1958; in the period 1966 to 1973 it averaged 47.3 percent. If we con-

sider that machinery prices on the CMEA market were about 35 percent higher than in the world market in the early 1960's and, judging by price trends in CMEA and world prices since that time, retained that edge throughout the period under consideration, the share of MDC's in total machinery imports valued at comparable prices for East and West came to nearly a third in 1960 and averaged around a half in the period 1966-1973. This share fluctuated a good deal in the 1960's and 1970's, due in part, for reasons explored in a forthcoming paper,<sup>22</sup> to changes in the availability of hard goods (mainly raw materials and foodstuffs) for exports. For the time being suffice it to note that the deficit with CMEA in trade in machinery at current *devisă* prices was not much greater in 1973 than it had been in the early 1960's (about 500 million lei). By contrast, the deficit in machinery trade with the MDC's rose from 322 million lei in 1960 (roughly \$50 million at the old official rate of 6 lei to the dollar) to 3.4 billion lei in 1975 (\$684 million at the new rate of 4.97 lei to the dollar). Credits extended by the MDC's to Romania, which are reflected in the large and increasing deficits in total trade with this area, greatly alleviated the burden that the country would have had to bear if they had been compelled to run surpluses in other groups to pay for all this equipment. (On average, from 1971 to 1973, the deficit in trade with the MDC's came to approximately half of Romania's deficit in the machinery group.) The large surpluses in machinery trade with other socialist countries (OSC's) and with the less developed countries (LDC's), amounting to 714 million lei in 1973,<sup>23</sup> offset less than a fourth of the deficit in this division with the MDC's. It is doubtful, in any case, whether any significant fraction of these surpluses could have been used to offset deficits in hard currencies with the MDC's.

We noted earlier that the surplus in raw materials and semi-fabricates of the early 1960's had turned into a sizable deficit in the 1970's. The turnaround occurred with both CMEA and the MDC's. but the shift was much more pronounced in the latter than in the former.<sup>24</sup> With CMEA there was a surplus of 217 million lei in 1960 and a deficit of about 300 million lei in both 1971 and 1973; with the MDC's, there was a tiny surplus of 53 million lei in 1960 and a very large deficit amounting to almost 1 billion lei in 1973 and possibly even somewhat more in 1974 and 1975. Surpluses in food-stuffs and industrial consumer goods played a crucial role in bridging these gaps. With CMEA, the surplus in foodstuffs rose only moderately—from 392 million lei in 1960 to 750 million lei in 1973. With the MDC's, however, it leaped from 282 million lei in 1960 to slightly in excess of 1.8 billion lei in 1973 (\$300 million at the old exchange rate of six lei to the dollar). The Romanian planners pushed exports of industrial consumer goods toward both East and West as vigorously as possible, holding to minimal levels their imports in this category from both

<sup>22</sup> J. M. Montias, "Romania's Foreign Trade Between East and West," sections IV and V. East-European Integration and East-West Trade," edited by Paul Marer and Michael Monhas. Based on the Conference on Integration in Eastern Europe and East-West Trade, held at Bloomington, Ind., Oct. 28-31, 1976. Forthcoming, 1978, Bloomington, Indiana.

<sup>23</sup> Machinery trade with the OSC's and LDC's combined was obtained as a residual from the data in table 1.

<sup>24</sup> The data on Romanian trade by nine commodity groups divided according to trading area (CMEA, Other Socialist, MDC's, and LDC's) on which the following analysis is based are presented in the Appendix, table A1.

areas. The surplus in trade in these goods, which had been negligible in 1960, rose to nearly 1.5 billion lei vis-a-vis CMEA and to 1.2 billion lei vis-a-vis the MDC's. Success in penetrating West European markets with consumer goods contrasts with the Romanian's mediocre performance—characteristic however of all the less developed socialist states—in promoting machinery exports to the developed West, the value of which amounted to hardly more than 10 percent of machinery imports from this group of countries in 1973. (This percentage was slightly higher than that achieved by the USSR and slightly lower than Poland's.)

The pattern of trade with the OSC's and LDC's is similar in one important respect: Romania ran large surpluses throughout the 1960's and early 1970's in the machinery group in trade with both areas. But the methods of balancing this trade differed. The "other socialist countries" (chiefly accounted for by China and Yugoslavia) paid for Romanian machinery for the most part with foodstuffs and consumer goods. In some years the LDC's balanced their accounts with Romania with raw-materials surpluses; but their deficit in total trade—generated by Romanian medium-to long-term credits—was so large in most years (amounting typically to a fourth of imports in the early 1970's) that, as an aggregate, they could afford to import a greater value of goods than they exported in any division. (Because exports of manufactures to LDC's must be lubricated with credits and because repayment is generally tied to bilateral accounts, the possibilities open to Romania of solving her trade and payments problems via exchanges with LDC's would seem rather limited.)<sup>25</sup> By contrast, credits to the OSC's, judging by the trade surpluses with these countries, only exceptionally rose above 10 percent of exports to these countries, at least in the 1970's. Trade with the Chinese Peoples' Republic, for one, has been more or less balanced for a number of years. Romania, if we may judge from these figures, seems to be more interested in cultivating the LDC's than her partners in the great socialist adventure. The motives for this preferential treatment of LDC's with respect to credits would seem to lie at least as much in the political as in the economic realm.

The above analysis of the broad features of Romanian trade, divided into four major commodity groups and four areas, needs to be disaggregated further in at least two respects. (1) Divisions II and III (raw materials, semifabricates, and foodstuffs) should be subdivided into four groups differing in their degree of processing or manufacture, with consequences for the direction of trade. (2) The Soviet Union should be separated from the rest of CMEA by reason of the special place it holds in Romania's trade.

In Division II (raw materials and semifabricates), the chemicals group (CTN 3) is of special interest. Romania in 1960 exported 72 million lei and imported 214 million lei of these goods. By 1973, exports had risen to nearly 1.4 billion lei and imports to 1.7 billion lei. In that same year, exports of chemicals to MDC's (negligible in 1960) were on a par with their exports to CMEA (about 500 million lei). This ex-

<sup>25</sup> For a more optimistic judgement on these possibilities, see Marvin R. Jackson's Comment on Montias, "Romania's Foreign Trade Between East and West," in "East European Integration and East-West Trade," edited by Paul Marer and Michael Montias. Based on the Conference on Integration in Eastern Europe and East-West Trade, held at Bloomington, Ind., Oct. 28-31, 1976. Forthcoming, 1978, Bloomington, Ind.

pansion in exports of more or less manufactured chemical products to market economies was made possible at least in part by imports of technologically sophisticated equipment for the chemical industry from the West. On the other hand, imports from the MDC's were 2.8 times as large as from CMEA. The behavior of the chemicals group in Romanian foreign trade resembles that of the machinery group in that in both cases the Romanians have turned away from CMEA toward the West for the bulk of their supplies, but the two groups differ in that the Romanians have been far more successful in their efforts to boost exports of chemicals to the West than they have been in the case of machinery products.

Also in Division II, groups 2 and 5 may be distinguished. Raw materials and semifabricates for heavy industry are covered chiefly in group 2 and raw materials for light industry (for textiles and footwear) in group 5. Because heavy industry grew more rapidly than light industry, the deficit in group 2 rose faster, particularly in the 1960's, than the deficit in group 5. There was a small surplus in group 2 at the beginning of the 1960's, which turned into a deficit in 1962, whereas in group 5 the deficit first appeared in 1970 and became significant only from 1972 on. Interestingly enough, in the crisis year 1975, the deficit in group 2 continued to increase (at least at current prices), while the deficit in group 5 was curtailed by nearly one billion lei. It is not known whether this curtailment was achieved by running down available stocks of cotton, wool, leather, and of other raw materials used in light industry or by operating textile and other consumer goods industries below capacity.

Exports to CMEA in groups 2 and 5 were remarkably stable from 1960 to 1971, as if they had been set according to quota. Imports in group 2 from this area rose by 4.5 percent per year in the period and in group 5 by 1.3 percent per year. Exports to the MDC's in groups 2 and 5 grew rapidly from 1960 to 1971 (by 11.1 and 8.4 percent respectively), but imports rose even faster (by 16.8 and 9.7 percent respectively). The bulk of exports to the developed West in group 2 consisted of oil products, over 70 percent of which (reckoned by tonnage) was directed to the West in the early 1970's.<sup>26</sup>

In Division III, group 7 represents raw materials for the food industry (cereals, fresh vegetables and fruits) and group 8 covers processed foodstuffs including meat. The MDC's accounted for the bulk of exports in group 7. Out of 2.5 billion lei of exports in group 8 in 1973, CMEA took 828 million and the MDC's approximately 1.5 billion. The foodstuffs accruing to CMEA include a large share of canned products and processed foodstuffs; the West got most of the meat, butter, and eggs.<sup>27</sup> Groups 7 and 8 illustrate the general rule according to which raw products are more likely to be sold to the West and processed products to the East. By and large, the more highly manufactured a product happens to be, the harder it is to sell to the West.

Estimates of trade with the Soviet Union and the rest of CMEA broken down by nine commodity groups (CTN) are presented in table 2. From table 2 we may infer the following points. (1) Trade in

<sup>26</sup> Computed from the country data in Ministerul Comerului Exterior, "Comertul exterior al R. S. R., 1973" (Bucharest: n.d.), pp. 76-77.

<sup>27</sup> *Ibid.*, pp. 102-03.

<sup>1</sup> Group 1 is identical with division I in table 1; groups 2 through 5 are included in division II, groups 6 to 8 in division III, and group 9 in division IV.

<sup>2</sup> Minor differences between sums for each year and their totals are due to rounding error.

Sources and methods: 1960 and 1973: Derived from percentages in "Ekonomicky casopis No. 9 (1975)": 790. These percentages were apparently based on Soviet statistics which omitted armaments both from group 1 and from the total. The difference between the Romanian statistics of imports from and exports to the Soviet Union in 1960 and 1973 was added to group 1 in the corresponding years; 1965 and 1972: "Rumanian Press Survey No. 961", p. 10. Trade in consumer goods was estimated from "Comertul exterior al R.S.R. 1973," pp. 108-116. Trade with CMEA other than the Soviet Union was derived by subtracting trade with the Soviet Union from the statistics of trade with CMEA in table A1 of the appendix. For 1972, a year for which no statistics of trade with CMEA broken down by commodity groups were available, imports and exports of machinery and equipment were taken from N. Suta, "Relatiile economice dintre tarile membre ale CAER, Bucharest: 1975," pp. 80 and 81.

manufactures (machinery and industrial consumer goods) with CMEA members other than the Soviet Union showed only a very small surplus in favor of Romania in 1973. (2) In that year, trade in machinery with the Soviet Union other than armaments was just about balanced (around 1.1 billion lei).<sup>28</sup> (3) The great surplus in manufactures ("soft goods") in Romanian trade with CMEA originated almost entirely in the surplus of manufactured consumer goods exported to the Soviet Union (1.3 billion lei) in 1973. Exports of these consumer goods to the Soviet Union rose 8.7-fold from 1960 to 1973, imports by only 50 percent, remaining negligible. (4) Trade with the USSR in raw materials and semifabricates (group 2) turned from a slight surplus in favor of Romania in 1960 to a deficit of nearly 900 million lei in 1973. The onset of this deficit may be traced to declining oil exports and rising imports of metallic ores, pig iron, and ferroalloys. (5) The surplus in Division II (groups 2 to 5) in trade with CMEA countries other than the Soviet Union came to 341 million lei in 1973,

<sup>28</sup> For estimates of trade in armaments, see sources and methods to table 2.

far short of the deficit with the Soviet Union in these groups (627 million lei). (6) Romania ran a surplus in foodstuffs (groups 7 and 8) with both the Soviet Union and the other members of CMEA in all four years. In trade with the Soviet Union in 1973, this surplus was insufficient to offset the import surplus in groups 2 to 5, leaving a continued deficit of 237 million lei in "hard goods" (Divisions II and III). The surplus earned from exports of foodstuffs to the other countries of CMEA, however, was so large that it more than offset the deficit in hard goods with the Soviet Union, leaving a positive balance in hard goods with CMEA as a whole equal to nearly 400 million lei. This positive balance, however, was appreciably smaller than in 1960 or 1965.

The year 1973 was somewhat exceptional in that the overall balance of merchandise trade with both the Soviet Union and the other CMEA nations showed very large surpluses (671 and 709 million lei respectively). In 1972, imports from CMEA as a whole exceeded exports by less than 400 million lei, and the surplus in hard goods with countries other than CMEA was some 200 million lei smaller than in 1973.<sup>29</sup> However, the main difference between the two years showed up in exports of Romanian machinery to CMEA members other than the USSR, which increased from 1.3 billion lei in 1972 to 2.1 billion lei in 1973, thus reducing the deficit in this group from 722 to 140 million lei. The available data allow us to infer that when Romania was faced with the necessity of repaying debts or to offset other negative items in her balance of payments with non-Soviet CMEA in 1973, she was able to do so mainly (i.e., to the extent of perhaps two-thirds) by increasing her exports of soft goods to these countries, thus economizing on the hard goods needed to earn convertible currencies in the West.

#### IV. A MICROANALYSIS OF TRADE IN MACHINERY

Recently released data and an important dissertation on trade in machinery and equipment by a Romanian economist afford valuable insight into the planners' decisions in this critical sector.

Romanian officials have very definite ideas about what constitutes a desirable structure of machinery imports and exports. In general, the more Romania's export structure gets to resemble that of an advanced industrial country, the better they like it, irrespective of specific differences in resource endowment, capital, or tradition. It is desirable, for instance, for machinery exports to represent a high percentage of total exports, as they do in advanced countries. The Romanians take pride in having increased the share of these imports from 4.2 percent in 1950 to 16.7 percent in 1960 and 25.3 percent in 1975. Responsible Romanian officials think this share should be raised considerably higher, in keeping with the relatively advanced state attained by the economy.

<sup>29</sup> To calculate this surplus as a residual, an estimate was needed of the balance in trade in consumer goods with CMEA in 1972. From percentages in the Economic and Commercial Guide to Romania 1974, Chamber of Commerce of the Socialist Republic of Romania, Propaganda Department (Bucharest: 1974), trade in this group with all socialist countries may be derived. To arrive at trade with CMEA alone it was assumed that the ratio of trade with CMEA to trade with socialist countries in group 9 was the same in 1972 and 1973. Only a small error can arise from this assumption.

The planner's policy with respect to machinery imports is not as clearcut. On the one hand, they would like to substitute domestic production for imports. On the other, they realize that advanced countries import a large proportion of their machinery needs. In point of fact, machinery imports have fluctuated without a clear trend from 35 to 40 percent of total imports, depending on the intensity of the domestic investment effort. The planners do, however, consider it to be a good thing for a country's imports of machinery to contain a high share of R & D-intensive equipment, including calculators, computers, optical apparatus, aircraft and aircraft motors, and telecommunications equipment. The total share of these items in the machinery imports of industrialized West European countries typically amounts to 21 to 30 percent and rises to 40 percent or more in Japan.<sup>30</sup> The writer of the dissertation referred to above found some comfort in the fact that the share of R & D-intensive machinery products rose in Romania from 1960 to 1971 (from 3.5 to 6.8 percent), while it declined in the Soviet Union (34.5 to 19 percent), Bulgaria (13 to 9.5 percent), and Czechoslovakia (7 to 4.3 percent), and remained constant in Poland (at 11 percent). Incidentally, the reasons given for the fall in these percentages elsewhere in CMEA were, first, the creation of domestic capacities that produced substitutes for these imports and, second, the lack of machinery available for reciprocal delivery to the capitalist countries and the consequent shortage of foreign currency to pay for them. The share in question despite the increase of the 1960's was still at a very low level in Romania at the end of the period, especially if we consider that this country, unlike Czechoslovakia, is hardly capable as yet of producing adequate substitutes for most of these imports.

Romanian exports of R & D-intensive equipment were deplorably low—indeed negligible—both in 1960 and 1971. These items represented an appreciable share of exports of all machinery and equipment only in Hungary and the GDR; but even Bulgaria had made far greater progress in this direction than Romania.<sup>31</sup> The recent Romanian co-production arrangement with the U.S. Corporation, Control Data, Inc., whereby Romania has committed itself to produce a variety of peripheral equipment for computers, may make a decisive difference in this regard.

The most revealing data on the desired orientation of the structure of machinery exports are contained in the following table (table 3) showing the actual composition of these exports in 1970, the volume and composition planned for 1975 and 1980, and the value in dollars per ton of each type of equipment.

<sup>30</sup> Iulian Dănescu, "Optimizarea exportului de mașini și utilajë al României în perspectiva anilor 1975-1980" (Doctoral Thesis, Bucharest, 1973), p. 40.

<sup>31</sup> *Ibid.*, p. 33.

Total.....	5, 750	10, 370	100.00	100.00	100.00	-----

Note: When the percentages for 1970 are applied to total machinery exports in that year (2,534.5 million *devisa* lei) the results are almost identically equal for those items for which data on detailed exports are shown in Ministerul Comerțului Exterior, "Comertul exterior al R.S.R. 1973" (Bucharest: 1973), pp. 31-34.

Source: Iulian Danescu, "Optimizarea exportului de masini si utilaje al Romaniei in perspectiva anilor 1975-1980" (Doctoral Thesis, Bucharest, 1973), p. 237.

The structure planned for 1980—a decade after the forecasts were made—clearly evinces the reorientation of machinery exports away from low to high dollars-per-ton items. The share in total machinery exports of railroad cars, for instance, which brought only \$600 per ton on world markets at the beginning of the 1970's, was slated to go down from 9.38 percent in 1970 to 6.38 percent in 1980. Ships, tractors, agricultural machinery, petroleum equipment, and trailers were other low-value items that stood to diminish in relative importance. It was planned to increase the shares of most high-price items, including electrical equipment (\$2,800 per ton), metal-working machinery (\$2,700), electric calculators (\$30,000), optical equipment (\$25,000), telecommunications equipment, and radios and televisions (\$5,800). There were a few partial exceptions to this general principle. The shares of construction equipment, refrigerators and washing machines,

automobiles, and buses, all of which are medium-to-low-value items (\$1,200 to \$1,700 per ton) were slated to increase from 1970 to 1980. Most of these, incidentally, are sheet-metal products that play an important role in intra-CMEA trade. The plan for 1975 showed far more exceptions than the plan for 1980 to the general rule whereby high-price items were to gain and low-price items to lose in importance. The shares of most types of motors and industrial electric equipment, which are fairly high-valued, were to decline by 1975 and then to rise above 1970 levels by 1980. The share of low-valued railroad cars was to rise by 1975 before falling again to below-1970 levels by 1980. The imperatives of available capacities must, in the short- and medium-run, override desired changes in structure.

Surely though, that structure of exports is not necessarily the most efficient which concentrates chiefly on pieces of equipment that fetch a high price abroad. High-price goods may be particularly expensive to produce in Romania. A *prima facie* question to consider is the domestic cost in lei per dollar (or per *devisă* lei) obtained in foreign trade. From the partial data given by Dănescu, no evident correlation can be discerned between this primitive indicator of efficiency and the price of the exported good per ton. Thus televisions, for which a high price per ton obtains, cost 39.7 lei per dollar obtained in 1972. Spare parts for automobiles, a relatively low-price item, cost 15.3 lei per dollar. The average for all machinery and equipment, incidentally, was 24.2 lei per dollar. Electric motors, electric locomotives, parallel lathes, and agricultural machinery were below this average (i.e., were relatively low-cost generators of foreign exchange), while high-tension transformers, tractors, trucks, railroad cars, cargoes, and diesel locomotives were above average (high-cost generators). Railroad cars, the dollar price of which per ton was the lowest listed in table 3, cost 25.6 lei per dollar, which was just above average—and below many categories of equipment commanding higher prices abroad.

The calculation of domestic costs per ton yields only a first approximation to efficiency. For one thing, as Granick points out, accounting costs in Romania are a very poor reflection of the resources required to produce a product.<sup>32</sup> Overhead costs, for instance, are distributed among products in proportion to their direct labor costs, a practice that must lead to the understatement of the costs of capital-intensive products. More generally, the costs of capital-intensive items are understated in the calculations shown by Dănescu because there were no charges made at that time for the use of capital beyond depreciation.<sup>33</sup> Also, at the very least, the planners ought to have considered *net* domestic costs per dollar earned—that is, those domestic costs and dollar returns obtained after subtracting the costs (in domestic lei and dollars respectively) of all imported or exportable goods entering into the manufacture of the item under consideration. These material costs, according to Dănescu, amounted to 20–30 percent for motors and tractors.<sup>34</sup> Yet such calculations do not seem to have been carried out, except possibly on an experimental basis when the plans for 1975 and 1980 were being prepared.

My impression is that these more sophisticated calculations would tend to confirm the correctness of the planners' decision to scale down

the share of exports of metal-intensive items such as railroad cars, tractors, and trailers, and to emphasize high-value-added items like electrotechnical equipment—especially if production methods can be based on imported high technology—but this is only a guess.

## I. INTRODUCTION

Romania shares the Balkan historical region with Albania, Bulgaria, Yugoslavia, and Greece. With a common location the Balkan people have shared a common fate of economic backwardness and foreign domination. Before the Second World War one could find only tiny islands of industrialization in what was otherwise Europe's greatest mass of extreme rural poverty. Following the War, the region continued to experience strong and sometimes overwhelming foreign influences, but in each country powerful forces were released to promote economic development. Since 1950 the region has experienced Europe's highest growth rates. Despite much progress the effects of history have not been easy to erase. The Balkan countries remain

\*\*Professor of economics, Arizona State University.

at the bottom of the list of European countries in terms of per capita output, per capita exports of manufactured goods, and other indicators of economic development. They face a common challenge of it, when, and how the economic gaps between themselves and Europe's mature industrial countries can be closed.

The processes and challenges of economic development for Romania and her neighbors may be usefully viewed in two phases. The first "extensive" phase finds investment mobilized through pressure on consumption and increased rates of labor participation, although these pressures may be reduced if foreign borrowing and aid are available. Imports of machinery and technology are paid for by exports of primary products from agriculture and mining. During this phase, industry at first absorbs the surplus population and increments to the labor force, but finally as these sources of increased industrial labor force are exhausted, the absolute labor force in agriculture falls. As industry and the urban population grow, more of the output of agriculture and mining is consumed and the export surplus tends to decrease.

If a country succeeds in initiating "extensive" growth, it will eventually face new challenges of "intensive" growth, a phase that begins when unused reserves of labor in other sectors are no longer available to provide rapidly expanding labor inputs in industry. Now capital: labor ratios will increase if high levels of investment continue. To prevent a reduction of capital productivity, greater emphasis must be placed on increasing labor skills and technological change in existing industry. Another aspect of "intensive" growth will be faced by countries (usually smaller ones) whose raw material base must be supplemented by imports and whose domestic demand for manufactures provides insufficient specialization and economies of large-scale production. A country in this circumstance will also be required to produce manufactured goods efficiently enough to compete in world markets. Its success determines both the cost of imports and the efficiency of domestic resource use.

The literature on centrally-planned economies has stressed both their relative success in generating extensive growth and the challenges to them in the intensive phase of growth. In the Balkans, four of the countries, not including Greece, have been able to initiate extensive growth through central planning and the political controls of a communist party. Yet, despite their common heritage of backwardness and a common beginning, they have followed diverse paths through more than thirty years of extensive growth. The divergence arises, in part, from politics, since three of the four, not including Bulgaria, have quarreled with Moscow. Of the three, Albania in any case, because it has the most backward economy and because of its tiny size, might have followed a different path from that of Romania or Yugoslavia, both of whom were favored by larger populations, more natural resources, and higher initial levels of development. Of the two largest Balkan countries, Yugoslavia has departed further from Moscow formulas, both internally and externally. Its different path, in contrast to Romania, has been greatly influenced by its independent communist revolution, ethnic diversity, and distance from the Soviet border. Romanian leaders, aside from other factors, have always had to face the reality of a border over 1300 kilometers shared with the Soviet Union and a location that provides the latter with access to the whole Balkan region.

### *A. The Origins of Romanian Policy*

When Romania is viewed in the context of postwar politics in Eastern Europe, it displays an interesting feature. Not counting the very first years of communist rule, Romanian people have shown an apparent willingness to tolerate or accept the leadership of the country, as evidenced by the absence of major civil disorder (found on occasion in Hungary, Poland, Czechoslovakia, and East Germany) or, as of recent years, fractional disputes and bloody purges within the Romanian Communist Party. In fact, national policy, as developed by the Party, has shown stability and continuity in both its direction and means of execution. Of course other factors may be involved but the evidence suggests that Romanians, while certainly not satisfied at all times by the party leadership, have found some identification between it and their own aspirations.

If one were to seek a single key to Romanian policy since the 1950's, in both domestic and international affairs, it is the pursuit of independence under constraints. In this respect, party leaders have roots at least to Romania of the last century. Indeed, it may be said that few other communist parties have made a greater effort to link present policies with the past of the country, especially threads of Romanian political economy in which the fundamental axiom was that a backward, unindustrialized country has no hope for independence. Therefore, the first principal of policy has been the pursuit of rapid industrialization. The special quality of postwar Romanian leaders is not only their success in the execution of industrialization, but in their further recognition that the process of industrialization breeds new threats to independence, which, if they are to be avoided or minimized, limit the rapidity and dictate the shape of industrialization.

A backward country must acquire capital and technology in the first stages of development. In fact, within the absorption limits of the domestic economy the more capital and technology that is imported, the more rapidly the initial constraints of backwardness can be widened. The danger to independence arises to the extent that countries supplying capital and technology impose conditions that may hinder further development and even turn the recipient into an economic or political appendage. The threat of a new dependence may be reduced in several ways: (a) Limiting the levels of imports, (b) distributing imports widely among supplier countries, and (c) distributing imports and other industrial resources among many domestic branches in order to acquire self-sufficiency. In later stages of development, a small country, having successfully initiated industrialization, may face similar threats imposed through dependency on raw material imports or manufactured goods exports. In general, the strategy to reduce threats to national independence calls for similar resources: do not push industrialization at the cost of undue dependence, and distribute imports and exports widely among goods and countries.

The threats to independence in the process of industrialization appear with a significant amount of uncertainty. Avoiding them usually imposes costs, which slows down industrialization, thus maintaining the dependencies of backwardness longer, and increasing the costs of importing, exporting, and, in general, any given rate of growth in terms of the domestic sacrifices required for it. Clearly maintenance

of independence has costs and requires a developing country that wishes to maintain it to decide, under conditions of uncertainty, a balance between independence and actions that could make industrialization easier, at least in the short run.

Romanian policy since the 1950's seems to have followed such a logic. Professor Montias has provided a detailed study of Romania's quarrel with CMEA and the reorientation of trade with the West through 1965.<sup>1</sup> What is less known about the earlier years is that Romania, unlike Bulgaria, received no economic aid from the Soviet Union, but instead paid rather large sums to it, while faced with unfavorable terms of intra-CMEA trade.<sup>2</sup> It may be added that, in contrast to Greece and Yugoslavia, Romania received neither Western aid nor substantial remittances from nationals working abroad. Whether through necessity or choice, Romania's early industrialization was largely self-reliant.

In the late 1960's and early 1970's Romania continued to reduce its trade dependence on the CMEA countries in general and the Soviet Union in particular.<sup>3</sup> But even though dependence was reduced, significant supplies of such vital imports as iron ore and coking coal still come from CMEA. Moreover, CMEA exports and imports increased significantly in 1974 and 1975.

Western borrowing and Western imports of capital equipment reached a peak in the late 1960's. After 1970, Romania's absolute debt to the West continued to increase, but the rate of increase was sharply reduced and, with it, the share of western sources of total capital imports. The change may be interpreted as indicating a weakening of Romania's credit based in turn on estimates of her ability to export for convertible currency. Without doubt, Romania exhibits a continuing strong interest in convertible currency exports, as witnessed by her acceptance in 1975 of U.S. terms for granting MFN. Romania was the only CMEA member to do so. However, another interpretation may be given to Romania's behavior. Expanded U.S. markets allow Romania to diversify trade with the West. Of greater significance is the opinion that Romania could borrow significantly more from the West if she desired to do so strongly enough to meet western bank requirements for greater information about her current, credit, balance of payments, and trade plans. Possibly Romania believes that her independence would be compromised by providing more information or greater western trade shares.

Another aspect, perhaps the most interesting, of Romania's international economic policy is her strong interest in an option between East and West. Romanian trade with the less developed countries (LDC's) increased sharply in 1974 and 1975, and the plan for 1980 calls for nearly a third of total trade in this direction. From the perspective of Romania's independence, raw materials from the LDC's are clearly preferred to those from the Soviet Union, or other CMEA countries. Romania may also prefer to acquire raw materials directly

<sup>2</sup> Paul Marer, "Soviet Economic Policy in Eastern Europe," in Joint Economic Committee, Congress of the United States, "Reorientation and Commercial Relations of The Economies of Eastern Europe." Washington, 1974, pp. 135-63.

<sup>3</sup> Changes in trade dependence are sometimes hidden in changes of total and regional trade. For an analysis that abstracts from these and other statistical problems, but shows Romania's significantly decreased dependence on CMEA, see: Paul Marer, "Intra-Comecon Trade: Patterns of Standardized Trade Dependence," prepared for NATO Colloquium on COMECON, NATO Headquarters, Brussels, Belgium, March 16-18, 1977, especially Chart 7.

from the LDC's rather through western intermediaries. In this case, Romania not only reduces export market dependence on the West and a certain need to pay in convertible currencies, but opens the possibility of supplying exports from her heavy industry to LDC's. It is consistent with Romania's past willingness to pay a price for independence to make these changes even if greater LDC trade may be immediately less profitable than West or CMEA trade and bear an additional cost of requiring Romanian credits to the LDC's.

These points will be explored further in the text of this paper. They are part of an overall policy that Romania calls "cooperation." This means that Romania will bargain for compensation; that is, ask to pay for equipment, for example, with Romanian industrial products. In a narrow sense, cooperation means that industrial products must exchange for industrial products if Romania is to avoid a dependent relation with the supplying country. In a broader sense, it means that Romania will cooperate with as many countries as possible in order to reduce dependence on any one or group of them.

### *B. Romanian Economic Organization*

As initially planned, this paper was to be concerned equally with structural changes and organizational changes in the Romanian economy. Although Romanians might disagree, it became evident that what has been most interesting about Romanian economic organization, especially by comparison to other CMEA members, is not change but a relative lack of change. To say no organizational changes have taken place would be incorrect. They have; but the dominant change in Romanian economic organization has not been in decision making as much as in what might be called "organizational mood," at some risk of implying something more subtle than what is obvious in Romania. The best term for describing the phenomenon is the word "mobilization," defined by Montias as "the form of pressure on individuals and their families, usually channeled through local party cadres, to make them contribute as much as they can to the pursuit of the regime's goals."<sup>4</sup>

The Romanian economy was mobilized once in the early years following communist acquisition of power. But the degree of mobilization seemed to taper off, reaching a low point between 1965 and 1970. Since 1970, the Romanian system has been remobilized, a process that has affected policy, performance, and organization.

Policy mobilization in Romania is best illustrated two ways. First, Romania's planned rates of overall economic growth and industrial growth for both five-year periods, 1971-75 and 1976-80, are significantly higher than the plan figures for other members of CMEA. Second, mobilization reflects in Romania's determination to achieve these high rates of growth while reducing net international debts and acquiring a substantial trade surplus. To accomplish this, Romania must severely limit imports and maintain high levels of self-sufficiency in all commodities and in technology. From a historical point of view the present leadership seems to have adopted an old Romanian slogan of the nationalist (but also capitalist) Liberal Party of the 1920's, "prin noi insine", best translated as "all by ourselves".

<sup>4</sup> John Michael Montias, "Types of Communist Economic Systems," in *Change in "Communist Systems"*, edited by Chalmers Johnson. Stanford, Calif., 1970, p. 117.

Performance mobilization shows in the overfulfillment of the ambitious plan for 1971-75 in spite of the floods in the summer of 1975. Similar actions have been repeated more recently when, following the earthquake tragedy of this March, persons have reportedly been placed on ten hour days to make up for the material losses. One notes that the only part of the 1976-80 plan to change so far as a result of the earthquake is a year's delay in the transition from a 48 hour work week to a shorter one.

Organizational mobilization is suggested by the relative size of Romania's Communist Party. It grew 25 percent from 1969 to 1974 to roughly 2,500,000 members, or one in every nine citizens, the highest ratio of party members to population of any CMEA member.

As might be expected Romania's economic organization is and has been highly centralized. The so-called "economic reform" movement came to Romania later and with less impact than elsewhere in CMEA.<sup>5</sup> It is suggestive of Romania's organizational approach that David Granick, on the basis of his interview studies shortly after Romanian reforms were initiated, concluded Romania was more centralized than either East Germany or the Soviet Union.<sup>6</sup>

Some slight decentralization (in a Romanian sense) lasted from 1969 through 1972 or 1973, but disappeared quickly after the National Party Conference in July 1972 called for the plan of 1971-75 to be fulfilled in four and one-half years. Since then, among the evidences of recentralization in the organization of industry and foreign trade are the following: (1) A standard internal organization was imposed on the industrial associations and enterprises, and the number of industrial associations was reduced from about 200 to 100 early in 1973;<sup>7</sup> (2) the number of industrial enterprises increased from 1965 to 1972, but were reduced back to the 1970 level by 1975, and the number of locally subordinated enterprises was sharply reduced in 1972;<sup>8</sup> (3) the number of organizations permitted to negotiate foreign trade contracts was also reduced in 1973, and again in 1975, when some foreign trade enterprises were returned to the ministry of foreign trade.<sup>9</sup> Still other dimensions of recentralization were reflected in the state plan for 1974 (prepared in 1973), which provided for: (1) an increase in centrally allocated products from 180 in 1973 to 720;<sup>10</sup> (2) the elimination of "decentralized" investments;<sup>11</sup> (3) the elimination of "departmental" imports (i.e., those not specifically approved by a central agency) and the designation of a single agency for each type of imported product.<sup>12</sup> As far as is known, with a few exceptions, price setting was never intentionally decentralized in

<sup>8</sup> Anuarul statistic-1976, p. 79, hereafter referred to as *AS*.

<sup>9</sup> These and additional details on foreign trade are discussed in a paper by Josef C. Brada and Marvin R. Jackson, "Strategy and Structure In the Organization of Romanian Foreign Trade Activities, 1967-75," in this volume.

<sup>10</sup> Probleme economice, 1973:11, p. 23. Also in 1974, the state plan established energy and fuel consumption norms for 250 products. In 1975, such norms were extended to all products in the state plan ("Revista economica, 1975": 12, p. 9).

<sup>11</sup> As stated by Ceausescu, "Scinteia" 29 November 1973. In 1975, he went a step further saying, "Is the future, not a single investment, including local industry, can be made without central approval." "Scinteia," 24 July 1975.

<sup>12</sup> "Scinteia," 29 November 1973.

Romania.<sup>13</sup> However, in 1976 Ceausescu complained about the lack of price control and then explained that measures had been taken to ensure "In the future, not one kind of enterprise will have the right to establish prices without approval of the [central] price and financial agencies."<sup>14</sup>

As far as is known, Romanian agriculture was not touched by economic reforms. Here it is significant that Romania has never dismantled the machine-tractor stations as other CMEA countries did. Creation of various types of intercooperative associations in the 1970's appear to be a form of centralization. By far the most important change in Romanian agriculture has been the thorough overhaul of peasant incentives, which will be discussed further on in this paper.

Altogether, Romania's centralized organizational system seems to be a logical consequence of the concern for maintaining independence and the intense mobilization of the economy. It also appears to be a workable system since Romania continues to grow rapidly by relying on an "extensive" strategy.

The principal inquiry of this paper is to identify the economic structure and quantitative economic policies that permit continued rapid growth in Romania under a highly centralized organization. Throughout the inquiry the question is raised as to when and how the conditions for continued growth will change to the "intensive" phase as defined above. This question is reconsidered in the conclusion.

### *C. The Approach of the Inquiry*

The approach taken in this paper is that Romania's structure and policies ought to be examined based on data dimensions similar to those available to Romanian decision makers, that is, on the basis of Romanian data rather than Western recalculations. This is a difficult task as the reader will see. In spite of a declared intention to cooperate economically with all countries, and because of a perhaps exaggerated fear of compromising their independence, Romanian leaders have seen fit to publish less data and to permit less useful discussion about the Romanian economy and policies than any member of CMEA, possibly excluding Mongolia or Cuba. Consequently, the attempt to reconstruct data from terribly scattered sources and to indirectly estimate critical economic magnitudes has been a painful and not completely successful effort. Moreover, at some risk of tiring the general, nonprofessional reader, effort has been taken to explain most estimates and to provide out of the way data in the hope of attracting others to share the task of analyzing Romania's most interesting development experience.

## II. THE REMOBILIZATION PROCESS: 1971-80

Romania's economic growth and industrialization up to 1965 were given a "generally positive appraisal" in Professor Montias' detailed study.<sup>15</sup> Official Romanian data for the period are presented in Table 1. Western recalculations of overall growth and of industrial growth in Romania, although suggesting some exaggeration of the official data, have confirmed that Romania did achieve very rapid growth by world standards during this period.

<sup>13</sup> See Spigler, *op. cit.*, pp. 129-132.

### A. The 1965-70 Transition

The years from 1965 through 1970 turned into years of transition and uncertainty in Romanian politics, political economy, and economic performance. Gheorghiu-Dej, who had held firm control of this nation since 1952 and had pioneered a policy of "national communism," including the redirection of Romania's trade toward the West and its industrialization based on heavy industry independent of CMEA-dictated specialization, died in March 1965 during a period of intense policy confrontation with the Soviet Union. Under a new leader, Ceausescu, the policies of economic involvement with the West and of independent national development continued, even intensified, as did the conflict with the Soviet Union over "national communism." West Germany was recognized in 1967, a year when Romania also refused to denounce Israel after the Six-Day War. In 1968, Romania openly denounced and defied the Warsaw Pact intervention in Czechoslovakia. In 1969, Nixon was invited to visit Romania.

In terms of domestic political economy, public discussion of economic reforms began in 1967. In 1968 a major reorganization of regional administration was carried out. Basic economic priorities were not changed. As will be seen in the following tables, the share of national income for investment was increased, with a consequent, significant increase in the growth rate of fixed capital in both industry and agriculture.

Increased investments accompanied a pronounced increase in borrowing from the West to enlarge the flow of new industrial equipment and technology. Estimates of the growth of Romania's indebtedness to the West suggest an increase of \$1 billion from 1965 to 1970, roughly equivalent to 20 to 30 billion lei and 6 to 10 percent of total investments of 1966-70.<sup>16</sup>

<sup>16</sup> The problem of exchange rates and of converting Romanian currency values is discussed in Marvin R. Jackson, "Prices and Efficiency in Romanian Foreign Trade," in Josef C. Brada (ed.), "Quantitative and Analytical Studies In East-West Economic Relations," Bloomington, Inc., 1976, pp. 117-33.

Indebtedness estimates are from Edwin M. Snell, "Eastern Europe's Trade and Payments With The Industrialized West," in Joint Economic Committee, Congress of The United States, "Reorientation and Commercial Relations of the Economies of Eastern Europe," Washington, 1974, p. 718.

Overall real economic growth in 1966-70 measured 7.7 percent per year in terms of the socialist concept of national income (net material product), or a slightly lower 6 percent per year by a western recalculation of GNP. This was a substantial achievement by world standards, one that would have pleased most developing countries. Still, by comparison to the overall Romanian experience of 1951-65, all output and income indicators showed less growth while fixed capital inputs were being increased at much higher rates. At the same time, even though population was growing at slightly higher rates because virtually free abortion had been outlawed in 1967, both total employment (including those in cooperative and private activities) and employment in state enterprises and agencies grew more slowly. Reference to table 3 provides a clearer picture of the situation from 1966 to 1970. Here the percentages of growth of national income, industrial output, and agricultural output are compared to input growth and input productivity growth (see text for an explanation of calculations).

Romanian agriculture posed a major problem. With severe spring floods, net output in 1970 was lower than before collectivization, having fallen in 1967, 1968, and 1970. A larger gross output was available only because of more material inputs. But, overall, greater inputs of capital were not compensating for withdrawals of labor.<sup>17</sup>

Lower rates of increase of industrial labor in the index of inputs were also offset by higher rates of increase of fixed industrial capital.

Both gross and net industrial output growth rates were lower than in 1961-65. The relatively slower growth of gross output strongly suggests a lower growth of material inputs from non-industrial sectors, either agriculture or foreign trade. A limitation on agricultural output may have been the cause of a reduced growth rate of the food industry that counted for about twenty percent of gross industrial output. Indirect affects of agriculture's poor performance could have been felt through (a) restrictions on the urban food supply, which would slow the growth of urban labor and labor incentives; and (b) restrictions on exports of foodstuffs, which would slow the growth of imports of both industrial capital equipment and materials. In fact, possible problems with labor may be suggested in Table 1 in the slower growth of wages and incomes, and of state employment. Romania's trade balances illustrate the existence of the second restriction. An export surplus of food products grew by 492 million devisa lei from 1960 to 1965, nearly enough to cover a 541 million devisa lei increase in net imports of industrial raw materials (from a 1960 surplus of 371 million devisa lei to a 1965 deficit of 170 million devisa lei).<sup>18</sup> But, from 1965 to 1970, the export surplus of food products did not increase from a level of about 1,200 million devisa lei. Yet, the import deficit for industrial materials increased by 953 million devisa lei to a level of 1,122 million lei.<sup>19</sup>

Some general and tentative conclusions may be drawn from this survey of data. One has a definite sense that Romania was in transition from a phase of extensive growth to a phase of intensive growth,

<sup>17</sup> Actually, as will be discussed later, the quality of agricultural labor (measured by sex and age composition) deteriorated significantly so the withdrawal of labor was larger than shown in the table.

<sup>18</sup> The devisa lei is the external unit of account reflecting current foreign trade prices.

<sup>19</sup> Trade data from AS-76, pp. 384-385.

as defined in the introduction. The organizational system did not seem to manage the increase in capital investments well. In industry, with a slower intake of labor inputs and a much larger investment flow, productivity fell resulting in less output growth than in 1961-65. A more rapid growth of industrial labor appeared to be inhibited by the inability to compensate labor withdrawals from agriculture with larger investments in that sector. The poor response from agriculture made it difficult to provide greater urban labor incentives. Perhaps of most importance, Romania's transition from raw materials surpluses to large raw materials deficits in trade, plus the lack of growth of foodstuffs exports, now made it imperative for the country to export manufactured goods. To succeed in this effort, not only would industry have to produce goods of international quality, but the Romanian foreign trade system, which had heretofore handled the relatively easy task of selling raw materials and foodstuffs, would now have to solve a more difficult marketing of manufactured consumer and industrial goods.

### *B. Remobilization Plans, 1971-80*

Given the background of 1966-70, one might have expected intensified effort to improve organization in industry, foreign trade, and agriculture. Some important changes in organization have been made, especially in foreign trade and agriculture, but the main thrust of subsequent policy had a different spirit. Also, given the need to more effectively absorb investments, one might have taken seriously the modest proposals for growth and development for the next five years, 1971-75, presented at the Tenth Party Congress in 1969 (see Table 2). The floods of 1970 added their damage to the country's prospects. However, what was to come was a very ambitious remobilization of the economy.

TABLE 2.—INITIAL AND FINAL VERSIONS OF RECENT 5-YEAR PLANS

Feb. 4, 1976. (3) 1976-80 plan—initial plan, "Directives of the 11th Congress of the Romanian Communist Party Concerning the 1976-80 5-yr Plan and the Guidelines for Romania's Economic and Social Development over the 1981-90 Period," Meridiane Publishing House: Bucharest, 1975, p. 14; final plan, Scinteia, July 3, 1976.

It cannot be known for sure whether basic political issues were being resolved at this time. In the economic realm, evidence suggests that subsequent changes in the 1971-75 plan were connected with an improved information system that was starting to provide Romanian leaders a better view of where the Romanian economy stood compared to the world and what would have to be done to improve Romania's level of development. In May 1971 an important party central committee meeting considered the rate of development of the economy through the end of the century. The final version of the 1971-75 plan, passed in October 1971 by the National Assembly, suggested a new sense of resolution and confidence on the part of the country's leaders. As seen in table 25 the plan provided higher growth rates and a greater relative increase over the party congress directives than took place in either 1966-70 or 1976-80. The question of Romania's development gap continued to be discussed, culminating in the National Party Conference in July 1972. At this time it was decided that the rate of investment in national income would have to be raised and maintained at levels of around 32 to 34 percent if Romania were to be able to join the ranks of the developed countries by about 1990. A target was set of 60,000 lei, or \$2,500 to \$3,000 per capita national income by 1990. It was also decided to push ahead with a continuing reduction of the role of agriculture, and emphasize the development of industry, stressing producer goods, as the means of attaining the higher economic stage.

At this time President Ceausescu signaled the beginning of an intense campaign to fulfill the ambitious targets of the original 1971-75 plan in four and one-half years. Such a step-up in the target dates for fulfillment was equivalent to increasing the annual average growth rates of national income and gross industrial output from 11 to 12 percent as planned to over 13 percent, and the target for gross agricultural output from 6.3 to 8.3 percent to 7.3 to 9.3 percent. The Romanian economy was now under pressure not only to outperform its recent past, but also to significantly surpass the rest of Eastern Europe and the Soviet Union. The Romanian targets for 1971-75, given the "four and a half" fulfillment campaign, were for agriculture slightly over twice, for national income about twice, and for industrial output slightly under twice the average annual rates of growth planned for the rest of CMEA in 1971-75.<sup>20</sup>

Directives for the sixth five-year plan, 1976-80, given at the Eleventh Party Congress in the autumn of 1974 followed those of the previous congresses in suggesting modest growth targets in light of the economy's rapid growth. Even though it was certain that higher targets would be subsequently announced, it was a surprise, and perhaps suggestive of the Party's determination, that higher targets were announced in July 1975 while parts of the country were still covered with waters of the floods from the first of the month. Discussions of the new plan continued and, in the meanwhile, the 1971-75 plan was concluded. Because of agriculture's poor performances of several years and the 1975 floods, the final targets of the 1971-75 plan for national income and agricultural output were not met. Obviously the campaign to fulfill the plan in four and a half years was not a complete success. Yet, gross industrial output grew at 13.1

<sup>20</sup> United Nations, Department of Economic and Social Affairs, "World Economic Survey 1975," New York, pp. 152-154.

percent per year, enough to fulfill the plan two months before the end of the year.

These shortcomings possibly have shown the limits to remobilization in Romania. The final 1976-80 plan, passed into law in July 1976 by the National Assembly, was a slightly less ambitious plan than 1971-75 in all indicators except labor productivity and investment growth. But even though less ambitious than before, Romania has set growth targets in 1976-80 as in 1971-75 for national income, industry, and agriculture that are much higher than in other CMEA countries.

### *C. Performance in 1971-77 and Growth Prospects*

Table 3 illustrates the principal features of the 1976-80 plan in contrast to earlier plans. The overall percentage growth of three principal output categories and of the labor and fixed capital inputs are shown. Sources of growth are calculated by combining labor and capital inputs on a fifty-fifty basis and then dividing the derived growth of total inputs into output growth in order to estimate total input productivity change.

TABLE 3.—CHANGES IN OUTPUTS, INPUTS, AND PRODUCTIVITY

	[Percentage change]					Plan
	1951-55	1956-60	1961-65	1966-70	1971-75	1976-80

Total input productivity <sup>2</sup> .....	58.1	-6.6	-6.2	-12.8	9.7	12.6

<sup>1</sup> Capital and labor each weighted 50 percent.

<sup>2</sup> The index of net output divided by the index of total inputs.

Sources: AS-76, pp. 53, 56 and 66-67. Plan 1976-80 is based on sources in table 2; planned national income of 610,000,000,000 lei from "Scinteia," Feb. 5, 1976; and planned total capital of 2,000,000,000,000 lei from "Scinteia," July 2, 1976.

Mobilization, along with better weather, reversed the earlier tendency for growth rates to fall. In 1971-75, industrial and agricultural growth increased significantly, but the much more rapid growth of national income resulted from the first significant growth of net agricultural output since the early 1950's. The productivity of total inputs accounted for a greater share of national income than in either of the principal sectors of material output, showing the influence of labor transfers from agriculture to industry. The economy generated even larger increases in inputs than before, with industry, especially, growing "extensively" more than "intensively." Industrial productivity growth continued to slow down, a fact of considerable concern for Romanian planners.

The 1976-80 plan projects a virtual repeat of the 1971-75 experience. Agriculture will continue to be a source of labor for industry, although other sectors will acquire more labor than before. The critical assumptions of the plan are in the expected increases in total input productivity. In the Romanian conception, which sees output growing as a result of either increases in labor inputs or increases in the productivity of labor (output divided by labor), the Eleventh Party Congress Directives expected increased labor productivity to account for 70 percent of the growth of gross industrial output from 1976 to 1980, a figure subsequently raised to 75 to 80 percent.

As shown in Table 4, the annual plans of 1976 and 1977 implement the intent of the five-year plan. In 1976, shortfalls of real wages, retail trade, and services combine with a slight overfulfillment of real income to suggest a very large increase in social consumption. A serious shortcoming of actual investments caused the Party great concern, and, combined with the tragic earthquake of March 4, 1977, place the annual, and possibly the five-year, plan targets in question. Damages to state, cooperative, and personal property from the earthquake were officially reported to be 9 to 10 billion *lei*, or about \$500 million (converted at 20 *lei* per dollar). Losses of output, which are still unreported, may be added to this figure. A total of 763 industrial, construction, and transportation units were damaged, but, as of March 18, only 17 were reported as still without their whole capacity.<sup>21</sup> The extent to which international assistance will offset reported material losses is not known. If the losses are estimated in current 1977 prices, they will equal about 28 percent of total planned investments for the year, or about 11 percent of the planned national income for 1977.<sup>22</sup> Following the earthquake, the government stated that the plan to reduce the workweek (discussed below) will be delayed one year; otherwise, the announced development plans will be fulfilled.

TABLE 4.—ANNUAL PLANS AND FULFILLMENT, 1975-77

Sources: 1975—Actual, "Anuarul Statistic 1976." 1976—Planned, "Scinteia," Dec. 21, 1975. Actual, "Scinteia," Feb. 6, 1977—Planned, "Scinteia," Nov. 6, 1976.

<sup>21</sup> "Scinteia," 18 March 1977.

<sup>22</sup> Plan figures for 1977 were total investment, 180.45 billion lei, and national income produced, 445 billion lei, both in "current 1977 prices," as reported in "Scinteia," 6 November 1976. In "comparable 1963 prices," planned total investment would be about 174 billion lei and national income about 445 billion lei. These estimates are based on data in AS-76, p. 47, for 1975 and plan reports in Table 4. It is interesting that the national income estimate in "comparable 1963 prices" is the same as that for "current 1977 prices."

It is certain that Romania's economy will be subject to strain in the coming years. A bad year in agriculture would probably cause a serious shortfall compared to the 1976-80 plan. In any event, Party mobilization will have to overcome the more limited possibilities for material incentives. But it must be remembered that the Romanian economy recovered rapidly from the floods of 1970 and 1975. Pressure is not new and, with favorable crop years, the 1976-80 plan targets may be met.

Tables 5 and 6 summarize the experienced and planned growth and structural changes in the economy. The figures for 1980 and 1990 express the commitment to an industrial future. The planned shares of employment for industry and agriculture in 1980 are approximately those of Hungary in 1970, whereas those of 1990 resemble the 1970 figures for East Germany. The planned levels of per capita national income (converted at 20 lei to the dollar) of about \$1,360 in 1980 and \$3,000 in 1990 suggest in the latter year material standards equal to, or just slightly exceeding those of East Germany and Czechoslovakia in the early 1970's. By 1990 Romania's urban population is projected at 68 percent of total population, somewhat less urbanized than the East German and somewhat more urbanized than the Czechoslovakian populations in 1970.

### III. SOURCES AND USES OF RESOURCES FOR INDUSTRIALIZATION

The presentation of plan and performance provided a useful overview of Romanian remobilization for industrialization after 1970, but it insufficiently identifies critical areas of resource availability and allocation. The task in this section is to evaluate the sources and uses of investments, equipment and industrial materials, and agricultural output. Throughout the section interconnections between the domestic and international economies will be explored.

Romania's industrialization drive has been focused in two areas: (a) An effort to acquire investment by maintaining limits on consumption while attempting to avoid adverse affects on the labor supply and incentives; and (b) an effort to acquire the equipment into which investment is transformed, and the raw materials and fuels to supply growing productive capacity. These largely domestic efforts, in both cases, have been influenced by Romania's international economic relations. The supply of investment has been influenced directly by capital flows and indirectly by the terms of trade. The terms of trade have determined the domestic sacrifice needed to service a foreign debt and to import needed equipment, raw materials, and fuels. The commitment of investment to industry has changed the relative supplies of exportables from industrial raw materials and agriculture to manufactured goods with a consequent need to find new international markets.

#### A. The Supply of Investments

The basic problems of identifying sources of investments in Romania are illustrated in Chart 1.<sup>23</sup>

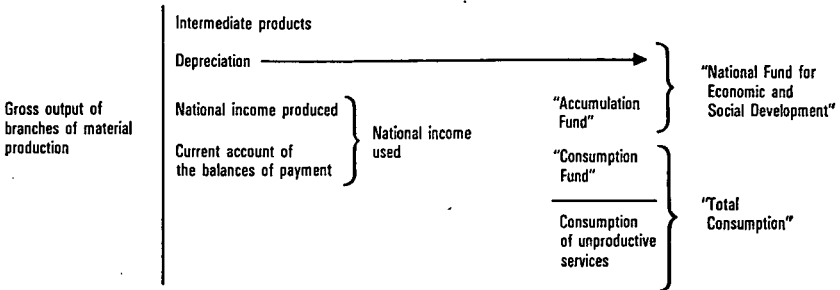

<sup>23</sup> The chart ignores losses to the economy, which are subtracted to obtain national income used, and defense goods. It is not known if defense services are considered "productive services." Its value may be subtracted before divisions of national income used are published, or may be included in accumulation along with other "nonproductive" investments.

Chart 1

## Basic Relationships in Romanian Income and Product Accounts

### Social Product

Romanian income and product accounting follows the general practice in communist countries of basing data on the combined gross output of branches of material production, a sum referred to as "social product." The sources of social product in a branch include the values of imports, fuels, and materials from other branches, and value-added by each branch. The uses of social product include exports and products available to the domestic economy, both intermediate products and two categories of final products (consumer goods and gross investment goods). The Romanian national income concept, or net material product, is similar to net national product. It is derived by subtracting intermediate products and depreciation, together called "material expenditures," from social product. The result is a measure of net final products, or net value-added. Two national income concepts are identified. "National income produced" in the country is equal to social product minus (a) "material expenditures" and (b) the balance of imports over exports. "National income used" is equal to national income produced plus the balance of imports over exports.

The import-export balance used is the balance of payments current account. When the current account balance shows a surplus, national income produced is larger than national income used; when the balance shows a deficit, Romania, in effect, has acquired a net addition of final goods through international capital transactions so that national income used is larger than national income produced.

The flow of gross or total investments, known in Romania as the "National Fund for Economic and Social Development," is influenced by three flows: (a) The division of national income used into new investment (the "accumulation fund") and consumption (the "consumption fund"); (b) the net change in foreign credits, which determines if foreign goods are available to augment national income produced; and (c) depreciation flows. Total investments equal the accumulation fund, or net investments, and depreciation.

### 1. THE ACCUMULATION FUND

Romanian data do not identify the current account of the balance of payments or any of its components in domestic prices. Only the

commodity trade balance is given, but in current foreign (devisa lei) prices. In addition, the only identification of "national income used" in the statistical yearbook is its percentage division by five-year (not annual) periods, in both current and constant prices. These data are presented in Table 7 along with supplementary data not given in the statistical yearbooks. Table 8 contains two related measures of real resources allocated to Romanian consumers. The "consumption fund" in part A of Table 8 is based on the real, or deflated, values of consumption expenditure flows, both social and private, the latter including depreciation of privately owned houses. It is shown in the only available form, an index estimating average change from one five-year period to another. "Real income of the population" is a polyglot measure, also defined as "final income of the population." It includes all earned income, income imputed from social consumption and housing depreciation, net taxes and transfers, and net changes in saving deposits. In conception, it should equal the consumption fund, plus cash accumulations and net private investment in housing.<sup>24</sup> An index value for this statistic has appeared in the statistical yearbook since 1975 for years indicated in Table 8.

In Table 9 indices of "national income used" and the "accumulation fund" are calculated using the shares in Table 7 and consumption fund index from Table 8, part A. In the lower part of Table 9, the estimated growth, based on the average of one five-year period compared to the previous five-year period, is computed for both national income concepts; their relative growth is then compared.

Ratio of growth, (5):(6).....		.54	.84	.83	.83	.74-.80

<sup>1</sup> Planned.<sup>2</sup> Percentage growth over preceding period.

Source: Tables 7 and 8, AS-71, and AS-76; indices of national income used and the accumulation fund calculation are from the growth rate of the consumption fund and shares in national income used in constant prices.

Data in Table 9 must be interpreted with caution. Both national income indices have been deflated by unexplained and probably differing price series. They may also be influenced by changes in the underlying activity classifications. Moreover, the absolute values of the magnitudes are not established by the indices. Montias' estimates of national income produced and used in current prices show the latter larger by some 10 percent in 1963, a difference that may be underestimated.<sup>25</sup> In any case, the relationships that are of interest in this paper are those from the middle 1960s and the apparent planned

<sup>25</sup> If the percentage distributions of national income used into consumption and accumulation did not include losses and defense expenditures, then such an underestimation would have taken place. See Montias, "Economic Development in Communist Romania," pp. 267-279.

relationship for 1976-80. Given what is known about Romania's debts to the West and trade balance, it is somewhat surprising that the ratios of growth of national income produced and used were so constant from 1960 to 1975 when the latter's growth (for five-year periods) was always 83 to 84 percent of the former's growth. In Table 8, part B, a similar constancy shows up in the ratio of growth of real incomes of the population to national income produced.

The ratios of growth of national income produced to national income used imply that about 16 to 17 percent of the growth of national income produced was allocated to a combination of reducing a deficit (or increasing a surplus) in the current account of the balance of payments and to increasing material defense expenditures and losses to the national economy. No estimates of the division of the increases into the three alternatives are available.<sup>26</sup> In 1976-80, the planned allocation of national income growth to these uses rises significantly to 20 to 26 percent and, as discussed below, it coincides with indications of Romania's intent to obtain large current account surpluses for the repayment of foreign debt.

## 2. DEPRECIATION

Romanian statistical practice identifies the share of material expenses (intermediate products and depreciation), in social product in current (but not constant) prices. The share of depreciation remains unidentified and data are unavailable to suggest the levels of depreciation charges. Estimates of capital retirement are provided in Table 10. They vary greatly as a percentage of total investments on an annual basis, averaging 12.4 percent for 1966-70 and 10.1 percent for 1971-75. If depreciation followed capital retirement in these years, then part of the slower growth of net final production in 1966-70 compared to 1971-75 observed in both concepts of national income would be explained by greater depreciation charges against gross final production in the earlier period.

TABLE 10.—CAPITAL RETIREMENTS AND TOTAL INVESTMENTS

(In billions of "constant 1973" lei)

1971.....	825.2	68.2	73.7	5.8	11.4	88.4	-----
<b>Total.....</b>		<b>446.4</b>	<b>469.6</b>	<b>32.3</b>	<b>55.4</b>	<b>549.0</b>	<b>10.1</b>
1970.....	757.1	60.2	69.0	5.2	14.0	80.0	-----
1969.....	696.9	65.1	62.6	3.3	.8	71.7	-----
1968.....	631.8	40.1	55.2	2.7	17.8	67.3	-----
1967.....	591.7	50.2	47.3	2.7	-.2	60.2	-----
1966.....	541.5	40.1	46.2	2.4	8.5	51.6	-----
<b>Total.....</b>		<b>255.7</b>	<b>280.3</b>	<b>16.3</b>	<b>40.9</b>	<b>330.8</b>	<b>12.4</b>

Sources: AS-71, pp. 115, 514-5, 472; AS-75, pp. 290, 332; AS-76, pp. 56, 274, 325.

<sup>26</sup> Again, this assumes that material losses and material defense expenditures are subtracted before national income used is divided into accumulation and consumption.

A different view of depreciation is presented in Table 11. Here the estimated growth of the accumulation fund, or net investment, is compared to the growth of total investments. For all three periods, 1961-75, net investment grows more rapidly than total investment. Once again, greater depreciation in 1966-70 may account for a slower growth of the accumulation fund (and national income) compared to 1971-75. Estimates for the plan period, 1976-80, suggest a much different experience. Accumulation or net investment is not planned to increase as a percentage of national income used as it had done in all previous periods. National income used also is planned to grow more slowly compared to national income produced than in previous periods. As this happens, total investment growth will sharply increase to 82 percent, while national income produced will increase about 60 to 65 percent (see Table 9 above). There is a clear implication that depreciation as a share of social product and as a share of total investments will sharply increase in 1976-80.

## B. Investment Supplies and the International Economy

### 1. THE BALANCE OF PAYMENTS

Romania has not published a complete balance of payments and, as is the case with other CMEA members, estimation of it is very difficult. Not only are trade balances published only in foreign prices without indications of other items in the current account, but also trade flows and related international monetary transactions fall into three categories, necessitating separate balances of payments. These categories are comprised of trade and credit flows with (a) other members of CMEA in convertible rubles, (b) other countries, usually less developed countries and other socialist countries, in bilateral clearing agreements, and (c) the developed capitalist countries in convertible currencies. To further confuse estimation, convertible currency transactions now take place, probably with increasing frequency, with countries in groups (a) and (b) and, also, with the International Monetary Fund (IMF) and other international agencies.

The officially reported commodity trade balances that give rise to the bulk of international transactions are presented in Table 12.<sup>27</sup>

<sup>27</sup> According to the head of the Romanian Foreign Trade Bank, the volume of foreign exchanges (decontari) grew 21 percent from 1969 to 1970 and in the latter year were composed of commercial operations (75.5 percent), external credit (17.3 percent), and tourism (7.2 percent). The figures presumably reflect both sides of the balance of payments when Romanian enterprises, other banks and agencies, and citizens are either credited or charged internal lei for foreign currency obtained or given up. It is not known if bilateral clearing transactions are included. Vasile Volesenie, "Rolul activ al Bancii Romane de Comert Exterior," "Finanti si Credit," 1971-8, p. 17.

The balances do not reflect invisible transactions, transfers, and capital transactions.<sup>28</sup> The division of trade by groups of trading partners is that used by Montias. It should not be compared with similar data without explicit reference to the listing of countries in each division. The data in Table 13 are a case in point. The devisa lei trade balances with the developed capitalist countries from Table 12 have been converted in line 3 to dollars at official Romanian exchange rates. In line 4(a) similar estimates by Snell are presented in which there is some variation of country groupings. Snell's estimates of Romania's "other" convertible currency trade are given in line 4(b). Line 4(c) presents his estimates of Romania's convertible currency deficits on current account (without capital transactions) and line 5 shows his estimates of Romania's end of year debts with the West. By comparison, line 6 presents the Chase Manhattan Bank estimates of Romania's convertible currency commodity trade balances, defined as including balances of all "nonsocialist" countries that did not have bilateral agreements with Romania as listed in IMF sources. Line 8 shows the Chase estimates of Romania's debts to the West for 1974 and 1975.

<sup>28</sup> In reference to the credit side of the balance of payments, tourism was reported to account for "slightly over 2 percent" and "about 4 percent" of total earnings from exports of goods and services in 1965 and 1972. "Turismul-ramura a economiei nationale", Bucharest, 1973, p. 48.

Sources: (4) and (5)—Snell, op. cit., p. 718. (6)—(8)—the Chase Manhattan Bank.

Up to 1971, differences in lines 3 and 4(a) may be accounted for by differences in the inclusion of countries. But Snell's deficit for 1971 looks mistakenly large (it seems to arise from the import side, which is not shown in the table). For 1971 and after, lines 3 and 6 differ because of the greater number of country balances included in line 6. Movements are similar except in 1973 and 1975. There is no obvious accounting for differences in 1973.<sup>29</sup> However, 1975 differences are consistent with the effort Romania is known to have made to increase trade with the less developed countries (as revealed in Table 12).

A complete view of Romania's convertible currency trade, which influences her ability to sustain deficits and debt with the West, must include her convertible currency trade with Socialist countries. Romania is known to have recently sold grain to CMEA countries on this basis. Increased possibilities are demonstrated by the 10 to 15 percent of Hungary's trade turnover with Socialist countries in 1973-75 that was in convertible currencies and that earned Hungary an estimated positive balance of \$174 million in 1975.<sup>30</sup> The only Romanian evidence of its convertible currency balance was given in a speech by President Ceausescu on November 28, 1973, in which he referred to preliminary estimates for 1973 and planned figures for 1974, giving exports and imports in totals and in convertible currencies (*devisa libere*). The data are given in Table 14 along with the actual totals for 1973 and 1974 subsequently reported in the statistical yearbooks. Obviously, as one can see, it was becoming very difficult for Romanian planners to forecast world price changes. The 1973 preliminary estimates were 2.8 and 4.3 percent short of total exports and imports, and the 1974 plan figures were much further off the mark so that actual total trade balance was 4,102 million *devisa lei* less than planned. Given these errors, Ceausescu's figures may be discounted but they merit an attempt to derive corrected estimates for 1973. Suppose the least optimistic assumptions are made for 1973, that none of the increase in actual exports over estimated exports was convertible currency, but all of the increase in actual imports over planned imports was convertible currency. This would result in a convertible currency deficit of 645 million *devisa lei*, or about \$129 million. Using a similar procedure with the 1974 planned figures, except assuming all the decrease in actual over planned exports was convertible currency, results in a deficit of 1.916 million *devisa lei*, or about \$386 million. The change from \$129 million in 1973 to \$386 million in 1974 is not far off from a 1975 report by Ceausescu that, "In 1974 we registered a growth of the deficit in the convertible currencies balance of about \$200 million."<sup>31</sup> Both figures show smaller convertible currency deficits than the Chase-Brainard estimates in Table 13. The differences may be accounted for by convertible currency surpluses with socialist countries of \$67 million in 1973 and \$30 million in 1974. In any case, it appears that Romania has succeeded in offsetting convertible currency trade deficits with the West with significant convertible currency surpluses with both the socialist and the developing countries.

<sup>29</sup> In part, differences may arise because of different rates of conversion of *devisa lei* to dollars.

Another problem in analyzing Romania's balance of payments is to estimate capital transactions with CMEA, other socialist countries, and the L.D.C.s. What strikes one in the case of CMEA is that Romania, one of the least developed members, continuously has maintained a positive trade balance with other CMEA members. Romania probably acquired additional current account surplus from tourism within CMEA on the one hand, but additional deficits for transportation and communications on the other. Romania's overall credit position with CMEA is unreported. Through 1972, at least, Romania was the only member of the CMEA International Investment Bank to borrow in excess of its capital contribution. Its credits totaled 78.8 million transferable rubles (525.6 million devisa lei), or 26.8 million TR in excess of its contributions.<sup>32</sup> When such credits were received in imports, they would have tended to reduce Romania's positive CMEA rate balance. This happened only in 1970 when imports from CMEA increased by an unusual amount (see Table 12). It is possible that Romania has settled some CMEA balances through switch-trading or through deliveries of military supplies not shown in the published trade data. Otherwise, the curiousness of Romania's creditor position remains.

Romania is also a known creditor, not in money but goods, of the developing countries, especially in so-called cooperation ventures for which compensation payments are made in goods.<sup>33</sup> As in the case of CMEA credits, there seems to be no way of evaluating Romania's credit position with the developing countries. Still, it may be assumed that stepped-up exports of machinery to the L.D.C.'s has required credits. Considering recent Romanian trade surpluses with CMEA, other socialist, and developing countries, a growing credit position must have reduced available domestic investments.

## 2. TERMS OF TRADE

No direct measures of Romania's terms of trade are available since 1966. For the period from 1960 to 1966, according to official unit-value indices cited by Montias, Romania was favored by about a 3 percent increase in export prices and a 3 percent decrease in import prices.

<sup>32</sup> J. T. Crawford and John Haberstroh, "Survey of Economic Issues in Eastern Europe: Technology, Trade, and the Consumer," in Joint Economic Committee, *op. cit.*, pp. 43-44.

<sup>33</sup> See Radio Free Europe, RAD Background Report 1180 (Romania), 22 December 1975.

Since 1966, Montias suggests that Romanian foreign trade prices may be judged by the Hungarian experience. If so, from 1966 to 1972, export prices would have been unchanged while import prices rose by about one percent per year. After 1972, Romania import and export prices rose rapidly according to the following price indices:<sup>34</sup>

Exports:	
1972	100.0
1973	110.4
1974	133.3
1975	141.8
Imports:	
1972	100.0
1973	109.5
1974	135.1
1975	142.6

These approximate indicators imply that Romania has probably avoided any adverse changes in terms of trade since 1972 and, in this respect, has been in a favorable position compared to other East European members of CMEA.

### 3. SUMMARY

In the five-year period, 1966 to 1970, Romania made extensive use of credit from the West to increase supplies of investments. By Snell's estimates, debt to the West increased nearly \$1,135 million. In the period of the next five-year plan, gross debt increased \$1,300 million, but net debt, taking into consideration Romania's convertible currency holdings, increased by only about \$900 million.<sup>35</sup> Gross debt increased about 100 percent at a time when exports to developed capitalist countries increased in current value about 150 percent and exports in convertible currencies may have increased even more. Romania's ratio of net debts to exports inconvertible currencies must have decreased significantly from 1970 to 1975. In 1975 and in 1976, the ratio was estimated at 1:2 to 1:3, significantly lower than any other East European member of CMEA except Czechoslovakia.<sup>36</sup>

Romania has planned large trade surpluses for 1976-80. The large turn-around in surplus from 1974 to 1976 indicated the economy had taken a significant step towards realizing the plan, but it may have suffered a setback with the 1977 earthquake. Export deliveries probably have been delayed while priority imports accelerated, in part financed by international assistance and, in part taking the place of non-priority imports. How quickly the country recovers and what the net effect on the trade balance will be is difficult to predict at this point.

Since 1973 a major shift of Romania's trade toward the less developed countries has taken place. According to Romania's country classification, the total trade percentage with LDC's increased from 9 percent in 1973 to 19.5 percent in 1975. Further increases to 25 percent by 1977-78 and to 30 percent by 1980 are planned. The

<sup>34</sup> Montias reports deflated percentage increases of exports and imports derived by using Hungarian price indices for four commodity groups in trade with dollar and ruble areas. The above indices are, accordingly, the Hungarian indices weighted by the commodity and area composition of Romanian trade estimated by Montias. J. M. Montias, "Romania's Foreign Trade Between East and West," *op. cit.*, pp. 3-4.

<sup>35</sup> Snell does not provide data to estimate net debt for the earlier period. Net debt estimates were provided by the Chase Manhattan Bank and Lawrence Brainard.

<sup>36</sup> Chase-Brainard data.

strategy of this shift calls for Romania to import commodities directly from LDC's that have been purchased through western intermediaries and to pay in exports of manufactured goods, technical assistance, and construction services.<sup>37</sup> Such trade diversion probably accounts for the decrease in trade with developed countries in 1975. Since a portion of the diverted trade no doubt will be conducted in clearing agreements and compensation, and will involve Romanian extensions of credit, the overall effects will further confuse analysis of the Romania trade and credit position.

Romanian efforts to slow the growth of or to reduce her debts to the West, the increases in her trade surplus with CMEA, and her large surpluses with the rest of the world, some of which have involved Romanian credit, account for the trend of national income produced to rise faster than national income used in the periods 1971-75 and planned 1976-80. It is more difficult to explain the near constancy of growth ratios going back to 1960. The increase in the ratio from 1956-60 to 1961-65 may be the result of improved terms of trade and western credits. But, with the much larger flow of western credits in 1966-70, one would have expected a greater growth of national income used relative to national income produced than was estimated. Unless the estimates are far off the mark, there ought to have been changes to offset western credits in the current balance or more differences between national income produced and used than the current balance shows. Possible offsets could have been unreported imports of military supplies or increased shares of defense expenditures not reported in national income used.

Romania's determination to increase net exports in 1976-80, combined with a constant ratio of accumulation in national income, would imply a slower growth of investments. However, total investment growth increased over 1971-75, which implies an increased share of depreciation charges in social product. Phrased in western concepts, gross final output (or gross national material product) is planned to grow much faster than national income or net material product. In terms of gross final output, Romania is apparently projecting even greater increases of productivity than those indicated in table 3.

### *C. Investment Allocations and the Growth of Industry*

The achieved and planned allocations of total investments outlined in Table 15 reveal a major increase in the commitment to industry. After receiving a nearly constant 50 percent share up to 1975, industry's share of total investments in 1976-80 increases to 58 percent, or to two-thirds of the total planned increase of investments over 1971-75. Agriculture's planned share decreases in 1976-80, but the smaller expected share of agriculture in labor and total output must be kept in mind. With the agricultural labor force falling by 25 percent, the 51 percent increase in investments will result in a very large increase in investments per occupied person.

<sup>37</sup> In 1974 President Ceausescu stated, "It is correct that because of the methodology of calculation, these figures [trade by countries] do not mirror all of our economic relations with the respective countries. Trade in convertible currencies is included under the heading of exchanges with capitalist countries. Probably it will be necessary to review this form of accounting in order not to deform reality. In reality [trade with less-developed countries] has a weight much greater than is shown in the statistics." "Cuvintare la constatarea cu activul de partid si de stat din domeniul comerului exterior si cooperarii economice internationale," 16 mai 1974. Bucharest, 1974, p. 8.

Sources: 1971-75, "Anuarul statistic 1976," pp. 278-9. 1976-80, "Scinteia," July 3, 1976.

As yet no data are available on planned investments by branch of industry for 1976-80 (no fixed capital data are available for industry branches even before 1975). The only available figure from the preliminary plan presented in the Eleventh Party Congress Directives stated that electric power, metallurgy, machine building, and chemicals would receive 70 percent of total investments in industry. This figure exceeds their share of 62.2 percent in the 1971-75 period, affirming Romania's intention to continue a priority development of heavy industry.

Table 16 provides further insight to Romania's industrialization strategy. The center columns show the shares of each branch in gross industrial output for 1965, 1970, and 1975, together with the respective shares of total investments and additional labor during the five-year periods, 1961-65, 1966-70, and 1971-75. In the first column, Montias' calculations of relative capital:labor ratios in 1963 are shown; the final column to the right shows the ratios of each branch's share of investments divided by the share of labor for 1971-75. The table suggests both the commitments to branches and the relative factor proportions used in the branches.

<sup>1</sup> Percentage share of fixed capital divided by percentage share of labor.

<sup>2</sup> Percentage shares of fixed capital unavailable after 1963. Ratios are percentage share of investment divided by percentage share of the change in labor.

<sup>3</sup> Output shares for 1965, 1970, and 1975.

Sources: John Michael Montias, "Economic Development In Communist Romania," M.I.T. Press: Cambridge, Mass., 1967, p. 61. "AS-76", pp. 98-9, 126-7, and 284-5.

Attention is first drawn to the output shares, which may be compared to the actual and planned rates of growth of gross output in Table 17. It is evident in these tables that a high priority is given to the machinery and metal processing branch and the chemical branch up to 1975. In spite of Romania's relatively low level of development, in 1975 the shares of these relatively advanced branches in total industrial output were larger than (a) in Bulgaria, Poland, and Hungary for machinery and metal processing, and (b) in the Soviet Union, Czechoslovakia, Bulgaria, and Hungary for chemicals.<sup>38</sup> The pattern of planned growth in 1976-80 shows a continued emphasis on chemicals with a slightly reduced emphasis on machinery and metal processing. Still, the Eleventh Party Congress Directives called for this branch's share in gross output to rise to 34 percent in 1980 (compared to 32.4 percent in 1971-75); combined with chemicals, the two branches will reach almost 50 percent of industrial output (and will supply almost 50 percent of total exports, as planned).

TABLE 17.—ANNUAL AVERAGE RATES OF GROWTH OF INDUSTRIAL OUTPUT

	1951-60	1961-65	1966-70	1971-75	Planned 1976-80
1. Total industry.....	13.0	13.8	11.9	12.4	10.2-11.2

Sources: "AS-76," pp. 90-93, and "Scinteia," July 3, 1976.

Romania's machine building industry in the past has been a heavy user of labor inputs and even in 1971-75 had a low ratio of investment share to incremental labor share. As best as can be judged with available data, the pattern of relative factor shares among industry branches appears to be stable. How much this reflects technological constraints

<sup>38</sup> "Statisticheskii ezhegodnik, stran-chlenov Soveta Ekonomicheskoi Vzaïmopomoshchi 1976." Moscow, p. 73.

as opposed to a special Romanian development strategy bears further research. In any case, one sees clearly where incremental labor has been concentrated since nearly half was absorbed in machine building in 1971-75, and over 70 percent in machine building plus textiles.

#### *D. The Sources and Uses of Industrial Products*

Important detail on Romania's industrialization effort may be found by examining the four broad commodity trade balances which are reflected in Table 18. Romania's trade plans call for exports and imports in 1976-80 to average, respectively, 11.8 to 13.1 and 9.8 to 11.2 percent above their values for 1971-75.<sup>39</sup> It may be assumed that these figures approximate the compound growth rates of 1980 over 1975. The planned import structure is not known for 1980. The only available version of the planned export structure unfortunately follows a different commodity structure than in Table 18.<sup>40</sup> With the 1975 exports rearranged, these data provide trade projections (Table 19).

<sup>39</sup> After publication of these figures, the overall foreign trade turnover target was raised from 72 to 80 percent to 90 to 101.4 percent, but revised targets for exports and imports have not been found.

<sup>40</sup> Manea Manescu, "Avutia nationala a Romaniei Socialiste (11)," "Era socialista, LV:12" (June 1975), pp. 6-7. Manescu's estimates for the 1975 export structure in the four categories in the table were 23.5 percent, 13.0 percent, 30.8 percent, and 32.7 percent, respectively. Expected exports of machinery were exceeded; those for chemicals fell short.

Slightly more than 62 percent of the planned export growth is concentrated in machinery and chemicals, the priority industries in Romania's growth strategy. As expected, with Romania's increasing dependence on imported materials and fuels, planned exports in this sector grow very slowly.

In general, data on the share of Romanian production that is exported is unavailable. Production and exports are both given for some individual items. Occasionally the units are not comparable, or, when comparable, they are usually given as physical units. Here and there a general figure is given. For example, it was said that the ministry of light industry (textiles, clothing, glassware, shoes, and leathers) in 1973 was expected to export about 55 percent of the output of finished goods (a concept of output not reported in the statistical yearbook).<sup>41</sup> A more identifiable figure is the "over 20 percent" of total industrial output that was exported in 1974. At 21 percent, this would amount to about 110 billion lei, or 33.5 percent of an estimated 328 billion lei national income produced in 1974.<sup>42</sup> Unprocessed foods and other agricultural goods accounted for about 5 to 6 percent of exports in devisa lei, and may have been a larger percentage of exports in internal prices. If so, total exports in internal prices may be estimated at around 120 billion lei, or nearly 37 percent of national income produced.

<sup>41</sup> "Viata economica," 1973:9 (March 2), p. 18.

<sup>42</sup> Manescu, op. cit., p. 6. Calculations are based on data from AS-76, pp. 46-7.

It is surprising that planned total exports do not appear to increase as a percent of planned national income. The five-year plan proposals in the Eleventh Party Congress Directives said that, for the 1976-80 period, exports will be over one-third of the value of national income. It is assumed that reference is to national income produced, which is planned to reach 610 billion lei in 1980. If planned exports reach, say, 35 percent, exports in internal lei prices in 1980 will be approximately 214 billion lei. On the average, a value of products worth 4.5 internal lei will exchange for one devisa lei in foreign trade.

A division of the internal value of exports is impossible on the basis of available data. First, trade commodity classifications do not follow divisions of production by sectors of the economy and branches of industry. For example, machine building production includes consumer durables, which are exported as manufactured consumer goods. Second, even if production and export classifications were known and comparable, relative internal prices differ greatly from export prices in devisa lei. Generally, because of internal pricing policies, sometimes said to be set to encourage exports, a devisa leu of machinery exports will bear less than the national average internal value, probably in the neighborhood of one to four lei. One devisa leu of agricultural exports or manufactured consumer goods exports will normally have higher internal values, in some cases as high as ten lei or more.<sup>43</sup>

For these reasons, and because the trade data in Table 19 are in current prices, whereas the output data are in constant prices, direct comparisons cannot be made between planned export growth and planned output growth from 1975 to 1980. The only reasonably certain observation is that exports of the industrial materials group, with the possible exception of metallurgy, will grow more slowly than output. For all other product groups, a general assumption is that exports will increase at about the same rate or slightly faster than production increases.

There appears to be more definite shifts in imports away from more-processed goods towards less-processed materials. Table 20 shows the shares of domestically produced equipment in total equipment deliveries for annual investments. The domestic share rises from its low of 62.1 percent to a high of about 75 percent in 1975. It is unlikely to fall below this figure in 1976-80. No planned figure for 1976-80 has been encountered, but in 1967 a campaign was introduced with the theme "self-equipping" (*autoutilare*), and strict central controls have been introduced to avoid unnecessary machinery imports.

<sup>43</sup> For a further discussion of relations between internal and external Romanian prices and for example of price differences, see Jackson, *op. cit.*, pp. 120-4 and 131, fn. 12.

The Romanian steel industry, whose output is planned to rise from 10.3 million tons in 1975 to 17 to 18 million tons in 1980 and 25 to 27 million tons in 1990, is planned to supply 95 percent of rolled steel needs in 1980. Domestic coke production increased from 31 percent to 45 percent of consumption from 1970 to 1975, but plans for 1980 are not available. Compared to Bulgaria and Yugoslavia, Romania has neglected ferro-alloys in the past, but by 1980 new plants will be built to provide 60 percent of ferro-alloy needs and 80 percent of ferro-silicon needs. In nonferrous metals, nearly all needs for rolled aluminum and 80 percent of needs for rolled copper will be provided in domestic production. Domestic flax, hemp, leather, and synthetics will supply 73 percent of the raw materials of the textile industry in 1980, up from 53 percent in 1975, and 75 percent of the raw materials of the leather and footwear industries in 1980, up from 58 percent in 1975. Over 90 percent of cellulose needs are planned from domestic sources in 1980.<sup>44</sup>

In contrast, Romania is increasingly dependent on imported ferrous and nonferrous ores and concentrates, and other inorganic minerals. Domestic iron ore production leveled off in the 1970's, and, whereas steel output increased 7.9 percent per year from 1970 to 1975 (see Table 21), imported iron ore increased 1.16 percent per year. The percentage of iron ore consumption supplied by imports increased from 66.3 percent to 78 percent. Figures for bauxite and aluminum oxide imports are only available for the period 1970-73 when they increased over 21 percent per year. Aluminum output increased 15.1 percent per year during 1970-75 (see Table 21). Domestic chemical fertilizer output increased at an average annual rate of 13.7 percent in 1970-75, with much needed imports of potash increasing 25.2 percent per year.<sup>45</sup>

<sup>44</sup> Data are from the Eleventh Party Congress Directives, and "Revista economica" 1976:17 (30 April), pp. 17-18 and 1978:45 (12 November) p. 5.

<sup>45</sup> Import and production data are found in AS-76 and "Comertul exterior al Republicii Socialiste Romanie 1974." Bucharest, 1975.

TABLE 21.—ACHIEVED AND PLANNED OUTPUTS OF IMPORTANT ENERGY, FUELS, AND RAW MATERIALS

Item	Quantity			Annual average percent growth	
	1970	1975	Plan 1980	1971-75	1976-80 <sup>1</sup>

<sup>1</sup> Computed as midpoint of plan target.

<sup>2</sup> In late 1974, "Revista de statistica," 1974:10, pp. 32-46, gave the following targets: steel, 1975-10.3, 1980-17 to 18, 1990-25 to 27; chemical fertilizers, 1975-2.1, 1980-3.3 to 3.5, 1990-6.2.

Sources: "Scinteia," July 3, 1976, p. 2, and A.S.-76, pp. 112-113.

Romania is well-endowed with primary energy sources. Its earlier investments in these products, the present low levels of development, and strict rationing of energy for non-industrial purposes all contributed to its ability in 1974 to supply 86 percent of needs from domestic sources. This has been claimed as the highest ratio of self-sufficiency in Europe, and will remain high even in 1980 when domestic sources are expected to supply just 75 percent of needs. Primary energy sources include natural gas and crude oil, domestic production of which scarcely increased in 1971-75 (see Table 21). At the same time, imported crude oil more than doubled and the ratio of imports to consumption increased from 15.4 percent (1970) to 25.9 percent. Coking coal is also included in this category and the share of imports as compared to consumption increased from 35 to 55 percent from 1970 to 1975.<sup>46</sup>

Tables 22 and 23 provide a clear picture of Romania's overall energy sources and uses for the actual period, 1970 to 1975, and the planned period, 1975 to 1980, with some projections of electric power production through 1990.

As might be expected, coal sources of energy are increasing. Yet the share of petroleum increases even more, no doubt because of its inclusion as a raw material source for the rapidly expanding chemical industry. As seen in Table 23, the conversion from liquid and gas fuels to coal fuels really will not take place until after 1980. By 1985, Romania's first nuclear power plant will be commissioned. Hydroelectric power is planned to have reached 83 percent of economically manageable reserves by 1985 and 100 percent by 1987.

Romania's achievement of goals for energy, fuels, and raw materials will depend on the extent to which three critical tasks can be carried out by the economic organization: (1) Discovery and exploitation of marginal domestic resources; (2) continuance of a strict rationing program, including small shares for consumers, and an ambitious effort to increase fuel and material productivity in industry and other sectors; and (3) acquisition of the means to import rapidly growing quantities of fuels and materials.

Evaluation of the possibilities for carrying out the first task goes beyond the scope of this paper. In the case of the second task, the possibilities of achieving its immediate planned dimensions, which appear in Tables 24 and 25, may be discussed.

TABLE 24.—ENERGY TARGETS IN INDUSTRY, 1976-80

	Target reductions in consumption per unit of output (percentage)		Recovery of secondary energy (1,000 tons of conventional fuel)

Source: Maxim Berghianu, "Cresterea gradului de utilizare si valorificarea a resurselor materiale, directie hotaritoare de sporire a eficientei economice," (1), "Revista economica" 1976:25 (June 25), p. 5.

In order to evaluate the possibilities of more productive uses of fuels and materials, it can be noted that the 1971-75 target for industry cost reductions of 11 to 12 percent was only 80 percent fulfilled (see Tables 1 and 2). Also during this period the "material expenditures" portion of gross industrial output fell from 61 percent (1970) to 58.9 (1975). The reduction for the whole economy was small, from 59.5 to 58.1 percent, although the five-year plan called for a reduction to 54.4 percent in 1975.<sup>47</sup> The 1976-80 plan calls for a cost decrease in industry of 8.5 to 9.5 percent, or about what was achieved in 1971-75. Material costs in industry are planned to fall somewhat less, by 7 percent. As a result of economies in all sectors, the proportion of "material expenses" in national income is planned to fall from 58.1 to 55 percent, somewhat more than the last five-year's achievements, but less than the last five-year plan.<sup>48</sup>

Yet another consideration is the growth of fuel electric power compared to the growth of industrial output and national income. Looking at Tables 22 and 23, it appears that electric power grows at 69 percent of industrial growth in both 1971-75 and 1976-80, but at a slightly decreasing percentage of the growth in national income, from 81 percent in 1971-75 to 70 percent in 1976-80. In the case of fuels there is the opposite tendency. That is, the percentage growth in fuels compared to growth in industry increases from 53 percent in 1971-75 to 64 percent in 1976-80. A slight increase takes place with respect to national income.

It does not appear that Romanian planners are asking for greater economies in fuels and energy in 1976-80 than were achieved in 1971-75. In this sense, one may consider the targets in the realm of the possible. Still, the question remains whether Romania may have already used up the more available economies in fuels and energy. The answer to this question would require presently unavailable comparative analysis and technical expertise.

### *E. Sources and Uses of Agricultural Products*

With about 38 percent of its labor force still in agriculture in 1975, Romania may chose to place significant reliance on agricultural production, a strategic development option that is attractive in the long run because of possible world food shortages. Long-range Romanian plans call for agriculture's share of the labor force to fall to about 27 percent in 1980 and to about 13 percent in 1990.

The latter figure approximates the share of agricultural labor in the United States in 1950 or in East Germany about 1970; this is another way of saying that Romanian agriculture in 1990 could play a large or a small role, depending on methods of organization; quantities of material inputs, and levels of labor skills that may be provided the agricultural sector. Romania appears to have sufficient water and land resources, which, if properly managed, even with projected population growth, could provide important export surpluses twenty years from now. However, the immediate future is a larger problem.

<sup>47</sup> Also, a target of 50 percent was set for 1990. Aurel Iancu, "Modele de crestere economica si de optimizarea a corelatiei dintre acumulare si consum," Bucharest, 1974, p. 30.

<sup>48</sup> "Era socialista," LVI:18 (September 1976), p. 11.

## 1. OUTPUT PERFORMANCE AND PLAN

The average increases in agricultural output for the five year periods, 1966-70 (compared to 1961-65), and 1971-75 (compared to 1966-70) were about the same in terms of either gross or net output. Gross output, the relevant measure of potential delivery increases for food supplies and exports, grew at an average rate of about 4.2 to 4.5 percent per year for the ten years from 1965 to 1975, a rate sufficiently above the population growth rate of about 1.1 percent during the same period to permit modest increases in domestic food supplies per capita and a growing export surplus in food products.<sup>49</sup>

According to Montias' calculations, Romania's export surplus in food products, which includes both unprocessed goods directly from agriculture and goods processed by the food industry, grew at an average rate of about 5 percent per year from 1966 to 1972, a period when export prices can be assumed to have been relatively stable.<sup>50</sup> In this case, one may assume that the real value of agriculture output exported directly or after processing grew somewhat less than 5 percent because of the increasing share of processed goods having higher prices in the export mix. As can be seen in Chart 2, the export surplus of food products grew rapidly in 1973, but decreased in 1974 and 1975. The value in 1975 represented a growth rate of about 5 percent per year over 1972, but since exports are in current prices and export prices of foods probably increased from 1972 to 1974, the real value of the export surplus in foods must have been less. Given the influences of changes both in export mix and in export prices, one may assume that from 1965 to 1975 the real value of the export surplus of food products due to agriculture increased at about 4.2 to 4.5 percent, the same as the increase in gross agricultural output.

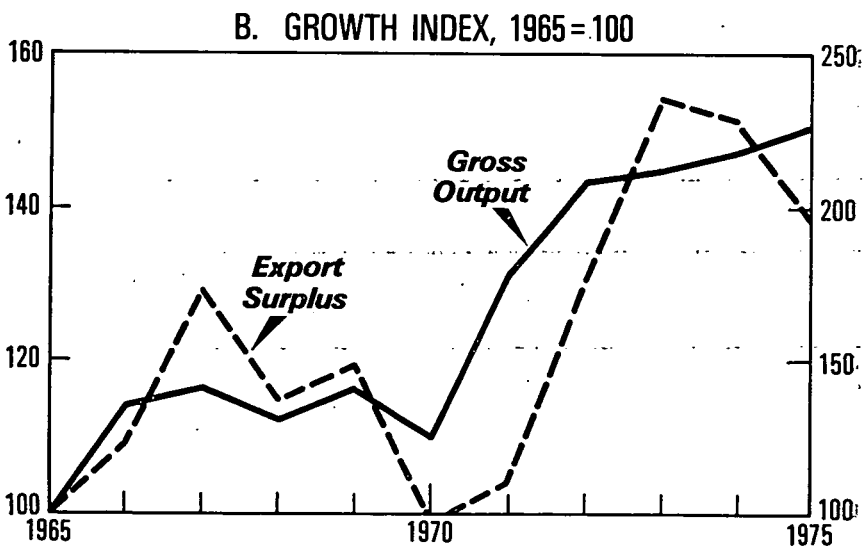

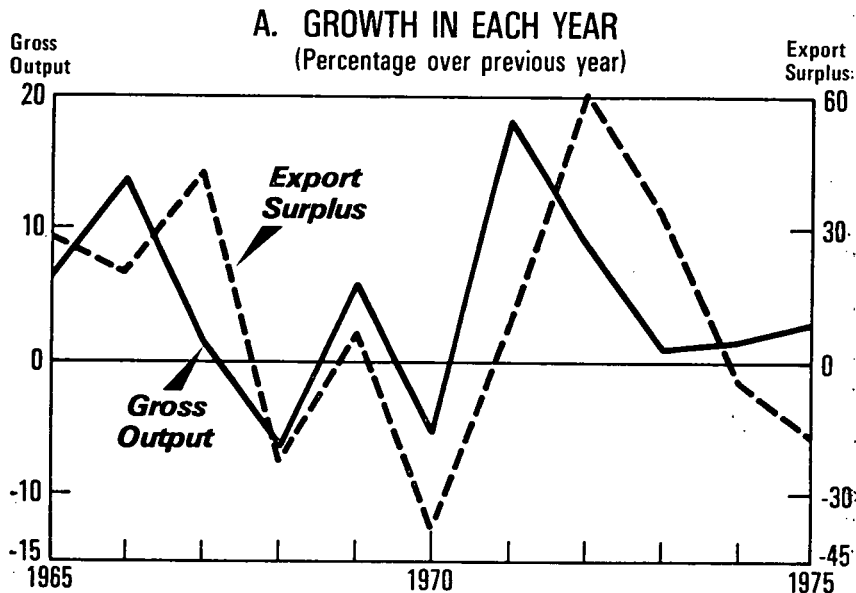

<sup>49</sup> Reported agricultural growth rates are sometimes reported as compound rates from one year to another and sometimes as the equivalent annual average growth derived from the average growth in one five-year period compared to the previous five-year period. The 4.2 percent is a compound rate from 1965 to 1975, as reported in AS-76, p. 46.

<sup>50</sup> Montias, "Romania's Foreign Trade Between East and West," *op. cit.*, p. 16.

Chart 2

# Growth of Gross Agricultural Output and Of Export Surplus in Food Products

(Gross output growth in constant prices;  
Export surplus growth in current prices)

Sources: Calculated from AS-71, pp. 107, 417-8, and AS-76, pp. 46 and 385 with corrections for reclassifications of export commodities in 1979.

Returning to the question of food supplies for domestic use, if gross agricultural output for domestic use increased 4.2 percent per year and population increased 1.1 percent per year, then gross output per person increased about 3.2 percent per year from 1965 to 1975. This growth may be compared to the reported growth rates for the same period of 5.5 percent for real income per capita, 5.8 percent for real incomes in money and kind per active peasant, and 3.7 percent for real wages.<sup>51</sup> Both real income concepts probably exaggerate the growth of real disposable incomes per capita because of the inclusion of state-provided social consumption; real wage growth understates real disposable income growth per capita because of tendencies toward increasing numbers of wage earners per family and toward shifts in the labor force from agriculture to industry where pay is higher. One may assume that real disposable incomes per capita (discounting social consumption) grew about 4.5 to 5 percent per year. Real gross agricultural output per capita available for domestic consumption appears to have grown about two-thirds as fast as real disposable incomes per capita from 1965 to 1975. The meaning of this estimate will be discussed later.

An overview of the realized and planned growth of agricultural output is presented in Table 26. The percentages of growth are those used in plans and in reports of plan fulfillment, i.e., the average growth of one period over the previous period. The growth target for 1976-80, as discussed earlier in Table 3, is an optimistic one that probably assumes favorable weather conditions and higher productivity of capital and labor inputs. Going beyond 1980, as projected in the Eleventh Party Congress Directives, planned agricultural output growth is much slower through 1990, having an implied annual average rate of increase of only 1.6 to 2.3 percent per year from 1980 to 1990. The structure of output appears almost fixed from 1970 to the plan year 1980, but the share of animal products planned for 1990 increases significantly. Given a population growth of around one percent per year and a total output growth of 1.6 to 2.3 percent per year from 1980 to 1990, the figures imply that vegetable output will grow less than population.<sup>52</sup> If Romania is to export food products, it appears to be planning to specialize in meat products; in fact, it may be planning to exchange meat for vegetable products in world markets.

	1980 structure	1990 structure	Growth in 10 yr	
			Amount	Percent
Vegetable.....	58.0	50.0	58.5- 62.5	0.1- 7.0
Animal.....	42.0	50.0	58.5- 62.5	39.3-48.9
Total.....	100.0	100.0	117.0-125.0	.....

<sup>51</sup> Real income per capita and real wages as reported in AS-76, p. 46. Real income per active peasant as calculated from plan reports cited above.

<sup>52</sup> The implied percentage growth of vegetable output for the ten-year period is only 0.1 to 7.0 percent, as seen in the following:

(b) Animal products.....	36.8	41.2	43	42	50

Sources: AS-76, pp. 265-6, and AS-71, p. 463. Planned 1976-80—"Scinteia" 2-3, July 1976. Planned 1986-90—"Directives of the 11th Party Congress," p. 69. Structure—Ovidiu Popescu, "Cresterea eficientei cheltuielilor materiale in agricultura (I)," "Revista economica, 1976": (May 21), p. 12.

For the plan period 1976-80, gross agricultural output grows an implied 5.1 to 7.6 percent over 1971-75. However, population and incomes are not planned to grow faster than in 1971-75, and it is probably safe to assume that if supplies are available, Romanian planners will not permit deliveries for home consumption to increase faster than the 3.2 percent per year for 1965 to 1975.<sup>53</sup> Therefore, increased supplies of agricultural exports ought to be available if the plan is fulfilled. If output grows at the lower margin of the plan, or even slightly less, the export surplus of food products could still grow by about 5 percent as it did from 1965 to 1975.

## 2. THE GROWTH AND USE OF CAPITAL AND MATERIAL INPUTS

The ease with which Romania's agricultural output can be made to grow at the planned rates for 1976-80 and in the future will depend on how two major weaknesses of the past are overcome.

The first weakness is shown clearly in Chart 2 in the instability of gross output and export surplus of food products. Unfortunately, the last two five-year plans ended with the serious floods of 1970 and 1975, whereas drought has been common in other years. Romanian agriculture has not yet acquired the ability to avoid, or at least reduce, the historical instability of the country's climate.

The second weakness has already been touched upon in the discussion of Table 3 earlier. Increases in capital inputs have not seemed to adequately compensate for reductions in labor. Moreover, the share of "material expenses," which reflects depreciation, and material inputs from other sectors (such as fertilizers, as shown in Table 27), have increased significantly as a share of gross output. Increases show up for all forms of production organization. The low response of output to increased material inputs suggests problems of labor quality, incentives, and organization.

<sup>53</sup> One may argue that planners assume a declining income elasticity for food as income increases. Actual preferences of the Romanian population are difficult to estimate because the distribution of food stocks are influenced by queues and empty-shelves rationing, the extent of which has varied in time and space. It is certain that the average Romanian would like to have much larger supplies of food available, especially meat and fresh produce out of season.

Table 28 presents estimates of fixed capital in agriculture according to three categories of organization—state farms, machine-tractor stations, and a residual that includes collective farms and private agriculture. Fixed capital in agriculture increased an impressive 49 percent from 1965 to 1970, and 57 percent from 1970 to 1975. According to estimates for 1980 as presented in Table 3, fixed capital in agriculture will also increase 57 percent from 1975 to 1980. Past and planned increases in selected major inputs (Table 29) suggest that increases in tractors, fertilizer, and irrigated land are planned to continue at about the same rate as in 1971-75.

Even with the planned increases for 1980, Romanian inputs of tractors and fertilizers per hectare appear to remain below levels achieved by East European members of CMEA.<sup>54</sup> The main thrust

<sup>54</sup> Comparative data are presented in Gregor Lazarcik, "Agricultural Output and Productivity in Eastern Europe," in Joint Economic Committee, Congress of The United States, "Reorientation and Commercial Relations of The Economics of Eastern Europe" (Washington, 1974), pp. 375-377.

of planned agricultural investments in 1976–80 is directed toward efforts to reduce climatic influences on output. Before the 1975 summer floods, soil conservation, irrigation, drainage, and flood control were reported to be taking half of the investments in agriculture.<sup>55</sup> The floods prompted a reassessment of plans and, in 1976, an even more ambitious long-term water basin management plan was announced.<sup>56</sup> It may be that catching up in levels of fertilizer application and mechanization has been further delayed.<sup>57</sup>

#### *F. Summary of the Sources and Uses of Material Resources*

The ambitious character of Romania's plan for 1976–80 is reflected in several dimensions. The internal investment flow is to increase 92 percent over 1971–75 and, at the same time, large export surpluses are to be generated. There is an evident desire to restrict additional borrowing and equipment imports from the developed West. Additional credits to the less developed countries will be used to expand exports of Romanian equipment and technical assistance as part of long-term efforts to acquire greater proportions of raw material needs.

Romania's plan continues to emphasize the development of heavy industry, especially machine building and chemicals. Tied to this development is an effort to acquire greater self-sufficiency and export ability in equipment and in processed materials such as steel products. In spite of intentions to exploit margin domestic reserves of industrial raw materials and to squeeze industry with lower consumption norms, Romania's import dependency will grow in critical products, such as iron ore, coking coal, nonferrous metals, and crude oil. But, partly because of a low level of development, a high degree of self-sufficiency in primary energy will be maintained.

Even though agriculture's share of total investments will fall compared to 1971–75, the absolute flow of investments will be a large increase over 1971–75. In fact, by 1980 the investment share will about equal the share of agriculture in national income produced. However, relative levels of mechanization and fertilizer application (a current material input) will probably remain below levels in other CMEA countries. At least half of investments in agriculture will be used in irrigation, flood control, and land reclamation in an effort to better isolate agriculture from periodic droughts and floods. Given that these projects can only be executed slowly and have a long recoupment compared to mechanization, this strategy appears to have an element of short-term risk.<sup>58</sup> All things considered, Romanian agricultural output ought to grow at least at the same rate as in 1965–1975, and should still provide the country with the needed export surplus of food products. Looking beyond 1980, the plan suggests an intent to decrease agricultural growth to shift from vegetable products to animal products. If Romania has an export surplus in food products in the 1981–1990 decade, it will clearly be in animal products.

<sup>55</sup> Miles J. Lambert, "Romania Moves to Revamp Its Lagging Agriculture," *Foreign Agriculture*, XIII :34 (August 25, 1975), p. 12.

<sup>56</sup> "Scinteia," 16 April 1976, p. 2.

<sup>57</sup> The plowing, seeding, and harvesting of cereals and soya was reported to have been fully mechanized by 1976, but cultivating was only 80.9 percent mechanized on state farms and 63 percent mechanized on cooperatives. Mircea Bulgaru, "Optimizarea relatiilor industrie-agricultura si echilibrul economic-social," "Era socialiste," LVI:18 (September 1976), p. 12. Also, mechanization was planned to be completed for corn, sunflower, and fodder plants by 1977; for potatoes by 1978; and by 1980 for sugar beets, truck produce, vineyards, and livestock care. Stanciu, *op. cit.*, p. 2.

<sup>58</sup> A recoupment period of ten years has been given for investments in irrigation, soil drainage, and erosion control. "Revista economica," 1976:50 (December 17), p. 6.

## IV. SOURCES AND USES OF LABOR RESOURCES

During the period from 1950 to 1972, the ratio of working-age population to total population did not materially change. Although Romania's population growth rate has been second highest among the CMEA countries, the available labor force growth has been smaller because of decreasing participation in both age-group extremes, which has not been offset by increasing female participation in the middle age-group. Non-participation has taken the usual forms of retirement and school enrollment, but it also may be observed that the ratio of estimated civilian employment to the estimated active population decreased from 95 to 96 percent in the late 1950s to 93 percent in 1972. The decrease could be accounted for by both greater employment in military and security forces and apparent unemployment of younger persons not currently enrolled in school.<sup>59</sup>

Given a growing concern about possible labor shortages, the latter group has been of large enough size, apparently, to evoke a 1976 law "concerning the enrollment in useful labor of persons apt for work."<sup>60</sup>

No current participation data by sex or age group is available, but may be forthcoming from the 1977 census. In the last census year, 1966, female participation in the labor force was 48.1 percent and, among urban females, 37.0 percent. Both rates were relatively high by comparison with other countries and could be accounted for by extensive participation in agriculture, even of urban females. At the same time, in 1973 females were only 34.4 percent of state employees, the lowest rate among the Eastern European CMEA members. In 1975, Prime Minister Manescu indicated that two-thirds of the increased number of state employees in 1976-80 will be female. The proportion of females will then reach 40 percent.<sup>61</sup> Reaching the employment growth goals of the plan will require a significant movement of rural females out of agriculture and increased urban female participation in state employment.

## A. Agricultural Labor

Approximate calculations indicate that in 1970 the ratio of national income produced per occupied person in industry reached an all-time high of 5.9 times the income produced per occupied person in agriculture.<sup>62</sup> By 1975, the ratio fell to 4.9, as the number of persons occupied in agriculture fell by over one million and agricultural investments increased. Nearly another million persons are planned to leave agriculture by 1980. With further agricultural investments, the ratio will fall slightly; still, in 1980, national income per occupied person in industry will be over four times that in agriculture. Unlike Romanian industry, Romanian agricultural labor productivity has probably suffered from a lack of capital and incentives. It is also of significantly poorer quality. In 1975, there was only one-third the

<sup>59</sup> Except where otherwise noted, the data in this section draws on a forthcoming work, Marvin R. Jackson and Stephen H. Happel, "Population Structure," in K. D. Grothusen (ed.) "Südosteuropa Handbuch, Volume II," Rumänien, Göttingen, 1977.

<sup>60</sup> Discussions of the law were accompanied by numerous comments about neglectful parents and "parasitism" among youth. It provided for obligatory registration for persons from sixteen to pension age were not attending school, employed, housewives, or disabled. "Scinteia," 6 November 1976, pp. 5-6.

<sup>61</sup> Manescu, *op. cit.*, p. 8.

<sup>62</sup> Calculations are based on 1975 shares projected back by growth rates of national income produced in each sector. The shares were given in Table 6, above, and growth rates taken from AS-76, p. 53.

number of engineers and technicians per 1000 workers in agriculture as compared to industry.<sup>63</sup>

In agriculture, educated personnel tended to work on state farms and machine-tractor stations, where in 1968 one out of 34 employees had secondary education and one out of 25 had higher education. By contrast, on collective farms in 1969 only one out of 1067 had secondary education and one out of 492 had higher education.<sup>64</sup> In addition, the last available data on age structure, presented in Table 30, show that even in 1966, the labor force of collective farms, which is the major component of production, was much older than the national average. More recent reports suggest that nearly 60 percent of the Romanian agricultural labor force is over 45 years and that it is 60 to 70 percent female.<sup>65</sup>

TABLE 30.—AGE STRUCTURE OF THE OCCUPIED POPULATION IN INDUSTRY AND AGRICULTURE, MAR. 15, 1966

Source: Constantin Grigorescu, "The Labour Force Quality and the Modernization of Agriculture," "Revue Roumaine des Sciences Sociales, Serie de Sciences Economiques," 15, 2, 1971, p. 199.

It would be argued correctly that Romania's poorly-educated, aging, female, and, because of the latter two factors, often part-time, agriculture labor force is effectively smaller than the reported numbers. This is the case with the collective farm labor force, shown in Table 31, but sufficient current data are lacking on age, sex, education, and work participation to make "quality" corrections. Data in Table 31 suggest why the labor force on collective farms is of poor quality. The number of families on collective farms has actually increased slightly since 1965, but the number of members (and workers) supplied per family has fallen possibly to less than one per family. Many members of collective farm families, usually males or younger persons, commute or temporarily migrate to industrial employment where they are attracted by higher incomes. This was shown as early as the census of 1966, which indicated significant nonagricultural employment of rural males. With higher incomes available to males and younger persons, it is not difficult to understand why the family member remaining for collective work is an aging female who works only part-time.

<sup>1</sup> Estimate from Bulgaru, op. cit. p. 15.

Sources: Collective families from A.S.-75, p. 182 (data not published in A.S.-76). Private farm members calculated from percentage of "nonsocialist" sector employment in A.S.-71, p. 125. (Data not published in A.S.-72 and after.) Plan data from table 6. All other from A.S.-76, pp. 66-69, 164, 166.

### *B. Labor Incentives in Agriculture*

Major changes in Romania's labor force have been caused by large income differentials in collective agriculture compared to other activities, especially employment in urban areas. Such income differentials not only resulted in large permanent movements out of agriculture and to the cities, especially on the part of the rural youths who used the advantages of educational opportunity, but also served to stimulate a large flow of migrant and commuter workers who have been willing to leave their families for long periods of time or to tolerate daily travels of several hours to gain the higher wages of industry.

The income differential between peasants and state employees has been estimated in Table 32. As line 6 shows, the differential grew rapidly after 1955 and reached a maximum in 1970. At that time, real incomes per "active" peasant were possibly less than half of the real wages of state employees. Comparisons are difficult because, as Table 31 suggests, significant numbers of peasant family members were earning wages as state employees. In addition, except for housing, rural areas offer lower levels of services, including those provided by the state as free or subsidized social consumption.

TABLE 32.—PER CAPITA REAL INCOMES AND WAGES

	1950	1955	1960	1965	1970	1975	1980 <sup>1</sup>

<sup>1</sup> 1980 based on plan data, using midpoints where plan targets are given as a range and assuming an occupied population, of 10,500,000 and a total population of 22,500,000.

Sources: "Anuarul statistic," 1976, except as follows: (1) Absolute values of "real income of the population" (see text for an explanation of this concept) are computed on the basis of statement "total real incomes of the entire population [grew] 46 percent or by 74,000,000,000 lei," which was reported in "Scinteia," Feb. 4, 1976, for the period from 1970-75. According to this, the absolute amount in 1970 would have been about 160,000,000,000 lei. This agrees with a comment in "Revista economica" that from 1966-75, "real income" increased "over 110,000,000,000 lei." Using the index of "total real income of the population" given in "Anuarul statistic," the absolute amounts of total real income are: 1950—49,000,000,000 lei; 1955—71,500,000,000 lei; 1960—89,200,000,000 lei; 1965—122,000,000,000 lei; 1970—159,800,000,000 lei; 1975—233,000,000,000 lei; and (planned) 1980—321,400,000,000 lei. (2) The calculation of the ratios of income per peasant to real wages of state employees, as explained in the text, is actually comparing two different concepts of income. Given this major weakness, the relatives are based on 2 observations that turned out to be consistent with each other and with movements in the 2 indexes. C. Grigorescu ("The Labour Force Quality and The Modernization of Agriculture," in "Revue roumaine des sciences sociales, serie de sciences economiques," 15:2 [1971], pp. 199-200) indicated that in 1970 incomes per worker in agriculture were 50 percent of industrial wages. At this time industrial wages were 94.4 percent of average wages of all state employees. In 1976, Mircea Bulgaru ("Optimizarea relatiei industrie-agricultura si echilibrul economic-social," in "Era socialista," LVI:18 (September, 1976), p. 18) stated that a worker in collective agriculture "in normal conditions" receives on the average 60 to 70 percent of the income of a worker in state industry or state farms.

Table 32 shows the results of a significant effort to overhaul the income system in collective agriculture from 1971 to 1975. It is equally clear that the present five-year plan does not allow for the continuance of such changes. Details of policy for 1976-80 are unclear from available sources and, in some aspects, somewhat contradictory.

In 1970, a decision was taken to base income in collective agriculture on the so-called "global accord," which in essence is either a form of share-cropping or piece-rate wages. By 1973, centrally-determined rates of payment has been established for all farm activities.<sup>66</sup> And, beginning in 1971, a system of guaranteed monthly incomes was made available for special categories of farm work. Table 33 shows the subsequent increased levels and extensions of "guaranteed" incomes to other activities, and compares them with average monthly money wages for workers on state farms. Besides different conditions for acquiring income, from 1971 on peasants were provided with opportunities for paid vacations, child and maternity benefits, sick leave, and more adequate pensions.

Sources: A.S. 1976, p. 76. "Revista de statistica," xxv:2 (February 1976), p. 23. "Scinteia," Dec. 11, 1975, p. 1.

On the face of it, share-cropping and piece-rate systems seem to contradict the idea of guaranteed minimum monthly incomes. Also, it is known that both guaranteed minimum incomes and other fringe benefits have been provided selectively, that is, only to the more prosperous collective farms. Even in these cases, special state credits sometimes have been necessary. By December 1975 a generalized system of wages for all collective peasants was decreed and was to serve as a basis for a new, permanent law to be passed in 1976.<sup>67</sup>

Finally, in developing new agricultural incentive systems, Romania has not neglected the important sector of production from private agriculture and from the personal gardens of collective peasants. In 1975, these sources provided, as examples, 12 percent of cereal output, over half of the potatoe output, 40 percent of produce, over half of fruit production, and over 40 percent of livestock herds.<sup>68</sup> During 1971-75, these activities were stimulated by policies of selective price increases and of reducing taxes on income earned from them. In 1976, these changes culminated in the abolition of the tax on income from private and personal garden agriculture, and its replacement by a final tax per hectare of land used for such purposes.<sup>69</sup>

### C. Urban Labor

Shortly after the 1966 census results were available, the Romanian government, without prior warning, outlawed the virtually free abortions that had been available. The birthrate rose abruptly. Since then, despite continuing pronatalist policies, which included renewed efforts in 1974 to restrict semilegal and illegal abortions, the birthrate has fallen, although not as far as the pre-1966 level. Pronatalism presents a conflict in labor policy between increasing urban female labor force participation today and obtaining a larger labor force in the future. It also conflicts with other aspects of economic policy.

Among the impediments to larger families in Romania, as in other socialist countries, is a shortage of urban housing. As far as is known,

<sup>67</sup> Scinteia, 21 December 1975, p. 4. Further discussion of the decree and the proposed law have not been encountered.

<sup>68</sup> No general output data by organizational units are currently published. Cited data are from individual product categories in "Annual Statistic 1976," pp. 196-243.

<sup>69</sup> "Revista de statistica," xxv:2 (February 1976), p. 23.

comparative data on housing stocks are unavailable, but Romanian investment in housing is a low percentage of total investments compared to other CMEA countries, which may indicate more difficult housing conditions.<sup>70</sup>

In addition, in 1972, Romania had only one retail outlet for every 317 persons compared to Hungary, Poland, and East Germany with, respectively, one outlet for every 160, 170, and 95 persons.<sup>71</sup> The data suggest the difficulty of shopping, another factor discouraging larger families, especially for working parents. Yet a third factor that may discourage larger families is the change in total family income resulting from a woman's work. This change may be approximated by the percentage of the minimum wage for unqualified labor (representing the woman's potential contribution) to the average wage (representing the man's contribution). In Romania, this ratio was 51 percent in 1965 and rose to 68 percent in 1974. Such wage leveling may have had the effect of increasing the labor participation of married women, thus discouraging larger families. The Romanian government has encouraged working mothers through a system of family allowances, paid maternity leaves, and kindergarten programs for children aged three to five years. But family allowances at present are modest. The flow of payments for a first child, until the child reaches sixteen years, are only slightly more than one year's average wages.<sup>72</sup>

Another important influence on labor participation, especially among urban persons, is education policy. In 1966, the percentage of the economically active population attaining higher education was 2.0, and the percentage of those attaining secondary-vocational education was 13.2. In Poland the same attainment rates were 3.0 and 18.8 percent, and in Hungary they were 4.5 and 48.4 percent.<sup>73</sup> Since 1966, Romania has followed policies of restricted entrance into higher education. Educational programs at lower levels have been expanded, but with the emphasis reduced on general education and that on specialized, vocational-technical education increased. Current policy gives particular emphasis to combining work and education. Table 34 probably reflects Romania's educational policies in 1970, but the data, especially the changes from 1970 to 1974, also may be influenced by organizational policies.

#### *D. Summary*

Barring the availability of more detailed data, the characteristics of Romania's potential labor force are what one might expect in a country with such rapid industrialization. The point of this review is to suggest that Romania's reserves of labor for continued extensive development may be less than the numbers indicate. In the future, significant movement out of agriculture will occur by natural attrition. Pronatalist policies may slow the growth of female labor participation

<sup>73</sup> Romanian data are from Vladimir Trebiel, "Populatia Romaniei si cresterea economica," Bucharest, 1971, p. 209. Polish and Hungarian are from Marjory E. Searing, "Education and Economic Growth—The Post War Experience in Hungary and Poland," in Joint Economic Committee, Congress of the United States, "Reorientation and Commercial Relations of The Economies of Eastern Europe." Washington, 1974, pp. 512-3.

in urban areas, although the effects of those policies tend to be offset by income leveling and by the relative scarcity of housing and urban services. Finally, at present, policies restricting higher educational enrollment and encouraging vocational-technical training combined with work, may require much greater investments in higher education, with a consequent reduction in the numbers available for work, as Romania continues the transition to more intensive development. These possibilities are all the more real because of increasingly frequent reports of labor scarcity in some regions, industries, and skill categories.

The possibility of growing labor scarcity is an interesting preface to the planned transition to a shorter work week called for in the Eleventh Party Congress Directives in 1974. In February 1976 Ceausescu announced that "debate" would begin on the proposed reduction, and that an immediate transition would begin by eliminating "unjust" supplementary hours and Sunday work.<sup>74</sup> The law, as described in the plan for 1976-80 and published in July 1976, called for a work week of 42 to 44 hours by 1980.<sup>75</sup>

Finally, in November 1976 it was decided that during 1977 the country would begin the transition from a 48-hour work week to a 44-hour work week, with the transition generalized by 1982.<sup>76</sup> Final measures were to be approved in a National Party Conference scheduled this year. In the meantime, as noted earlier, the transition was delayed one more year in order to recoup losses from the earthquake in March.

It may be that delays in the transition, aside from the earthquake, arose over a concern with labor supplies. Evidence to support this arises from two laws passed at the same time as the transition was announced. One law, already discussed, called for obligatory registration for labor service. The other law established a new system of labor recruitment. This law requires that each district must recruit from within itself, and can go outside for labor only with central approval. Other details of the law are presently unavailable.<sup>77</sup> In all probability, the transition to a shorter work week will prove to be a low priority objective, contingent upon fulfillment of planned growth in the labor force.

## V. CONCLUSION

Remobilization turned the Romanian economy from uncertain growth in 1966-70 to more rapid growth experienced through 1976. The growth process from 1971 to 1976 was predominantly extensive, that is, the result of increased inputs more than increased productivity. Mobilization pressure evoked higher growth of capital investment at a time of lesser reliance on borrowed foreign resources. Labor transfers from agriculture stepped up and, with effort to maintain or even increase urban participation rates, provided a rapidly increasing industrial labor force.

The high growth rate of productivity in national income produced was, itself, more the result of extensive than intensive processes because transfers of labor from agriculture to industry brought

<sup>74</sup> Scintela, 5 February 1976, p. 3.

<sup>75</sup> Scintela, 3 July 1976.

<sup>76</sup> Scintela, 6 November 1976, p. 1.

<sup>77</sup> A discussion of both laws is found in "Scintela," 6 November 1976. It might be suggested that the recruitment law may have the unintended effect of reducing labor mobility and, therefore, increasing the frequency of regional labor shortages.

immediate increases in output per worker of four to five times. More accurate indicators of mobilization influences on productivity are seen taking industry and agriculture separately. In both sectors, productivity growth fell below planned levels. Romanian industrial management may have had problems absorbing so many new workers and facilities, especially given the more sophisticated technologies in the dominant machine building and chemical sectors. In agriculture, droughts and floods were a problem. But performance after the initial recovery from the 1970 floods must have been a disappointment in the face of changed incentives and a spectacular rise in peasant incomes.

The plan for 1976-80 envisages a similar growth process as in 1971-75, i.e., primarily extensive growth. But the margin of plan fulfillment to be provided by productivity growth is larger in both industry and agriculture. An important shift of strategy is apparent in agriculture as evidenced by less reliance on increases in peasant incentives, although peasants clearly have greater income possibilities than at any time since collectivization. The new strategy aims at reducing climatic influences through investment in an ambitious program in irrigation, flood control, land reclamation, and related projects. The effort is plainly needed and ought to have positive long-term benefits of more reliable crops. But, in the short term, investments will be diverted from further mechanization needed to raise the very low productivity of agricultural labor.

All signs indicate a rapid exhaustion of easily obtainable extensive growth opportunities in Romania after 1980. Reserves of labor in agriculture are smaller than a simple count of occupied persons would indicate. The 60 percent of the agricultural labor force that is over forty to forty-five years old is probably not available to industry and will provide agriculture with labor of diminishing productivity. How much and how quickly urban female participation rates can be raised is a big question. Also, present effort to reduce apparent unemployment of youths will provide, at most, a one-time increase. Working against increased labor force participation is the need for Romania to expand education in preparation for a greater future reliance on labor skills than on crude labor. The supply of labor will be reduced if delayed plans for a shorter workweek are carried out.

One suspects this objective has low priority, but, at the same time, may give a healthy boost to labor productivity. Since 1975, increasingly frequent reports of labor shortages have appeared in Romania sources. Possibly they indicate inefficient labor allocation rather than aggregate labor scarcity. If so, an improved allocation system, the objective of new labor laws in late 1976, may be a source of other labor reserves, but, again, on a one-time basis only.

The state of foreign trade provides further evidence of the change from extensive to intensive growth. Romania already has an import deficit in the combined categories of industrial raw materials and food products. The 1976-80 plan includes methods to control the growth rate of this deficit by reducing use norms in industry, exploiting marginal domestic reserves, and exporting agricultural output. All three measures may be considered among the more uncertain aspects of the plan, although within the range of achievements in 1971-75. The most important method planned as compensation for

the deficits that do occur is the effort to shift trade to the less developed countries with whom Romania hopes to trade heavy industrial products and engineering services for raw materials. Romania also had success in expanding exports of manufactured consumer goods, but may face restrictions on supplies of exports because of the relative low growth priority of light industry. Romania probably needs an assist in this area from world economic recovery. Under depression conditions and given weaknesses of Romania's marketing system, available foreign markets seem increasingly restrictive.

Beyond 1980, Romania's planned agricultural growth appears insufficient for this sector to provide growing export surpluses. By then industry will necessarily have to be the major source of exports. With exports one-third or more of domestic production, Romania's growth rate will be greatly influenced by her success in producing and marketing manufactured goods.

In the 1960's Romania increased economic independence by a shift of trade from CMEA to the West through which her economy acquired additional stimulation from credits and improved terms of trade. Maintenance of economic independence in the 1970's has been more inward oriented through mobilization pressure to provide resources for extensive growth and to reduce reliance on Western credits, and possibly even Western markets. Romania's new outward orientation is towards the third world which, in present conditions, offer few fears of dependent trade relations. Opportunities to redirect commodity imports originating in LDC's, by purchasing them directly rather than through Western intermediaries, facilitated the recent rapid expansion of Romania's LDC trade share. But, among other possible additional costs of this strategy, Romania probably has provided credits to the LDC's, which further increase pressure on domestic supply and the need for mobilization.

Romania in the 1980's will be forced to grow intensively. The economy already faces signs of increasingly tight supplies of domestic labor and need to export more competitive manufactured products. The essentials of successful intensive growth are productivity growth, widely distributed technological change, and high quality products. It is an axiom among western specialists of centrally-planned economies that, although the system works well to generate growth under the kinds of conditions faced by Romania up to the present, it has not done as well under conditions that Romania will confront after 1980. Romania's special ingredient has been the combination of central planning with mobilization pressure. Use of mobilization was facilitated by a population willing to accept the leadership's identification with national independence. Romania's future goal is an economic structure and an economic system, generally speaking, like those of East Germany or even Czechoslovakia today. With similar structures and systems, one may expect similar challenges or problems. Will Romania's unusual ability to mobilize provide an ingredient unavailable heretofore in more advanced centrally-planned economies? One can only wait to see what happens then.

A survey of recent economic developments in Yugoslavia may seem misplaced in a volume of papers dealing with Eastern Europe. Neither the economic nor the political system of Yugoslavia fits the models which usually come to mind when analyzing the countries of this area. Yugoslavia remains alone as a "socialist non-aligned nation" separate from the political, economic and defense ties linking Eastern Europe with the Soviet Union on the one hand and from similar ties linking the nations of Western Europe on the other. Nonetheless, it seems useful to examine Yugoslavia within the Eastern European context because the Yugoslav system has grown out of Eastern European roots, and, consequently, represents a possible path for further socialist transformation within the Soviet bloc in the future.

Because of its unique experiment with a kind of "market socialism" and workers' self-management, the Yugoslav economy has received much attention from western scholars in recent years. Therefore, so as

The author is indebted to Professor Egon Neuberger (State University of New York at Stony Brook) and Professor Michael Kaser (Oxford University) for helpful comments.

not to be repetitive, this survey tries to build on existing studies of Yugoslavia, such as the one recently completed at the International Bank for Reconstruction and Development,<sup>1</sup> by surveying important economic, and, to a lesser extent, political developments during the 1970-76 period and by identifying future problems and prospects. In addition, an attempt will be made to relate economic goals and problems to the specific economic and political system within which economic decisions and policies are formulated. This approach reflects a methodological conviction that economic changes can be understood only by examining the particular economic and political environment which influences both the kinds of economic problems which arise and the policies available for their solution.

The paper begins with an introduction to several important features of the Yugoslav economic and political setting and then moves on to analyze the performance of the Yugoslav economy. Section I looks at the roles which the level of economic development, regional development disparities, the political system and ideology play in shaping economic problems and their solutions. In Section II, the economic system, as it has been transformed by recent constitutional changes and as it currently functions, is described in greater detail. Section III analyzes economic growth and efficiency over the 1970-76 period and contrasts actual accomplishments with the projections embodied in the 1971-75 Social Plan. Sections IV and V examine regional growth and performance and agricultural growth and performance respectively. As might be expected, problems in these areas are interrelated because of the importance of agriculture to the economies of the less developed regions. Section VI returns to the issue of aggregate economic performance and focuses on the problem of persistent inflation and on the recurrent attempts of the Yugoslav authorities to combat it. A number of hypotheses about the causes of the Yugoslav inflation are contrasted, and the effectiveness of recent policy responses is studied. Finally, in Section VII, Yugoslav foreign trade problems and policies are discussed. The paper concludes with an overall assessment of basic economic and social accomplishments during the past six years.

## I. THE ECONOMIC AND POLITICAL ENVIRONMENT

Perhaps the single most important feature of Yugoslavia's economic environment is its level of economic development. According to traditional development indicators, such as the level of gross domestic income per capita, the distribution of the working population among industry, agriculture and services, and the provision of the population with certain types of services and durable goods, Yugoslavia ranks as a developing economy, along with such countries as Greece, Turkey, Spain, Portugal, Hungary and Romania.<sup>2</sup> The still untapped development potential associated with this position has definite implications for economic policies and goals. Most significantly, the relatively low level of development necessitates a continued priority for rapid growth and structural transformation and a resultant need for a high savings effort and for careful co-ordination

<sup>1</sup> International Bank for Reconstruction and Development, "Yugoslavia: Development with Decentralization" (Baltimore: Johns Hopkins University Press, 1975).

<sup>2</sup> See footnote 2 on p. 943.

of investment. Growth priorities in turn shape policies designed to achieve other economic goals, such as price stability or balance of payments equilibrium. For example, Yugoslav policy-makers have struggled to find ways to reduce inflationary pressures without sacrificing real economic growth and to relieve a balance of trade deficit without reducing the growing flow of intermediate and capital imports required by increases in domestic production. As these examples indicate, Yugoslavia's development potential has established rapid growth as the major economic goal and has restricted policy options in other areas.

A second factor influencing both economic goals and acceptable policies is the existence of marked regional disparities in the level of economic development. Because of their diverse political and economic histories, the six republics and two autonomous provinces<sup>3</sup> which make up the Yugoslav state differ widely in their economic situations, as the data in Table 1 reveal. The existence of regional development gaps presents a problem in many developing countries, but the problem is particularly severe in Yugoslavia, both because of the extent of such gaps and because of underlying ethnic or nationality conflicts among the different regions. These conflicts magnify the significance of a resolution to the regional development problems while simultaneously rendering the formulation of acceptable policies to achieve such a resolution very difficult. In fact, it has been argued that disagreement over a workable regional development strategy

TABLE 1.—REGIONAL DEVELOPMENT INDICATORS

<sup>3</sup> The six republics are Bosnia-Herzegovina, Croatia, Macedonia, Montenegro, Serbia and Slovenia. The two autonomous provinces are Kosovo and Vojvodina.

have sometimes caused major structural changes in the entire Yugoslav economic system.<sup>4</sup>

The "nationalities" problem, as it is sometimes called, has important implications for economic policy-making in other areas as well. Under the new Constitution and related laws, both the state and party organizations are built along republican lines, and federal government action must be approved by the competent republican leaders. Consequently, federal economic policies are frequently compromises among conflicting republican interests. Because such compromises are time-consuming to achieve, substantial lags in policy formation and implementation sometimes seriously interfere with policy-making effectiveness. For example, countercyclical federal expenditure and taxation policy to maintain macroeconomic balance is difficult to formulate. As another example, the Yugoslav monetary authorities have had persistent difficulty in sterilizing unexpected increases in the money base caused by unexpected balance of payments surpluses, because they have been unable to reduce their rediscount commitments which have a major impact on credit availability in different republican credit markets.<sup>5</sup>

A final factor shaping economic priorities and policies is the commitment of the Yugoslav leaders to certain ideological goals, among them socialism and the principle of self-management. The commitment to socialism has meant limitations on the degree of income inequality and on the types of ownership rights acceptable to policy-makers. These limitations in turn have restricted policy options. For example, solutions to the problems of interenterprise and interrepublican capital mobility have been hindered by ideological barriers to equity ownership. Deprived of this option, the Yugoslavs have adopted a number of laws to induce enterprises to invest in extra-enterprise projects and to induce banks to extend loans across republican boundaries. So far, these efforts have not been completely successful, and the immobility of capital remains a major hindrance to efficient economic growth.<sup>6</sup> In other planned economies which share Yugoslavia's aversion to equity ownership, the desired distribution of capital can be achieved, at least in principle, by the state planning and financial apparatus. However, this option is also unavailable to the Yugoslavs because of their commitment to self-management which is interpreted to be inconsistent with state control over the allocation of enterprise profits and investment funds.

As the examples provided in this section suggest, several distinctive features of the political and economic environment in Yugoslavia play an important role in determining its economic goals and problems and in dictating feasible policy solutions. To understand how these policy solutions are arrived at and how they are implemented to achieve their desired effects, it is now necessary to look in greater detail at the information, motivation and decision-making structures which define the unique Yugoslav economic system.<sup>7</sup>

<sup>4</sup> This argument is used to explain the 1961 and 1965 economic reforms by Deborah Milenkovitch in her book "Plan and Market in Yugoslav Economic Thought" (New Haven: Yale University Press, 1971), pp. 167-186.

<sup>5</sup> For a more detailed discussion of this problem in monetary policy implementation, see Section VI of this survey and OECD, Yugoslavia, 1974.

<sup>6</sup> The problem of capital immobility in Yugoslavia is discussed in greater detail in Section III of this survey and in the IBRD volume, Yugoslavia, op. cit., pp. 229-233.

<sup>7</sup> The division of an economic system into its information, motivation and decision-making structures is suggested in an approach to the study of economic systems derived by Egon Neuberger and William Duffy. Their approach is fully described in their book "Comparative Economic Systems: A Decision-Making Approach" (Boston: Allyn and Bacon, Inc., 1976.)

## II. THE ECONOMIC SYSTEM

Since the major economic reforms of the early and mid-sixties the Yugoslav economy has functioned as an imperfect market system, based on the principles of social ownership of the means of production and workers' self-management in enterprise decision-making. Within this system the role of the government at the federal, republican, and communal levels has been mainly limited to selective, ad hoc interventions in monetary policy, investment policy, price policy and foreign trade policy. Such interventions have been designed to change the parameters which influence the actions and decisions of enterprises and households on the market rather than to directly change the actions and decisions themselves. As distinguished from indirect interventions of this type, direct controls over economic activity have been concentrated in three main areas: government financing of investment projects and priority sectors, an important part of which reflects continued efforts to achieve regional development goals; government regulation of economic activity in the private sector; and government regulation of the use of foreign exchange.

Temporary or short-term economic policy measures, be they direct or indirect, have been guided and co-ordinated by a series of long-term development plans, the most recent of which covers the 1976-80 period. In practice, because the government has lacked the tools required for ensuring the realization of plan targets, plans have tended to be more statements of government goals than blueprints for action. In this sense the Yugoslav plans appear to fall into the category of "indicative" plans which provide information about projected economic developments to individual actors who then incorporate this information into their decision-making process. Plans of this type act to guide rather than to constrain economic decisions in the marketplace, and it seems fair to conclude that this has been the function of Yugoslav plans in recent years. Efforts to directly implement plan targets have been limited to the use of selective monetary policy, government subsidies, and government investment funds to encourage priority sector development. Since government funds financed about 17% of total fixed investment expenditures between 1970 and 1975, their use undoubtedly influenced the extent to which individual plan targets were realized.

The market and planning system described here underwent significant, although not fundamental, changes during the 1971-75 period. These changes, embodied in the 1971 constitutional amendments and broadened in the 1974 Constitution and subsequent laws, influenced the actual distribution of decision-making power among different government authorities, between the government and enterprises, and within enterprises themselves. The types of changes either actually adopted or planned for the future were shaped by the political and economic circumstances which gave rise to them.

Between 1970 and 1971, the continuing "republicanization" of both government organizations and the League of Communists threatened to paralyze effective economic policy-making at the federal level. In response to this threat, President Tito, with the support of party leaders, began a two-pronged offensive to restore central control. First, in 1971, a series of 21 amendments to the 1963 Constitution were introduced which, in effect, partially dismantled federal decision-making organizations and formally recon-

stituted them as instruments of the republics, composed of republican representatives on a parity basis.<sup>8</sup> These amendments were designed to establish a definite institutional framework within which inter-republican consensus could be reached on crucial aspects of federal economic policy. Second, the League of Communists, again under Tito's direction, began to rebuild an effective political center by removing republican party leaders who appeared to foster divisive republican rivalries and by exercising more influence over all constituent republican party organizations. These two actions strengthened central party control in the economy, while simultaneously widening the economic responsibilities of the republican governments and narrowing those of the Federal Government.

The political pressures motivating the institutional reforms were reinforced by economic pressures. The early 1970's witnessed a growing disenchantment with excessive dependence on market forces and a growing realization of the need for greater coordination of investment decisions. Disenchantment with the market stemmed from worries about the apparent increase in economic inequality both among republics and among individuals within each republic and from concern over the perceived concentration of economic power in the hands of financial institutions, the managerial elite, and wholesale, retail and foreign trade enterprises.<sup>9</sup> These developments, which were attributed to the growing domain of the market, came into direct conflict with the ideological goals of socialism. Concern over the government's inability to coordinate investment, with consequent duplications and inefficiencies in the use of scarce investment resources, added to skepticism about the market. Gradually, some economic and political leaders became convinced that the "indefensible theory" that the market would solve all economic problems was the cause of economic difficulty.<sup>10</sup> The policy prescriptions warranted by this view were clear: a general strengthening of the planning system and an increase in the number and variety of selective economic interventions. As shall be seen below, these policy prescriptions were followed during the 1971-75 period.

### 1. *Changes in the Decision-Making Structure*

The political and economic pressures encouraging changes in the economic system led to actual changes which modified the decision-making, information and motivation structures. In the decision-making structure, changes occurred at both the government and enterprise level. The major modifications in government decision-making were a marked transfer of authority from the federation to the individual republics and autonomous provinces and a re-organization of the procedure for the exercise of federal authority. As a result of these modifications, federation responsibilities were limited to

<sup>8</sup> A. Ross Johnson, "Yugoslavia: In the Twilight of Tito" (Washington, D.C.: Center for Strategic and International Studies, Georgetown University, 1974), p. 13.

<sup>9</sup> Evidence reflecting concern over the growing concentration of economic power is reported by A. Ross Johnson in "Yugoslavia: In the Twilight of Tito", op. cit., pp. 20-21 and by D. Milenkovich in "Plan and Market: The Case of Yugoslavia," a draft paper presented at the annual meetings of the American Economic Association in September, 1976, p. 3.

<sup>10</sup> These are the words of D. Vojnić, President of the Federal Executive Council in 1973, as reported in *Nin*, November 11, 1973, pp. 15-16 and as translated in ABSEES (Abstracts of Soviet and East European Studies), January, 1974.

national defense, internal security, protection of self-management and the socialist system, economic relations with foreign countries, foreign affairs, and regulation of a special fund for financing development in the less-developed regions. The federation also retained executive and coordinating functions for monetary and foreign exchange policies, certain tax and expenditures policies, the development of social plans, and price controls for selected goods and services. Federation functions were further distinguished according to whether they could be exercised independently of the republics and provinces or whether they required prior consultation with them. The former group included defense, internal security, foreign affairs, and economic relations with foreign countries, while the latter included monetary policy, foreign trade and exchange policies, price controls, policies to aid the less developed areas, the rates of certain turnover taxes, the social plan and the size of the federal budget.<sup>11</sup> In cases where prior consultation with republics and provinces was required, definite consultative procedures were established and allowance was made for the possibility of emergency measures should the republics and provinces fail to reach agreement.

Besides restructuring federation powers, constitutional changes reconstituted both the legislative and executive organizations of the federal government so that they reflected the principle of parity representation of the republics and autonomous provinces.<sup>12</sup> This principle guaranteed, as far as possible, that federal actions would represent compromise policies acceptable to republican and provincial leaders alike.

Another important change in the decision-making structure outside the enterprise was introduced in the form of so-called self-management agreements and social compacts. Under this system, social compacts on questions of economic policy were concluded between the competent government authorities, the trade unions, and enterprises, and subsequent or related self-management agreements were concluded among enterprises in the same industrial branch or between individual economic actors, such as interested buyers and sellers in a given type of economic transaction. Self-management agreements were binding on the actors who entered into them, but participation was usually not compulsory. However, the competent government body could require specific actors to conclude a self-management agreement if voluntary negotiations failed to develop. Once an agreement was formulated, whether voluntarily or as a consequence of government intervention, the economic actors involved were subject to various sanctions and monetary fines for failure to comply with its terms.

During the 1971-75 period, social agreements and self-management agreements were instrumental in the design and implementation of the incomes and price control policies discussed in Section VI. Agreements in these areas substituted for the direct co-ordination of economic policy by government or party organizations. Because they allowed

<sup>11</sup> D. Milenkovitch, "Plan and Market," *op. cit.*, p. 5.

<sup>12</sup> Within the legislative branch, the Federal Chamber is composed of 30 delegates from each republic and 20 from each autonomous province, and the Chamber of Republics and Provinces of 12 delegates from each republic and 8 from each autonomous province. Within the executive branch, the Presidency is composed of a member of each republic and autonomous province, and the Federal Executive Council is composed of officials elected in conformity with the principle of equal representation of the republics and autonomous provinces and of officials in charge of federal administrative agencies specified by law. This information is taken from the 1974 Constitution of the Socialist Federal Republic of Yugoslavia (Ljubljana: Delo, 1974).

for enterprise participation in policy-making while simultaneously guaranteeing needed coordination in crucial policy areas, such agreements were viewed as preferable to both the free market and direct or indirect government intervention as a means to achieve desired policy objectives. As a result, some observers have argued that the market mechanism will gradually be replaced by a system of self-management agreements covering all important aspects of economic decision-making.<sup>13</sup>

Within the enterprise itself the most important modification in the decision-making structure was the introduction of the so-called basic organization of associated labor (BOAL) as the fundamental decision-making unit. According to the 1974 Constitution, a BOAL could be established to represent any individual group of enterprise workers whose work results could be evaluated independently of the results of other workers. Relationships among BOAL's within an enterprise were to be formalized by voluntary intra-enterprise self-management agreements. Associations of BOAL's could freely delegate certain power to central administrative and central self-management bodies of the enterprise, but decisions involving the distribution of personal incomes, investment, and collective consumption were subject to ratification by individual BOAL's. The independence of BOAL's in the formation of enterprise-wide policy promised to weaken central enterprise administrative control thereby permitting individual workers to realize their self-management rights on the basis of equality.<sup>14</sup> However, this promise carried with it a potential threat that enterprise efficiency might be undermined by excessive decentralization and resulting stalemate in the decision-making process. To counter this threat, the 1974 Constitution gave to the enterprise trade union organization the responsibility to develop and enforce resolutions to intra-enterprise conflicts among BOAL's which could not be resolved by regular procedures.

Although it is too soon to judge what the effects of BOAL's on enterprise behavior will be, past experience with "economic units" within the enterprise might be instructive. Economic units, like the BOAL's which superseded them, were independent self-management organizations within an enterprise with much the same decision-making powers. Available anecdotal evidence cited in a recent study by David Granick suggests that worker participation in economic units did not lead to decentralization in matters of importance to the enterprise as a whole. Rather, units seemed to perform three important functions: (1) They served as a means of providing group incentive pay for all members of a given unit, with the amount of such pay being linked to the degree of fulfillment of the enterprise plan for the unit; (2) they decided on issues affecting individuals within the unit, such as the distribution of personal income and enterprise housing among unit members; and (3) they provided a mechanism through which unit members could insist on additional information from the enterprise central management.<sup>15</sup> Because such

<sup>13</sup> For example, J. Zupanov, a noted Yugoslav sociologist, has argued that the "market mystique" is being replaced by the "mystique of self-management agreements" in Yugoslavia. Zupanov is quoted by D. Granick in "Enterprise Guidance in Eastern Europe" (Princeton: Princeton University Press, 1975), p. 332.

<sup>14</sup> This was one of the goals behind the establishment of BOAL's, as stated in Article 14, Part II of the 1974 Constitution.

<sup>15</sup> D. Granick, "Enterprise Guidance in Eastern Europe," *op. cit.*, p. 378.

functions are important to the realization of self-management rights, BOAL's are likely to continue to satisfy them.

Special self-management structures, called "self-managing communities of interest," were also introduced in the social services sector during the 1971-75 period. By law, such communities were to be formed in education, science, culture and health. Each such community was to include those working in the respective service, representatives of the appropriate level of government, citizens groups, trade union representatives, and representatives of the enterprises which financed the service through their tax payments. The members of each community were to determine the quantity, quality, and price of the service in question by internal agreement. It was hoped that the formation of communities of interest would broaden local control over and local participation in the provision of social services to the population.

Before leaving the decision-making structure, something must be said about actual or potential changes in the economic decision-making role of the League of Communists. Unfortunately, only tentative conclusions can be drawn. It does seem clear that the party has become more unified since the early 1970's and that it has reasserted its leading role in the "construction of socialism." This undoubtedly means that the party organization and its members now play a more vital role in shaping economic policy within all government organizations. Within the enterprise, party influence can be exercised by individual workers, by enterprise party organizations and by the trade unions. Because the trade unions have been given a substantial role in the negotiation of self-management agreements, they may provide the most direct channel for party supervision of both intra-enterprise and inter-enterprise decisions. Regardless of the actual channel used, however, it seems reasonable to hypothesize that the 1971-75 period witnessed a strengthening of party influence in enterprise decision-making.

## *2. Changes in the Information Structure*

The 1971-75 period was marked by a growing realization of the need for greater co-ordination of economic decisions to meet development needs and to offset existing market distortions arising from price controls, monopoly pressures, and barriers to regional capital and labor mobility. Economic theory suggests that concern in this area was warranted. Investment decisions are known to involve externalities and to require information on future prices and factor costs which even a perfectly competitive market may not be able to supply. Furthermore, the existing theoretical literature on the self-managed enterprise<sup>16</sup> indicates that self-management of enterprise decisions in a market environment may interfere with the free flow of capital and labor to their most profitable uses. This problem is exacerbated in Yugoslavia by historical barriers to factor mobility across republican borders.

<sup>16</sup> The most exhaustive treatment of the western theory of the self-managed firm is found in J. Vanek, "The General Theory of the Labor-Managed Market Economy" (Ithaca: Cornell University Press, 1970). An alternative theory of the behavior of the self-managed firm based on Yugoslav experience is provided by B. Horvat in "Prilog zasnovanju teorije jugoslavenskog poduzeta," *Ekonomska Analiza*, 1967, I, Nos. 1-2; pp. 7-28.

The recognized need for more co-ordination, particularly in investment decision-making, gave rise to renewed interest in long-term development plans, and this interest culminated in a new law on the social planning system introduced in February, 1976. The law calls for a new system of plan development in which the economy-wide plan is to be based on individual plans originating in the enterprises. Enterprise plans in turn are to be built up using a common methodology, common assumptions, and a common plan period.<sup>17</sup> Republican and federal planning authorities are to aggregate and reconcile individual plans to come up with an overall plan which is internally consistent and which achieves macroeconomic balance.

The new planning system should strengthen the influence of the planning process on economic activity in at least three ways. First, enterprises are obliged by the new law to develop their own long-term plans, and the process of doing so may improve the quality of enterprise business decisions. Second, enterprises are to commit themselves to planned output, investment, wage and price targets in self-management agreements. Enterprises failing to comply with their intentions, as formulated in these agreements, may be penalized by specific sanctions or monetary fines. Finally, assuming the plans improve as a result of better information, they may be taken more seriously as a guide in individual enterprise decision-making. Unfortunately, the planning apparatus required for putting the new law into effect was not ready in time for the preparation of the 1976-80 plan.<sup>18</sup> Therefore, it is impossible to judge at this point how the new system will actually operate; only future experience will tell.

### 3. *Changes in the Motivation System*

The constitutional and legal changes which occurred between 1971 and 1975 did little to change the basic premise of the motivation structure which is a dependence on material incentives and, to a lesser degree, on social or political incentives in economic decision-making. The introduction of BOAL's and the experience with self-management agreement probably broadened the scope for social incentives by focusing on self-management principles and by providing vehicles in which social consciousness could be brought to bear on economic decisions. One of the factors encouraging institutional change during this period was certainly the continued efforts of the leaders to preserve and strengthen the self-management ideal, and these efforts were probably successful in enhancing the role of socialist ideology in shaping economic decisions.

In summary, the 1971-75 period witnessed some major modifications of the decision-making and information structures, and only minor changes in the motivation structure of the Yugoslav economic system. Despite these modifications, the system remains fundamentally as it was before: a market system, guided by a long-term planning process, and exhibiting several special features due in part to the principles of self-management and socialism and in part to Yugoslavia's multi-

<sup>17</sup> D. Milenkovich, "Plan and Market: The Case of Yugoslavia," p. 9.

<sup>18</sup> A major stumbling block to the realization of the new planning system is the absence of long-term plans in the majority of enterprises. For example, only 40 percent of all enterprises had a long-term plan for the 1971-75 period. This figure is reported in *Ekonomiska Politika*, May 11, 1974, pp. 18-19 and is cited in ABSEES, April, 1975.

national character. These special features will become clearer through an examination of actual economic development in Yugoslavia during the last five years.

### III. ECONOMIC GROWTH AND EFFICIENCY, 1971-75

#### 1. Growth Rates

Table 2 contains actual and target growth rates for various categories of output and expenditure during the 1971-75 period and comparable target growth rates projected for the 1976-80 plan. The data reveal that between 1971 and 1975, total social product, defined according to the material product approach used by the Yugoslavs,<sup>19</sup> grew at an average annual rate of 6.0 to 6.3 percent, about 1.2 percentage points below the target growth rate. The actual growth rate was nearly identical to the 6.1 percent growth rate achieved during the 1966-70 period. Growth performance of this magnitude is disappointing to the Yugoslavs who have consistently targeted growth rates in the 7.0 to 7.5 percent range, and who have argued that such growth rates are essential to development and standard of living goals. Therefore, it is not surprising that the 1976-80 plan targets remain in this range, with a projected overall growth rate of 7.0 percent.

Within total social product, individual sectors differed in the extent to which plan targets were realized. In industry, actual and target growth rates were identical. In agriculture, where the OECD and

<sup>2</sup> 5 = minimum acceptable. Minimum rates are cited on p. 38 of Social Plan for Yugoslavia, 1976-80 (Belgrade: Kultura, 1976).

<sup>3</sup> Basis 1970 with average of agriculture for 1969-70.

<sup>4</sup> 6 = minimum acceptable. Minimum rates are cited on p. 38 of Social Plan for Yugoslavia, 1976-80 (Belgrade: Kultura, 1976).

<sup>5</sup> Investment in fixed assets and stocks.

<sup>6</sup> Economic or productive investment is to grow by 8.5 percent while noneconomic investment in housing, public utilities and the like is to grow by 7.5 percent; see p. 66 of Social Plan, op. cit.

Sources: OECD estimates of actual growth from Yugoslavia (Annual Survey), 1976, p. 7. Yugoslav estimates of actual growth and 1976-80 plan targets from the Yugoslav Federal Planning Office document "Analytical Basis for the Documents of the Social Plan of Yugoslavia for the Period 1976-80," February 1976. Yugoslav plan targets for 1971-75 are from the Federal Planning Office document "Dokumentacija uz Društveni Plan Jugoslavije za Period od 1971 do 1975 godine," October 1971. In this and future tables, industrial growth rates are based on official Yugoslav statistics. For a discussion of possible weaknesses in these statistics see the paper by John Moore entitled "A New Index of Industrial Production in Yugoslavia, 1952-71" appearing in this volume.

<sup>19</sup> Yugoslav accounting methodology is based on the material product approach which excludes government wages and salaries, certain professions (education, legal and financial services, etc.), and certain other services from social product. Measures of social product based on this approach are less than standard GNP (gross national product) measures.

Yugoslav estimates differ, it seems fair to conclude that actual growth was at most .5 percentage points below the target of 3.5 percent. The biggest shortfalls between actual and target rates occurred in construction, transportation and communications, and trade and tourism. The poor performance in construction and, to a lesser extent in transportation and communications, is attributable in large part to the uneven impact of restrictive monetary policy on investment between 1971 and 1973, while the weak performance in trade and tourism can be explained in part by the slowdown in tourist receipts caused by the recession in Western Europe in 1974 and 1975.<sup>20</sup> The 1976-80 plan targets for transportation and tourism have been revised downward from their 1971-75 levels to reflect actual performance in these sectors. However, the 1976-80 plan target for construction remains in the 1971-75 plan range, and may be overly optimistic, given actual performance in recent years. Another optimistic target in the new plan may be the agricultural growth rate of 4.0 percent, which is in excess of the average rate of 3.2 percent a year realized in Yugoslavia during most of its postwar history.<sup>21</sup> The target agricultural growth rate reflects the fact that agriculture has been designated as a priority development sector along with energy, basic raw materials (ferrous and non-ferrous metallurgy, basic chemicals and non-metallic minerals), transportation, mechanical engineering, shipbuilding, and tourism.

Turning now to categories of expenditures, the data in Table 2 indicate that gross investment in fixed assets grew at an average annual rate of 7.1 percent during the 1971-75 period, slightly below the targetted rate of 7.5-8.0 percent. This performance is quite strong particularly in light of the restrictive investment policies followed in the 1972-73 stabilization period. (See Section VI.) A significant shortfall between actual and plan targets occurred in consumption. The actual average annual rate of growth of real personal consumption was only 5.3-5.5 percent instead of 6.5 percent as planned. Weak consumption performance was rooted in the stagnation of real personal incomes which increased by only 1.5-2.0 percent a year between 1971 and 1975. Real personal incomes were held down by a variety of factors, the most important of which included a slowdown in the rate of growth of nominal incomes paid in social sector enterprises, unexpectedly large increases in the cost of living index, and a slowdown in the rate of growth of worker remittances. The growth target for personal consumption during the 1976-80 period is 6.0 percent, only 0.5 percentage points below the 1971-75 growth rate. The new plan, like the 1971-75 plan, also calls for collective consumption to grow more rapidly than personal consumption, at an average annual rate of about 7.0 percent. Of particular importance in the collective consumption goal is the realization of a large increase in housing construction during the coming years. The new plan projects an increase of about 820,000 dwelling units by 1980, which implies an annual rate of growth of 8 percent in construction investment.

<sup>20</sup> In 1974, tourist earnings increased around 12 percent in nominal terms compared with a comparable increase of about 37 percent in 1973. In 1975, nominal tourist earnings increased by only about 5 percent. See Table 16.

<sup>21</sup> This is the growth rate of agriculture during the 1953-71 period. IBRD, Yugoslavia, op. cit., p. 152.

In the new plan, the growth target for fixed investment is not slated to decrease from the target rate of 7.5–8.0 percent set for the 1971–75 period. Continued emphasis on a high investment growth rate probably reflects the prevalent view that macroeconomic stabilization of the economy can only be guaranteed by fostering increases in aggregate capacity and supply. (For more on this view, see Section VI.) According to this view, slower growth in the real standard of living is required to strengthen investment capability and the balance of payments position, thereby providing a stable foundation for greater improvements in the standard of living in the future.

## 2. Sectoral Growth Plans, 1976–80

Figures from the long-term development plan for 1976–80 attest to the commitment of Yugoslav policy leaders to foster growth in critical “priority” sectors and to focus on important structural change during the next four years. The emphasis on priority sectors reflects in part the continuing efforts to reduce what is considered to be an excessive dependence of the economy on imports of raw materials and equipment and in part the need to eliminate certain domestic growth constraints particularly in energy, agriculture, and transportation.

Actual and target growth rates for individual sectors within industry are presented in Table 3. The data clearly identify the priority growth status accorded to electrical energy, coal, metallurgy, and chemicals. A perhaps more illuminating insight into growth priorities is obtained by examining growth targets for different types of goods. Not unexpectedly, basic metals (ferrous and non-ferrous metallurgy), equipment, and chemicals, goods which contribute to Yugoslavia's import dependence, are slated to grow the most rapidly.

TABLE 3.—ACTUAL AND TARGET GROWTH RATES BY SECTOR OF PRODUCTION,<sup>1</sup> 1971–80

Of course, priority sectors cannot be identified by target growth rates alone. In fact, transportation and tourism have been designated as priority development areas, but their target growth rates (as presented in Table 2) are not high relative to either actual or targetted

growth rates for the 1971-75 period. A similar observation applies to energy, which has been accorded priority status partly in response to the impact of the 1973-75 oil crisis and partly in response to the pressing shortage of domestically generated electrical energy. Within the energy sector, only coal is targetted to grow at markedly faster rates than it did in the past. On the other hand, the priority of the energy sector can clearly be seen in the projected distribution of total investment expenditures among sectors during the 1976-80 period. Total investment in fixed capital is projected to rise by 185 percent above its 1971-75 level in energy, with a 140 percent increase in electrical power, and a staggering 625 percent in oil. The only other priority sector in industry slated to achieve such a large increase in investment expenditures is the chemical sector where total investment in fixed assets is to rise by 282 percent.<sup>22</sup> If these increases are realized, the share of energy in total fixed investment will increase from 23.7 percent during the 1971-75 period to 41.9 percent during the 1976-80 period, while the share of chemicals will rise from 3.6 to 8.4 percent. Perhaps more revealing, the share of energy, basic metals and chemicals in total industrial investment will increase from 45.8 to 63.3 percent, leaving only 36.7 percent for all other industrial sectors.<sup>23</sup> A concentration of investment expenditures of this magnitude reflects the decision of policy makers to emphasize priority sectors and significant structural change during the new plan period.

The Yugoslav leaders appear committed to undertake the policy measures required to guarantee the desired pattern of investment expenditures during the coming years. The most important such policy measures identified in the 1976-80 plan include the following:

1. The use of public loans and bond issues to obtain funds for priority investment projects;
2. Preferential treatment of equipment imported for priority sectors;
3. Preferential credit terms for loans to finance priority projects;
4. Tax breaks for enterprises that engage in "socially necessary" investment and for individuals who subscribe to public loans or bonds to finance such investment; and
5. Possible obligations imposed by competent government authorities on enterprises to pool their labor and investment resources in the realization of certain priority projects.

The commitment to these policies suggests that the Yugoslav government plans to take a more active role in the allocation and stimulation of investment expenditures during the current plan period.

### *3. Growth and Efficiency in Resource Use*

#### A. SAVINGS AND INVESTMENT RATES

Since the economic reform of 1965, the Yugoslavs have emphasized both high investment rates and the efficient use of capital and labor

<sup>22</sup> Foreign loans and financing will undoubtedly play an important role in the realization of some of the investment growth targets. For example, in both oil and chemicals, foreign funds are already committed to the completion of certain large projects, such as the Adria oil pipeline.

<sup>23</sup> The investment figures are taken from Table 22 of the Federal Planning Office document, "Analytical Basis for the Documents of the Social Plan of Yugoslavia for the Period 1976-80," February, 1976.

as the means to achieve desired growth targets. Efforts to realize this growth strategy, however, have been hampered by the presence of market imperfections and by the absence of government policies to directly promote efficiency in resource use. Most government measures to stimulate growth have concentrated on encouraging additions to the capital stock through productive investment in the enterprise sector. The continuation of this investment-oriented approach during the 1971-75 period fostered the high investment effort suggested by the figures presented in Table 4. In fact, the average investment rate for additions to fixed capital realized during this period exceeded the rates realized during the previous plan period and reversed the gradual decline in the investment rate that began, at least partly by intent, in 1965.

TABLE 4.—THE DISTRIBUTION OF SOCIAL PRODUCT BY CATEGORY OF EXPENDITURE

<sup>3</sup> Measured in 1972 prices.

Sources: Yugoslav estimates provided to the OECD and reported in OECD, *Yugoslavia (Annual Survey) 1976*, table A, Statistical Appendix. 1975 figure for investment from table 106-11, *Statistički Godišnjak, 1976*.

The substantial investment effort of the past five years necessitated the mobilization of domestic savings to support it. An apparent increase in household and enterprise savings rates was instrumental in this regard. Household savings increased from 26.2 percent of total savings during the 1966-70 period to 33.6 percent during the 1970-74 period. The corresponding rise for the enterprise sector was from 51.4 to 53.5 percent of total savings.<sup>24</sup> The increase in the role of enterprise savings was noteworthy because it reversed an earlier trend. Between 1965 and 1970, the share of enterprise net income retained as savings in various funds declined from an average of about 45 percent to an average of about 40 percent.<sup>25</sup> Short-term policy measures and the 1971-75 plan aimed at reversing this downward trend and apparently achieved some success at least in 1973 and 1974, when enterprise savings rates increased to about 44 percent of net income.<sup>26</sup> The introduction of an incomes policy which regulated the distribution of net income was largely responsible for the increasing savings rate, although a number of temporary regulations aimed at strengthening enterprise liquidity and designed to alleviate the "illiquidity" crises (described below) also had a stimulating effect on enterprise savings.

The apparent tendency of Yugoslav enterprises to reduce savings rates when they have discretion over the distribution of net income

<sup>24</sup> Figures are calculated from data reported in Table 7, Appendix, of National Bank of Yugoslavia, *Quarterly Bulletin, January 1974 and January 1976*.

<sup>25</sup> Figures are calculated from data reported in Table 6.5, Statistical Annex of IBRD, *Yugoslavia, op. cit.* Savings includes depreciation and is measured out of enterprise net income defined as the total of depreciation, net personal incomes and allocations to funds.

<sup>26</sup> Figures are calculated from Tables 107-4 and 107-5, *Statistički Godišnjak, 1976*.

can be explained by models of the savings and investment behavior of the self-managed firm developed by Vanek, Pejovich and Furubotn and others.<sup>27</sup> The conclusions of these models are derived in the appendix to this paper and are only summarized here. Consider first the case in which all enterprise investment is financed by retained earnings. As long as enterprise capital is socially rather than privately owned, workers face a choice between distributing net income and investing in individually owned assets which earn a rate of return and have a recoverable principal, or retaining a share of enterprise net income to finance enterprise capital investment which earns a rate of return but has non-recoverable principal. Assuming workers maximize the present discounted value of their earnings over time, their choice depends on a comparison of the expected rates of return on individual and collective investments.

For a fixed rate of return on privately owned assets, it can be demonstrated that the equilibrium capital stock and the desired volume of enterprise savings and collective investment will depend on the expected length of job tenure and the marginal rate of time preference of individual workers. The shorter the length of time workers expect to remain with an enterprise and the greater their preference for current over future consumption, the smaller the equilibrium enterprise capital stock and the smaller the volume of enterprise savings and collective investment.

So far the discussion has assumed that all enterprise investment is "self-financed" by retained earnings. Suppose instead that the enterprise can borrow funds from external lenders, such as banks, at a fixed interest rate. Then, depending on the relationship between this interest rate, the marginal rate of time preference of workers, and the expected rate of return on enterprise investment, three outcomes are possible: (1) All enterprise investment is financed by external funds and enterprise savings is zero; (2) enterprise retained earnings are used to finance enterprise investment and external borrowing is zero; or (3) enterprise investment is financed by a combination of enterprise savings and external funds. What is important to note here is that if external lending rates are set artificially low, this will encourage enterprises to drive their internal savings towards zero, relying on external sources of funds for collective investment.

To summarize, savings in the self-managed enterprise depends on the rates of return on collective and individual assets, the rate of interest on external sources of funds, the time horizon considered and the collective rate of time preference shared by enterprise members. To understand the savings behavior of the Yugoslav firm, it is necessary to examine the relationship between these parameters in the Yugoslav economy. According to prevailing estimates, the real rate of return on enterprise investment in Yugoslavia has been anywhere from 9 to 12 percent during the last decade and one-half.<sup>28</sup> The nominal return on individually-owned savings accounts, the asset

<sup>27</sup> See, for example, J. Vanek, "The Basic Theory of Financing of Participatory Firms," in Vanek, ed., "Self-Management: The Economic Liberation of Man" (Ithaca: Cornell University Press, 1975) and S. Pejovich and E. Furubotn, "Property Rights and the Behavior of the Firm in a Socialist State: The Example of Yugoslavia," *Zeitschrift für Nationalökonomie*, 1970, pp. 431-454.

<sup>28</sup> An estimate of 9 percent is suggested by J. Vanek and M. Jovicic in "Capital Market and Income Distribution in Yugoslavia," *Quarterly Journal of Economics*, August, 1975, pp. 432-444. P. Miovic suggests a measure of 12 percent in his work on Slovenian industry in "Determinants of Income Differentials in Yugoslav Self-Managed Enterprises," unpublished Ph.D. dissertation, University of Pennsylvania, 1975.

alternative most accessible to workers, has been on the order of 6 to 10 percent. The data in Table 5 indicate that the associated real return, adjusted for the inflation rate, has frequently been negative. Similarly, nominal interest rates on medium-term and long-term bank credits, ranging from 8 to 12 percent, have frequently meant very low and sometimes negative real interest rates, which have not come close to estimated rates of return on enterprise investment. Under these circumstances, theory predicts low enterprise savings rates and persistent enterprise competition for scarce bank credit. These predictions appear to have some relevance to Yugoslav experience. Most observers agree that there is fairly continuous excess demand for bank credit by Yugoslav enterprises. Moreover, as was noted earlier, during the period of full enterprise discretion over net income distribution, savings rates fell markedly. Nonetheless, enterprise savings has been substantial despite the availability of cheap external funds, and enterprise retained earnings have contributed about 34 percent of the finance for fixed capital investment in recent years. The banks themselves have been instrumental in encouraging enterprise savings by requiring such savings as collateral for bank loans and by granting loans to finance only a certain percentage of an investment project, the remainder to be financed out of enterprise retained earnings. The banks have used these criteria as rationing devices to allocate credit among competing users. Such devices enhance the leverage effects of enterprise savings, because a relatively small savings effort may result in access to the real resource transfer associated with an external loan at low or negative real interest rates.

Assuming the theory of enterprise savings behavior discussed here is roughly applicable to Yugoslav experience, it can be used to explain why the Yugoslav authorities were forced to adopt some control over enterprise income distribution to achieve desired savings rates. As long as enterprise workers share in the returns to enterprise capital only while they are employed by the enterprise, and as long as nominal interest rates fail to reflect the real rate of return on capital, discretionary enterprise savings rates are likely to be low. During the current plan period enterprise savings rates will be influenced by the continuation of some form of incomes policies and by new legislation designed to modify the rules for calculating required depreciation. In addition, by more frequent revisions of the values of fixed and working capital, the Yugoslavs hope to offset some of the negative effects of inflation on enterprise savings rates.<sup>29</sup> Finally enterprise savings should be

<sup>29</sup> See "Social Plan of Yugoslavia, 1976-1980," *op. cit.*, p. 38.

influenced by the new accounting rules for enterprise income which prevent distribution of anticipated income, in the form of outstanding accounts receivable, before it is actually realized. (See discussion of illiquidity crises below.)

#### B. GROWTH AND CAPITAL EFFICIENCY

To evaluate efficiency in capital usage two different types of measures should be considered: first, aggregate measures of the relationship between capital and output or labor which reflect trends in capital intensity and aggregate capital productivity; and second, measures which relate to the efficiency of capital allocation among enterprises, sectors of production, and regions. Both types of measures are examined here, as far as the data permit, to evaluate the Yugoslav experience in recent years.

Aggregate and sectoral measures of changes in capital, output, and employment during the 1966-70 period were recently calculated and reported in the IBRD study of Yugoslavia. The results indicated that both the incremental capital-output ratio and the incremental capital-labor ratio increased sharply between 1965 and 1970 for total industry, construction and transportation. Although no simplistic conclusions about capital efficiency can be drawn from these results, they do suggest that in the first post-reform planning period, additions to the capital stock had smaller effects on output and employment than had been the case earlier. Preliminary results presented in Table 6 indicate that the situation may have improved during the 1971-75 period, at least as far as the output effects of additions to the capital stock are concerned. If the figures are to be believed, then the incremental capital-output ratio apparently declined noticeably in both industry and transportation. Of course, the decline in industry may have been the result of changes in the sectoral composition of aggregate industrial investment rather than the result of changes in the efficiency of capital usage. On the other hand, even a change in investment composition in favor of less capital intensive sectors is relevant to an examination of resource efficiency, when there is reason to suppose that past investment patterns have been biased in favor of capital intensive sectors by market distortions and other factors.

Aggregate data suggest that additions to capital had significantly greater employment effects during the 1971-75 period when real

TABLE 6.—INCREMENTAL CAPITAL/OUTPUT RATIOS,<sup>1</sup> 1966-70 AND 1971-75

	1966-70	1971-75
Industry.....	4.90	3.38
Construction.....	1.41	1.94
Transportation.....	9.17	6.77
Trade and tourism.....	2.12	2.44
Total social sector.....	4.53	3.31

<sup>1</sup> The ratios are calculated in the following way: the increase in real output over the period is measured by the change in real social product; the increase in the real capital stock is measured as the sum of total real investment in fixed capital during the period. This procedure does not allow for the very real possibility of gestation lags between real investment and actual increases in the capital stock. However, data limitations precluded alternative procedures allowing for such lags.

Sources: 1971-75 figures are calculated using the social product and investment data in tables 2 and 12 of the Federal Planning Office document "Analytical Basis—1976-80 plan," op. cit. 1966-70 figures are calculated using the social product and investment data in tables 105-4 and 105-6, Statisticki Godisnjak, 1974.

investment grew at an average annual rate of 7.0 percent and social sector employment grew at an average annual rate of 4.3 percent than they did during the 1966-70 period when social sector employment grew by 0.7 percent a year while investment grew at 6.9 percent a year. These figures imply a downward trend in the aggregate capital-labor ratio in recent years. Despite the possibility of such a decline and even assuming it did occur, concern about the excessive capital intensity of the Yugoslav development effort persists.

There are several factors acting to bias factor proportions in favor of capital in Yugoslavia. Low nominal and real interest rates, as reported in Table 5, certainly have this effect. A fiscal system which bases enterprise taxes on labor inputs and which fails to tax capital usage or the returns to capital inputs has a similar impact.<sup>30</sup> Finally, enterprise decision-making rules themselves may encourage excessive capital intensity. Models of the self-managed enterprise indicate that if enterprise workers seek to maximize net income per worker then they will try to maximize the productivity of labor currently employed by the enterprise. Increasing the capital stock per employed worker may be a reasonable means for seeking to achieve this objective, provided the enterprise pays no rental charge or tax on its use of capital. In this case, the returns to capital may be distributed to workers as personal incomes, and if workers leave the firm and are not replaced, distributable income per remaining worker will rise as a result of the increase in the capital/labor ratio. Under these circumstances, there exists a tendency towards what Vanek has labeled a *reductio ad absurdum* where the last man runs the whole firm after restructuring the capital equipment in favor of automation.<sup>31</sup> Moreover, even if the firm pays a rental charge for its capital, a tendency towards excessive capital intensity may exist. Suppose that after payment of this charge, the firm has excess profits which it distributes as worker incomes. In this case, the wage/rental ratio implied by the relationship between distributed labor incomes and the capital charge may bias the firm in favor of capital-using and labor-saving production techniques.

Although it is conceivable that excessive capital intensity in Yugoslavia is attributable to enterprise behavior of the type modeled here, it is impossible to isolate the role of this factor from the roles of the fiscal and financial systems which undoubtedly contribute to the problem. It should be noted, however, that if the taxation guidelines of the new plan are followed, then the fiscal system may become less of a problem in this regard. According to these guidelines, taxation of enterprise net income or some other measure of the "results of economic activity" is to be substituted for taxation of factors of production.

The presumption that the capital-labor ratio is too high in Yugoslavia implicitly depends on the assumption that there exists a fairly substantial choice of capital-labor techniques for producing different kinds of output. However, opinion differs about the reasonableness of this assumption, particularly as it applies to a small open economy

<sup>30</sup> IBRD, *Yugoslavia*, op. cit., p. 61. Wage-based taxes have increased the cost of labor to enterprises by some 40-45 percent in recent years.

<sup>31</sup> J. Vanek, "General Theory," op. cit., p. 306.

seeking to become more independent of raw material and capital imports and to become more competitive in the export of these same commodities. Modern, efficient, and technologically advanced industries which will aid in the realization of these objectives may be capital intensive by their very nature. Under these circumstances, the objective of maximizing the employment effects of a given investment effort may conflict with other policy goals, and a choice among objectives will be required. Perhaps this scenario is relevant to the Yugoslav experience. Certainly, policy has favored capital intensive methods and sectors of production, largely in an attempt to make the Yugoslav economy more competitive internationally. During the 1971-75 plan period, this policy was combined with growing efforts to foster the expansion of labor intensive sectors, such as housebuilding, services and agriculture, to alleviate pressing employment problems. The rapid increase in labor employment which was realized implies considerable success in this area.<sup>32</sup>

Even if capital intensity distortions are not as great in Yugoslavia as is sometimes thought, capital may still be used inefficiently if it is misallocated among competing users. Unfortunately, it is virtually impossible to obtain quantitative measures of capital misallocation. Nonetheless, the presumption is strong that capital distribution is suboptimal primarily because of the criteria impinging on capital allocation decisions. Interregional optimality is prevented by significant barriers to capital mobility which encourage banks, enterprises, and republican and communal governments to keep capital resources within local boundaries. "Political factories" and the duplication of investment efforts among republics are some of the consequences of these barriers.<sup>33</sup> Intersectoral allocations of capital are influenced by the existence of market distortions in the form of incorrect interest rates and price controls. (See Section VI.) These distortions are either offset or exacerbated, as the case may be, by government policies to favor investment in certain priority sectors by access to preferential credit and foreign exchange. Finally, interenterprise allocations which are affected by both the interrepublican and intersectoral distribution processes are also influenced by the credit rationing rules of the banking system. In an environment of disequilibrium credit rates and excess demand for loanable funds, these rationing rules effectively determine the allocation of funds among potential users. Although banks are beginning to use sophisticated project analysis rules as a rationing device, many credit decisions are still based on rules which reflect the influence of major borrowers on bank decisions. Because of the co-operative nature of the Yugoslav banks, enterprises which contribute to bank capital funds and thereby obtain a voice in the formulation of bank lending policies are frequently able to win for themselves the real resource transfer carried with a low interest bank loan.<sup>34</sup> The potential importance of bank membership on bank loan

<sup>32</sup> To increase the rate of growth of employment opportunities in the future, the Yugoslavs hope to create more favorable conditions for the development of private sector activity by establishing various forms of cooperation with the social sector and by adjusting taxation policies in the private sector. These policies are discussed in "Resolution on Fundamental Principles of Common Policy of Yugoslavia's Economic and Social Development in 1975," translated by T. Perović for the IBRD from Borba, January 27, 1975, p. 16.

<sup>33</sup> The role of republic and communal governments in investment decisions has been discussed in detail in the IBRD study, Yugoslavia, op. cit., Chapter 9, and in D. Granick, "Enterprise Guidance in Eastern Europe, op. cit.," pp. 395-404.

<sup>34</sup> For greater detail on the institutional structure of Yugoslav banks, see L. D'Andrea Tyson, "The Yugoslav Banking System and Monetary Control," unpublished paper presented at the meetings of Western Economic Association, June, 1976.

terms is suggested by the fact that loans to non-members frequently carry interest rates as high as 25 percent and account for only about 5 percent of total bank loans.<sup>35</sup>

A final factor which may distort the interenterprise allocation of capital is the recurrent tendency of enterprises to default on outstanding trade debt, thereby obtaining at least a temporary extension of credit at fixed cost from involuntary lenders. Although increases in the stock of involuntarily held trade debt cannot provide a net addition of credit to the enterprise sector, they can reallocate scarce credit among competing users. In this reallocation process, there is no guarantee that the more efficient enterprises will be the recipients of additional credit; in fact, the presumption is that the less efficient enterprises will default, causing a reallocation of credit from more to less profitable users. Reallocations of this type have undoubtedly become less important in recent years with the introduction of several legislative measures to quell the 1969-71 illiquidity crisis.<sup>36</sup> Of particular importance in this regard is the new enterprise accounting law of 1975 which redefines enterprise income to exclude outstanding accounts receivable unless covered by bank guarantees<sup>37</sup> and which calls for the merger or bankruptcy of enterprises failing to meet their financial obligations. The law also envisions the introduction of a financial market for the buying and selling of commercial bills of exchange. Such a market will allow for the orderly reallocation of credit among enterprises.

In concluding this section on the efficiency of capital use, it is important to recognize that the Yugoslav authorities are well aware of the problems discussed here. As a matter of fact, concern about inefficiencies in the investment process has fostered the new emphasis on the role of planning. This concern has also led to laws which stimulate capital mobility by allowing enterprises to lend directly to one another and which encourage joint efforts or pooling of funds among enterprises to finance large investment projects. In addition, concentration by merger or other means has continued to receive official support because of the widespread feeling that large size is required for competitiveness and that "powerful groups of producers are the protagonists of production and development."<sup>38</sup> Although sectoral figures on the degree of concentration are unavailable, aggregate figures reported by *Ekonomska Politika* indicate that it is substantial, at least as measured by the 1975 share of the 200 biggest enterprises in total gross income (44 percent), total turnover (51 percent), total fixed and working capital (50 percent), and total labor employment (38 percent).<sup>39</sup> It should be emphasized that planning, industrial

<sup>35</sup> Figures cited in IBRD, Yugoslavia, *op. cit.*, p. 241.

<sup>36</sup> The policies adopted to combat illiquidity are described in the OECD's Annual Survey of Yugoslavia for 1973 and 1974.

<sup>37</sup> OECD, Yugoslavia, 1976, p. 28.

<sup>38</sup> This quotation is taken from the Federal Executive Council's document "An Outline of the Concepts of the Social Plan of Development of Yugoslavia from 1971 to 1975," Belgrade, 1971. D. Granick's recent study of Yugoslav enterprises indicates that the Yugoslav belief that concentration in industry will foster greater efficiency and capital mobility is reasonable. Granick himself argues that "mergers are the principal form of transferring capital from one sector to another and of strengthening the managerial capabilities of enterprises that are poorly directed." See Granick, "Enterprise Guidance in Eastern Europe," *op. cit.*, pp. 428-429.

<sup>39</sup> These figures are calculated from data provided in "The Biggest Two Hundred Firms" ("200 Najveći") a supplement to *Ekonomska Politika*, September 20, 1976, p. 360. The figures are reported in "Yugoslavia's 200 Biggest Enterprises," Radio Free Europe Background Report No. 215, October 12, 1976, p. 5, written by Zdenko Antić.

concentration, and special legislation for joint ventures and the pooling of funds are among a variety of measures which can serve to stimulate capital mobility in a system where equity ownership is precluded by ideological principles.

### C. GROWTH AND EFFICIENCY IN THE USE OF LABOR

Partly because of the new emphasis on efficiency introduced by the 1965 reform and partly because of the prolonged recession which followed its introduction, employment in the social sector of the Yugoslav economy<sup>40</sup> increased by only 0.7 percent per year during the 1966-70 period. By chance, this exceptionally low growth rate coincided with an unusually rapid increase in the labor force available to the social sector which is estimated to have increased by about 4.7 percent per year.<sup>41</sup> The resulting imbalance between the demand for and the supply of labor was undoubtedly one of the factors behind the steady increase in the number of registered jobseekers and behind the tremendous outflow of Yugoslav laborers to Western European labor markets. In fact, during this period, when the annual net outflow of workers increased from 26,000 in 1966 to 240,000 in 1970, emigration provided jobs for more than twice as many workers as did the expansion of domestic employment.<sup>42</sup>

The disappointing growth in employment in the last half of the sixties led to a policy decision to increase job opportunities in the social sector by an average of 2.5 to 3.0 percent a year during the 1971-75 plan period in order to absorb the natural increase in the labor supply caused by population growth and to reduce, as far as possible, the number of unemployed workers. The plan foresaw that this employment target would necessitate a drop in the rate of growth of labor productivity from the 5.9 percent per year which had prevailed between 1966 and 1970, to a more moderate 5.0 percent a year. As the data in Table 7 reveal, the anticipated slowdown in productivity did materialize, but it was more marked than had been expected. Actual productivity slowed to an increase of only 2.4 percent a year while employment grew in excess of target at 4.3 percent a year. Actual increases in productivity differed importantly between sectors. High productivity growth was realized in social sector agriculture and, significantly, in industry which accounted for about 47 percent of total social sector employment. Disappointing labor productivity gains were realized in construction, trade and tourism, transportation, and crafts and services, all of which contributed substantially to employment growth.<sup>43</sup>

<sup>40</sup> The Yugoslav economy is divided into a modern socialist sector governed by the principles of social ownership and self-management and a private sector which is largely peasant agriculture but also includes private activity in tourism and services. In the 1971-75 period, approximately 45 to 50 percent of the economically active population and about 17 percent of total social product were located in the private sector.

<sup>41</sup> The actual labor supply available to the social sector is defined as the sum of workers in the socialist productive sector, the socialist non-productive sector (mainly government and communal services), workers abroad and persons who are actively seeking work and are registered as unemployed. Figures on the labor supply as thus defined are taken from J. Mencinger, "A Quarterly Macroeconomic Model of the Yugoslav Economy," unpublished Ph. D. dissertation, University of Pennsylvania, 1975, p. 55.

<sup>42</sup> OECD, *Yugoslavia*, 1973, p. 27. This survey contains a detailed discussion of labor force and employment trends during the 1961-71 period.

<sup>43</sup> No attempt is made in this survey to calculate the behavior of total factor productivity in recent years because of the difficulties involved in determining a correct measure for the return to capital in Yugoslavia.

TABLE 7.—EMPLOYMENT AND LABOR PRODUCTIVITY GROWTH RATES, 1971-75

<sup>1</sup> Figures from Federal Planning Office document, "Dokumentacija—1975 godine," op. cit., table 1.

<sup>2</sup> Figures from Federal Planning Office document, "Analytical Basis—1976-80 plan," op. cit., table 2.

<sup>3</sup> Rates of growth calculated using average annual employment levels for 1971 and 1975 reported in Indeks, June 1972 and June 1976.

<sup>4</sup> The rate of growth of labor productivity is approximated by the difference between the rate of growth of social product and the rate of growth of employment by sector. Data limitations on the level of real social product by sector (measured in 1966 prices) necessitated this approximation approach.

Although the Yugoslav leaders are undoubtedly pleased by the rapid increase in domestic employment opportunities, which was particularly crucial given the reduction in the new outflow of emigrants following the 1973-75 recession in Western Europe, they remain anxious to stimulate productivity gains in social sector activities. In fact, according to the plan, economic growth during the present period is to be predominantly based on increases in labor productivity. Such increases are thought to be necessary to keep the economy competitive in international markets and to reduce cost pressures in internal price formation. Consequently, the 1976-80 plan targets aim to moderate social sector employment growth to an average annual rate of 3.5 percent which, based on projections about the growth rates of social product, should allow for a targetted growth of 4.0 percent in labor productivity. It is hoped that productivity will be helped by better coordination of investment and production both through government policy measures and through further concentration and joint efforts in industry.

Because of the pressing domestic employment problem, however, the Yugoslav leaders can no longer be preoccupied with high productivity growth as they were in the 1966-70 period. The magnitude of the problem is suggested by the fact that despite the realized increase in employment between 1971 and 1975, the number of registered jobseekers increased dramatically from 290,000 to 540,000 during the same period. Of course, this increase is not solely the result of an increase in the number of openly unemployed workers, since jobseekers include both those who already have a social sector job but wish to find another and those who are currently employed in the private sector (mainly agriculture) but seek social sector employment. Both types of workers are likely to register in greater numbers during a period of rapid employment growth when the probability of finding a social sector job increases. However, these

two groups should be distinguished, because those who are currently employed in the private sector represent disguised unemployment which reflects the dualism between the private and social sectors of the economy. Although there is no precise measure of the magnitude of disguised unemployment, recent estimates suggest that there are anywhere from 300,000 to 1,000,000 workers in private agriculture who can be transferred to the social sector without any appreciable decline in agricultural output.<sup>44</sup>

The disguised unemployment problem has an important regional aspect. In the less developed regions and particularly in Kosovo, where the share of private sector unemployment and the rate of population increase are higher than the national average, a substantial volume of disguised unemployment exists. In contrast, in the more developed regions, particularly in Croatia and Slovenia, a situation of full employment and excess demand for certain skill categories of labor may already exist. These regional differences in the magnitude of the employment problem are suggested by differences in regional unemployment rates, calculated as the ratio between registered jobseekers and the sum of jobseekers plus social sector employment. In 1975, for example, regional unemployment rates ranged from a high of nearly 24 percent in Kosovo to a low of about 2 percent in Slovenia, and the share of the less developed regions (Macedonia, Montenegro, Kosovo and Bosnia-Hercegovina) in total registered jobseekers was 43 percent while their share in total social sector employment was only 26 percent.<sup>45</sup> The regional dimension of the unemployment problem suggests that any policy efforts to solve it must focus on methods to facilitate the flow of workers from labor surplus to labor scarce regions. Moreover, even if the interregional flow of migrants from the less developed regions to the more developed regions continues<sup>46</sup> and expands, there remains the problem of matching the skill composition of the migrants with the skill requirements of available jobs in the developed republics. Unskilled private sector agricultural workers may not be a substitute for the skilled workers required by social sector industry at least in the short run.

Part of the shortage of skilled workers in the developed regions is due to the emigration of such workers to Western European labor markets in search of higher wages.<sup>47</sup> Consequently, this shortage may be alleviated somewhat by the net return of workers which began in 1974, when a reported net inflow of 50,000 migrants was recorded, and which continued in 1975, when another 50,000 workers were reported to have returned.<sup>48</sup> Of course, the net return of migrant labor adds to

<sup>44</sup> The OECD recently suggested a figure of 300,000 while the IBRD quoted an estimate of nearly one million. See OECD, *Yugoslavia, 1973*, p. 32, and IBRD, *Yugoslavia, op. cit.*, p. 89.

<sup>45</sup> Figures calculated from data in Tables 203-1 and 203-11, *Statistički Godišnjak, 1976*.

<sup>46</sup> According to the 1971 census, about 265,000 people migrated from the less developed republics to the more developed republics during the 1961-71 period. No data are available to estimate the migration flow during the 1971-75 period. See IBRD, *Yugoslavia, op. cit.*, p. 82.

<sup>47</sup> Of emigrant workers covered by the 1971 census, about 57 percent were paid employees before they left Yugoslavia, 16 percent were private farmers and 27 percent were unemployed. Skilled workers were estimated to account for about 26 percent of the total emigrant labor force in 1971. See OECD, *Yugoslavia, 1973*, pp. 34-35. Additional estimates indicate that at least one-third of all Slovene migrant workers are skilled or have a college education. These figures are quoted in Borba, March 12, 1973, p. 5, and cited in ABSEES, April, 1975.

<sup>48</sup> These figures are reported in the Federal Planning Office document "Analytical Basis \* \* \* 1976-80 plan," *op. cit.*, p. 3. Other estimates suggest that the net inflow of workers may have averaged 100,000 in 1974 and 1975. These larger figures are cited by Z. Antić in "Yugoslavia on the Way to Economic Recovery," Radio Free Europe Background Report No. 229, November 9, 1976, p. 5, and are taken from *Ekonomska Politika*, May 17, 1976.

the magnitude of the overall employment problem and makes a rapid expansion of domestic job opportunities a major development task. It should be noted, however, that the gradual return of migrant labor and restrictions on the further outflow of certain types of labor have been policy goals throughout the 1970's. As early as 1973, legislation was passed to control the number and composition of departing workers by republic, and in 1974, a social compact provided that the employment bureaus in Yugoslavia could no longer offer foreign positions to workers who had vacated domestic positions in order to work abroad. In summary, although most observers agree that the benefits external migration have exceeded the costs, it seems that the scope for further migration will be limited both by employment conditions abroad and by policy measures in Yugoslavia aimed at keeping migration within its permissible range, the upper limit of which seems to have been reached in the early 1970's.<sup>49</sup>

Because of limits on the magnitude of further migration and because of the continuing pressure of disguised unemployment in the countryside, the Yugoslavs must try to expand domestic job opportunities during the next five years. According to the 1976-80 plan, the employment tasks include the following: employment of the increment of the working-age population and of skilled labor; faster employment of women; and a reduction in the number of unemployed in the country and in the number of Yugoslav workers temporarily employed abroad. Some of the necessary jobs to achieve these tasks will be located in the social sector. The expectation is that social sector jobs will arise largely through the reallocation of labor to labor-intensive activities especially in the tertiary sector. However, recent policy resolutions indicate that considerable effort will be exerted to increase jobs in the "minor or secondary" private economy in such activities as services, construction and agriculture.<sup>50</sup> To achieve these goals, legislation reducing taxes and expanding credit opportunities for the private sector and legislation stimulating greater co-operation between social and private agriculture are being discussed. In addition, the Yugoslavs plan to introduce new retraining and worker education programs to tackle special structural and regional unemployment problems.

Finally, it should be noted that the Yugoslavs themselves are not overly optimistic about redressing the imbalance between labor demand and labor supply within the next five years. According to the Fundamentals of Common Policy for Long-term Development of Yugoslavia until 1985, the Yugoslavs expect to reduce both temporary employment abroad and unemployment at home; they do not expect to eliminate them.<sup>51</sup>

#### IV. REGIONAL PROBLEMS AND POLICIES

Disparities in the levels of economic development between the different republics and autonomous provinces continued to be recog-

<sup>49</sup> The OECD cites a 1973 resolution of the League of Communists which notes that "emigration has reached the permissible limits and policies should be formulated for the gradual return of the emigrants." See OECD, *Yugoslavia, 1973*, p. 42.

<sup>50</sup> The importance of the secondary economy in employment creation is discussed in the "Resolution on Common Policy of Yugoslavia's Economic and Social Development in 1976," translated for the IMF from *Službeni List*, No. 66, December 26, 1975, p. 48.

<sup>51</sup> The aims of the "Fundamentals of Common Policy for Long-term Development \* \* \* until 1985" are listed in "Resolution on Common Policy of Yugoslavia's Economic and Social Development in 1976," p. 10.

nized as a major political, economic and social issue during the 1971-75 plan period.<sup>52</sup> According to the plan, growth rates in the recognized less developed areas—Bosnia-Herzegovina, Macedonia, Montenegro, and Kosovo—were to average 25 percent higher than the growth rate in the country as a whole so that these disparities might be reduced somewhat. Some progress towards the achievement of this goal was made in Kosovo where the 1971-75 average growth rate was about 37 percent greater than the national average, and in Bosnia-Herzegovina and Macedonia where the 1971-75 average growth rate was about 6 percent greater than the national average. No progress was achieved in Montenegro where the growth rate was only about 75 percent of the national average.<sup>53</sup> Despite higher growth rates in three of the less developed areas, differentials in per capita income levels did not decline noticeably because of more rapid population growth in these areas. Per capita social product remained roughly the same fraction of the national average in Bosnia-Herzegovina, Macedonia, and Kosovo, and actually declined as a fraction of the national average in Montenegro.<sup>54</sup> However, these results are important because they represent a possible reversal in the trend of increasing regional differences which characterized the 1961-71 period.

The 1976-80 plan reaffirms the commitment to reducing regional differentials and once again calls for higher growth rates in less developed areas, with Kosovo, the least developed area, slated to grow most in excess of the average growth rate. Target growth rates in the less developed regions are to be 20 to 25 percent above the national average while the corresponding figure for Kosovo is 60 percent. The realization of these growth targets presupposes an increase in the share of the less developed regions in total investment. According to the plan, this increase is to be realized primarily on the basis of savings generated in the less developed areas, augmented by the continued availability of investment funds from the federal fund for accelerating development in less developed areas, by the availability of funds from the pooling of enterprise efforts across regional boundaries, and by the planned allocation of the largest share of IBRD and other foreign credits to the less developed regions.

The federal regional development fund will continue to operate in the manner which characterized the 1971-75 period. The fund will collect a targetted 1.97 percent of gross product originating in the socialist enterprise sector by a compulsory enterprise loan system. Enterprise loans to the fund will continue to earn 4 percent interest with a three-year grace period and a fifteen-year maturity. The funds collected in this manner will in turn be dispersed to the less developed areas as preferential credits (with lower interest rates and longer repayment period than would otherwise be available), to be allocated by them in accordance with the goals of their own 1976-80 plans. Because these regional plans mirror the aggregate plan, the sectoral priorities, of the latter are likely to guide the sectoral distribution of,

<sup>52</sup> For a broad discussion of some of the economic reasons for these disparities, see IBRD, Yugoslavia, *op. cit.*, chapter 8.

<sup>53</sup> These calculations were made using data contained in Tables 204-1, *Statistički Godišnjak*, 1976.

<sup>54</sup> The following figures show the ratio between republican per capita real social product and the national average in 1971 and 1975: Bosnia-Herzegovina: .667, .662; Montenegro: .742, .696; Macedonia: .688, .676; and Kosovo: .329, .331. These figures are calculated from data in Tables 202-2 and 204-1 in *Statistički Godišnjak*, 1976.

the regional development loans made available in this way. The planned division of the federal funds among the less developed areas reflects the special attention to be accorded to Kosovo. An earmarked 0.20 percent of gross enterprise product made available to the federal fund is to be set aside in advance for Kosovo, and the remaining 1.77 percent is to be distributed according to the 1971-75 regional shares, estimated by the IBRD to be the following: Bosnia-Herzegovina 34 percent; Kosovo 30 percent; Macedonia 24 percent; and Montenegro 12 percent.<sup>55</sup>

As in the 1971-75 period, additional federal funds will be channeled to the less developed areas by federal budgetary support to the governments of these areas for maintaining a higher level of social services (mainly health and education) than they could from their own resources. During the 1972-75 period, an average of about 6.8 percent of total federal budgetary expenditures was allocated for this purpose.<sup>56</sup> In the allocation of budgetary grants of this nature during the 1976-80 period, Kosovo is to be accorded special priority. In addition, Kosovo is also to be favored by the introduction of special legislative measures designed specifically to stimulate the flow of investment and other credits to this area. For example, the plan calls for a new law to ensure the availability of supplementary working capital for enterprises in Kosovo.

The basic principle of regional development strategy in the 1976-80 plan is the same principle which characterized earlier efforts, namely the transfer of resources to foster investment in the less developed areas. Therefore, some of the general weaknesses in the regional development strategy of the past will probably reappear in the coming years. These weaknesses include: excessive reliance on investment transfer and insufficient stimulation of skilled labor and technical assistance transfers to the less developed regions; and failure to provide measures encouraging the optimal interregional and intra-regional allocation of investment funds among competing projects. As regards the first of these problem areas, the Yugoslavs hope that the concentration and pooling of enterprise efforts across regional boundaries will encourage the requisite interregional labor mobility, and in particular, will foster the needed transfer of skilled labor and technical help to the less developed areas. Only time will tell whether these desired and necessary developments will occur.

## V. AGRICULTURAL PERFORMANCE AND POLICIES

In 1975, total agricultural production accounted for about 16 percent of social product and employed approximately 40 percent of the economically active population.<sup>57</sup> These figures alone attest to the importance of agriculture in Yugoslavia's economy, and that importance has been reaffirmed by the identification of agriculture as a priority development sector for the 1976-80 period.

Probably the single most significant feature of the Yugoslav agricultural situation is its dualistic nature. In 1975, socialized agriculture, comprised of large, agro-industrial enterprises operating on

<sup>55</sup> IBRD, *Yugoslavia*, op. cit., p. 204.

<sup>56</sup> This figure is based on budget data presented in OECD, *Yugoslavia*, 1976, p. 24:

<sup>57</sup> "Analytical Basis . . . 1976-80 plan," op. cit., Tables 2 and 7.

the principles of social ownership and self-management, accounted for about 15 percent of the cultivated land, 7 percent of the active population in agriculture, 10 percent of the agricultural livestock and 25 percent of real agricultural gross social product.<sup>58</sup> The remaining land, labor, livestock and output were found on the small, family-owned and operated peasant farms which constituted the private agricultural sector. Besides being distinguished by size and method of organization, the two sectors can also be distinguished by differences in labor productivity—productivity in the private sector is estimated to be only about one-fourth of that in the social sector<sup>59</sup>—and by differences in market behavior—most of social sector output is sold on the market while much of private output goes into the own consumption of the family household. Relations between the two sectors can be viewed as largely complementary: the social sector produces the bulk of industrial crops and grains, while the private sector produces most of the vegetables, fruits and meat products that supply the population with food.

During the 1971–75 period, as in earlier periods, agricultural output grew much more rapidly in the social sector than in the private sector. The respective growth rates were 6 percent in the social sector and 2.3 percent in the private sector. Differential growth rates are projected for the 1976–80 period as well, when social sector output is targetted to grow at 8 percent and private sector output at 3.1 percent.<sup>60</sup> These projected growth rates are high by historical standards and will be difficult to realize as the Yugoslavs are aware. For the social sector the goals can only be achieved by more intensive production techniques and changes in production patterns, since there are severe limits to increases in social sector land availability. In the peasant sector relatively low yields and low productivity leave much room for more rapid growth if the development potential can be tapped by a proper set of economic policy measures.

The private sector will be of particular importance in the coming plan period because of the continued emphasis on the development of livestock breeding to achieve both domestic diet and export goals. According to plan, national diets are to shift away from cereals toward higher quality foodstuffs, especially meat. Outputs of meat are also slated to provide considerable quantities for export. As the 1972–73 experience with impending meat shortages and rising meat prices suggests, export and domestic diet goals for meat products can conflict, given current levels of livestock production. Therefore, if these goals are to be realized simultaneously, significant increases in livestock breeding at a planned rate of 4 percent per year must be achieved. Since the bulk of livestock is located in the private sector, special attention must be focused on encouraging increases in the productivity of livestock breeding on private farms. Among the techniques suggested for stimulating output and productivity growth in meat as well as in other products on private farms are the following: land rationali-

<sup>58</sup> Calculations from Table 7 of "Analytical Basis \* \* \* 1976-80 plan," and Tables 106-9 and 108-2 of Stasticki, Godisnjak, 1976.

<sup>59</sup> This productivity estimate is based on the 1975 figures discussed here. A 1973 study estimated that private agricultural productivity was only one-fifth of social sector agricultural productivity in 1969/1970. Therefore, some reduction in the productivity differential seems to have occurred in recent years. See OECD, "Agricultural Policy in Yugoslavia," 1973, p. 26.

<sup>60</sup> "Analytical Basis of 1976-80 plan," op. cit., Table 4.

zation schemes to reduce the fragmentation of peasant land holdings; tax and credit policy measures to promote co-operation of private farmers both among themselves and with social sector agricultural enterprises; greater use of mineral fertilizers and tractors; the development of long-term contracts to guarantee the selling prices of livestock products when they reach market channels; and the extension of health and pension insurance and vocational training to private farmers to stem the outflow of productive labor. Special emphasis is placed on the need for greater co-operation between private and social sector farms in the plan, but if recent years are a guide, then not much headway in this direction is likely.

Within agriculture as a whole, growth targets are aimed at reducing all food imports except those of goods that cannot be rationally produced at home. Outputs of wheat and maize are to increase to cover current domestic consumption and to provide domestic reserves and surpluses for export. In the past, below average harvests in these crops necessitated grain imports, sometimes in significant amounts, and the plan hopes to preclude the necessity of such imports in the future. To eliminate the need for sugar and food oil imports, a substantial increase in sugar beets and sunflowers is slated, and in the food industry, special attention is to be accorded to the production of sugar and oil for domestic use.

In pursuing overall and specific crop growth targets, the Yugoslavs intend to rely on many traditional agricultural promotion policies and to introduce some new policies as well. Traditional policies will include the following:

1. The continuation of a protective pricing system which establishes guaranteed prices for field crops and livestock products and minimum prices for basic foodstuffs;
2. In conjunction with the pricing system, the maintenance of reserves of basic agricultural and food products;
3. A premium system whereby farmers receive bonus or subsidy payments for the production of certain basic products, including livestock products; (premium payments are to be earmarked for investment expenditures);
4. The use of preferential rediscount credits to finance the production and inventories of basic agricultural goods; and
5. The allocation of a share of government investment funds to agriculture, mainly to finance irrigation and other large projects.

New policies will include greater use of tariff protection to prevent unnecessary food imports and the development of an extensive system of long-term contracts between large buyers of agricultural products, such as industrial centers, tourist resorts, and towns, and suppliers. It is hoped that this system will build greater certainty and stability into the functioning of domestic food markets.

In conclusion, it seems that the biggest obstacles facing the realization of agricultural targets lie in the private sector. Some of these obstacles stem from the important regional dimension of private sector agriculture. The bulk of social sector output—about 80 percent in 1974 and 1975—comes from the developed regions. In the less developed areas, where the social sector has had trouble implanting itself, the private farms are particularly backward, with a much lower

utilization of tractors and fertilizers than that observed in the more developed areas. Private farms in the less developed regions, like those in the more developed regions, are also hampered by smallness of size—due partly to legal limitations and partly to rapid population growth in some areas—an adverse age structure of the agricultural population, a relative paucity of investment resources and limited access to credit facilities, and the out-migration of skilled labor. The Yugoslav government hopes to find the solution to many of these problems by the extension of co-operation among private farmers and between private farmers and social sector enterprises. So far, however, private farmers have been reluctant to pursue co-operation in either direction, despite some obvious economic incentives, such as preferential access to credit. Therefore, greater incentives will be required if such co-operation is to develop according to the planned pace.

## VI. MACROECONOMIC PERFORMANCE

### *1. Sources of Inflationary Pressure*

A rapid and accelerating rate of inflation was one of the most persistent problems plaguing Yugoslav economic performance during the 1971–1975 period. As the data in Table 8 reveal, inflation in industrial producer prices (wholesale prices), retail prices, and the cost of living index was substantial, particularly between 1973 and 1975, when domestic and foreign factors combined to push prices up. The magnitude of the inflation problem led government authorities to conclude that “inflation is enemy number one of our socialist society and the struggle against it is a major political problem.”<sup>61</sup>

The basic strategy behind the control of inflation underwent an important change in 1973. Between 1971 and mid-1973, the government tried to reduce inflationary pressure by restrictive policy measures. In mid-1973, after two years of disappointing real growth rates and only minor reductions in inflation rates, the government switched to an expansionary policy stance, motivated by the belief that only rapid growth could end the inflationary spiral by increasing capacity, labor productivity, and the real standard of living, thereby slowing growth in wages and other production costs which were thought by many to be the cause of inflation. Under this new policy guideline, real growth rates picked up markedly in 1974, as the data in Table 8 illustrate. The revival in economic activity in turn generated additional domestic demand pressures, which in conjunction with worldwide inflation in key raw material, fuel and food prices, gave rise to the highest inflation rate since 1965.

The 1971–75 experience attests to the tradeoff between real growth and price stability which seems to have characterized the Yugoslav economy since the 1965 reform. To understand the causes of this tradeoff, it is necessary to examine the role of the external environment, the economic system and economic policy in the inflationary process. Because of the critical impact of foreign markets on the 1973–75 inflation, it seems wise to begin with the external environ-

<sup>61</sup> B. Šefer, Vice-President of the Federal Government, made this comment which was quoted in Nin, January 1, 1975, p. 5, and cited in ABSEES, October, 1975.

ment.<sup>62</sup> As the data in Table 8 indicate, in 1973 and 1974, import and export prices increased sharply, mainly under the pressure of rising raw material and fuel prices on world markets. Foreign price increases fed directly into Yugoslavia, facilitated by a system of price controls which allowed domestic producers to increase their prices on the basis of two criteria: increases in world prices of similar commodities and/or increases in production costs, stemming from price increases in domestic and imported inputs.

Of course, import and export induced price increases in certain sectors of production need not have fostered an increase in the aggregate rate of inflation, provided prices in other sectors either fell or failed to rise as fast as they would have otherwise. Given sectoral nominal wage and price rigidities and the government's commitment to stimulate aggregate demand in 1974, however, this condition was not satisfied.<sup>63</sup> Consequently, foreign price increases caused an increase in the overall inflation rate. In fact, calculations based on the 1972 input-output table indicate that not much less than one-half of the inflation in industrial producer prices in Yugoslavia during 1974 was due to the simple pass-through of foreign price increases to domestic price increases.<sup>64</sup>

Foreign economic developments also contributed indirectly to inflationary pressures in 1972, through the effects of the 1971 dinar devaluation on wages and prices. Input-output calculations for that year indicate that the devaluation of the dinar by about 11.8 percent relative to the dollar caused a domestic price rise of about 9 percent.<sup>65</sup> A further devaluation of about 8 percent in October 1974, undoubtedly generated additional inflationary pressure in that year and in the succeeding one as well. However, it is important to note that inflation due to the effects of devaluation on the domestic prices of imports and exports is in fact the product of the excess demand pressures which led to a deterioration in the current account and resultant pressures for the devaluation in the first place. Therefore, inflation caused by devaluation is to be distinguished from inflation caused solely by price increases in world markets, such as those which occurred between 1973 and 1975.

Domestic inflationary pressures continued to be significant in the 1971-75 period as they had been during most of the preceding plan period. Because of the persistence of the inflation problem, it is important to understand the many factors thought to contribute to it. Two main schools of thought about the causes of inflation in Yugoslavia exist. According to one theory, inflation is the consequence of excess demand in product and labor markets generated by the "over-investment" of government and enterprises and fueled by an excessively expansionary monetary policy. A second theory, which has become increasingly popular in Yugoslavia in recent years, focuses

<sup>62</sup> For a full discussion of the impact of external economic conditions on Yugoslav macroeconomic performance between 1973 and 1975, see the paper by Z. Fallenbuchl, E. Neuberger, and L. D'Andrea Tyson appearing in this volume.

<sup>63</sup> For a broader discussion of the sources and consequences of wage and price rigidities in Yugoslavia, see E. Neuberger and L. D'Andrea Tyson, "Can a Rise in Import Prices be Inflationary and Deflationary: The Case of Yugoslavia," Stony Brook Economics Department Working Paper.

<sup>64</sup> The input-output calculations assume that increases in import prices of intermediate and final products are directly passed through to domestic producer prices. The calculations are reported by Sekulić and Babić in "Uvozna Zavisnost Jugoslavenske Privrede i Efekti Povećanja Uvoznih Cena," *Ekonomski Pregled*, Nos. 5-6, 1975, pp. 347-365.

<sup>9</sup> Rate of growth January-July 1976 over same period of previous year; figures calculated from data in Indeks, August 1976, p. 34.

<sup>10</sup> Figures calculated from data in tables 114-3 and 114-4, Statistički Godišnjak, 1976.

on inflationary wage increases as the primary source of domestic inflation. In its most simplistic form, this theory is similar to the wage-push hypothesis. According to this hypothesis, nominal wage increases in excess of productivity increases cause production costs to rise, and this in turn causes prices to rise as long as some form of cost markup pricing prevails.

Anecdotal evidence about the behavior of some Yugoslav firms is not inconsistent with the model of enterprise price determination on which the wage push hypothesis depends. Many firms apparently set a fixed minimum monthly income for workers and include labor costs evaluated at this income in production costs. Prices in turn are set by applying a markup to total intraenterprise transfer prices which are themselves based on material inputs and fixed labor incomes in each production section. If these rules are followed, then excessive increases in fixed nominal worker incomes will lead to corresponding increases in producer prices.

One complication arises, however, because the one-to-one relationship between labor income (wage) increases and price increases can be disturbed by variations in enterprise savings or retained net income. It is at least theoretically possible for enterprise members to finance an excessive nominal wage increase by reducing the share of savings in total enterprise net income, in which case the wage increase need have no impact on producer prices. For example, the large nominal wage hikes which occurred in the late 1960's and early 1970's may have been at least partially financed by the reduction in enterprise savings rates which took place during those years. On the other hand, Yugoslav economists and policy-makers who adhere to the wage-push idea argue that enterprises are reluctant to sacrifice savings and investment funds. Therefore, they are more likely to raise selling prices in an attempt to earn higher net income per worker than to sacrifice savings targets to meet worker requests for higher earnings. Some observers have even argued that on occasion, as in 1974, it is

enterprise efforts to increase internal funds that has led directly to price markups.<sup>66</sup> Implicit in this view is a kind of profits-push hypothesis applied to the self-managed enterprise.

Econometric evidence on price determination in Yugoslavia suggests that both demand and cost factors have contributed to inflation. In recent price equations estimated by Popov, Mencinger and Tyson,<sup>67</sup> aggregate demand conditions and wage and raw material production costs appear as significant determinants of the increases in retail and producer prices for industrial goods. Moreover, the econometric results reveal that the elasticity of price increases with respect to unit labor costs is usually less than one, indicating that increases in labor costs do not lead to offsetting increases in prices. This result is consistent with the evidence on falling enterprise savings rates through 1971, but might prove inconsistent with new econometric estimation based on the period of rising savings rates since 1972. The econometric evidence also indicates that the independent influence of aggregate demand on price increases is small; the major effects of demand pressure are felt through increases in factor costs.

The evidence discussed here suggests that the majority of industrial commodities in Yugoslavia have what are called "administered" prices,<sup>68</sup> set on the basis of a markup over production costs, the size of which is influenced by the state of aggregate demand. A similar conclusion applies to the prices of services which are largely cost-determined. Some commodities, however, are more appropriately viewed as having "auction" prices set on the basis of supply and demand. Important among such commodities are agricultural goods, whose prices fluctuate in response to harvest conditions within the limitations set by the price controls discussed earlier, and major tradeable goods, such as raw materials, whose prices are heavily influenced by world market developments. Because of the greater sensitivity of auction prices to demand conditions and because of a system of price controls in Yugoslavia that has impinged more frequently on prices of food, energy and raw materials, the cost-price inflationary spiral has been most severe in processing industries and services.

The distinction between administered and auction prices partly explains the severe inflationary impact of the 1973-75 world inflation in raw material and fuel prices. Auction prices rose as a result of world market conditions. These price increases meant major production cost increases and consequent price increases for commodities whose prices were set administratively. From the point of view of economic policy, it is important to note that price increases in administered markets would have occurred even if the government had acted to reduce aggregate demand within politically acceptable limits. In other words, given administered pricing rules in a variety of markets, price increases in certain key markets were destined to cause an in-

<sup>66</sup> The OECD argues that in 1974, the combination of accelerating wages and tightening credit conditions on the one hand and pent-up investment demand and an investment conducive policy stance on the other favored aggressive price fixing by enterprises. See OECD, *Yugoslavia*, 1975, p. 27.

Mencinger, "A Quarterly Macroeconomic Model of the Yugoslava Economy," *op. cit.*, chapter 3; and L. D'Andrea Tyson, "The Yugoslav Inflation: Some Competing Hypotheses," forthcoming in *Journal of Comparative Economics* (June 1977).

<sup>68</sup> This term is due to W. Nordhaus in "Inflation Theory and Policy," *American Economic Review, Papers and Proceedings*, May, 1976, pp. 59-65.

crease in the overall price level which could have been avoided only at the cost of major reductions in output and employment.

The distinction between administered and auction markets also bears on a popular argument that inflation in Yugoslavia is caused by structural shortages in crucial raw materials and food. For shortages of this type to lead to overall inflationary pressure, prices in other sectors must be inflexible, and the existence of administered prices in these sectors will provide the needed inflexibility. As long as prices are administratively set in certain markets, excess demand in other markets can cause aggregate inflation, even when aggregate demand is not excessive, at least as measured by overall indicators of capacity utilization, unemployment and inventories. Inflation under these circumstances is the consequence of excess demand in certain markets and the downward rigidity of the labor and material production costs on which administered prices in other markets depend.

The importance of labor costs in the determination of administered prices suggests that nominal wage changes play a crucial role in the inflationary process. Therefore, it is necessary to identify the factors which influence the direction and magnitude of these changes. According to existing anecdotal evidence, the most important factors include changes in the expected rate of inflation, changes in actual or trend labor productivity, and changes in enterprise net income. The first two of these factors have been shown to exercise a significant impact on nominal wage growth in aggregate wage equations estimated by Mencinger and Tyson.<sup>69</sup>

There is some controversy over whether labor market conditions exercise an independent influence on wage changes. Because workers in each self-managed firm are free to make their own wage decisions (within the confines of the incomes policy discussed below) employed workers in each firm and unemployed workers may be viewed as members of non-competing labor groups. In this case, even if labor of comparable training and ability is available in the unemployed pool or in other enterprises, an individual firm will not reduce its wage to the lowest reservation wage of potential job applicants be they employed or not. On the other hand, if the enterprise wage falls short of the reservation wage of available labor, then some adjustment will be necessary, if the enterprise is trying to attract additional workers. If all enterprises are competing for scarce labor, then aggregate excess demand for labor will clearly influence the rate of growth of wages in each enterprise and the aggregate rate of growth of wages. Therefore, even in an economy of self-managed enterprises, the aggregate rate of wage inflation can be influenced by labor market conditions at least when a state of excess labor demand exists. However, this conclusion seems to be irrelevant to the Yugoslav case during the post 1965 period since it is impossible to reconcile the existence of large surpluses of unemployed workers with the assumption of excess labor demand.

As it turns out, aggregate nominal wage growth can be influenced by labor market conditions, even when the aggregate labor market is in macro equilibrium or in a state of overall excess supply, provided wages respond asymmetrically to excess supply and excess demand on

<sup>69</sup> See footnote 67 for references.

individual labor markets. Significantly, an asymmetrical response is particularly likely in an economy of self-managed firms since those enterprises operating in markets of excess demand respond by raising their wages to attract scarce labor and those firms operating in markets of excess supply continue to set wages according to individual negotiation, irrespective of the availability of unemployed workers. Under these conditions, even if there is macro equilibrium, the economy-wide rate of wage inflation will be influenced by the tightening of demand on individual labor markets. This conclusion probably has some relevance for Yugoslavia, given the apparent unevenness of labor market conditions among republics. If the economy enters an expansionary phase, then individual labor markets, such as those for skilled labor in Croatia and Slovenia, may quickly find themselves in conditions of excess demand. As labor market conditions tighten, wages will rise, and this increase, combined with rising or constant wages in labor markets characterized by persistent excess supply, will lead to aggregate wage inflation. This mechanism may be behind the apparent impact of labor market conditions on the overall rate of inflation found in recent econometric work of Mencinger and Tyson.<sup>70</sup>

The asymmetrical response of wages to conditions of excess supply and excess demand imparts a significant inflationary bias to the Yugoslav economy. Because wages fail to adjust rapidly or completely to slackening labor demand, slowdowns in economic activity do not result in a major reduction in labor cost pressures on prices. In fact, Horvat and Mencinger have argued that these pressures are actually growth. According to this view, the only way the government can counter cost induced inflation is by stimulating growth and labor productivity, thereby offsetting the effects of nominal wage growth on unit labor costs.<sup>71</sup> This view lends support to the 1973 reversal from a "stop" to a "go" policy as a means to contain inflationary pressure.

So far the discussion has identified increases in labor productivity and in the expected rate of inflation and the tightening of macro or micro labor markets as determinants of wage increases in Yugoslavia. These findings are not inconsistent with a demand pull theory of the Yugoslav inflation, provided allowance is made for the existence of asymmetries in wage responses to excess supply and excess demand and for administered pricing rules. What has been demonstrated is that both product and labor markets impart a significant inflationary bias to the economy because of downward rigidities in corresponding prices and wages.

<sup>70</sup> Mencinger's measure of labor market conditions is the social sector unemployment rate adjusted for the number of job vacancies and defined as  $[(\text{vacancies} - \text{jobseekers}) / (\text{vacancies} + \text{employment})] - 3.6$  percent, where 3.6 percent is taken by Mencinger to be a measure of the minimum attainable structural unemployment rate. Tyson uses the inverse of the social sector unemployment rate  $(\text{jobseekers} / \text{jobseekers} + \text{employment})$ . See footnote 67 for references. Mencinger ascribes the relationship between unemployment and the rate of growth of wages to the fact that party and trade union discipline of enterprise wage decisions tightens or loosens as the aggregate unemployment rate increases or decreases.

<sup>71</sup> Mencinger's quarterly model supports this conclusion: using this model, expansionary fiscal policy is demonstrated to reduce rather than to increase the rate of inflation of producer prices. See Mencinger, "A Quarterly Macroeconomic Model," *op. cit.*, chapter 10. Horvat argues that "there is less pressure on prices in an expansionary phase than in a contractionary one, since unit labor costs increase during a recession due to the lowering use of capacity and due to personal incomes which follow cycles in production but with reduced amplitude." To support this view, he reports that the correlation between the rate of growth of prices and the rate of growth of nonagricultural production is  $-.62$ . See "Kratkoročna Nestabilnost i Dugoročna Tendencije Razvoja Jugoslavenske Privrede," *Ekonomist*, 1-2, 1974.

There is at least one popular theory about wage behavior in Yugoslavia which explicitly identifies wage increases as the cause of inflation. This theory introduces a "wage-chase" model of inflation whereby worker efforts to maintain target interenterprise or intersectoral wage differentials generate aggregate wage and price inflation. According to this theory, wages rise in high wage sectors in response to market conditions, such as increases in worker productivity or enterprise income earnings. Wage increases of this type are market determined and therefore respond to rather than cause increases in product selling prices. In low wage industries, wages rise as workers attempt to catch up or compete with incomes received by workers in high wage firms. Wage increases of this type, which are not offset by labor productivity growth, necessitate an increase in prices as long as enterprise savings rates are to be maintained. Constant prices in high wage industries and rising prices in low wage industries then generate aggregate price inflation.

The model of wage competition discussed here bears a close resemblance to the so-called Scandinavian model of inflation in small open economies. According to this model, wage increases in export sectors are determined by price increases for exports set in world markets and by productivity increases. Wage increases in domestic or nontradable sectors are determined by worker efforts to match wage increases granted in the export sectors. Price increases in domestic sectors therefore depend on the relationship between realized productivity increases and these exogenously given wage increases. The Yugoslav model of wage competition is nothing more than the Scandinavian model transplanted to a domestic setting. Moreover, to the extent that high wage sectors in Yugoslavia are export sectors and low wage sectors are nontradeable goods sectors, there is no difference between the two models.

Several Yugoslav economists, including Bajt, Horvat, and Popov,<sup>72</sup> have studied the behavior of intersectoral wage differentials to determine the validity of the wage competition model of inflation. Their findings, while not conclusive, are consistent with the model's predictions. There appears to be a distinct countercyclical pattern to intersectoral wage differentials which rise when the economy is in a downturn and fall when the economy is growing rapidly. This pattern is attributed to the fact that high wage industries are able to maintain or even increase nominal wage growth during a downturn because of the special characteristics of their markets or because of their ability to shift enterprise income from savings to wages. Low wage firms are unable to raise wages as fast because of market pressures and inadequate savings, and consequently wage differentials increase. During an upturn, low wage firms attempt to make up for lost ground by marking up prices to finance target wage increases, and wage differentials decline. A second set of findings documented by Popov, Vanek and Jovicic, and others,<sup>73</sup> provides

<sup>72</sup> See, for example, S. Popov, *Uticaj Ličnih Dohodaka na Kretanje Cena* (Belgrade: Institut Ekonomskih Nauka, 1972) and A. Bajt "Patterns of Instability in Socialist Countries," in "International Aspects of Stabilization Policies," edited by Ando, Herring and Marston (Boston: Federal Reserve Bank of Boston, 1975).

<sup>73</sup> S. Popov, *Uticaj Ličnih Dohodaka*, op. cit., and J. Vanek and M. Jovicic, "Capital Market and Income Distribution in Yugoslavia," op. cit.

evidence which supports this explanation of counter-cyclical wage differentials. These findings indicate that high wage industries tend to be those which have the greatest monopoly power, as measured by concentration figures, and those which have the highest degree of capital intensity, as measured by capital labor ratios. Low wage industries, in contrast, tend to be found in more competitive market situations and tend to be more labor intensive. If this distinction is true, then it explains why high wage industries can maintain target wage growth during economic slowdowns either because of their protected market conditions or because they can redistribute returns from capital, their relatively abundant factor, to labor, their relatively scarce factor.

Low wage firms, which also tend to be those with low savings rates, do not have sufficient capital returns to maintain similar wage increases, and so they fall behind. As soon as demand picks up and market conditions allow, however, these firms attempt to raise selling prices to cover target wage growth.

The presence of wage competition pressures on prices during the 1971-75 period is suggested by the figures presented in Table 9. The table includes rates of growth of labor productivity and rates of growth of wages for a selected group of Yugoslav industrial sectors ranked according to their relative position in the wage scale in 1971 and 1975. The first thing to note is that there are no major changes in the ranking of sectors between the two years. This implies that nominal wage growth was about equal for all sectors over the period, and the data support this implication. The data also indicate that, if anything, labor productivity growth was higher in the low wage sectors than in the high wage sectors. What then accounts for the growth of wages in high wage sectors which is assumed to set the target growth of wages in low wage sectors? The findings of Popov and others suggest that the rate of growth of profits, the return to capital and/or monopoly position, determined the rate of growth of

wages for high wage sectors. At least one additional factor may have been at work, however, and this is the influence of world markets. Of the eight high wage sectors, five—coal, oil, ferrous and non-ferrous metallurgy, and chemicals—undoubtedly benefited from the world inflation in raw material and fuel prices. Wage increases in these sectors were clearly encouraged by price developments in world markets. Applying a Scandinavian type model, it follows that price increases in other sectors were then partly determined by the relationship between realized productivity increases and these exogenously given wage increases.

## *2. Policy Responses to Inflation*

The wage chase theory of inflation was one of the factors encouraging the adoption of an "incomes policy" to guide enterprise wage decisions. Other factors working in this direction were dissatisfaction with what were considered to be excessive interenterprise wage differentials and anxiety over declining enterprise savings rates. The form of the incomes policy actually adopted reflected these official concerns. Between 1971 and 1974, annual social agreements on enterprise incomes were concluded in each republic. These agreements related the total wages an enterprise could pay out and hence total enterprise savings to enterprise net income per "standardized" worker.<sup>74</sup> In general, enterprises with higher than average net income per standardized worker were allowed to pay out higher wages per worker but they were also constrained to save at a higher rate out of enterprise income.<sup>75</sup> In addition, most of the annual incomes policy agreements set allowable maximum and minimum personal incomes for each region.

Although incomes policies along these lines were adopted specifically to reduce relative wage differentials rather than to control the level or the rate of growth of aggregate labor payments, they probably had some success in moderating wage growth by cutting into the inflationary effects of the wage chase mechanism and by setting maximum allowable incomes. Wage growth was undoubtedly also moderated by the adoption of a six-month wage freeze between December 1972 and June 1973. The freeze applied to all government and public service workers and to workers in some trade branches and covered approximately 30 percent of the labor force in the social sector. The combined effects of the freeze and the incomes policies can be seen in the reduced rates of growth of nominal wages in 1972 and 1973. However, in 1974, and through mid-1975, nominal wage growth accelerated markedly, indicating that the incomes policy mechanism was not able to thwart worker efforts to reverse the stagnation of real wages which had occurred during the two preceding years. The failure of the existing policy led to the introduction of a new kind of incomes agreement in 1975, which did not embody any specific formula for the distribution of enterprise income but instead aimed to keep the rate of growth of wages within the limits of the rate of growth of

<sup>74</sup> The standardized work force of an enterprise was computed on the basis of skill coefficients defined to reduce each skill category to equivalent units of unskilled workers.

<sup>75</sup> In fact, savings routes were higher in enterprises with above average net income even before the introduction of the incomes policy, so that the agreements acted to strengthen rather than to counteract existing trends. Indeed, the incomes policy schedules relating enterprise income to allowable personal incomes and required savings were framed using historical enterprise data.

labor productivity in each republic. Enterprises with above average productivity growth were directed to allocate larger shares of enterprise income to savings to keep wage growth within the specified limits.<sup>76</sup>

In addition to introducing incomes policy guidelines to stem inflationary pressures, the Yugoslavs also resorted to a rather complicated system of price controls. After allowing free market determination to expand to about 60 percent of industrial producer prices at the end of the sixties, the government reversed the liberalizing trend, and by 1974, about 80 percent of industrial production was subject to some form of price control. Basic food items and services (electricity, transportation and communications, and communal services) remained under control throughout the period. It is important, however, to understand what control meant in the Yugoslav context, especially if the existence of price controls is to be reconciled with the persistence of inflation during the 1971-75 period.

Three different types of price controls can be distinguished. Some prices, such as those for electricity, communal services, and the like, were set by government decision and were subject to the most direct control. Other prices were determined by social agreements in which various market criteria, such as world market conditions and production costs, were considered to warrant acceptable price increases. Prices set by social agreement were subject to the approval of the competent price control authority. In some cases, price increases and their approval were automatic. For example, some domestic prices were related by formula to world market prices, so that a rise in the latter would induce an automatic adjustment in the former.<sup>77</sup>

Automatic formula of this type played an important role in the transmission of inflation from world markets to Yugoslav markets in 1974-75. For other goods, although price increases were not automatic, they were nonetheless likely to occur and to be approved by the competent price supervisory body if warranted by either world market conditions or by increases in production costs. Besides these criteria "development policies" served as a guide to some price control decisions. The importance of development priorities explains why the prices of some basic materials and agricultural products were in general controlled more effectively than the prices of produced or processed goods. Finally, a third set of prices were set on the basis of an "agreement" between buyers and sellers of the commodities involved. Approval of price increases determined in this way was required by the competent price control organization which tended to base its decisions on the same criteria of world market conditions, production costs and development policies.

Price controls of the type discussed here probably did less to reduce the rate of inflation than they did to distort the timing of price increases and the pattern of relative prices. However, available evidence suggests that the controls did not postpone price increases

<sup>76</sup> The principle of relating real personal income growth to realized productivity growth in each republic was reaffirmed by the 1976-80 plan. The plan calls for annual social agreements on worker incomes based on this principle.

<sup>77</sup> As an example of an automatic formula consider the social agreement on prices for non-ferrous metal and products. According to this agreement, domestic prices were set on the basis of average futures prices in selected international markets for the last six months evaluated at official exchange rates, and increased by 2 percent due to differences in buying and selling rates, and by 3 percent due to tariff protection. See I. Karli, "Neki aktuelni problemi sistema i politike cijena," *Ekonomski Pregled*, 8-9, 1974, pp. 603-632.

by more than one quarter.<sup>78</sup> In addition, relative price distortions in the form of repressed inflation in basic commodity prices were largely eliminated by the worldwide inflation of these prices in 1974.

Although the overall price controls probably did not contain inflationary pressure, periodic price freezes in 1971 and 1972, and a more stringent control policy in 1975 undoubtedly had an impact. The 1975 price control resolution, which may provide a clue to future control efforts, called for the price authorities to set prices directly if price increases agreed upon between buyer and seller exceeded permissible limits set by the resolution. The goal of the resolution was to "set prices according to the market but within the limits set by the resolution."<sup>79</sup> It was clear that the limits would be honored by direct administrative price setting, if this directive proved contradictory. A similar implication is contained in the 1976-80 plan which calls for price fixing if prices fail to satisfy plan established criteria.

In the discussion on inflation so far, no mention has been made of the money supply. Yet it is certain that an inflation of the magnitude observed in Yugoslavia in recent years could not have been sustained without large increases in the money supply. That such increases occurred is clear from the data in Table 8. What is not clear is whether these increases caused inflationary pressure or merely served to validate the pressure generated by enterprise efforts to raise prices to meet wage and savings targets. Evidence can be marshalled to support both views. Because of the sensitivity of investment to money market conditions, increases in the rate of growth of the money supply, caused largely by increases in the rate of growth of National Bank credits to business banks, stimulate aggregate demand, thereby generating inflationary pressure on some product and labor markets. The very large increases in the money supply in 1972 and 1973, undoubtedly provided some stimulus to the investment boom and concomitant inflation beginning in mid-1973.

Argument supporting the view that money supply increases validate inflationary pressure tend to refer to the recurrent liquidity crises as the factors forcing the hand of the monetary authorities.<sup>80</sup> According to these arguments, enterprises mark-up wages and prices or undertake excessive investment programs with little regard to market conditions. When they find themselves unable to sell their output at prevailing prices or to cover their investment spending commitments, they do not reduce prices, lay off workers, or cut back their spending plans. Instead, they finance their production and expenditure by bank credit when available and by defaulting on outstanding business debt when necessary. Defaults pass the disequilibrium in one firm onto its suppliers who in turn must finance unplanned increases in their holdings of trade credit by offsetting changes in their assets and liabilities. The usual response is for the unwilling creditor to default on its own outstanding debt or to reduce

<sup>78</sup> As an example of the timing problem, in the first quarter of 1974, 43 price agreements took 77 days for approval and 18 days for administration suggesting a timing delay of no more than one quarter.

<sup>79</sup> "Agreement on the Carrying-Out of Price Policy in 1975" translated from Borba, February 12, 1975, p. 9.

<sup>80</sup> For an example of arguments along this line, see D. Dimitrijević, "Neki finasiki elementi inflacije, kod nas," *Ekonomski Pregled*, 5-6, 1975, pp. 287-298 and L. D'Andrea Tyson, "Liquidity Crises in the Yugoslav Economy," *Soviet Studies*, April 1977.

its own cash reserves. As more and more firms are brought into the default network, the monetary authorities are forced to intervene to reduce the threat of multiple bankruptcy.

This scenario clearly has some applicability to the liquidity crisis of 1969-71, when about 30% of all enterprises were in default and when the volume of interenterprise trade credit increased by a staggering 96%.<sup>81</sup> However, after 1972, due to tighter controls on enterprise financial and investment behavior and more severe penalties for default, the proportions of the illiquidity phenomenon declined, and the pressure on the monetary authorities to validate inflationary wage, price, and expenditure decisions abated. Consequently, for the 1972-75 period, the excessive money supply increases probably tended to add to inflationary pressure rather than to validate pressure arising from enterprise decisions.

Yugoslav policy-makers are cognizant of the stimulative effects which money supply changes have on economic activity, especially investment, and prices, and they have relied on countercyclical monetary policy to alter the state of aggregate demand. Therefore, the large increases in the money supply which occurred in 1972 and 1973, and again in 1976, years in which the authorities were committed to restrictive demand policies, are surprising. However, they can be explained by the institutional peculiarities of the Yugoslav money and credit system. Because of barriers to regional capital mobility and the absence of market clearing interest rates, the National Bank has played a major role in the selective allocation of credits. Throughout much of the 1971-75 period, the Bank established both the quantity of central bank credits and the purposes for which they would be allocated at the beginning of each year. These commitments, once made, could not be easily reversed in response to unanticipated developments on the money market. For example, in 1972 and 1973, the Bank was unable to reduce its discount credits to the business banks sufficiently to offset the unexpected money inflows caused by unanticipated reductions in the balance of payments deficit. Consequently, the money supply grew at rates much in excess of those projected by the Bank when it first established its annual credit policy.

The Yugoslavs realize that selective crediting and restrictive monetary policy in a situation of below equilibrium interest rates are not compatible. Therefore, since 1973, they have discussed reforms to divest the National Bank of its responsibility in selective crediting and to limit its role to aggregate monetary control. Such control is to depend increasingly on open market operations in which the National Bank buys and sells enterprise commercial bills of exchange. According to the proposed reforms, which are described in the 1976-80 plan, self-management agreements among commercial banks are to be the vehicle for the realization of selective crediting goals. These agreements are to be encouraged and guided by the National Bank, and, once negotiated, are to become binding on the commercial banks. At least through the end of 1975, however, the credit reforms were not realized and the selective crediting activity of the National Bank continued to hamper its effectiveness as an instrument of aggregate monetary control. Thus, it is not surprising that once again in 1976,

<sup>81</sup> See L. D'Andrea Tyson, "Liquidity Crises," *op. cit.*

when the balance of payments unexpectedly improved, the rate of growth of the domestic money supply increased sharply.

Fiscal policy, like monetary policy, has been an ineffective countercyclical tool in Yugoslavia for institutional reasons. Because of political limitations on federal expenditure and taxation policy and because of the difficulties of co-ordinating republican and communal expenditure and taxation to achieve a desired aggregate effect, countercyclical fiscal policy is not practicable. With only a few exceptions, such as the use of republican "stabilization taxes" in 1973 to reduce personal incomes and consumption demand, fiscal policy focused on both the size and the composition of taxes and expenditures rather than on their countercyclical effects during the 1971-75 period. In fact, the major fiscal goal of the period was to constrain total taxes and public expenditures to grow less than aggregate social product, while maintaining overall balance in individual budgets. Available evidence indicates that this goal was not realized to any significant degree. Between 1971 and 1974, total expenditures and total revenues of the consolidated budgets grew about 32 percent while nominal social product increased by about 26 percent.<sup>82</sup> In pursuing its fiscal goals, the government made little attempt to vary the timing of taxes and expenditures to cool the economy as needed. In fact, the OECD has judged that aggregate fiscal policy was probably expansionary in 1973 and 1974, when restrictive or at least neutral policy was advisable.

In the absence of effective countercyclical monetary and fiscal policies, the government has resorted to selective, ad hoc controls on various categories of expenditure to control aggregate demand. For example, in 1971 and 1972, macroeconomic restraint was exercised by the imposition of a number of policies which reduced enterprise investment demand. Such policies took various forms including the following: regulations requiring enterprises to set aside advance dinar deposits when initiating investment projects or when obtaining foreign investment credits; laws prohibiting investment expenditures until a specified level of working capital had been achieved; and laws requiring minimum own participation rates in the financing of investment projects. Direct controls on enterprise investment of this variety were successful in reducing the rate of growth of real investment expenditures from an average of about 7 percent in 1970 and 1971 to an average of about 3 percent in 1972 and 1973. Unfortunately, the use of direct or indirect restrictions on investment expenditures as a tool of macroeconomic stabilization policy may necessitate a greater tradeoff between growth and price stability than would be required if other forms of aggregate demand were controlled.

Having surveyed the many sources of inflationary pressure in Yugoslavia and the policy problems involved in containing or reducing this pressure, it is possible to end on a somewhat optimistic note. Inflation rates in retail and wholesale prices for the January-July period in 1976 (as shown in Table 8) were lower than they had been at any time between 1971 and 1975.

The slowdown in inflation was the consequence of three factors: a decrease in external inflationary pressures; more stringent application

<sup>82</sup> Budget figures are taken from OECD, *Yugoslavia, 1976*, p. 25.

of price controls; and a reduction in real growth caused largely by a policy-induced slowdown in investment expenditures.<sup>83</sup> The reduction in the rate of growth of investment demand was the result of the application of direct controls of the type discussed above and of the new enterprise accounting law which encouraged greater caution in enterprise investment commitments. Although real growth stagnated during the first half of 1976 in response to slackening investment demand, there were no absolute declines in production, and by the second half of the year, real growth rates began to pick up. On this score, the Yugoslavs have done better than many of their western neighbors who managed to stem inflation only at the cost of actual declines in real production in 1974 and 1975. Hopefully, the reduced inflation rates of 1976 will make the future struggle against inflation easier by moderating the inflationary expectations which exacerbate and prolong the inflation process.

## VII. FOREIGN TRADE PERFORMANCE AND THE BALANCE OF PAYMENTS

### *1. Export and Import Performance*

The 1971-75 period was marked by major swings in Yugoslavia's foreign trade performance. Overall, plan targets for a growth rate of exports of goods and services of 11 to 13 percent and a growth rate of imports of goods and services of 9 to 11 percent were not realized. The actual growth rates were 7.3 percent and 5.8 percent respectively.<sup>84</sup>

However, growth rates varied widely from year to year, as the data in Table 10 illustrate. During the period of contractionary policy ranging from mid-1971 to mid-1973, import growth moderated, only to pick up again in response to the expansionary policy which followed. Export growth fluctuated also, though largely in response to conditions in Western Europe, rather than in response to domestic economic policy. Thus, the rapid growth of exports in 1972 can be attributed to expansive foreign markets while the stagnation of exports in 1974 reflects the beginning of the oil-induced recession in Western Europe. The very different pattern of export and import growth led to substantial variations in the trade deficit and in the percentage of import transactions covered by export receipts, as the data in Table 10 reveal.

To better understand the determinants of export and import growth, it is necessary to look at the commodity and geographical composition of Yugoslav foreign trade in greater detail. The data in Table 11 break down Yugoslav exports and imports by three major regions: industrial countries of the west; centrally planned economies; and developing economies. Two conclusions are immediately evident. First, the major share of the imbalance between exports and imports arises in trade with western industrial countries. For example, in 1973, 1974, and 1975, the share of the overall trade deficit arising in this segment of trade transactions was 74 percent, 75 percent, and 89

<sup>83</sup> Although there are no available data on real investment expenditures for 1976, the slowdown in investment during the first half of the year is suggested by the fact that hours of work in construction (an indirect indicator of investment activity) during the January-June 1976 period did not increase above the level reached during the same period of the previous year.

<sup>84</sup> Target growth rates from Table 1. "Dokumentacija \* \* \* 1975 godine," op. cit.; actual growth rates from Table 1, "Analytical Basis \* \* \* 1976-80 plan," op. cit.

<sup>3</sup> January-June figures calculated from data in Indeks, August 1976, p. 29.

percent respectively. In contrast, trade with planned economies was balanced with only minor net surpluses or deficits in each year. The same conclusion applies to trade with the developing countries; only in 1974 and 1975 did the deficit in trade with these areas increase sharply due primarily to the oil price rise, and even in these years, the magnitude of the deficit was small relative to the deficit realized in trade with the industrial west.

Second, the geographical pattern of trade underwent some important modifications during the period. Within imports the share from western sources gradually declined from a high of 68.9 percent in 1970 to a low of 60.5 percent in 1974. The share from planned economies remained more or less unchanged, while the share from the LDC's showed a significant increase, especially in 1974 and 1975, again due to the oil price rise. Within exports the most important developments were a precipitous decline in the share of exports going to the west and a noticeable increase in the share directed to planned economies and, to a lesser extent, to the LDC's. The decline in the share of exports to the west was mirrored in the growing trade deficit with this area.

Exports to the west were adversely affected by a variety of factors over which the Yugoslavs had no control. First, the imposition of a ban on Yugoslav exports of beef to the EEC in 1974, caused a substantial decline in the volume of beef exports by 38 percent and reduced earnings of convertible western currencies by about \$96

million.<sup>85</sup> Second, the oil-induced recession in western industrial countries caused their total imports to slow down considerably during the second half of 1974 and throughout 1975. Declining demand for foreign goods was felt in Yugoslav markets. However, Yugoslav export performance in these areas was even worse than market-conditions predicted. For example, between 1974 and 1975, total imports by the EEC increased by 2 percent while total Yugoslav exports to this area fell by about 11 percent. Similarly, for the same period, total imports in industrial Europe and the United States increased by 0.3 percent while Yugoslav exports to these areas fell by 19 percent.<sup>86</sup> These figures suggest that Yugoslavia lost a share of the declining western market, and this conclusion is borne out by the figures in Table 12 which show a significant decline in the Yugoslav share of the western import market over the entire 1971-75 period.

There are many factors which can explain why this decline took place, the most important of which are market discrimination against Yugoslavia by major Western European trading partners, high inflation rates in Yugoslavia only partially offset by currency devaluations, and the inability of Yugoslavia to compete in many commodities because it lacks the necessary production technology and sales apparatus. Inability to compete in certain markets, especially those for processed goods, has led the Yugoslavs to depend on exports of materials, semi-processed goods and food to western markets, and the demand for these products may have fallen off more sharply than overall demand during the 1971-75 period, thereby explaining, at least in part, the loss in Yugoslavia's market share.

TABLE 12.—YUGOSLAV EXPORT PERFORMANCE BY REGION, 1971-75

<sup>1</sup> Millions of U.S. dollars; figures taken from IMF, International Financial Statistics, November 1976; pp. 36-40; pp. 240-241.

<sup>2</sup> Market gains or losses are calculated as the difference between the growth of Yugoslav imports in each area and the growth of total imports in each area.

The market possibilities for Yugoslav exports to the centrally planned economies are favorable because of weaker competition and the relative absence of marketing difficulties. In comparison to these trading partners, Yugoslavia, due to its openness to the west, is far ahead in the design, quality, and selection of many processed commodities. Therefore, the Yugoslavs have tended to export manufactured goods both in investment and consumption categories to these areas and to import fuel, other raw materials and some heavy equipment, particularly from the USSR. The problem for Yugoslavia

<sup>85</sup> These calculations are based on data in Table 1-2 of the Federal Statistical Office publication, Statistika Spoljna Trgovina SFR Jugoslavije, 1975.

<sup>86</sup> These figures are calculated from data presented on pages 36-40 and pages 240-241 of the International Monetary Fund's International Financial Statistics, November, 1976.

in trade with the planned economies seems to be their inability to supply goods which the Yugoslavs want or need to import. However, during the period under consideration, the Yugoslavs did manage to work out trade arrangements which allowed them to redirect a portion of their exports from tightening western markets to planned economies in return for greater imports from these economies. This redirection of trade is likely to be a temporary development. Once the effects of the western recessions subside, a return to the more traditional western orientation of Yugoslav trade can be expected. Preliminary data for 1976 support this prediction. During the first eight months of 1976, total Yugoslav exports increased by nearly 22 percent, while exports to the west increased by about 43 percent over the same period.<sup>87</sup>

Finally, a word should be said about trade with the developing countries. During the 1971-75 period, the market share of Yugoslav imports in total imports of the developing countries increased as the data in Table 12 reveal. Yugoslav exports have been aided by Yugoslavia's relative superiority in the production and design of processed goods vis à vis these areas and by specific policy measures taken by the Yugoslav government to promote the growth of trade with LDC's. Yugoslav policy efforts to stimulate trade with these areas are likely to continue, given the commitment to a faster development and diversification of forms of economic co-operation with developing countries in the 1976-80 plan. Future policy initiatives to realize this goal are likely to take the form of preferential credit policies and long-term co-operation agreements to promote exports and preferential tariffs to promote imports. Policies of these types were important stimulants to the growth of trade with the LDC's during the 1971-75 period.

The commodity composition of Yugoslav exports and imports was relatively unaltered between 1971 and 1975. The data in Table 13 reveal that imports of intermediate inputs (fuels, materials and semi-processed goods) continued to account for more than 60 percent of total imports, with the remainder accounted for mainly by imports of investment goods. The increase in the share of raw material and fuel imports in 1974 and 1975 was attributable to the worldwide commodity price inflation. The major share of exports continued to be accounted for by semi-processed manufactured goods, manufactured consumer goods and machinery.

The most important characteristic of the commodity composition figures is the high degree of dependence on imports of raw material, fuel and capital inputs suggested by them. "Excessive" import dependence of this nature has been a constant source of anxiety to the Yugoslav leaders and was recognized in the 1971-75 plan as one of the problem areas to be resolved. The data suggest, however, that the elimination of the problem was not realized during the plan period. If anything, import dependence probably increased. The magnitude of the import dependence problem can be seen from the figures on "direct and indirect" import content by industrial sector and by source of final demand presented in Table 14. These figures, calculated from the Yugoslav input/output tables for 1968, 1970, and 1972, indicate that import content in production and in all sources

<sup>87</sup> These figures are cited by Z. Antić in "Yugoslavia On the Way to Economic Recovery," Radio Free Europe Research Report, November 9, 1976, p. 8.

of final demand increased between 1968 and 1972. The overall dependence of the Yugoslav economy on imports, and its openness in world markets, is also suggested by the fact that merchandise imports were approximately 29 percent of social product during the 1971-74 period.

Because of Yugoslavia's dependence on imports of productive inputs, foreign trade or balance of payments constraints can set limits on domestic growth possibilities. Several Yugoslav authors, including Horvat and Pertot, have argued that such constraints play a role in the development of Yugoslav growth cycles. For example, Horvat has argued that economic growth slows down as foreign exchange reserves are depleted, making it impossible for enterprises to obtain the imports of inputs they need to continue production increases.<sup>88</sup> In their simplest version, arguments which identify a balance of payments constraint on growth rest on several assumptions including: unitary elasticity of imports with respect to domestic production and low or near zero price elasticity for both imports and exports. Empirical estimates of the income elasticity of imports in Yugoslavia range from about 0.85 to 1.50 and are not incompatible with the first of these

<sup>88</sup> Horvat "Kratkoročna Nestabilnost," op. cit.

assumptions.<sup>89</sup> The assumptions about price elasticities have not been empirically tested, but at least as regards imports of raw materials and fuels, low price elasticities seem likely given the lack of available input substitutes. Of course, to the extent that price elasticities are low, devaluations cannot serve as a policy measure to improve the economy's balance of trade position.

The evidence from the 1971-76 period is consistent with the existence of a balance of payments constraint on growth. In years of rapid domestic growth, such as 1971 and 1974, imports increased rapidly and the balance of trade deficit increased. Only in years of domestic slowdown such as 1972 and 1975-76, did import growth slow dramatically and the trade deficit moderate. The existence of foreign constraints on internal growth is clearly illustrated by the 1974-76 experience. In 1974, the Yugoslavs continued to pursue an expansionary domestic policy which led to significant increases in imports of productive inputs. Exports slowed down due largely to world market conditions beyond the control of the Yugoslav authorities. Even at constant terms of trade these developments would have caused a worsening of the trade deficit. As it was, a deterioration in the terms of trade by about 11 percent in 1974, exacerbated the situation, and the trade deficit increased by about 125 percent.<sup>90</sup> Because the Yugoslavs entered the 1974-76 period with a substantial reserve of foreign exchange, they were able to finance the unanticipated increase in the trade deficit in part by drawing down this reserve. In addition, they managed to obtain additional short-term and long-term foreign loans to support their growing import surplus. However, by mid-1975, in response to continued reserve losses and the worsening trade deficit, they were forced to revert to a contractionary domestic policy in an effort to cut imports. The preliminary figures for 1976 indicate that the balance of trade deficit improved that year but only at the cost of a substantial reduction in growth which sharply reduced import demand. Economic growth through the third quarter of 1976 was exceptionally low; industrial production increased by only 3.8 percent and nonagricultural production stagnated through the end of the second quarter. (See Table 8.) This slowdown in growth cut sharply into enterprise demand for imported inputs, as evidenced by the fact that only two-thirds of total import permits (see section on import controls below) were used by enterprises during this period.<sup>91</sup>

Battered by the 1974-76 crisis, the Yugoslavs have put even more emphasis on the goal of reducing excessive import dependence in the 1976-80 plan. Priorities for growth in ferrous and non-ferrous metallurgy, energy, chemicals and mechanical engineering are designed to provide domestic substitutes for raw material and capital goods imports. It is hoped that by 1980, net imports of raw materials will decline by 50 percent, mainly via the development of import substitutes in these priority sectors. Similarly, it is hoped to increase the share of domestic equipment in the total consumption of equipment to 60 percent. More extensive use of protectionist tariff measures

<sup>89</sup> Mencinger's quarterly model of the Yugoslav economy yields an elasticity of about .85; the OECD estimates a 1.50 elasticity for the 1964-1973 period. See Mencinger, "A Quarterly Macroeconomic Model," *op. cit.*, and OECD, *Yugoslavia*, 1976, p. 18.

<sup>90</sup> For a detailed examination of the changes in the Yugoslav terms of trade during the 1971-75 period, see the paper by Z. Fallenbuchl, E. Neuberger, and L. D'Andrea Tyson appearing in this volume.

<sup>91</sup> The use of import permits is referred to by B. Sefer, Vice-President of the Federal Executive Council, in his interview printed in *Borba*, Wednesday, October 27, 1976, p. 9, column 1.

and selective credit policy to stimulate import substitution industrialization is called for. Greater use of aggressive credit policy to foster sales of domestic equipment over sales of foreign equipment is also identified as an important policy tool. Finally, the system of import regulation described below is to be used more effectively to ensure that imports are limited to those goods which cannot be produced at home or whose domestic production is quantitatively insufficient. In general, it seems reasonable to expect a more concerted effort to promote import substitution programs and to restrict imports in Yugoslavia during the next four years. These policies should be matched by the continuation of traditional export promotion techniques.

## 2. Foreign Trade and Exchange Policies

During the 1971-75 period the Yugoslavs maintained their decentralized foreign trade and foreign exchange systems and relied on traditional export and import policies to guide enterprise trade decisions. On the import side there was continued reliance on a system of direct import controls which varied over time in their coverage. The controls distinguished between five categories of goods largely in accordance to the manner in which foreign exchange was made available for their importation; liberalized goods for which foreign exchange was freely available; goods imported under special license; goods imported under global foreign exchange quotas; goods subject to individual quotas, set in quantity or dinar terms; and imports subject to ad hoc licensing.

The trend toward less control over imports which began in 1967, continued through 1973, when an estimated 42 percent of total imports were placed in the liberalized category.<sup>92</sup> In 1974 and 1975, however, this trend was reversed in response to the deteriorating trade position, and many items, which had previously been imported under the more liberal control categories, were made subject to direct, ad hoc quotas.<sup>93</sup>

In addition to strengthening direct controls in this fashion, the Yugoslavs also relied on a scheme of import deposit requirements which they had used periodically in the past to restrict imports. According to this scheme, importers were required to make dinar deposits in some fraction of the amount of imports prior to the importation of goods. These deposits were held in non-interest-bearing accounts at the National Bank for as long as twelve months. In 1974, the import deposit scheme was applied to about 5 percent of total imports, but in 1975, the deposit requirements were relaxed for many products, as more direct controls were substituted. Finally, during the 1971-75 period, the prices of imports were influenced by existing tariffs and by a variety of additional import taxes, the rates of which were changed in response to the trade situation.

The 1976-80 period should witness a continuation of the traditional import policies discussed here. At least in the area of tariffs, however, some changes might be anticipated, based on the new plan's commit-

<sup>92</sup> IBRD, Yugoslavia, op. cit., p. 265.

<sup>93</sup> For example, in 1975, imports of 413 items, nearly 30 percent of total 1974 imports and including most consumer goods, certain machines, and some raw materials, were made subject to direct approval by the Federal Secretariat for Foreign Trade. See OECD, Yugoslavia, 1976, p. 25.

ment to use protectionist policy to implement structural goals and on its call for a reform of the current tariff schedule which is not considered to be sufficiently protective. Under the schedule existing during the 1971-75 period, the average nominal tariff on industrial imports was 13.6 percent, but rates differed among sectors, increasing from 0 percent for electrical energy to 21 to 24 percent for electrical equipment and metal products respectively.<sup>94</sup> Under the proposed tariff revision, sectoral differentiation of rates will continue as rates on basic commodities and materials are increased and rates on processed goods are decreased. The new tariff law will also allow the federal government to automatically increase tariffs by up to 50 percent if such an increase is required by the international situation. Finally, the proposed revision will allow for the continuation of a schedule of preferential tariffs for imports from the LDC's, this in keeping with the proposed goal of strengthening trade relations with developing markets. Along these lines, the plan also calls for the use of preferential credit terms on loans to finance imports from developing countries.

Perhaps the most important factor likely to affect imports in coming years is the proposed strategy of import substitution inherent in the system of sectoral and structural priorities on which the new plan is based. If the investment and growth strategy is successful, then imports are likely to grow less rapidly than social product as planned, and the overall import dependence of the economy will be reduced.

The 1976-80 period should also witness a continuation and strengthening of traditional export promotion policies pursued by the Yugoslav government including: schemes linking foreign exchange allocations for imports by enterprise or sector to their export earnings; tax exemptions and tariff rebates to exporters; preferential credit for the preparation and exportation of goods and services; and special funds to credit exports of equipment, shipping and the construction of capital projects abroad, and to insure export deals against non-commercial risks. The plan suggests that the linking of import capabilities to realized export earnings will be vigorously enforced as an export incentive mechanism. It is also hoped that the organization of the foreign trade network towards the creation of big units integrating productive, banking, and trading enterprises will encourage more effective export promotion and marketing techniques. However, individual enterprises themselves are also called upon by the plan to develop their own annual and long-term policy measures and plans for export promotion.

A final policy measure designed to foster both the realization of export promotion and import substitution goals is the continuation of the joint venture program allowing for long-term links between Yugoslav enterprises and foreign partners. The joint venture program, which had a slow beginning after its initiation in 1967, picked up pace in the early 1970's, and by the end of January, 1974, 97 joint venture contracts had been registered.<sup>95</sup>

According to the 1976-80 plan, joint ventures are to be encouraged because of their role in the transfer of technology on terms of equality

<sup>94</sup> IBRD, Yugoslavia, op. cit., p. 214.

<sup>95</sup> OCED, "Foreign investment in Yugoslavia," 1974, p. 17.

between domestic and foreign enterprises. However, in the conclusion of future contracts, it is to be guaranteed, in ways which are to be specified in future laws, that the proposed joint venture will contribute to the expansion of foreign markets for Yugoslav exports. This condition reflects Yugoslav concern over the possibility that joint ventures might increase import demand for raw materials without generating offsetting foreign exchange revenues from exports.

Within total exports, it is hoped that the 1976-80 period will yield a change in the composition of exports towards an increase in the proportion of processed industrial goods in the total. Growth in the export of food products, however, is also slated as a lasting orientation of policy. Agriculture's status as a priority sector should be helpful in the realization of this objective. Also useful in this regard is the proposed development of long-term contracts with interested buyer countries, especially the LDC's.

A continued emphasis is to be placed on tourism as an earner of foreign exchange during the next four years. During the 1971-74 period, tourism accounted for an average of 10.5 percent of total foreign exchange inflow on current account.<sup>96</sup> Similar results are projected for the 1976-80 period. The number of foreign tourist nights is expected to increase at an average annual rate of 7 percent, the rate realized during the 1971-75 period, and foreign exchange inflow from tourism is slated to grow at an annual rate of 9 percent.<sup>97</sup> These goals are linked to the more general goal of offsetting a larger share of the balance of trade deficit by earnings from services by 1980. Net transportation services, which accounted for an average of about 3 percent of total foreign exchange inflow on current account between 1971 and 1975,<sup>98</sup> and construction services, particularly in the form of building projects in LDC's, are also expected to be instrumental in the realization of this goal.

Before ending this section on foreign trade policies, it is important to mention the changes in the foreign exchange regime which occurred during the 1971-75 period. After a major devaluation in December, 1971, the dinar exchange rate remained fixed in terms of the dollar until mid-1973. Then, just as world market prices began their sharp ascent, the Yugoslavs removed the peg to the dollar and appreciated relative to it, in an attempt to bring the dinar-dollar rate into line with the rate between other western currencies and the dollar. Since mid-1973, the dinar exchange rate has been set on a managed foreign exchange market regulated by the National Bank. The rate has been determined by the supply and demand for foreign currency by authorized buyers and sellers but within limits maintained by National Bank intervention. Thus, the new system is best understood as a managed flexible or floating exchange rate system. The data in Table 15 indicate that the rate has been kept within fairly narrow limits for protracted periods of time, with a major devaluation occurring in October, 1974. This system of a managed flexible exchange rate should continue throughout the current plan period.

<sup>96</sup> This figure is calculated from data in Table 22, Appendix, National Bank of Yugoslavia, Quarterly Bulletin, July 1976.

### 3. Balance of Payments Performance

As might be anticipated, the major swings in export and import growth which occurred during the 1971-75 period gave rise to major swings in the current account as the data in Table 16 reveal. The current account moved dramatically from deficit to surplus in 1972, and then plunged from surplus to deficit in 1974. Preliminary figures indicate the most recent reversal from substantial deficit in 1975 to significant surplus in 1976. Of major importance in the current account picture are worker remittances which amounted in size to an average of about 40 percent of total earnings from exports between 1971 and 1975. Although remittances are expected to continue to be a major source of foreign exchange between 1976 and 1980, they are expected to decline as a share of the total, because the net outflow of new emigrant workers is expected to remain below the levels realized in the 1971-73 period.

As the data in Table 16 indicate, the large current account deficits of 1974 and 1975 were financed by reductions in foreign exchange reserves and by official long-term loans and credits, and, to a lesser extent, by short-term suppliers' credits. The increase in foreign loans in these years brought the gross convertible foreign currency debt, both public and commercial, to about \$5.6 billion by the end of 1975 (up from \$1.9 billion at the end of 1970). The debt service ratio at the end of 1975 was estimated to be about 20 percent.<sup>99</sup> Such a ratio is not excessive, and the Yugoslavs have not planned to markedly reduce it over the 1976-80 period. Instead, the new plan states that external indebtedness will be limited to a level which will not increase the amount of indebtedness relative to the inflow of foreign exchange over the period.<sup>1</sup>

In 1976, the current account deficit was reversed and by September an estimated surplus of about \$330 million<sup>2</sup> had been recorded. This surplus, combined with the impact of foreign loans made available

<sup>3</sup> Trade figures for 1976 are through the end of September; imports are c.i.f. basis.

in 1976, dramatically increased foreign exchange reserves which climbed from about \$777 million at the end of 1975, to \$2006 million by the end of 1976.<sup>3</sup>

Thus, whereas in 1974 and 1975, the Yugoslavs were worried about excessive losses in foreign exchange, in 1976, they appeared concerned about finding the most profitable ways in which to manage their current exchange reserves. The dramatic turnabout in the foreign exchange situation reflects the revitalization of Western European markets on the one hand and the adoption of a restrictive domestic growth and import policy on the other.

It should be noted that the Yugoslavs have been able to recover from the balance of payments deterioration of the 1974-75 period more rapidly and with a smaller sacrifice in real growth than many of their neighbors to both the east and the west. Nonetheless, the turnabout may be shortlived. Judging from the historical record, it seems clear that if 1977 is a year of rapid growth in Yugoslavia, then the current account position will worsen and foreign exchange reserves will once again decline. Only in the longer run, as the economy reduces its import dependence and increases its export markets, will the tradeoff between domestic growth and external balance be improved.

### VIII. CONCLUSIONS

The 1971-75 period was not an easy one for Yugoslavia. Weakened by internal political divisiveness and macroeconomic instability in

<sup>3</sup> IMF, International Financial Statistics, February, 1977, pp. 390-391.

the early 1970's, the economy was only just beginning a recovery phase when it was hit by the unanticipated impact of worldwide inflation and recession in 1974 and 1975. These developments added to domestic inflationary pressures, caused a sharp deterioration in the balance of trade, and thwarted recovery plans. As a result, domestic employment and growth targets had to be sacrificed. Reductions in growth in turn conflicted with policy objectives to alleviate pressing unemployment and regional development problems.

By the middle of 1975, the economic situation seemed bleak. By the end of 1976, however, circumstances had improved markedly: the rate of inflation was lower than it had been at any time during the current decade, the trade deficit had declined, the current account had moved from deficit to surplus, and the level of international liquidity was at an all time high. Significantly, the reversal in the economic situation was accomplished without the sacrifice of the principles of market socialism and self-management on which the Yugoslav economic system rests. Although the temptation to introduce a greater degree of state control to deal with the economic crisis may have been great, it was resisted. In this respect—as in most others—Yugoslavia differs from the countries of Eastern Europe, many of which are purported to have sacrificed economic reform to the exigencies of the recent crisis period.

The good economic results of 1976 were accomplished only at the cost of disappointing real growth. Therefore, in the next few years, it is reasonable to expect that the Yugoslavs will revert to a more expansionary domestic policy to stimulate output, investment and employment. The new commitment to sectoral priorities and import substitution is likely to influence the measures by which domestic expansion is promoted. If the 1976–80 plan is used as a guide, then selective rather than general promotion of investment can be expected, as policy-makers strive to realize sectoral targets in agriculture, basic raw materials, and energy.

Looking ahead, it seems clear that some of the economic problems facing Yugoslavia will persist through 1980. Unemployment will remain high even if projected employment growth targets are realized. Agriculture will remain weak because of the existence of large numbers of small, low productivity, private farms, and regional disparities will continue even if the less-developed regions grow more quickly than the more developed ones as planned. In addition, there is no reason to anticipate the disappearance of inflationary pressures, since the sources of inflationary bias in product and labor markets have not been eliminated. Nonetheless, some progress in all of these problem areas is possible provided prudent economic policies are adopted and provided the international economic situation does not once again act as a barrier to the realization of domestic economic goals.

In conclusion, it is important to note that several of the problems confronting the Yugoslav economy are largely the consequence of two important characteristics of its environment—its level of development and the existence of regional divisions and differences which are themselves exacerbated by historical ethnic rivalries and suspicions. In some of the existing literature on Yugoslavia, these characteristics

are overlooked, and the institution of self-management is identified as the source of many economic difficulties, including unemployment, inflation and barriers to labor and capital mobility. Although it is certainly true that the behavioral rules of self-management may contribute to these problems, or may constrain feasible solutions to them, it is impossible to distinguish the effects of these rules from the effects of other characteristics of the Yugoslav economic system and environment. Whatever the case, however, it is certain that the Yugoslavs remain committed to the ideological principles of self-management and guided market socialism on which their economic system rests. Therefore, in the future, as in the past, these principles are likely to shape the policies which are adopted to achieve economic goals. Because these principles are unique to Yugoslavia, economic and political developments there will continue to be followed with interest throughout the world.

#### APPENDIX. THE THEORY OF THE SAVINGS AND INVESTMENT BEHAVIOR OF THE SELF-MANAGED FIRM

In a situation in which enterprise capital is socially rather than privately owned, workers face a choice between distributing net income and investing in individually owned assets which earn a rate of return and have a recoverable principal, or retaining a share of enterprise net income to finance enterprise capital investment which earns a rate of return but has non-recoverable principal. Assuming workers maximize the present discounted value of their earnings over time, their choice depends on a comparison of the expected rates of return on individual and collective investments. For simplicity, suppose all workers in an enterprise have the same marginal rate of time preference "R" and the same expected length of job tenure "t." Suppose further that privately owned assets carry a fixed real rate of return "s." Then the real rate of return "m" on collective investment required to make workers indifferent between private investment and collective investment is given by the equality

$$(1+m)^t - 1 = (1+s)^t.$$

The equalizing differential "d" between "m" and "s" is the result of the differences in property rights between privately owned assets and collectively owned enterprise capital. Clearly, the existence of such a differential implies a possible misallocation of investment resources between private and collective assets. Of more relevance to the savings issue examined here is the fact that the enterprise is likely to "underinvest" in socially owned assets, distributing the bulk of its earned income in wages instead of retaining it to finance enterprise investment.

Workers will continue to invest in enterprise capital until its marginal product just equals the marginal rate of time preference plus the premium which the workers require to make them indifferent between investment in enterprise assets and investment in privately owned assets. Thus, the equilibrium capital stock is given by the equality

$$MP_k = R + (m - s) = R + d$$

where  $MP_k$  is the marginal product of capital.

The shorter the time horizon and the higher R, the higher must be the marginal product of capital, and hence the smaller the equilibrium enterprise capital stock and the smaller the volume of enterprise savings and collective investment. From this, Vanek and others have concluded that for reasonable values of t and R, and for an interest rates on privately owned assets which reflects the marginal return to capital from society's standpoint, collective enterprise savings and investment rates are likely to be low.

So far the discussion has assumed that all enterprise investment is "self-financed" by retained earnings. To add realism to the picture, suppose that the enterprise can borrow funds from external lenders, such as banks, at a fixed borrowing rate "r." <sup>4</sup> As long as  $r < R < m$ , enterprise workers will save nothing out of their current incomes but will borrow to finance collective investment projects. Under these circumstances the collective savings rate will be zero while collective investment will be positive. On the other hand, if  $r > R < m$ , then collective savings and investment will occur together. In intermediate cases, enterprise investment projects are likely to be financed by a combination of enterprise savings and bank loans.

What is important to note here is that if bank lending rates are set artificially low, this will encourage enterprises to drive their internal savings rate to zero, depending on external sources of funds for collective investment. Under these circumstances, enterprise demand for external finance may appear insatiable while enterprise savings are zero. If bank lending rates reflect the marginal productivity of capital, and if enterprises are compelled to finance all of their investments externally, then the misallocation and underinvestment problems associated with self-financing will be eliminated. In the intermediate cases where internal and external sources of funds are used, these problems will be mitigated, largely in proportion to the degree of external financing.

---

<sup>4</sup> "r" is a measure of the total borrowing cost including interest payments plus any repayment of the loan principal made over the period of the planning horizon "t."

## I. INTRODUCTION

The CMEA countries are trying to overcome their relative isolation from the world economy, and to institutionalize their increasing economic relations by agreements with, or membership in multinational organizations. At present however, these efforts are somewhat overshadowed by the developing countries increasingly urgent demand for a reorganization of the international economic order and by the expanding complex of negotiations and relations among the Western industrialized countries and the Third World. Yet, the international economic weight of CMEA members has become too great to discuss new forms for international economic relations without taking into consideration the needs of the State Trading countries.

The increasing volume of East-West economic relations has led to institutional arrangements on a multinational basis. During the last few years all relevant global and a great number of regional economic organizations have been confronted with problems arising from the interactions of capitalist and socialist nations or groups of nations. An analysis of these relations has to be conducted on several levels, because, on the one hand, West and East (at least in part) are trying to find mutually satisfactory arrangements within common frameworks, such as GATT (General Agreement on Tariffs and

\* This paper is based on the authors "Institutional Aspects of East-West Economic Relations", in: *Journal of World Trade Law*, vol. 10, No. 5 (August/September 1976), pp. 434-452.

Trade), IMF (International Monetary Fund), or ECE (UN Economic Commission for Europe), while on the other hand organizations from two opposing European camps, i.e. CMEA (Council for Mutual Economic Assistance), and the EC (European Community), are negotiating together for their mutual benefits. A look into these organizations must take into account the interaction of co-operation and conflict in international economic relations. The crucial questions can be stated as follows: to what extent can global and regional economic organizations set the framework to promote economic relations among countries having different economic and social systems? Where are their possibilities, where are their limits?

To tackle these questions the following approach has been chosen: After a brief outline of the present state of East-West relations as regards international economic organizations, the relevant economic and political objectives of the CMEA countries will be discussed and some main problems of regional and global settlements will be pointed out. Some concluding remarks will be made as to possible consequences and perspectives for the integration processes in East and West Europe and for the discussed international economic organizations.<sup>1</sup>

## II. THE PRESENT SITUATION

Since the mid-sixties, the West has had to cope with attempts by some East European countries to join GATT in order to expand the socialist world market and to participate in the world economy. Although the CSSR is one of the founding nations of GATT (1947), it takes no active part in its activities. Thus it has been absent from the past rounds on tariff reductions, Poland joined GATT as a full member in 1967, followed by Romania in 1971 and Hungary in 1973. Bulgaria has had observer status since 1967.<sup>2</sup> These countries participate in the current "Tokyo Round" of GATT without making substantial proposals or taking decisive initiatives.

Another organization increasingly attracting CMEA members is the IMF. Poland and the CSSR were among the founding nations of the IMF, but resigned in the early fifties. It was not until the mid-sixties that some socialist countries began to modify their negative attitude towards the IMF. Thus in 1968, Hungary appeared close to applying for membership. But it was Romania which was the first CMEA nation to become (again) a member of IMF and the World Bank.

Presently, there are no definite indications that other CMEA members are going to apply in the near future.

Corresponding to these developments at the global level, unprecedented steps have also been taken at the regional (European) level. In this respect, Romania acted as pioneer; in 1973, upon its own application, it was granted the EC's General Preferences. In the same year, the Secretary General of CMEA took an initiative

<sup>1</sup> These issues are discussed in more detail in M. Baumer: Zur Multilateralisierung des Außenhandels der RGW-Mitgliedstaaten, (Multilateralization of CMEA Member Countries' Foreign Trade), SWP-S 235, Ebenhausen, April 1975; H. D. Jacobsen: Die wirtschaftlichen Beziehungen zwischen West und Ost, (The Economic Relations between the West and the East), Reinbek 1975.

<sup>2</sup> The two remaining European member states of CMEA, the GDR and the USSR, are the only countries that have so far shown no interest in direct cooperation with or membership in GATT.

towards the EC with the objective of formalizing CMEA-EC relations through treaties and arrangements. This step was surprising because until then the EC had been labelled an "instrument of imperialism" or an "extension of NATO". In early 1976 the president of CMEA's Executive Committee submitted to the president of the EC Council of Ministers a detailed draft for an agreement between the EC and CMEA, to which the EC reacted in November 1976.

Beyond these chronological developments, it is conceivable that the provisions set out in the Final Act of the Conference on Security and Cooperation in Europe (CSCE) will lead to an enlarged scope of all-European institutions, such as the Economic Commission for Europe. It cannot yet be determined, however, to what extent the increasing uneasiness in some Western countries about the results of continued "detente" will influence the future course of such institutional relations.

### III. ECONOMIC OBJECTIVES OF EAST EUROPEAN COUNTRIES AND THE SOVIET UNION

The socialist countries of Eastern Europe<sup>3</sup> are closely tied into the integration process within CMEA. By utilizing gains from specialization and importing raw materials from the USSR, the smaller CMEA members have been able to achieve high rates of growth. However, the economic reforms in the socialist countries—which among other things caused a reassessment of the role of foreign trade in the development process of socialist countries—led to the insight that the technological gap between Western and socialist countries could not readily be diminished by increased and better use of own resources and a higher degree of division of labor within CMEA. Greater utilization of Western technology and credit promotion of economic cooperation with the West (acquisition of licenses, cooperation in research and development, co-production, joint enterprises, etc.) turned out to be advisable. Moreover the growing demands on the part of the population of socialist countries—caused among other things by the "demonstration effect" of Western prosperity—could partially be covered that way. Consequently, the East European countries are trying to increase their hard currency earnings by exporting complementary goods (raw materials and foodstuffs), as well as substitutional (manufactured) goods.<sup>4</sup>

Because of their geographical proximity to the highly industrialized capitalist world, an East-West division of labor may grant greater advantages to some East European countries than trade with certain enterprises and regions within the USSR (their location might be less favorable due to higher transportation cost).

<sup>3</sup> The term "East European countries" refers to the European members of CMEA with the exception of the Soviet Union (i.e. Bulgaria, CSSR, GDR, Romania, Poland and Hungary). This distinction seems useful as the problems and objectives of these smaller countries often differ from those of the USSR.

<sup>4</sup> These objectives concur with those of the Western countries which are looking for new markets for their products as well as for stable sources of raw material and energy imports. Moreover, in relation to countries like the U.S. and Japan, the West European countries seem to be able to realize their competitive advantages (geographic location, etc.) easier in the CMEA market than in other areas of the world economy. Cf. J. Bethkenhagen/M. Lodahl/ H. Machowski: Auswirkungen der EWG auf den Ost-West-Handel (Implications of the EEC on East-West trade), Gutachten des Deutschen Instituts für Wirtschaftsforschung (DIW) im Auftrage des Bundesministers für Wirtschaft, Berlin, December 1976, p. 66 (table 7).

The role of foreign trade in national economic development (dependence on foreign trade) is much greater for relatively, small countries such as the socialist states of East Europe, than for large countries like the Soviet Union. Thus, the percentage share of foreign trade in the GNP of East European countries is about three to five times higher than in the USSR.

The Soviet Union can be termed gifted as far as its economic self-sufficiency and independence is concerned, because of the size of its domestic market and thanks to its ample natural resources. The smaller East European nations do not have such assets which explains their economic dependence on the Soviet Union and their commitment to the Soviet socialist bloc: they cover their raw material needs almost exclusively from Soviet deliveries which they must finance with industrial exports that to a high degree are not competitive on the world market.

The structural changes on the world market since 1973 have resulted in more favorable terms of trade for the Soviet Union which is therefore striving for increased sales of raw materials to hard currency countries. World market prices for these materials presently exceed those within CMEA (e.g. on the world market the price for oil is almost twice as high as it is within CMEA).

This fact contributed to the Soviet modification of their stance vis-a-vis their East European partners. The USSR took steps to lower the barrier between CMEA and the capitalist economies in favor of a partial rapprochement with the highly industrialized Western nations and their institutions and organizations. On this premise, the approaches of some of the smaller socialist countries towards GATT, IMF, etc. seem also acceptable from a Soviet point of view. The attempts of these states to expand their political and economic leverage through a greater opening towards the West and access to Western organizations in order to limit Soviet influence and to gain economic benefits, now coincides with Soviet endeavors to expand their own trade with the West. But the decisive aspect is the fact that economic constraints narrow the political margin of action on the part of the smaller East European countries. Thus the above mentioned price rises for raw materials and fuels on the world market (in contrast to much lower increases within CMEA) have placed the smaller socialist countries into the unfavorable position of being unable to buy more raw materials in the world market in order to reduce their dependence on the Soviet Union.

In addition, there are other motives for a lessening of Soviet resistance against East European initiatives towards Western economic organization:

The long-run Soviet interest in internationally competitive trading partners in Eastern Europe both as providers of high-quality industrial goods and as reduced consumers of their own raw material exports so that hard currency earning can be increased.

The enhancement of CMEA's attractiveness vis-a-vis third countries.

Considering the high degree of economic dependence between the socialist states a possible decline of East European commitment to CMEA (as a consequence of increased contacts with the West) is unlikely to reach substantial proportions.

The possession by the Soviet Union of effective political (through the parties) and military (through the Warsaw Pact) instruments to control its CMEA partners.

The strengthening of the world-wide economic position of the Soviet Union as a result of the increases in the market price of fuels and raw materials.

The incentives for CMEA member states for joining multinational economic organization can be summarized briefly. Priority is placed on improved earnings of hard currency in order to finance imports from the West. As far as international organizations are concerned this can be achieved through the lowering of barriers to trade (tariff and nontariff). Secondly, a larger volume of Western credits and better terms of payment might help smaller CMEA states with a few raw materials and dependent on foreign trade to reach higher rates of economic growth and to speed up the restructuring of their economies. The necessary adjustment processes on the part of CMEA nations will increase their economic flexibility and may thus have favorable political implications. But this consequence raises the question as to the compatibility of such developments with the socialist system; i.e., as to the crucial limit of measures that might jeopardize the scope and stability of socialist economic and political order.

#### IV. RELATIONS BETWEEN THE EC AND CMEA

In the fifties and early sixties relations of CMEA countries with member states of the European (Economic) Community were not only determined by terms of the strategic embargo and economic warfare on the part of the West, but also by the socialist view that the West European Community ". . . cannot be separated from the dominance of private property and the power of the capital. It is subordinated to the interests of maintaining the capitalist system, to the interests of monopolies."<sup>5</sup>

Since then, and particularly since the early seventies, the socialist countries have visibly modified their assessment of the EC and changed their tactics as well. Against the background of political détente, the rapidly developing relations between the two economic blocs and the increasing integration within them, showed the need for a modus vivendi. In 1973, M. Maximowa reasoned that ". . . capitalist integration for its inherent contradictions increases the economic and scientific and technical potential of the integrating countries, helping increase the efficacy of their economies. This must be taken into account when considering the question of economic competition between the two systems."<sup>6</sup> . . . and "For all its limitations and incompleteness, capitalist integration is a factor exerting considerable influence on the development of centripetal and centrifugal tendencies in the capitalist camp, on the relationship and alignment of forces there, and on the position of both individual capitalist

<sup>5</sup> M. Maximowa: *Integrationsprozesse im System des Imperialismus (Integration Processes in the System of Imperialism)*, in: *Probleme des Friedens und des Sozialismus*, No. 3, (1971) p. 372 (translated by the authors). The historical development of the Soviet attitude towards the West European integration process has been described by B. Dutoit: *L'Union Soviétique face à l'intégration européenne (The Soviet Union and the European Integration)*, Lausanne 1964, pp. 87; and E. Schulz: *Moskau und die europäische Integration (Moscow and the European Integration)*, München-Wien 1975.

<sup>6</sup> M. Maximowa: *Economic Aspects of Capitalist Integration*, Moscow 1973, p. 331.

countries and certain regional groupings. This is of great importance for the foreign policy of the Soviet Union and the countries of the socialist community."<sup>7</sup>

This modification of the Soviet evaluation of the West European integration occurred in the same time period when the "international socialist division of labor" was redefined as "socialist integration", and a "Comprehensive Program"<sup>8</sup> was adopted by the CMEA countries. The member states succeeded in agreeing on this long term Program which in itself is not completely consistent as far as its goals and instruments are concerned. However, it could provide the framework for furthering the economic and political unification process within CMEA.

Moreover, it has to be kept in mind when evaluating CMEA initiatives towards the EC that—parallel to the above mentioned developments—the Soviet Union propagated a European Security Conference. According to Soviet intentions, the CSCE was to sanction and consolidate the status quo in Europe, and to develop all-European perspectives which would effect the West European integration and cooperation within NATO.<sup>9</sup>

Realization of the then ambitious integration plans of the EC (e.g., establishment of a currency union) could have led to the creation of an economic and political power bloc which could have effected Soviet interests in Eastern Europe. Moreover, direct relations with the EC implied a chance to influence the development of the EC<sup>10</sup> and the Atlantic Community.

The goals and policies of the member countries of CMEA and the EC vary and are subject to change as far as the form of institutionalized East-West relations is concerned. CMEA's recent initiatives for establishing direct relations with the EC seem to have somewhat abated in spite of the February 1976 draft agreement. This can be explained by a change of policy on the part of the Soviet Union. Whereas the Soviet intention of achieving a stronger commitment of the East European countries to CMEA by means of direct EC-CMEA relations has not altered, changes in the political and economic framework have reduced the importance of this objective. Noteworthy enough in many respects this development concurs with the aims of the East European countries which believe that their own political and economic objectives are better served by bilateral contacts with individual West European states than by negotiations with the EC as such. They also expect to reach more concessions this way than by coordinated EC-CMEA settlements.<sup>11</sup> Although not stated explicitly, these countries seem to hope that the Soviet hegemony within CMEA will at least not be increased in this way.

<sup>7</sup> *Ibid.*, p. 330.

Ropers, G. Zellentín (editors): *Grünbuch über die Folgewirkung der KSZE*, DGFK-Veröffentlichung, Bd 3, Köln 1977, forthcoming.

<sup>10</sup> Especially since EC integration progress slowed down considerably in 1973/74.

<sup>11</sup> Cf. also Pinder, *COMECON, An East European Common Market?* In: J. Lukaszewski (ed.): *The People's Democracies After Prague-Soviet Hegemony, Nationalism, Regional Integration?* Bruges 1970, p. 155.

Similar considerations may have caused the EC and its member states to react reservedly in this matter. Although the coordination of the national foreign economic policies vis-a-vis centrally Planned Economies is an integration goal, this interest is superseded by reservations against supporting Soviet dominance in the CMEA area. Furthermore, some EC member states seem to believe that their economic competitive position vis-a-vis Western rivals for the Eastern markets can be ensured by continued bilateral contacts with individual CMEA countries. The EC-Commission also appears to prefer bilateral relations with individual CPE's (compared to contacts with CMEA as such), but at the same time with the objective of achieving a joint policy in trade and cooperation within the Community. Another indicator for divergencies of interest between the Commission and the member states is the failure to establish a common credit policy with respect to CMEA countries. The "Gentlemen's Agreement" on export credits reached between the main Western trading partners of CMEA in 1974 has not solved this problem and does not seem to be very effective. Although the EC commission and member states differ on matters of competence, they agree insofar as both prefer to negotiate with each State Trading country separately rather than with the CMEA secretariat.<sup>12</sup> One of the reasons for this preference is the argument that CMEA lacks the authorization to conclude agreements that are binding for all member states. Although this seems to be correct it has no relevance for negotiating agreements encompassing only "interested" partners. Another reason is the fear that in the case of an agreement between EC and CMEA Soviet predominance in CMEA could be formally acknowledged and even endorsed by the EC. To be sure, in the last few years some CMEA countries have tried to compensate at least in part for the U.S.S.R.'s economic dominance in Eastern Europe by increasing their own relations with the West. However, since the Soviet Union has granted the smaller East bloc nations a greater margin for action towards the West—as has already been pointed out—this argument must be put into perspective. The political levers exercised by the Soviet Union continue to be functionable. Agreements between CMEA and third countries could result in making "maverick actions" by individual CMEA countries less likely or in lessening the probabilities for direct Soviet intervention because of the existence of a common CMEA framework for extra-bloc relations.<sup>13</sup>

<sup>12</sup> This can be demonstrated by a statement made by Sir Christopher Soames, former Vice President of the Commission and in charge of foreign relations. In February 1975 before the European Parliament he said that the EC Commission could establish relations with COMECON and develop them in such areas in which either organization fulfils more or less comparable functions and where questions of mutual interest can be found, discussed and possibly solved together. At the same time and parallel to this the Commission could establish and develop relations between the Community and the member countries of COMECON in such areas in which the Community and the member countries of COMECON have competence, as e.g. in trade policy. Cf. Sitzungsdokument des Europäischen Parlaments, No 186/75 17.-21. February 1975, p. 206.

<sup>13</sup> The above arguments do not consider the specific intra-German problems and their implications for EC-CMEA-relations. The GDR has special privileges arising from the "intra-German" trade and her indirect access to the EC market, and therefore must be considered as a typical representative of CMEA. For its specific political and economic interests cf. D. C. Ehlermann /S. Kupper /H. Lambrecht G. Olling: Handelspartner DDR—Innerdeutsche Wirtschaftsbeziehungen (Tradingpartner GRD—Intra-German economic relations), Baden-Baden 1975; P. Scharpf: Europäische Wirtschaftsgemeinschaft und Deutsche Demokratische Republik (The European Economic Community and the German Democratic Republic), Tübingen 1973. Conceivable agreements would have to take account of the inner-German relationship. For possible solutions confer E. Schulz: Moskau und das Problem der Integration in Westeuropa (Moscow and the problem of integration in Western Europe). in: Europa-Archiv, Vol. 30 (1975), Nr. 12, pp. 388.

### 1. *The State of EC and CMEA*

The legal basis for the EC's joint trade policy is clearly determined.<sup>14</sup> On Jan. 1, 1973, competence for the conclusion of trade agreements with third countries switched from individual EC members to the EC Commission. The last bilateral trade agreements ran out on Dec. 31, 1974. In the fall of 1974, the EC submitted to each CMEA member a "scheme" for trade agreements between the Community and individual State Trading countries. The main features were the following:<sup>15</sup>

EC's readiness to conclude long-term, nonpreferential trade agreements which ensure equal mutual benefit.

Creation of conditions for promoting the dynamic development of mutual trade.

Mutual Most-Favoured-Nation (MFN) treatment (i.e., EC-MFN in return for reciprocal concessions by CPE's).

Search for possibilities to liberalize imports.

Payments and financial problems in foreign trade are to be discussed case by case.

Common agricultural policy is not mentioned as a subject for negotiations.

None of the CMEA countries reacted favorably, nor concluded an agreement on the basis of this "scheme". Hence, since the beginning 1975, trade between EC- and CMEA member countries lacks a contractual basis. In order to bridge the situation the Community autonomously takes charge of the member countries import regulations.

The urgency to sign a trade agreement with the EC was not very high for the CMEA countries. Most EC countries decided to conclude long-term, bilateral cooperation contracts with individual State Trading countries in which the distinction between matters of trade and those of cooperation was not altogether clear-cut. Since Art. 113 EEC-Contract covers trade but not economic cooperation agreement, this practice could be interpreted as a dodging of EC regulations. In the summer of 1974 the Commission initiated an information and consulting procedure for conclusion of economic cooperation agreements between EC members and third countries.<sup>16</sup> Consequently the Commission and/or individual members can now demand information on the terms of a new cooperation agreement, yet they have no direct influence on its formulation. The basis for CMEA's foreign trade policy is not unequivocally determined. The Council for Mutual Economic Assistance according to its statute is not a supranational institution and has no supranational powers. It can only make recommendations. Moreover national governments are free to announce that they are not interested in any particular matter under discussion (Art. IV CMEA-statute). The EC argues that for this reason it can sign foreign trade agreements only with individual CMEA nations, but not with the institution CMEA. The State Trading countries

<sup>14</sup> Art. 110 seq. of the EEC Treaty envisaged a joint trade policy beginning Jan. 1, 1970. However, with respect to CMEA countries these provisions were not put into effect until Jan. 1, 1973.

<sup>15</sup> The bargaining position of the EC-countries in the CSCE was very much based on these features. Cf. O. G. Schwerin: Die Solidarität der EG-Staaten in der KSZE (The solidarity of the EC countries during the CSCE), in: Europa-Archiv Vol. 30 (1975) No. 15, pp. 483.

<sup>16</sup> Cf. EC official press release No C 106, 6 Dec 1975., release No. L 208, 30 July 1974.

reacted by revising Art. III of the CMEA-Statute in June 1974 which now allows for CMEA to sign international contracts with other countries or with international organizations.<sup>17</sup> In June 1976, at the thirtieth meeting of the CMEA Council the CMEA was officially instructed to conduct negotiations with the European Community.

### *2. The CMEA Draft for a Treaty With the EC (February 1976)*

An analysis of the CMEA countries' attempts to expand and institutionalize their economic relations with Western Europe indicates a concerted action. Shortly after phase I of the CSCE had ended in July 1975, CMEA's Secretary General established contact with the President of the EC Council (27 August, 1975). About six months after the signing of the Final Act of the CSCE (1 August, 1975), the CMEA submitted the draft for a treaty with the EC in Luxembourg (16 February, 1976). A comparison of this draft with the principles which have been formulated and agreed upon in basket 2 of the CSCE shows that the proposals made in the draft go beyond the text of basket 2 and largely correspond with those which were made by the socialist countries at the beginning of the CSCE. There is another important difference between CSCE and EC-CMEA negotiations: At the EC level, the socialist countries can propose concrete measures and for improving their economic relations with the West without having to discuss-as in basket 3 of the CSCE-problems in the humanitarian field. In its preamble the draft explicitly cites the CSCE Final Act and states that the contracting parties wish to expand and consolidate their economic relations for their mutual benefit at the bilateral as well as on a multilateral basis. This means that a framework agreement is proposed which is to be filled out by bilateral agreements between individual countries and groups of countries.

Some of the proposed subjects for negotiations should not be very controversial.<sup>18</sup> Whereas other demands delineate the ones for credits at best possible terms (Art. 10) and for reciprocal Most-Favoured-Nation treatment (Art. 11), although being dealt with at the CSCE, were not settled there.

The agricultural sector which was explicitly excluded from the EC's "model" agreement of 1974 is mentioned in Art. 9 of the draft. The draft does not explicitly exempt the joint trade policy of the EC.<sup>19</sup> However, Art. 11 tends to neglect the Commission's competence in this field by considering bilateral as well as multilateral settlements in questions of foreign trade.

### *3. The Response of the EC (November 1976)*

In November 1976, the EC Commission reacted by submitting its own draft for an agreement with CMEA to the officiating chairman of the CMEA Executive Council in Warsaw.

<sup>17</sup> In 1975 CMEA has concluded co-operation agreements with Iraq (4 July 1975) and Mexico (13 August, 1975) (CMEA-Iraq agreement in *Pravda* 5 July, 1975, No 186 p.6; CMEA-Mexico agreement in *Izvestija*, 15 August 1975, No. 190, p. 3).

<sup>18</sup> In Art. 3 of the draft the following subjects are mentioned: "Improvement of conditions for economic and trade policy cooperation between the member countries of CMEA and the EC: standardization, environmental protection, prognoses of production and consumption in agreed upon subjects". (Cf. the unofficial translation of the draft as published in: *Vereinigte Wirtschaftsdienste (VWD)*, No. 36, 1976, 21 February 1976, pp 1/7).

<sup>19</sup> Art. 13 of the draft states that the provisions of this treaty are not to touch upon the rights and duties of CMEA, EC and their member countries which result from other bi- and multilateral treaties and agreements.

The EC draft agreement is rather restrictive insofar as matters of trade policy, particularly the demand for Most-Favoured-Nation treatment and non-discrimination, are not mentioned. The argumentation runs basically along the same lines as during the CSCE: Instruments of foreign trade policy decidedly have diverse functions in CPE and in market economies; hence, realization of the principle of reciprocity would be very difficult. Additionally, in its letter of advice the EC refers to its offer of 1974 (to conclude trade agreements with individual CMEA countries) and stresses that its present draft provides for a skeleton agreement which does not exclude agreements between the Commission and individual CMEA members; the contents of such an agreement is limited by the existing asymmetry in material competences, as reflected by the EEC-Treaty and the CMEA-Statute, respectively. Finally, the EC rejects the mention of the CSCE Final Act in the CMEA draft as this would tend to give binding force to the CSCE recommendations.<sup>20</sup>

No mention is made of problems of credit availability and credit conditions in the EC draft. Rather, it concentrates on questions which should be less controversial politically, and where, in the judgement of the Commission, both organizations have equal competence to conclude contracts: Economic prognoses, statistics, problems of environmental protection, and standardization.<sup>21</sup> Intensification of information exchange, particularly in these areas, is to provide the basis for improved working relations between the two organizations and their member countries.

Since these four areas are mentioned in the CMEA draft as well, it is conceivable that an agreement between the two European integration systems could be reached.<sup>22</sup>

## V. THE ECE

The political conflicts of the post-war era as well as the polarization between East and West have hampered the development of normal or cooperative forms of economic relations. For the United Nations Economic Commission for Europe (ECE), created in 1947 as an all-European body for European economic cooperation and development, this meant that it had to be content with playing a minor political and economic role and did not therefore succeed in becoming the institutional forum for increasing economic relations and decreas-

<sup>20</sup> The listing of CSCE principles in the preamble of the CMEA draft does not mention basket 3, thereby neglecting one of the essentials of Helsinki, namely, equality of rank of all three baskets.

<sup>21</sup> Basically, these are problems which should be dealt with by the UN Economic Commission for Europe.

<sup>22</sup> If an agreement between the two blocs should be worked out it presumably would have to be an agreement that provides the basic framework for specific contracts between countries or economic agents (e.g. private industry in the West, foreign trade organizations, state enterprises or groups of enterprises in the East). With certain restrictions the 1973 treaty between Finland and CMEA might serve as a model for, such a skeleton agreement. (Cf. M. Baumer: Zur Multilateralisierung des Außenhandels der RGW-Staaten, op. cit., p. 155). Among other things this agreement provides for the establishment of a Cooperation Commission between Finland and CMEA to explore the potential for a multilateral economic and scientific technical cooperation. "The Cooperation Commission presents recommendations and makes decisions in consent with the Republic of Finland and those CMEA members interested in the subject under consideration". (Art. 2/3 of the COMECON-Finland treaty of 16 May 1973. Reprinted in *Ibid.*, p. 222). The principle of "interested" parties in such a skeleton agreement can have positive effects, particularly for smaller COMECON members in so far as they can, but need not, take part in specific cooperation agreements and can act according to their individual economic needs.

In questions of organization and procedures, the Cooperation Commission has decision-making power. As early as November 1973, five sub-commissions were set up in the areas of foreign trade, machine industry, chemical industry, transportation, and scientific-technical cooperation.

ing politico-economic conflicts in Europe.<sup>23</sup> This was primarily because of the failure of the 34 ECE member states to reach fundamental economic decisions "... due to the statutory basis of the organization according to which no member state can be compelled to implement ECE decisions if it withholds its approval. Thus insisting upon majority voting would only lead to tensions within the regional organization."<sup>24</sup>

In this context it has to be noted that not only most West and East European nations—including the USSR—are members of ECE, but the US and Canada as well.

Since 1954 ECE activities have been focused on the intensification of East-West trade, particularly by the preparation of European agreements on international trade jurisdiction and the standardization of export documents, the creation of ways and means to provide information on trading potentials, the elimination of obstacles to trade (tariffs and non-tariff) as well as the discussion of preconditions for multilateralization of trade and cooperation. During the last few years ECE activities have concentrated on the promotion of industrial cooperation, technical and scientific exchange, long-term economic projections, and problems of environmental protection.

In view of the strains imposed on it by East-West differences, the role of the ECE has remained restricted to the achievement of separate pragmatic solutions. This seemed to be the only way to ensure member states' willingness for collaboration.<sup>25</sup> CMEA countries considered the ECE as an appropriate forum to achieve economic objectives against politically motivated Western resistance. This helps to explain why ECE activities have commonly received little attention by Western governments.

As a consequence of the results of the Conference on Security and Cooperation in Europe (CSCE), the scope of ECE responsibilities and activities might increase, and the ECE might become the all-European organization providing the framework for quantitative as well as qualitative intensification of East-West politico-economic relations. In the Final Act of the CSCE, the participating nations declared their determination to pay due consideration to the provisions of this act, also as far as the ECE is concerned. In the following areas the ECE is distinctly called upon to expand and intensify its activities:<sup>26</sup>

Examination of ways for establishing a multilateral system for diffusing foreign trade laws and regulations (including their modification) among member countries.

Standardization of statistical nomenclatures;

The study of possibilities for trade promotion, including promotion of marketing.

Pavement of the way for industrial cooperation by means of

<sup>23</sup> A copious presentation of the early phases of ECE is given by G. Myrdal: *Twenty Years in the United Nations Commission for Europe*. In: *International Organization*, Vol. 23 (1968), No. 3, p. 617-628; cf. also ECE: *The Work of the Economic Commission for Europe 1947-1972*, E/ECE/831, New York 1972.

<sup>24</sup> K. Bolz/B. Kunze: *Wirtschaftsbeziehungen zwischen Ost- und West-Handel und Kooperation* (Economic Relations between East and West Trade and Cooperation); edited by CEPES, since anno et loco, p. 52 (translation by the authors).

<sup>25</sup> Cf. I. Bailey-Wiebecke/E. Chossudovsky: *Folgewirkungen der KSZE im multilateralen Bereich: Die Wirtschaftskommission der Vereinten Nationen für Europa (ECE) (The consequences of CSCE in the multilateral field: The Economic Commission for Europe)*. In: J. Delbrück/N. Ropers/G. Zellentin (Hrsg.): *Grünbuch zu den Folgewirkungen der KSZE (Consequences of CSCE)*, II. DGFK-Veröffentlichung, Bd. 3, Köln 1977 (forthcoming).

<sup>26</sup> *Schlusakte der Konferenz für Sicherheit und Zusammenarbeit in Europa (Final Act of the CSCE)*; *Deutscher Bundestag, Drucksache 7/3867*; passim.

informing interested parties and providing assistance in the preparation of cooperation agreements.

Promotion of the exchange of information and results by expanding multilateral collaboration in the area of technical and scientific cooperation and the organization of conferences and meetings of experts.

Inclusion of various aspects of environmental protection in its work.

Intensification of the work of the ECE Subcommittee on inland traffic and the standardization of traffic rules on inland water ways.

However, a precondition for realization of these rather modest goals is that West and East be prepared to supply the ECE with necessary information and competence. As far as more substantial projects of potential East-West cooperation are concerned, e.g., the creation of a joint energy network between West and East Europe, joint development of transportation systems, division of labor in technological research, the ECE is not mentioned in the Final Act of the CSCE.

## VI. GLOBAL INSTITUTIONS

The institutional organization of the world economy, drawn up by the industrialized countries at the end of World War II, began to show severe signs of malfunction, at least since the beginning of the 1970's.<sup>27</sup> Free trade, being the basic postulate underlying the "International Monetary Fund" (IMF) and the "General Agreement on Tariffs and Trade" (GATT) has failed to prove its adaptability to the development goals and economic structures of the Less Developed (LDC) and the State Trading countries. Furthermore, the creation of regional economic groupings, the increasing importance of non-tariff barriers to trade, the introduction of foreign exchange and convertibility restrictions, the abandonment of the fixed-parity system have contributed to the collapse of the traditional order, within the Western world itself. Whereas the LDC's "Group of 77" energetically express their conceptions about a reorganization of the international economic order (mainly within the UN Conference on Trade and Development (UNCTAD)), the CMEA countries have been rather quiet on the subject.

### 1. GATT

Among the existing multinational economic organizations GATT seemed to have the greatest attraction for East European countries: all CMEA countries except the GDR and the USSR (Bulgaria has observer status) are now members of GATT. This may in part be explained by the relative success of the Kennedy Round on multilateral tariff reductions. But more important may have been that GATT is increasingly occupied with non-tariff barriers to trade which have been affecting international trade relations to growing degree. In general, non-discrimination and MFN-treatment were the advantages to be derived from GATT membership, thereby improving

<sup>27</sup> The USSR and some East European countries participated in the formulation of the economic order after World War II. The USSR participated in the preparation of the "International Currency Agreement" and the "International Trade Organization". In the wake of increasing tensions between East and West, however, the socialist countries ceased collaborating, canceled their membership, or—as was the case with ITO—the considered regulations never came into effect.

the foreign trade prospects (e.g., import prices, competitiveness on the world market) of the East European countries.

The main agreements put forth against membership of CMEA countries were the centrally-planned and discriminating character of their economies.<sup>28</sup>

The basic principles of the GATT system are oriented on the classical postulate of free trade between capitalist countries and codify the trade practices of developed market economies (if one ignores Chapter IV of Trade and Development which was added in 1965 and which accords developing countries certain preferences).

On the other hand, with the CPE's foreign trade monopolies, quantitative measures are not the exception, but rather the rule: the import plan, which is directly related to quantities, structure and goals of the national economic plan, constitutes the key element of foreign trade planning, although the economic reforms have resulted in modified structures. Customs duties are of minor importance, with being a possible exception:<sup>29</sup>

As a socialist manifestation of regional integration, CMEA differs from customs unions or economic communities (such as the EC) or free-trade zones (LAFTA or EFTA) in that the protective measures it employs against foreign imports are not based upon customs barriers, but rather it simply does consider or ignores offers from abroad.

Western government stressed repeatedly that "effective reciprocity" has to be insured before MFN treatment could be extended to State Trading countries. Due to political changes accompanied by attempts of CPE countries to intensify their economic relations with the West, membership was finally granted to them.

Since the CSSR was one of the founding members of GATT in 1947, Poland's accession in 1967 served as a precedent.<sup>30</sup> As Poland, being a centrally-planned economy had no tariff system, specific terms for accession had to be worked out. It was agreed that instead of granting tariff concessions, Poland would commit itself to an annual seven percent increase of its imports from the other GATT members. Even though controversies arose on how to compute this percentage,<sup>31</sup> Rumania's application for membership (July 1968) was accepted in November 1971. The conditions for accession<sup>32</sup> provided that other GATT members pledged to reduce their tariffs vis-a-vis Rumania to the level already applied in their mutual trade, i.e. tariff discrimination in relation to Rumania was "officially" lifted. In return, Rumania pledged to increase its imports from other GATT members at least at the same rate as total imports. The mode worked out for Hungary's accession<sup>33</sup> corresponded to the basic principles determining arrangements between the socialist and other GATT countries; qualitative concessions against cessation of quantitative restrictions. However, it has to be pointed out that Hungary disposed of a functioning tariff

<sup>28</sup> Cf. J. Pinder: EWG, EFTA und COMECON; in: H. Reiber (ed.), *Europas Zukunft zwischen Ost und West*; Baden-Baden 1971, p. 126.

<sup>29</sup> P. Wiles argues that the CMEA countries used tariff solely as an instrument for negotiations and propaganda: they were used to reach MFN treatment from the West. Their introduction and their abandonment had only declamatory values. Cf. P. Wiles: *Communist International Economics*, Oxford 1968, p. 220.

<sup>30</sup> Cf. Protocol of Accession of Poland; in GATT; *Basic Instruments and Selected Documents*, Fifteenth Supplement, Geneva 1968, p. 46.

<sup>31</sup> Cf. H. Schaefer: *East European Relations with GATT*; in: RFE-Research, *Economics* No. 5 18, November 1971, p. 3.

<sup>32</sup> Cf. GATT: Protocol for the Accession of Romania to the GATT, Geneva, 15 October 1971.

<sup>33</sup> Protocol of the Accession of Hungary; in GATT; Document L/3908, 14 August 1973

system as a consequence of its economic reforms since 1968. Thus potential mutual granting of Most-Favoured-Nation status was an element in the entry negotiations.<sup>34</sup>

The intense discussion about the problems of extension or denial of MFN to socialist countries cannot distract from the fact that the economic meaning of this clause has diminished due to a generally lower tariff level and due to the growing non-tariff trade barriers.<sup>35</sup> Hence, the repeated demands of the socialist countries for granting of MFN in the last analysis amount to the demand for non-discrimination.<sup>36</sup> It is still undetermined, however, what economic gains the CPE's can derive from MFN.<sup>37</sup> A quantitative evaluation of these gains could be the basis for ensuring "reciprocity" of mutual economic concessions<sup>38</sup> which is being demanded by the Western countries.

There are indications that GATT's "Tokyo Round" might lead to a softening of the principles of MFN and reciprocity in favour of the LDC's. This would necessitate CMEA members of GATT to associate themselves with one or the other group which in turn could put pressure on them to underpin their verbal support of the LDC's demands by material concessions. The Western members of GATT might then be in a position to pursue a more unified approach vis-a-vis the CPE's, whereas the latter might be induced to coordinate their foreign trade policy.

## 2. IMF

Whereas GATT is to promote the expansion of world trade by reducing trade restrictions and selective preferences, the International Monetary Fund pursues similar objectives in the monetary field by promoting convertibility of currencies, balance-of-payment equilibrium, and coordinated policies with regard to exchange rates.

The rapid growth of East-West trade and the expansion of East-West contacts seem to have facilitated chances for CMEA countries to become members of the International Monetary Fund. The IMF provides its more than 120 member states with credits at favorable terms for compensation of temporary balance-of-payments deficits. Twenty-five percent of a country's subscription to the Fund must be paid in gold upon accession. As these convertible means can indirectly be obtained from the Fund itself, applicants are not confronted with any severe financial strain. Simultaneous membership in the World Bank (IBRD) enables countries to obtain long-term credits in convertible currencies at favorable terms.<sup>39</sup>

<sup>34</sup> Cf. J. Reuland: GATT and State-Trading Countries; in: *Journal of World Trade Law*, Vol. 9, No. 3, May/June 1975, p. 318.

<sup>35</sup> Cf. G. Schiavone: The Most-Favoured-Nation Clause and East-West-Trade-Limitations and Prospects; in: *La Comunità Internazionale*, No. 4/1974 (Padova), pp. 651; P. M. Wijkman: GATT and the New Economic Order; in: *Intereconomics*, No. 8/1975, p. 247.

<sup>36</sup> This demand is raised by the CPE's not only in bilateral negotiations (e.g. USSR-USA), but at the regional (e.g. CSCE, CMEA-EC relations), and the global level as well (e.g. discussions about the Charta of Economic Right and Duties in 1974).

<sup>37</sup> T. Wolf summarizes the results of his work in this field as follows: "While there is little persuasive evidence that in receiving MFN, the socialist countries would in fact be able to realize a significant short-term expansion in their exports to the U.S., it is clear that the effect would in any case be positive, and many East Europeans have stressed the dynamic effects of the goodwill and certainty which would be created by the granting of MFN." T. A. Wolf: *New Elements in US-East-West-Trade Policy*, Forschungsberichte des Wiener Instituts für internationale Wirtschaftsvergleiche, No. 19, June 1974, p. 28.

<sup>38</sup> Cf. C. F. Bergsten: *Future Directions for U.S. Trade Policy*; in: C. F. Bergsten (ed.): *Toward a New World Trade Policy: The Maidenhead Papers*, Lexington-Toronto-London 1975, p. 348; and C. F. Bergsten: *Completing the GATT—Toward New International Rules to Govern Export Controls*; *British-North American Community*, 1974.

<sup>39</sup> One per cent of a country's share in the World Bank must be deposited in gold or dollars, nine per cent must be paid in national currency. The remaining 90 per cent is regarded as guarantee contract and actually amounts to a joint liability of the member states for the obligations of the World Bank, Cf. A. Zwass, *Zur Problematik . . .* op. cit. p. 134.

The Soviet Union actively participated in preparations for the "International Currency Agreement" during World War II but did not sign the Bretton Woods agreement. Poland and the CSSR, two founding members, left the IMF at the beginning of the 1950's.

Currently, Rumania is the only CMEA member of IMF.<sup>40</sup> The main reason for Rumania's accession to IMF and World Bank was probably to increase its credit ceiling. Rumania enjoys a special status within CMEA as far as foreign policy is concerned, which has enabled it to act more independently than other members.

Rumania's contribution, i.e. Rumania's quota in the IMF, amounts to 190 million special drawing rights (SDR). Twenty-five per cent of the quota (47.5 million SDR's) were paid in gold. Thus, Rumania was not granted any special advantages. The rest of Rumania's IMF quota was provided in national currency. Rumania is participating in the special drawing rights account at a rate of exchange which was provisionally set at one US dollar=14.38 leu (SDR=17, 3 leu). Rumania drew its gold tranche in the amount of 47, 5 million SDR's in May of 1973. Thus, the IMF held 100 per cent of the quota in leu. At the end of 1976 Rumania's net drawings amounted to 285 Mio SDR.<sup>41</sup>

In accordance with Art. VIII, Par. 5, of the IMF statutes, candidates for admission must furnish detailed information with respect to their economic situation and development (gold production and stocks, foreign trade data, balance of payments data, national income, price indices and similar information). It is not known what agreements were made between Rumania and the IMF with respect to supplying this information. However, Rumania has not yet completely been included in the official IMF statistics which were available at the beginning of 1977.

The capital stock subscribed by Rumania in the World Bank amounts to 1,621 shares with a nominal value of 162.1 million US dollars (US dollar before the conversion of May 1972). In the first two years of its membership, Rumania was granted investment credits in the amount of over 250 million dollars.

Rumania's application for admission was approved on the basis of Art. XIV of the IMF statutes. In accordance with the latter, economically weak members have the right to restrict current transactions during the transition period. This article makes no distinctions with respect to the motives underlying the payment restrictions. CPE's without convertible currencies can therefore also take recourse to this article.

The collapse of the Bretton Woods agreement and the uncertain future of the international monetary system may have diminished the incentives to join the IMF at present from the standpoint of

<sup>40</sup> In 1968, there were indications for a Hungarian application for IMF membership. The main objective of this step did not seem to be to raise the credit ceiling—as was later the case with Romania—but rather to benefit from political implications of IMF membership. No definite statements are available why Hungary did not pursue its application further. But it is surmised that Hungary accorded priority to its internal economic reform (which was started at that time) and was cautious against overstraining Soviet (as well as domestic conservative) tolerance by embarking on external adventures as well. Regarding Hungary's accession to the IMF, the Vice President of the Hungarian National Bank, H. Fekete, said in late 1973 that Hungary would be hard put to join a monetary system that did not really exist. He said the accession would not be merely a financial question: "Without a general political arrangement, such a step is out of the question and without the other socialist countries, Hungary will not take action." *Vilaggazdasag*, No. 202, 19 October, 1973, p. 1; quoted from *Die Wirtschaft des Ostblocks*, No. 12, 1973 (translation by the authors).

<sup>41</sup> Cf. IMF—International Financial Statistics, Vol. 30, No. 1 (1977), p. 8.

CMEA countries. The chance to integrate the East European countries into the worldwide monetary system which was being built after the end of World War II was missed. But the present situation seems to be appropriate for a second attempt as it should be easier to take into account the specific requirements of socialist countries while formulating a new monetary system as opposed to the modification of an already-existing one.

In the process of East-West rapprochement, both sides seem to be interested in reaching a mutually acceptable international monetary order. But this can only be achieved if, on the one hand, processes of price formation are made compatible among CMEA countries and adjusted to the price structure on the world market combined with the objective of reaching at least partial convertibility and if, on the other hand, the regulations of a new monetary system take into account the specific characteristics and needs of centrally-planned economies. In other words, the scope of the provisions must be wide enough to encourage the participation of non-capitalist economies.<sup>42</sup>

During the last few years, worldwide inflation has hampered the formulation and acceptance of a new monetary order as much as the continuing controversy between the industrialized and the developing countries over a "proper" distribution and redistribution of economic resources. Thus, in a phase of monetary unrest and difficult negotiations greater participation of CMEA countries could create additional problems, especially since the conflicts of interest between developing and industrial nations may be exacerbated by the entry of State-Trading countries.

The formulation and acceptance of a new monetary order is closely linked to a solution of the fundamental problems of the industrialized countries' economic relations with the less developed countries. However, in April 1976 the Council of Governors agreed to change the statutes of the IMF in order to accord them better with economic reality, and in order to give some perspectives on the future functioning of the monetary system.

The characteristics of the envisaged form of the future international monetary system will now be examined in order to determine whether the membership of CMEA countries in the IMF would be encouraged by the new system or not.<sup>43</sup>

The first innovation of the new system that of fixed but adjustable exchange rates, has the advantage that relatively little currency reserves must be held in order to support a national currency. However, since the IMF can provide credits to needy members, the disadvantages of flexible exchange rates, weigh more heavily for the State-Trading countries. These disadvantages are primarily based on the fact that long-term economic planning is further complicated by unstable exchange rates.

The second characteristic of the new system, the planned replacement of the main reserve currencies (primarily the U.S. dollar) and of gold as main reserve units by Special Drawing Rights, will presumably concur with the interests of the smaller East European countries.

<sup>42</sup> For example, a modification of Article VIII of the IMF statutes might be needed, so that it no longer provides for unlimited international capital flows (which are anyway restricted in many parts of the West today).

<sup>43</sup> Cf. J. Witteveen: Das internationale Währungssystem gewinnt an Konturen; in: Finanzierung und Entwicklung, Vol. 13 (1976), No. 3, p. 7.

This is because SDR's are distributed by the IMF to its members (detailed criteria still have to be worked out) which reduces the obligation to hold large stocks of currency reserves. In the longer run, East European countries would probably like to get their currencies into the weighted "basket" determining the value of SDR's. However, some basic problems of convertibility of East European currencies would have to be tackled first.

Lastly, arrangement of details and formulation of the IMF's options for the intervention in the control of liquidity and the processes of adjustment could be influenced and shaped by CPE countries. By this, the objectives of CMEA countries as to the working mechanism of a new international monetary system could be more easily realized.

The new system is to be "multipolar" in character, i.e. it permits diversifications according to the interest of participating countries and groups of countries. It could thus constitute a worldwide framework within which special arrangements could be made on the regional level; the long-term goal of a uniform arrangement is not abandoned, however.

The membership of CMEA countries in the IMF seems conceivable on this basis. One reason for this is that the problem of convertibility seems susceptible of solution, and moreover a modified convertibility concept could be applied for the East. For instance, the Soviet Union, while maintaining the foreign trade monopoly and by regulation the flow of goods, services and capital, could effect Ruble exchange operations with Western banks, i.e., it could achieve the financial convertibility of the Ruble.<sup>44</sup> In a reformed monetary system, the Ruble could prove to be functional even if convertible only to a limited extent.

Should the Soviet Union become a member of IMF it would, thanks to a high quota, be able to nominate an executive director, i.e., it would participate directly in all decision-making processes and would have a veto right.<sup>45</sup> The ensuing shift in the allocation of votes in the board of directors would under present circumstances mean that the EC's qualified minority status would be repealed. It can be expected that should the Soviet Union join the IMF, the distribution of quotas would have to be totally revised, just as the qualified minority rule.<sup>46</sup>

The prospect of benefit from the Fund's credit and financing facilities constitutes the main incentive for State Trading countries to consider an adaption to the international monetary system. However, it has to be kept in mind that questions of price formation and determination of the role of money touch upon the very root of the political economy of socialism and its underlying ideology.

### 3. UNCTAD

GATT and the IMF are both multinational organizations which use admission conditions and obligations to constrain their members to adhere to a certain behavior toward one another. Such binding stipulations are not existing for the United Nations Conference on

<sup>44</sup> Cf. P. Wiles: "On Purely Financial Convertibility", in: *Banking, Money and Credit in Eastern Europe: NATO Colloquium*, ed. Y. Lailan (Brussels, 1973), pp. 119-125.

<sup>45</sup> Even if all CMEA states, with the exception of the U.S.S.R. and the GDR, would join the IMF, the distribution of quotas would not be changed decisively: These countries would not be able to nominate an executive director and thus would only be indirectly involved in the decisions, i.e. by a deputy.

<sup>46</sup> Independent of a possible Soviet entry, the increased economic and political weight of the OPEC countries has led to a redistribution of quotas within the IMF.

Trade and Development (UNCTAD). The latter represents a forum which was established in the context of the United Nations' First Decade of Development. All UN members and members of UN organizations can participate in UNCTAD.

The original task of UNCTAD was the development of world trade. Since 1964, however, UNCTAD is mainly concerned with the problems of LDC's and is used by the "Group of 77" (which now consists of about 110 LDC's) as a forum to articulate their economic demands. As long as these demands were mainly directed towards the capitalist countries they were supported by the USSR and her allies. From a Soviet point of view accomplishment of these demands would strengthen the position of the socialist countries. In supporting the LDC's demands at UNCTAD, the CPE's expected in return to get support from the LDC's as far as socialist conceptions on East-West economic relations are concerned.

This strategy seemed to work. In the "Declaration of Lima" of November 1971,<sup>47</sup> the "Group of 77" differentiated between "market economies" and "socialist countries of Eastern Europe." At the Manila meeting in February 1976, market economies and CMEA countries were dealt with separately. At the same time, however, the "Group of 77" stressed the point, that they expect more development assistance from the socialist countries and better support for their demands for a new international order.

Specifically, the "Manila Declaration" lists 15 points of complaint as far as CMEA countries are concerned. The most important ones are the following:<sup>48</sup>

The share of development aid in GNP is too low (approx. 0.01 percent.)

Aid is mainly granted on a bilateral level.

The more developed CMEA countries are not sufficiently promoting the marketing and consumption of the LDC's products.

Preferential tariffs are not granted for imports from LDC's.

The CMEA countries are quite passive when it comes to take up concrete measures for realizing the declarations and principles.<sup>49</sup>

In trade with CPE's the same problems are encountered as in trade with the industrialized market economies: use of world market prices and other instruments of the capitalist trading system.

Fundamental problems of the less developed countries, like stabilization of export earnings have not been dealt with by GATT (which the LDC's label as a "rich man's club"<sup>50</sup> with rules designed and operated only for the benefit of the wealthy industrialized countries). The lasting discussions of these problem in UNCTAD, however, may have caused the industrialized countries to earnestly consider the introduction of some sort of raw material program.

<sup>47</sup> Cf. The Declaration and Principles of the Action Programs of Lima; adopted on 7 November 1971; UN Doc. MM/77/II/11.

<sup>48</sup> Cf. Manila Declaration and Program Action; UNCTAD, Doc TD/195, February 12, 1976.

<sup>49</sup> The "Joint Statement" which the CMEA nations submitted at UNCTAD IV and which provides for a number of beneficial measures, is a non-binding declaration of intent. Cf. UNCTAD; Joint Statement by Socialist Countries at the fourth session of UNCTAD, TD/211, May 28, 1976.

<sup>50</sup> E. Wyndham-White (former Secretary-General of GATT) put it this way: Negotiations in Prospect, in: C. F. Bergsten (ed.): *Toward a New World Trade Policy*, cit, op., p. 337.

In this sense it seems conceivable that UNCTAD could play a more important role in a new international economic order, e.g., by closer cooperation with the IMF and GATT.<sup>51</sup>

## VII. CONCLUSIONS AND PERSPECTIVES

Some possible implications of closer institutionalized East-West economic relations for the East European countries and the Soviet Union can be stated as follows. The process of eliminating Western economic discrimination may be promoted while the CMEA countries may be compelled to remove trade barriers themselves. This would contribute to continued growth of East-West trade (gains from division of labor, larger markets, etc.). Membership or greater participation of CPE countries in international economic organizations, as well as bilateral and multilateral agreements could promote international economic interdependence, and thereby help to reduce the risk of conflicts and contributes to the improvement of international relations.

It cannot be expected that the Western countries fully endorse a far-reaching institutionalization of economic relations at the multinational level as long as they put first priority on the realization of national objectives which may very well conflict with those of other capitalist countries. Assuming that the West European integration process will continue it seems possible, however, that in the long run such competitive positions might gradually be replaced by a more unified approach.

It is not surprising, however, that the socialist countries have political reservations against an integration into economic organizations dominated by the West. These institutions might jeopardize the socialist system if their interests are not sufficiently taken into account. Yet, appropriate representation and consideration of national economic requirements seem to be a problem in intra-CMEA relations as well. This is illustrated by the isolated extra-bloc initiatives of some East European countries. These initiatives can be looked upon as efforts to overcome the traditional economic bilateralism.

Generally speaking, increasing contacts by socialist countries with organizations of the Western world economy may promote economic and social development in CMEA countries. The Soviet Union seems to be interested in improved access of its CMEA partners to Western markets as it directly and indirectly might derive benefits for itself (social stabilization in Eastern Europe through better consumer satisfaction via intra-bloc imports, acquisition of advanced technologies, and higher growth rates).

It should not be overlooked that closer institutional cooperation might entail problems of delimitation which could develop particularly within CMEA. A greater opening toward the West may in the long run impair genuine "socialist" objectives due to effects of penetration and demonstration inherent in this process and could thus in fact provoke social and ideological conflicts within and among the socialist countries.

<sup>51</sup> In his speech at UNCTAD IV in Nairobi, the Soviet foreign trade minister Patolichev did not want to exclude the possibility that UNCTAD may become an International Trade Organization which has competence over GATT problems. (Cf. *Aubenhandel*, No. 7, 1976, p. 8). This argumentation reminds of the Soviet proposal for the creation of an International Trade Organization which was made to UNCTAD in 1964 and which explicitly mentioned the Havana Charta of 1948. (Cf. UNCTAD, E/CONF. 46/50 and E/CONF. 46/51 of 5 February 1964).

A further result of integrating CMEA countries in world economic organizations can be found in the fact that the institutions which were originally founded by the industrialized countries could cease to fulfill their original purpose (uniform articulation of interests to the outside, obligatory solution of problems within) because of divergent interests and economic systems. Under these conditions, these organizations would form a generally acceptable and thus broad context within which various regional and/or multipolar interest groups agree upon binding and functionable arrangements. For this reason it would seem from the point of view of the Western industrialized nations that the inclusion of countries with lower levels of development and/or other social systems would only be plausible if at the same time an institutionally secured and strengthened formulation of their own interests can take place, for instance, within separate organizations (such as OECD), or by building fractions within global organizations (such as the Club of Ten within the IMF).

In this context it seems conceivable that the OECD could cover institutionally the following subjects:

- Formulation of a joint strategy vis-a-vis CMEA countries and development of joint regulations for the conclusion of trade and cooperation agreements with them.

- Safeguarding of reciprocity in trade relations with CPE's;

- Determent of unfair trade practices (e.g., dumping).

- Evaluation of possible effects of indebtedness.

- Promoting multilateralization of East-West economic relations, and coordination of bargaining positions within multinational organizations.

- Effectuating that the CMEA countries bear their share of obligations to the Third World.<sup>52</sup>

Institutional reglementations of East-West economic relations could also be embedded in a new international order. In this context, the historical ideas on the creation of an International Trade Organization could be reconsidered. Such an organization could not only work on the solution of GATT problems, but also on problems of capital transfer ("GATT for investment") and raw material supply.

Chances for such developments however seem to be slim.

<sup>52</sup> Cf. H. D. Jacobsen: Die Entwicklungen der wirtschaftlichen Ost-West-Beziehungen als Problem der westeuropäischen und atlantischen Gemeinschaft (The Development of East-West Economic Relations as a Problem of the West-European and Atlantic Community), SWP—S 242, Ebenhausen, 1975, p. 114. In June 1976, the former U.S. Secretary of State proposed to the OECD an East-West trade policy which would strengthen the role of OECD in East-West economic relations.

## I. INTRODUCTION

Over the last decade, East-West commercial exchanges between market and non-market economies have increased in both volume and complexity. From simple trade transactions, these exchanges have evolved to include licensing, co-production, joint marketing, and even joint equity ventures. Along with these changes in the size and character of commercial transactions, there has been a transformation of old, creation of new, and general proliferation of institutional arrangements. In the commercial sector, industrial cooperation agreements have become the *dernier cri* of contractual relations between Western companies and Eastern committees or enterprises, and a host of joint chambers of commerce or economic committees have sprung up between Western and Eastern industrial associations. The comparable institutions on the government-to-government level have become the cooperation agreements and joint commissions.

At the end of 1976, there were in existence 128 agreements on economic, industrial, scientific and technical cooperation between the twenty Western market economy and the seven Eastern planned economy countries which are members of the U.N. Economic Commission for Europe.<sup>1</sup> The number of joint commissions between these

<sup>1</sup> United Nations, Economic Commission for Europe, *Long-Term Agreements on Trade, Economic, Industrial, Scientific and Technical Cooperation* (Secretariat Note), TRADE/R.334/Rev. 1, 16 November 1976, p. 1.

countries probably is only slightly smaller. Given the seeming popularity of the joint commission institution and the resources committed to it by the governments of East and West, a number of questions inevitably arise. Where do the joint commissions fit into the overall context of East-West commercial relations? Have they contributed to the elimination or reduction of the barriers to trade posed by the fundamentally different economic systems of East and West? To what extent have they responded to private sector interest in increased trade, and to what extent have they stimulated it? What types of problems have they effectively resolved, and what matters have proven not suitable for commission action? What more might the joint commissions still accomplish?

Two years ago, the nations which are the parties to these commissions concluded the Conference on Security and Co-operation in Europe by adopting a Final Act which set out guidelines and principles for economic and commercial relations among the participants. In many instances, the declared purposes of the joint commissions parallel the objectives set forth in Basket Two (Co-operation in the Field of Economics, of Science and Technology and of the Environment) of the Final Act. In some instances, the Act even indicates the joint commissions as suitable bodies for encouraging the envisioned cooperation. How then might the joint commissions contribute toward furthering the objectives of the Helsinki Accords?

In addressing these questions, this paper will first review the experience of the other Western parties to joint commissions and then focus in greater detail on the American experience with the three joint commissions the United States has established in the commercial sphere with the U.S.S.R., Poland and Romania.

## II. THE EXPERIENCE OF THE INDUSTRIALIZED WEST

### *Establishment and Purposes of Joint Commissions*

Although trade commissions between the countries of the industrialized West and the Eastern European countries originated in the 1950's, it was only in the mid-1960's that joint commissions began to develop in their present form. It was then that traditional trade agreements increasingly came to be supplemented by science and technology cooperation agreements, and later by long-term "umbrella" agreements for economic, industrial, scientific and technical cooperation.<sup>2</sup> Whereas in the late 1960's most of the agreements being concluded were concerned with trade, by the mid-1970's the economic, industrial, scientific and technical cooperation agreements achieved predominance.<sup>3</sup> A report of the Economic Commission for Europe noted that as of November 1976, there were in existence 94 trade agreements and 128 agreements on economic, industrial, scientific and technical cooperation between the Western and the planned economy members of the Commission.<sup>4</sup> Most recently, the umbrella cooperation agreements are being supplemented by "programs" for economic, industrial and technical cooperation.

<sup>2</sup> There are numerous variations in the formal titles of these agreements, which may include all four types of cooperation (economic, industrial, scientific, and technical) or only two or three.

<sup>3</sup> United Nations, Economic Commission for Europe (ECE), *Long-Term Agreements on Economic Co-operation and Trade* (Secretariat Note), TRADE/302, 25 October 1974. The entrance into force of the European Economic Community's common commercial policy concerning the negotiation of trade agreements undoubtedly contributed to this shift.

<sup>4</sup> ECE, *Long-Term Agreement*, *op. cit.*, p. 1.

It is this elaborate network of closely related and often overlapping agreements which has spawned the complex body of implementing structures known as joint commissions. Most of these agreements, whether concerned with trade or with economic, industrial, and technical cooperation, provide for the establishment of joint commissions to supervise their implementation. Many of the joint commissions originated from the provisions of trade agreements and were responsible for drafting the annual trade protocols specifying levels and commodities of trade. As the additional agreements were concluded, the scope of the joint commissions' functions usually was broadened to encompass the new agreements. In rarer instances additional commissions were created to facilitate the implementation of cooperation agreements.<sup>5</sup> Where no joint trade commission already existed, the signing of a cooperation agreement usually involved the creation of a joint commission.

The transition from trade agreements to cooperation agreements involved more than a change in nomenclature. Whereas trade agreements were essentially prescriptive, with each of the parties undertaking specific obligations such as to accord most-favored-nation treatment to the exports of the other, the cooperation agreements are more hortatory. The signatories assume few concrete obligations, but rather undertake to exert their best endeavors toward fulfillment of the objectives of the agreement. Hence the prevalence of terminology such as "facilitate," "encourage," and "promote" in these agreements.

There has been a corresponding change of emphasis in the functions of the joint commissions. Whereas under the trade agreements the joint commissions tended to be treated essentially as fora for the consideration of complaints between the two parties, the commissions have now been given a more positive mission, stimulation of trade and commercial cooperation. Their terms of reference thus foresee them framing measures to facilitate cooperation, defining the forms of cooperation which might be pursued, and determining the branches of production which might be of interest.

Along with the expansion of the scope of commission endeavors, there has been a broadening of representation on the commissions. Delegations of the respective countries now include not only government officials, but also representatives of their industries and research institutes. This reflects the basic characteristic and limitation of the cooperation agreements and the joint commissions which oversee their implementation. These institutions can only create the possibilities and framework for commercial cooperation. They cannot negotiate or conclude the specific contracts which would bring about the envisioned cooperation.

Although bilateral commissions are not a new phenomenon in international relations, having previously been created for specific purposes such as fisheries or boundaries or between a few selected partners such as the U.S. and Canada, joint commercial commissions have proliferated and become identified primarily as an institution of East-West trade. There is evidence, however, that the joint commission concept is gaining acceptance beyond the East-West trade

<sup>5</sup> For instance, Canada and the Soviet Union created two commissions, the Mixed Commission on Cooperation in the Industrial Application of Science and Technology and the Joint Consultative Commission on Trade.

context. There is a growing number of joint commissions between the countries of Eastern Europe and those of the Third World. Industrialized Western countries also have begun participating in joint commissions with countries from other geographic areas such as the Near East.<sup>6</sup>

### *Organization*

All the joint commissions, despite individual variations, operate in a fairly similar manner. The organization and responsibilities of each commission are usually set out in a separate document linked with the long-term agreement. These terms of reference define the authority for the creation of the commission, the scope of its activities, the possibilities for creating working groups, and administrative procedures.

The commissions normally meet once a year for two to five days. On the average five to six persons participate from each country, although some commissions include as many as fifteen or twenty from each side. Each country's delegation is headed by a senior government official, such as the minister or deputy minister of either foreign trade or another economic agency, who cochairs the commission session.

Generally, all the fields of economic activity defined in the bilateral agreements are within the competence of the joint commission, although additional subjects may be considered by mutual agreement of the parties. A typical commission agenda would include: (1) review of the general economic situation in the two countries; (2) review of developments since the last session of the commission; (3) discussion of on-going cooperation projects; (4) possible new cooperation projects; (5) other questions.

Working groups are an integral part of the commissions and carry out the greater part of the practical work upon which the decisions of the commissions are based. Sessions of the commission proper involve an exchange of views and resolution of issues at the highest official level. Each side informs the other of what it sees to be the desired direction of development in bilateral commercial relations, the policy issues of primary importance, and the particular projects, either on-going or under negotiation, of greatest interest. The Commission creates and defines the terms of reference of particular working groups. The working groups in turn submit recommendations to the Commission for action on matters beyond their jurisdiction or on matters on which they have been unable to resolve differences.

### *Mixed Commissions*

Most of the joint commissions are "mixed commissions" in the sense that they are a "mix" of government and industry. Businessmen participate alongside government officials in both the commission and its working groups or at least in the working groups. The way in which industrial associations and private businessmen are selected and participate in the commissions reflects the particular relationship between government and industry in the particular Western country.

<sup>6</sup> Since 1974, the United States, for instance, has established joint commissions with Egypt, Israel, Jordan, Saudi Arabia and Tunisia. See Stephen D. Hayes, "Joint Economic Commissions as Instruments of U.S. Foreign Policy in the Middle East," *The Middle East Journal*, Vol. 31, No. 1 (Winter 1977).

The private sector has played the greatest role in the joint commissions in those Western countries where there has been a long tradition of cooperation between industry and government, such as West Germany, or where the government exerts a strong influence on the private sector, as in France. The organization of industry itself also influences the nature of private sector participation. Where industrial associations have historically served as a vehicle for mobilizing industry along sectoral lines, channeling information, and providing a link between government and industry, these federations have become an integral part of the mixed commission mechanism. In Britain, for example, the Confederation of British Industry (C.B.I.) had established twelve joint working groups with the Soviet State Committee on Science and Technology before the mixed commission was established, and currently the C.B.I. and its member federations provide staff for the commission's working groups, participate in nominating company representatives, canvas firms to obtain their views, and disseminate information.

On the Eastern side, the representatives of industry are usually officials of industrial ministries, their research and design institutions, and the state committee on science and technology, and perhaps representatives of foreign trade organizations. Matching the interest and expertise of the Eastern and Western industry participants in the working groups, especially sectoral ones, is not always an easy matter. The Western businessmen may be more interested in the commercial questions of discussed projects, while their Eastern counterparts come prepared to look at the technical aspects. "We have found that, as presently constituted, the working groups often bring together Soviet technicians and Canadian salesmen who talk at cross-purposes," reported the investigators of the Canadian-Soviet Commission.<sup>7</sup> The Eastern delegations sometimes include fewer "industrialists" or managers of end-user enterprises than the Western businessmen might desire.

### *Working Groups*

Working groups may be either permanent or *ad hoc*, depending on the continuing importance of the problem. There are two types of working groups—*functional* groups which consider questions such as financing, industrial cooperation, agricultural trade, patents and trade regulations, and *sectoral* groups which focus on the possibilities for cooperation in specific industries such as mining, metallurgy, engineering, chemicals, food processing, or textiles. The number of working groups varies from commission to commission and even within the same commission over time. The Canadian-Soviet Mixed Commission on Cooperation in the Industrial Application of Science and Technology, for instance, has established eight working groups, while the Franco-Soviet Mixed Commission has fourteen. Many commissions have two or three functional working groups and set up *ad hoc* sectoral groups as interest is generated.

<sup>7</sup> I. A. Litvak and C. H. McMillan, "Intergovernmental Cooperation Agreements as a Framework for East-West Trade and Technology Transfer," in Carl H. McMillan, *Changing Perspectives in East-West Commerce* (Lexington, Mass.: D. C. Heath & Co., 1974), p. 169.

*Sectoral Groups*<sup>8</sup>

The sectoral working groups are essentially mechanisms to bring together potential partners from East and West. Particular Western governments play a greater or lesser role in the activities of these working groups, but generally the role of the Western government in the sectoral groups is facilitative rather than directive.

Sectoral groups are formally charged with studying specific problems in technical areas, establishing the framework for private cooperative agreements, and planning technical exchanges and trade missions. For the Western businessmen the primary motivation for participating in such meetings has been to gain information about the Eastern markets and other necessary commercial information and access to decision-makers and end-users as a means to making sales.

The working groups have proven most effective in helping Western businessmen to identify key Eastern decision-makers in production sectors and establish personal contacts with them. They have done this through the working group sessions themselves, the plant visits often organized in conjunction with a working group meeting, and the seminars and trade missions organized through their initiative. While not eliminating them totally, the working groups have helped to reduce the institutional barriers interposed by some Eastern countries to direct contacts by Western firms with Eastern producing enterprises and research and development institutes. Participation in the working groups is particularly useful for small or medium sized companies for whom independent pursuit of contacts may be difficult and expensive. Contacts with Western industrialists probably have proven useful to the Eastern participants for whom the identification of interested Western firms to contact may prove confusing even with the accessibility of Western firms to such contacts.

The working groups have been marginally effective in accomplishing the exchange of detailed commercial and project information. The interests of the two sides in different types of information and the nature of the working groups contribute to this. The Western participants generally seek to gain commercial information, while the Eastern side looks more for technical information. Since competing Western firms generally are represented in the working groups, discussions of projects tend to be general lest privileged information be passed to the competition. The working level members of Eastern delegations at times do not have authority to discuss certain types of information, while Western businessmen may be able to speak only for their own firms and not industry in general. Nevertheless, there is a feeling that, as a result of relationships built up over the years, some information base is being developed about capabilities, requirements, and business practices, and greater understanding is being generated about the respective systems.

While the ultimate objective of the agreements and commissions is the conclusion of concrete sales and cooperation contracts between the respective countries, the working groups and indeed the commissions can only facilitate and not accomplish this. It is in this area that the major operational difference between Western and Eastern

<sup>8</sup> This section draws on research done in 1974 by Christine Lucyk of the Bureau of East-West Trade of the U.S. Department of Commerce.

participants in joint commissions is most evident. The Western delegates (both government and private sector members) as representatives of a market economy can act at a general framework level. They can receive and agree to disseminate information from their Eastern counterparts as to individual sectors or projects in which the latter are interested. They can provide similar information about the interests of their own industries if they have the possibility to poll the industry or have strong industrial associations. They can discuss and propose solutions concerning problems of cooperation in particular industries. The Western members may be able to agree to arranging trade missions or seminars. They may even be able to draw up programs for industrial cooperation. The Western side, however, cannot commit the private sector to participation in projects. Following these working group discussions and contacts, contract negotiation is still up to the discretion of individual firms.

Eastern delegations, however, represent unified systems which can present proposals and determine whether or not they wish to participate in a specific contract. When similar working groups or commissions take place between Comecon countries, the outcome frequently is a concrete agreement concerning specific projects. The working groups between East and West cannot do so. This difference in authority between Western and Eastern delegations, stemming from differences in economic systems, inevitably leads to the Western delegation being placed in a more passive role vis-a-vis its Eastern counterpart. The rare exceptions in which the Western side approaches the decision-making competence of the Eastern counterpart are in projects falling under the nationalized industries or semi-state enterprises of the Western country.

Thus the asymmetry of the respective systems places limits on what the working groups can accomplish. In their response to an inquiry of the Economic Commission for Europe, member governments stated that working groups have proved helpful in organizing seminars, visits, symposia and consultations between experts and have facilitated the establishment of direct links between enterprises and other organizations or bodies in partner countries.<sup>9</sup> Despite the above indicated shortcomings, some see the sectoral working groups as the most substantive and operational element present in the mixed commissions.

### III. THE U.S. EXPERIENCE

The three Joint Commercial Commissions which the U.S. has established to date with the countries of Eastern Europe were the products of the summit meetings of the early 1970's which initiated a new phase of relations with each country. The Joint U.S.-U.S.S.R. Commercial Commission and the Joint American-Polish Trade Commission were established during President Nixon's visit to Moscow and Warsaw in May-June 1972. The creation of the American Romanian Economic Commission was agreed upon during the December, 1973, visit of President Ceausescu to Washington.

Commercial and economic ties were but one aspect of the broad range of bilateral relations discussed at these summit meetings. They,

<sup>9</sup> United Nations, Economic Commission for Europe, *The Work of the Intergovernmental Joint Commissions in the Field of East-West Industrial Co-operation* (Secretariat Note), TRADE/AC.3/R.3, 27 August 1976, p. 4.

nevertheless, were deemed "an important and necessary element in the strengthening of bilateral relations."<sup>10</sup> The utility of creating an institutionalized framework for treating economic relations was suggested not only by the interest in expanding trade ties, but also by the need to resolve various framework issues and overcome the complex problems inherent in trading between centrally planned and free market economies if normalization and expansion of trade ties was to take place.

### *Organization*

All three commissions share certain broad common purposes: to coordinate efforts to broaden and facilitate trade relations and to monitor the spectrum of bilateral commercial relations, identifying and, when possible, resolving issues that may be of interest to both parties. The terms of reference, which set out the tasks for each commission, reflect the particular state of relations existing between the U.S. and the particular Eastern European country at the time of the Commission's creation. Those for the Joint American-Polish Trade Commission are the most general, reflecting the fact that trade between the U.S. and Poland had been conducted on an MFN basis since 1960 and was already increasing modestly. The terms of reference of the Joint U.S.-U.S.S.R. Commercial Commission set out quite specifically the basic problems the Commission was to address. They call for the Commission to negotiate an overall trade agreement including reciprocal MFN treatment; arrangements for the reciprocal availability of government credits; provisions for the reciprocal establishment of business facilities; and an agreement establishing an arbitration mechanism for settling commercial disputes.<sup>11</sup> The terms for the American-Romanian Economic Commission, in addition to facilitative measures, task the Commission to "provide a forum for exchanging information and consultation on areas for cooperation,"<sup>12</sup> a function which has gained in importance in all three commissions.

All three of the joint commissions are similarly organized. Each commission meets annually, or as otherwise agreed upon, alternately in Washington and the foreign partner's capital. The commissions' work is conducted both in plenary sessions and in working groups to consider specific matters. Working group or experts' meetings may be held between commission sessions if the need arises. Unlike many of the West-East European commissions, the U.S.-East European joint commissions are not "mixed commissions," that is they do not include industry representatives. They are strictly government-to-government bodies. The commissions' exchanges are conducted at the highest government levels. Chairmanship of the commissions for the U.S. side is performed by either the Secretary of Commerce or the Secretary of Treasury, and by either a Vice Premier or the Minister of Foreign Trade for the Eastern European commission partner. Working groups are chaired at the sub-cabinet level. The delegation of each side, in addition to the Departments of Commerce and Treasury, includes representatives of the various government agencies with an interest

<sup>10</sup> "Basic Principles of Relations between the United States of America and the Union of Soviet Socialist Republics," May 16, 1972, seventh principle, in *U.S.-Soviet Commercial Agreements 1972* (Washington: U.S. Department of Commerce, January 1973), p. iii.

<sup>11</sup> *Ibid.*, p. 3.

<sup>12</sup> *American-Romanian Economic Accords 1973-1974* (Washington: U.S. Department of Commerce, March 1975), pp. 9-11.

in the subjects discussed, such as the Departments of State and Agriculture, the Export-Import Bank, the Special Trade Representative, and the Council on International Economic Policy. The high level at which the discussions are conducted reflects the political implications which are attached to these commercial relations and the fundamental government policy decisions which have been required for some of the Commissions' actions. The interagency character of the representations, on the other hand, facilitates discussion and resolution of issues cutting across agency lines or linkage of issues falling under different agency jurisdictions.

In 1977, the Joint American-Polish Trade Commission will hold its Seventh Session, the Joint U.S.-U.S.S.R. Commission its Sixth Session, and the American-Romanian Economic Commission its Fourth Session. The matters which they have considered will be reviewed under several headings—trade agreements, trade targets, commercial policy, business facilities, exchange of information, and industrial cooperation.

#### *Agreements*

Unlike the West-East European joint commissions, the joint commissions in which the United States participates were not created under the terms of trade or long-term cooperation agreements. In the case of the U.S.S.R. and Romania, the joint commissions with them were the instrumentalities through which first trade agreements and later long-term cooperation agreements were negotiated. In the case of Poland, although no agreement of either kind has been concluded, the Joint Statement on Economic, Industrial, and Technological Cooperation issued by President Ford and First Secretary Gierek in Washington in October 1974, was prepared within the commission framework. Both the U.S.-U.S.S.R. Trade Agreement of 1972 (Art. 9, par. 2) and the U.S.-Romanian Agreement on Trade Relations of 1975 (Art. 11) designate their respective joint commissions to oversee and facilitate the implementation of the trade agreements. Similarly the long-term agreements with the U.S.S.R. (Art. V) and Romania (Art. V) on economic, industrial, and technical cooperation specify that the joint commissions are to monitor the implementation of the agreements.

In addition to serving as mechanisms for the negotiation of the trade and cooperation agreements, the joint commissions have served as fora in which the negotiation of specific agreements such as those in taxation or air worthiness has been proposed and agreed upon. Although negotiation of these specific agreements has been conducted outside the commission framework, the commissions have monitored their progress and, on occasion, provided impetus for the resolution of differences and conclusion of the agreements. While the trade agreements and some of the specific commercial agreements could equally well have been negotiated through normal diplomatic channels, the long-term cooperation agreements require a forum for problem identification and continuing implementation and thus are intimately linked to the existence of joint commissions.

#### *Trade Targets and Trade Promotion*

The review of past trade performance and setting of future trade targets has become an integral part of commission proceedings. Thus

the First Session of the American-Romanian Economic Commission in April 1974, agreed that a trade level of \$1 billion would be a realistic and desirable goal for 1980.<sup>13</sup> This goal was reaffirmed at the Second Session in November 1975. In addition, more specific targets were set for each of the next five years (1976—\$400 million; 1977—\$500 million; 1978—\$670 million; 1979—\$800 million; 1980—over \$1 billion). The Trade Agreement which was concluded earlier that year envisaged a tripling of bilateral trade during the initial three-year period of the Agreement, as compared with the 1972–1974 period. These goals were reaffirmed at the Third Session in November 1976.

The Joint American-Polish Trade Commission discussed trade prospects at some length at its Second Session in November 1972, reviewing both the products and conditions which could contribute to trade expansion. Thus it was projected that U.S.-Polish trade could at least triple over the coming five years from the 1971 level of \$180 million. It was also expected that U.S. exports to Poland of manufactured products could increase over several years from the level of \$2–3 million annually to \$150 million annually.<sup>14</sup> At its Fourth Session in September 1974, the American-Polish Commission anticipated that bilateral annual trade might reach \$1 billion in 1976 and grow to \$2 billion by 1980. These goals were incorporated into the Joint Statement on Cooperation and continue to be operative.<sup>15</sup>

Potential levels of trade were similarly discussed with the Soviet Union. The U.S.-U.S.S.R. Trade Agreement of October 1972, contemplated that total trade during the three-year period of the agreement would at least triple over the 1969–1971 level to an aggregate amount of \$1.5 billion.<sup>16</sup> The Joint Communique issued in June 1973, during General Secretary Brezhnev's visit to the United States stated that the two countries should aim at a total of \$2–3 billion of trade over the next three years. In all three cases, the established trade goals have in general been met or surpassed.

The setting of trade goals, even though these are not binding on either side, serves more than a public relations function in East-West trade relations. It is a recognition of the centrally planned nature of the Eastern economies, and the inefficiency of commercial incentives alone (MFN, prices and quality of goods, etc.) in allocating the level and direction of trade in the face of planning directives. The targets for trade increases are a mechanism for bridging to some extent the differences between different economic systems. The targets are also a trade promotion technique of sorts to interest traders by indicating the potential of the market. At the same time, presupposed as they are on the adoption of certain commercial policies, the trade targets serve as both an incentive to and a measure of policy implementation.

### *Business Facilities*

The efficient conduct of international business requires the availability of various physical and administrative facilities. As recognized by the Final Act, such business facilities can contribute positively to

<sup>13</sup> *Ibid.*, p. 17.

<sup>14</sup> *American-Polish Trade Accords 1972–1973* (Washington: U.S. Department of Commerce, February 1974), pp. 5–6.

<sup>15</sup> "Joint Statement by President Ford, Polish Leader," *Commerce America*, October 24, 1974.

<sup>16</sup> *U.S.-Soviet Commercial Agreements 1972*, *op. cit.* pp. 75 and 89.

the development of commercial relations. Measures aimed at improving the working conditions for foreign businessmen and firms in the respective countries have received prominent consideration in the work of the three U.S. joint commissions with Eastern Europe.

At the time the joint commissions were established, very limited opportunities existed for American companies to operate on a permanent basis in the Eastern European countries. Business had to be conducted either through the communist country's state commercial agents or frequent visits by company representatives to the country. The few exceptions in which U.S. companies had their own offices were limited to trade, tourism, or purely technical operations. Prior to the commissions' negotiations, only two U.S. companies in Moscow and one in Warsaw—all in tourism or travel—had been accredited to operate their own offices. Only in Romania, following the 1971 decree on foreign representations,<sup>17</sup> had firms been able to establish their offices prior to specific bilateral arrangements.

While no system of accreditation similar to that obtaining in Eastern Europe existed in the United States to bar the establishment of Eastern European commercial representations in the United States, visa restrictions and a lack of official encouragement acted as an effective deterrent.

Initial discussions of business facilities thus focused on creating the right for foreign firms to establish commercial offices and defining the basic conditions for their operation. A broad gamut of issues was covered: criteria and procedures for accreditation, office space, communications and office equipment, employees, housing, visas, customs, taxes, and exchange rates. Understandings on these matters were reached at the very earliest meetings of the respective joint commissions and were set forth in the documents emanating from the commissions.

Both the First (July 20-August 1, 1972) and Second (October 12-18, 1972) Sessions of the Joint U.S.-U.S.S.R. Commercial Commission devoted considerable attention to the question of business facilities and the establishment of commercial representations for firms of the two countries. The agreed upon facilities were embodied in Art. 6 of the U.S.-U.S.S.R. Trade Agreement signed at the conclusion of the Second Session on October 18, 1972 and in the exchange of letters and attachments on business facilities between Minister of Foreign Trade Patolichev and Secretary of Commerce Peterson on that same date.<sup>18</sup>

These were reaffirmed in Art. 4 of the Long-Term Agreement to Facilitate Economic, Industrial, and Technical Cooperation Between the USA and the USSR of June 29, 1974. Since then, the number of U.S. firms with offices has grown to twenty-six.

The Joint American-Polish Trade Commission took up the question of business facilities in general at its Second Session (Nov. 4-8, 1972), at which time Poland agreed to accredit foreign firms for the conduct of commercial in addition to technical activities. As directed by the Second Session, a Working Group on Business Facilities met March

<sup>17</sup> "Decree on Authorization and Working Regulations of Commercial Agencies Set Up by Foreign Trading Firms and Economic Organizations in the Socialist Republic of Romania," Decree No. 15 of January 25, 1971, *Official Bulletin of the Socialist Republic of Romania*, No. 10, January 27, 1971.

<sup>18</sup> *U.S.-Soviet Commercial Agreements 1972*, op. cit., pp. 90, 96-101.

1-7, 1973, to work out in detail the conditions for representation offices, and its "Summary Report" set forth the new conditions.<sup>19</sup> Twenty U.S. companies subsequently have opened offices in Poland.

In the Romanian case, where commercial representation already existed; specific understandings concerning commercial representations were written into the U.S.-Romanian Agreement on Trade Relations of April 2, 1975 (Annex 2) and were reaffirmed in the Long-Term Agreement on Economic, Industrial and Technical Cooperation.<sup>20</sup> Eleven U.S. firms currently are represented in Romania.

Although the basic conditions for commercial representation were agreed upon early in the history of the joint commissions, business facilities issues have continued to receive consideration in their deliberations. In some instances, delays were encountered in the availability of certain facilities initially provided for. In other instances, experience indicated that originally conceived formulations required revision or expansion. As the number of companies establishing offices increased and the scope of their activities broadened, new situations arose which required regulation. Thus the joint commissions have considered such additional questions as office accreditation for banks, multiple-entry visas and visa fees, exit permits for local employees of the offices, the generation and use of local currency, discriminatory exchange rates, and costs of operation.

Although considerable progress has already been achieved, further development in the realm of business facilities will be called for as commercial contacts expand. An easing of the various restrictions which apply to company offices—such as those concerning accreditation, number of foreign employees, procurement of local services, or access to end-users—may well prove necessary as the number of offices increases. Measures which would facilitate the representation of medium- and small-sized firms would contribute to a broadening of the type of firms participating in this trade. Development of service facilities for visiting businessmen lacking their own offices—for instance secretarial and interpreter pools or photo copying services—would contribute to improved working conditions.

Individual firms may be able to obtain some needed facilities directly for themselves through negotiations with foreign authorities. Many of the more important facilities, however, affect a number of firms and also require a revised or new policy by the host country. In many instances these can be more efficiently negotiated on a government-to-government basis. Not all facilities, of course, are equally amenable to negotiation, especially those which involve basic systemic principles for one of the parties. Even in these cases, discussion within the commission context can contribute to better understanding of the problems or encourage long-term policy modification.

The joint commission context offers certain advantages for treating an issue area such as business facilities. The asymmetry of market and state-controlled economic systems raises different problems for the firms of each country, with different facilities assuming different importance and priority for each side. Since direct *quid-pro-quo*s may be lacking, compromise and solutions are more likely to be achieved by treating the issue area as a whole rather than as isolated problems.

<sup>19</sup> *American-Polish Trade Accords 1972-1975, op. cit.*, pp. 29-30.

<sup>20</sup> *East-West Foreign Trade Board Report, Third Quarter 1975, Appendix D; article by Jay A. Burgess, "An Analysis of the U.S.-Romanian Long-Term Agreement on Economic, Industrial and Technical Cooperation,"* in this volume.

In addition, business facilities fall under the jurisdiction of various agencies and the Commission context encourages interagency coordination.

While discussion of business facilities within the context of the joint commissions has concerned conditions for the national firms of the respective countries, a certain spillover effect improving the general state of business facilities has been noticeable. Facilities granted to one country have often been made available to other countries, either because of the required changes in national regulations or the desire not to appear discriminatory. Similarly, practices instituted by one country have sometimes been adopted by other countries in order to remain competitive.

### *Exchange of Information*

Availability of information is a prerequisite for the development of international trade and economic cooperation. As some of the basic framework setting issues have been resolved, the three joint commissions between the United States and the countries of Eastern Europe have increasingly turned their attention to questions of information. Several different kinds of information have been the subject of their exchanges: national economic data and market analysis; foreign trade statistics and regulations; commercial information and regulations; and business practices. All of these areas have been covered in varying degrees in each of the three joint commissions.

An obvious area of commission interest has been the laws and regulations concerning foreign trade. Changes in tariff laws are of interest both to governments granting MFN and to exporters evaluating foreign purchasing decisions. New tariff laws were introduced by Romania in 1974 and Poland in 1976. In both instances, explanations were provided at the next regularly scheduled commission sessions. Regulations governing foreign investment have received extensive consideration by the commissions. The American-Romanian Commission, for instance, explored in depth issues relating to the regulations governing joint ventures in Romania. Following the enactment of Poland's foreign investment regulations, the Polish delegation provided the American-Polish Trade Commission with a detailed written explanation of the various decrees and regulations governing foreign investment in Poland. The U.S. Section in turn has provided its commission partners with information concerning regulations and procedures for foreign investment in the United States. As indicated in the section on business facilitation, the regulations governing firm representation also have been explored extensively by the joint commissions. The operation of U.S. antidumping and countervailing duty laws and other regulations governing imports have been of considerable interest to our Eastern European partners, and the commission meetings have provided an opportunity to provide them with information about these laws. Questions concerning unpublished Eastern Europe directives on foreign trade, such as those concerning buy-back arrangements, also have been raised in the joint commissions.

Domestic regulations and standards also frequently impinge on foreign trade, especially as they relate to products entering the country. Thus the commissions have taken up such questions as product standards and food and drug regulations, patent registration procedures, bank legal lending limits, and similar problems. The working

group of experts which met prior to the Second Session of the U.S.-Romanian Economic Commission exchanged extensive information on such matters. Matters of interest to companies engaging in major projects, such as the hiring of local labor, qualifications for skilled personnel, and access to local social service benefits for foreign personnel, have also been explored in the joint commission working groups.

The most comprehensive exchange of information of this kind was the "Joint Seminar on the Organizational and Legal Aspects of U.S.-U.S.S.R. Trade," held in Moscow on December 17-19, 1975.<sup>21</sup> The seminar arose out of a proposal made by the U.S. side at the first meeting of the Working Group of Experts established in accordance with Article III of the U.S.-U.S.S.R. Long-Term Agreement to facilitate Economic, Industrial, and Technical Cooperation and agreed upon at the fifth session of the Joint Commission.

The Soviet delegation presented information on such aspects of the Soviet foreign trade system as organizations involved in industrial cooperation projects, regulation of exports and imports, legal status of foreign trade organizations, credit and finance, liability of the seller for the quality of goods to be delivered, the FTO Soyuzvneshstroy-import, and questions in contracts. The American delegation for its part made presentations on such aspects of the U.S. system as the structure of U.S. commercial law, the prevention of injurious or unfair imports, Food and Drug regulations, import quotas, textile restraints, federal laws regulating foreign trade and economic activity, product liability, export licensing, legal provisions concerning the financing of trade, and contract clauses. Presentations were followed by questions and answers. Publication and dissemination of the information exchanged at this seminar, which greatly enhanced its utility, was made possible by the availability of texts and clarification of textual and translation questions. It is highly unlikely that useful exchanges such as this could be arranged without the existence of an institutional setting in which they can be advocated, prepared, and followed-up.

The three joint commissions also have tried to develop mechanisms for the continuing and regular exchange of information and forecasts of basic economic, industrial, and commercial trends. It has, for instance, become an accepted practice of the commissions for the centrally-planned-economy partners to present information on their annual and five-year plans. A more ambitious initiative in this direction has been the establishment of Working Groups of Experts. Such expert groups have met within the framework of the U.S.-U.S.S.R. and U.S.-Romanian bilateral arrangements. The first U.S.-U.S.S.R. Working Group of Experts met in Moscow on February 12-14, 1975. At that meeting, both sides made presentations on the performance and prospects of their respective economies, industries, agriculture and foreign trade, and on the data sources used to measure and analyze these trends and forecasts. It was agreed that similar information would be presented at future meetings. If indeed the experts group meetings and the envisioned exchanges become regularized, considerable progress could be made toward the narrowing of the information gap which stymies East-West commerce.

<sup>21</sup> *American-Soviet Trade; A Joint Seminar on the Organizational and Legal Aspects* (Washington: U.S. Department of Commerce, September 1976).

The initial attempts of the joint commissions to foster cooperation in market analysis have had marginal results. Possibilities for the expansion of market research were explored at a meeting of U.S.-U.S.S.R. Market Research Teams in Moscow on February 17 to 19, 1975. Although a great deal of information was exchanged during the meetings, no concrete steps for the development of this area were agreed upon. A similar meeting of U.S.-Polish teams in February 1975 indicated considerable interest existed on both sides in market analysis, but there was a lack of vigorous follow-up to translate interest into action.

The information gap can be caused by either a lack of knowledge of what information is available or by the unavailability of the information itself. The commissions have tackled both gaps. On the former, the members have provided one another with information about data sources, including lists of publications in specific sectors. As concerns the unavailability of information, the participants have been able to advise their partners as to the kinds of information which would be commercially useful or even essential. Thus the United States has provided its counterparts with lists of the kinds of information which are necessary for commercial purposes and urged that it be made available.

As the exchange of economic and commercial information receives increasing joint commission attention, it is worth reflecting about the factors which encourage the free flow of information. The generally positive results of the exchange of information under the Working Group on Agricultural Cooperation of the Joint American-Polish Trade Commission would suggest that the more concrete are the interests of the parties in a given area and the more immediate are the benefits to be gained from providing the information, the more likely are the parties to be forthcoming with the desired information. Thus the record of the joint commissions in increasing the availability of information will be related to their accomplishments in other areas of joint commission work, especially as concerns economic cooperation.

### *Industrial Cooperation*

In addition to their other responsibilities, the joint commercial commissions are charged with monitoring the implementation of the Joint Statements (U.S.-Poland and U.S.-Romania) and Long-Term Agreements (U.S.-U.S.S.R. and U.S.-Romania) on Economic, Industrial, and Technical Cooperation. The cooperation envisaged by these statements and agreements is primarily commercial, industrial, and long-term.

Such cooperation is commercial in that, according to clauses of each of these documents "cooperation transactions will be effected on the basis of contractual arrangements between firms, companies and economic organizations of the two countries." As indicated by the titles of these documents, the envisaged cooperation is to be in industrial sectors. The joint commissions do consider questions of agricultural cooperation, but that takes place under the agreements (U.S.-U.S.S.R.) or joint statements (U.S.-Poland and U.S.-Romania) on agricultural cooperation and within specialized agricultural working groups. Although major transactions of a non-cooperative nature

may receive attention, the focus of the basic documents and commission deliberations is on transactions continuing over an extended period (5, 10 or 20 years), hence long-term, with cooperation between the partners.

The concept of industrial cooperation and the instruments of government-to-government and firm-to-firm industrial cooperation agreements have developed in the context of East-West trade as mechanisms of bridging some of the asymmetries in the structure and level of development of the market and centrally planned economies. The reasons for the development of industrial cooperation and the motivations of both East and West have been extensively analyzed and do not need repeating.<sup>22</sup> Our interest here is in the nature of joint commercial commission consideration of industrial cooperation.

The nature of discussions concerning industrial cooperation in the U.S. joint commissions with Eastern Europe is shaped by two factors: the private nature of any transactions which would implement the envisioned cooperation and the purely governmental composition of the joint commissions. Both result from the nature of the U.S. economic-legal system and the relationship between U.S. Government and industry.

Industrial sector working groups with private sector participation (mixed groups) have never been established under the U.S.-East European commissions. Both legal and practical considerations have dictated such a course. On the legal side, the prescriptions of U.S. laws concerning federal advisory committees, avoidance by government employees of preferential treatment to any organization or person, anti-trust, and conflict-of-interest pose serious problems to the establishment and operation of such groups. On the practical side, especially given the loose organization of U.S. industry as compared to that of most European countries, the creation of such working groups would involve the commitment of resources in excess of the benefits likely to be gained. Beyond these considerations, however, there are intrinsic and deeply-seated reservations about the propriety of the government's involvement in commercial transactions beyond the framework setting and facilitative functions which only it can perform.

In the absence of private sector participation, joint commission consideration is confined to three general areas: possible industrial sectors, subsectors or projects for cooperation; forms that cooperation might take; and government policies affecting cooperation.

The joint commissions serve as clearing houses of information on proposals for industrial cooperation. Discussion of areas for cooperation has assumed a typical pattern of the Eastern European delegation presenting a list of sectors or projects for which it is interested in finding cooperation partners among American firms. The American delegation for its part agrees to disseminate this information to American business. Such dissemination is usually accomplished by publishing the list in *Commerce America* and distributing reprints to

<sup>22</sup> Samuel Pissar, *Coexistence and Commerce* (N. Y.: McGraw-Hill, 1970), pp. 34-39; Robert Starr, "Evolving Patterns of East-West Business Transactions: Introductory Note on Cooperation Agreements," in R. Starr ed., *East-West Business Transactions* (N. Y.: Praeger, 1974), pp. 488-497; R. S. Kretschmar, Jr. and R. Foor, *The Potential for Joint Ventures in Eastern Europe* (N. Y.: Praeger, 1972), pp. 3-18; I. Spigler, *Direct Western Investment in East Europe* (Oxford: Holdan Books, 1975), pp. 69-77; U.N., Economic Commission for Europe, *Analytical Report on Industrial Co-operation Among ECE Countries*, (E/ECE/844/Rev. 1).

the private joint councils, trade publications, and individual businessmen.<sup>23</sup> There is no undertaking by the U.S. commission delegation that American firms actually will pursue cooperation in any of these fields. Seldom, also, does the American side present its own proposals of sectors for cooperation, since no mechanism exists for polling American industry as to its interests. The lists of sectors or projects are phrased in very general terms and the joint commissions have been very marginally successful in devising a mechanism for developing more specific information about the size and scope of the proposed cooperation projects. The lists thus provide only the most general indication of possibilities for cooperation.

More concrete discussions sometimes occur concerning projects already under negotiation between U.S. and Eastern European firms. Of the three commissions, the Joint U.S.-U.S.S.R. Commercial Commission has most frequently addressed itself to such reviews. For instance, the Joint Communiqué issued at the conclusion of the Commission's Fourth Session on May 22, 1974, reported:

The Commission received reports and exchanged views on the current status of a number of longterm cooperation projects under negotiation between U.S. firms and Soviet foreign trade organizations, including projects in the field of fertilizer production, exploration for natural gas and oil, timber products, machine building facilities and products of power-consuming industries. The U.S. Section reported that in accordance with its commitment made at the last session of the Joint Commission, the Department of Commerce had referred the Soviet interest in power-consuming production facilities, including aluminum, ferro-manganese and ferro-chromium, and chemicals, to appropriate industry trade associations and directly to potentially interested U.S. companies. The Soviet delegation provided the U.S. Delegation additional data on several of the projects for transmittal to U.S. firms.

Reviews of specific projects are most likely to occur where these involve multi-million dollar projects and government facilities such as credits, export licenses, or permission to establish offices. Discussions also may involve discreet probing of seriousness of the buyer's intent and signaling of anticipated problems.

Since experience with industrial cooperation has been rather limited and of recent date, the joint commissions, especially the U.S.-Romanian Economic Commission, have devoted considerable attention to the forms of and conditions for industrial cooperation. In the case of Romania where joint equity ventures have been possible for some years, the joint commission has examined in some depth the various questions pertaining to Romanian joint venture regulations and the conditions for their establishment and functioning. Based on the discussion of this subject at the Expert's Meeting of September 1975, the U.S. members prepared a study on this subject for publication which was referred to the Romanian delegation at the Commission's Third Session for their review.<sup>24</sup>

The Joint American-Polish Trade Commission discussed the forms which cooperation might take in the absence of joint venture regulations. The subject of joint ventures was also discussed regularly, with the two delegations exchanging views on the advantages and problems of the joint venture form of cooperation and the conditions necessary

<sup>23</sup> See, for instance, *Commerce America*, October 27, 1975, p. 9 and September 27, 1976, p. 21, for the lists of potential areas for cooperation emanating from the Joint American-Polish Trade Commission.

<sup>24</sup> Jay Burgess and Pompiliu Verzarit, *Joint Venture Agreements in Romania; Background for Implementation*, (Washington: U.S. Department of Commerce, Summer 1977).

for its effectiveness. With the enactment of a foreign investment law by Poland, the commission likely will explore its potential for further industrial cooperation. It would be a gross overstatement to say, as some have suggested, that "it is only due to western insistence, largely American, that joint-equity ventures have become an option for future business relations" in Poland.<sup>25</sup> The decision whether to and under what conditions to permit the equity form of cooperation is basically a domestic policy issue in which the preferences of trading partners can play only a very peripheral role. The discussions within the joint commissions can help further understanding by each side of the other's interests and factors taken into consideration in commercial decision-making. Thus, for example, the Eastern European countries point out the interest of their firms in cooperating with U.S. firms in third countries and the U.S. side expresses the interest of its firms in having the opportunity to enter into joint ventures in the Eastern European countries.

The joint commissions also consider issues related to industrial cooperation which come directly under the purview of the two governments. The most obvious are government-to-government agreements which facilitate cooperation, such as tax treaties, or which are necessary for the conclusion of certain types of cooperation, for instance bilateral airworthiness agreements for cooperation in the aviation industry. The discussions within the joint commissions can facilitate acceptance of the negotiation and conclusion of such agreements. Some matters concerning industrial cooperation, however, are not amenable to resolution or facilitation. The Eastern European countries, for instances, have reached agreements with some of their other Western commission partners concerning special customs treatment, exclusion from import quotas, protection from antidumping charges or credit facilities for products involved in industrial cooperation.<sup>26</sup> Such special considerations are deemed by the Eastern European countries to facilitate planning and eliminate some uncertainty concerning industrial cooperation projects. Under U.S. laws, such special considerations are not possible. However, information has been supplied by the U.S. side which could assist the Eastern European side in decision-making concerning industrial cooperation. In the area of U.S. export licensing, for example, although special treatment cannot be accorded to products or data destined for industrial cooperation projects, the list of areas for industrial cooperation which is received from them has been analyzed by U.S. Export Administration authorities and general information provided concerning export licensing problems which are likely to be encountered in any particular area.

As is evident from the foregoing discussion, joint commission consideration of industrial cooperation consists of the exchange of fairly general information. The experience of other countries would seem to indicate that the existence of mixed working groups does not produce fundamentally different results. Nevertheless, it seems that some

<sup>25</sup> Harold Horstmeyer, "Caution Urged in Construing Investment Guidelines," *Journal of Commerce*, March 7, 1977, p. 20A.

<sup>26</sup> For example, under the February 23, 1970 agreement between France and Czechoslovakia, and the February 12, 1971 agreement between the Federal Republic of Germany and Bulgaria, items traded under cooperation agreements enjoy a special status *vis-a-vis* import restrictions in the importing country. The January 23, 1970 agreement between France and Bulgaria contemplates advantageous conditions of credit for industrial cooperation projects. R. Starr, *op. cit.*, p. 489.

forum intermediate between the government-to-government commissions and the firm-to-firm negotiations would be useful, at least at this stage in the development of East-West industrial cooperation. Within the last several years, joint economic councils have been created between U.S. industry and the Eastern European economic organizations of the three countries with which the U.S. has joint commissions. Whether and how these joint councils can provide a bridging link between the respective commissions and industries will need to be explored.

### *Commercial Issues*

As the institution which focuses exclusively on the economic aspects of bilateral relations and convenes regularly, the joint commission is asked to consider and resolve a variety of different commercial issues. Questions concerning credit facilities and export licenses are foremost among these. But there are a host of other problems brought before the commissions—shipping and port access, marine cargo insurance, non-tariff barriers, antidumping and countervailing duty regulations, or privileges under the Generalized System of Preferences for Romania. In addition, very specific complaints of individual firms of either country which have not been resolved through normal channels may be brought to a commission's attention. In addition to whatever facilitation the commissions may provide for the resolution of such issues, they also provide a forum for assessing the total picture of bilateral commercial relations and viewing any specific problem in the context of the overall relationship. This in itself may contribute to a climate conducive to the negotiation of differences and progress in adopting facilitative arrangements.

## IV. A NETWORK OF RELATIONSHIPS

It is clear that the joint commercial commissions by no means limit themselves to the tasks of dismantling barriers to trade. They also seek to stimulate trade and cooperation between the parties. There is an understandable reluctance of the participating sides to publish candid evaluations of the joint commissions to which they are party. Indeed, most of them note the difficulty of measuring the results of the deliberations of the commissions in terms of increased trade volumes or concrete cooperation agreements concluded.<sup>27</sup>

The experience of the U.S. and other Western countries participating in joint commissions with Eastern Europe suggests that the joint commissions perform several functions effectively, including the development of business contacts, identification of potential cooperation projects, and expansion of commercial information. The foremost of the commissions' contribution to the development of East-West commercial relations is the resolution of commercial policy issues lying within the competence of the two governments. For this reason, it is sometimes suggested that the joint commercial commissions concentrate in the main on activities realizable through the agencies of the two governments concerned.

Commissions are action-forcing and decision-facilitating events. They create a certain urgency for each side to address itself to outstanding issues and undertake decisions. The commission sessions

<sup>27</sup> ECE, *Joint Commissions*, *op. cit.*, pp. 4 and 5.

also provide an incentive for the development of new initiatives. The direct engagement of senior policy-making officials in commission sessions facilitates the decision-making process. In addition, the regularized contacts created by the commissions permit consultation on economic issues before they reach crisis proportions. The commission mechanism likewise provides a readily available channel for dialogue when urgent problems arise. The conduct of commercial relations on an institutionalized rather than *ad hoc* basis encourages the development of a network of individual and institutional relationships and a pattern of cooperation which can provide a measure of the stability and continuity, as well as innovation, of policy necessary for the development of commercial relations.

### *Political Dimension*

Beyond whatever economic purposes the joint commercial commissions serve, there is also the political dimension which should not be ignored, for the joint commissions are institutions between not only different economic systems but also different political systems and alliances. The political nexus was paramount in the creation of the Franco-Soviet "Grande Commission" in 1966—an element in DeGaulle's vision of a "Europe to the Urals." Even greater political importance was attached to commercial relations and the joint commission in the development of the U.S. policy of "détente" with the Soviet Union. "We have approached the question of economic relations with deliberation and circumspection and as an act of policy not primarily commercial opportunity," Secretary of State Kissinger told the Senate Foreign Relations Committee.<sup>28</sup> The political dimension may assume greater or lesser importance, but it is present in all the joint commission relationships.

Political considerations cannot help but have an impact on the life of the joint commissions, both facilitating and stymying their work. Since joint commissions normally are created at a time when bilateral political relations are improving and rapid progress on a variety of issues appears possible, their initial sessions record an impressive list of accomplishments. Once the initial spate of issues is resolved, however, the commissions may find it difficult to meet, on a continuing basis, the high expectations generated, especially if the political impetus diminishes.

The effect of politics may surface in many ways. It may be reflected in the selection of issues to be raised and the tone in which they are presented and the sessions conducted. Political considerations may reinforce or contervene the inherent tendency created by the regularity of commission meetings to try to be responsive to the proposals of the other side. Politics may determine the level at which the sessions are held, whether meetings are held as scheduled, and the various arrangements made for social or business contacts in conjunction with a commission meeting. Should a commission be so successful as to outlive its commercial usefulness, political considerations may make its dismantling a delicate diplomatic matter.

<sup>28</sup> Dept. of State Press Release, Sept. 19, 1974. For a discussion of U.S. Government thinking on the relationship of economics and politics in U.S.-Soviet relations, see: Peter G. Petarson, *U.S.-Soviet Commercial Relations In a New Era* (Washington: U.S. Dept. of Commerce, August 1972).

While the joint commissions have generally benefitted from the desire of the participants to improve bilateral relations, they also have fallen victim to deteriorating political relations. The sensitivity of joint commissions to political events is illustrated by the British and U.S. Commissions with the U.S.S.R. Following the British expulsion of over 100 Soviet citizens in 1971, the joint commission, at Soviet request, did not meet and the activity of the working groups virtually came to a halt.<sup>29</sup> Similarly in 1976, when U.S.-Soviet relations deteriorated over Angola, the Joint U.S.-U.S.S.R. Commercial Commission did not hold its annual meeting, and meetings of other joint bodies were postponed.

Although they are primarily instruments of commercial policy, the joint commissions can contribute to the maintenance of a stable political relationship insulated from temporary stresses. Their regularly scheduled meetings enable high level officials of both sides to meet periodically to review general trade and economic relations and keep them on the desired course. At such meetings the commercial relations can more readily be placed in the context of overall relations. At the same time other matters of considerable importance can be addressed in an atmosphere conducive to negotiation. In relationships where political differences diminish in sharpness, as they have with some of the Eastern European countries, commerce has come to assume the essence of bilateral politics.

### *Surfeit of Superstructure?*

It is appropriate to ask how necessary joint (and mixed) commissions are to the development of East-West trade. The question of whether East-West trade and cooperation could expand without the myriad of agreements and joint commissions is by now academic for, even if these institutions were to be abolished tomorrow, they have existed and contributed in a greater or lesser degree to the developmental process during the crucial take-off stage.

The issue today is a different one. Have these commissions proliferated to the point where they no longer effectively perform the functions for which they were created? To accomplish the ambitious goals set out for them by the long-term cooperation agreements and their own terms of reference, the sessions of the joint commissions and the meetings of their working groups require solid preparation and purposeful follow-up. The joint commissions entail heavy demands on the time of senior officials, but they also place a time-consuming burden on the working level. In most instances, there is a very small staff in the foreign trade ministry or similar agency which is responsible for conducting joint commission or economic cooperation affairs. One gains the impression that often preparations for joint commission sessions or working group meetings are inadequate and follow-up actions almost non-existent.<sup>30</sup> The multi-agency character of government participation may require the allocation of significant time and resources to coordinating the activities of all the agencies involved. These demands are further increased where private sector participation is involved. But one cannot help wondering whether the sheer force of numbers of commissions, especially but not only for the Eastern Euro-

<sup>29</sup> I. A. Litvak and C. H. McMillan, *op. cit.*, p. 165.

<sup>30</sup> ECE, *Joint Commissions, op. cit.*

pean partners, poses basic obstacles to the optimal use of the joint commission institution. One bureau of an Eastern European government purportedly has responsibility for eighty cooperative bodies.

As the respective governments and joint commissions reassess the course of East-West commercial relations, consideration of alternatives to the joint commissions as currently structured may be warranted. One option is to consider how much and which of the joint commission functions could be taken over by private sector organizations. As was pointed out repeatedly by the Western members of the Economic Commission for Europe, the task of the public sector in economic cooperation matters is to supply the framework and create the possibilities for enterprises to conclude contracts. It is the industrial sector, however, that holds the key to such contracts. As contacts and relations between firms become regularized, the government parties to the joint commissions may wish to consider relinquishing some of the joint commission responsibilities to private sector organizations.

In some instances, private organizations carried the full burden of cooperation with Eastern European countries before the government got involved in cooperation agreements and joint commercial commissions, as, for instance, did the C.B.I. in Great Britain and the industrial associations in West Germany. Since then, in addition, new unilateral and binational private East-West trade promotion groups have sprung up in many countries. Individual firms also have succeeded in establishing fruitful contacts. A portion, if not all, of the responsibilities of the joint commissions might fruitfully be turned over to such groups, thus focusing the efforts of governments on the framework matters which only they as governments can handle. Such a solution would ameliorate some of the problems raised by the governments themselves, private industry, and academic critics<sup>31</sup> concerning the government-firm relations in a market economy.

Alternately or in conjunction with such a devolution of powers, the participating governments may want to consider restructuring the joint commissions. Such a transformation might involve reducing the level at which the commissions are chaired by a notch or two, or reducing the frequency of commission sessions held at the highest level to biennial events with perhaps working group meetings held in alternate years. The joint commissions may also wish to consider setting "sunset laws" on their activities—defining the conditions under which their goals will have been met sufficiently to warrant disestablishment of their joint commission. At some point the cooperation which they have fostered, facilitated, and promoted must be capable of taking independent root, or else, like the seed fallen on barren ground, it will prove fruitless.

### *The Helsinki Accords*

In the meantime and for some time to come, the joint commissions remain a functioning institution linking the market and centrally planned economies of East and West. In agreeing to the Final Act of the Conference on Security and Cooperation in Europe, the participatory states acknowledged that commercial cooperation is an important aspect in their mutual relations, and is an element which

<sup>31</sup> Edward A. Hewett, "Government, the Market, and East-West Trade," in C. H. McMillan, *op. cit.*, pp. 173-185.

contributes significantly to their security and well-being. In reading through the text of Basket Two on economic relations, one is struck by the parallel between the guidelines and recommendations of the Act and the objectives of the joint commercial commission as set out in the bilateral cooperation agreements.<sup>32</sup>

The progress which has been achieved in recent years, both before and after the signing of the Helsinki Accords, in the exchange of economic information, provision of business facilities, and stimulation of industrial cooperation has come about primarily through the efforts of the joint commissions. There is no doubt that the commissions can play a significant part in furthering the implementation of the Helsinki Final Act. The joint commissions provide each of the signatories a mechanism through which they can strive bilaterally towards accomplishing its goals. Although the bilateral character of the joint commissions may involve much duplication of effort and prove less efficient than multilateral efforts, the work of each commission should reinforce the efforts of the others and thus hasten fulfillment of both the Final Act's and the commissions' objectives. Concerted effort to implement the guidelines and recommendations of the Final Act, in turn, cannot help but infuse added vitality and effectiveness to the life of the joint commercial commissions.

### I. INTRODUCTION

Roughly 40 percent of East-West trade consists of trade between six East European countries (hereafter, the CMEA(6): Bulgaria, Czechoslovakia, the German Democratic Republic (GDR), Hungary, Poland and Romania) and twelve West European industrial competitors of the United States (hereafter, the WE(12): Austria, Belgium, Denmark, France, the Federal Republic of Germany (FRG), Italy, Luxembourg, the Netherlands, Norway, Sweden, Switzerland and the United Kingdom).<sup>1</sup> This intra-European East-West trade, which accounts for approximately 80 percent of total CMEA(6) trade with OECD countries, on the whole less spectacular, and consequently not as well publicized in the United States, as the occasional mammoth transactions involving West European, Japanese or American companies and the Soviet Union (eg., the Kama truck plant, the grain deals). Intra European East-West trade is also generally less politicized than are U.S. economic relations with the U.S.S.R. and the People's Republic of China. (Such trade is not entirely without controversy, however, as evidenced by the debate in the FRG prior to the 1976 agreement with Poland which in effect provided the latter with subsidized credits in return for assurances regarding the ability of ethnic Germans to emigrate to the West.)

This paper briefly surveys the major developments in East-West European trade relations over the past decade, including the evolution of East-West trade policies and the changing commodity composition, growth and geographical distribution of this trade. Omitted, because discussed elsewhere in this volume, are such topics as East-West industrial cooperation, tourism in Eastern Europe, the Common Commercial Policy of the European Community (EC), EC-CMEA relations, institutional aspects of West European export and import policies, and balance of payments and hard currency indebtedness developments in Eastern Europe.

\*Assistant Professor of Economics, The Ohio State University, and Faculty Associate, Mershon Center.

<sup>1</sup> The proportion accounted for by intra-European East-West trade would be even larger were we to include the trade of Finland, Greece, Ireland, Portugal, Spain, Turkey and Yugoslavia with the CMEA(6).

## II. GENERAL DETERMINANTS OF EAST-WEST EUROPEAN TRADE, 1965-75

Intra-European East-West trade over the past decade has been shaped by a number of factors: continued normalization of political and economic relations, increased export competition for WE(12) countries on East European markets, the growing significance of WE(12) government-backed export credits, continued liberalization of discriminatory West European import barriers, expansion of the EC to nine members and the conclusion of free trade agreements between the EC and individual European Free Trade Association (EFTA) members, foreign trade reforms in several CMEA(6) countries, a determined reorientation by several East European countries of their trade towards the West, and most recently, the severe macro-economic disturbances affecting the Western economic system.

By the mid-1960s most West and East European countries had basically normalized their mutual political and economic relations. The most significant exceptions were the two countries which together are involved in roughly one-third of all intra-European East-West trade: the FRG and the GDR. Only by virtue of its *Ostpolitik* begun in the late 1960s and its treaties with a number of East European countries in the early 1970s did the FRG finally more or less normalize its political and economic relations with Eastern Europe. The signing of the *Grundvertrag* between the GDR and the Federal Republic, recognition of the GDR by most Western countries and the admittance of the two countries to the United Nations in 1973 culminated a normalization phase which had gradually evolved over a number of years. A symbol of the more general East-West normalization process was the signing of the Helsinki *Final Act* in August 1975.

Throughout the past decade the WE(12) have embargoed from export to Eastern Europe only a narrow core of strategic products, those for which the collective Western embargo machinery (COCOM) still applies. Indeed, in the late 1960s West European firms enjoyed a considerable competitive advantage in Eastern Europe over U.S.-based firms which were still subject to the wideranging unilateral (extra-COCOM) U.S. export controls.<sup>2</sup> By 1970, however, significant new U.S. "decontrolling" was under way, and the United States even began to exert pressure for relaxation of the embargo on various COCOM-controlled products and technology. The decontrolling, and the more general dramatic turnaround in U.S. East-West trade policy from control to promotion, has undoubtedly led to greater competition for the WE(12) on the export markets of the CMEA(6). (The extent of this competition is probably less than they face from the U.S. on the Soviet market, however, and should not be exaggerated.<sup>3</sup>)

It was only in the mid-1960s that governmentally backed export credits became a significant competitive factor in WE(12) East-West trade. While it is difficult to prove that the East Europeans historically have obtained preferential terms on government backed credits, there is little doubt that official credit support (OCS) has played a relatively important role in exporting to the socialist countries.

<sup>2</sup> For evidence on the past restrictiveness of the U.S. strategic export controls program, see Thomas A. Wolf, "A Note on the Restrictive Effect of Unilateral United States Export Controls", *Journal of Political Economy* 81(1), Jan./Feb. 1973; and Josef C. Brada and Larry J. Wipf, "The Impact of U.S. Trade Controls on Exports to the Soviet Bloc", *Southern Economic Journal* 41(1), July 1974.

<sup>3</sup> See Thomas A. Wolf, "U.S.-West German Competition in Exporting Manufactured Products to Eastern Europe and the Soviet Union", *Jahrbuch der Wirtschaft Osteuropas*, Band 7, 1976.

Between 1963 and 1970, for example, while only 3.5 percent of French exports went to CMEA countries, 28.9 percent of French OCS for export credits of more than five-years supported exports to that region. In 1972, the proportion of the five major Western grantors' (of credits to the East) worldwide OCS authorizations to the CMEA countries was 3.3 times the proportion of these countries' total exports directed to the CMEA region.<sup>4</sup> Among the larger WE(12) countries, France, Italy and the United Kingdom appear to have relied on sizable and generous government-backed credits in an attempt to maintain CMEA market-share against West German and more recently U.S. competition. Given the high capital goods intensity of exports to the East, however, and continuing uncertainties involved in East-West trade, the relatively large provision of government credit support may not have been inordinate.<sup>5</sup>

Most West European countries have for some time either *de jure* or *de facto* extended non-discriminatory, or most-favored-nation (MFN) tariff status to imports from Eastern Europe. MFN tariffs have therefore not been an issue except to the degree that the East Europeans have chosen to view tariff-free trade *within* the two West European trade blocs (EC and EFTA), as constituting discrimination against all non-members of these blocs. Another argument frequently encountered in Eastern Europe is that, particularly for heretofore residual suppliers (ie, CMEA(6)), the existence of high West European tariffs on some products may *de facto* discriminate against them in their attempts to gain significantly larger market-shares in WE(12) markets, even though there exists no *formal* discrimination (*vis a vis* other non-bloc suppliers).

There are also East European fears that the free trade agreements signed between the EC and EFTA members, designed to eliminate tariffs on a broad range of products by 1977, may be seriously diverting imports away from CMEA(6) suppliers. For example, one study estimates that as a direct result of trade diversion to EC producers Hungary's share of Austrian imports may decline for nearly one-fifth of those Hungarian products currently exported to that country.<sup>6</sup> Particularly affected, it is argued, are foodstuffs and crude materials, which together comprise over one-half of Hungarian exports to Austria.<sup>6</sup>

Discriminatory West European quantitative restrictions (QRs) on imports from CMEA countries are also interpreted by the latter as violating the principle of MFN. Indeed, removal of these QRs has in some cases not kept pace with the QR elimination provided for in the GATT accession protocols of several CMEA(6) countries.<sup>7</sup> Nevertheless, there has been considerable liberalization, including elimination, of many WE(12) countries' discriminatory QRs over the past 10-15 years. Recent studies of QR liberalization in Austria and the FRG for the period 1966-1972 indicate that these countries (and probably most of the WE(12)) tended in the past to follow "selective" liberalization strategies, eliminating QRs on a wide range of products but

<sup>4</sup> See Thomas A. Wolf, "East-West Trade Credit Policy: A Comparative Analysis", in Paul Marer (ed.) *U.S. Financing of East-West Trade: The Political Economy of Government Credits and The National Interest* (Bloomington: International Development Research Center, Indiana University, 1975), pp. 149-199. The five countries were France, the FRG, Italy, the United Kingdom (all WE(12) countries) and Japan.

<sup>5</sup> An argument along these lines is developed in *ibid.*

<sup>6</sup> Frigyes Horchler, "The Future of Austro-Hungarian Foreign Trade", *Forschungsbericht* Nr. 27 des Wiener Instituts fuer Internationale Wirtschaftsvergleiche, June 1975.

<sup>7</sup> For a detailed analysis of existing West European policies on imports from Eastern Europe, see the paper by Karen Taylor in this volume.

retaining QRs precisely on many of those products in which CMEA countries appear to have a potential export potential which threatens domestic producers. These studies also suggest that discriminating QRs do in fact restrict manufactures imports from some CMEA(6) countries, with the evidence being strongest for the FRG, where the degree of liberalization was greater during the period examined. This contradicts the conventional wisdom in the West that because of supply inelasticities and poor product quality and marketing the East Europeans cannot take advantage of the new export opportunities afforded by QR elimination.<sup>8</sup>

Foreign trade reforms were carried out by some CMEA(6) countries in the past decade. In 1968 Hungary, as part of its New Economic Mechanism (NEM), embarked on foreign trade reforms designed *inter alia* to establish an organic link between world market and domestic prices and to induce domestic enterprises to plan and produce more efficiently under the pressure of foreign competition. Less comprehensive reforms of a similar nature were undertaken in Poland after 1971. These reforms should have led, *ceteris paribus*, to at least some reorientation of foreign trade towards the West.

Also included in the reforms were new tariff structures (Hungary: 1968; Poland 1976) designed to replace direct quantitative controls over most imports with "parametric" tariff schedules which would reflect both the planners' preferences as to import composition and the desire to reinforce the direct linkage of foreign and domestic prices. While the tariff schedules are designed to be non-discriminatory, it is not clear that they have had or will have any direct impact on the overall (East vs. West) geographical distribution of these countries' imports. Furthermore, the question arises whether all Western trade partners receiving equal tariff treatment can really expect to obtain equal access to these countries' import markets. Indeed, it is commonly believed that a great deal of *ex ante* bilateralism persists in Eastern Europe. Non-discrimination among WE(12) exporting countries is an even more speculative proposition for the other CMEA(6) countries. This holds even for Romania, which in its 1971 accession to GATT pledged in effect to meet a global quota on imports from GATT members (these imports were to increase at an annual rate no less than the rate of growth of Romania's imports as provided for in its Five-Year Plans). This is because fulfillment of a global quota could still entail substantial discrimination among Western supplier countries.<sup>9</sup>

With the general shift in emphasis by CMEA countries in the 1960s towards more intensive growth strategies and greater participation in the "international division of labor", each CMEA(6) country has stepped up its purchases of machinery and technology from the West over the past decade. The increased reliance on imports from Western Europe was particularly notable for Romania in the late 1960s and

<sup>8</sup> See Thomas A. Wolf, "The Impact of Elimination of West German Quantitative Restrictions on Imports from Centrally Planned Economies", *Weltwirtschaftliches Archiv* 112(2), 1976; and Thomas A. Wolf, "The Effects of Liberalization of Austrian Quantitative Restrictions on Imports from CMEA Countries", *Empirica* (1), 1976. For a different view of the restrictiveness of West European QRs, see Josef C. Brada and Larry J. Wipf, "The Export Performance of East European Nations in Western Markets", *Weltwirtschaftliches Archiv*, Band 111, 1975.

<sup>9</sup> For a more extensive discussion of East European discrimination in East-West trade, see Thomas A. Wolf, "Progress in Removing Barriers to East-West Trade: An Assessment", in Franz Nemschak (ed.) *World Economy and East-West Trade* (Vienna: Springer, 1976), pp. 111-127.

for Poland in its dramatic trade reorientation after 1971. Romania was also able to considerably expand the share of its exports moving in a westward direction during this period (see Table 6).

Since 1973, rapid inflation and sudden shifts in terms of trade on world markets, followed by severe recession in the industrialized West, have combined to noticeably affect intra-European trade. Faced by rising domestic unemployment and deteriorating trade balances, many WE(12) countries have been recently pushing exports to the East with particular vigor, assisted in some cases by extensive and generous government supported credits. At the same time, formal and informal mechanisms to restrict imports from the CMEA(6) have been utilized to protect domestic employment and/or as anti-dumping measures.<sup>10</sup>

Several CMEA(6) countries, notably those with significant domestic raw materials and fuel deficits (Czechoslovakia, GDR and Hungary) have experienced a dramatic deterioration in their hard currency terms of trade, while others (notably Poland) have benefited from recent changes in world price relatives. Reduced real exports caused two CMEA(6) countries' exports to WE(12) to decline in value terms between 1974 and 1975, and other East European countries' exports to WE(12) grew slowly by recent historical standards.<sup>11</sup> Whereas in 1971 the CMEA(6) had a combined trade surplus of \$11.1 million with the WE(12), the Polish import drive and the adverse effects of terms of trade changes and the loss of Western export markets had resulted in a combined CMEA(6) trade deficit with WE(12) of \$3.9 billion by 1975. According to Western statistics, the cumulative 1971-1975 CMEA(6) trade deficits with the WE(12) amounted to \$9.1 billion (see Table 1). These balance of payments problems have most recently caused several CMEA(6) countries to slow the growth of their own imports from the WE(12) and the West more generally. Romanian imports from WE(12) actually declined in 1975 (in value) and Hungary's imports from this region remained virtually unchanged.<sup>12</sup>

<sup>11</sup> Bulgaria and Hungary exported less to WE(12) in value terms in 1975 than in 1974. See Bureau of East-West Trade (BEWT), *Selected Trade and Economic Data of the Centrally Planned Economies* (Wash., D.C.: U.S. Department of Commerce, September 1976).

<sup>12</sup> Calculated from *ibid*.

### III. TRENDS IN COMMODITY COMPOSITION, GROWTH, AND GEOGRAPHICAL DISTRIBUTION OF INTRA-EUROPEAN EAST-WEST TRADE

#### *A Commodity Composition*

Roughly 87 percent of total 1975 WE(12) exports to Eastern Europe of \$12.5 billion was accounted for by manufactured products (SITC 5-8)-Tables 2 and 4). The proportion of manufactures in WE(12) exports was uniformly high (84 to 93 percent) among the CMEA(6) countries, and is higher than the proportion of manufactures in total OECD trade with the entire CMEA region (82 percent).<sup>13</sup> Machinery accounted for 38 percent and manufactures classified by material (SITC 6) accounted for 30 percent of total WE(12) exports to Eastern Europe. Miscellaneous manufactured products (which include most consumers goods) made up less than 4 percent of WE(12) exports, while chemicals and chemical products accounted for 15 percent. Although WE(12) exports to Eastern Europe have always been predominantly manufactures, the relative importance of these products has increased significantly (from 76 to 87 percent) since 1965. This has been largely offset by a decline in the share of agricultural exports (SITC 0, 1, 4) in the past decade (see Table 4).

The structure of CMEA(6) exports to WE(12) has undergone an even more striking transformation since 1965. Agricultural exports have fallen from 35 to 19 percent of total exports at the same time that crude materials and fuels have remained at about 25-30 percent and the share of manufactures has increased from 36 to 51 percent. (By contrast, in 1975 manufactures accounted for only 36 percent of *total* CMEA exports to the entire OECD region.<sup>14</sup>) There remains, however, considerable variability in export structure among the CMEA(6) countries, with the proportion of manufactures exports ranging from 38 percent (Poland) to almost 70 percent (GDR). Roughly one-third of Hungarian and 40 percent of Bulgarian exports to WE(12) are agricultural products, while almost one-half of Polish exports to Western Europe consist of fuels and raw materials. Consumer goods such as clothing and furniture make up over 20 percent of Romanian exports to Western Europe, with another 20 percent consisting of oil-based fuels (see Table 3).<sup>15</sup>

The asymmetrical (or complementary, depending on the point of view) East-West trade commodity structure persists, but as Table 4 indicates, it is far less asymmetrical than just a decade ago. In this connection it is noteworthy that the commodity structure of East European exports to the FRG has undergone significant transformation since 1965. While only 16 percent of combined imports from Bulgaria, Czechoslovakia, Hungary, Poland and Romania (CMEA(5)) were classified as *Fertigwaren* (manufactured goods) in 1965, this percentage had risen to 35 percent by 1970 and 45 percent by 1975.<sup>16</sup> This would appear to be at least partly attributable to the elimination of QRs on a wide range of manufactured products in the 1966-1973 period.<sup>17</sup> By 1974, imports from the CMEA(5) accounted for 9.1, 8.8 and 5.3 percent of total FRG imports of clothing, woodenware and glass and glassware respectively.<sup>18</sup>

### B. Growth of Trade

As indicated in Table 5, WE(12) exports to Eastern Europe have grown somewhat faster than their total exports over the past decade. Accounting for 2.7 percent of WE(12) exports in 1965, exports to the CMEA(6) comprised 3.5 percent of total exports by 1974, and the 1975 figure was probably higher. This compares with analogous proportions of 1.4 percent for WE(12) exports to the Soviet Union, and 0.8 and 0.6 percent for U.S. exports to CMEA(6) and the U.S.S.R. in 1974. The growing weight of exports to CMEA(6) has been particularly notable in the FRG, Sweden and Switzerland. Corresponding to this growth in relative importance of WE(12) East-West exports

<sup>16</sup> Jochen Bethkenhagen, "Osthandel der Bundesrepublik Deutschland in einer Consolidierungsphase", *Wochenbericht* 14/76 (Berlin: Deutsches Institut fuer Wirtschaftsforschung, 8 April 1976).

<sup>17</sup> See Wolf, "The Impact of Elimination of West German Quantitative Restrictions on Imports from Centrally Planned Economies", *op. cit.*

<sup>18</sup> Bethkenhagen, *op. cit.*

for the West Europeans has been the striking increase in the proportion of Romanian and Polish imports originating from the WE(12) (see Table 6). Indeed, by 1974-75 Poland was purchasing 40 percent of its *total* imports (East and West) from the WE(12). A far less dramatic, but still upward trend has been evident for most of the other CMEA countries, including the Soviet Union.

<sup>1</sup> In 1974 the percentages for Poland were 27.6 and 40.8 for exports and imports respectively. Corresponding Polish figures for 1975 were 24.2 and 39.6 percent.

Source: B. Askanas, H. Askanas and F. Levčik, "Structural Developments in CMEA Foreign Trade Over the Last 15 Years (1960-74)", Forschungsbericht Nr. 23 des Wiener Instituts fuer Internationale Wirtschaftsvergleiche (Vienna: February 1975); and Bronislaw Wojciechowski, Polish Foreign Trade 1975 (Warsaw: Polish Chamber of Foreign Trade, 1976).

Only Romania has significantly increased the proportion of its total exports going to WE(12) in the past decade (from 16 percent in 1965 to 29 percent in 1973), although other countries, such as Czechoslovakia, Hungary and Poland, have also increased their reliance on West European export markets. As we might expect from the aforementioned growing CMEA(6) trade deficits in their trade with Western Europe, the East European countries have not been able to increase their share of total WE(12) imports over the past decade (see Table 5). Their import share in the largest WE(12) market, the FRG, has essentially stagnated since 1970.<sup>19</sup> Only in

<sup>19</sup> CMEA(5) import-share in the FRG actually peaked in 1973 at 2.9 percent, which compared with 2.5 percent in 1970 and 2.6 percent in 1975. In 1974, FRG imports from the CMEA(5) declined by 8.1 percent in *real* terms. (See Bethkenhagen, *op. cit.*)

France and Sweden were the CMEA(6) able consistently to increase their import market-shares between 1965 and 1974. (As with exports, the most dependent of all the WE(12) countries on imports from Eastern Europe, in terms of its weight in overall imports, is Austria.)

In view of the improving commodity composition of CMEA(6) exports over this same period, the inability of these countries to increase their share of overall WE(12) imports is somewhat mystifying, and certainly disturbing to the East Europeans. This development is likely due to a combination of factors. One possibility is that rapidly expanding domestic demand for many exportables in the CMEA countries has caused export supply to be relatively income inelastic. Furthermore, despite the evidence that these countries can take advantage of QR liberalization and can improve the commodity structure of their exports, they may not be as successful as many market economy competitors in moving into exportables that are relatively income elastic in WE(12) demand.<sup>20</sup> Diversion of EC and EFTA imports towards one another and away from Eastern Europe, as a result of their mutual free trade agreements, may be another explanatory factor. Moreover, in the past two or three years the severe recession in many of the WE(12) has affected their imports more generally, and if the CMEA(6) can in many cases be considered truly "residual" suppliers, they might be the first to be adversely affected. Finally, a number of non-tariff barriers (NTBs) continue to hinder the East Europeans in their attempts to penetrate WE(12) markets, and NTBs have undoubtedly been used with particular urgency in the most recent period of WE(12) preoccupation with minimizing unemployment.<sup>21</sup>

### *C. Geographical Distribution*

The Federal Republic of Germany is by far the dominant exporter to Eastern Europe. In 1975 the FRG accounted for from 31 percent (Poland) to 62 percent (GDR) of WE(12) exports to individual CMEA(6) countries (see Table 7). Overall, the FRG was responsible for 41 percent of WE(12) exports to CMEA(6), almost identical to its share of WE(12) exports to the Soviet Union in that year. Following the FRG in terms of export market-share in Eastern Europe were France (11 percent), Italy (9 percent), Austria (8 percent) and the U.K. and Sweden (6 percent). Noteworthy is that the French and Italian shares are considerably higher in the U.S.S.R. than in Eastern Europe.

<sup>20</sup> For some tentative and not totally unambiguous evidence regarding the relative income elasticity of FRG demand for CMEA(6) exports, see Thomas A. Wolf, "The Relative Income Elasticity of Demand for Socialist Exports: The West German Case", in Josef C. Brada (ed.), *Quantitative and Analytical Studies in East-West Economic Relations* (Bloomington: International Development Research Center, Indiana University, 1976), pp. 51-70.

<sup>21</sup> For a detailed listing of various administrative restrictions in East-West trade, see Economic Commission for Europe, *Consolidated Inventory of Administrative Restrictions in East-West Trade*, Trade/R.336, 8 October 1976.

While the FRG has traditionally been the dominant exporter to Eastern Europe, the extent of its dominance has increased significantly just since the late 1960s. Undoubtedly *Ostpolitik* paved the way for this resurgence in export share, but it should also be recognized that it has only been in the 1970s that the FRG has surpassed the United States as the world's largest exporter of manufactured products. Consequently, the expansion of export market-share in the East is partly a concomitant of more general competitive developments. Roughly coinciding with the FRG's increasing share of exports to CMEA has been the striking deterioration of the British position in CMEA markets. The United Kingdom accounted for 16.7 percent of Atlantic area industrialized countries' (WE(12), U.S. and Canada) exports of manufactures to CMEA in 1961, but by 1974 this share had fallen to 6.3 percent.<sup>22</sup>

The FRG export market-shares in Eastern Europe are not so disproportionate if taken in the perspective of that country's dominant share of manufactured goods exports to Western Europe. It has been argued elsewhere that given the apparent *relative* complementarity of FRG export and CMEA import structures, possible transport-sales-service cost advantages of the FRG in exporting to the East, the close historical-cultural ties as well as the continued high regard in that area for Germany engineering, a higher FRG market-share in East than West Europe might be expected. Indeed, East-West bilateralism pressures emanating from the East as well as from some of the less competitive WE(12) countries may be keeping the German share of CMEA(6) markets below its "normalized" level.<sup>23</sup>

East European exports to the West are not typically discussed in terms of the "competitive shares" of each CMEA(6) country in the individual Western countries. Nevertheless, it is interesting to note

<sup>22</sup> Wolf, "U.S.-West German Competition in Exporting Manufactured Products to Eastern Europe and the Soviet Union", *op. cit.*

<sup>23</sup> See *ibid.*

that by 1973 Poland had surpassed the GDR as the dominant CMEA (6) exporter to Western Europe (see Table 8). Each country accounted for roughly one-quarter of CMEA(6) exports to WE(12), followed by Czechoslovakia (16 percent), Romania (14 percent), Hungary (13 percent) and Bulgaria (3 percent). Poland was the dominant exporter in all WE(12) markets except in the FRG (where the GDR had 41 percent of CMEA(6) exports) and Austria and Switzerland (where Czechoslovakia dominated). Noteworthy is that GDR exports to the FRG accounted for 62 percent of GDR exports to the entire WE(12). By contrast, while the FRG accounts for over 60 percent of WE(12) exports to the GDR, its sales to the GDR amount to only 29 percent of its total exports to CMEA(6). This only highlights the relatively greater importance of *innerdeutschen Handel* ("inner German trade") for the GDR than for the FRG in East-West trade.<sup>24</sup>

#### IV. CONCLUSIONS

Generally favorable policy changes in both Eastern and Western Europe have encouraged the growth and changing structure of intra-European East-West trade over the past decade. An ever greater proportion of East-West trade between the WE(12) and CMEA(6) consists of manufactured products. The sharp decline in the importance of CMEA(6) agricultural exports and the equally dramatic increase in manufactures exports reflects a significant transformation of East European export opportunities and capabilities. In the period 1965-1975 West European exports to CMEA(6) grew at an above average rate, but the East European countries on the whole were unable to increase their share of total WE(12) imports. These contrasting trends are reflected in the deteriorating intra-European East-West trade balance of the CMEA(6) countries. We suggested that a number of factors may help to explain the relative stagnation of East European exports. Also noted was the intense competition among WE(12)

<sup>24</sup> Because the FRG considers trade with the GDR as inner-German trade, GDR exports to the FRG enter duty-free, which means that they can also enter other EC markets as well on a duty-free basis.

countries for Eastern markets. At the policy level this is reflected in the growing importance over the past decade in governmentally-backed export credits in East-West trade. In the trade statistics this competition is apparent in changing export shares. In the past the degree of competition among the CMEA(6) for export markets in Western Europe has seldom been discussed. This competition could intensify in the post-Helsinki period, however, if in the context of increasing CMEA(6) indebtedness and continuing trade balance deficits, the East Europeans decide to make a determined effort to compete in more than a residual manner on a variety of West European markets. Whether East European balance of payments and indebtedness constraints will lead to a relative slowdown in the growth of intra-European East-West trade remains to be seen.

## I. INTRODUCTION

*A. The Effect of Eastern Export Capabilities on Future Levels of East-West Trade*

Unsatisfied Soviet and East European needs for Western technology, manufactured goods, and grain remain large, holding the prospect of enlarging Western exports in the years ahead. Needs, however, are not the sole determinant of trade. Over the long term continued growth of East-West trade must rely on an ability of the East European countries to expand their hard currency earning exports to the West, rather than on continuing the increase in the debt that has fueled much of the recent growth of Soviet and East European imports.

The disparity between Soviet/East European hard currency imports and the exports needed to pay for them has been wide in recent years. In fact, viewing Eastern Europe and the U.S.S.R. as a whole, the 1976 hard currency trade deficit was probably about \$11 billion. After considering earnings from invisibles, arms sales, etc. on the one hand, and interest on debt requirements on the other, total net debt probably grew about \$11 billion in 1976 to an end year total of \$40 billion.

Western governments and commercial lending institutions are unlikely to continue indefinitely a rapid expansion of credit to the East. Rather, an enduring trade relationship will require an increase in Eastern hard currency earning capabilities.

There are, no doubt, opportunities for the Soviet Union and the communist countries of Eastern Europe to increase their hard currency earnings on invisibles, such as shipping and tourism. The Soviet Union may be able to earn increased amounts of hard currency from gold sales, particularly if the price should increase, and through increased arms sales. Inevitably, however, the bulk of increased hard currency earnings will have to be achieved through increased merchandise exports, i.e., shipments of foods, raw and semi-processed materials, manufactured goods and other commodities. A balancing of the 1976 Soviet-East European hard currency trade through increased merchandise exports would have required additional exports of about \$11 billion, about 50% over estimated 1976 levels.

*B. Objectives and Methodology of Paper*

Given the assumption that future levels of trade with the West will be constrained by Soviet/EE export capabilities, a basic objective of this paper is to contribute to an ability to project future trade levels through examination of Soviet/EE export capabilities. More specifically, our objectives are twofold: first, to contribute toward an understanding of near term<sup>1</sup> Soviet and East European hard currency export capabilities through examination of the volume and composition of their recent exports, along with a limited analysis of potential for the next few years; second, to provide data that may be useful to other researchers in performing their own analyses.

Our basic assumption is that genuine growth in Soviet/EE export capabilities, or changes in their composition, must normally occur in

<sup>1</sup> Throughout this paper "near term" is considered as the current plan period, i.e., through 1980.

relatively moderate stages. Examination of recent exports can therefore give an indication of the kinds of items and the likely export volumes in the years immediately ahead. Of course, Eastern exports are determined not only by their ability to supply goods, but by Western demands, which fluctuate with swings in the Western business cycle. Thus, analysis of export data and a disaggregation of total exports into individual items can also provide some indication of the sensitivity of Eastern hard currency earnings to swings in both Western demand and prices, particularly in raw and semi-processed materials items.

This paper provides data covering recent exports of the Soviet Union and each of six communist countries of Eastern Europe (Poland, German Democratic Republic, Czechoslovakia, Romania, Hungary, Bulgaria) to 15 Industrialized Western nations (I.W.).<sup>2</sup>

For each of these seven countries, the following individual data tabulations are provided:

1. Exports to the I.W. for individual years, 1972 through 1975, showing dollar value and composition by "product sections"<sup>3</sup>, i.e., at the one digit Standard International Trade Classification (SITC) level of disaggregation.

2. Rank order disaggregations showing—

- 1975 top 15 product "divisions" (2 digit SITC) exports to the I.W.<sup>4</sup>

- 1975 top 50 export "items" (5 digit SITC level of disaggregation), and

- 1974 rank and dollar value and 1973 dollar value for each of the divisions and items.

3. For each of the top twenty-five 1975 item exports to the I.W., the percent of the I.W. total absorbed by each I.W. country.

Only analysis of limited depth can be provided in this paper. Generally, we will tend to concentrate on:

Distinguishing among major export earners on the basis of whether they are "primary products", "intermediate goods" or "manufactured goods", and identifying items possibly subject to significant price variation or potentially "import sensitive" in Western countries.<sup>5</sup>

Citing emergence of new export item capabilities or the decline of earlier capabilities as an indicator of the future.

Distinguishing diversity or concentration of sales of major export items among the 15 I.W.<sup>6</sup>

<sup>2</sup> The 15 I.W. are: Austria, Belgium, Canada, Denmark, the Federal Republic of Germany (FRG), France, Italy, Japan, Luxembourg, the Netherlands, Norway, Sweden, Switzerland, the United Kingdom, and the United States. Henceforth, in this paper, unless otherwise noted, the term "I.W." refers to these 15 countries.

<sup>3</sup> The terminology used in this paper, i.e., one digit SITC=section, 2 digit SITC=division, 5 digit=item, follows the definitions stated in the *Standard International Trade Classification, Revised*, Statistical Office of the United Nations, New York, 1961.

<sup>4</sup> The SITC (1961) system defines and uses 56 two-digit product division classifications and 1312 five-digit item classifications.

<sup>5</sup> These are defined at a later point in the article. It appears that the demand and price of certain raw and semi-processed materials are particularly sensitive to the state of the Western business cycle. On the other hand, they are less likely to encounter Western tariff and non-tariff barriers and quality, style, marketing, servicing and other difficulties than manufactured goods.

<sup>6</sup> Concentration of sales in only a few of the 15 would tend to make export capabilities sensitive to economic conditions in the importing I.W. country and, conceivably could also make sales dependent on political relations between the communist country exporter and the I.W. country importer.

*C. Limitations of Methodology*

There are always significant limitations on the use of historical data in predicting future trends. Even though the recent past may be a good indicator of the near term, it has obvious faults. For example, while there is little likelihood, even for planned economies, of very large year-to-year changes in the general composition of the items that can be offered for export, Western demand, particularly for raw materials, may fluctuate. Thus, not only Eastern supply, but Western demand is important in projecting future Eastern exports, a factor which was significantly relevant in 1974-75 when Western recession decreased demand and prices of many commodities that were in ready supply.

Additionally, projections of future capabilities obviously cannot rely solely on historical data, but should make use of all available information concerning the intentions of the exporter. Thus, Five-Year Plans and other indicators of intent (such as countertrade arrangements under which Western firms agree to import specific items from the communist countries over several years in the future) should be examined in attempting to estimate future East European export capabilities. It is also important to maintain a perspective on the importers' environment such as import restriction policies.

In addition to these general problems concerning the use of historical data, the reader should be aware of a limitation which is specific to data in this study. Data available for use in this paper includes only Soviet/EE exports to 15 Industrialized Western countries. While these countries represent the major source of hard currency export earnings by the East, there are additional markets not included; e.g., some of the OECD countries, some LDCs, and hard currency exports to OPEC countries.

These additional markets are, however, limited sources of hard currency. The OECD is a good proxy for "the developed West" and provides timely and detailed statistics covering trade of its members with the world. Since the 15 I.W. countries included in our data bank are a sub-set of the OECD,<sup>7</sup> a comparison of our data with that of OECD provides one means of assessing the completeness of our coverage.

Finland, Iceland, Greece and Turkey conduct their trade with some of the CMEA countries on a "soft currency" basis, i.e. through bilateral clearing arrangements. Since our interest in this paper is in hard currency export capabilities, by deleting the OECD imports under soft currency arrangements, we can determine approximate percentages of total hard currency Soviet/EE exports to the OECD countries that are reflected in our data covering 15 Industrialized Western countries. (See Table 1.)

<sup>7</sup> OECD countries not included in our data are: Australia, Spain, Portugal, Ireland, Finland, Iceland, Greece, and Turkey.

TABLE 1.—PERCENT OF TOTAL OECD<sup>1</sup> HARD CURRENCY IMPORTS FROM U.S.S.R./EASTERN EUROPE TAKEN BY 15 INDUSTRIALIZED WESTERN COUNTRIES

Country	1974	1975
U.S.S.R. <sup>2</sup>	97	97
Poland <sup>3</sup>	88	89
German Democratic Republic <sup>4</sup>	98	98
Czechoslovakia <sup>5</sup>	93	92
Romania <sup>6</sup>	88	88
Hungary <sup>7</sup>	98	97
Bulgaria <sup>8</sup>	89	87

<sup>1</sup> OECD countries are: Belgium-Luxembourg, Denmark, France, West Germany, Ireland, Italy, Netherlands, United Kingdom, Austria, Finland, Greece, Iceland, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, Canada, United States, Japan, and Australia. Countries which do not trade in hard currency with any of the centrally planned economies listed in the table are cited under separate footnotes.

<sup>2</sup> OECD less Finland, Iceland, Greece, and Turkey.

<sup>3</sup> OECD less Greece and Turkey.

<sup>4</sup> OECD less Finland, Greece, plus West German imports from the German Democratic Republic. West Germany does not treat its trade with the GDR as foreign trade and hence does not report it to international agencies. However, West Germany is a source of hard currency earnings for the GDR. FRG-GDR trade data figures cited in this paper are derived from interzonal trade data in: Federal Republic of Germany Statistical Office, "Gross und Einzelhandel, Reihe 6."

<sup>5</sup> OECD less Finland and Greece.

Additional sources of Soviet/EE hard currency export earnings outside the OECD that are not reflected in our data are, with some exceptions, principally LDCs, and have not in the past been significant hard currency earners for the U.S.S.R. or Eastern Europe. In fact, 1975 Soviet exports to LDC hard currency countries are estimated to have been about one-seventh of total Soviet hard currency exports.<sup>8</sup> Moreover, taken as a whole, hard currency trade with the LDCs left the Soviets with nearly a billion dollar deficit in 1975, and about half a billion in both 1973 and 1974.

East European 1974 exports to LDCs were about 12% of total hard currency exports, yielding a surplus of about \$240 million. For some countries, however, exports to LDCs have been more significant. For example, LDCs took about 32% of Bulgaria's total 1974 hard currency exports and provided a surplus of about \$120 million.

The 1975 Czechoslovak trade with LDCs accounted for nearly one-fourth of hard currency exports and yielded a positive trade balance of about \$150 million. Poland's hard currency exports to LDCs in 1975 were about 20 percent of its total, yielding a surplus of about \$250 million. In 1974, Romania's LDC trade was about 15% of its hard currency total, yielding a surplus of about \$125 million.<sup>9</sup> Based on 1974 data, however, the GDR and Hungary appear to have relied less on LDC hard currency trade, both incurring deficits.

Based on the information available, we thus argue that the data used in this paper, which covers Soviet/EE exports to 15 I.W. countries, includes the great majority of Soviet/EE hard currency exports to Western developed nations, and that hard currency exports to LDCs provide a relatively minor portion of the Eastern countries' total hard currency earnings capabilities. We further argue that LDCs, excepting some OPEC countries, are generally experiencing debt and trade deficit problems of their own and therefore, as a group, are not promising targets for exports that could develop significant hard currency surpluses for the U.S.S.R. or Eastern Europe.

<sup>8</sup> The estimates of Soviet/EE hard currency trade with LDCs appearing in this section were derived by assuming that, in all instances where a bilateral clearing agreement does not exist, Soviet/EE trade with LDCs is conducted in hard currency. However, in a number of instances, exports of machinery and equipment to LDCs with whom trade appears to be on a hard currency basis, in fact involves a Soviet/EE agreement to accept compensation in product over a number of years in the future. Thus, some of the transactions contributing to a current surplus do not in fact yield hard currency, either currently or prospectively, which can be used for Soviet/EE settlement of hard currency deficits elsewhere.

We conclude then, that the hard currency trade deficits leading to the current level of Eastern debt have been generated largely on trade with the 15 I.W. countries included in the data used in this paper, that elimination of hard currency deficits will have to be achieved principally by expanding exports to these same 15 countries, and that our data are therefore useful in assessing overall near term Soviet-East European export patterns and hard currency capabilities.

Other limitations on our data include:

**Timeliness**—The most recent data available, disaggregated to the level of detail in this paper, covers 1975 Soviet/EE exports to the I.W. Similar 1976 data will not be available until mid-1977.<sup>9</sup> In making analyses of future export capabilities employing the technique used herein, there will inevitably be a lag of from six to 18 months between the period covered by the data available and the time of the analysis.

**Value and Volume**—The Western countries generally report imports on a C.I.F. (Cost, Insurance and Freight) basis. Dollar values cited in our tables thus include these costs, which vary in significance depending on the item involved; e.g., the C.I.F. charges included in a given dollar value of diamond exports are relatively less than on the same value of coal or steel exports. Additionally, using the United Nations data in our automated data bank we do not have meaningful measures of the physical volumes of export items; i.e., tons of steel, copper, etc., and even with the use of outside data we were unable to determine definitely, in all cases, whether changes in dollar value resulted from price or quantity changes.

## II. COUNTRY BY COUNTRY ANALYSIS OF SOVIET AND EAST EUROPEAN EXPORTS TO THE I.W.

In this section we analyze exports of the Soviet Union and each of the East European countries on a country-by-country basis, in descending order of dollar value of exports to the I.W. In 1975 these exports totaled \$16.6 billion, ranging from Soviet exports of \$7.1 billion down to \$0.3 million of Bulgarian shipments to the I.W.

### A. U.S.S.R.

#### 1. DATA HIGHLIGHTS

Table 2 disaggregates Soviet exports for the period 1972-75 into "sections" (at the one digit SITC level of detail). From this table we note the following:

At \$7.1 billion, 1975 exports to the I.W. were about 151% above the 1972 level, but up only 6% from 1974.

By 1975, Soviet exports of intermediate goods (SITC 5-6) were still relatively small, at \$1.4 billion representing just under 20% of the total. Over three-fourths of 1975 Soviet exports were primary products (SITC 0-4).

<sup>9</sup> This paper will be updated as soon as 1976 data are available. The revision should be available by August, 1977 and may be obtained from the authors, c/o Office of East-West Policy and Planning, Bureau of East-West Trade, Department of Commerce, Washington, D.C. 20230.

Manufactured exports were very small, with machinery and transport equipment (SITC 7) exports only \$229 million, representing only 3.2% of the 1975 total. Miscellaneous manufactures (SITC 8), at \$51 million were even smaller, and less than those of any of the East European countries, except Bulgaria.

Mineral fuels (SITC 3), including petroleum, coal, gas, increased from 28% of total hard currency earnings in 1972 to nearly 48% in 1975, largely due to increases in oil prices.

	<b>Total.....</b>	<b>2,845</b>	<b>100.0</b>	<b>4,533</b>	<b>100.0</b>	<b>6,739</b>	<b>100.0</b>	<b>7,131</b>	<b>100.0</b>
0-4	Primary products.....	1,848	64.9	2,863	63.1	4,740	70.3	5,417	76.0
5-6	Intermediate goods.....	871	30.6	1,474	32.5	1,790	26.6	1,403	19.7
7-8	Manufactured goods.....	106	3.7	174	3.8	180	2.7	280	3.9

Table 3 provides the top 15 product divisions and, at the greatest level of detail available from United Nations data, the top 50 items exported to the I.W. by the U.S.S.R. Examination of these data leads to several observations:

Soviet hard currency export capabilities have been concentrated in a relatively few raw and semi-processed materials items. The top five export items constituted over 40% of the total; the top 25 items 80%; the top 50, 88%.

The top 50 1975 Soviet exports were composed of: 27 primary product items; 19 intermediate product items (15 items of manufactured goods classified by chief materials, SITC 6; four of chemicals, SITC 5); and four manufactured goods items. Only one manufactured goods item, automobiles, appears in the top 25.

Twenty-eight of the 50 top 1975 items exported increased in dollar value compared to 1974, while 22 decreased. The decreased dollar values appear to reflect the price and demand sensitivities of raw and semi-processed materials to I.W. business cycle conditions, which were relatively depressed in 1975. Furthermore, it is possible that those commodities which did increase in value might have increased even more were it not for slackened Western demand.

The top 50 items for 1975 included only two newcomers compared to a similar 1974 list. The two new commodities were tractors (rank 40) and hoopwood (rank 50). The fact that there

was little variation in the export commodity structure indicates a stability in the principal sources of hard currency income.

1975 exports of various forms of petroleum products (SITC 33) constituted some 38% of the dollar value of Soviet exports to the I.W., making it the top ranking product division, with three items in the top five alone accounting for about 28% of exports. Natural gas (SITC division 34 and item 3411) exports were an additional two percent of the total; coal and briquettes (SITC 32) contributed another six percent, raising "energy" exports to almost 48% of the total. Thus, further increases in oil prices (which would also probably raise coal and natural gas prices) are important to Soviet hard currency capabilities.

With nearly \$800 million of 1975 exports (down from one billion in 1974), wood and lumber division (SITC 24) exports, including sawlogs (SITC 24221, sixth ranking item), lumber (SITC 24321, ninth rank), and pulpwood (SITC 2421, 18th rank) were the second largest, comprising nearly 11% of the 1975 total.

At \$481 million, non-industrial diamonds (SITC 6672) were an important (fourth ranking) hard currency source.

Passenger motor vehicles achieved 17th rank in 1975, more than doubling from 1974 levels to a 76.2 million dollar total.

<sup>1</sup> Small amount, rounding to zero.

In terms of total trade, the Federal Republic of Germany was the U.S.S.R.'s best customer, absorbing the greatest percentage of U.S.S.R. exports to I.W. and supplying the greatest portion of Soviet imports from the I.W. Japan was the second largest trading partner for Soviet exports but was eclipsed by the United States as the second ranking supplier of Soviet imports from I.W., thereby placing Japan in third rank. United States-Soviet trade exhibited the widest spread between exports and imports, in that the United States took a mere four percent of all 1975 Soviet deliveries to the I.W., but provided 17% of Soviet imports from the Industrialized West (largely accounted for by grain shipments).

Table 4 also reveals some interesting individual item trade relationships. For example, the U.K. took a major portion (79%) of Soviet non-industrial diamond exports (SITC 6672) and large quantities (46%) of lumber, sawn lengthwise (SITC 24321). The United States purchased nearly 30% of Soviet platinum (SITC 68121) exports to the I.W., and 25% of chromium ore (SITC 6831). Japan imported 99% of Soviet exports of sawlogs and veneer logs (SITC 24221) to the Industrialized West and large shares of Soviet platinum, chrome, and aluminum alloys exports. In cases where a large portion of an individual commodity was absorbed by a single country, economic conditions in that country had a greater effect on Soviet exports of that commodity than they would have had if the items were marketed among several countries.

Additionally, Table 4 provides some insights regarding the breadth of individual country trading relationships with the U.S.S.R. For example, the FRG imported measureable shares of 23 of the top 25 Soviet exports, while the United States imported only 10 of these items, fewer than any other I.W. country except Canada.

Analysis of the data in the three tables leads us to several conclusions:

The recent strong growth in dollar value of Soviet exports (57% increase from 1973 to 1975) apparent from the data provided can be deceiving. In large measure it reflects very large increases in the prices of petroleum products, coal, and lumber, rather than increased penetration of Western markets. For example, increased petroleum and coal exports together provided more than half of the 1974 Soviet gain in total exports to the I.W. Furthermore, crude petroleum tonnage shipments to the West actually declined from 1973 to 1974, but dollar value of exports nevertheless nearly doubled. Similarly, strong 1974 price increases for coal, lumber, cotton, platinum, copper and aluminum spurred earnings. Subsequently, as a result of world market conditions, prices for some of these items, e.g. lumber and copper, declined from 1974 highs, contributing to reduced Soviet earnings growth in 1975. While future world market prices of coal and petroleum products may still go higher, and while recovery of prices of some commodities depressed in 1975 will assist earnings growth, a repeat of the windfalls enjoyed from 1973 to 1975 seems improbable. Thus, future Soviet gains in the value of hard currency exports are likely to be much more dependent on increasing export quantities than they were, for example, in 1974.

Overall, near term (through 1980) levels of Soviet hard currency earnings seem much more dependent on world market prices for oil, gas and some other basic raw materials (logs, lumber, platinum, cotton, coal, copper) and on a capability to expand volume exports of these items, than on finished manufactured goods capabilities that might be brought on stream. This is particularly true for energy exports (petroleum, gas, coal).

The prices of primary products, raw and semi-processed materials, and the quantities demanded are, of course, closely correlated with the state of Western economies. As a result, Soviet exports fluctuate with production fluctuations in the importing I.W. countries.

On the other hand, there are probably important advantages inherent in exporting raw and semi-processed material, since these tend to be less labor intensive, and are thus less likely to face Western import barriers than are finished goods manufactures.

Primary products and raw and semi-processed materials items are likely to dominate Soviet exports for many years to come. Given the problems of quality, style, servicing, etc., inherent in penetrating new markets, expansion of finished manufactured goods exports from the current very low levels to the point where they are major export earners would take a good number of years. Perhaps in recognition of this, there are indications that Soviet emphasis on expanding raw and semi-processed material exports has been renewed, with attention, but less emphasis, on broadening machinery and equipment exports.

## 2. PRODUCT DIVISION ANALYSIS

### *a. Energy*

How much can the Soviets expand the export volume of energy products? Exports of energy (including those to CMEA countries) are roughly 14% of total energy production and are planned to increase about 4.7% per year during the 1976-80 period. This growth rate is considerably lower than the 7.3% achieved during the previous plan period and probably reflects the constraints of the shift to development of Siberian deposits, as well as the inadequacy of Soviet technology. Of total energy exports, roughly one-third is imported by hard currency countries; the bulk of Soviet deliveries has gone to communist countries. According to published Soviet commitments, this pattern will continue.

Although natural gas exports are expected to assume greater near term importance, petroleum and petroleum products will still comprise about two-thirds of energy exports. Growth in coal sales, which account for a relatively small share of energy exports, should continue at about the same rate as in the previous plan period.

Thus, although analysts' views may differ, it appears that the volume of total energy exports will exhibit relatively slow growth rates during the next five years, effecting proportionately small increases in hard currency earnings. This can be expected because of the anticipated slow growth (possibly even a decline) in petroleum exports, which will not be compensated for by accelerated growth in natural

gas shipments. Therefore, substantial earnings increases from energy, if realized, will probably be more a function of rises in world market prices than of greater volume sales.

*b. Nonfuel raw materials*

Wood and wood products (SITC 24) exports were the second largest product division exported to the Industrialized West during the years 1972-75. Representing 11% of total 1975 Soviet shipments, these items earned the U.S.S.R. about \$1 billion in hard currency in 1974 and \$800 million in 1975, even though volume sales declined in both years. Gains in dollar value earnings in 1974 were the result of drastically escalating world market prices, but price levels were insufficient to offset the 1975 volume decline.

Prospects for 1976-80 increases in exports of wood commodities are dependent upon both world market prices and the successful development of Siberian timberland. As world economies recover, the demand for and prices of wood products should improve. Some increases in export capability should be forthcoming from Siberian resource development. One estimate<sup>10</sup> predicts that development of the East Siberian forest areas could increase wood products exports by as much as 15% per year for the next decade. The extent to which potential increases are realized, not only in production but in export sales, will in part be affected by Soviet success in negotiating compensation arrangements with the West. The most significant of these may originate out of negotiations with Japan, which had already invested in Siberia's timberland development as early as 1970. Although the 1970 agreement did not involve product payback, subsequent arrangements are likely to do so, as the Soviets attempt to make Siberian development projects self-liquidating. One agreement already signed, which calls for export of Soviet timber products in return for Japanese forestry handling equipment, will contribute about \$1 billion to hard currency earnings between 1976-80.

On balance, the 1976-80 planned average annual growth rate for production in the forest products industry is about four percent, not significantly different from that achieved in the previous plan period. Sustained production increases, improved prospects for Western economic recovery that would enlarge demand and increase prices, and potential gains from compensation arrangements, should serve to maintain the relative importance of wood and related products exports in the current plan period. Given these factors, it is possible that 1980 hard currency wood products earnings could approach \$2 billion.

Exports of textile fibers (SITC 26), consisting primarily of raw cotton, added \$360 million to 1975 hard currency earnings from sales to the Industrialized West, about five percent of the total. Sales of cotton can be expected to continue through the remainder of the decade. It is unlikely, however, that cotton exports can contribute much more to foreign exchange earnings than in recent years.

<sup>10</sup> Smith, Alan, "Soviet Dependence on Siberian Resource Development", *Soviet Economy in a New Perspective*, Joint Economic Committee Publication, 1976, p. 494.

Nonmetallic mineral manufactures (SITC 66), primarily diamonds, in 1975 accounted for almost a half billion dollars in hard currency earnings, with Great Britain being the major importer. Due to expected price increases for the remainder of the decade, the prospects for continued hard currency earnings from diamond shipments are good, in spite of difficulties in mining Siberian areas.

Non-ferrous metals (SITC 68) exports (platinum group, copper, aluminum, nickel) of \$440 million represented six percent of total U.S.S.R. sales to I.W. countries in 1975. Nonferrous metals have exhibited substantial instability as hard currency earning commodities. In 1975, recession in Western economies severely curtailed demand for these items. Prices fell sharply, reducing earnings from the 1974 peak of \$800 million to about \$400 million. The 1975 decline in value was due in part to a drastic drop in platinum prices and was also particularly aggravated by disproportionately large declines in copper prices. It is noteworthy that the U.S.S.R. is the world's biggest producer of many minerals and metals. Although the Soviets are very secretive regarding these commodities, there is little doubt that their supplies are substantial. On the production side, however, it appears that the nonferrous metals industry has run into some difficulties. One indication is the planned slowdown in production growth in the current five year period. The entire nonferrous industry is slated for an annual average growth rate of 4.6%, slightly below the previous plan's rate of 5.0%. Planned growth in aluminum output is to be between 20-30% during the 1976-80 period, a target significantly lower than the 50-60% of the previous plan. Increases in copper and nickel production are also to be between 20-30%, again down from the 1971-75 growth rates of 35-40%. Elsewhere, the plan calls for improved mining methods among extracting industries. As is the case with energy products and other raw materials, indications are that production increases, particularly for export, will have to come from development of Siberian resources. Here again, as accessible areas are depleted, costs for developing new areas may become enormous. Lagging technology also serves to compound the logistic problem. Imported Western technology and expertise appear to be a solution, but escalating debt and the concomitant need to restrain imports diminishes the feasibility of this alternative. In an attempt to circumvent these difficulties, the U.S.S.R. has increasingly sought technology through countertrade arrangements. As an example, in 1976, an agreement was signed between France and the U.S.S.R., whereby a French company is to export an aluminum refinery plant in return for aluminum. Exports from this deal are scheduled to come on stream in 1979. Additionally, to develop the vast Udokan reserves, which reportedly can sustain copper exports for the next 50 years, the Soviets are seeking U.S. and British cooperation. Negotiations have not yet been finalized. Even in the unlikely event that an agreement could be reached in the very near term, output from this area could not be expected before 1982, since the copper industry operates under at least a 5-6 year lag between development and output. Besides Udokan, the Norilsk area in East Siberia also holds promise for substantial increases in production of nonferrous metals. Most platinum already comes from this area and there is a strong potential for increased copper and nickel output. Developing the Norilsk nickel reserves

could make the U.S.S.R. the world's major exporter of this commodity. To tap the rich copper deposits, the Soviets already have concluded an arrangement with Finland for a copper smelter. Neither output nor exports, however, can be expected in the 1970's.

To summarize expectations for the current plan period, world prices for nonferrous metals will be a very important factor in determining the level of foreign exchange earnings. Demand should begin to recover as Western economies improve. However, substantial gains in the volume of nonferrous metals exported to the West in the next few years are not likely, and additional exports arising out of countertrade agreements geared toward Siberian development will not significantly affect volume until the 1980's.

### *c. Manufactured goods*

Soviet leadership has from time to time made ambitious calls for increased manufactured goods exports to the West. These exhortations have been undoubtedly motivated mainly by economic advantages perceived to result from the larger "value added" in manufactured goods as compared to raw materials, but probably also by perceptions of a greater "status" being involved in export of manufactures. Additionally, raw materials tend to be more vulnerable to world market price swings. Furthermore, not only are natural resources depleted by raw material exports, but in the case of the U.S.S.R. they are increasingly costly to develop.

The two digit product divisions representing virtually all manufactured goods exports by the Soviet Union to the Industrialized West for the four year period, 1972-1975, are provided in Table 5.

TABLE 5.—U.S.S.R.: MAJOR EXPORTS OF MANUFACTURED GOODS TO INDUSTRIALIZED WESTERN COUNTRIES, 1972-75, RANKED BY 1975 VALUE<sup>1</sup>

[In millions of U.S. dollars]

SITC	Commodity group	1972	1973	1974	1975

	Total manufactured exports to industrialized Western countries.....	106	174	180	280	.....
	Total exports to industrialized Western countries.....	2,845	4,533	6,739	7,131	.....
	Manufactured goods as percent of total exports.....	3.7	3.8	2.7	3.9	.....

<sup>1</sup> Commodities classified in SITCs 7 and 8.

The record of Soviet sales of manufactured goods to the West has been weak. Despite an increase of 2½ times in value terms between 1972 and 1975, manufactured goods have consistently comprised less than 4% of Soviet exports to the I.W.

Transport equipment represents the top two-digit level manufactured product group exported by the U.S.S.R. Within this category,

passenger motor vehicles and ships/boats are items whose exports more than tripled in value over the four year period, 1972-1975. This indicates that the Soviets have had some success in increasing sales of transport equipment, but these items nevertheless remain a relatively minor two percent of total exports to the I.W.

Soviet auto production and exports provide an interesting item for analysis. Between 1970 and 1975 Soviet car production increased 250%. This rapid rise is attributable to output from the Togliatti plant, completed in 1970 and built with plant and equipment imported from Fiat of Italy. A large part of export sales have been to COMECON countries, but the West has also become a target for expansion, and autos were the 17th ranking item among exports to the I.W. by 1975. Exports have consisted principally of the Lada (trade name of the Soviet Fiat designated for foreign consumption), which in 1975 found a Western market for 64,000 cars. Primary Western importers were: West Germany (9700), Belgium (9400), Great Britain (6300) and Holland (6300). The Soviets have recently been particularly aggressive in their sales to Great Britain, where the Satra Corporation, through its network of dealerships, expects to sell 12,000 cars in 1977.

Attention is also turning to the United States market. Here again, the Satra Corporation will handle transportation, processing, and distribution. To this end, construction of a \$2.1 million "pre-delivery center and spare parts depot" in Savannah, Georgia was slated to begin in the spring of 1977. Soviet shipments of the Lada should begin in early 1978 at the rate of 10,000 cars annually. Optimistic goals call for an increase to 25,000 within a few years. Future Lada sales to the West in significant volumes depend, however, on several factors. Lack of a time-tested favorable reputation of Soviet manufactured goods will most likely be a basic problem.<sup>11</sup> It seems unlikely that Lada sales in the United States will be large, not only because of lack of an established reputation, but also because the American consumer has such a wide variety of time-tested cars from which to choose. As has been the case in other Western markets, low pricing rather than quality may be the best selling point. However, low prices can raise the spectre of anti-dumping actions.

The other noteworthy category of manufactured exports is non-electric machinery (SITC 71), which, though comprising only one percent of total U.S.S.R. exports to the I.W., has also risen considerably since 1972. Metalworking machine tool sales and tractor shipments have carried most of this group.

The U.S.S.R. has been particularly ambitious in developing sales of tractors, the 40th ranking 1975 export to the I.W. Rapid growth rates were achieved in 1973, 1974, and 1975, with similar expectations for 1976. Sales were primarily to the United States, Canada, and Great Britain. To attract Western buyers the Soviets made minor design modifications and set up servicing and spare parts facilities. More importantly, lower pricing gave them a competitive advantage over Western counterparts. Whether sales growth will continue at as rapid a pace as it has in the past few years depends in large measure on the performance of the tractors already sold.

The car and tractor export drive illustrates the aggressiveness and flexibility with which the Soviets can approach market penetration in

<sup>11</sup> Notably, recent publicity campaigns promoted by Satra in Great Britain adroitly avoided mentioning that the Lada was a Soviet product.

the West. Their attempts have met with some success, as evidenced by the 1972-1975 increases. On balance, however, although the above cited isolated cases may be impressive, they cannot be used as indications of an overall Soviet capability to satisfy I.W. manufactured goods' import needs. The overall near term potential of Soviet manufactures exports still remains weak. Factors limiting really significant growth include their lack of diversification and traditionally negative Western attitudes toward Soviet manufactured goods. Overcoming these difficulties will require not only time, but continued investment and infusions of Western equipment and technology.

It thus seems that, in the near term, developing traditional energy and semi-processed exports, rather than manufactured goods will yield the greatest returns on investment. Given existing constraints, a 1980 upper limit of 5-6% of total exports may be as much as can be expected from the manufactured goods sector.

### 3. THE ROLE OF COUNTERTRADE IN SOVIET EXPORTS THROUGH 1980

About 10% of Soviet hard currency earnings in the 1976-80 period are reputed to be forthcoming from exports originating out of countertrade agreements. The U.S.S.R. has relied heavily on these agreements in an effort to provide assurance of a market for the exports required to pay for imported equipment and technology.

Countertrade agreements abound in industries relying heavily on Siberian development for future production expansion (natural gas, oil, timber, coal). In fact, a considerable volume of future export increases (particularly of natural gas) will be based upon product payback originating from these agreements.<sup>12</sup>

One industry which has not in the past figured prominently in Soviet exports to the Industrialized West is the chemical industry (SITC 5); its sales accounted for just under four percent of foreign exchange earnings from the I.W. in 1975. However, as a result of a substantial number of countertrade arrangements signed between the Soviets and France, West Germany, Italy and the United States in the early 1970's, marked increases in chemical exports (particularly polyethylene and ammonia) will come on stream beginning in 1978.

Although countertrade involves various difficulties, including pricing the flow of return product over extended (5 to 20 years) periods, and sometimes a reluctance of Western firms to tie themselves to Soviet supply, it will contribute a growing amount to Soviet hard currency earnings in future years.

### 4. SUMMARY

The strong growth in Soviet hard currency earnings from I.W. countries between 1972 and 1975 can be deceiving if used to predict future levels of Soviet export growth to the developed West. In large measure the performance between 1972 and 1975 reflected very large increases in the prices of petroleum products, coal, lumber, and nonferrous metals, rather than expanded volume deliveries or increased penetration of Western markets. While future world market prices of these products may go still higher, and while recovery of

<sup>12</sup> For a more complete treatment of countertrade, see Matheson, et al., "Countertrade Practices in Eastern Europe", in this volume.

prices of some commodities depressed at mid-decade will assist earnings growth, a repeat of the windfalls enjoyed from 1973 to 1975 seems improbable. Thus, future Soviet gains in the value of hard currency exports are likely to be much more dependent on increasing export quantities than they were, for example, in 1974.

Accounting for 48% of the dollar value of shipments to the I.W. in 1975, energy products exports will be a key to future earnings growth. It appears that the volume of total energy exports will exhibit relatively slow growth rates during the current plan period, effecting proportionately small increases in hard currency earnings. This conclusion can be attributed both to increasing domestic and East European energy needs and to the technical difficulties bearing upon developing Siberian reserves, which appear to be the primary source of future hydrocarbon energy supplies. The only energy product likely to show noteworthy export growth is natural gas, whose deliveries, arising out of compensation arrangements, should begin to come on stream in the latter part of this decade.

Although the Soviets have in the past attempted to increasingly penetrate the Western market with sales of manufactured goods, they have been relatively unsuccessful in that manufactures have comprised only about 4 percent of total Soviet deliveries to the I.W. Given the problems of quality, style, servicing, etc., inherent in penetrating new markets, expansion of finished manufactured goods exports from the current very low levels to the point where they are major export earners would probably take many years. Perhaps in recognition of this, there are indications of a renewed emphasis on expanding raw and semi-processed materials exports, e.g., wood and wood products, platinum, copper, diamonds, with a somewhat lesser call for broadening machinery and equipment deliveries.

## *B. Poland*

### 1. DATA HIGHLIGHTS

Table 6 displays, at the one-digit SITC level of detail, 1972-75 Polish exports to the 15 I.W. We note the following:

Total exports to the I.W. doubled from nearly \$1.4 billion in 1972 to nearly \$2.8 billion in 1975.

The 61% portion of total exports provided by primary products in 1975 was virtually unchanged from 1972.

Composition at the one-digit level remained essentially unchanged, except for a decline in the relative portion of food and live animal exports (SITC 1). This was almost exactly offset by an increased importance of mineral fuels (SITC 3), principally due to increased coal prices. Also of note is the expansion of finished goods manufactures (SITC 7 and 8) from 16.8% total in 1972 to 20.8% in 1975.

Examining Poland's top 15 export divisions and top 50 items (see Table 7) we find:

Like the U.S.S.R., Polish export capabilities have been concentrated in a relatively few items. The top five provided 44% of 1975 exports to the I.W., the top 25 items, 67%.

Coal (SITC 32) was overwhelmingly the largest hard currency product division, accounting for 30.7% of total exports in 1975.

Other important product divisions included: Meat (SITC 01), of which five items in the top 50 constituted 9.0% of total exports; nonelectric machinery (SITC 71), four items comprising 3.4% of total; clothing (SITC 84), five items making up 4.2%; and nonferrous metals (SITC 68)—principally copper, silver, and zinc—earning 4.7% of total hard currency in 1975.

Poland's top 50 items included 15 finished manufactures (SITC 7 and 8) versus only four in the Soviet Union's top 50. Included among Polish manufactures were several items that are potentially import sensitive in the I.W., e.g., six clothing and footwear items.

Ships and boats (SITC 7353) was the third ranking export item, based mainly on sales of large ships. However, 1975 export earnings were essentially unchanged compared to 1973.

Sulfur (SITC 2741), the fourth ranking item, more than doubled earnings from 1973 to 1975, and it appears that the increase was totally based on price rather than volume.

Exports of live horses (SITC 0015), in ninth rank, provided an unusual but growing revenue source.

<sup>1</sup> Not elsewhere specified.<sup>2</sup> Exports to United States only. Inclusion of exports to other I.W. countries at this level of aggregation would result in a higher rank for this item.

Examination of Table 8, which describes the distribution of Polish exports among the 15 I.W., leads to the following observations:

Poland's number one trading partner was the Federal Republic of Germany, taking 21% of 1975 Polish exports to the I.W., followed by France, Italy, the U.K., and the United States.

For the most part, exports of the major income items were spread across several of the I.W. countries. However, 69% of prepared or preserved meats (second rank, SITC 0138) went to the United States in 1975; 77% of internal combustion engines (10th rank, SITC 7115) to Italy; and virtually 100% of bacon (11th rank, SITC 0121) to the U.K.

The United States imported 14 of Poland's top 25 export items to the I.W.

## 2. PRODUCT DIVISION ANALYSIS

From our data we draw some general conclusions with respect to future export capabilities:

Polish growth in exports to the I.W. has not been as broadly based as might be anticipated. 1975 export values dropped in 21 of the top 50 items when compared to 1974 levels. In fact, nine items were lower in 1975 than in 1973. The vast majority of dollar growth between 1973 and 1975 has stemmed from coal. Other gains of some significance came in sulfur (\$41 million), internal combustion engines (\$45 million), and clothing (\$47 million). Clearly, however, these increases were overwhelmed by those of coal.

Like the Soviet growth, a substantial portion of Polish 1973-75 export growth stemmed from energy price increases. Indeed, coal volume shipments decreased from 1974 to 1975, but value increased. In fact, earnings increases from 1973 to 1975 of some \$547 million on two coal items were equivalent to almost two-thirds of the total advance in Polish exports to the I.W. Additionally, petroleum products exports advanced \$60.5 million apparently on the strength of price increases. Thus, over 70% of Poland's 1973-75 dollar earnings increase on exports to the I.W. came from coal and petroleum products exports and these gains were essentially the windfall outcome of price increases of a magnitude unlikely to be repeated.

Because coal has been overwhelming the largest hard currency item (30.7% of 1975 total) both future export prices and volumes are of very great significance to Polish hard currency capabilities in the years ahead.

Also very important will be price and export volumes of meat, sulfur, and copper.

At a total of \$575 million and with 20.8% share of 1975 exports to the I.W., finished goods manufactures (SITC 7 and 8) exports have become relatively significant income earners that may be expanded in the future.

*a. Coal*

Next to the United States, Poland is the world's second largest coal exporter, with half of its shipments going to hard currency countries. Earnings from coal and coke (SITC 32) sales accounted for 16% of total exports to the Industrialized West in 1973, but had mushroomed to 31% by 1975. The 181% increase in dollar earnings between 1973 and 1975 was principally due to the effect of substantial coal price increases similar to those evident in the world market price of oil.

The relative importance of coal as an export commodity is based on Poland's vast reserves, whose development has been particularly brisk in the 1970's. An indication of the recent stress placed on coal production is the 1975 opening of the Katowice Colliery, thirty months ahead of schedule. The complex is reportedly the largest in Europe, wholly mechanized and automated, and built using 90% Polish-made equipment. Katowice was the fourth new mine opened between 1970 and 1975, during which time fifteen mines were also modernized and

expanded. The Poles are committed to the goal of increasing production capacity. Total output is slated to increase 4.1% annually during the 1976-80 period, while the entire coal mining industry is to undergo extensive modernization. Part of the upgrading scheme will be supported by Western credit, earmarked for development of a new mining area at Lublin.

In addition to modernizing and expanding the mining industry, Poland has allocated large research and development expenditures in the current Five-Year Plan for comprehensive coal processing systems. Much of the ongoing research follows lines similar to that in the United States and includes liquefaction and hydrogenation.

In sum, Poland has potential for substantial increases in coal producing capacity using relatively sophisticated domestic technology. Long-term contracts have assured a hard currency outlet for most planned coal exports to the West,<sup>13</sup> which should increase moderately, perhaps six to eight percent per year over the 1976-1980 period. Strong Western demand, motivated in part by attempts to expand coal's share of the energy base, should keep prices on the upward trend. Even if the Poles find that capacity increases become difficult to realize or that CMEA and domestic demands impinge upon above-contract shipments to the West, unit price increases could buoy earnings as they did in 1975 when slightly decreased volume exports were offset by rising prices. Substantial further export increases may come on stream in the early 1980's, when the Lublin mines begin to turn out large volumes of coal, and when some of the gains from current R & D become evident.

#### *b. Meat and meat preparations*

Exports of meat and meat preparations were the second largest commodity group shipped to the Industrialized West in 1975. Sales of meat products, particularly hams and bacon, have earned on the average of \$263 million in hard currency since 1973. Although prepared meat exports increases have been steady, it is highly unlikely that they can increase to a significant degree in the near or long term. Factors weighing heavily against expansion are domestic demand and uncertainties in agricultural performance, created by both periodic unfavorable weather conditions and structural problems in the sector.

Polish meat consumption has escalated in recent years, and there seems to be no end in sight. Demand has far outstripped supply and last year's attempt to apply limits to domestic food consumption by raising prices clearly failed. To ease the bottleneck, Poland is reportedly looking to Western markets as possible sources of supply for some kinds of meat. Although this appears to be a short-term expediency, it does illustrate that assured increases in meat exports may be difficult to achieve.

Further, in recent years Poland has had to import increasing quantities of grain and protein feeds from hard currency sources to satisfy its total requirements. Unless the situation changes, increased meat exports can be gained only at the expense of increased grain imports, reducing the net hard currency benefit of such exports.

<sup>13</sup> Countries which negotiated coal contracts with Poland are (in order of approximate size of contract): Finland, Italy, France, Belgium, Japan, Denmark, Austria, Netherlands. Contracts are reported to be still under negotiation with United Kingdom and Sweden.

Also noteworthy is the precipitous drop in exports of live animals (see Table 7), particularly bovine cattle (SITC 0011), whose sales plunged from \$123 million in 1973 to \$11 million in 1975. Apparently the principal factor behind the decline was an EC restriction on beef imports that began in 1974, frustrating what was an existent Polish export capacity. Added to this was the decline in bacon, ham, and other pig meat (SITC 0121) exports which had been almost totally absorbed by Great Britain. It appears that upon Great Britain's entry into the Common Market in 1973, it became economically more advantageous to import bacon products from other EC member countries, thereby causing a decline in imports of this commodity from Poland.

#### *c. Nonferrous metals*

Exports of nonferrous metals (SITC 68) (copper, silver, zinc) ranked fifth among Polish exports to the Industrialized West in 1975. Substantial future increases in export tonnage of nonferrous metals, particularly copper, are probable.

Poland is said to possess Europe's largest copper reserves, and to develop these deposits, an extensive modernization scheme has been underway and will continue. To spearhead the effort, in 1975 the Poles raised \$240 million on the Eurodollar market. In addition, West Germany extended a ten year credit line for developing raw materials, particularly copper.

A new mine was added at Rudna in 1974 and the Lublin and Polkowice complexes are to be expanded. Expansion is also in progress at the Legnica smelter and at Glogow, for which a \$100 million joint United States-Canadian loan has been negotiated.

Research and development allocations have also been earmarked for the copper industry. The Poles are primarily interested in furthering their capacity in developing copper products, whereby value added brings higher prices in the Western market.

As is the case with coal, copper exports are largely under long-term contracts. In 1975, Poland agreed to deliver 25,000 tons of copper annually to France for the next fifteen years. In 1976, Poland signed a deal with West Germany's Metallgesellschaft consortium to deliver 40,000 tons of electrolytic copper (cathodes and wire bars) for the next twelve years. Consequently, some feel copper export tonnage to the West can be reasonably expected to nearly triple by 1980.

#### *d. Minerals and chemicals*

Ranking second only to Canada, Poland has become a major sulfur exporter in recent years. In addition, it has developed technology and equipment for complete sulfuric acid plants. These have been installed in several less developed countries around the world.

Exports of sulfur are expected to double as development of the Tarnobrzeg basin continues during the current plan period. Furthermore, it appears that earnings from chemicals, particularly sulfuric acid, caustic soda, nitrogen fertilizers, PVC, and synthetic fibers exports could also double by 1980. These products can be expected to come on stream during the latter part of the current plan period as plants built largely with Western cooperation (equipment and credits) become operative.

*e. Manufactured goods*

Poland is unique among the countries of Eastern Europe in that during the Five-Year Plan between 1971-1975, it adopted a deliberate policy of modernizing its manufacturing base by massive imports of Western plant, equipment, and technology. The game plan called for some of these imports to produce manufactured goods which, in turn, could be sold in Western markets for hard currency.

Exports of manufactured goods during 1974 and 1975 accounted for 17 and 21% of total exports to the I.W. (see Table 6). Historical data are inadequate, however, for analysis of Poland's manufactured goods export potential because the manufacturing base had not yet reached the full potential prescribed by the plan set out during 1971-75. A more meaningful approach is instead to analyze those product divisions and items which appear to have been earmarked for expansion.

Those which appear to be geared for export increases in the next five years are machinery, tractors, ships, and automobiles. Many of these will be produced under Western license and geared toward series output aimed at making the goods more competitive in terms of efficiency, quality and profitability.

Machinery, nonelectric (SITC 71) has become the third largest Polish export to the Industrialized West with earnings nearly tripling from the 1973 value of \$48 million to \$145 million in 1975 (see Table 7).

Internal combustion engines, mining equipment, tractors, and machine tools, were among major exports from that group. Sales, specifically of engines and tractors, can be expected to increase during the current plan period, in part on the basis of a \$350 million deal signed in 1974 with two British firms, Massey-Ferguson and Perkins Diesel Company (both are part of Massey-Ferguson Holdings). The Ursus works, just outside Warsaw, is expected to bring MFP tractor units into series production by about 1978. Since the 1974 deal is in part buy-back, tractor sales should register an increase in the latter part of the plan period. However, hard currency exports cannot be expected to surge dramatically as domestic plans call for a one-third increase in farm production based largely on increased mechanization.

Mining equipment sales have accounted for a noteworthy portion of capital goods exports; in particular, Poland's coal mining equipment is relatively competitive in Western markets.

The remaining category of heavy industry goods which seems to have export potential is the transport equipment (SITC 73) group, wherein the primary commodities are ships and automobiles. Improvements in shipbuilding technology, the result of substantial investment outlays during the 1971-1975 plan period, have been significant. An indication of what may be a future trend is the 1977 scheduled Polish delivery of two liquefied natural gas tankers to the United States, valued at \$93 million. Reportedly, the French are also examining the possibility of importing Polish-made ships.

Gains in sales of automobiles also appear promising during the current plan period. The Poles have imported Fiat technology, manufacturing the "Polski Fiat" for export markets. By sticking to one licensee, it has been possible to gain efficiencies of scale and to benefit from series production. Auto output, doubling between 1971-1975 can be expected to double again in the current plan period. Production

increases, however, will not necessarily imply proportionate increments in export sales if fulfillment of domestic demands becomes increasingly urgent.

A third group of recently developed commodities is in the aviation industry. Primary commodities have been light planes and agricultural aircraft and engines. Sales of these, however, are not likely to come on stream until the 1980's.

Huge export campaigns have also been launched in some light industries. Exports of clothing have been particularly significant in recent years, as have sales of footwear. However, as with output of some other consumer goods, pent up domestic demands can be expected to mitigate against a large surge in exports to Western markets. Additionally, in some markets, quota restrictions limit the export expansion of these import sensitive items.

Finally, a relatively "young" export line, developed largely in this decade, consists of sports and camping equipment. Although it is questionable whether sales of these items will be significant enough in the next few years to account for substantial hard currency earnings, they are nonetheless noteworthy. In these product lines, Polish manufacturers have continuously evolved toward ever-higher quality and expanded capacity. The export mix consists of bicycles, quality camping tents, air mattresses, boats, and ski equipment. The Polish firm, Universal Foreign Trade Enterprise, has been the primary exporter of these goods, which in part have been produced in cooperation with Western manufacturers.

To summarize, although much can be said about the extent to which infusions of Western technology have upgraded the manufacturing base, it is questionable whether Poland can realize substantial export gains from this sector by 1980. It appears that the manufacturing base is still not completely geared toward export production, evidenced by the call in the current plan for further streamlining and continued modernization. Also, greater marketing efforts and outside distribution networks are needed for exporting increased quantities of manufactured goods. Beyond these factors is the traditional Western hesitation about the quality of East European manufactured goods, not to mention the strong domestic pressures bearing on the Polish economy. A final unknown is the extent to which trade barriers in Western economies may act to prevent meaningful market penetration. On balance, it appears that near term hard currency capabilities will still center around coal, sulfur, and copper exports, rather than on sales from the manufacturing sector.

### 3. ROLE OF COUNTERTRADE IN POLISH EXPORTS THROUGH 1980

In light of their rising hard currency debt, the Poles have increasingly sought to tie their imports to future exports, in order to provide, at the minimum, an assured debt-servicing capability. At the outset of the 70's, cooperation deals involving buy-back of Polish products accounted for about 1.5% of sales to the West. By 1975 this share had risen to about 12%. Since most of the countertrade agreements were negotiated between 1973 and 1975, it can be expected that at least some of these will begin to add to hard currency earnings before the end of the decade.

One of the largest deals was negotiated in 1974 between the British concerns Massey-Ferguson and Perkins Diesel Company and the Polish Foreign Trade Enterprise Agromet-Motoimport.<sup>14</sup> This agreement called for Polish imports of equipment for the tractor and diesel industries which in turn would produce tractors and diesel exports for marketing in the West. Output is expected to come on stream in the latter part of the seventies, but will not reach full potential until the 1980's.

Countertrade agreements in the chemical industry have also been significant and are expected to contribute in large measure to the projected two-fold increase in chemical exports by 1980. One chemical deal, negotiated in 1975 with Britain's Petrocarbons Ltd., calls for annual Polish exports of almost \$125 million of PVC. France's Creusot-Loire exported equipment and technology for a fertilizer plant which is also expected to generate chemical fertilizer exports.

Finally, several contracts have been negotiated with Western firms which are to export plant, equipment, and technology, in part to be financed by imports of coal, copper, and sulfur.

Although countertrade arrangements can be viewed as a vehicle for furthering Polish export capability, it appears that in the near term, their contributions to export volumes will be mixed, due in part to the fact that it seems to be taking more time than anticipated to get new plants to produce efficiently.

#### 4. SUMMARY

The potential for increasing Polish exports to the I.W. countries through 1980 appears promising for several commodity groups. Among these are coal, copper, sulfur, and some manufactured goods. However, increases in export earnings will probably depend more on ability to increase the volume of shipments than on price increases, since the large windfalls, carried by escalating prices between 1973 and 1975 are not likely to be repeated.

Coal exports will probably increase in volume, based on production increases which should be forthcoming from the continued development, using relatively sophisticated technology, of extensive domestic coal reserves. Exports to the I.W. countries, already scheduled under previously negotiated contracts, will assure substantial earnings in the near term.

Poland's second largest export group, meat and meat products, however, cannot be expected to show significant increases in hard currency earnings. Uncertainties in agricultural performance coupled with escalating domestic demand may appear as constraints on available export volumes.

Copper exports can be expected to rise based on increasing production from extensive reserves. This production already has an assured export outlet in long-term contracts similar to those negotiated for coal deliveries.

Exports of sulfur show promise of doubling during the current plan as existing export capacity is further augmented by development of additional sulfur deposits.

<sup>14</sup> For a more complete treatment of countertrade arrangements, see Matheson, et al., "Countertrade Practices in Eastern Europe", in this volume.

Manufactured goods exports may increase as Poland begins to capitalize on the benefits of its massive technological import program of the 1971-75 Five-Year Plan. In particular, exports of machinery, tractors, ships, automobiles, and light industry manufactures such as clothing, and camping and sports equipment, may show an upward movement. However, quality and servicing problems, which beset many East European manufactures, added to potential Western import barriers, may mitigate against substantial penetration of Western markets.

### *C. German Democratic Republic*

#### 1. DATA HIGHLIGHTS

With a 1975 total of \$2.25 billion, after the U.S.S.R. and Poland, the German Democratic Republic is the third largest exporter to the I.W. (13.6% of total U.S.S.R./EE exports to the I.W.) in the Soviet/EE group covered by this paper. Table 9 disaggregates GDR exports at the one-digit section level and indicates the following:

Growth in GDR exports has been relatively rapid, increasing nearly 86% over the 1972-75 period, with no really significant changes in the overall composition.

The composition of GDR exports is in marked contrast to that of the U.S.S.R. and Poland, with primary products (SITC 0-4) providing only 33.8% of deliveries to I.W.

The GDR total of \$1.48 billion of intermediate and manufactured goods (SITC 5-8) exports represented 65.7% of its total, only about \$200 million less than that of the Soviet Union, and substantially larger than that of any other East European country. In manufactured goods exports (SITC 7-8) the GDR is the first ranking exporter in the Soviet/EE group, with a total of \$728 million.

TABLE 9.—GERMAN DEMOCRATIC REPUBLIC: EXPORTS TO INDUSTRIALIZED WESTERN COUNTRIES, 1972-75.

7-8	Manufactured goods.....	433	35.8	512	32.0	648	30.7	728	32.4

Our disaggregated 2 and 5 digit information in Table 10 is faulty in that the data do not include exports to the Federal Republic of

Germany.<sup>15</sup> Exports to the FRG in 1975 were \$1.36 billion, an amount equal to over 60 percent of the total to the I.W. Similar percentages went to the FRG over the years 1972 through 1974. Additionally, there were some rather significant differences in the composition of exports to the FRG, compared to those to the remaining I.W. countries. Generally speaking, the relative shares of GDR exports to the FRG were lower than the Table 9 percentages in the case of chemicals (SITC 5) and machinery and transport equipment (SITC 7), but relatively higher in manufactures classified by chief material (SITC 6) and miscellaneous manufactures (SITC 8).

Recognizing the serious limitations this places on our disaggregated data, examination of Table 10 reveals the following:

There was no single dominant product division in GDR exports to the other 14 I.W. The top ranking division, chemical elements and compounds (SITC 51), with 8.3% of total, was less than twice as large as the eleventh ranking export, furniture (SITC 82), which comprised 4.3% of the total.

The top 50 1975 export items included 19 manufactured goods items (SITC 7 and 8), a number larger than that of any other country in the Soviet/EE group.

Live swine (SITC 0013) was the first ranking export item, with 5.7% of total exports to the 14 I.W.; swine meat (SITC 0113) ranked second and provided another 4.6% of the total.

Of the top 50 items, 1975 sales increased relative to 1974 in 38 items, declined in 12.

---

<sup>15</sup> The FRG does not report trade with the GDR as foreign trade. Rather, it is considered to be "international trade".

<sup>2</sup> Not elsewhere specified.

<sup>3</sup> Small amount, rounding to zero.

Table 11 shows the destination of the top 25 items exported to the 14 I.W. in 1975 (data on the FRG is excluded). Some points of interest are:

Other than the FRG, France and Sweden were the largest I.W. markets for GDR goods. Each took over 18% of the total exported to the 14 I.W.

France took nearly 73% of the GDR's swine meat (SITC 0113) exports and 94% of railway locomotive parts (SITC 7317) exports. Sweden took nearly 100% of pulpwood (SITC 2421) shipments.

## 2. GDR'S EXPORTS TO THE FEDERAL REPUBLIC OF GERMANY

Over 60% of GDR's exports to the 15 I.W. countries have gone to the Federal Republic of Germany, with which the GDR enjoys a unique trading relationship. Our disaggregated data presented in Tables 10 and 11, however, do not include GDR-FRG trade. Given the relative importance of the Federal Republic of Germany in GDR's Western export market, we treat exports to the FRG in the following separate analysis.

Shipments of GDR goods to the FRG are treated by the FRG as inter-zonal trade rather than as foreign trade, and therefore, are free from import duties, tax on value added, and EC levies on agricultural commodities. Moreover, West Berlin's location in the heart of the GDR creates a substantial market for GDR deliveries, particularly of foodstuffs. Inter-German trade is conducted on a strictly bilateral basis. Finally, GDR's imports from the FRG are eligible for the special category of interest-free "swing" financing granted by the FRG only to the GDR to cover trade between the two countries. Funds available under the swing credit arrangement, however, are limited to a total of DM 850 million (about \$360 million). These combined factors make for a unique trade relationship between the GDR and the FRG.

The composition of GDR exports to the FRG differs most significantly from that offered to other Western trading partners in that large quantities of clothing, textiles, agricultural, and oil products are exported to the FRG. Except for livestock and meat, products in these groups do not appear in quantity in GDR exports to other I.W. countries, whose potential import restrictions provide added reasons for this difference. On the other hand, exports of chemical products and machinery, both of which are among top product groups shipped westward, account for a relatively small share of FRG imports from the GDR.

The outlook for continued and, indeed, increased GDR-FRG exchanges is good, and the relatively large share of GDR's exports to the I.W. going to the FRG will probably continue. Future economic progress in GDR's economy is to some extent dependent upon imports from the West and the FRG provides a convenient, favored source, given the preferential trading arrangement between the two countries. To pay for continued imports, and to service the already existing debt requirements, the GDR will seek to expand exports to the FRG. The ability of the GDR to increase supplies of marketable goods to its neighbor will however, in large part, determine the rate at which total trade between the two countries increases in future years.

## 3. PRODUCT DIVISION ANALYSIS OF EXPORTS TO 14 I.W. COUNTRIES

### *a. Chemicals*

Turning to analysis of the GDR's exports to the 14 I.W. countries (excluding FRG), GDR's top ranking export division in 1975 (see Table 10) was chemical elements and compounds (SITC 51). Since

1973 the dollar value of these exports more than doubled, and unlike the experience of the U.S.S.R. and every other East European country, deliveries of GDR's chemical elements and compounds maintained their strength in 1975, the year of lagging Western demand.

Future increases in exports of chemical products seem likely, based upon two factors. The first is that production expansion in the chemical industry is among top priorities in the current plan period; supplies should be augmented as output is slated to increase nearly 30% by 1980. The second factor motivating optimistic export projections is the relatively strong performance of chemical shipments during the recent Western recession, i.e., the absolute dollar value of GDR's chemical exports to the 14 I.W. countries did not decrease, although the rate of increase did slow. Assuming that GDR chemical supplies for export are adequate, recovered Western demand may open more new markets for GDR's chemicals and thereby expand already large markets.

Other intermediate goods exports such as iron and steel, fertilizers, and textile yarns—each contributing relatively small shares (6, 5, 4 percent respectively) to hard currency earnings from shipments to I.W. countries—may also be able to expand moderately, assuming good Western economic conditions.

#### *b. Manufactured goods*

The GDR's exports of finished manufactures have comprised over one-third of deliveries to the 14 I.W. countries (excluding FRG), and are spread among the following major product divisions (from Table 10): nonelectric machinery (SITC 71), miscellaneous manufactures such as toys, pianos, books, etc. (SITC 89), electric machinery (SITC 72), and transport equipment (SITC 73). Since 1973, changes in dollar value shipments of products in these commodities divisions have not been particularly noteworthy.

Due to the overall importance attached to the manufacturing sector (particularly capital goods) and because the GDR has been relatively successful in meeting planned goals, it can be expected that exports of manufactures to the 14 I.W. countries should at least continue at about the same pace as before. During the current plan period, production of machinery output, in particular, is projected to increase by about one-half, as the machine engineering sector is to receive top priority. Therefore, added supplies of machinery goods manufactures may be available for export to the fourteen I.W. countries. The extent to which these supplies can be absorbed by the I.W. depends in part on the degree to which the GDR is able to overcome quality, spare parts, and servicing shortcomings, and on the degree of recovery in Western economies.

#### *c. Meat and live animals*

The remaining noteworthy group of export commodities to the fourteen I.W. countries (excluding FRG) is that comprised of live animals (SITC 00) and meat (SITC 01). Exports of items in these two-product divisions contributed about 12% to hard currency earnings from the 14 I.W. in 1975. Deliveries of the GDR's livestock and

meat to the West have been steady and have not encountered the import restrictions which faced other East European countries' (Poland, Hungary, Romania) meat exports. This may be attributed to the fact that the GDR's meat exports have been swine meat, whereas the EC restrictions which curtailed Eastern deliveries were placed on beef shipments. It seems probable, therefore, that there will be a continuing market for GDR's livestock and meat exports to the West, but increases in future shipments, however, will likely be a function of GDR's supply availability.

#### 4. SUMMARY

In looking at GDR exports to the FRG on the one hand and exports to the remaining I.W. countries on the other, the GDR appears to offer a wide range of export commodities to the West when compared to other communist countries. In addition, it has capitalized on the special trade benefits accorded to it by its relationship with the FRG.

Given that the GDR economy is industrialized and the raw material base is limited, the GDR has the expressed goal of aiming to increase its exports of manufactured goods (particularly capital goods). How much the GDR can expand these shipments, however, is not clear. Past performance has pointed to considerable success in this direction, but in spite of the relative competitiveness of GDR manufactures on Western markets, at times they are still plagued by some of the quality, spare parts, and servicing inadequacies which have often characterized East European manufactured goods. Furthermore, if machinery exports in particular can increase, they will probably be marketable only in countries other than the FRG, whose own sophisticated manufacturing base is superior to that of the GDR. Finally, the GDR economy, like other East European economies, has already strained its production capacity. Future expansion in manufacturing capacity may in large part be dependent on productivity gains, which in turn depend to some degree on imports of Western technology.

On balance, while the GDR aims toward adjusting its export commodity structure in favor of capital goods manufactures, near term hard currency earnings from the West can be expected to be sustained by continued deliveries of chemicals, foodstuffs, light industry manufactures and oil products.

#### *D. Czechoslovakia*

##### 1. DATA HIGHLIGHTS

Czechoslovak exports to the I.W. increased 71% from 1972, to a 1975 total of nearly \$1.5 billion (see Table 12). While the composition has remained relatively constant, it differs significantly from that of the U.S.S.R. and Poland, showing fewer exports of primary products and a greater number of intermediate and manufactured goods. Together, intermediate and manufactured goods comprised 64.4% of 1975 exports to the I.W., while manufactures alone represented 30.8% of total.

TABLE 12.—CZECHOSLOVAKIA: EXPORTS TO INDUSTRIALIZED WESTERN COUNTRIES, 1972-75

(Amounts rounded to millions of U.S. dollars)

SITC Description	1972		1973		1974		1975	
	Amount	Per-cent	Amount	Per-cent	Amount	Per-cent	Amount	Per-cent

9 Commodities not elsewhere classified.....	12	1.4	17	1.4	28	2.0	24	1.6
<b>Total.....</b>	<b>869</b>	<b>100.0</b>	<b>1,172</b>	<b>100.0</b>	<b>1,401</b>	<b>100.0</b>	<b>1,487</b>	<b>100.0</b>
0-4 Primary products.....	267	30.7	362	30.9	439	31.4	504	33.9
5-6 Intermediate goods.....	319	36.7	433	36.9	544	38.8	500	33.6
7-8 Manufactured goods.....	272	31.3	361	30.8	391	27.9	459	30.8

Referring to Table 13, we note the following:

The top ranking product division, iron and steel (SITC 67) provided 11.3% of total 1975 earnings, but reflecting the Western recession, dollar value dropped one-seventh from 1974 levels. The second ranking product division, machinery other than electric (SITC 71), nevertheless advanced \$30 million over 1974 to a 1975 level of \$142 million and comprised 9.5% of the total.

Coke (SITC 3218) and coal (SITC 3214) were the number one and two rank export items, together combining to form the third ranking product division (SITC 32) which accounted for 9.2% of 1975 earnings from the I.W. Dollar earning increases in these items, which benefited heavily from price increases, represented about 24% of the total 1975 Czechoslovak gain over 1973 exports to the I.W.

Other significant gains were achieved in wood, lumber, and cork (SITC 24); clothing (SITC 84); and chemical elements and compounds (SITC 51).

Czechoslovak exports were more broadly diversified than those of the U.S.S.R. and Poland; the top five items in 1975 comprised only 17.5% of total, the top 50 provided 60% of earnings.

The top 50 export items in 1975 were similar to those exported in 1974, but included seven new items.

The top 50 ranking included 17 items from SITC 7 and 8; 1975 export values increased over 1974 in all but two of these items, though generally only marginally.

Compared to 1974, dollar value of 1975 exports advanced on 33 of the top 50 items, and declined on 17.

<sup>1</sup> Not elsewhere specified.

<sup>2</sup> Small amounts rounded to zero.

From Table 14 we note the following:

Except for the Federal Republic of Germany, which took 31.6% of the 1975 total, Czechoslovak exports were broadly diversified over the 15 I.W., with Japan taking the smallest (1.7%) share.

Austria, however, was the principal recipient of Czechoslovakia's two top earners, coke and anthracite coal, while the FRG took 96.5% of lignite exports to the I.W.

## 2. PRODUCT DIVISION ANALYSIS

*a. Intermediate and manufactured goods*

Czechoslovak industry, well developed before World War II and relatively spared from damage during the war, emerged into the post-war period with a considerable production and economic advantage over its East European neighbors. Czechoslovakia remains today a highly industrialized economy, with manufactured and intermediate goods providing the major portion (over 64% in 1975) of its exports to the I.W. However, it has become increasingly evident that Czechoslovakia's industry is now badly in need of modernization, a factor which has affected its performance in exporting to the West.

Czechoslovak officialdom appears painfully aware of the shortcomings of its industry. In an attack on the management of the metal-lurgy and engineering industries, Premier Lubomir Strougal pointed out that quality and technical performance of most products did not match that of their Western counterparts.<sup>16</sup> Citing a sample of metal-lurgy and engineering sectors' products (e.g., steel products, machine tools, industrial machinery, etc.) surveyed by a state testing institute, it was indicated that poor design, lack of innovation, and limited capacity pulled half of the C.S.S.R.'s products below the world average. Another fourth were reportedly found to be inaccurately dimensioned and shaped, while others were unsafe and could not be serviced properly. The conclusion was that these failings severely curtailed Czechoslovak competitiveness on the world market and depressed prices so far that some products earned so little convertible currency that it was not worth putting them on the market.

Additional shortfalls have ranged from incomplete packaging, to lengthy delivery times, to inadequate servicing. While these are problems common to many Soviet and East European manufactured products exports, they may be relatively more important to the Czechoslovaks, given their lack of a significant primary product export base and the resultant heavy reliance on exports of intermediate and manufactured goods.<sup>17</sup>

In a disclosed effort to restructure Czechoslovak industry between 1976 and 1980, there are plans for heavy investment in the "engineering" and chemicals sectors, giving testimony to a strategy of forcing a comeback for exports of capital goods and equipment, while also strengthening chemical and consumer goods capabilities. (It is noteworthy, however, that the planned industrial investment does not show significant departure from that, of the 1971-75 plan.) Part of this effort is expected to be supported by a call for \$3.5 billion in imports of Western technology and equipment. Emphasis is also being placed on purchases of carefully selected Western licenses, since the Czechoslovaks have accepted that a further significant improvement in their technical standards is beyond their own strength. There is also a new emphasis on cooperation agreements, although it does not appear that a significant number of these will be forthcoming, a conclusion that appears warranted by Czechoslovak hesitancy to au-

<sup>16</sup> Business Eastern Europe, September 24, 1976, pp. 297-298.

<sup>17</sup> Of the Soviet/EE group, only the G.D.R. has a higher portion of its exports to the I.W. in intermediate and manufactured goods (65.7% vs. 65.4% for Czechoslovakia). The G.D.R. however, has a specially favorable trading relationship with the Federal Republic of Germany, a newer industrial base, and perhaps, a somewhat lesser degree of the difficulties noted above.

thorize outlays for sizeable imports which would not immediately generate export revenue. In fact, Czechoslovak officials have retained their financially conservative posture by stating that the import drive will not mirror Poland's acceptance of a large debt to the West, and have clearly pointed to an intention of maintaining balance between imports and exports.

To summarize Czechoslovak manufactured goods export potential, it can be concluded that although recession in the West dampened recent demand for Czechoslovak manufactured goods, Western recovery cannot be expected to generate large increases in hard currency earnings from exports of intermediate and manufactured goods. Difficulties in increasing exports to the West stem largely from the low quality and outdated nature of many Czechoslovak manufactures. In the near term, therefore, it does not appear likely that there will be a noteworthy change in either the kinds or volume of intermediate or manufactured goods sales to the West. Whether a longer term comeback can indeed be achieved is uncertain, but appears to be largely a function of success of the C.S.S.R.'s investment and import strategy during the current plan period.

#### *b. Coal, wood*

Two groups of primary product (SITC 0-4) exports have been important to Czechoslovak earnings from the Industrialized West. The first of these is coal (SITC 32), which comprised roughly nine percent of hard currency dollar sales to the I.W. in 1975. Large future increases of hard currency coal exports, however, do not look promising.

After neglect of the coal industry during the 1960's and Czechoslovakia's focus on foreign sources for energy supplies, the current plan calls for a new energy-use strategy marked in part by a fallback on domestic production of solid fuels. In the past, Czechoslovakia was largely dependent upon cheap Soviet oil and gas, but recent price increases, coupled with the prospect of limited Soviet supplies, have led to questions about continued dependence on Soviet energy products. Hence, the renewed emphasis on production of coal. Domestic coal reserves, however, (when compared to a coal exporting country like Poland) are not especially plentiful. Furthermore, existent reserves are basically bituminous reserves which can be deployed for industrial consumption on the home market. Given these factors, it is unlikely that coal will be available in such supply that it can be exported to the West in sufficient quantity to provide substantial increases in hard currency earnings in the near term.

The other primary product group which has in the past been important to Czechoslovak earnings from the I.W. is wood and wood products (SITC 24). While depressed Western markets caused a decline in dollar value sales from 1974 levels, wood shipments nonetheless achieved fourth rank among exports by product division in 1975. Wood is perhaps the major plentiful raw material present in Czechoslovakia, as one-third of the country is forested. The Czechoslovaks have been attempting to maintain, if not increase, their timber reserves, and continued hard currency earnings from this group appear plausible. However, in setting the level of dollar earnings, Western economic conditions and price fluctuations will probably have more impact than production increases.

## 3. SUMMARY

It appears that Czechoslovakia's hard currency export potential is largely dependent on its ability to upgrade or modernize its manufactured goods industry. It further seems that imports from the West are the key to modernization. The Sixth Five-Year Plan's (1976-80) directives call for large industrial investment, including \$3.5 billion in technology and equipment imports from the West. Czechoslovak officials, however, are cautious about accumulating deficits vis-a-vis the West, and thus have called for imports which can be expected to be covered by exports. A dilemma is apparent. Management problems, which in part account for shortcomings in industrial performance, will likely take many years to cure. On balance, it seems clear that exports face a steep uphill climb before they can pay for the very imports which could make them competitive in the West.

*E. Romania*

## 1. DATA HIGHLIGHTS

Looking at the general composition of Romanian exports, (see Table 15), we find:

Romanian exports to the I.W. were \$1.4 billion in 1975, nearly double the 1972 level.

Petroleum exports profited heavily from price increases of recent years, with the dollar value of mineral fuels (SITC 3) increasing over 400% from 1972 levels to a 1975 total of \$354 million. This acceleration significantly increased the relative importance of mineral fuels in Romania's export commodity structure. By 1975, they accounted for one-fourth of total Romanian exports to the I.W.

Strong advances were also achieved, however, in exports of intermediate products and manufactured goods, which doubled over the 1972-75 period.

TABLE 15.—ROMANIA: EXPORTS TO INDUSTRIALIZED WESTERN COUNTRIES, 1972-75

[Amounts rounded to millions of U.S. dollars]

0-4 Primary products.....	378	52.1	529	52.4	645	47.7	738	51.4
5-6 Intermediate goods.....	175	24.2	222	22.0	289	21.3	288	20.0
7-8 Manufactured goods.....	167	23.0	255	25.3	329	24.3	405	28.2

Disaggregating and using Table 16 reveals several points:

Three petroleum products items (residual fuel oils, gasoline, distillate fuels) were the top ranking export items, together accounting for 23% of 1975 earnings from the I.W. As with the U.S.S.R. and Poland, increased oil prices benefited Romanian hard currency earnings. In fact, nearly 56% of Romanian export gains from the I.W. between 1973 and 1975 came in petroleum products, largely on the basis of price increases achieved during that period.

Fifteen of the 1975 top 50 items were intermediate goods and another 15 were manufactured items. Seven manufactures were clothing items, supporting \$149 million of 1975 clothing exports (SITC 84), and making clothing Romania's second ranking division among exports to the I.W.

Meat of swine (SITC 0113) was the fourth ranking export item. Together with other meat items (SITC 01) it provided 8.3% of 1975 exports to the I.W., making it the third ranking product division.

Two furniture items in the top 50 were the major export items in Romania's fourth ranking product division, furniture (SITC 82), which contributed 6.5% to 1975 exports to the I.W.

Examining Table 17, we note the following:

The Federal Republic of Germany was Romania's principal I.W. trading partner, importing 28% of Romania's I.W. exports and supplying 35% of Romanian imports from the I.W. In 1975, the FRG imported 24 of Romania's top 25 export items.

Romanian exports among I.W. countries have been generally well diversified, although in 1975 Italy, took 73% of Romania's fourth ranking I.W. export item, swine meat (SITC 0113) and nearly 99% of meat of bovine animals (SITC 0111), the 23rd ranking item.

## 2. PRODUCT DIVISION ANALYSIS

*a. Petroleum products*

As noted in Table 16, Romania's largest export product division has been petroleum products (SITC 33), with 1975 hard currency earnings from the fifteen Industrialized Western countries valued at \$349 million. The threefold increase from \$112 million in 1972 to \$349 million in 1975 was carried in large part by substantial increases in the world market price of oil. It is noteworthy that, although Romania has for many years had substantial oil reserves, it is expected that by 1976 it will have become a net importer of oil and oil products. This situation is based upon continuous depletion of existing reserves, without compensating discoveries and development of new deposits extensive enough to continue to supply growing domestic and export needs.

The prospects for sustaining or increasing petroleum hard currency earnings are a function of several factors, among which the availability of crude is foremost. Romania, whose own domestic production is virtually not increasing, imports oil from Middle Eastern and North African countries in large part on the basis of both barter deals and bilateral clearing arrangements. In turn, Romania refines crude oil and sells it to the West for hard currency. How long this sequence can continue may, in large part, be determined by Romania's ability to obtain contracts which provide for Romanian exports of technology, plant, and equipment, in return for oil. As previously negotiated barter deals and bilateral clearing arrangements come up for renewal, it is uncertain whether oil producing countries will be willing to renegotiate on similar terms. Algeria, Iran, Greece, Kuwait and some South American countries have been approached by the Romanian government for contracts which involve potential sources of oil for Romania. Perhaps the largest source may be Kuwait, where the "Constanta" project could provide Romania with substantial amounts of oil for refining and for processing into petrochemicals. This deal and others, however, are still in the negotiation stage, with actual output seemingly a long way off.

Romania has also been investing substantial capital in geological research aimed at finding new oil reserves in its territorial Black Sea waters. However, progress from research to actual output is slow and uncertain. "Gloria I", a large drilling platform built with American technical and financial aid has been launched, but as yet, producing wells have not been brought on stream.

In sum, it can be expected that hard currency earnings from oil shipments will continue in the very near term. However, since it is uncertain that large new supplies of crude will be available, it is not clear that there will be any substantial near term jump in earnings from petroleum product exports. Added to this less than optimistic prospect is the fact that fulfillment of the current Five-Year Plan, not even accounting for the implications of this year's earthquake, relies heavily on increasingly large domestic demands of energy supplies. Lastly, should the Romanians realize gains in hard currency earnings based on exports of petroleum products, these gains may indeed be outweighed by a rising oil import bill. This situation could arise if Romanians are unable to greatly expand what are essentially barter deals and/or fail to markedly increase domestic production.

*b. Meat and meat preparations.*

Meat and meat preparations have ranked among the most important Romanian exports to the West. Although hard currency earnings from this group have been slowly rising over the past three years, there has been a basic shift in the individual items comprising the group. Exports of bovine meat (SITC 0111) were drastically reduced in both 1974 and 1975, apparently as a result of the same EC restrictions which curtailed beef shipments from both Poland and Hungary. However, a nearly five-fold increase in processed meat of swine (SITC 0113) between 1973 and 1975 served to sustain the strength of hard currency meat shipments to the I.W.

How much meat exports will increase is uncertain, since success in the agricultural sector is an important element in maintaining and expanding livestock. Organizational difficulties, compounded by two flood and two drought seasons between 1970 and 1975, have frustrated agricultural sector performance and as a result created a constraint on the economy.

A further possible supply complication could arise out of consumer dissatisfaction over meat and other food shortages. If satisfying domestic demand assumes greater importance in the current plan period, this constraint may mitigate increases in meat exports in the near term.

*c. Manufactured goods*

Romania has made large investments in industrialization for several years, achieving a high growth rate in comparison to other economies, both East and West. On the basis of this modernization and upgrading, Romania expected to build its export trade. The areas indicated by our data (Table 16) have achieved export success are clothing (SITC 84), furniture (SITC 82), non-electric machinery indicated by our data (Table 16) that have achieved export success are clothing (SITC 84), furniture (SITC 82), nonelectric machinery (SITC 71), and footwear (SITC 85).

Several factors are key to future increases in exports of these items. Although planned 1976-1980 growth in light industry was set at roughly 50%, this does not imply a parallel increase in exports. Even if it is possible to increase the supply of manufactured goods available for export, these could increasingly run into I.W. import restrictions. Among Romanian export items which countries of the EC have attempted to limit on their market are footwear, bearings (non-electric machinery group), and furniture. If action is taken, Romanian exports of these goods could run into increasingly greater barriers on I.W. markets. A case in point where action has been finalized is the Romanian-EC textile export pact signed earlier this year. The accord, which stemmed from earlier Italian complaints against "dumping" of Romanian men's suits and trousers, requires that Romania provide advance information about the quality and quantity of textiles entering Italy directly, or indirectly, through other EC countries. The agreement is particularly significant because it is the first bilateral agreement signed between the European Communities (EC) and any of the CMEA countries. A second constraint which may work against marked increases in exports of light industry manufactures is that ability to supply these goods may be reduced by damage from the 1977 earthquake. Lastly, consumer demands have recently brought pressure on light industry output. Hence, goods for export may not be as abundant as they were in the past.

Aside from difficulties which may slow increases of hard currency earnings from clothing, footwear, and furniture, some gains in hard currency exports of bearings should be realized as output from two compensation arrangements comes on stream. Lipe Rollway, a U.S. firm, signed an agreement in 1975 for export of an entire roller bearing plant to Romania. Partial payment is to be based on sales of bearings in the United States and Western Europe. In addition, a West German company signed a similar agreement in 1976, which should also contribute to Romanian exports of bearings.

#### *d. Chemicals*

Development of export potential in the chemical industry has been noteworthy. The chemical industry's rate of growth has outpaced that of all other industrial branches, and according to 1976-80 plan directives should continue to do so in the future. Of particular interest is the increase in manufactured chemical fertilizer output. Expanded fertilizer production has been one of the primary objectives of the chemical industry, and will continue to be among top priorities in the current Five-Year Plan, with output planned to at least double during the 1976-80 period. In spite of growing domestic demand it appears that exports of manufactured fertilizers will be on the rise. Should the ambitious production plan be attained, the Romanians hope to achieve growing sales to the United States, Britain, and Western Europe on the strength of increased production, primarily of the nitrogeous-type fertilizers.

### 3. SUMMARY

In general, analysis indicates that Romanian ability to achieve sizeable near term increases in exports to the Industrialized West is uncertain. Basic to this conclusion is the apparent challenge in maintaining growth in petroleum products exports, together with the likelihood that increases in exports of light industry consumer products, such as clothing, will face difficulties stemming from Western import restrictions and increasing domestic demands.

Finally, at least for the current plan period, damage from the recent earthquake could threaten realization of planned objectives. Recalling the 1975 flood and Romanian resilience to that disaster, however, the earthquake alone may not be enough to preclude meeting planned goals, although the economic effects of damage will inevitably place strain on the economy as a whole.

#### *F. Hungary*

##### 1. DATA HIGHLIGHTS

Since Hungary is a small country, foreign trade contributes substantially to its economic development. One-third of Hungary's trade has been with the West, and since 1974 has resulted in substantial deficits. Hungary will need to increase its exports to the West not only to balance its accounts, but also to continue its economic development. It is noteworthy that, although Hungary's hard currency foreign trade is important to its economy, total volume of

exports to the I.W. has been small. At less than \$1.2 billion, this amount was equivalent to about 4 percent of its 1975 GNP of \$28. billion. Therefore, changes in export volumes that may seem small by Western standards can thus be relatively important to Hungary. In examining Hungary's export structure to the I.W. we note the following from Table 18:

Hungarian exports grew 57% from 1972 to 1975, a rate lower than that of the countries reviewed so far. Moreover, exports actually declined 7% from 1974 to 1975, largely on the basis of a decline in SITC 6 and SITC 9. (The miscellaneous SITC 9 category, unusually high in 1974, fell to a residual amount in 1975.) It is noteworthy that Hungary lacks the energy and raw material items that enjoyed such significant price increases between 1972 and 1975.

The general composition of Hungarian exports to the I.W. has altered somewhat. From a 1972 portion of 21.2%, manufactured goods (SITC 7-8) exports rose to 28.8% of the 1975 total, with 20.4% accounted for by miscellaneous manufactures (SITC 8, largely clothing and footwear). Less than a third of 1975 exports was food and live animals (SITC 0), down from about 43% in 1972 and due probably to 1974 EC beef restrictions. This group, however, was still a very important export source to I.W. earnings in 1975.

TABLE 18.—HUNGARY: EXPORTS TO INDUSTRIALIZED WESTERN COUNTRIES, 1972-75

[Amounts rounded to millions of U.S. dollars.]

SITC	Description	1972		1973		1974		1975	
		Amount	Per-cent	Amount	Per-cent	Amount	Per-cent	Amount	Per-cent

3	Mineral fuels, lubricants and related materials.....	13	1.8	19	1.8	27	2.2	25	2.1
4	Animal and vegetable oils and fats.....	11	1.5	15	1.4	22	1.7	18	1.5
5	Chemicals.....	33	4.5	52	4.9	83	6.6	81	6.9
6	Manufactured goods classified chiefly by material.....	134	18.0	220	20.7	258	20.4	196	16.7
7	Machinery and transport equipment.....	39	5.2	65	6.1	81	6.4	98	8.4
8	Miscellaneous manufactured articles.....	120	16.0	166	15.7	266	21.0	240	20.4
9	Commodities not elsewhere classified.....	8	1.0	12	1.1	146	1.5	14	1.2
	Total.....	746	100.0	1,060	100.0	1,264	100.0	1,173	100.0
0-4	Primary products.....	413	55.3	545	51.4	432	34.1	545	46.4
5-6	Intermediate goods.....	167	22.4	272	25.6	341	26.9	277	23.6
7-8	Manufactured goods.....	158	21.2	231	21.8	347	27.4	338	28.8

Disaggregating and using Table 19 reveals the following:

Hungarian exports are more widely diversified than those of any other country in our group except Czechoslovakia; the top five items providing only 17.9% of earnings, the top 25 items, 43%.

Clothing items (SITC 84) provided 14.5% of total earnings, meat (SITC 01) 13.7%, and live animals (SITC 00) seven percent.

1 Not elsewhere specified.

As has been the case with each of the East European countries covered in this paper, Table 20 shows the Federal Republic of Germany to be Hungary's major trading partner, taking 31.2% of its 1975 exports to the I.W. Italy, however, imported predominant portions of several items of meat and live animals, absorbing 18.3% of Hungarian exports of all products to the I.W.

## 2. PRODUCT DIVISION ANALYSIS

### *a. Meat and live animals, fruits, vegetables*

Among Hungary's top ranking exports to the Industrialized West were foodstuffs—meat and meat preparations (SITC 01), live animals (SITC 00), fruits and vegetables (SITC 05). These commodities, and others based on agricultural production, accounted for roughly one-third of Hungary's I.W. hard currency sales in 1975.

Foodstuffs exports have been attributed to successes in the agricultural sector, where production capacity was augmented between 1971 and 1975. During these years Hungarian investment in agriculture reflected increased mechanization, construction of storage facilities, and extensive application of chemical fertilizers. Widespread fertilizer usage is one of the main reasons for considerably higher yields of grains, which has helped to make Hungary a net grain exporter.

The 1976–80 plan period calls for major investments in development of the food processing industry. Funds are earmarked for building meat packing plants, canning plants, and refrigerated warehouses. In addition, Hungarian officials have shown interest in Western co-operation agreements which could further enhance Hungarian capabilities in highly processed agricultural output.

Although potential Hungarian export ability in fresh and preserved meats, vegetables, and fruits may very well increase in the next few years, it is uncertain whether there will be an expanding Western market for these commodities. The countries of the European Communities (EC), which by virtue of geographic proximity have been primary consumers of Hungarian food exports, have clearly expressed a goal of agricultural self-sufficiency. What can happen when the EC applies protectionist restrictions is illustrated by the 1974 restrictions on imports of beef. Among affected Hungarian exports were shipments of bovine cattle (SITC 0011). Whereas in 1973 that item alone constituted a sizeable \$133 million and 12.6% of total exports to the I. W. countries (See Table 19), by 1975 it had plummeted to a mere \$19 million and 1.6% of the total. The same restrictions also severely curtailed Polish and Romanian exports of bovine cattle. Thus, unless hard currency markets for foodstuffs exports can somehow be expanded, foodstuffs may not bring the increased earnings expected from an enlarged export capacity.

### *b. Chemicals, iron and steel, aluminum*

Three groups of intermediate goods which appear to have near term hard currency export potential are chemicals, iron and steel, and aluminum.

Growth in the chemical industry has consistently been the most rapid of all Hungarian industrial sectors. Investments between 1976–80, moreover, are to expand over those allotted during the first half of the decade.

During 1971–75 plan period, the chemical industry made substantial gains in development of agricultural chemicals, pharmaceuticals, and petrochemicals. Current planned goals indicate a continued emphasis on pharmaceuticals, with even greater stress on petrochemicals,

which should offset a diminished importance assigned to agricultural fertilizers.

The development of facilities at Leninvaros (an effort which has and will continue to spearhead the petrochemical industry's production growth) came on stream in the mid-seventies, producing ethylene and propylene. By 1978, additional capacity is expected to be available with production of PVC (polyvinylchloride), which in part, is intended for Western markets. The Leninvaros plant, however, is far from reaching full capacity. Development of the petrochemical industry is a very long range project for which the Hungarians are continuing to seek Western cooperation.

Within the pharmaceutical branch, Hungary has had significant production capability for many years and has reached a level where roughly one-third of pharmaceutical output is exported for hard currency. As yet, Western countries do not permit dosage products on their markets, but do allow purchases of intermediates for domestic preparation. It seems likely that the desire for Western cooperation (which Hungary would like to see in the near term for the pharmaceuticals branch) is in large part motivated by a search for marketing benefits and, if successful, could provide increased exports of these items by 1980.

The 1975 decline in hard currency chemical exports from 1974 levels (see Table 19) can be attributed in large part to slackened demand on recession troubled Western markets. As the economies of the Industrialized West begin to recover, however, sales of these items may increase, particularly in light of the export drive which the Hungarians expect will double hard currency chemical earnings by 1980. Given the broad spectrum of commodities within any chemical industry, it is less likely that chemical goods will encounter the export restrictions which have often been seen to prevail among items in the food products group.

Ranking fifth among product divisions exported by Hungary to the Industrialized West in 1975, iron and steel (SITC 67) shipments contributed nearly six percent to total hard currency earnings. The substantial decline in 1975 dollar value receipts from the high 1974 levels also can be attributed to slackening Western demand.

Investments earmarked to augment future production levels of iron and steel are to include a new coking plant and a new converter for the Lenin Iron and Steel Works. Assuming that demand for these commodities strengthens with Western recovery, earnings from iron and steel shipments could also rise through 1980.

Another commodity of interest in the intermediate goods group is aluminum. Production of this non-ferrous metal is based upon bauxite, the only mineral found in Hungary on a large scale. Under an agreement which runs through 1980, Hungary turns over large quantities of alumina (extracted from bauxite) to the U.S.S.R. for smelting. The processed aluminum is then returned to Hungary. In an effort to broaden domestic aluminum production capacity, Hungary is investing in expansion of aluminum processing facilities for which, once again, Western cooperation is being sought. Although aluminum exports to the West have been moderate (see Table 19), they could increase in importance if efforts to expand domestic production are successful.

*c. Manufactured goods*

Hungarian hard currency exports of manufactured goods to the I.W. have been dominated by clothing (SITC 84), whose shipments were particularly strong in the last few years. Clothing ranked as the top commodity division exported in both 1974 and 1975 (see Table 19) and contributed 14.5% to the value of 1975 hard currency earnings from the I.W. Sales of electric machinery (SITC 72) were the second largest manufactured goods product division export but comprised only 4.6% of the value of 1975 exports to the Industrialized West.

Emphasis during the 1976-80 plan period is on modernizing and upgrading existing production capacity in clothing and on diversifying the commodity range of manufactures which can be offered on Western markets. Contributing to this end will be the 28% increase in industrial investment over the previous plan; industrial investment is to account for 40% of total investment in the economy.

The footwear industry is one in which Hungary has been successful in acquiring Western technology and thereby creating a potential export base. In a deal signed with the U.S. firm Katy Industries, Inc., Hungary imported just over \$3 million in machinery, equipment, and technology. Under terms of the agreement, women's shoes are to be produced and exported to Katy Industries' sales network in the United States. Furthermore, the acquisition of U.S. technology has provided Hungary with good prospects of marketing footwear in other Western countries. However, one cannot ignore the possibility of Western countries placing restrictions on imports of this commodity.

Hungarian high technology items such as transport equipment and measuring and controlling instruments have not appeared in significant volume on Western markets. During the current plan, however, Hungary hopes to begin exporting commodities within these classifications. The Raba-Steiger deal, signed in 1974 and extended in 1976, has provided added capability in the Hungarian transport sector. The accord calls for assembly and manufacture of tractors by Hungary (Raba) based on Steiger technology and using Steiger components. In return, Steiger is to import tractor axles produced by Raba, which has opened a market for Hungarian production of these components and will increase their exports during the current plan period. Another advantage to Hungary is that it has acquired Steiger technology for production of tractors which could be competitive on Western markets, particularly the United States. (Steiger tractors are not suitable for use on the small farms of Western Europe).

Hungary would also like to export buses to the West. Hungary's Ikarus Body and Coach Building Works boasts up-to-date technology and is among the biggest bus factories in Europe. Although Hungary has been a primary supplier of buses to Eastern Europe for many years, it has not yet been able to penetrate the Western market to any large degree, although exports to the Federal Republic of Germany, Austria and Sweden have been rising. Whether sales to the West can increase to a large enough degree in the next few years to make buses a significant export item remains to be seen.

For some time, Hungary has been aggressively developing the technical standards of its instruments industry, in part through domestic investments, which have been augmented by purchases of Western licenses and conclusion of cooperation agreements. The first joint venture agreement with a Western company was finalized in 1976 between Corning Glass and Radelkis. The newly formed company, Radelcor (in Budapest), is to produce blood gas analyzers which will be competitive on Western markets. This is only one of a number of cooperation agreements which Hungary would like to use as vehicles for expanded export capacity of scientific equipment.

In sum, Hungarian efforts and successes in developing manufactured goods sales to the West offer the possibility of increased future hard currency earnings. However, expansion of higher technology goods exports still presents a challenge, with much depending on the degree to which Western firms are willing to participate in cooperation agreements that would assist both Hungarian production and Hungarian marketing in the West. Furthermore, the possibility of Western restrictions on imports of manufactured goods (particularly light industry) cannot be ignored.

### 3. SUMMARY

During the current plan period Hungarian foreign trade is slated to grow faster than the economy as a whole. Trade is to shift in favor of the West, (particularly LDCs), with Hungary's exports increasing faster than its imports. Exports to LDCs are expected to increase faster than deliveries to the developed West, since manufactured goods are more marketable among less developed countries than among I.W. countries.

Factors motivating planned foreign trade goals include the very large deficits vis-a-vis the West incurred in both 1974 and 1975, and Hungary's desire to restructure plus expand its industrial capacity—a goal which is to be attained with the help of Western technology, imported through licenses, plant, and equipment. To service its debt and allow for continued imports, Hungary must significantly increase its hard currency exports.

Barring increased Western import restrictions, Hungary will probably be able to sustain its shipments of foodstuffs commodities, which alone have comprised roughly 30% of total hard currency earnings. Planned export capability increases in manufactured goods could be frustrated by difficulties in penetrating Western markets, and success could again be tempered by increased Western import barriers. To date, Western anti-dumping charges have already been issued against clothing, light bulbs and footwear.

In its turn toward expanding export capacity of higher technology items, Hungary has eagerly sought Western cooperation. Despite difficulties encountered in negotiating cooperation contracts with Western firms which to some degree are hesitant about entering the small Hungarian market, some significant deals have been signed (Katy, Steiger), and can be expected to contribute to Hungarian export capabilities in the near term. Others which may be concluded

in the current plan probably could not contribute significantly to hard currency earnings until after 1980. However, hard currency earnings could show longer term improvement.

Finally, one cannot ignore the business-oriented outlook of Hungarian officials who have often been more financially and administratively innovative in their approach to increasing hard currency sales than their counterparts in other East European countries. Although it is difficult to measure the degree to which these will contribute to increased earnings, they serve to emphasize the importance attached to increases in hard currency exports.

### *G. Bulgaria*

#### 1. DATA HIGHLIGHTS

Of all East European countries, Bulgaria's exports to the I.W. have been the smallest. Examination of data presented in Tables 21, 22 and 23 reveals the following:

Bulgarian exports to the I.W. (see Table 21) in 1975, at \$318 million were less than five percent of those of the Soviet Union. The 1975 total was up 31% from 1972, but down 10% from 1974. The bulk of the slippage from 1974 levels was accounted for by a \$43 million decrease in exports of manufactures by chief materials (SITC 6), principally iron and steel (SITC 67) and non-ferrous metals (SITC 68).

Food and live animals (SITC 0) exports were important to Bulgaria, providing 31% of the 1975 total compared to nearly 39% in 1972. At 42.5% of the 1975 total, manufactured and intermediate goods (SITC 5-8) held virtually the same share as in 1972.

Tobacco (SITC 1210) was the single most important export item, providing 13.8% of the 1975 total, but several food items combined to make fruits and vegetables (SITC 05) the single largest export division (see Table 22). Various clothing items (SITC 84) combined to provide 10.2% of 1975 earnings while iron and steel (SITC 67) ranked fourth with a contribution of 8.6% to the total.

The Federal Republic of Germany has been Bulgaria's number one trading partner (see Table 23), taking nearly 30% of its exports to the I.W. in 1975 and providing 40% of Bulgaria's imports from I.W. The United States, however, took by far the largest share (over 39%) of tobacco, Bulgaria's major export item. Italy was also a major market for a number of Bulgarian food and manufactures exports.

## 2. PRODUCT DIVISION ANALYSIS

*a. Fruits, vegetables, tobacco, meat*

Agricultural products, including fruits, vegetables, and tobacco products, all of which fall into SITC 0 (Food and live animals) and SITC 1 (Beverages and tobacco) comprised nearly one-half of total exports to the Industrialized West in 1975 (see Table 21). This high percentage reflects the general profile of the Bulgarian economy, in that 42% of the population still lives in the countryside and farming employs almost as many as industry.

Assuming domestic consumption and demands from other East European communist countries do not alter drastically from past patterns, the extent to which hard currency exports of agricultural commodities can increase in the remaining years of the current plan will be largely a function of the performance of the agricultural sector. During the last Five-Year Plan period, agricultural production was somewhat below target. Plans for the current period project a 20% growth in the sector, and call for a general organizational change that is expected to ease some of the bureaucratic shortcomings which have at least in part accounted for past difficulties.

In addition to exports of fruits, vegetables, tobacco and wine, which can be expected to remain significant in the next few years, the current plan places an apparent emphasis on meat production. The stress on meat production, coupled with the fact that livestock did relatively well during the past Five-Year Plan, may make for increases in meat and meat products output and export capabilities in the near term. Furthermore, since Bulgaria's meat exports to the I.W. have consisted primarily of swine, sheep, lambs, and goats, they have not been subject to the serious cutbacks resulting from the EC restrictions on beef imports which have troubled meat exports of other East European countries.

*b. Iron and steel, nonferrous metals, chemicals*

Among exports of intermediate goods (SITC 5 and 6) to the Industrialized West, iron and steel and nonferrous metals (zinc, aluminum) were the two primary commodity divisions appearing in our data (see Table 22). As noted earlier, the substantial 1974 to 1975 decline in shipments of items within these two groups account in large part for the decrease in total sales to the I.W. in 1975. This decline was precipitated by Western recession, and as demand recovers, exports of these commodities should regain their strength, and could show an improved earnings position for the remainder of the decade. Bulgaria's ability to meet potentially increasing Western demand for iron and steel, in particular, should be buoyed by the planned 13-18% annual increase in ferrous metal output, attributable in part to modernization of two steel works and construction of a third.

The other intermediate goods category which may have some increased export potential is chemicals, which also suffered a 1975 setback in earnings from the levels of the two prior years. During the current plan period the chemicals sector is slated to be one of the fastest growing sectors, with 1980 output planned to increase almost 80% over 1975 levels. Within the industry, priority has been assigned to petrochemicals, with emphasis on output of plastics and chemical

fibers and yarns. Thus far, however, Bulgaria has not made significant penetration of Western markets with its chemical exports and it is questionable that there can be increases in hard currency earnings above and beyond those that can be expected from expanded demands of existing Western customers.

### *c. Manufactured goods*

In 1975, exports of manufactured goods (SITC 7 and 8) represented 20% of Bulgaria's shipments to the Industrialized West. Three-fourths of these were accounted for by clothing (SITC 84) and nonelectric machinery (SITC 71) shipments.

As a whole, Bulgaria's industrial production is slated to increase 55-60% during the 1976-80 plan period, a goal which is basically the same as that of the prior plan (between 1971-75, an actual 65% was achieved). Light industry is to raise output by slightly over 40%, less than the all-industry target. It seems unlikely that any significant surge in light industry exports, particularly clothing, can be expected, given that the industry will continue to receive lesser priority. Exports of nonelectric machinery (primarily fork-lift trucks wherein Bulgarian technology appears competitive) however, may show an increase, as machine building has been designated as the "core of Bulgarian industrialization". The machine building sector is to double output between 1976 and 1980; undoubtedly some of the output increases will result in increased sales to the West.

Exports of Bulgarian manufactured goods frequently suffer from the same quality shortcomings which prevail among other East European manufactures. This problem, coupled with the fact that the bulk of manufactures are earmarked for East European consumption, makes it unlikely that near term manufactures exports to the West can be very much larger than in the past.

### 3. SUMMARY

Increasing the level of trade with the West has not been a primary concern in Bulgarian economic planning. With as much as 80% of its trade conducted with other CMEA members, Bulgaria has the highest such ratio among all East European countries. Current Five-Year Plan figures indicate a continuation of this trend which, in effect, makes trade with the West somewhat of a residual. Bulgaria will seek continued imports from the West in specific project areas (machine building, precision machines, chemicals, electronics, food processing), and to pay for these it will need to expand its capacity for hard currency earnings. Exports to the LDCs will probably become more important sources of hard currency than will exports to the developed West. Bulgaria's trade with LDCs has been leaving it with a surplus, and surpluses may continue to be expected as the marketability of Bulgarian manufactures is generally better among less developed countries than among I.W. trading partners.

Insofar as trade with developed Western countries, it appears that the commodity structure of exports will not differ much from past patterns, and value increases (particularly among iron, steel, chemicals, and nonferrous metals) will in large part be contingent on Western recovery from the 1974-75 recession.

## III. SUMMARY

A basic objective of this paper is to contribute to an ability to project future levels of Soviet and East European trade with the West. We see Soviet/EE needs for imports from the West as very large. But we also foresee a limit to further expansion of the debt to the West which has supported much of the recent growth of Eastern imports. Rather, we believe Soviet/EE ability to increase imports is, in the longer term, inevitably largely dependent upon an expansion of the dollar value of their hard currency exports to the West. Ability to accomplish this expansion is, in turn, dependent on at least four basic factors:

Increasing the physical volume of products available for export.

Increasing penetration of Western markets, i.e., successfully selling increased quantities to the West.

The rate of Western inflation.

The terms of trade (the relationship of import to export prices).

The U.S.S.R. and the East European countries are not yet major exporters to the I.W. Soviet/EE exports to the 15 Industrialized Western countries are still small, in 1975 totaling only \$16.6 billion (see Table 24), an amount equivalent to less than five percent of the \$334 billion exported during the same year by the 15 I.W. countries to other countries within the I.W. group. Nor have recent exports significantly increased the Soviet/EE share of the I.W. market. The large (107%) increase in Eastern exports to the I.W. between 1972 and 1975 is less striking when taking into account the 74% increase in I.W. to I.W. exports over the same period. Soviet/EE exports to the I.W. were equivalent to only 4.2% of the value of I.W. to I.W. exports in 1972; the percentage rose only somewhat from 1972 to 1975; from 4.2% to about 5%.

1 Not elsewhere classified.

Table 24 also synthesizes the volume and composition of Eastern exports. Over 76% of 1975 Soviet exports to the I.W. and over 59% of total Soviet/EE exports were primary products (SITC 0-4); only 17% were manufactured goods (SITC 7-8). Energy products (petroleum, coal, and gas) were dominant in Soviet, Polish and Romanian exports. Manufactured good exports were relatively unimportant to the U.S.S.R. (about four percent of the 1975 total, and a smaller dollar value than any of the EE countries except Bulgaria), but were much more important (28 to 32% of total) to the GDR, Czechoslovakia, Romania and Hungary. Export growth rates between 1972 and 1975 were highest for the U.S.S.R. (151%), Poland (103%), and Romania (98%), where price increases in petroleum, coal, and other raw materials spurred large dollar advances. However, the GDR also achieved rapid growth (86%).

In general, export dollar value increases achieved over the 1972-1975 period appear to be due primarily to increases in price rather than quantities exported. Looking to the future, Soviet/EE export capabilities can be expected to grow steadily through 1980, but usually at modest rates. Export capabilities in crucial sectors, e.g., Soviet petroleum, Romanian petroleum, Soviet and Polish coal, Soviet lumber and ores, East European food products, appear to be generally constrained by increasing domestic demands and/or difficulties in bringing new production on stream, making large near term increases in quantities available for export unlikely.

Intermediate and manufactured goods export volume capabilities of the Soviet Union and most European countries are also likely to increase only moderately over the next few years, although Polish and Romanian capacities may increase relatively more rapidly than others.

Export volumes achieved are, of course, also a function of Western demand. In some cases, manufactured goods export capabilities may expand faster than ability to overcome traditional marketing problems that hamper ability to penetrate Western markets. Additionally, Western import requirements, particularly for raw materials and capital goods, are closely tied to the Western business cycle.

Improved economic conditions in the West will particularly facilitate sales of raw and semi-processed materials, but would also provide an improved climate for the sale of Eastern manufactured goods, which must frequently overcome the handicap imposed by lack of an established positive reputation for providing quality, reliability, service, etc. Better Western economic conditions also will act to lessen the likelihood of I.W. restrictions on imports from Eastern sources of intermediate and manufactured goods.

With its very low volume of manufactured good exports, a situation that will not change significantly in the next few years, the Soviet Union is probably least vulnerable to potential Western import restrictions. The GDR, with approximately 60% of its exports going to the FRG (considered as inter-zonal trade and hence excepted from FRG trade barriers), is also less vulnerable to Western restrictions. However, the export and trading capabilities of the remaining East European countries are potentially much more susceptible to Western restrictions, not only in intermediate and manufactured goods, but also in some food items that are important sources of hard currency.

Eastern hard currency export prices are, in general, determined in Western markets. Inflation in the West will, therefore, tend to raise unit prices of Eastern imports and exports and, with constant real trade volumes, to proportionately increase the dollar value of their imports from and exports to the West. If East-West terms of trade and trade volumes were to remain constant, the short run effect of inflation in the West would therefore be to increase the dollar value of existing Eastern trade deficits with the West. At the same time, however, the real burden of previously incurred hard currency debt would decrease, since the quantity of exports required to service existing debt would diminish, to the extent that the nominal rate of interest paid on existing debt is not adjusted upward to fully include an inflation premium.

Of course, other things need not be equal. Western inflation could produce or be commensurate with business conditions that reduce the demand for, and/or the price of, those raw and semi-processed materials that dominate Eastern exports. However, over the 1972-1975 period, changes in the terms of trade generally favored those Eastern countries with energy products and other raw materials available for export, i.e., U.S.S.R., Poland, and Romania, while those countries relying more on intermediate and manufactured goods exports probably experienced a deterioration in the terms of their trade.<sup>18</sup>

Looking to the future, the very large 1972-75 price increases in energy products seem unlikely to be repeated, even though energy prices may continue to climb at slower rates. Price trends in other raw materials key to Soviet and Polish hard currency export capabilities; e.g., lumber, sulfur, copper and other nonferrous metals, are even less certain and decreases from 1975 levels are not impossible.

In sum, prospects for hard currency export growth through 1980 vary significantly within the Soviet/EE group, with each country capable of some growth, but the U.S.S.R. and Poland probably capable of the fastest advances. However, barring high rates of Western inflation, or further large price increases in key export items, the U.S.S.R., Poland, and most of the other EE countries will be hard pressed to match 1972-1975 rates of growth in exports to the I.W. during the 1977-1980 period.

<sup>18</sup> According to the Economic Bulletin for Europe, Vol. 28, prepared by the Secretariat of the Economic Commission for Europe, Geneva, 1976, p. 114, "the Western terms of trade deteriorated by 6.5% in 1973 and by 13% in 1974—most of the deteriorations were concentrated in Western trade with the Soviet Union. This was due to an upsurge in the price of fuels and other industrial materials which account for a high share of Western imports from the Soviet Union. . . . the terms of trade of Western countries in trade with Eastern Europe other than the Soviet Union improved. These countries exported relatively little of fuels, timber and some other industrial materials . . ."

# IMPORT PROTECTION AND EAST-WEST TRADE: A SURVEY OF INDUSTRIALIZED COUNTRY PRACTICES

## INTRODUCTION

During the 1970's most industrialized nations witnessed impressive increases in their trade with the communist countries.<sup>1</sup> During these years the communist countries as a whole ran up significant deficits with the industrialized West. The recession in 1975 in the industrialized world served to increase the hard currency trade deficits of the communist countries even further by reducing import demand in the West. To cover these deficits and to maintain planned levels of essential imports, hard currency indebtedness also expanded rapidly. By the end of 1976 the estimated aggregate debt to the West totalled around \$40 billion. Increasing deficits and increasing indebtedness by Eastern European countries and the Soviet Union will exert pressure upon these nations to export more manufactures and semi-manufactures, as well as the more traditional exports of raw materials and agricultural products.

Historically, a good deal of concern has been expressed by Western governments, industries and workers that centrally-planned economies have the potential to disrupt the production of market economies. The theoretical argument has been that the centrally-planned economy can ignore (or does not know) the real costs of production and can thus undercut the price of an item produced under costs set by the price system in a market economy. In fact, however, the economic circumstances of the communist countries, their need to import capital goods and their need to realize the maximum hard currency return from their exports, generally militates against the tendency to price exports significantly below world market prices. Nevertheless disruptive activity has occasionally occurred. In response, Western

\*It should be understood that the views expressed in this paper are those of the author and do not necessarily represent the position of the U.S. Government.

<sup>1</sup> The communist countries included in this study are: Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, People's Republic of China, Poland, Romania, and the U.S.S.R.

nations have taken and no doubt will continue to take protective measures to meet these problems.

The central paradox that must be resolved by systems designed to protect against disruptive or damaging imports is how to provide a sufficiently effective system to protect important domestic interests, but one that is at the same time flexible enough to permit economically beneficial trade to continue and to expand. This problem is not readily resolved, even when trade between states which enjoy the same type of economic system is involved, much less when trade between free-market and non-market economies is involved.

Each Western industrialized nation has developed its own system of laws and methods for dealing with imports which cause or threaten to cause injury to its domestic industry. The practices are many and varied. Some have special rules for dealing with imports from communist countries. Some have special bilateral arrangements. Some employ quantitative restrictions. This paper examines briefly the methods of relief available at the multilateral level under the General Agreement on Tariffs and Trade (GATT), and looks in some detail at the methods employed by Austria, the United Kingdom, the European Community (EC), and the United States. By surveying the many types of practices employed, it is hoped that some assessment can be made about the effectiveness of given protective systems under given circumstances; and that some judgment can be made on the relative merits of different systems.

In the past, imports from communist countries were small and effectively excluded from the markets of industrialized countries not only because of problems of quality, but also due to a low degree of communist interest in Western markets. However, as their goods become more competitive in terms of quality, and as the communist countries face pressures to export in order to earn hard currency, it will be increasingly important for the Western countries to have import protection devices that can prevent market disruption, but which also permit beneficial trade with the East to grow.

#### THE MAJOR INSTITUTIONAL AND LEGAL TOOLS OF IMPORT PROTECTION

Since the field of import protection is a virtual morass of competing legal authorities, we will first discuss some of the primary protective tools and their underlying concepts. For the convenience of the reader, abbreviated definitions of some basic terms are provided here.

*Dumping*, or price discrimination, is the practice of exporting goods at prices lower than those which would obtain in the domestic market of the exporting country in the normal course of trade. The *margin of dumping* is the difference between the export price and the home market price in the country of export.

Anti-subsidy or *countervailing duties* are imposed against imports which have benefitted from governmental subsidies, bounties, or grants either during production of the good or upon its export.

*Safeguards or escape clause actions* are taken against imports which cause or threaten serious injury. A signatory to the General Agreement on Tariffs and Trade (GATT) must take safeguards actions which conform to Article XIX of GATT. The original intent behind Article XIX was to be able to provide a limited buffer against the

more undesirable results of general trade liberalization, hence the terminology—safeguards or escape clause.

*Market disruption* has several varying definitions depending on the statute involved, but can be generally defined as a situation in which rapidly increasing imports cause or threaten material injury. The intent of market disruption regulations is to provide protection against sudden changes in trade patterns which adversely affect a domestic industry.

In all cases in which it is employed, *injury* is interpreted as meaning injury to a domestic industry producing a like or directly competitive product. Different types of authority invoke different levels of injury, i.e., the United States requires serious injury in escape clause actions, and material injury in market disruption actions.

*Quantitative restrictions* (QRs) take many forms, but the most common are quotas and tariff-rate quotas (a higher tariff applied to imports of a commodity over a given volume or value). QRs can either be global (non-discriminatory)—that is applied against all suppliers or a particular product; or discriminatory—that is applied against a product originating in a particular area or country.

The above definitions list only the most important terms relating to import protection. It should be noted that other practices (foreign exchange controls, trade measures taken for balance-of-payments purposes, certain nontariff barriers, denial of most-favored-nation (MFN) status, and a generally high level of tariffs) also play a part in the overall system which protects against general imports as well as against imports from communist countries. Non-discriminatory import protection devices do not normally place a heavier burden upon communist exporters than on other exporters. However, if they provide a generally high level of effective protection, there is a reduced need to provide for special protection against communist imports. It should further be noted that trade restrictions have often been taken against the communist countries for political as well as economic reasons.

There are three kinds of authority under which any nation can seek import relief: the multilateral authority of the GATT (providing it is a GATT signatory); bilateral authority—usually under the rubric of a bilateral trade agreement; and unilateral authority based on national legislation and administrative authority. These three authorities, interact with and reinforce each other—but may sometimes conflict. This paper deals briefly with the multilateral institutions. Bilateral arrangements, which serve mostly to facilitate amicable solutions whether under the multilateral or unilateral authorities, will not be treated extensively in this paper either. Our most basic interest is in the unilateral or nationally legislated protective devices.

In addition to the three types of authority, protective systems fall into two generic groupings: *ex ante* and *ex post*. The *ex ante* systems provide protection prior to importation and include such practices as established quantitative restrictions, the denial of MFN, the arbitrary denial of automatic licenses and other nontariff barriers. *Ex post* systems provide protection after the fact of importation and include such practices as anti-dumping, countervailing, market disruption, and safeguards actions. These actions are taken only after a determination is made that a particular importation is undesirable (for whatever

reason). However, some remedial actions (e.g., new quotas or voluntary export restraints), taken under *ex post* systems can become new *ex ante* restrictions, especially if they are continued indefinitely.

In terms of liberal trade theory, *ex post* systems, as long as they do not lead to an excessive development of new *ex ante* restrictions, are preferable to *ex ante* systems because they generally permit more trade to occur. It is sometimes argued that since the potential for disruption is greater from a centrally-planned economy, *ex ante* systems can be employed against these countries with some justification. However, while communist countries have occasionally disrupted markets, they have not been particularly troublesome. Certainly there has been little difference between the behavior of communist traders and Western traders.

*Ex post* systems can be categorized under several different headings, according to the standards they employ. One approach is to use a "fair trade practices" or "behaviorial" standard. Examples of this type of standard can be found in GATT and throughout U.S. legislation. Anti-dumping, for example, involves the premise that export prices shall not be less than domestic prices. Export at a lower price than is charged domestically is assumed to constitute an unfair trade practice against which, it is claimed, nations rightfully can be expected to protect themselves.

The other basic standard used by *ex post* systems is the "injury" standard. An injury standard evaluates only the effects of an import on a domestic industry, without making a judgment about whether or not the practice giving rise to the import is desirable. Escape clauses and market disruption clauses rely basically on an injury standard. When injury is the standard, then the pertinent question becomes not whether an export is fair or unfair, but rather how much injury is to be permitted before calling for action and what factors are to be considered in determining whether or not that level of injury has been reached.

Some *ex post* systems (e.g., anti-dumping), combine both an unfair trade practices standard and an injury standard. This paper will argue that while these arrangements were practical and sensible under the liberal trade regime established when the GATT was first negotiated, when these arrangements are applied to trade with non-market economies, significant anomalies have cropped up, particularly with respect to fair trade practices standards.

#### GATT, THE ESCAPE CLAUSE AND THE EVOLUTION OF THE CONCEPT OF MARKET DISRUPTION

Before investigating the practices of individual countries, we will first examine briefly the multilateral safeguards and market disruption systems employed by the General Agreement on Tariffs and Trade (GATT).

Under the GATT, as initially negotiated in 1947, there were no provisions to deal directly with the problems of imports from non-market economies. The specific actions which could be taken to protect a country's economic interests were carefully set out and circumscribed as being the only permissible exceptions to what was intended to be a free trade regime. These exceptions included: (a) The general escape clause; (b) anti-dumping and countervailing duties; (c) nullification or

impairment; (d) actions taken for balance-of-payments purposes; and (e) deviations from obligations when necessary for economic development. The escape clause and the related thinking about market disruption will be the only exception listed above which will be discussed in this section. Anti-dumping and countervailing will be discussed later in the paper in the context of national anti-dumping and countervailing legislation. The other exceptions are not generally relevant to East-West trade and will therefore not be treated in this paper.

Actions taken under the general escape clause (Article XIX) were restricted to circumstances whereby imports were increasing to such an extent as to cause or threaten to cause serious injury and must have resulted from both unforeseen developments and the effect of obligations incurred under the GATT. Any restrictive actions employed by a contracting party when invoking the escape clause were to be taken on an MFN basis; and any contracting party which felt it had been injured by a safeguard action taken against it could either withdraw an equivalent concession or demand compensation.<sup>2</sup> The main problems with using the escape clause were: its high standard of injury, the mandatory link to concessions made under the GATT, the requirement to take restrictive actions on an MFN basis, and the potential for retaliation which could lead to actions and counteractions that could ultimately erode whatever progress had been made in liberalizing trade and freeing it from undue restrictions.

During the early 1950's the application of Japan to become a contracting party highlighted the weaknesses of the escape clause and generated some thinking about what constituted market disruption. There was a great deal of opposition to the accession of Japan because of the lack of an effective *ex ante* protective mechanism (which, of course, would have been contrary to the spirit of GATT anyway). The problem of Japanese accession was resolved through a series of bilateral agreements, which included protocols of quantitative restrictions (QRs) between Western European countries and Japan, while some of these countries were still maintaining their reservations to Japan's accession under Article XXXV. The QR agreements were continued as a condition of removing these reservations.

In addition, it was realized that the GATT had no provision by which contracting parties could legally take action against increased imports from another contracting party that was highly competitive because of low wages. As long as the imports were not dumped or did not benefit from a government subsidy, free trade theory would have held that such imports should be welcomed by consumers and that employment in the importing country should be shifted to more competitive production.

By the late 1950's attention was no longer focused solely on Japan, but there was a general concern that imports from developing countries might lead to the same set of problems. At this point the GATT Secretariat decided to work out an approach to deal with the problem which by then had come to be termed market disruption.

In 1960 a questionnaire was sent out to the contracting parties asking them to report on their market disruption practices. The U.K.,

<sup>2</sup> Article XIX does not provide specifically for compensation. The practice of compensation developed in order to avoid the detrimental effects of retaliation.

France, Germany, Austria, Canada, Finland, Italy and others reported having taken various import restrictions. The measures used included tariffs, import quotas, anti-dumping duties, internal taxation, exchange rate manipulations, voluntary export quotas, and a host of administrative restrictions. Problems reported were mostly in the area of textiles, but also included stainless steel flatware, plywood, and plastic buttons. Japan was the exporter against whom actions were most often taken, but Hong Kong, Eastern Europe, Poland, Hungary, East Germany, India and Pakistan were also mentioned.<sup>3</sup>

The definition of market disruption drawn up by the Working Party was as follows:

These situations (market disruption) generally contain the following elements in combination:

(i) A sharp and substantial increase or potential increase of imports of particular products from particular sources;

(ii) These products are offered at prices which are substantially below those prevailing for similar goods of comparable quality in the market of the importing country;

(iii) There is serious damage to domestic producers or threat thereof; and

(iv) The price differentials referred to in paragraph (ii) above do not arise from governmental intervention in the fixing or formation of prices or from dumping practices.<sup>4</sup>

The conditions set out under point (iv) specifically preclude the application of the GATT Working Party definition of market disruption to non-market economies. This was done partly for political reasons and partly because it was felt that existing anti-dumping and countervailing procedures were adequate to handle the problem and were the appropriate measures to take.

The efforts of the Working Party on market disruption never amounted to much. This was largely due to the fact that in 1961 work on a textiles agreement began in earnest. Since most of the market disruption problems were textiles problems, with the conclusion of a multilateral Cotton Textiles Agreement the need to arrive at a solution to the general problem of market disruption became less pressing. Today, in the Multifiber Agreement (MFA)—successor to the original Cotton Textiles Agreement—one finds an explicit definition of what constitutes market disruption in the area of textiles, as well as a comprehensive system of dealing with the difficult problems of this industrial sector.<sup>5</sup>

The question of protection against imports from state-controlled economy countries was not addressed directly by the GATT until 1961, which was the first time that the question of accession by a non-market economy (Poland) arose. The main concern in negotiations with the Poles, and subsequently with the Romanians and Hungarians as well, was how to obtain concessions which would be reciprocal for Western tariff concessions—not how to provide adequate protection.

<sup>3</sup> Gardner Patterson, *Discrimination in International Trade: The Policy Issues 1945-1965*. (Princeton, N.J.: Princeton University Press), 1966, pp. 303-305.

<sup>4</sup> GATT, *Basic Instruments and Selected Documents*, 9th Supplement (1961).

<sup>5</sup> Actually the MFA plays an important part in East-West trade. Under the MFA, the U.S. has negotiated bilateral textiles agreements with several East European countries, as has the European Community. Under these bilateral agreements constant consultations are held concerning quota levels for several types of import sensitive products. Due to time constraints, the textiles agreement is not dealt with in detail in this paper. It is nevertheless an important instrument of import policy for many countries.

However, as part of the accession protocols for these three countries, a special safeguards clause was included. While the Polish, Romanian and Hungarian safeguards clauses do not involve a different criterion for taking action than is contained in Article XIX (serious injury), they do simplify the procedures for taking action and permit such actions to be taken on a non-MFN basis, i.e., to be invoked only against the non-market exporting country. Also, the increased imports need not have occurred as a result of obligations undertaken as a GATT member.

Thus, several import protection approaches—general safeguards (Article XIX) and protection against market disruption (which was incorporated in the textiles agreement) and special procedural methods employed against non-market economies (as reflected in the special protocols of accession)—remain separate in the GATT system.

In the absence of a clearcut multilateral authority for taking actions against communist imports causing market disruption, unilateral national authority remains the most frequent source of import relief. The sections which follow on Austria, the U.K., the European Community and the United States will describe how these nations have chosen to protect themselves against disruptive communist imports, and how national import protection strategies can differ.

#### NATIONAL IMPORT PROTECTION SYSTEMS

The following four sections describe the national import protection systems of Austria, the United Kingdom, the European Community, and the United States. These countries were selected in order to give a cross sample of experience in East-West trade. Austria was chosen because it is a small, neutral country, heavily dependent upon foreign trade generally, and very active in East-West trade in particular. The United Kingdom was selected because its balance-of-payments and other economic problems provide the example of a country under conditions which usually give rise to pressures for import protection. It was also chosen to illustrate how a member of the European Community can mesh its own trade policy actions with the instruments of the Community. The European Community was chosen because the nine members combined are the most important Western trade partners for the communist countries, and because these countries combined form an economic unit roughly equivalent to the United States. Finally, the United States was chosen because of its general economic strength and because its trade patterns and policies toward the communist countries differ in important respects from the other three subjects. While this paper obviously does not cover the entire universe of actions which can be taken against communist imports, the inclusion of the countries selected guarantees that the most important ones are covered. Further, the reader will be able to see how each country uses the various tools available for import protection in different ways.

##### *Austria*

During the course of the last two decades, Austrian trading relations with Eastern Europe evolved from a relatively restrictive relationship characterized by: an almost total denial of MFN status to the communist countries; a significant number of discriminatory quantitative

restrictions (which for example were applicable to roughly 35 percent of Austria's imports from CMEA countries in 1973),<sup>6</sup> and the use of bilateral currency clearing arrangements. Presently, Austrian trade with the communist countries is characterized by a liberal relationship that: provides MFN status to all the Eastern European nations and the Soviet Union; has abolished all discriminatory quantitative restrictions; and no longer extensively utilizes bilateral currency clearing arrangements.

Before going into a discussion of Austria's import protection tools, we will first investigate its trade patterns with the centrally-planned economies. Austria is a country which is highly dependent on foreign trade generally (its total exports to the world equalled roughly 20 percent of its GNP in 1975). In the last decade Austria's trade with its Eastern neighbors consistently represented about 10-13 percent of its trade with the world. During the early 1970's Austria's trade balance with the centrally-planned economies was always in modest surplus. However, between 1972 and 1975, the favorable balance of trade increased by over 1,400 percent, or an absolute increase of just under \$318 million. The increase in the Austrian surplus seems even more noteworthy when one considers that it occurred despite an increase during the same period in the dollar value of Austrian purchases of coal, oil, gas and raw materials of some \$317 million. The drastically increased trade surplus was almost entirely due to sales of chemicals, manufactured goods, machinery and transport equipment to Eastern Europe, specifically, Poland, Hungary and the German Democratic Republic. (See Tables 1-3.)

Tables 4 and 5 rank the top fifteen categories of Austrian imports and the top fifteen categories of Austrian exports (at the 2-digit SITC level) for 1975. It is interesting to note that the import list is dominated by fuels, raw materials, and semi-manufactures and contains very few of the categories of imports which are usually considered to be sensitive such as textiles and footwear. The export list is dominated by machinery, iron and steel products, and chemicals. In all cases where items appear on both lists (with the exception of petroleum and petroleum products), the value of Austria's exports exceeds the value of its imports.

TABLE 4.—AUSTRIAN IMPORTS FROM CPE'S IN 1975 RANKED BY VALUE

[Dollar amounts in thousands]

Total top 15 exports.....			1,085,546	-----	-----	-----
Total all exports to CPE's.....			1,308,842	-----	-----	-----

<sup>1</sup> Figure is too small to appear in rounding, but is not zero.<sup>2</sup> Austria does not disaggregate all of its chemical exports. It does, however, count these items in the total for the chemical section (SITC sec. 5). Therefore, the 3 SITC divisions ranked above (58, 51, and 53) understate the significance of Austrian chemical exports by some \$77,304,000, most of which (82.8 percent) was exported to Eastern Europe.<sup>3</sup> Not elsewhere specified.

Source: U.N. trade data, as reported by member countries.

Agricultural and manufactured products containing relatively higher labor "value added contents" are usually the primary targets of import restrictions. In 1975 imports of agricultural and manufactured products by the Austrians totalled some \$324 million as contrasted to exports of manufactured goods alone of almost \$1,203 million. What these figures strongly suggest is that the Austrians would have a great deal to loose in terms of profitable exports should they opt for a restrictive import policy toward the communist countries.

As might be expected, Austrian trade policy toward the centrally-planned economies has been one of emphasis on exports and the development of export markets through industrial cooperation both in Eastern countries and in triangular cooperation in third (usually developing) countries. However Austria, like other Western nations, has provided mechanisms to protect itself against dumping and market disruption. In addition, Austria maintains a number of non-discriminatory quantitative restrictions including global quotas, discretionary licensing, state trading and seasonal restrictions, mostly on imports of agricultural products. Austria also employs a generally higher tariff schedule (almost 15.9 percent based on a 1971 trade-weighted estimate) than do the major Western trading nations (8.9 percent for the U.S. and 10.4 for European Community). The higher tariff and non-discriminatory quotas provide a higher level of generalized protection thereby reducing the need for discriminatory protection.

As characterized by an Austrian trade authority, Dr. Jan Stanovsky, the objectives of Austrian trade policy toward Eastern Europe and the U.S.S.R. are:

- To secure and extend trade outlets;
- To guard against market disturbance;
- To check the building up of economic power and an Eastern trade monopoly by the central economic bodies of the East; and

To obtain material reciprocity for trading concessions, since formal reciprocity cannot be established at all, or at least not on a satisfactory basis, with the socialist countries.<sup>7</sup>

Also, as Stankovsky notes:

Nowhere in Austrian laws or orders is reference made to Communist states, East-Block, state-trading countries, planned economies, or anything similar, so that these countries cannot refer to Austrian legislation as grounds for complaining that they are objects of discrimination.<sup>8</sup>

In 1975, except for textile products, Austria began removing its rather extensive system of discriminatory quantitative restrictions against imports from the Eastern European countries.<sup>9</sup> However, Austrian law still provides for three basic types of import protection that can be directed at imports from state-controlled economy countries. The first type of protection is the "Federal Law of June 24, 1971 Concerning Measures to Prevent Injuries to the Austrian Economy by Market-Disrupting Imports" (Anti-Market Disruption Law). The second type of protection resides in the Austrian customs regulations and procedures as applied to the Eastern European countries. Finally, the practice of informal, bilateral consultations, which the Austrians have resorted to fairly frequently, provides a third important tool for restricting disruptive imports.

The Anti-Market Disruption Law came into being when Austria revised its anti-dumping legislation to bring it into conformity with the GATT Anti-Dumping Code. The market disruption provisions of the old Austrian Anti-Dumping Law were extracted from the Law and formed the basis, with only minor changes, for the new Anti-Market Disruption Law. It has been suggested that the Anti-Market Disruption law was established in order to be able to deal with low-priced imports from state-controlled economies since in these cases it is often difficult to prove dumping. However, the law has been invoked against market as well as non-market economies—once in 1972 against Romanian calcium chloride, and once in 1976 against all suppliers of pantyhose.

The Austrian anti-market disruption law essentially permits the Austrian Government to set minimum prices for imported products which cause or threaten to cause serious material injury to an Austrian industry. It is very similar to an anti-dumping action except that the procedures for determining the establishment of a minimum price are different from those for determining a dumping margin. The Austrian law establishes the minimum price according to the following standards as applied in the following order:

- (1) The *price of goods quoted at stock exchanges*; or
- (2) If (1) is not available, *average representative Austrian export prices*; or
- (3) If (2) is not available, *average representative export prices of pertinent supplier countries*; or
- (4) If (3) is not available, *average home market prices of pertinent supplier countries*; or

<sup>7</sup> Jan Stankovsky, "Austria's Foreign Trade: The Legal Regulation of Trade with East and West," *Journal of World Trade Law*, Vol. 3, Number 6, November/December 1969, p. 628.

<sup>8</sup> *Ibid.*, p. 629.

<sup>9</sup> As of January 1, 1976, Austria completed this process of liberalization by removing its discriminatory quantitative restrictions on imports from Czechoslovakia.

(5) If (2) through (4) are not available, the *lowest Austrian export price*; or

(6) If (5) is not available, a *constructed price based on the Austrian export price of the closest possible product*.

The prices arrived at under methods (1) through (4) may not be more than 5 percent below the lowest Austrian export price (5) or the constructed export price (6). As can be seen, these provisions provide an effective means of raising the prices of potentially disruptive imports.

Perhaps of more potential significance to products from Eastern Europe is the Austrian customs procedure of issuing informal import permits for all industrial products and certain agricultural products of the Soviet Union and the Eastern European countries. Under this *ex ante* system, imports from these countries are subject to an import monitoring procedure. Importers of merchandise originating in these countries must submit in advance a copy of a commercial invoice or pro forma invoice to the Austrian Trade Ministry for clearance. The Trade Ministry may state on the invoice certain conditions under which the import can be presented to the customs authority for issuance of an informal import permit. This system provides substantial surveillance over imports and the potential to administratively inhibit, obstruct or delay the importation of goods. In fact, although the East Europeans have consistently praised the Austrians for abolishing their discriminatory quantitative restrictions, they have complained frequently about the so-called Austrian system of "visaing invoices".<sup>10</sup> Despite the potentially disruptive impact of these regulations, it is not known what quantitative significance they have had on Austria's trade with Eastern Europe, if any.

Finally, the Austrians have concluded (and this is a practice of long-standing) bilateral trade agreements with the Eastern European nations and the Soviet Union. These agreements usually include two important clauses. One clause states that sales shall be made at world market prices or, if not available, at comparable prices in important markets. The other clause is an escape clause which is usually worded as follows: if import liberalization or unforeseen developments result in disproportionate increases in imports of a product into the territory of the other contracting party, causing or threatening to cause material damage to manufacturers of like products, the affected party may discontinue the liberalization partly or wholly, if no agreement is reached in early consultations between the parties within five work days.<sup>11</sup>

The Austrians have also used informal bilateral consultations to deal with problems relating to disruptive imports. While available details are few, the Austrian press has reported from time to time that cases involving market disturbances (relating mostly to canned fruit, vegetables, and textiles) were handled in this fashion, and to the satisfaction of the Austrian Government. While the exact legal basis for these consultations is not clear, it is likely that the information supplied by the import monitoring system is used to establish some sort of a case. The bilateral consultation clauses and the mechanisms

<sup>10</sup> Economic Commission for Europe. "Consolidated Inventory of Administrative Restrictions in East-West Trade," TRADE/R. 336, October 1976 (Geneva: United Nations Economic Commission for Europe, 1976). Annex pages 1-109.

<sup>11</sup> For those countries which are GATT members (Poland, Hungary, Romania and Czechoslovakia) the Austrian trade agreements invoke the GATT escape clause and the relevant protocols of accession instead of the clause described above.

provided by the bilateral trade agreements no doubt supply methods under which to request consultations and a set of common obligations to invoke. Also, the existence of the Anti-Market Disruption Law could well provide an important incentive to conclude a mutually satisfactory agreement.

Generally, however, the Austrian Government has not actively pursued all the cries for protection that have originated from small and medium-sized producers. In fact, the Austrian Government has not taken an anti-dumping action against any country, since it revised its laws, much less against the Eastern Europeans. While the official reasons for a liberal trade policy are that low-priced imports help to keep inflation down and permit the effective restructuring of the economy, as much credit should be given to the importance of Austrian exports of manufactured goods to Eastern Europe.

The Austrians do pursue what would appear to be a relatively liberal trade policy with the Eastern European countries and the Soviet Union. However, Austria's somewhat higher tariff schedule and its agricultural restrictions provide a degree of generalized protection. At the same time, the provisions of the Austrian Anti-Market Disruption Law, and the Austrian tendency to successfully engage in informal bilateral consultations, combine to provide an effective system for limiting imports in situations where real damage to Austrian economic interests is threatened.

#### *United Kingdom*

The United Kingdom provides an opportunity to examine the practices of a country experiencing serious economic difficulties and balance of trade problems. The United Kingdom is also an EC member state and as such it will provide an example of how an EC nation can mesh its own import strategy with the Common Commercial Policy of the EC.<sup>12</sup> The United Kingdom uses three major tools to implement its policy: "voluntary" bilateral understandings; anti-dumping actions (which until June 30, 1977 were the responsibility of the British Government, and came under the authority of the EC after that date); and quantitative restrictions (which are partially under the authority of the EC).

Like the Austrians, the British are highly dependent upon foreign trade (United Kingdom total exports to the world equalled 19 percent of its GNP in 1975). But unlike the Austrians, the United Kingdom's total trade with the centrally-planned economies (CPE's) has usually averaged only around 3 percent of its trade with the world. Since 1972, the U.K. balance of trade with the CPE's has fluctuated considerably and more often than not has been in substantial deficit. Like the Austrians, the British partially offset a large deficit with the Soviet Union (due to heavy imports of raw materials) by exports of manufactured goods, largely to the Eastern European countries, but importantly as well to the Soviet Union and the PRC.

The size of the deficit with the Soviet Union is quite large, if one includes Britain's imports of non-industrial diamonds. Great Britain imported some \$200 million worth of Soviet diamonds in 1972; \$410

<sup>12</sup> Details of the scope of the EC authority over import policy will be fully discussed in the following section.

million in 1973; \$397 million in 1974; and \$380 million in 1975. These diamond imports raised the U.K. deficit with the CPE's from \$146 million to \$346 million in 1972; from \$50 million to \$460 million in 1973; from \$154 million to \$551 million in 1974; and from a surplus in 1975 of \$168 million to a deficit of \$212 million. However, rather than emphasize the diamond imports, it seems more reasonable to discount their contribution to trade deficits, since they are no doubt being re-exported at a profit to other areas of the world.

Setting aside the diamond trade, 1975 showed a definite improvement in the U.K. balance of trade with the CPE's. Between 1972 and 1975, the U.K. trade balance improved in six one-digit SITC categories for a total improvement of \$582.2 million; while in three SITC categories and the diamond imports, the U.K. trade balance deteriorated by only \$448.5 million. The largest gains occurred in SITC section 7 (machinery and transport equipment). In 1975, the top three divisions of British exports (non-electrical machinery, transport equipment, and electrical machinery) were all in section 7, and represented almost 47 percent of total U.K. exports to the CPE's. Of these top three exports, 52.0 percent (\$349.8 million) was destined for Eastern Europe, 31 percent (\$208.4 million) for the U.S.S.R., and 17.5 percent (\$117.8 million) for the PRC.

Six-month trade figures for 1976, however, present a less optimistic picture and show a decline in the British balance of trade with the Soviet Union of some 179 percent (inclusive of diamonds), but more importantly a decline in the British balance of trade with Eastern Europe of some 53 percent. In both cases, despite the fact that exports increased moderately, imports increased by a factor of 3-4 times the size of the increased exports.<sup>13</sup>

Interestingly, in 1975 the United Kingdom did not import much more from the CPE's in value terms than did Austria (\$1.3 billion—excluding diamonds—versus \$1 billion). However, the top fifteen British imports include such items as fabrics, clothing and footwear—all sensitive products. In fact, only six of the top fifteen U.K. imports are non-industrial items. In 1975 imports of manufactured goods (excluding the diamonds) equalled \$589.6 million or 46 percent of the U.K. imports, as contrasted to Austrian imports of manufactured goods equalling \$217.8 million or 22.5 percent of all Austrian imports.

In short, while the British exports of manufactured goods to the CPE's are sizeable, the pattern of British imports from the area, and the general condition of the British economy have made British trade with the CPE's a somewhat mixed blessing. (See Tables 6-10.)

British import policy with respect to Eastern Europe and the Soviet Union has taken several turns during the post-war period. During the 1950's, Great Britain, like other Western European nations, assembled an extensive array of fixed discriminatory quantitative restrictions (QRs) against imports of agricultural and manufactured goods from Eastern Europe and the Soviet Union. During the 1960's the political climate warmed up considerably, and Great Britain, in advance of many Western European nations, began eliminating many of these quantitative restrictions. By the late 1960's, however, Great Britain's economic and balance of trade problems became increasingly apparent. The liberalizing trend was halted, and rising unemployment ultimately resulted in increasing complaints from trade unions to take import control measures, both generalized controls as well as controls specifically directed against communist imports. Between 1968 and 1970, Great Britain imposed an import deposit scheme. The current Labor Government, however, has strongly resisted suggestions to re-institute the import deposit scheme. Edmund Dell, Trade Secretary, during a parliamentary debate in October 1976, was quoted as saying:

If import deposits have any effect at all, they lead to foreigners helping to finance our balance of payments deficits and also have certain internal monetary effects. . . . It may be possible to protect the home market but what is impossible—if we are not going to invite retaliation—is the protection of our export markets. A great deal of employment in this country depends on those exports. The industries concerned are our most efficient and rapidly expanding industries.<sup>14</sup>

At the same time, Dell reported to the House of Commons that the Government was taking steps to strengthen its anti-dumping unit and speed up its processing of anti-dumping complaints. Dell indicated he was prepared to act in specific cases where cheap imports were disrupting a particular industry.<sup>15</sup> The following actions were taken against Eastern European and Soviet imports during 1976:

Quotas were imposed on suits from Eastern Europe;

<sup>14</sup> John Hunt, "Dell indicates tougher anti-dumping action," *London Financial Times*, October 19, 1976.<sup>15</sup> *Ibid.*

Quotas were imposed on woolen jackets from Czechoslovakia; Voluntary export restraints were negotiated with Czechoslovakia, Romania, and Poland on footwear imports;

Anti-dumping duties were assessed against Eastern European fiberboard and sugar beet harvesters, and against polyester fiber from Romania;

Romania's license to import synthetic men's shirts was revoked; and

Fines were imposed on U.K. importers illegally importing suits from Romania.

In 1975, Great Britain maintained quotas against some 343 separate listings of items from eight centrally-planned economies (Bulgaria, Hungary, Poland, Romania, Czechoslovakia, the U.S.S.R., the GDR, and the PRC). By far, the largest number of quotas was on clothing (119 items) and textiles (95), followed by fruits and vegetables (71), china and earthenware (23), transistorized television and radio receivers, tubes and semi-conductors (13), matches (12), and footwear (10).<sup>16</sup> Some of the British quantitative restrictions date back to the old system established during the 1950's. Others have been imposed recently utilizing the authority of the EC with respect to quantitative restrictions. Under the EC unilateral rules for imports which coordinate the QRs of EC member countries, Great Britain may liberalize its quotas (within certain limits) but may not institute any new ones, or reduce the volume or value of items permitted entry under existing QRs, without first going through an EC consultation procedure. However, such consultations are only necessary if requested by another member state or the EC Commission.

Under different statutes (the EC's common rules for imports from state-trading countries), Great Britain has taken emergency action against communist imports by imposing new quotas, and has received expedited consideration of its need to take emergency measures by the EC Commission. To illustrate how these different types of authority intermesh and how "voluntary" export restraints can sometimes add an extra dimension, we will examine the experience of Great Britain with suit imports from the communist countries. Beginning late in 1975, a large number of complaints were received by the U.K. Government from British industry about sharply increasing imports of low-cost men's woolen suits from Eastern Europe. Poland and Hungary agreed to voluntarily restrain their exports. The GDR, Romania and Czechoslovakia refused. Under the provisions for measures requiring urgent action, the U.K. applied to the EC to restrict the subject imports. Within a matter of days the procedure was completed and the QRs put into effect. Early in 1976 new imports of woolen jackets (presumably to circumvent the suit restrictions) began to come in from Czechoslovakia. This time the U.K. did not take the "fast-track" procedure, but went the more formal route as required by the unilateral rules for imports. Nevertheless, within a short time a new QR on woolen suits from Czechoslovakia went into effect.

The U.K. is a signatory to the GATT Anti-Dumping Code, and does not employ any unique anti-dumping regulations. As of July 1, 1977, the United Kingdom's authority over anti-dumping actions

<sup>16</sup> *Official Journal of the European Communities*, Vol. 18, No. 199, 21 April 1975.

passed on to the Commission of the EC. It was planned, however, that the anti-dumping unit in the Department of Trade would continue to function for the purpose of advising British industry and assisting the EC Commission. Consultations were undertaken during 1976 in order to anticipate problems which might arise and to facilitate the transition. There had been some speculation that the British would press for a more vigorous and legalistic application of anti-dumping regulations from the Community, which has in the past preferred to settle such problems "amicably", either by arriving at price understandings on the part of the exporter or through a dismissal of the case.<sup>17</sup>

In any event, the number of anti-dumping complaints has risen dramatically over the last year. This increase may be partly a result of a realization on the part of British industry that widespread, general import controls were not in the cards. It was estimated that about 50 percent of the anti-dumping complaints were against centrally-planned economies. The Eastern European and other centrally-planned economies would appear to be particularly vulnerable to anti-dumping charges since: these governments are unable to ascertain their actual production costs; their nonconvertible currencies deny accurate price comparisons; and because it is generally felt that a high degree of subsidization occurs in these economies. Late in 1976 the following cases were reported to be under review by the Department of Trade:

Paper from Romania;

Men's suits from Bulgaria, Czechoslovakia, the GDR, Hungary, Poland and Romania;

Horticultural glass from the Soviet Union, Czechoslovakia, the GDR, Romania, Hungary, and Poland;

Electrical motors and car light bulbs from the Soviet Union and all East European countries;

Domestic light bulbs from Poland, Czechoslovakia, and Hungary;

Men's suede shoes and children's sandals from Poland;

Printing presses and thermostats from the GDR; and

Copper sulfate from the Soviet Union.

As noted earlier, the U.K. has also resorted to "voluntary" export restraints. One of the better known examples of this occurred in early 1975 when there was a large increase in the number of imports of low-cost men's leather shoes coming from Poland, Czechoslovakia and Romania. Rather than proceeding with a formal action through the EC Commission, the U.K. chose to negotiate a "voluntary" agreement. In this case, all three countries agreed to restrict exports to the U.K. at levels that were some 5-10 percent below their levels in 1974. All three countries subsequently agreed to extend this "voluntary" agreement through the end of 1976.

A problem with all such so-called "voluntary" agreements is knowing how much is "voluntary" and how much is agreed to under threat of more severe action, such as a request for action from the EC, or proceeding with an anti-dumping case. Another criticism is that the results of such negotiations depend more upon the relative bargaining strength of parties than upon the merits of the case.

<sup>17</sup> H. Peter Dreyer, "Anti-Dumping Policy of EC May Change," *New York Journal of Commerce*, November 11, 1976.

Finally, it is very difficult to know, as these are informal agreements, what actually has been agreed upon. Nor is it possible to feel certain that one is aware of all existing "voluntary" agreements.

By late 1976 and early 1977, it had become apparent that the British strategy for economic recovery was one of seeking basic productivity gains in British industry, and in particular its export industries. The British Government sought to supplement this domestic economic strategy with an international trade strategy aimed at expanding British export markets. For example, as reported in the British press, for some time there had been significant grumblings about the slowness of the Soviets to draw down the 950 million pound line of credit extended by Great Britain over two years ago. Perhaps to counter Soviet arguments that British goods are not competitive in either price or delivery terms, Prime Minister Callaghan, late in December 1976, in an unprecedented diplomatic move, raised with the Soviet Ambassador official disappointment at this state of affairs.

It seems that, at least for the near term, the British will have to continue to mediate between the sometimes conflicting objectives of an export expansion policy and domestic pressures for increased protection. If their industry strategy succeeds, the pressures for increased protection should ease up some. However, if the export push falters, pressures for protection will continue to build. This will then be a problem not only for the government of the U.K., but also for the European Community, which in mid-1977 assumed competency over virtually all instruments that could be used to restrict imports.

#### *European Community (EC)* <sup>18</sup>

Having examined the case of one EC member state, let us now explore in detail the competence of the EC in matters relating to East-West trade. The European Community administers rules for imports from state-trading countries and different rules for imports from non-state-trading countries. It also is the competent body (in consultation with member states) with respect to anti-dumping, countervailing, and GATT safeguards actions. The Commission of the EC can extend community-wide surveillance over certain imports. It coordinates the unilateral rules for imports (bilateral quotas). It reviews bilateral economic cooperation agreements to be certain that such agreements do not circumvent or impinge upon the common commercial policy. The Commission has the sole authority to negotiate trade agreements. In fact, the only aspect of East-West trade not yet under the authority of the EC Commission is export promotion; and even in this area there are mechanisms for coordination, for example with respect to credit policies. The Commission of the EC, therefore, exercises a significant degree of control over trade policy generally and more particularly over the importation of products into the Community.

<sup>18</sup> There were originally three separate European Communities involving the same member countries: the EEC (European Economic Community or sometimes called the Common Market), the ECSC (European Coal and Steel Community), and EURATOM (European Atomic Commission). In 1967 these three organizations were combined under the authority of a single executive agency—the Commission of the European Communities. The initials EC, therefore, have come to represent the combination of the three groups, or more simply put, the unified concept of the Community—a term which is much broader in scope than the term Common Market. Throughout this paper, the initials EC will be used, except when referring specifically to authority deriving directly from the Rome Treaty which established the original European Economic Community (EEC).

The most important protective tools employed by the EC that directly affect the state-trading countries are: the common rules for imports from state-trading countries (which includes an import surveillance system), anti-dumping regulations, and the partial control exercised under the unilateral rules for imports whereby the EC has established common rules and procedures for member states which maintain discriminatory quantitative restrictions against the communist countries.

Together, the nine nations of the EC are highly dependent upon foreign trade (the exports of the EC to the world equalled 24 percent of combined EC GNP in 1974), but their total trade with the CPE's in 1975 only equalled about 5 percent of their total trade with the world. Data on the European Community since its enlargement in 1973 show the EC to have consistent and increasing surpluses with the CPE's (from roughly \$1.4 billion in 1973 to roughly \$5.3 billion in 1975), in contrast to a fluctuating deficit with the world as a whole. In 1975 the EC's major trading partner, both for imports and for exports, was the Soviet Union, with whom the EC was in surplus (\$1.8 billion). The EC surplus with Eastern Europe, however, was over a billion more (\$2.8 billion). Between 1973 and 1975, the EC's overall surplus with the CPE's increased by 284 percent, with the largest increases occurring in exports of chemicals (\$1.2 billion or 83 percent), manufactured goods classified chiefly by material (\$2.8 billion or 85 percent), and machinery and transport equipment (\$3.4 billion or 98 percent), more than offsetting the only really large increase that occurred in imports—mineral fuels and products (\$2.3 billion or 162 percent). (See Tables 11–15.)

<sup>1</sup> Does not include Irish trade data.<sup>2</sup> Not elsewhere specified.

Source: U.S. trade data, as reported by member countries.

The major items imported by the EC in 1975 included a number of import sensitive items in two major categories—textiles and agricultural products. These are in fact the items experiencing the highest degree of restriction on entering the EC market. In only one instance—textile yarns, fabrics and made-up articles—did the value of EC exports exceed the value of imports.

## EC RELATIONS WITH THE STATE-TRADING COUNTRIES

The history of EC relations with the state-trading countries has been very complex. Article 113 of the Rome Treaty establishing the EEC stipulates that the Council shall authorize the Commission to open trade negotiations with third countries.<sup>19</sup> At the time, the state-trading countries, following the active lead of the Soviet Union, did not recognize the EEC as an entity at all. An exception was therefore granted by the Commission for member states to continue to negotiate bilateral trade agreements and maintain quantitative restrictions against the state-trading countries. This exception was continued until the end of 1974, when most existing bilateral agreements between individual member states and the state-trading countries expired. Since that time the EC has maintained that only the Community has the authority to negotiate such agreements, and that existing EC regulations (i.e., common rules for imports from state-trading countries, rules regarding QRs, anti-dumping rules, etc.) provide the basis for trading with the state-trading countries.

One result of the lapse and non-replacement of the bilateral trade agreements was that in early 1976 the EC sought, for the first time ever, safeguards relief as provided for in the Polish, Hungarian and Romanian GATT protocols of accession. The products involved were light bulbs and small motors. By the end of 1976, consultations with these countries had proved "satisfactory" to the EC. This action was probably taken as a test of the protocols; and it obviously proved successful.

## THE EC'S DUAL SYSTEM OF RULES FOR IMPORTS

The EC regulations on common rules for imports (from non-state-trading, non-EC countries), Regulation (EEC) No. 1439/74, of June 4, 1974,<sup>20</sup> establishes a community-wide safeguards type of system. It, and the common rules for imports from state-trading countries, Regulation (EEC) No. 109/70, of December 19, 1969,<sup>21</sup> provide the legal basis for either taking action or seeking consultations under the GATT safeguards clauses, as well as for taking action against non-GATT countries. The general import system will be described in detail first, since the system of common rules for imports from state-trading countries differs only in selected procedures.

The general rules for imports establish a system under which action can be taken at two levels. At the first level, items threatening to "cause injury to a community producer of like or directly competing products" (Article 7), can be put under a community-wide surveillance system. When a product has been placed under surveillance, it can only enter into free circulation upon production of an import document. This document must supply information about the name

<sup>19</sup> The Commission of the EC is responsible both for proposing EC regulations, directives and decisions, as well as for implementing such measures. The Council of the EC approves or disapproves (but may not amend) Commission proposals. Voting in the Council is by a weighted formula and most decisions not requiring amendment of the Rome treaty are taken by a qualified majority. However, the Council has not taken a formal vote in about ten years.

<sup>20</sup> *Official Journal of the European Communities*, No. L159, of June 15, 1975.

<sup>21</sup> *Official Journal of the European Communities*, No. L19, of January 26, 1970.

and address of the importer; a description of the product, including tariff headings, country of origin and country of consignment; the c.i.f. price and the quantity (in units customary to that product); and the dates and places of importation. Such documents are to be issued free of charge by any member state, in any quantity requested, within five working days of submission of a request by a community importer. Member states are thereafter required to provide monthly statistics, within the first ten days of each month, on sums of monies and quantities of goods for which import documents were issued for the month. This information must be broken down by product and by country. Community-wide surveillance is not employed too frequently, for example, in early 1977 only two products were under surveillance: electronic calculators; and slide fasteners.

The second level of action permits protective measures to be taken. Such measures may be taken "where a product is imported into the community in such greatly increased quantities and/or on such terms or conditions as to cause, or threaten to cause substantial injury to community producers of like or directly competing products" (Article 12). The product may, but need not, have been previously subject to surveillance. Under such conditions, the EC can limit the period of validity of import documentation, or alter the import rules to require import documentation which will be granted only under certain conditions as set out by the Commission and which will then require subsequent approval by the Council. Such actions can be limited to imports intended for specific regions of the Community and may not be imposed on goods already in transit. The EC is empowered either to prevent the importation in such greatly increased quantities and/or under such terms or conditions as to cause or threaten to cause substantial injury, or to seek fulfillment of the rights and obligations of either the Community or its member states at the international level. Where the establishment of a quota would constitute a retreat from liberalization, the following should be taken into account: the desirability of maintaining traditional trade flows; the volume of goods exported prior to the protective measure being taken; and the avoidance of jeopardizing the aim which required the establishment of the quota in the first place.

Action may be initiated at the request of a member state or upon the initiative of the Commission. When requested by a member state, the Commission has five working days to reach a decision. This decision is then transmitted to the Council and all the member states. Within ten working days after taking interim measures (which the Commission can do immediately once it makes a decision) the Commission must present its recommendations as to the appropriate course of final action, which the Council must then approve or disapprove. If the Council does not take action on the Commission proposal within six weeks after the interim measures were initiated, such measures will be revoked. With respect to limiting the period of validity of an import document, the Commission can make the final determination, unless the matter is specifically referred to the Council by a member state.

As mentioned in the section on the U.K., under these statutes there is provision for member states to take emergency action on their own behalf. Such action, however, can only continue if it is not

revoked by the Council, which must take action within two months after the matter was referred to it. In practice, the EC has permitted most cases of emergency action initiated by member states.

As can be seen, while the procedures for taking action are painstakingly detailed, the actions themselves are neither described, listed, nor circumscribed, except by the provisions in the preambulatory material which state that the Commission should submit proposals which have regard for international obligations, and that actions against GATT countries must conform to GATT practice.

The system with respect to state-trading countries is a parallel system, i.e., it provides both for surveillance and remedial action as well as setting out the procedures for taking action. Differences in detail, however, do occur. The provisions requiring prior consultation before initiating surveillance or taking protective action are slightly different with respect to state-trading countries. Under certain circumstances, consultations can be called in four, not eight days. The criterion for initiating surveillance is also different. Surveillance may be initiated "where community interests so require" (vice "threaten to cause injury"). The import document requires much the same information except that it must include the country of export (not consignment) and the total *and* per unit c.i.f. price. However, instead of an automatic license as in the case of non-state-trading countries, the granting of a license to an import from a state-trading country is not automatic when "community interests so require" and when an injury situation is likely to arise. The import license can carry a limited period of validity, or it can be issued only subject to "certain conditions", which are unspecified. In short, products can be placed under surveillance when the community interests dictate and, in potential injury situations, import licenses need not be automatically granted. Reporting obligations for the member states are the same in both cases.

Protective measures are initiated in response to basically the same criteria as employed in the common rules for imports (substantial injury or threat thereof—see the definition in the preceding paragraph). Protective measures are to be the granting of an import license only under conditions set down by the Commission pending decision by the Council. The notification and ratification procedures are the same as for non-state-trading countries. The provisions for individual states taking emergency action are the same. The state trading measures do not specify that the Commission may recommend seeking relief at the international level, nor do they specify that any special considerations such as traditional trade flows need to be taken into account. Reference is made, however, in the preambulatory material to "due regard for existing international obligations".

#### EC ANTI-DUMPING REGULATIONS

The European Community administers anti-dumping and countervailing duty regulations on a community-wide basis. These regulations,<sup>22</sup> drawn up in 1968, follow closely the provisions of the GATT Anti-dumping Code which was completed in 1967. For purposes of the EC regulations (as well as in Article VI of the GATT) anti-

<sup>22</sup> Regulation (EEC) No. 459/68 of April 5, 1968, *Official Journal of the European Communities*, No. L93 of April 17, 1968.

dumping and countervailing both involve the criteria of "material injury". Some detail will be provided at this point in the paper since the EC provisions conform closely to those of the GATT thus providing a basis for later comparison with U.S. practice.<sup>23</sup>

In the case of anti-dumping the fact of dumping, must be established. Dumping occurs when a product is exported at a price less than the price of that product when sold in the ordinary course of trade for consumption in the domestic market of the exporting country. This requires some very specific definitions as to what constitutes a like product; and how to make the evaluation of price in cases where it appears that the export price is unreliable (such as in the case of compensation agreements between exporters and importers), where there are no sales in the domestic market of the exporting country, or where it appears that prices in the domestic market of the exporting country do not permit a proper comparison.

Since price comparisons are notoriously difficult to make (some would say impossible) when dealing with a centrally-planned economy, the EC regulations provide for this situation. While the law itself does not spell out exactly what shall be done, the administrative interpretation is that comparison may be made with either the export price or the production price of a market economy.<sup>24</sup>

A determination of injury can only be made when dumped imports are demonstrably the principal cause of material injury (or threat thereof, or materially retard the establishment of an industry). A long list of factors to be taken into account when determining injury is set out, including: turnover, market share, profits, prices, export performance, employment, volume of dumped and other imports, capacity utilization, productivity, restrictive trade practices, as well as volume and prices of undumped imports, competition within the industry, contraction in demand due to substitution of other products and changes in consumer tastes.

The definition of industry is also quite detailed. Since the Community considers itself to be a single, unified market, it is not sufficient to prove injury only in a national market. Such injury must be community-wide to producers of like or directly competitive products. However, in certain circumstances—when, due to transportation costs or other factors, several regional markets actually exist—injury need only apply in the specific regional market.

Any legal or material person can act on behalf of an industry and lodge a complaint. The complaint must be submitted in writing either to a member state or to the Commission of the EC. The complaint must cite basic information such as a description of the allegedly dumped product and the exporting country, as well as offer evidence of both dumping and injury. Most complaints are first filtered through the governments of the member states. Upon receipt of a valid complaint, either from a member state or community producer, the Commission, in cooperation with the member states, commences an investigation of both dumping and injury charges. Information is gathered from all interested parties, written submissions are accepted,

<sup>23</sup> For a detailed description of the EC anti-dumping regulations, see J. F. Breseler, "EC Protection against Dumping and Subsidies from Third Countries", *Common Market Law Review*, Vol. 6, No. 3, July 1969.

<sup>24</sup> *Debates of the European Parliament*, sitting of Wednesday, February 11, 1976, p. 117.

and parties directly interested can request the opportunity to express their views orally, as well as to meet with those holding opposing viewpoints.

The anti-dumping duty (whether provisional or otherwise) is not to exceed the margin of dumping (the amount of price discrimination) and can be less if a lower duty would remove the injury. Anti-dumping duties are to be levied on a non-discriminatory basis on all imports found to be dumped. No action need be taken by the Commission unless dumping has been proved, injury has been determined, and *Community* interests have been deemed to be involved. The latter provision supplies a considerable amount of flexibility and permits general economic interests to be taken into account.

Price undertakings by exporters which would eliminate the dumping margin can be and often are accepted. For the exporter's protection, the investigation can be continued, if the exporter so requests it. Table 16 summarizes the anti-dumping activity of the EC between 1970 and 1975.

TABLE 16.—SUMMARY OF EC ANTIDUMPING ACTIVITY REPORTED TO GATT, 1970-75

6. Cases pending as of end of period (June).....	5	8	3	1	.....

Source: GATT, "Basic Instruments and Selected Documents", supplements 18, 19, 20, 21, and 22.

The most striking thing that stands out about EC anti-dumping policy is the relatively few cases which have actually resulted in dumping duties being assessed. In fact, the provisional negative dumping finding in February of 1977 against Japanese ball bearings was only the second such finding in the nine years since the new regulations were put in place.<sup>25</sup> On the whole, the EC prides itself on settling such complaints, where a case could be proved, through price agreements on the part of the exporter.

The EC regulations for countervailing duties reside in the same regulation as those for anti-dumping and share identical administrative procedures, as well as the same criteria for injury. However, the countervailing duty regulations do not specify (as do the anti-dumping regulations) how causality is to be proved. The regulations provide that countervailing duties may be applied against products which have benefited from bounties or grants in their countries of origin or export. The amount of such a duty is not to exceed (but may be less than) the amount of the subsidy, bounty or grant. No countervailing duty actions have been taken by the EC.

<sup>25</sup> The other case was a dumping finding against bicycle chains and motor cycles from Taiwan in November of 1976. See "EEC Anti-Dumping Action Is Second in Nine Years," *Commerce America*, February 21, 1977.

## QUANTITATIVE RESTRICTIONS

The authority over discriminatory quantitative restrictions against communist countries is divided between the EC and its member states. Currently the products which may be imported without restraints in any member state include 929 entire tariff positions and 63 partial tariff positions out of a total of 1,097 tariff positions listed under the Common Customs Tariff (CCT). Once a product is no longer controlled by any member state, it is added to the community-wide liberalization list. For those products not entirely liberalized (108 full headings) the import rules can vary from one member state to the next.

Between 1970 and 1975 the EC has increasingly tightened its authority over quantitative restrictions maintained against state-trading countries. Citing the need to coordinate unilateral import arrangements pending the initiation of trade negotiations with these countries, the EC Council regularly publishes lists of the existing bilateral QRs.<sup>26</sup> National quotas not included in the published Community lists must be held at the highest levels reached in one of three preceding years. Quotas by member states included in the lists published by the EC can be increased by 20 percent without any need to consult the Community. New quantitative restrictions can be imposed only after procedures set forth in the common rules for imports have been taken.

In 1975 for example, the bilateral quotas listed by the EC numbered a total of some 1,570 different restrictions against the following state-trading countries:

Albania.....	47	Czechoslovakia.....	269
Bulgaria.....	213	USSR.....	105
Hungary.....	219	GDR.....	140
Poland.....	238	PRC.....	88
Romania.....	247	N. Korea.....	4

Some of these restrictions can be quite unspecific, such as a restriction by Denmark against all non-liberalized products from Albania, not to exceed 1 million Danish Kroners; or the restriction by France against miscellaneous manufactured goods from Hungary (listing no tariff heading), not to exceed 6 million French francs.

The Community has set forth measures to guide nations with respect to their bilateral quotas. Technically these have not resulted in any derogation of national authority to the Community. While in most cases it has proved easy to obtain the approval of the EC to amend these quotas, the discretion available to the member states may be more illusory than real. For example, in late 1974, France proposed to unilaterally liberalize certain products of unwrought aluminum, certain products covered by the multifiber arrangement (MFA) and a number of linen goods not covered under the MFA, originating in state-trading countries. The Commission decided unfavorably in all three cases. In the case of the aluminum products it recommended that only interim measures be undertaken, given the condition of the Community's aluminum industry. It also objected strenuously to the liberalization of the textile products because

<sup>26</sup> Council decision of March 27, 1975, on unilateral import arrangements in respect of state-trading countries, (75/210/EEC), *Official Journal of the European Communities*, No. L99, of March 21, 1975.

negotiations were ongoing with the countries in question under the MFA, and the Commission did not want their negotiating position undercut by unilateral French action. In the third case (linen goods not covered by the MFA), the EC disapproved because the products involved were products under restriction in every member state and unilateral French liberalization would have "conflicted with the goal of harmonization of import arrangements".<sup>27</sup> More recently, extensive negotiations between the West Germans and the rest of the EC resulted in West Germany being given permission to exceed quotas (import more) on the outer processing of textile goods on a case-by-case basis. In return, German quotas on these products were to be held at lower levels than for other members of the Community.<sup>28</sup>

#### THE EC'S COMMON EXTERNAL POLICY

Since the early 1970's there has been an increasing tendency on the part of the member states of the EC to negotiate long-term (usually of 10 years in duration) bilateral "economic cooperation" agreements with the state-trading countries. Since these are technically not trade agreements, this is perfectly legal. These economic cooperation agreements attempt to foster trade by listing potential areas for industrial cooperation, facilitating exchanges of information, and generally promoting business interests. In the course of negotiations, a country may well agree to liberalize some of its QRs. This is a complex issue, for while the EC is trying to strengthen and complete its authority over trade regulations generally, the lack of any current bilateral trade agreements and the dynamics causing an increase in industrial cooperation and compensation arrangements have the potential to erode the Community's authority, with respect to the common commercial policy.

This is an over-statement of the situation, however, and takes no account of the considerable amount of control already exercised in the area of imports. Further, a Council decision<sup>29</sup> of July 22, 1974 (74/393/EEC) requires that member states inform the Commission and the other member states of any proposed economic or industrial cooperation agreements with third countries, or any measures proposed as parts of such agreements (such as protocols), or any renewals of such agreements. Where appropriate, this is to be done prior to actual bilateral negotiations. Intra-EC consultations can be called at any time on these measures at the initiative of a member state or the Commission. Such consultations are held to ensure that all agreements are consistent with common policies, to encourage coordination among member states and to ascertain if the EC itself (the Commission) should take unilateral measures to promote cooperation projects. Member states are instructed to ensure that cooperation agreements do not conflict with their obligations as member states of the EC.

While the EC has not been able to establish total (and some would say effective) control over such agreements, it has on occasion been able to have especially objectionable clauses removed. During the course of German-Polish negotiations on an economic cooperation agreement, the Poles requested that the West Germans grant special tariff and quota exceptions to goods produced in cooperation projects.

<sup>27</sup> Answer to written question No. 6/75, by Mr. Bordu, to the Commission of the EC.

<sup>28</sup> "CMEA Import Quotas," *East-West Markets*, January 24, 1977, p. 4.

<sup>29</sup> *Official Journal of the European Communities*, No. L208 of July 30, 1974.

The Germans were reported as willing to do so but declined in the face of an EC protest. Clearly, the tariff portion of that request would have violated the common external tariff, and quota liberalization would have been subject to EC consultation and approval.<sup>30</sup>

National security, political, and economic goals, all jostle and bump against the authority of the EC. Despite the attempt to preserve the appearance of a unified front at all times, national policy goals usually take precedence over EC harmonization policies that conflict with the perceived national interest. It should be remembered that while the EC Commission proposes regulations which the EC Council may not amend, in point of fact the Commission always seeks a consensus first and very rarely offers a package that does not have sufficient support to be passed.<sup>31</sup>

Nevertheless, with respect to East-West trade, there is no great divergence of national interests, at the present time, among the member states of the Community. The various nations, of course, want to be able to compete for access to Eastern European and Soviet markets. However, access to Eastern markets would presumably not be affected by the EC eventually becoming the negotiator for either traditional trade-type or economic cooperation-type agreements. It would simply make such access available on a community-wide basis. In addition, the EC member states want to be assured of effective protection against injurious imports. A common system in this respect is firmly in place. The EC has proved that even in the absence of bilateral trade agreements it can: (1) take GATT safeguards actions; (2) exercise surveillance and control over imports from state-trading countries; (3) implement anti-dumping regulations; (4) coordinate member countries' bilateral quotas; and (5) review long-term economic cooperation agreements.

### *The United States*

The value of U.S. trade with the centrally-planned economies has not been on the same order of magnitude as the value of East-West trade conducted by the nine members of European Community. For example, in 1975 U.S. total trade with the CPE's equalled about 13 percent of the EC total trade with the CPE's in that year. Also in 1975, U.S. imports from the CPE's equalled about 7 percent of the total imports from the CPE's absorbed by the EC, and the value of imports into the United States was even lower than the value of imports absorbed by either the U.K. or Austria.

Nevertheless, the concern over providing adequate protection against imports from communist countries has been a persistent theme in American legislative history dating from the depression era when the Soviet Union was hotly accused, and with some justification, of dumping grain and other commodities in the United States. The United States' collection of tools to provide import protection include: the general escape clause; anti-dumping and countervailing duty provisions; and a market disruption provision which applies

<sup>30</sup> H. Peter Dryer, "EEC States Cling to East Deals," *New York Journal of Commerce*, December 11, 1974.

<sup>31</sup> For an excellent description of the politics of arriving at an implementing external policy, see Chapter 2 of Werner Feld, *The European Community in World Affairs*, (N.Y.: Alfred Publishing Company), 1976 pp. 17-32.

solely to communist countries.<sup>32</sup> Additionally, bilateral market disruption clauses have also been negotiated in several trade agreements, as required by the Trade Act of 1974. Furthermore, the continued denial of MFN to certain communist countries (Hungary, Czechoslovakia, the German Democratic Republic, Bulgaria, the U.S.S.R., and the People's Republic of China) affords a degree of protection with respect to imports of manufactured goods. While the United States has been reluctant to grant MFN, it does not maintain a system of discriminatory quantitative restrictions, as do most European nations which have granted MFN to the communist countries.

Despite the small portion of U.S. trade represented by trade with the CPE's, this trade has consistently yielded a significant surplus for the United States. But the U.S. trade with the CPE's, unlike that of the European countries, is dominated by a large surplus in the agricultural sector. In fact, U.S. exports to the area are almost bimodal, that is concentrated largely in the categories of food (\$1,571.3 million in 1975), and machinery and transport equipment (\$885.8 million in 1975). Imports from the CPE's to the United States on the other hand are concentrated in three areas—manufactured goods classified chiefly by material (\$249.8 million), fuels (\$182.2 million), and food (\$158.5 million) in 1975.

This contrasts with the European pattern which usually records Western deficits in SITC categories 0 through 3 (foods and raw materials), which are more than offset by Western surpluses in categories 5 through 7 (chemicals and various manufactured articles). Given these differences in the pattern of trade, it is not surprising that the Europeans have been restrictive with respect to agricultural imports and aggressive in promoting exports of manufactured goods. In contrast, the United States with its large agricultural and high technology surpluses and the correspondingly lower significance of its exports of general manufactured goods has had less built-in resistance to domestic pressures for protection.

In general, the Europeans have more to lose in terms of profitable exports through a restrictive import policy than does the United States. The difference in dollar volume involved—\$17 billion worth of exports for the EC in 1975 versus \$3 billion worth of exports for the United States, or almost \$16 billion worth of manufactured goods exports versus slightly more than \$1 billion for the United States—highlights the disparity. In fact, in 1975, the United States exported to the CPE's slightly less in manufactured goods categories (SITC sections 5-8) than did Austria.

Raw materials and semi-processed items do not dominate the U.S. list of top 15 imports from the CPE's, to the extent that they do for the European countries, and these places are taken in some instances by import sensitive manufactured goods: textile yarns, miscellaneous manufactured articles, clothing and footwear. And only in the case of textile yarns are exports in that category larger than imports. (See Tables 17-21.)

<sup>32</sup> The authority for the escape clause is contained in Title II of the Trade Act of 1974; anti-dumping is in the Anti-dumping Act of 1921 as amended (c.f. Section 321 of the Trade Act of 1974); countervailing is in the Tariff Act of 1930 as amended (c.f. Section 331 of the Trade Act of 1974); and market disruption is in Section 406 of the Trade Act of 1974.

### GENERAL IMPORT PROTECTION—ANTIDUMPING, COUNTERVAILING, AND ESCAPE CLAUSE

The major instruments of general U.S. import policy are its anti-dumping, countervailing, and escape clause (safeguards) provisions. Table 22, compares anti-dumping and countervailing regulations. A later table, Table 23, compares general escape clause authority applying to all countries, with the market disruption authority which applies only to communist countries.

TABLE 22.—SUMMARY OF U.S. ANTIDUMPING AND COUNTERVAILING REGULATIONS

	Antidumping	Countervailing
Practice directed against....	Dumping—sales at less than fair value which result in injury to a U.S. industry.	Subsidization—bounties or grants paid on the manufacture and/or export of products (it is necessary to prove injury only with respect to duty-free items).
Remedy.....	Antidumping duty—a duty equal to the margin of dumping (difference between purchase price or exporters sales price and foreign market value or constructed value.)	Countervailing duty—equal to bounty or grant.
Legislative authority.....	Antidumping Act of 1921 as amended (c.f. sec. 321 of the 1974 Trade Act).	Tariff Act of 1930 as amended (c.f. sec. 331 of 1974 Trade Act).
Competent U.S. agency....	Treasury (for determination of sales at LTFV); ITC (for determination of injury).	Treasury (ITC when injury is involved).
Proceedings initiated by....	Petitions can be filed by any party on behalf of a U.S. industry as long as the petition contains adequate factual substantiation of alleged dumping.	Same as for antidumping, except that petitions from third countries can be considered.
Time limits on procedures.	Treasury 6-9 mo. for tentative decisions; 12 mo. for final decisions; ITC 3 mo. to determine injury once case is referred to it by Treasury. If Treasury determines that there is reasonable doubt that a U.S. industry has been injured, Treasury may request ITC to conduct 30-day preliminary inquiry. If ITC finds no reasonable indication that a U.S. industry is being injured, investigation will be terminated.	6 mo. for preliminary determination; 12 mo. from date of initiation for final determination.
Applicability.....	All countries (special provisions for state-controlled economies).	All countries.

### *Anti-dumping*

United States anti-dumping legislation dates back to the Anti-dumping Act of 1921. Although the United States is a signatory to the GATT Anti-dumping Code, the U.S. Congress did not pass enabling legislation to bring U.S. statutes into conformity with the Code. The stated U.S. policy has been that any anti-dumping decisions which were made would be within the spirit of the Code. Sufficient administrative flexibility exists for this to be the case. The fact remains, however, that U.S. statutes diverge from provisions of the GATT Anti-dumping Code in three key areas: methods of proceeding with an investigation, procedures for determining dumping from state-controlled economy countries, and in the definition of injury.

United States anti-dumping investigations proceed in two stages. First after receipt of a petition, an investigation to determine the existence of sales to less than fair value is undertaken by the U.S. Treasury. If such sales are found, the U.S. International Trade Commission investigates the injury charges. This contrasts with the GATT Anti-dumping Code which provides that both dumping and injury should be investigated simultaneously. The 1974 Trade Act attempted to ameliorate this disparity by providing that if there is reasonable doubt that a U.S. industry is being injured, the ITC may conduct a 30-day preliminary investigation of injury. Of course, this only helps in those cases where there is substantial doubt that injury exists and which are likely to be dismissed following the preliminary investigation.

Rather than providing for temporary anti-dumping duties, U.S. law provides for a withholding of appraisement of goods under investigation. The effect of this practice is that goods enter the United States with a great deal of uncertainty as to the amount of duty which will finally be assessed. And since anti-dumping duties are not assessed until after the injury investigation is completed, this can

result in a considerable time lag from the date when the withholding of appraisement notice was first published.

The U.S. method of determining dumping as practiced with respect to state-controlled economies is generally within the spirit of GATT—which for political reasons is deliberately not too specific in this area. There are special U.S. regulations used in certain cases involving state-controlled economy countries which provide the choice of comparing the export price to either: (a) the selling price or export price in a market economy, including the United States; or (b) the constructed value of the product in a market economy.<sup>33</sup> In practice, the Treasury inevitably chooses the former. But the potential to use an American “floor” price as provided under section (a), which was emphasized by the amendments to the Anti-dumping Act contained in the Trade Act of 1974, is a significant departure from the Anti-dumping Code.<sup>34</sup>

For the state-controlled economy, where home market prices cannot be used for comparison, the difficulties involved in constructing a value based on prices in market economies—even when the law is applied as fairly as possible—can make a decision appear arbitrary. If the product subject to an anti-dumping investigation is a fairly standard product, produced by a wide selection of market economies bearing some similarity in economic development to the country under investigation, the chances for a less arbitrary determination are improved. If however, the product is unique, and producers in market economies are few, grave difficulties can ensue as was the case with Polish electric golf cars which were found to be being dumped in the United States despite the fact that there was *no* home (Polish) market for the product.<sup>35</sup>

Finally, U.S. legislation simply requires proof of injury, not the more rigorous standard, “demonstrably the principal cause of material injury” called for by the GATT Anti-dumping Code. Nor does the legislation require that causes of injury to the industry other than dumping be considered and weighed to the extent required by the Code. The net effect of the U.S. statutory divergence from the multi-lateral standard is an anti-dumping law that can be and is more readily invoked, that can more often result in anti-dumping duties, and that involves a high degree of uncertainty for the importer. Despite the relative ease of taking anti-dumping actions, in actuality not many cases have been taken against state-controlled economy countries. For example, of some 62 findings of dumping in effect in mid-1976, only six were against non-market economies.<sup>36</sup> Since 1970, only five anti-dumping cases have been initiated against NMEs. One was discontinued (on Czechoslovakian felt fur hat bodies). Three resulted in a finding of no injury (Polish cast iron soil pipe fittings, Romanian welt work shoes and Romanian sheet glass). Only one has been found to involve injury to a domestic industry (Polish golf carts).

<sup>33</sup> Section 321 of the Trade Act of 1974, P.L. 93-618, p. 70.

<sup>34</sup> The Austrian provisions establishing an Austrian floor price were presumably one of the reasons to establish a new authority for market disruption separate from the anti-dumping regulations.

<sup>35</sup> For a discussion of the implications of U.S. anti-dumping legislation for East-West trade see, Peter Buck Feller, “The Antidumping Act and the Future of East-West Trade.” *Michigan Law Review*, Vol. 66, 1967-68, pp. 115-140. In this 1967 article Feller states, “It would be difficult to deny that the legal, as well as conceptual, framework for dealing with dumped communist imports is less than satisfactory, and needs to be re-cast in anticipation of an increased volume of imports from East Europe.” (p. 132.)

<sup>36</sup> *Federal Register*, Vol. 41, No. 124, Friday, June 25, 1976.

*Countervailing duties*

While many countries carry anti-subsidy or countervailing duty legislation on their books, only the United States actively utilizes these provisions. For example, in 1975 a total of 38 countervailing duty cases were initiated. Of these, 14 resulted in affirmative decisions (in 5 of these cases the countervailing duties were waived), 9 received negative determinations, and 15 were terminated during the investigation.

United States countervailing duty law dates back to 1897 although the immediate statutory authority is the Tariff Act of 1930 as amended. This law provides that commodities receiving bounties or grants on the production, manufacture or export from the government of the exporting country shall be subject to the assessment of a duty equal to the net amount of the subsidy. Contrary to GATT provisions, under U.S. law, it is not necessary to prove injury when the items imported are dutiable.<sup>37</sup>

No countervailing duty case has been brought against a state-controlled economy country. However, there has been much thought given by the U.S. Treasury, which would be the agency conducting the investigation, as to how such a case might be handled. The procedure would probably involve constructing a cost of production, but would take into account known differences in factor costs in the state-controlled economy country. Although no countervailing cases have been initiated against CPE countries, the existence of these statutes, without an injury test for the majority of products of concern, provides additional potential for impeding imports from a centrally-planned economy. Further, for purposes of assessing a countervailing duty, it would be very difficult to measure the amount of a "subsidy" in a non-market economy where internal prices are an imperfect guide to actual costs. The question of countervailing duties has the potential to become a more important problem in the future as the CPE's follow increasingly aggressive marketing and export promotion policies.

*Escape clause*

The third generally protective measure which the United States can apply is the escape clause—Title II of the 1974 Trade Act (P.L. 93-618). This legislation, like the EC common rules for imports, provides the legal basis for taking GATT safeguard actions under Article XIX. The U.S. escape clause provides protection on a product basis, regardless of country of origin.

Two separate and distinct types of action can be taken under this legislation. One type is adjustment assistance for workers, firms, and communities upon the determination that increased imports of a like or directly competitive product contributed importantly to the separation of workers and to a decline in sales. The second type of action provided under this authority enables the President to impose import relief measures. Import relief measures can be initiated upon

<sup>37</sup> The U.S. countervailing duty (CVD) legislation shows an interesting example of how the grandfather clause functions. Because U.S. CVD legislation predated the GATT, it was exempted under the grandfather clause of the GATT protocol of provisional application. However, the U.S. CVD legislation only applied to dutiable items. When in the course of drafting the new trade legislation, which ultimately resulted in the Trade Act of 1974, it was deemed desirable to include duty-free items under the CVD regulations, an injury test had to be provided in order to conform to the GATT. Today, as a result, injury need not be proved with respect to a dutiable item, but must be proved with respect to a duty free item.

a determination that "an article is being imported into the United States in such increased quantities as to be a substantial cause of serious injury." Further, substantial cause is defined as "a cause which is important and not less than any other cause." (See Section 201 of the 1974 Trade Act, P.L. 93-618.) This is clearly a more difficult standard of injury than either the GATT Anti-dumping Code, or U.S. anti-dumping legislation. It is an injury standard roughly comparable to the EC common rules for imports which require "substantial injury."

The import relief which may be provided can take the form of: (a) an increase or imposition of a duty; (b) a tariff rate quota; (c) a quantitative restriction; (d) an orderly marketing agreement; or (e) any combination of the above. Detailed and specific constraints are placed upon the various actions which can be taken. (See section 203 of the 1974 Trade Act, P.L. 93-618.) Suggested import relief remedies are supposed to take into account any and all petitions and grants of adjustment assistance. Escape clause actions, under GATT regulations can be subject to retaliation by affected countries. Usually, rather than retaliation, however, compensation in terms of reduced tariff rates on other items is usually negotiated with the principal suppliers of the imports.

Escape clause investigations are handled by the International Trade Commission (ITC), which has six months following receipt of a petition to report to the President with recommendations. The President then has sixty days to decide on the type of relief. If the President's recommendations are different from those of the ITC, he must report immediately to Congress, which then has 90 days to disapprove the Presidential recommendations. In the event this should happen, the original ITC recommendations will go into effect within 30 days.

Since the escape clause was revised by the 1974 Trade Act, some eighteen cases were initiated between April 1975 and September 1976, in contrast to a total of 28 cases conducted under the old Trade Expansion Act of 1962. However, most of the cases taken up under the 1974 Trade Act, either received a negative determination by the ITC, or no import relief measures were ordered by the President. The most important escape clause actions initiated in 1975 and 1976 with a potential to affect East-West trade were cases involving footwear imports. Despite the concern engendered on the part of non-market economies exporting shoes to the U.S. market, the final outcome of these cases did not directly affect the non-market economies.

#### SPECIAL IMPORT PROTECTION—MARKET DISRUPTION

Finally, the United States has special legislative provisions for taking action against market disruption resulting from imports from communist countries.<sup>38</sup> A realization of the problems inherent in the

<sup>38</sup> Section 406, Trade Act of 1974, P.L. 93-618.

GATT system with respect to centrally-planned economies, combined with a realization of the difficulties of administering anti-dumping and countervailing duties with respect to non-market economies led U.S. legislators to include a special section in the 1974 Trade Act dealing with market disruption resulting from imports from communist countries. The Senate Finance Committee Report on the Trade Reform Act of 1974 (Report no. 93-1298) sets out the need to take special protective action with respect to imports from communist countries for the following reasons:

(1) The capability of state-controlled economies to disrupt the domestic market of the market economy through state control of the distribution and pricing systems;

(2) The capability of the state-controlled economy to disrupt within a shorter period of time than could a freemarket economy; and

(3) The need to be able to prevent undue dependence upon communist bloc suppliers (i.e. to maintain domestic production and/or assure non-communist suppliers of a continuing market share), especially in the area of vital raw materials.

The market disruption provisions apply to all communist countries regardless of whether or not they have been granted MFN. The definition of market disruption contained in Section 406 of the 1974 Trade Act is "significant cause of material injury" or "threat thereof." It requires a lesser amount of injury (material injury) than the provisions of the general escape clause (serious injury) before action can be taken and is therefore intended to be an easier test to meet. In addition, the language of the market disruption clause implies a more direct link to causation than the provisions relating to adjustment assistance. However, adjustment assistance was not made available as a form of relief under Section 406.<sup>39</sup>

Despite their intended special use, the market disruption provisions are in many ways similar to escape clause actions. (See Table 23.) The same types of relief are available under the market disruption provisions as under the escape clause. The major difference in the implementation of the two types of authority is that the timetables contained in the market disruption section are telescoped: the ITC must report to the President within 3 months (versus 6); the President can take emergency action prior to a final determination; and any orderly marketing arrangements negotiated must go into effect within 60 days (versus 90) of the final determination. In the first two years following the enactment of the market disruption provisions, no petitions were filed.

<sup>39</sup> Adjustment assistance is available, of course, to any group of workers, firms, or communities which can demonstrate that increased imports (regardless of the source) have contributed importantly to the separation of workers and to a decline in sales.

TABLE 23.—SUMMARY OF U.S. ESCAPE CLAUSE AND MARKET DISRUPTION REGULATIONS

Escape clause	Market disruption	
Practice directed against....	Injurious imports—importation in such increased quantities as to be a substantial cause of serious injury or threat thereof to a domestic industry.	Market disruption—rapidly increasing imports (absolute or relative) so as to be a significant cause of material injury or threat thereof to a domestic industry.
Remedy.....	<ol style="list-style-type: none"> <li>1. Increase or imposition of a duty.....</li> <li>2. Tariff rate quota.....</li> <li>3. Quantitative restriction.....</li> <li>4. Orderly marketing agreement.....</li> <li>5. Any combination of above.....</li> </ol>	Same as 1-5 listed under escape clause (applied only against products imported from Communist countries).
Legislative authority.....	Historically dates back to U.S. trade agreement with Mexico of 1942; Trade Agreements Extension Act of 1952, et al.; title II of 1974 Trade Act.	
Competent U.S. agency.....	ITC, and the President (Labor and Commerce for adjustment assistance applications).	ITC and the President (no adjustment assistance is available).
Proceedings initiated by....	Trade association, firm, recognized union, workers, industry representative, the President, STR, House Ways and Means Committee, Senate Finance Committee, ITC.	Same as escape clause.
Time limits on procedures..	ITC 6 mo to report to President with recommendations. President 60 days to decide on type of relief. If Presidential recommendations are different from ITC, must report immediately to Congress which has 90 days to disapprove his report. If Presidential recommendations are disapproved, ITC recommendations must be proclaimed within 30 days. Orderly marketing agreements must go into effect within 90 days of final determination.	Same as for escape clause except: ITC 3 mo to report to President. President can take emergency measures pending final determination, and orderly marketing agreements must go into effect within 60 days of final determination.
Applicability.....	All countries (nondiscriminatory).....	Communist countries only.

As can be seen, the United States has relied in practice on a denial of MFN and an active anti-dumping stance to protect itself against communist imports. These are by no means, however, the only tools available. Escape clause actions provide generalized protection against disruptive imports regardless of origin and the, as yet only potential, restrictions contained in countervailing duty regulations or the market disruption provisions of the 1974 Trade Act complete the selection of tools available to protect U.S. industries and workers.

### SUMMARY AND CONCLUSIONS

This paper has described the various import protection systems employed by selected Western countries. What generalizations can be made about these protective systems?

First, it can be said that none of the countries covered by this paper have left themselves defenseless.

Second, no country relies on a single instrument; all have several tools available to them.

Third, all the countries observed employ *ex ante* protection to varying degrees. The most restrictive of the types of *ex ante* protection are probably the discriminatory quantitative restrictions employed by the Western European countries, the denial of MFN by the United States, and the generally high Austrian tariff rate.

Fourth, all the Western nations covered by this paper maintain both general and special and protective systems against imports from state-controlled economies (although in the Austrian case this is not explicitly stated in the legislation). In no case are the general and special systems for imports mutually exclusive—in other words both general and special measures

can be employed against imports from state-controlled economy countries.

Fifth, an important feature of the various *ex post* protective systems is the degree of restrictive potential which has not yet been utilized. Given the number of instruments available both for general and special protection against communist imports, restrictive actions have been relatively restrained. Of course, this may be due partly to the protection provided prior to the fact of importation by the *ex ante* protective systems.

The central policy issues with respect to imports from communist countries are the proper mixes of *ex ante* versus *ex post* controls and fair trade practices versus injury criteria which will provide effective protection and, at the same time, permit trade to continue and expand. In the context of trying to maintain a liberal trade regime worldwide, the *ex ante* protective systems are probably the least defensible tools. Furthermore, as the trade behavior of the communist countries has probably been no more disruptive than the behavior of other traders, it is hard to demonstrate "special case" reasons to maintain *ex ante* restrictions against the state-controlled economy countries that are not maintained against other countries. In fact, recent years have witnessed a progressive reduction in the number of *ex ante* restrictions maintained against the communist countries, albeit at a slow rate.

*Ex post* restrictions involve more complicated issues. First, if *ex ante* systems were disbanded, there would have to be complete confidence that the *ex post* protective systems could be employed effectively, but with as little disruption to the overall conduct of East-West trade as possible. Import surveillance systems could play an important role in enhancing the effectiveness of *ex post* systems. However, when an automatic licensing system, which is primarily used for surveillance purposes becomes less than automatic, a new *ex ante* protective system has been established. Therefore, surveillance systems should be carefully limited in scope.

Secondly, the current patchwork of *ex post* systems—some multilateral, some bilateral, some unilateral, some applying a fair trade practices standard, some employing an injury criterion, some merging elements both of injury and fair trade practices—makes it very difficult to sort out how protection should be provided.

It seems to the author that the fair trade practices standards really have no relevance when dealing with imports from communist countries. The nations of today's world subscribe in varying degrees to either the competitive market economy concept or the centrally-planned and state-controlled economy concept, although no "pure" forms exist. While many countries have adopted elements of both, the communist countries have generally placed little reliance on prices set by market forces. It does not seem to be reasonable, therefore, either in theory or as actually practiced in anti-dumping or countervailing investigations, to attempt to apply market economy standards of behavior to non-market economies. The problem with abandoning market economy standards, however, is that relieving state-controlled economies from being subject to anti-dumping and countervailing actions without providing an effective alternative means of control would actually discriminate against Western traders who would still be subject to these tests. An additional problem with removing non-market economies from being subject to anti-dumping and counter-

vailing actions would be how to deal with those non-market economies which are evolving along market economy lines.

It could be argued that the GATT system should replace the multiplicity of tools and varying criteria which apply to both market economies and non-market economies with some form of an injury spectrum concept for protective actions. In actuality, this is how the current system usually works. For example, under GATT, anti-dumping and countervailing require a lesser standard of injury than do escape clause actions. Market disruption actions taken by various nations usually fall somewhere in between anti-dumping and escape clause actions on the injury spectrum. However, the new emphasis would be on injury and the causal link to injury, rather than on the practice or circumstances calling forth the restrictive action. Such a standard could be applied with equal ease to market or non-market economies, since it would rely on an internal, not an external standard. If it were deemed necessary to provide special protection against non-market economies because of their alleged potential to be disruptive, a lower standard of injury could be applied, or a faster procedure for taking action could be provided.

A move toward and emphasis on injury would require a formal recognition that nations do have a legitimate right to provide temporary, minimal protection, carefully constrained by multilateral considerations, for injured industries regardless of circumstances giving rise to that injury. This differs from the concept central to free trade theory that protective measures are not really legitimate because they limit the ability of nations to benefit from the comparative advantages available under free trade. The present GATT system has accepted this free trade logic (which is harmless enough in itself) and has established standards which no nation has managed to live up to, and from which there are increasing derogations. The result has been an agreement honored more in the breach than in the observance.

Despite the difficulties inherent in the GATT provisions for import protection, both generally and with respect to state-controlled economy countries, it is not likely that a major overhaul of the GATT will be accomplished in the foreseeable future. However, there are several adjustments in U.S. procedures which may be practical and desirable. One change which should be made is to increase the flexibility of U.S. anti-dumping regulations so that where information on costs and efficiencies in the nonmarket economy is available and deemed reliable, it could be used in the dumping determination.

It would also be helpful if U.S. anti-dumping regulations were to conform more closely to the international standard, both in terms of the procedures used and the definition of injury. As demonstrated by the U.K., the international standard provides ample protection when actively pursued. Countervailing duty regulations should also be brought up to the international standard by the insertion of an injury test for dutiable items. The net effect of these suggested reforms in the anti-dumping and countervailing areas would probably be to make market disruption actions under Section 406 of the Trade Act the preferred means of dealing with communist imports. Currently, anti-dumping is the most attractive route because the lack of flexibility in the law tends to encourage the assessment of dumping duties, and since it involves a lower standard of injury.

Market disruption actions theoretically have several advantages over anti-dumping, both for the U.S. industry and the communist exporter. The first of these is the speed with which actions can be taken, and the second is the flexibility in the type of relief provided which can be more readily tailored to the needs of the industry.

Dumping duties may be attractive on first glance, but sometimes so much time passes before the duties are actually assessed that they are of little help to an industry struggling with an immediate problem. In addition, market disruption actions do not get caught up in the web of whether a given export practice is "fair" or "unfair". The only relevant test is whether the imports in question have been a significant cause of material injury. Finally, market disruption actions more readily permit ongoing consultations with the exporting country and can better accommodate its interests as well.

It could be reasonably argued that the present U.S. system provides more protection against imports from communist countries than is necessary. Certainly, the present system is needlessly complex and legalistic. The changes in U.S. practices suggested here could help to improve the functioning of the import control system as applied to the nonmarket economies without impairing the nation's ability to take effective action when necessary.

In the U.S., and in other Western nations, a proper balance will have to be struck between the rightful need on the one hand, of industries and workers for a minimum of protection and, on the other hand, the more general benefits to the economy as a whole provided by the increased selection and lower prices resulting from open access to the home market. As imports from communist countries increase in volume and value, as indeed they must if East-West trade is to continue a long-term expansion, the issue of Western import control policy will become increasingly critical to the mutually beneficial development of two-way trade.

## 1. INTRODUCTION

In the first half of the 1970's, industrial cooperation became one of the catchwords of East-West relations, achieving prominence in the new vocabulary of detente. In the East it has even been the object of what might be regarded as a "campaign": its desirability has been clearly signalled in repeated policy statements of the leadership; and it has been promoted by a series of institutional measures, including the creation of special incentives and the establishment of new agencies designed to cut through bureaucratic impediments.

The purpose of this paper is to examine the phenomenon of East-West industrial cooperation (EWIC) in the form of a general survey.

\*Director, Institute for Soviet and East European Studies and professor of economics, Carleton University, Ottawa, Canada.

EWIC encompasses a wide variety of organizational and functional forms. We shall be exploring a subject which is inherently diverse, across a range of seven Eastern European, and more than twice that many industrial Western, economies. In a paper of the present scope, EWIC can therefore only be examined in broad outline, and at a relatively high level of generalization. Frequent references will be made to the rapidly growing volume of literature on the subject for the benefit of readers who wish to follow up specific aspects.

To narrow the topic to more tractable dimensions, while still capturing what we would regard as its essence, we shall deliberately emphasize certain features more than others. We shall stress what is often called "inter-firm cooperation"—EWIC (inter-firm)—cooperative relationships which occur at the level of the enterprise, or firm.<sup>1</sup> Nevertheless, some mention will be made of inter-governmental arrangements—EWIC (inter-government)—which not only provide the framework for inter-firm cooperation but also for cooperative activity at the governmental level. Inter-governmental agreements provide official sanction and support for cooperation at the enterprise level and frequently establish mixed commissions and joint working groups to designate fruitful areas of activity and to match potential partners. Table 1 shows that the network of bilateral agreements for economic, industrial, scientific and technical co-operation was 87% complete in the second half of 1975. In the remainder of this paper, EWIC without qualifier will be used to denote EWIC (inter-firm).

<sup>1</sup> Economic, industrial, and technical (applied science and technology) cooperation agreements.

Source: Based on U.N. ECE, "Practical Measures to Remove Obstacles to and to Promote and Diversify Trade", Oct. 19, 1976 (Trade/R. 334).

EWIC is also generally defined to include joint equity ventures between Eastern enterprises and Western firms. We shall incorporate them in the broad framework of the paper, but shall devote a minimum of attention to them. Our focus will be on non-equity forms of inter-firm cooperation.

In keeping with the theme of this volume, the experience of the Eastern European countries (especially the six Eastern European members of the CMEA) will be the main object of our attention.

<sup>1</sup> In the East-West context, inter-firm cooperation is usually defined as involving at least one partner at the enterprise level, normally on the Western side.

Occasional reference will be made to the Soviet Union, for purposes of comparison and because of the important inter-relationship which exists between the policies and experience of the Soviet Union and those of the Eastern European countries. For more detail on EWIC in Soviet policy and practice, however, the reader is referred to several papers in the preceding, 1976 JEC compendium on the Soviet economy.<sup>2</sup>

The next section of this paper will deal with concepts and definitions. The fundamental nature and characteristics of EWIC will be examined and then the problems of translating the concept into an operational definition will be discussed. Varying Eastern and Western definitions will be presented and explained. A third section will summarize quantitative evidence on the overall dimensions of EWIC. In Section 4, the principal functional attributes of EWIC will be explored in turn. The analysis will seek to demonstrate its wide-ranging significance and to reveal the variety of factors motivating the establishment of cooperative relationships. In Section 5, individual Eastern country approaches and experience will be explored. A final section will review the major conclusions to be drawn from experience to date, briefly discuss trends and outline current policy issues posed by the continued evolution of EWIC.

## 2. CONCEPTS AND DEFINITIONS

International industrial cooperation enjoys no generally accepted definition. Deficiencies of definition are in part a reflection of the newness of the subject. Because of its range and complexity, however, EWIC presents fundamental problems of conceptualization. This section will first seek to delineate the concept of industrial cooperation and then explain difficulties in translating the concept into an operational definition.

The impatient practitioner may question the concern for definition, but in fact the matter is of considerable practical importance. The absence of definition not only reflects our limited understanding but contributes to it, by restricting analytical progress. Without definition, when we generalize from individual cases, we risk serious misunderstandings and tend to talk at cross purposes. Considerable semantic confusion has in fact arisen in the growing literature on the subject, with terms such as "industrial cooperation", "production sharing", "coproduction" and "joint ventures" used at times interchangeably and at others to indicate differentiable forms. (Increasingly, however, industrial cooperation has become the generic term for a type of relationship which may occur at various levels, and the remaining terms have been reserved to denote variants of it, usually at the enterprise level.) Without definition, efforts to quantify the meaning of EWIC and to measure its dimensions are severely hampered, and results are rendered non-comparable if not incomprehensible. Moreover, without adequate definition, policies seeking to stimulate or regulate EWIC cannot be effectively formulated and implemented.

<sup>2</sup> Smith (1976) and Theriot (1976).

*The concept.*<sup>3</sup>—The term cooperation itself carries no precise meaning and is even misleading in the context at hand. It is often not fully appreciated that what is at issue is not a function or activity, but an institutional relationship. EWIC should therefore not be juxtaposed with such international functional categories as “trade” and “investment”, but with fundamental international institutional mechanisms, such as the “market” and the “firm”. Activities such as trade and investment may be undertaken through all three basic institutional mechanisms.

In line with this approach, EWIC is defined by this writer as constituting arrangements whereby individual producers, based in East and West, agree to pool some assets and jointly to coordinate their use in the mutual pursuit of complementary objectives. The assets pooled under the arrangement may be tangible and intangible: plant, capital equipment, technology, and know-how. Some may be transferred between the partners; others may remain in place. The pooling of assets may or may not involve the partners in formal equity ties. Coordinated use of assets may therefore be on a fee basis or may be according to an income-sharing scheme. Coordination may be accomplished informally, through *ad hoc* consultation or may be further institutionalized through the creation of a formal joint body for the purpose, possibly even through the founding of a new, mixed equity company. The activities coordinated may extend beyond production to related activities, such as resource development, capital expansion, research and development, financing, marketing and distribution.

The complex range of forms and activities encompassed by the cooperative concept is readily apparent from this definition. Nevertheless EWIC is a conceptually identifiable and differentiable phenomenon. Cooperative associations among producers are familiar in the domestic sphere (agricultural cooperatives for production and marketing are an example). In the international sphere we find firms adopting similar patterns, and organizing their interaction in ways which are essentially different from their relations through the market or within the framework of a centralized, multinational firm. As a mechanism for the international coordination of relations among producers, cooperation is intermediate to the market and the firm. It is in a sense a hybrid, combining attributes of both of the other two mechanisms, to which it can be regarded as a basic institutional alternative.

Like union in a multinational firm, cooperative association permits direct, extra-market coordination of designated activities. In the firm or the cooperative, intra- or inter-firm, planning, control and accounting are conducted within the framework of internalized institutional arrangements which substitute for the market-price mechanism. Under cooperation, however, this substitution is less complete, and the parties continue to conduct an important share of their relations through the market. Moreover, cooperating firms retain their separate legal and commercial identities and essential operational autonomy to a degree which distinguishes them from the units of a single multinational firm.

<sup>3</sup> This section draws on a recent paper by the author. See McMillan (July, 1976) for further argumentation.

Nevertheless when they choose to pool certain assets for coordinated purposes under the provisions of a cooperation agreement, the parties consciously impose restrictions on their autonomous rights to use, derive income from, and dispose of, these assets. For this reason cooperation involves complex property rights arrangements which create an interdependence among firms qualitatively different from, if not necessarily quantitatively greater than, the interdependence generated through market relations. Cooperative and market relationships differ in other ways as well. The buyer-seller, user-supplier dichotomy characteristic of market relations tends to blur when there is a pooling of capabilities in a joint endeavor. In contrast to the isolated, often non-recurring, transactions of the marketplace, cooperation is inherently of a continuing nature, often linking firms for an indefinite period. Cooperation agreements encompass a broader range of activities than do most market transactions and often extend coordination directly to operations (production, research and development) which are only indirectly coordinated by the market.

These considerations can be summarized in the following characteristics of EWIC:

1. EWIC associates Western firms and Eastern state enterprises in arrangements through which they agree to pool certain of their capabilities in a common endeavor.

2. Such arrangements typically cover a set of complementary activities and extend directly to line production operations, as well as to related activities such as capital expansion, research and development, financing, marketing and distribution.

3. In contrast to the isolated transactions of the market place, EWIC requires continuing commitments and obligations from the partners. Agreements are therefore generally long-term, and not infrequently made for an indefinite time period.

4. Joint activities are coordinated and enforced by the terms of an inter-firm agreement, periodically modified and extended through direct negotiation and consultation. Coordination through direct inter-firm agreement contrasts with the indirect, impersonal coordination of the price mechanism, in the case of market relations, and with coordination by fiat of a central managerial authority, in the case of intra-firm relations. Typically no special organizational machinery for coordination is established in EWIC; the exception are the joint management boards created in the still relatively infrequent case of joint ventures, or mixed companies.

5. EWIC does not generally establish formal equity links between the partners (again with the exception of joint ventures). Complex inter-firm distributions of property rights result, involving the separation and attenuation of rights to use, derive income from and dispose of the pooled assets. EWIC thus increases the institutional flexibility through which proprietary rights may be exploited internationally.

6. EWIC agreements demonstrate a strong evolutionary tendency. Not only does EWIC frequently evolve from market relationships between firms, but it tends to progress from arrangements of a near-market character through forms of association which increasingly assume aspects of the organization of relations among units of a decentralized multinational firm.

*Operationalizing the concept.*—Translating these conceptual distinctions into operational criteria poses a number of practical problems. Operationalizing the concept is rendered especially difficult by the intermediate and hybrid nature of EWIC. The various forms of cooperation are stretched along a continuum which extends from market relations on the one hand to intra-firm relationships on the other. There is therefore the problem of delimiting cooperation from both. Moreover there are a large number of variants and sub-categories within the cooperative spectrum, and they combine in varying ways elements of both the market and the firm. It is not surprising that in these circumstances progress towards a fully operational, generally acceptable, definition of cooperation should be slow.

Several typologies have been constructed which have helped very much to identify and clarify the forms of cooperation.<sup>4</sup> Table 2 lists, and briefly defines the forms usually included. It cannot be sufficiently stressed, however, that in practice almost every cooperation agreement is unique in its arrangements. Few fall neatly within the classifications of such typologies, most spanning several. The fundamental weakness of these classification schemes is that they mix functional and institutional characteristics.

Operational definitions of cooperation vary according to where they draw the lines between cooperation and intra-firm relations and between cooperation and market relations. Because direct foreign investment has been severely limited in East-West relations, the line between the former pair is less contentious. However even in East-West relations the problem is not entirely absent. How, and where, for example, does one draw the line between the activities of multinational socialist enterprises and those of joint East-West equity ventures in the West, since the latter are usually included in definitions of EWIC?

It is in the area of distinguishing EWIC from large-scale transactions, involving transfers of capital and technology, where most operational problems of definition have arisen. Cooperation is frequently defined as encompassing agreements which "go beyond traditional, straightforward, arms-length transactions". But what transactions may be regarded as "straightforward" and "arms-length" and what constitutes "going beyond" them? In particular, an increasing number of East-West transactions involve the transfer of productive equipment and technology in the form of entire production "systems". Should contracts of this nature, which package a variety of elements, and may take a number of years to consummate, be defined as "cooperative"? The conceptual approach outlined above would suggest that they be regarded as complex forms of market transactions; on the other hand they are classified under the heading of cooperation in the terms of a number of East-West inter-governmental agreements.

East-West contracts for the transfer of plant, equipment and technology have increasingly entailed at least partial repayment in the resulting, or a related, product. East-West licensing agreements often specify the terms for future market sharing (perhaps in addition to product-payback features). Both product-payback and market-sharing entail a certain degree of inter-firm coordination of the future

<sup>4</sup> UN ECE (1973) and St. Charles (1974).

use of the capital and/or technology transferred under the agreement. Should they constitute sufficient conditions for classification as EWIC, even if turnkey plant sales and licensing agreements *per se* do not? If so, how are resulting or related product to be defined, and what degree of market sharing is required?

These are some of the problems of establishing a rigorous operational definition of EWIC which have plagued experts in both East and West, and have prevented them from reaching a definitional consensus. What needs to be stressed is that, at this juncture, there exists no single, internationally accepted definition of EWIC, nor even a standard Western or standard Eastern definition. Instead several, broader and narrower, definitions are used on both sides (national government agencies tend in East and West to prefer broader definitions). We shall have more to say about individual Eastern country definitions in Section 5 below. The definition of EWIC is inevitably linked to the principal objectives perceived to be attainable through it.

The dimensions of some of the principal definitions used in East and West are indicated in Table 2. Unless otherwise specified, all data reported in this paper will be based on definition B of Table 2.

### 3. OVERALL DIMENSIONS OF EWIC

Quantitative studies on EWIC are still in the pioneer stage.<sup>4</sup> A necessary first phase in any attempt to quantify the concept of EWIC has been to determine its overall dimensions and the broad outlines of its structure. In this section we shall examine the picture which has begun to emerge from several initial research efforts.

#### *Problems and Limitations of Measurement*

Statistical analysis has been shackled with a number of conceptual and practical difficulties which have slowed progress and limited results. Most fundamentally, quantitative research has been hampered by the absence of a standard definition of cooperation; and results have often not been readily comparable. The usefulness of much data has been further limited by the failure to specify precisely the nature of whatever definition was used in deriving them.

Clarifying the definition by no means solves the problems of measurement. Accurate classification requires fairly detailed knowledge of a given arrangement and such information is generally not readily or systematically available. No Western governments require registration of EWIC agreements, and Eastern registries, when they exist, are not made public. Individual researchers are therefore forced to compile their own statistics from scattered data.

The information problem makes it often difficult to establish whether an agreement falls within a given definition of EWIC. It makes it practically impossible to classify EWIC agreements further, by major types. Any such statistical breakdown is rendered the more difficult by the fact that agreements are complex and do not fit neatly into simple classification schemes. Statistical classifications by type should therefore be interpreted with particular caution.<sup>5</sup>

<sup>5</sup> Since agreements in practice incorporate several forms, some analyses classify an agreement by the "highest" form incorporated, but this obviously makes the results difficult to interpret. For example, production contracting on the basis of a license subsumes licensing with payment in product, but classification under the former results in an underestimate of the latter. One solution is to analyze component elements of agreements rather than to classify entire agreements. See Table 4 below.

TABLE 2.—Types of contractual arrangements included in different definitions of East-West industrial (inter-firm) cooperation<sup>1</sup>

1. Sale of equipment for complete production systems, or "turnkey" plant sales (usually including technical assistance).
2. Licensing of patents, copyrights and production know-how.
3. Franchising of trademarks and marketing know-how.
4. Licensing or franchising with provision for market sharing and quality control.
5. Cooperative sourcing: long-term agreement for purchases and sales between partners, especially in the form of exchanges of industrial raw materials and intermediate products.
6. Sub-contracting: contractual agreement for provision of production services, for a short-term and on the basis of existing capabilities, but often to design specifications furnished by the contractor. Some or all components also frequently supplied by contractor.
7. Sale of plant, equipment and/or technology (1-3 above) with provision for complete or partial payment in resulting or related products.
8. Production contracting: contractual agreement for production on a continuing basis, to partner specifications, of intermediate or final goods to be incorporated into the partner's product or to be marketed by him. In contrast to sub-contracting, production-contracting usually is on the basis of a partially transferred production capability, in the form of capital equipment and/or technology (on basis of a license or technical assistance contract).
9. Co-production: mutual agreement to narrow specialization and exchange components so that each partner may produce and market the same end product in his respective market area. Usually on the basis of some shared technology.
10. Product specialization: mutual agreement to narrow the range of end products produced by each partner and then to exchange them so that each commands a full line in his respective market area. In contrast to cooperative sourcing, product specialization involves adjustment in existing product lines.
11. Co-marketing: agreement to divide market areas for some product(s) and/or to assume responsibilities for marketing and servicing each other's product(s) in respective areas. Joint marketing in third markets may be included. Does not in practice stand alone, unless in the form of a joint marketing company (i.e., combined with 14 below). Otherwise combined with various forms, especially 4, 8, 9, 10.
12. Project cooperation: joint tendering for development projects in third countries.
13. Joint research and development: joint planning, and the coordinated implementation, of R&D programs, with provision for joint commercial rights to all product or process technology developed under the agreement.
14. Any of the above in the framework of a specially formed mixed company or joint venture between the partner firms (on the basis of joint equity participation, profit and risk sharing, joint management).

MAJOR APPLIED DEFINITIONS OF EWIC, ON THE BASIS OF THE ABOVE

- A. *Broad definitions* encompass all, or nearly all of the 14 types. The Soviet definition seems to include all, as does the definition used in the study prepared for the US Department of Commerce by Marer et al. (1975). The broader Eastern European official definitions include all but type 1.
- B. *Intermediate definitions* encompass types 6 through 14. This is the definition established by the United Nations Economic Commission for Europe and used by the author.
- C. *Narrow definitions* tend to concentrate on types 8 through 13.<sup>2</sup> Individual researchers in both East and West have sometimes preferred to adopt a narrow definition in their work on EWIC.

<sup>1</sup> The terminology used here is not standard, and the types are variously designated in the literature. For example, the term "production-sharing" is sometimes used to designate all or some of types 8 through 10. For more extensive definition, discussion and illustration of the many types of arrangement included in this table, but using somewhat different terminology, the interested reader is referred to the U.N. ECE (1973) and to St. Charles (1974).

<sup>2</sup> In Eastern Europe, a distinction is *sometimes* made between "economic cooperation" which could involve any one of the types of arrangement covered in Table 2 and "industrial cooperation" which is based on three core elements: specialization in production, transfer of technology and cooperation in marketing. According to this approach, industrial cooperation would have to include *at least one* of types 8 or 9 plus 11. Economic cooperation tends to be used more in a macro-economic context and may include government programs; industrial cooperation has here a micro-economic connotation.

A more fundamental problem faced is what basic measure to use. How can one express in concise form the magnitude of a complex set of activities which extend into an uncertain future? Once one does decide on one or more key variables, there are inescapable problems of valuation: some data may be available only in Eastern domestic prices, others only in transfer prices; and both forms of administered prices can be regarded as unsatisfactory standards. Furthermore at what exchange rates are component activities, priced in different currencies, to be homogenized?

The volume of merchandise trade conducted under cooperation agreements has been used as one measure, especially in Eastern Europe. Since 1972, the Polish statistical agency has recorded trade data by this criterion, and has occasionally made public statistics based on these data (see Section 5 below). The recording procedures have not been explained, however, and it would seem to be extremely difficult in practice to separate trade attributable to cooperation from other trade flows between a set of partners. Even if such trade can be statistically isolated, it is an inadequate measure of EWIC. There is no *a priori* reason to expect a positive correlation between the degree of cooperation and the volume of trade between partners. To the extent that cooperation is a substitute for direct investment, it may similarly displace trade. A transfer of technology abroad for cooperative use may substitute for exports. Cooperation based on market-sharing and on joint R&D may also occur without any necessary increase in exchanges of goods between the partners.

The value of resources pooled for cooperative purposes is a conceptually more attractive measure. In practice, the information required to apply such a measure is generally not available. If firms do record the share of productive assets devoted to cooperative activities, these data are not made public. Even if one could determine the separate recorded value of all cooperative activities occurring within an arrangement in a defined period, one would fail to capture their mutually reinforcing character: coordination of activities through an EWIC agreement is intended to ensure that the combined effect exceeds the sum of the parts. When cooperation is further institutionalized in a joint venture, the value of assets may be more easily obtained, but such arrangements remain relatively rare in Eastern Europe. Even in these instances, the capitalized contributions of the partner firms can fail to capture the full value of the arrangement.

Given these practical limitations, statistical analyses of EWIC have settled for the simple expedient of using numbers of agreements as the basic measure. This is obviously a poor reflection of their economic significance. It is a more meaningful measure of the significance of EWIC as an international institutional form which East-West partners may choose over alternative relationships.

Even measurement in numbers of agreements is not without difficulties, apart from the severe information problem already cited. What, for example, constitutes one agreement? Often various aspects of a single arrangement may be formulated in different inter-firm contracts, written or verbal. The participation of more than one partner on each side may also lead to double counting. Moreover, the drive which most Eastern European governments instituted in the 1970's to promote EWIC has created pressures for the over-classifica-

tion of agreements. Governmental preferences have not only led to the adoption of broad official definitions of EWIC, but have created positive incentives for enterprises and firms to classify their arrangements as "cooperative"—often with more imagination than justification.

*The Estimated "Universe" of EWIC Agreements*

While official Eastern statements make periodic reference to the total numbers of "cooperation" agreements signed with Western firms, they seldom provide sufficient accompanying information about what is covered in these statistics to permit useful interpretation. Nor have Western governments published systematic data. In the absence of meaningful and comparable national statistics, the U.N. Economic Commission for Europe has attempted to fill the gap through its own research efforts.<sup>6</sup> In early 1973, it published a major study on EWIC, with a short statistical section, and has sought to up-date the record in several subsequent reports.<sup>7</sup>

Based both on material supplied by member governments and on information gathered independently, the ECE presented in its 1973 Analytical Report the first quantitative outlines of East-West industrial cooperation. Its estimate of a universe of some 600 EWIC agreements in force at the beginning of 1973 has been widely quoted. It is important therefore to understand what this estimate covers. It includes agreements falling within the definition of EWIC established by the ECE in the *Analytical Report*, and which accords generally with definition B given in Table 2 above.<sup>8</sup> The 1973 ECE estimate covers not only inter-firm agreements, however, but also framework agreements between Eastern administrative organs and Western firms (such as the well-known protocols signed by the USSR State Committee for Science and Technology with several hundred Western firms). It also includes mixed East-West companies (joint equity ventures) established in both East and West. The estimate (presumably) includes all such agreements between partners in the USSR and Eastern Europe (including Yugoslavia) on the one hand, and in Western Europe and North America on the other.<sup>9</sup>

In a later (1975) statistical report on the state of industrial cooperation, the ECE makes reference to "certain recent estimates" according to which "the number of East-West industrial cooperation contracts concluded to date is approximately 1,000."<sup>10</sup> The ECE report does not explain nor state the source of this estimate, but a contemporary U.S. Department of Commerce publication, states that "Based on data developed earlier by the United Nations Economic Commission for Europe (the *Analytical Report*) one unofficial source has estimated that there are probably now more than 1,000 such East-West arrangements in existence, involving virtually the entire spectrum of Western industry."<sup>11</sup> The Indiana University

<sup>6</sup> In the absence of an official international registry, the ECE has maintained an unofficial registry as a data base for its analytical studies.

<sup>7</sup> UN ECE (1973), (1975) and (1976).

<sup>8</sup> The rigor of the UN definition is weakened by the added statement that it includes "contracts . . . which have been identified as industrial co-operation contracts by Governments in bilateral or multilateral agreements" (UN ECE, 1973, p. 2).

<sup>9</sup> Unfortunately, the *Analytical Report* leaves aspects of its methodology unclear, and the estimate is not broken down by country or category.

<sup>10</sup> UN ECE (1975, p. 3). This reference is repeated in the ECE's 1976 report (p. 2).

<sup>11</sup> U.S. Department of Commerce, *The United States Role in East-West Trade, Problems and Prospects*, August, 1975, pp. 12-13.

study on U.S. involvement in East-West industrial cooperation also cites the 1,000 estimate.<sup>12</sup>

Table 3 presents the results of efforts by the author to clarify the universe of EWIC agreements as of the end of 1976. The global estimate is broken down into three broad categories: framework agreements, non-equity cooperation agreements and joint equity ventures. Breakdowns by Eastern country are given under each category. With the few exceptions indicated, the estimates are based on EWIC agreements individually documented from a wide variety of published and unpublished, official and non-official sources.<sup>13</sup>

The estimates are of agreements reported as concluded; the information available does not permit estimation of how many are actually in force. It is also impossible to estimate how many agreements have gone unreported or have otherwise been missed, but considerable effort has been made to ensure that the count is as complete and accurate as possible.

Coverage in Table 2 is deliberately based on the parameters of the 1973 ECE study in order to provide comparability with UN estimates. The ECE definition of cooperation has been applied,<sup>14</sup> and country coverage is similar except for the inclusion of Japan (which, however, only serves to raise the total by an estimated 4%.) The Table 3 grand total, as of the end of 1976, considerably exceeds the 2,000 mark. If the Table 3 totals for individual Eastern countries are below some official Eastern claims, it should be remembered that the latter are based on a broader definition than that which underlies the Table 3 estimates. It should be borne in mind that the figures are cumulative totals of agreements concluded, and that there is no way of accurately estimating what proportion remain active. There is in fact reason to believe that significant numbers of agreements concluded have never been fully implemented or have fallen dormant.

Table 3 shows that the Eastern countries differ rather markedly in terms of their participation in broad categories of EWIC. The USSR is seen to dominate category I, because of the large numbers of protocols signed with Western firms by the State Committee for Science and Technology.<sup>15</sup> Their inclusion significantly raises estimates of Soviet participation in EWIC. The Eastern European countries have had far less recourse to framework agreements concluded with Western firms at the ministerial level. They have apparently regarded inter-governmental cooperation agreements as generally providing a sufficient official umbrella for the conclusion of substantive arrangements with Western corporate partners.

Three Eastern European countries, Yugoslavia, Hungary and Poland, stand far ahead of the others in numbers of more specific agreements with Western firms for non-equity forms of cooperation (Category II). They are followed by an intermediate group composed of Romania, the USSR and the CSSR, with Bulgaria and the GDR at the lower end of the scale. This ranking suggests a positive correlation between degree of participation in EWIC, East-West trade orientation and reform of the traditional foreign trade mechanism. The factors determining the extent of individual country participation will be discussed in Section 5 below.

<sup>12</sup> Marer et al. (1975, ch. 4, p. 21).

<sup>13</sup> There is reason to believe that the estimates have been biased upwards by the inclusion of data on Yugoslav and US agreements from other sources (see footnote 3, Table 3), because these data are based on a broader definition, although they have been roughly adjusted to accord with the definition underlying Table 3.

Yugoslavia, with the oldest (1976) joint venture legislation and its market socialist economy, has attracted the most equity investment from the West. In Romania and Hungary, joint ventures have progressed slowly since the Fall of 1972, when both countries passed enabling decrees. By the end of 1976, no joint ventures had been

<sup>1</sup> All agreements are between Eastern economic organizations and Western firms; no intergovernmental EWIC agreements are included. No information is available on Albania's participation in EWIC and it is presumed to be nil. Partners to the agreements included in this table are located in the following Western countries: Austria, Belgium, Canada, Denmark, Finland, France, FRG, Italy, Japan, Netherlands, Norway, Spain, Switzerland, United Kingdom, and United States.

<sup>2</sup> Definition of categories:

I. General agreements: Agreements or protocols with Western firms, establishing intent to cooperate and broad conditions for cooperation, but not containing specific terms of cooperation. Thus these are "umbrella" agreements under which substantive, followup agreements are concluded between the partners.

II. Specific agreements: Agreements establishing relationships covered by types 7 through 13 of table 2.

III. Agreements of type 14 of table 2.

<sup>3</sup> With a few exceptions, the figures given are the total numbers of cases individually documented by the East-West project, Institute of Soviet and East European Studies, Carleton University, Ottawa. Documentation of these cases is based on lists of agreements provided by official and nonofficial organizations (in East and West) and on published reports, adjusted to comply with definition B of table 2. Exceptions are: (a) Estimates of framework agreements concluded by the U.S.S.R., which are based in part on figures published by the U.S.S.R. State Committee for Science and Technology, (b) those portions of the estimates representing agreements with U.S. partners, which are based on the findings of an Indiana University research project, adjusted to the ECE definition (Marer et al., 1975, ch. 4), (c) the figures for Yugoslavia under categories II and III, A are based on an official Yugoslav submission to the United Nations and are not fully comparable with the other country figures in this table, since they do not conform exactly to the ECE definition and represent agreements with foreign partners generally, as of mid-1976. (U.N., ECE, Trade/AC.3/R.8/add.2, Sept. 24, 1976.) The estimate for Yugoslavia under category III, B is based on several secondary, Western and Eastern sources. (See McMillan, 1977, p. 6.)

<sup>4</sup> Not available.

established in Poland under its brand-new regulations, but joint venture negotiations with several Western firms were reportedly well underway in early 1977. Soviet activity in mixed companies in the West is noteworthy; the relative participation of the Eastern European countries under category IIIB is in closer accord with their participation in other categories of EWIC in Table 3.<sup>16</sup>

### *The Structure of EWIC Agreements*

Insufficient information is available on many of the agreements covered in Table 3 to permit a systematic, detailed analysis of the universe of EWIC agreements. Two surveys undertaken on an international, and two on a national, scale have, however, helped to reveal at least the broad outlines of the EWIC phenomenon, on the basis of sample data.<sup>17</sup> In the following paragraphs we shall summarize some of the principal statistical findings of these surveys, concentrating especially on the ECE and Carleton studies, since they are the broadest in coverage and most comparable in method. This necessarily brief summary will be restricted to the overall characteristics of EWIC; structural features associated with individual countries will be discussed in Section 5 below.

Both the 1975 ECE study (of a sample of 207 agreements) and the Carleton survey (of a sample of 218 agreements) analyze the structure of EWIC as of early 1975.<sup>18</sup> Both analyses apply the same definition of EWIC and focus on the range of agreements designated as category II in Table 3.<sup>19</sup> Both cover the same set of Eastern countries (those listed in Table 3 less Yugoslavia, which the ECE treats separately and Carleton excludes). They also cover the same Western countries, with one important exception: the ECE sample includes the US, while the Carleton study does not.<sup>20</sup> Neither study can claim that its sample is necessarily representative, although both of the samples investigated represent substantial shares (over half) of the estimated universe of agreements, as defined, in early 1975.<sup>21</sup> On the other hand, since the samples were compiled independently, the validity of any similar findings is reinforced.

<sup>14</sup> With the exception of the "loophole" in the UN definition (described in footnote 8, above) which could not be systematically adjusted for.

<sup>15</sup> These are described and analyzed by Theriot (1976).

<sup>16</sup> Category IIIB agreements have been explored by the author in a recent, unpublished paper: McMillan (1977).

<sup>17</sup> These studies were conducted by the following groups, and their findings reported as indicated. Research conducted by the Secretariat of the ECE; reported in UN ECE (1973, 1975 and 1976). Survey carried out by the East-West Project, Institute of Soviet and East European Studies, Carleton University, Ottawa; findings initially reported in McMillan (June, 1976), and since slightly revised, as reflected in the present paper. Survey on US participation conducted by International Development Research Center, Indiana University, Bloomington; reported in Marer et. al. (1975). Study on FRG participation conducted by HWWA-Institut, Hamburg; reported in Bolz and Plötz (1974).

<sup>18</sup> The ECE studies are based on material compiled by the secretariat from enterprise interviews and from published sources. The Carleton study is based on questionnaires completed by the Western partner firms covered in the sample, and on interviews with participating Western firms and Eastern enterprises. Although the ECE updated its 1975 analysis on the basis of a larger sample of 298 agreements in 1976, it has seemed more appropriate to compare the 1975 ECE study with the Carleton findings, because they cover the same time period. The 1976 ECE updating did not significantly affect any of the findings summarized here.

<sup>19</sup> The ECE analysis also incorporates category IIIA agreements for the countries covered, while the Carleton study treats them separately; but these agreements (joint ventures in Hungary and Romania) are too few in number in the ECE sample to affect the broad results. In this regard, it should be noted that the 1975 and 1976 ECE studies are based on samples more narrowly defined than in the 1973 *Analytical Report*. In particular, they exclude "certain specific forms of cooperation such as trade in licenses and capital goods, commercial joint ventures, technical and scientific co-operation agreements, etc." which were included in the 1973 report (ECE, 1975, p. 2 and ECE, 1976, p. 1).

<sup>20</sup> US agreements comprised only 7.7% of the ECE sample.

<sup>21</sup> See McMillan (June, 1976, Table B).

Both studies report similar findings with regard to country participation in EWIC. On the Eastern side, Hungary and Poland clearly occupy first place in numbers of contracts concluded with Western firms.<sup>22</sup> They are followed at some distance by Romania, the Soviet Union, and Czechoslovakia; Bulgaria and the GDR trail the list. On the Western side, the Federal Republic of Germany, Austria and France lead in both samples, but the Carleton survey finds a more salient role played by Austrian firms than does the ECE. Italy and Sweden fall into the next rank of countries in both studies, with the United Kingdom also included at this level in the Carleton sample. Japan, the United States and the smaller Western European countries account for smaller shares of EWIC agreements concluded, in both samples.<sup>23</sup>

There is again a consensus between the studies with regard to the distribution of EWIC agreements by industrial branch. Both find a leading role played by technology-intensive industries, with between 36-42% of the agreements on the samples studied falling into the machine-building industries (non-electric). This sector is followed at some distance by chemicals, transport equipment and the electrical and electronics industries (each ranging between 9-15% of the agreements in the two samples.) The Carleton study also classifies agreements according to broad user-categories, and finds over 70% of the agreements surveyed to involve producers goods (investment-oriented projects and products and intermediate industrial goods), with only 25 percent occurring in consumer-related industries. The ECE also found light industries and other more consumer-oriented industries to play a relatively small role (about 17%) in its sample.<sup>24</sup>

The two studies differ in approach to the question of the functional structure of EWIC agreements. The ECE classifies each agreement by type (licensing and delivery of plant or equipment, with at least partial payment in product; coproduction and specialization; subcontracting; joint ventures in the East; and joint tendering). The Carleton study deliberately avoids such classification and instead analyzes the frequency distribution of various component elements of the EWIC agreements studied. Both approaches reveal the essence of EWIC to lie in coordinated specialization in the production of components of an end product, on the basis of transferred technology. (Direct specialization in, and exchange of, final goods is seen rarely to constitute the basis for EWIC.) Nevertheless, both surveys find payment for capital goods and technology in resultant or related products to constitute a significant share (40-50%) of the arrangements surveyed. Nearly one quarter of the agreements in the Carleton sample included joint projects in third countries, but only 7% of the ECE sample were so classified.<sup>25</sup>

<sup>22</sup> Hungary and Poland together account for 58% of the Carleton sample and 60% of the ECE sample.

<sup>23</sup> The Indiana survey, adjusted to the ECE definition, reports 100-110 agreements for US firms. This represents a higher percentage (20%) of our estimate of the 1975 universe than the US share in the ECE sample (8%).

<sup>24</sup> The Indiana and Hamburg studies showed broadly similar industrial and end-user characteristics for US and FRG agreements studied, but Indiana noted somewhat lower participation by US firms in the machine tool and transport equipment branches.

<sup>25</sup> At present these arrangements make up a large part of what is termed "tripartite cooperation". An UNCTAD report describes and analyzes the latter. It identifies 132 "effective tripartite industrial cooperation projects" (involving firms located in East, West and South) as of mid-1975. See UNCTAD (1975).

Table 4 shows how the component elements of 218 EWIC agreements were distributed in the Carleton sample. (Each agreement is composed of a number of elements.) The data (which are based on questionnaires completed by Western firms engaged in EWIC arrangements and located in fourteen different Western European countries and in Japan) clearly illustrate the important transfer of technology function performed by EWIC arrangements. The elements most directly associated with transfer of technology between the partners are: custom design of plant or equipment (4), training of personnel (5), technical assistance (6), licensing (7) and cooperation in R&D (16). Nearly two-thirds of the agreements surveyed included provision of technical assistance, with nearly half involving licensing of technology and personnel training. All three elements were present in 30% of the agreements studied. Separate calculations show that 75% of the agreements in the sample contained at least one of the five, major transfer of technology elements (elements 4-7 and 16 in Table 4).

The data in Table 4 suggest that joint management as yet plays a limited role in EWIC agreements. The provision of managerial services (1) is an element in less than 9% of the agreements surveyed. The exercise of quality control by the partner (13) appears in only 25% of the cases. The obstacles to joint management will be discussed in Section 6 below.

Elements 1 through 8 can be regarded as establishing the base for industrial cooperation between the partners. Cooperation itself is manifested in elements 9 through 16. Most Eastern European specialists regard element 11 as the form of production specialization for which their countries strive in EWIC arrangements. It is interesting, but not surprising, that the survey reveals that only 19% of the agreements studied have evolved to this stage. A much larger proportion (47%) remain at the stage described in element 9.

The ECE finds a definite "affinity" between certain forms of cooperation and certain branches of industry. In the ECE study, licensing is most common in the machine-building and transport equipment industries; supply of plant and equipment in the chemical and metallurgical industries. The ECE is careful not to ascribe causal relationships to the associations found. Nevertheless, it would seem logical that technical and economic conditions characteristic of a particular industrial branch should play a role (among other factors) in determining the form of cooperation.<sup>26</sup> Thus the relative importance of supply of plant and equipment in Soviet EWIC contracts, shown by the ECE data, may in part be explained by the priorities which the data also indicate to be attached to the chemical and metallurgical sectors as the principal objects of Soviet EWIC arrangements.

The Carleton survey reveals certain characteristics of Eastern and Western partners to EWIC agreements. On the Eastern side, specialized foreign trade enterprises are by far the most frequent partners, and in about half of the cases are the sole Eastern parties to the agreement. On the Western side, a single partner, rather than a consortium, was found to be typical. On the other hand, in exactly half of the agreements studied, the Western partner could be identified as a multinational corporation (with direct foreign investments in one

<sup>26</sup> Cf. McMillan (July, 1976, p. 11 ff.).

TABLE 4.—COMPONENT ELEMENTS OF EWIC AGREEMENTS<sup>1</sup>  
 [Percent of country's agreements surveyed containing designated element]

	Country							Total all countries
	Bulgaria	CSSR	GDR <sup>2</sup>	Hungary	Poland	Romania	U.S.S.R.	
Number of agreements surveyed .....	17	18	6	75	51	30	21	218

14. Coordination of marketing/servicing .....	35.3	27.8	33.3	34.7	35.3	30.0	9.5	31.2
15. Joint project in 3d country .....	35.3	22.2	66.7	17.3	31.4	26.7	9.5	24.3
16. Joint R. & D. ....	23.5	5.6	33.3	26.7	17.6	20.0	47.6	23.9

<sup>1</sup> The data presented are based on questionnaires completed in 1975 by Western firms partner to the agreements. Details of the survey and methodology are described in McMillan (June 1976). This is a revised version of appendix table V there, based on a slightly extended sample. Agreements included conform to the ECE definition and fall into category II of table 3 above.

<sup>2</sup> In interpreting the percentages for the GDR, the small absolute number of agreements included in the sample should be borne in mind.

or more countries); and in nearly one-fifth of the cases, the Western partner was found to be a large MNC (with affiliates in more than 10 foreign countries and 1973 sales in excess of \$2 billion).<sup>27</sup> Western firms are often involved in several Eastern countries; the Carleton survey found that 27% of the firms in its sample had EWIC agreements in more than one country.<sup>28</sup> State participation in EWIC at the enterprise level was found not to be limited to the Eastern side in 20% of the cases, the Western partner was identified as the state enterprise (state majority ownership).

#### 4. FUNCTIONAL ATTRIBUTES

The systemic crisis which the Eastern economies faced in the 1960's has been well documented in earlier volumes in this series. Persistently unsatisfactory economic performance directed increased policy attention towards the potential gains from expanded and improved participation in the "international division of labor". EWIC forms an important part of a series of parallel external policy measures undertaken in these circumstances in the late 1960s and early 1970s. Its special attraction has stemmed from the possibilities which it has offered as an instrument through which several basic external policy objectives could be pursued concurrently: a larger and more stable volume of trade with the West, a more desirable trade structure, through an increased share of manufactured exports to the West, and more effective acquisition and absorption of Western plant and technology. Moreover, through its impact on the volume and structure of exports as well as imports, EWIC offered the prospect of minimizing the adverse balance of payments effect of increased acquisition of Western capital goods and technology.

EWIC should therefore be viewed not only as a policy, but as an institutional mechanism for the pursuit of policy objectives. In this respect, it may be regarded as one of a number of adjustments in their traditional foreign trade systems undertaken by the Eastern European countries to meet the demands of changing external policy priorities.<sup>29</sup> International industrial cooperation is an instrument which has not been limited to the attainment of economic objectives solely in relations with the West. Industrial cooperation at the enterprise level has also been emphasized as a means of developing and improving relations among socialist countries.<sup>30</sup>

The ways in which EWIC can serve a variety of policy purposes is better understood if we examine in turn its principal functional attributes, as a mechanism for capital investment, technology transfer, production specialization, joint marketing and self-financing. These diverse functions reveal the broad economic scope of EWIC, the variety of forces motivating its rapid growth over the past decade, and the mutuality of interests which is essential to effective and

<sup>27</sup> Comparison of the findings of the Carleton and Indiana studies suggests that a larger proportion of US participants in EWIC agreements fall into the category of industrial "giants" than is the case of participating Western European firms. The Hamburg study found medium-sized companies to predominate in its sample of participating West German firms.

<sup>28</sup> The Indiana study reports nearly half of the US firms, whose involvement could be identified by country, to be active in more than one Eastern country (but on the basis of a substantially broader definition of EWIC activity).

<sup>29</sup> See Matejka (1975) for an inter-country comparison of these adjustments.

<sup>30</sup> Cf. *Comprehensive Program for the Further Extension and Improvement of Cooperation and the Development of Socialist Economic Integration by the CMEA Member Countries*, Moscow: CMEA Secretariat, 1971 (Section 8).

viable cooperation. The discussion will concentrate on ways in which EWIC can in principle perform these functions; problems which have arisen in practice will be examined in Section 6.

### *Capital Investment*

Foreign equity investment in three Eastern European economies (Bulgaria, the CSSR and the GDR) is not legally possible. While now permitted in Hungary, Poland, Romania and Yugoslavia, it faces a number of legal and systemic constraints which have slowed its development. Although minority equity investment in joint ventures is permitted and encouraged, the establishment of foreign branches or subsidiaries is generally ruled out.<sup>31</sup>

In these circumstances, non-equity forms of inter-firm cooperation have assumed greater relative importance. EWIC is not simply a means by which a Western firm extends long-term credits to an Eastern partner. It is the framework for a form of real capital investment, since through production and market sharing provisions, quality control arrangements and other agreed procedures, the Western firm is able to play a continuing, if indirect, role in the use of productive assets within the Eastern economies.

While unable to establish more than a representative office in Eastern Europe, a Western European, North American or Japanese firm can transfer productive assets to an Eastern European location and, in partnership with an Eastern enterprise, take advantage of many of the circumstances which in another context would stimulate direct foreign investment. In particular, with Western European production costs raised to North American levels, Eastern Europe's raw materials, comparatively cheap and stable labor force and industrial base have made it an attractive production location on the periphery of the Common Market. Many of the agreements in the universe estimates recorded in Table 2 are based on such considerations. Significant proportions of the agreements in both the ECE and Carleton samples (20-30%) involve transfer of equipment or plant to the Eastern partner and a much larger proportion involve the transfer of intangible capital assets.

In sum, EWIC agreements can be viewed as a means by which, in principle, a Western firm can exercise some of the property rights which normally accompany equity investment. In the absence of formal title to assets in the East, the Western partner may nevertheless exercise some control over the use, allocation of income from, and disposal of, transferred assets during the life of the agreement. In this sense, EWIC can perform some of the functions of more direct forms of capital investment and can substitute for the latter in the face of East-West legal and systemic constraints. In practice, as will be argued in Section 6, the cooperative formula has proved least successful in ensuring an effective voice to the Western partner in the operational management of assets.

### *Technology Transfer*

To the Eastern European countries, with their high internal rates of capital formation, EWIC is of less interest as a mechanism for

<sup>31</sup> We are talking here of West to East flows; East to West direct foreign investment is analyzed in McMillan (1977).

capital investment than as a vehicle for the importation of Western technology, especially applied, industrial technology. This transfer of technology function is the major consideration underlying the Eastern emphasis on cooperative relationships, and is repeatedly stressed in official statements and legislative enactments on the subject.

Eastern perception of the potential significance of cooperation as a transfer mechanism extends beyond the objective of simple acquisition. Technology may in many cases be purchased or leased through straightforward transactions in the marketplace. Turnkey projects even afford the possibility of acquiring through the market whole production systems: from feasibility studies, through design, construction and equipment of an entire plant, to the training of personnel and the provision of technical assistance during an initial, run-in period. A cooperation agreement may also include these elements, but it extends the possible "package" beyond the acquisition of a complete engineering system to the creation of a reinforcing system of technical and commercial linkages, extending into the future and creating the possibility of continuing access to partner technology.

Cooperation can (like direct foreign investment) entail the transfer of technology which is not amenable to arms-length sale or lease, or of technology to which the possessor is not willing to relinquish all, or most, proprietary rights. It therefore affords the possibility of obtaining new, non-standardized technology, not generally available through market. These possibilities result from the continuing interest and involvement of the Western partner in the operational and commercial application of the technology transferred.

Of perhaps even greater importance to the Eastern countries, however, is the possibility that the full technological capability will be assimilated through continuing cooperation with the Western firm from which the technology is obtained. Degrees of assimilation involve the development of the capability to replicate the technology, to adapt it to different products or uses and to generate further improvements in it.

There are therefore strong motives for seeking the active, continuing cooperation of the Western firm, through a package arrangement which provides not only the basic production and marketing rights, but specialized equipment and components, continuing technical and managerial assistance, training of personnel, up-dating of technology, collaboration in production, marketing assistance and the possibility of cooperation in further R&D. To guarantee, however, that these features are fully implemented the continuing interest of the Western partner in the undertakings must be enlisted. This can only be ensured if the Western firm is able to profit through the arrangement from an enhanced ability to exploit its technological advantage, albeit indirectly, within the Eastern market area. Moreover, the Western partner must be given sufficient operational scope under the agreement to play the desired, active role in the transfer process.

If the Eastern goal of assimilation is to be realized, and continuing technological dependence to be avoided, the Eastern partner must also ensure that it is not relegated to a passive role in the process. It too must be given both the scope and the incentive under the arrangement

to take an active part in the decisions involved in the transfer and in their implementation. True cooperation implies shared responsibilities and the technological learning-by-doing that results. In the East-West context, the basic technical level of the Eastern partner facilitates its assuming such a role.

To what extent is this potential for technology transfer and assimilation realized in practice? How often is this complex set of conditions met in EWIC agreements? Some measure of the importance of the transfer function in actual agreements is conveyed by the data, presented in section 3, on the research-intensive nature of the industries in which EWIC agreements are concentrated and the relative frequency of technology transfer elements in the agreements surveyed.

On the other hand, a substantial share of agreements classified as cooperation scarcely exceed simple licensing contracts or turnkey plant sales. The large majority of agreements classified as EWIC—even those falling within the intermediate and narrow definitions—would not appear to meet the requirements for effective technology transfer described above. Many arrangements, by limiting the Eastern role to prescribed manufacturing operations, may even serve to widen the technical gap between the partners. The Eastern enterprise, while acquiring a new production technique, is locked into this technology by the provisions of a long-term agreement which grant it little scope to engage in product marketing or development. As for agreements which may be more truly characterized as cooperative, the diverse ways in which technology is transferred and the complex interdependence of the activities which are directly or indirectly involved in the process, make the transfer function extremely difficult to assess. More extensive analysis of the transfer function remains an important next stage in research.

Interviews with firms and enterprises involved suggest that the progression from acquisition to assimilation of technology is not something that can be planned or guaranteed in advance, but which evolves in the course of a relationship. The appropriate selection of partners, and the establishment of a flexible relationship, are probably more important than the institution at the outset of an elaborate formula for technology transfer, replete with extensive formal guarantees.

### *Production Specialization*

Production specialization is really the heart of cooperation. Transfers of productive equipment and technology merely set the stage for specialization; cooperation in marketing, financing, research and development are auxiliary to it. This is graphically depicted by the location of production arrangements at the center of the spectrum of forms of cooperation presented in Table 2.

From this aspect, therefore, the essence of cooperation is the shift of production activities to new, foreign locations. In the East-West context, at this stage of the evolution of relations, this shift is typically from West to East. An Austrian firm, for example, may find it advantageous to phase out certain production operations and to transfer them (together with the necessary plant and technology) to a cooperating enterprise in Eastern Europe. It will then concentrate on a small-

ler range of, usually more technically sophisticated, activities, relying on the Eastern partner as the source of the transferred output.<sup>32</sup>

Transfer of production to a partner, and the economies of specialization thereby achieved, entail contractual, inter-firm coordination of production activities. The arrangements through which this is accomplished differ in particulars but constitute variations of a single theme. They can be viewed as forming a progression of arrangements, through which the relationship between a pair of partners may evolve. Licensing or supply of plant and equipment, with payment in resultant product, and sub-contracting involve a minimum of production specialization. They can, and often do, evolve into production contracting arrangements, involving an increased and more permanent the transfer of production operations from the contractor to the contractee.

The progression from one form to another depends importantly upon the development of partner capability and the growth of mutual knowledge and confidence. It is motivated by the gains from increased specialization and the attractions of more commercially interesting two-way exchanges of goods and services, as partners become aware of the potential advantages of developing and exploiting inherent complementarities. As has been stressed earlier, differentiation of these types of arrangement can be extremely difficult in practice, since the difference between a licensing agreement involving partial payment in the resulting product and a production-contracting agreement on the basis of licensed technology may lie more in *ex ante* intentions than in the *ex post* terms of the arrangements.

These arrangements all involve one-way production commitments. In instances where partner technical capabilities are more balanced, or as more balanced capabilities develop, production contracting may evolve further into co-production and product specialization agreements, involving two-way commitments and resulting flows of goods and services. All else being equal, this evolution increases the inter-dependence of the partners.

It should not be surprising that these ultimate forms, standing as they do at the end of the progression of potential production specialization arrangements and involving the most comprehensive meshing of partner plans and operations should remain relatively rare. It may be recalled that in the Carleton sample, some 40% of the agreements involved payment in resultant product, 47% included production contracting of parts and components (40% covered production contracting of end products), but only 19% involved co-production and 6%, product specialization.

Most of the production specialization undertaken on a cooperative basis involves the vertical integration of coopting firms. That is, it represents a decision to narrow the range of components produced and to rely on contractual agreements with partner firms for the remainder. This leads to expanded East-West exchanges of intermediate products and to increased intra-industry specialization and trade among Eastern enterprises and Western firms. The close link between inter-firm cooperation and intra-industry specialization is a widespread phenomenon in the domestic and international relations

<sup>32</sup> A detailed example of this strategy is presented in Malzacher (1976).

of industrial economies. Its extension to the East-West context can be viewed as an aspect of the increased incorporation of East-West commerce into the mainstream of international economic relations.

### *Joint Marketing*

Inter-firm cooperation can also perform important marketing functions for the partners, each facing special problems in the other's market area. Some of the most basic of these functions follow directly from the forms of production specialization described above. The marketability of Eastern goods, manufactures in particular, produced in cooperation with a Western firm, to Western specifications and quality standards, on the basis of Western technology and equipment, often with a Western, or joint, brandname or trade-mark, is of necessity enhanced, whether sold domestically or abroad, in East or West. Moreover, the Western partner, as end-user or as direct distributor under the terms of the arrangement, constitutes a built-in "market" for the Eastern product or products in the West. If the terms of the agreement are met, this market is stable and long-term.

The direct links which a cooperative arrangement establishes between the partners perform a valuable market-feedback function, and help to ensure that the Eastern product not only meets, but will be continually adapted to meet, Western requirements. Products reimported after further processing in the East under EWIC arrangements may also be subject to more favorable Western tariff and quota treatment than similar products directly exported from the East. The Eastern partner gains not only exclusive marketing rights to the cooperative product within its domestic territory, but often as well exclusive or non-exclusive rights in other areas, especially within the Eastern European region. An EWIC agreement frequently includes marketing assistance, and even provision for after-servicing, of partner products not directly covered by the production specialization aspects of the agreement. In performing these various functions, EWIC agreements substitute for the institutional framework for effective marketing in the other system which each side has traditionally lacked.

The joint marketing function has also been performed through the establishment of mixed equity commercial ventures in the West. As shown in Table 3, more than 200 joint trading companies have been established with local partners in the industrialized Western economies by the USSR and the six Eastern European CMEA countries. Yugoslavia is estimated to have formed an even larger number of such partnerships. Not infrequently, extensive retailing and servicing facilities are set up by these joint companies. In a more institutionalized form than through non-equity links to Western firms, mixed companies seek to serve many of the same purposes: improving the marketability of Eastern products, especially manufactures, by raising their technical standards, adapting them more closely to Western requirements and promoting them more intensively within the Western market area.

EWIC offers to the Western firm the prospect of improved access to the planned Eastern economies. In the typical arrangement, the Western firm sells the initial plant, equipment and technology upon which the subsequent cooperation is based. It continues to supply

parts and components to be incorporated into the cooperative product (although there is usually an effort to substitute increasing proportions of Eastern domestic production for such imports over the long term.) Moreover, but for the self-financing function of cooperation (to be discussed next), such sales might well not have been made at all, or not in such volume, on a straight market basis, owing to balance of payments constraints. Finally, like the Eastern enterprise in the West, the Western firm faces the problem of getting its products sufficiently well known to establish a firm position in the Eastern market. Transfer of some product lines to an Eastern production location enhances the prospects of achieving these marketing aims, through the direct "presence" within the Eastern market area which results. This increased presence, together with the contacts which such arrangements bring within the Eastern planning bureaucracies and the good will which they generate in the East, serve to improve the general market position of the Western partner, beyond the specific terms of the agreement itself.

In practice, the marketing aims sought through cooperation have often failed to be realized, and this has led to disappointment for partners on both sides. Eastern partners complain of the failure of Western firms to live up to their purchasing commitments; Western partners lament continuing deficiencies of quality, uncertainties of supply and the limitations imposed by exchange controls. We shall return to these questions in the final section of this paper.

### *Self-Financing*

Many Western observers stress the self-financing or self-liquidating function of EWIC, and regard cooperation simply as a more sophisticated form of barter, dictated by the absence of convertible Eastern currencies. Others, taking a similar line, emphasize EWIC as an effective instrument of Eastern debt management. The importance of the financial function of cooperation is undeniable; and in the face of their mounting hard-currency indebtedness, the Eastern European countries have themselves laid increasing stress on it. To regard EWIC solely in these terms, however, is to neglect its other major functional attributes as outlined above.

It is useful to distinguish between the implicit and explicit aspects of the financing function. Production specialization agreements automatically result in a degree of self-financing. That is, they necessarily generate a certain amount of hard currency earnings which offset hard currency expenditures under the agreement. These built-in marketing features therefore overlap the financing function of EWIC agreements.

However, an explicit self-financing function can, and increasingly has been, superimposed upon the degree of self-financing which naturally results from other attributes of cooperation. The imposed necessity to achieve, or approximate, a bilateral balance of payments within an inter-firm arrangement can hamper other functions, and conflict with other objectives, of EWIC. If carried too far, it can constrain the development of existing arrangements and discourage the growth of new agreements.

Preference for balanced commitments under an agreement, and the tendency to strive for an ever greater degree of balance than would naturally result from a given arrangement, stem in part from the organization of the Eastern economies and the behavioral pattern which the system imposes upon planners and managers. Foreign trade enterprises, as we have seen the immediate parties to EWIC agreements, are charged with achieving export as well as import targets. At a higher level, exports and imports within a single EWIC agreement will often fall within the same "materials balance" for planning purposes.

Such tendencies are of course reinforced by external pressures. As Eastern hard currency indebtedness has increased, so has the pressure to enter into arrangements whereby additional Western plant and technology may be acquired without immediate commitment of limited hard currency reserves. The advantages of EWIC as a form of financing, however, extend beyond its use as an additional source of long-term credit. The compensatory provisions of a cooperation agreement shift the burden of financing to the Western firm.<sup>33</sup> The implication is that the Western partner can arrange hard currency financing for the arrangement more easily than could the Eastern partner (its national foreign trade bank) directly. The commitment of the Western partner to a cooperative undertaking (especially to its joint marketing features) facilitates Western commercial bank financing in the face of rising Eastern indebtedness.<sup>34</sup> Moreover, borrowing through the intermediation of a Western partner firm avoids direct increments to the country's formal debt structure, and thus forestalls imposition of credit limitations.

Comparison of ECE data for 1975 and 1976 provides some evidence of the impact of balance of payments pressures on the structure of EWIC. Between April 15, 1975 and June 1, 1976, the share of agreements in the ECE sample involving supply of plant, equipment and technology with at least partial payment in products or components, increased from 48% to 54%, and the increase was especially noteworthy for Poland, a country facing particularly acute pressures on available hard currency funds.<sup>35</sup>

Product-payback financing is not achieved, however, without cost to the Eastern country (apart from the possible conflicts with other EWIC objectives already cited.) The cost to the Western partner of financial intermediation is often passed on in the form of discounts on Eastern products taken in payment, or price supplements on goods supplied under the agreement. Moreover the Eastern partner ties itself to a single Western buyer and to an advance pricing formula, both of which can involve substantial risk in the longer run.

In this discussion of the principal functional attributes of EWIC, we have necessarily tended to concentrate on the most typical pattern of cooperative activity. It is worth noting, however, that EWIC

<sup>33</sup> Direct Western partner involvement in the financing is viewed in the East as providing an additional guarantee of partner commitment to the terms of the agreement.

<sup>34</sup> Western partner purchase commitments are seen as strengthening the commercial viability of the arrangement. Moreover, the bank presumably receives more details of the project than it would otherwise obtain.

<sup>35</sup> While the ECE reports imply that the increase in the sample between the two dates resulted from the inclusion of newly concluded agreements, this is not explicitly stated, and our interpretation must therefore be treated with some caution.

does not always involve the transfer of capital equipment and technology, or the shift of production operations, from West to East. The reverse, East to West, pattern also occurs. Since this activity has attracted less attention, a few examples would seem useful.

Both Soviet and East European machine tools are equipped abroad with Western programmed control systems and marketed locally under cooperative arrangements with firms in Western Europe. Other types of Eastern industrial equipment are assembled and installed in Western Europe under the terms of cooperation agreements with local firms. Cooperative production in the West under Eastern license is also observed. A Swedish company has begun production, under Soviet license, of installations for specialized equipment for electro-hydraulic casting, imported from the USSR. Bulgarian and Hungarian enterprises have established joint companies with Western European partners to produce, under license, electrical and medical equipment respectively. A special foreign trade enterprise has been set up in Hungary (*Novex*, of Budapest) to promote joint commercialization of Hungarian industrial technology in the West in cooperation with Western firms.

The list could easily be extended, but these examples suggest the variety of arrangements involved. Although they are the most industrially advanced of the Eastern European countries, the GDR and the CSSR have lagged behind in this activity. Nevertheless, the CSSR has used the cooperative formula to shift some production operations to neighboring Austrian locations, in order to take advantage of relatively abundant and cheap Austrian labor in the border region.

It should be apparent from the variety of functions which cooperation agreements are intended to perform, that there are strong *a priori* reasons for regarding large, multinational corporations as the ideal Western partners to such arrangements. Their functionally diverse, and geographically dispersed, capabilities would seem best to suit the "package" nature of cooperation agreements, which as noted can incorporate activities ranging from turnkey sales to joint, international marketing and tendering.<sup>36</sup>

While the role of Western multinationals in EWIC was seen in Section 3 to be quantitatively significant, it can easily be exaggerated. Their participation in billion-dollar deals, for the most part in the USSR, and the inherent sensationalism of the notion of prominent capitalist "giants" in partnership with "communist" state enterprises, has naturally attracted wide public attention. Not only do the multinationals not enjoy a monopoly on EWIC, but in cooperation between smaller Eastern and Western European countries their role has been observed to be below the overall East-West average, as measured by numbers of agreements.<sup>37</sup>

Consortia would seem to provide a framework within which smaller Western firms might compete effectively with large multinational corporations for major EWIC projects. Survey data indicate West-

<sup>36</sup> The Canadian subsidiary of a Western European multinational, for example, successfully negotiated a joint venture in Eastern Europe because it was able to contribute not only a turnkey plant embodying its own technology to the undertaking, but additional technology desired by the Eastern partner, obtained on a sub-license from its parent. Moreover, it was able to provide the services of affiliates in Western Europe not only in the marketing of a share of the joint venture product but of other products which the Eastern authority approving the arrangement wished to use in partial payment. Such instances are encountered repeatedly, not only in joint ventures, but in non-equity arrangements.

<sup>37</sup> See McMillan (June 1976, Appendix Table VII).

ern consortial involvement to be more suited to certain types of cooperation: joint projects in third countries and the supply of large-scale production systems on a product-payback basis. Production specialization agreements are almost exclusively bilateral (discounting the intermediary role played by the Eastern foreign trade enterprise in such arrangements).

## 5. COUNTY APPROACHES

The purpose of this section is to bring out the main aspects of individual Eastern European country approaches to EWIC.<sup>33</sup> The general conditions described in the preceding sections apply across the board, and will not be repeated here. Rather than stress the broad similarities in approach shared by these countries, we shall concentrate on the more unique features which differentiate them. Treatment is necessarily limited to the principal characteristics of each country's policies and experiences.<sup>39</sup>

### Bulgaria

By the standards set by some Eastern countries, Bulgaria's practical experience with EWIC has not been extensive. As shown in Table 3, Bulgaria accounts for an estimated 4% of substantive, non-equity agreements. On the other hand, in recent years Bulgaria has actively sought to promote cooperation, under the provisions of specially devised legislation and through newly created governmental bodies.

Bulgaria has for some time been active at the inter-governmental level in promoting cooperative ties with the West (see Table 1). By Decree No. 1196 of the State Council, issued on June 12, 1974, Bulgaria has sought to translate this inter-governmental framework into more concrete, inter-firm relationships, by encouraging "economic, industrial and technical cooperation" between Bulgarian economic organizations and "foreign juridical and physical persons." The decree stresses the extension and modernization of production capacities as the main objectives of cooperation and makes the foreign partner's remuneration contingent upon the introduction, through the arrangement, of new plant or technology (Article 13).

In the regulations accompanying the decree, cooperation is defined as involving three key elements: lasting or enduring relationships, joint activities and mutual advantage. The principle of reciprocal flows of products and services under a cooperation agreement is particularly stressed. This broad definition is to be applied in industry, construction, agriculture, transport, tourism, trade, finance and auxiliary activities; and it is to encompass the following general forms (Article 3):

1. Joint activities for setting up of production capacities or for the reconstruction or modernization of existing capacities, on the basis of the most advanced technologies and scientific and technological achievements.

<sup>33</sup> The material incorporated is based in part on interviews conducted by the author, in 1973-75, in all of the countries except Bulgaria.

<sup>39</sup> Further details on the approaches of various Eastern European countries may be found in Starr (1974), which stresses the legal conditions, Marer et al. (1975) and in a special issue of *Revue de l'Est* (Vol. 5, No. 2 1974). Studies specific to countries will be cited in passing below.

2. Joint scientific, research, design, construction, planning and similar activities.

3. Joint production of finished and semi-finished goods, according to documentation provided by the parties or by another organization, exchange of articles, spare parts, sections and details, documentation, licenses, know-how, technical assistance, etc.

4. Joint participation in the supply or construction of complete plants on the territory of the contracting parties and in other states.

5. Organizing of joint enterprises outside the territory of the People's Republic of Bulgaria, for industrial or other economic activities.

Joint equity ventures are not permitted in Bulgaria (and in fact foreign ownership in domestic enterprises is constitutionally prohibited), but the 1974 legislation establishes the conditions for extensive non-equity forms of inter-firm collaboration in production. To facilitate the pooling of productive assets, foreign partners are allowed to import equipment and materials without restriction. These assets are to be placed at the disposal of the Bulgarian enterprise during the life time of the agreement. Upon termination, they may be sold in Bulgaria or reexported. The regulations envisage a degree of joint management, through the stationing of representatives of the Western partner in the Bulgarian enterprise in order to provide technical assistance and to exercise quality control. The regulations permit substantial flexibility in the distribution of income from cooperation, including fixed fee arrangements, royalties and the sharing of income in proportion to partner contributions to the endeavor.

Thus the formula involves a fairly ambitious sharing of rights and responsibilities. While not allowing joint equity ventures in Bulgaria, it poses functionally similar non-equity arrangements. It also envisages the setting up of joint companies outside Bulgaria for the marketing of cooperative products. An interesting recent example of this last possibility is a mixed company (*Irion-Car Vertriebs GmbH*) established in Stuttgart, in partnership with a wholly owned subsidiary of *Daimler-Benz*, to market Bulgarian electric forklift trucks in the Federal Republic.

The available data do not indicate that the formula established by the 1974 decree has as yet been extensively employed, although the time elapsed thus far provides a very limited test. The 1976 ECE sample shows a concentration of Bulgarian agreements in the categories of licensing or delivery of plant and equipment, in exchange (at least partially) for products or components, that is well above the Eastern European average. The 1975 Carleton sample shows sale of complete plant to be a component of Bulgarian agreements twice as frequently as in the agreements of other Eastern countries (except the USSR). On the other hand, the Carleton sample shows a normal share of production contracting among Bulgarian agreements.

Both studies reveal a much larger share of Bulgarian cooperation agreements occurring in the food, beverages and tobacco industries than average for Eastern countries generally. However, the largest share of Bulgarian cooperation agreements are concentrated in the non-electrical machinery industries, followed by chemicals and electrical machinery and electronics.

The coordination and supervision of cooperation agreements is the responsibility of the Bulgarian Ministry of Foreign Trade (which has a special Department of Economic and Industrial Cooperation) and the State Committee for Science, Technical Progress and Education. In addition, a State Committee on Foreign Economic Relations was created in 1974, at the time of the new decree on industrial cooperation. The Committee, with four foreign trade enterprises dealing in complete plants and equipment subordinate to it, seemed destined to play a special role in cooperation contracts. However, the Committee was reportedly abolished in mid-1976, in what has been interpreted as a victory for the Ministry of Foreign Trade in reasserting its jurisdiction.<sup>40</sup>

Bulgaria's progress in realizing its aims with regard to EWIC has undoubtedly been slowed by its strong traditional trade orientation towards the USSR and the other CMEA countries. It is probably also due to the problem of integrating EWIC agreements into the centralized Bulgarian economic system. The 1974 regulations attempted to resolve this problem formally by providing for the incorporation of cooperation commitments into the national plan and for the allocation of supplies from reserves as necessary for the attainment of cooperative goals (Article 9). The Bulgarian stress on substantial repayment in resulting product has undoubtedly also been a deterrent to the growth of cooperative relationships with Western firms.

### *Czechoslovakia*

Czechoslovakia's special policy interest in EWIC is in its potential as a means to improve the structure of the country's industrial production. As an industrialized country, Czechoslovakia's trade is heavily concentrated (more than half of exports and nearly two-fifths of imports) in the machinery and equipment categories. At the same time, insufficient specialization in production and trade is a major drag on productivity. The over-diversification of industrial output has resulted in inefficient production runs.<sup>41</sup> International industrial cooperation is seen in these circumstances as a means to achieve desired specialization and the resulting economies in production.

The importance of EWIC has been affirmed by government officials and party leaders<sup>42</sup> and cooperative ties have been promoted by senior ministries. The Ministry of Foreign Trade (which has a section devoted to industrial cooperation) views it as a means of raising export potential; the Ministry for Technical and Investment Development recognizes cooperation as a mechanism for the introduction of foreign technology needed to promote the goals of industrial restructuring; the Ministry of Finance favors EWIC as a means of reducing hardcurrency outlays.

<sup>40</sup>*Business Eastern Europe*, July 9, 1976.

<sup>41</sup> A Czechoslovak source calculates that Czechoslovak industrial output includes 75-80% of the principal types of machinery and equipment produced in the world at large. (Nykryn, 1974, p. 19.)

<sup>42</sup> See the series of articles published in the party economic newspaper, *Hospodarske Noviny* (Nos. 41 and 43, 1973, and 28 and 45, 1974) by Dr. Rudolf Kobza of the federal Ministry of Foreign Trade. More recently "unconventional ways" have been advocated to meet the problem of declining export markets in the West and new measures have been announced to facilitate and encourage the negotiation of cooperative ventures with Western firms. (See *Rude Pravo*, Dec. 18, 1976 and *East-West Markets*, Jan. 10, 1977.)

On November 1, 1972, the Federal Assembly enacted a special law (No. 85/1972) "concerning procedures for the conclusion of agreements on economic cooperation with foreign countries".<sup>43</sup> The Act does not define economic cooperation rigorously but has industrial cooperation clearly in mind, stressing cooperation in production, with scientific and technical cooperation and production specialization as key components (Article 1.3). Under the Act, cooperation must be based on a specific enterprise agreement which in turn requires approval of higher authorities. The Act outlines the approval process, which depends in part upon the nature and ministerial subordination (federal, cooperative, local) of the Czechoslovak partner enterprise but in all cases requires approval of four senior federal bodies (the three ministries cited above and the State Bank).

The Act also affirms the jurisdiction of the Ministry of Foreign Trade over the commercial aspects of cooperation agreements. A foreign trade enterprise is usually a co-party to an agreement, together with the relevant production enterprise or association (VHJ) or, if the cooperation is purely commercial, the sole party. Nevertheless, an industrial enterprise or association can enter into a cooperation agreement without the partnership of a foreign trade enterprise, if authorized by the Ministry of Foreign Trade to export and import directly goods covered by the agreement.

Czechoslovakia ranks among those Eastern countries which have participated less actively in EWIC (see Table 3).<sup>44</sup> A majority of the agreements concluded have been with FRG firms, with the remaining cooperation partners located in those Western European countries with which the CSSR maintains most active trade relations: Austria, France, Italy, Sweden, Spain, the Netherlands. These countries are also countries with which Czechoslovakia has concluded inter-governmental agreements for industrial and technical cooperation, although production cooperation agreements at the enterprise level do not have to be covered by inter-governmental accords.

Sample data show that over two-thirds of the EWIC agreements concluded by Czechoslovakia are in the producers' goods industries, with a concentration (shared with most other Eastern countries) in non-electrical machinery, transport equipment and chemicals. A high proportion of the agreements take the form of production contracting of components by the Western firm, but co-production (where both parties specialize in the production of components and exchange them so that each produces and markets the final product) is more common in Czechoslovak arrangements than in those of other Eastern countries (see Table 4). About half of Czechoslovakia's production specialization agreements with Western firms are on the basis of a Western license.

Despite Czechoslovakia's industrialization, considerable awareness and expertise in the field of international industrial cooperation,<sup>45</sup> apparent high-level policy support for EWIC, special enabling legislation, and institution of a bilateral framework (inter-governmental

<sup>43</sup> The law replaces earlier cooperation legislation passed in the reformist year of 1968.

<sup>44</sup> An official Czechoslovak source stated in late 1976 that only 22 cooperation agreements were then in force with Western firms, and that about half of these were dormant because the Czechoslovak partner had proved unable to supply products of the required quality at a competitive price. (Reported in *Business Eastern Europe*, Nov. 5, 1976).

<sup>45</sup> Nykryn (1972) is an illustration; see also the articles and unpublished papers by Rudolf Kobza.

agreements and mixed commissions) for cooperation with many Western countries, Czechoslovakia has lagged behind most other Eastern countries in terms of degree of participation in EWIC. What factors explain this paradox? <sup>46</sup> The explanation would appear to lie in two sets of factors: political and systemic. While there is a definite policy commitment to EWIC and concern over the slow growth of Czechoslovak cooperation agreements in 1973-74 when other Eastern countries were rapidly expanding their participation, there is also a strong policy preference for industrial cooperation with the USSR and with the other CMEA countries. The CSSR has therefore preferred to move cautiously, stressing more advanced forms of East-West cooperation suitable to its level of industrialization and paramount objective of production specialization. The political aftermath of 1968 has undoubtedly had an inhibiting influence on both sides.

Systemic factors are probably of equal if not greater importance and are stressed in Czechoslovak analyses. Approval procedures are cumbersome and are complicated by the fact that cooperation agreements cut across ministerial jurisdictions. Moreover, enterprises are generally considered to lack incentives to take the initiatives required for the conclusion of complicated and risky cooperation contracts with foreign partners. It is not that incentives do not exist; in fact the government has sought to make cooperation profitable by attaching special income bonuses to deliveries to the West under cooperation agreements, and by granting special income tax incentives to participating Czechoslovak firms. However these incentives have been increasingly viewed as insufficient.

The response has been a continuing search for ways to increase incentives and to reduce bureaucratic obstacles to cooperation.<sup>47</sup> A specialized foreign trade enterprise, FINCOM, originally established to support Czechoslovak business investments abroad, especially in the LDCs, has recently been given responsibility for the promotion of industrial cooperation agreements, along the lines of specialized agencies in Hungary (see below). FINCOM is to maintain a data bank on potential projects and partners and to provide services to Czechoslovak enterprises and Western firms in the negotiation of agreements. It may also act as a partner to a cooperation contract, if no single foreign trade enterprise is appropriate to the role.<sup>48</sup>

### *German Democratic Republic*

Industrially the most advanced of the socialist countries, and therefore a potentially important partner for Western firms, the GDR might be expected to head the list of Eastern countries in terms of EWIC arrangements. Instead, it trails the list, its degree of involvement (like that of the CSSR) currently out of step with its level of

<sup>46</sup> To some degree the apparent lag is merely a statistical phenomenon. Our estimates (Table 3) place the CSSR in a higher relative position than is often ascribed to it. This is because the Czechoslovak statistical definition of cooperation is (in keeping with CSSR policy objectives) a narrower definition than that employed by most socialist countries. Hence Czechoslovak official figures are in closer accordance with Table 3's cumulative estimates of agreements concluded than are other Eastern official statistics.

<sup>47</sup> New tax and other incentives were introduced by Ministry of Foreign Trade regulations issued in 1976. Moreover, the approval process has been simplified, with small deals (involving exchange of goods to a value not exceeding three million crowns) at the discretion of the enterprise manager, and medium-size contracts (involving exchanges below 10 million crowns) requiring only the approval of the industrial ministry concerned (*Business Eastern Europe*, November 5, 1976).

<sup>48</sup> Author interview with enterprise officials. See also *Czechoslovak Foreign Trade*, No. 11, 1976.

industrial development. In the case of the GDR, this has been the result of conscious policy. GDR policy in this area is changing, however; and GDR participation in EWIC is gradually developing and evolving.

The reluctance of the GDR to engage more actively in cooperative ties with the West has been in line with its general foreign policy position and has been dictated in part by external factors. To the GDR, its relationship with the USSR and with the CMEA has been of prime importance. Economic relations with the West, on the other hand, have been dominated by carefully controlled trade, on special terms, with the FRG; and the introduction into these relations of cooperative links between GDR enterprises and FRG firms has been politically unpalatable. Meanwhile, the GDR remained diplomatically isolated from many of the Western countries.

In the course of the 1970s, there has been a sharp change in these external factors. The Soviet Union and the other CMEA countries have rapidly stepped up their trade and cooperation with the West, and East-West relations and CMEA integration have come increasingly to be regarded in the East as compatible trends. At the same time, the establishment of diplomatic relations between the GDR and the Western countries has created the opportunity for new economic relationships.

These changes in the political parameters have been accompanied by increasingly cogent economic reasons for adopting a more positive attitude towards economic cooperation with the West. For a country short of raw materials and labor, not only trade but also international industrial cooperation have become crucial factors in further economic development. Hence the GDR's interest in long-term cooperative arrangements for the supply of industrial raw materials and intermediate products, and for the introduction of Western labor-saving technology. Western know-how and cooperative East-West production and marketing relationships can also facilitate GDR efforts to rationalize investment and eliminate less efficient product lines. With the increase in the cost of Eastern, as well as Western raw materials and energy supplies, the self-financing features of EWIC have gained in attraction.

A first stage in the GDR's move to a new policy on EWIC has been to establish links at the governmental level. In a few years, beginning in 1973, an impressive series of bilateral agreements for economic, industrial and scientific-technical cooperation have been negotiated, linking the GDR to all of the major Western European countries except the FRG (see Table 1). These agreements serve a quasi-legislative role in the absence of special GDR legislation on industrial cooperation, and the mixed commissions and joint working groups established under them constitute machinery through which potential projects can be identified and partners matched.

The relatively small number of agreements with Western firms concluded in these years have been limited to a few categories. One of the formulas most frequently employed thus far is to conclude a long-term "framework" agreement with a large Western company, envisaging cooperation in any or all of three major areas: (1) Commercial cooperation, with target figures for categories of goods to be exchanged (these long-term, trade agreements have been employed

especially in the chemicals sector), (2) scientific and technical cooperation, covering exchange of scientific and technical information, licenses and patents and technical and commercial assistance, and (3) cooperation in third markets.<sup>49</sup> On the GDR side, these agreements are called *konsortialverträge*, because one foreign trade enterprise customarily signs the contract as the head of a consortium of GDR enterprises and enterprise associations participating in the arrangement. Often, working groups are set up under these agreements to meet regularly. Agreements of this sort have been reportedly concluded with (among others): *Dow Chemical* and *Rockwell International* (US) *Montecatini Edison*, *ANIC*, *Fiat* and *Olivetti* (Italy), *Mitsui* and *Nippon Steel* (Japan) and *Vöest-Alpine* (Austria). Among other functions, such agreements serve to familiarize large Western firms and their clients with GDR industrial products, as yet relatively unknown in the West.

The *Vöest-Alpine* agreement is cited as a model arrangement by GDR officials. It began with a turnkey chemical plant in the GDR, in which some GDR enterprises participated as sub-contractors. It then developed into a long-term commercial cooperation agreement and a joint program of development projects in third countries, including an oil refinery in Mauritania and lignite mining and processing facilities (on the basis of GDR brown coal technology) in Australia.

From the GDR perspective, such arrangements are appropriate because the GDR partner plays a more equal role than in the usual East-West production contracts. Nevertheless, the GDR has entered into licensing and franchising agreements in the consumer goods industries which have developed production contracting features. The pressure for self-financing seems likely to lead to the increased use of this form,

It had previously been believed that if the GDR began to engage in cooperation with Western companies, its last recourse would be to FRG firms. Nevertheless, framework agreements were concluded in 1975 with two leading firms in the FRG, *Farbwerke Hoechst* and *Krupp*. More recently a contract was concluded with the large FRG shoe manufacturer, *Salamander*, for GDR production of Salamander designs to be marketed in both Germanies. This last therefore represents a departure in terms of type of arrangement as well as nationality of partner.

#### *Hungary*<sup>50</sup>

As was shown in Section 3, Hungary has been the most active of the Eastern European countries in concluding EWIC agreements with Western firms. Official Hungarian data on numbers of agreements concluded incorporate forms not covered in the ECE definition, and are therefore higher than the estimates presented in Table 3.<sup>51</sup> Hungary's most frequent Western partners have been firms located

<sup>49</sup> These agreements, while broad in coverage, have been considered sufficiently substantive to be included in Category II of Table 3.

<sup>50</sup> Hungary's experience has been the object of an intensive study undertaken by Mr. Hugo Radice for the Centre for European Studies at Sussex University, the results of which have not as yet been published. Some preliminary findings were reported in Radice (1975). The joint Hungarian-FRG handbook on cooperation (1975) contains much useful information on Hungarian conditions and experience.

<sup>51</sup> At a press conference in Budapest in July, 1976, the Hungarian Deputy Minister of Foreign Trade stated that 410 cooperation contracts had been approved since 1965, of which 226 had entered into force.

in the FRG and in neighboring Austria. The sectors which have been the main objects of cooperation are those which have received priority elsewhere in the East: Non-electrical machinery and equipment, transport equipment, electrical machinery, electronics and chemicals.

As for the type of cooperative activity, within the parameters of the ECE definition a large share of Hungarian agreements have apparently been concentrated in forms of production specialization.<sup>52</sup> On the other hand, many of these are scarcely more than license and know-how agreements with provision for partial repayment of fees in the form of output. Hungarian agreements tend to be small in scale, to entail the processing or finishing of Western intermediate products and to involve the introduction of relatively little new technology.<sup>53</sup> The Carleton study found a much larger share (39%) of Hungary's EWIC agreements to be in consumer-oriented projects and products than was the case for any other Eastern country. The study revealed that only 40% of Hungary's cooperation partners could be classified as multinational corporations, thus providing further, indirect evidence of the relatively small scale of Hungarian agreements.<sup>54</sup>

Cooperation agreements with Western firms have not been necessary for most Hungarian enterprises outside the manufacturing sector; and these enterprises have been the source of the bulk of Hungarian exports to the West. Hungarian officials estimate that in the 1970's 3-4% of Hungarian exports to the West have been carried out under cooperation contracts (although the share of cooperative products in machinery and equipment exports to the West would be substantially higher).

In terms of our comparative perspective, the most unique feature of Hungarian participation in EWIC is its decentralization. The cooperative activity of Hungarian firms is not regulated by special legislation or governed by central authority. The Hungarian civil law was deemed sufficient to permit EWIC agreements, since it allows any form of contract.<sup>55</sup> Cooperation is coordinated by an inter-ministerial committee which functions under the Ministry of Foreign Trade.<sup>56</sup> If enterprises "declare" cooperation in order to benefit from special tax and customs privileges, the agreement must be approved by the committee. Otherwise there is no special registration of agreements. Production enterprises licensed to engage in foreign trade may enter directly into EWIC contracts without participation of specialized foreign trade enterprises.<sup>57</sup>

In addition to the Ministry of Foreign Trade and the Chamber of Commerce, which engage in general policy and promotion, several agencies play a more specialized, intermediary role in EWIC. Two foreign trade enterprises supply information on potential projects, initiate proposals with foreign firms and coordinate negotiations through conclusion of the contract, acting on a commission basis.

<sup>52</sup> See Table 4 above and also ECE (1976, Table 3).

<sup>53</sup> Cf. Hewett (1975).

<sup>54</sup> Hungarian concern about these features of its cooperation "profile" is reflected in recent reports of increased emphasis on large-scale agreements, concentrated in high-technology machinery and equipment rather than in consumer products (*Business Eastern Europe*, December 17, 1976).

<sup>55</sup> See the article by Joseph Varró in Starr (1974), p. 230.

<sup>56</sup> The Interministerial Committee on Cooperation is composed of the Chairman of the National Planning Office, a representative of the National Committee for Technological Development, the Minister of Metallurgy and Machine Industry, a deputy minister nominated by the Minister of Finance, the President of the Hungarian National Bank and the Secretary of State for Foreign Trade, who acts as chairman.

<sup>57</sup> In 1974, 5-6% of overall foreign trade and about 4% of East-West trade were transacted by such enterprises. See Czikos-Nagy (1976, p. 6).

The principal of these, *Intercooperation Ltd.*, is attached to the Ministry of Foreign Trade; the other, *Hunnicoop*, belongs to the Ministry of Machine Building. *Hunnicoop's* activities are concentrated on the key machinery and metallurgical sectors, and its role need not end with the conclusion of the contract. It may intermediate as well in exports and imports under the contract. Through its special Cooperation Department, the Hungarian Foreign Trade Bank not only renders banking services, but helps bring together partners and assist with negotiations.

Because of this decentralization, it is particularly necessary in the Hungarian case to distinguish between levels of motivation. At the macro level, EWIC is viewed as an instrument, in consonance with the NEM, through which the Hungarian economy can be adapted to the changing conditions of the international division of labor. EWIC has been specially promoted in Hungary since 1968. Hungary's heavy dependence on foreign trade and the deterioration in its terms of trade after 1973 have lent special force to this objective. Ties with Western firms are seen as ways to stimulate greater specialization and efficiency in Hungarian enterprises. So that this can be achieved, continuing relationships in the form of long-term production specialization agreements, not merely short-term commission projects, are encouraged.

That Hungarian enterprises do not always share this precise perspective is revealed in a survey undertaken in late 1973 by the Hungarian Chamber of Commerce.<sup>58</sup> Four main objectives were found to prompt enterprises to enter EWIC relationships:

(a) The aim most stressed was to find a substitute for imports through cooperative deliveries. This objective outweighed export creation or increased efficiency.

(b) Many enterprises saw EWIC as a means to alleviate the shortage of labor by acquiring labor-saving machinery and technology, especially to improve transport and packing.

(c) Potential capital cost savings, through the application of investment to proven techniques, were cited.

(d) Improved knowledge of world markets, through the Western partner, was seen as a means of increasing export sales.

At the same time, the Hungarian enterprises surveyed listed the following as major impediments to cooperation:

(a) Information about technological developments, about the international market and about other relevant subjects is not readily available.

(b) The approval process is often lengthy and arbitrary.

(c) Firms have inadequate knowledge of the privileges attached to cooperation.

(d) Customs formalities are complicated and the practice of making duty concessions contingent upon reciprocal treatment in the partner country is an unnecessary limitation.

(e) Enterprises dispose of inadequate investment funds and access to credits to undertake cooperation.

(f) The foreign trade system is cumbersome and frequently entails the participation of several foreign trade enterprises in negotiations.

<sup>58</sup> Reported in an article by Sandor Cseky, entitled in translation, "On Cooperation Ventures with Western Firms", in *Kulgazdasag*, 8/74, and reported in Radio Free Europe, Hungarian Situation Report/36, September 17, 1974.

The survey indicates that while the system has been decentralized, it has not been streamlined and that a complexity of regulations and red tape remain serious obstacles. The negotiation of an EWIC agreement is acknowledged to take from 18 months to six years!

In Hungarian circumstances, the incentives attached to EWIC agreements are especially important. These include: special credit terms, tax concessions, preferences in the granting of import licenses and customs privileges. Nevertheless, these stimuli appear to have failed to induce Hungarian enterprises, especially large industrial firms, to engage in major cooperative projects with Western partners. The orientation of such enterprises is primarily to domestic and CMEA markets, which are large, stable and undemanding. They may seek to obtain occasional Western technology or know-how on a cooperative basis but regard such contracts as of secondary importance.<sup>59</sup>

A Ministry of Finance decree issued in October, 1972 set forth the conditions under which Western equity investment, in the form of joint ventures with local partners, might be undertaken in Hungary.<sup>60</sup> Two principles underlie the Hungarian approach. Western equity interest in joint ventures in Hungary is generally limited to a minority share. Participation in the sphere of material production through joint ventures must be indirect. (Joint ventures may enter into contractual arrangements with Hungarian production enterprises but may not themselves engage in production.) These restrictions are seen as a means of bridging over the political and social problems which equity investment poses for a socialist country such as Hungary.<sup>61</sup> Joint ventures in Hungary are therefore limited to performing certain trading and liaison functions, usually in connection with a non-equity cooperation agreement between the Western partner and Hungarian enterprises (which are usually also parties to the joint venture). Only three joint ventures have been established since 1972. The joint venture form has been regarded in Hungary as playing a supplementary role in East-West cooperation. New Hungarian regulations on joint ventures have been announced—Decree no. 7 of the Ministry of Finance, May 6, 1977—which would appear to relax significantly the previous conditions on foreign investment in Hungary.

### Poland

While Poland follows Hungary in terms of numbers of EWIC agreements concluded, it is generally believed that they are of greater average value.<sup>62</sup> Certainly the inclusion of several major industrial projects with product payback features considerable raises the value of Polish participation in EWIC. Nevertheless, a number of large projects have more genuinely cooperative aspects.<sup>63</sup> In value terms, Poland probably ranks first among the Eastern European countries.

<sup>59</sup> The Hungarian economist Kalman Peci has argued that this is as it should be and that Hungarian participation in EWIC should be primarily through association with large-scale Soviet and CMEA cooperative projects with the West. See Peci, K., "Komplex Program és kelet-nyugati kooperáció", *Világgazdaság*, 6, 1974, summarized in *Abstracts of Hungarian Economic Literature*, 642/74.

<sup>60</sup> These are described in McMillan and St. Charles (1974) and Zoubek (1974). See also Czikos-Nagy (1976) for a recent, Hungarian view.

<sup>61</sup> Czikos-Nagy (1976, p. 5).

<sup>62</sup> Hungarian officials themselves, for example, have been quoted to his effect. See Radio Free Europe, Hungarian Situation Report/42, November 17, 1976, which gives an account of an article on cooperation which appeared in the October 16, 1976 issue of *Világgazdaság*.

<sup>63</sup> Polish agreements with *Fiat* (Italy), *Massey-Ferguson* (UK), *Berliet* (France) and *International-Harvester*, (US), for example.

While some early Polish EWIC agreements were concluded in the 1960s, growth has occurred principally in the 1970s. As mentioned earlier in this paper, Poland measures its participation in terms of volume of cooperative exports. This volume, at the end of 1974, was more than five times greater than in 1970. It nevertheless constituted only some 1.6% of total Polish exports to the capitalist countries (10% of machinery and equipment exports). By this same measure, in 1974 the FRG and the US were Poland's major cooperation partners (the US share having risen rapidly in 1973-74), followed by Great Britain, Switzerland and Sweden.<sup>64</sup>

Polish studies have indicated that many of the contracts signed, especially with the FRG, are for sub-contracting by Polish enterprises. Table 4 above shows a comparatively greater share of Polish sub-contracting, and production contracting, agreements to involve parts and components than end products (in marked contrast to Hungary, where the emphasis is reversed). Licenses are seen to play a part in more than half of the Polish agreements covered in Table 4. The active participation of the Polish foreign trade enterprise *Polimex-Cekop* in joint tendering with Western firms in third, especially developing, countries is revealed in the larger than average share of Polish agreements for project cooperation (element 15) in Table 4. Like other Eastern countries, Poland's emphasis has been on cooperation in the non-electrical machinery industries, followed by chemicals, electrical machinery and electronics and transport equipment.<sup>65</sup> Metallurgy has been the object of a larger share of Polish agreements than has been the case for most Eastern European countries, according to UN data. Intermediate and final producers goods accounted for more than four-fifths of the Polish agreements in the Carleton sample.

Poland's interest in EWIC is, like that of other socialist countries, linked to a perceived need to improve the composition of trade with the West. EWIC gets to the heart of the matter by focusing on the structure of production, on which trade specialization is based. As such, it is placed alongside other major instrumentalities: investment in export industries and improvements in the foreign trade system. Its role has been described in the following terms by the then Director of the Foreign Trade Research Institute in Warsaw and one of his senior colleagues:

We have to make efforts to better adapt our production to the needs of the highly developed countries. . . We see the need for our industry to master quickly high quality production of modern, functional, and attractive goods, which would better satisfy specific needs. We also see the necessity to improve the organization of sale of our goods on these markets and to develop modern forms of marketing and distribution.<sup>66</sup>

At the same time, it is maintained that by developing cooperation with the West, Poland will become an increasingly attractive partner in economic relations with other CMEA countries.

As noted above, much of Poland's industrial cooperation with Western especially Western European, firms has been in the form of Polish production of parts or components to be incorporated into the partner's product. Typically these are the more standardized, less

<sup>64</sup> These data are taken from Tabaczynski (1976).

<sup>65</sup> As indicated by both the ECE and Carleton samples.

<sup>66</sup> Clamaga, L. and Tabaczynski, E., "Cooperation and East-West Trade", in Foreign Trade Research Institute Collective Study (1973).

technically sophisticated components. If the relationship is successful and develops, the final product is assembled in Poland on the basis of an increasing share of components produced in Poland for marketing domestically and in the CMEA region. A portion of the output (either the final product or a component) is also marketed in the West, through the Western partner.<sup>67</sup> In this way Poland's still comparatively abundant, but relatively unskilled, labor force and natural resources are combined with Western technology and organizational know-how to lower production costs below Western European levels. Increasingly, large, well-known North American firms, directly or through their Western European subsidiaries, are licensing production in Poland on this formula to achieve marketing goals in Western and Eastern Europe.<sup>68</sup>

Poland's hard currency deficits have recently increased official pressures to emphasize the self-financing aspects of EWIC (*samos-plata*). Economists in Poland, however, have not lost sight of the basic strategy of EWIC, to sacrifice short-term balance in the interest of improved long-term export performance. The too primitive linking of exports and imports is seen as a factor which can constrain cooperation undesirably. A "more sophisticated" approach is to regard EWIC as affording longer run benefits from improved access to imperfectly competitive Western markets.

Cooperation policy has also shifted somewhat in recent years in response to the altered international energy and raw materials situation. Poland has lately emphasized inter-governmental agreements which exchange official assurances of access to Polish resources in return for Western official export credit support for the capital equipment and technology to develop them.

In contrast to many Eastern countries, in Poland there is a minimum of special regulations and institutions governing EWIC. There is no separate law on cooperation, which is regulated, as in Hungary, by existing commercial law. The Council of Ministers Ordinance on the Functions of the Minister of Foreign Trade and His Powers in Coordinating Economic Relations with Foreign Countries (July 9, 1971) included among them the responsibility for EWIC, and thereby empowered foreign trade enterprises subordinate to the Minister to engage in cooperative contracts.<sup>69</sup> A Council of Ministers decision (No. 170) issued on August 14, 1971, set forth the authorized forms and areas of cooperation. These extend beyond Definition B of Table 2 to include purchases of licenses and capital goods with payment in unrelated products. Decision 170 also sought to facilitate planning, materials supply and financing for enterprises engaged in cooperation, and increased the scope for participation by production enterprises in the negotiation and execution of cooperation agreements.

There is also no special approval process; and foreign trade enterprises can negotiate cooperation agreements on their own, as in trade relations. They are obliged merely to notify the central statistical office regularly of the volume of trade conducted under such agreements, for accounting purposes. The Ministry of Foreign Trade and

<sup>67</sup> A case study of a highly successful Polish-FRG arrangement is presented by the general director of the German firm, Rolf Hardt, in Saunders (1977).

<sup>68</sup> See Marer et. al. (1975), Chapter 8, p. 17ff.

<sup>69</sup> The Ministry has since been renamed the Ministry of Foreign Trade and Maritime Economy.

Maritime Economy plays a more direct, but still primarily advisory, role in the case of large agreements, involving several FTE's, where there can be problems of coordination. On the other hand, the Ministry has the power to intervene and advise an FTE not to enter into an arrangement which the Ministry regards as undesirable. A production association (WOG) will usually have a foreign trade enterprise within its group through which it is able to enter into cooperation arrangements with foreign firms.

There is no separate department of the Ministry to handle cooperation, although sections in various departments (e.g. machinery and equipment) can be specially charged with cooperation and licensing. In 1972, a special Department for the Promotion of Cooperation with Foreign Companies was established within the Polish FTE *DAL* to initiate, organize and mediate the negotiation of EWIC agreements. At the time, the Department was expected soon to become an independent enterprise, along the lines of the Hungarian firm *Inter-cooperation*.<sup>70</sup> However, this has not worked out; and currently there is no separate agency in Poland with special responsibility for cooperation agreements.

No special incentives for cooperation have been granted, except for the possibility of retaining a small percentage (4-5%) of foreign currency earnings beyond that applying to regular trade. Otherwise, FTE's are supposed to weigh the advantages of cooperation and regular trade by the same profitability criterion.<sup>71</sup> It has been recognized that special incentives may be needed to compensate foreign trade and production enterprises for the risks of cooperation, and to balance the attractions of production for the domestic, or for other socialist, markets. Moreover, initial profit calculations may become obsolete, given rapidly changing world conditions, if negotiations are long drawn out.

In the early 1970s, the Polish government examined the desirability and practicability of extending cooperation to the form of joint equity ventures in Poland. In 1973, following the publication of joint-venture decrees in Hungary and Romania, Poland seemed poised to follow suit. However, it backed off, explaining that no special legislation was required, and that any foreign proposals for arrangements of this nature would be considered. By May 1976, however, it had apparently decided that special regulations were needed and that the time was ripe to issue them.

In so doing, it has in some respects gone farther than other socialist countries, including Yugoslavia; and has added still another "variant" to the set of Eastern European joint venture formulae. The first two decrees issued in May, 1976<sup>72</sup> are in fact not limited to joint ventures at all. They permit foreign investment in the form of wholly owned companies in Poland. However, such investment is limited to certain sectors: small-scale industry, domestic trade and consumer services. These regulations appear to be designed primarily to attract hard currency funds from the Polish diaspora in the West, and to be linked to parallel measures to encourage more domestic, private activity.

<sup>70</sup> *Eastern Europe Report*, July 19, 1972.

<sup>71</sup> This information is based on author interviews with Ministry officials in March, 1975.

<sup>72</sup> Council of Ministers Decree of May 14, 1976 and Ministry of Finance Decree No. 109 of May 26, 1976.

in consumer services. The third decree,<sup>73</sup> while not limited by sector, does specifically refer to the joint venture form.<sup>74</sup> On the other hand, it appears to be more flexible than joint venture regulations elsewhere in Eastern Europe, setting no ceiling on foreign equity participation.<sup>75</sup> In early 1977, the negotiation of several joint ventures (including a Polish-UK venture in shipping and a Polish-Australian venture in food processing) under the new regulations were reportedly close to conclusion.<sup>76</sup>

### *Romania*

Romania's commitment to EWIC is perhaps most strikingly illustrated by the creation in 1974 of a new, main department for cooperation in the renamed Ministry of Foreign Trade and International Economic Cooperation (MFTIEC). This reorganization, however, merely reflected a priority which had been formally established several years earlier by Law No. 1 of March 17, 1971.

This law, which has since remained the cornerstone of Romania's foreign trade system, reflected the important changes which had been instituted in the organization of Romania foreign trade in the preceding several years, and which were intended to facilitate Romania's increasing commercial orientation towards the West. Law No. 1, formally titled, "On Foreign Trade and Economic and Technical-Scientific Cooperation Activities in the Socialist Republic of Romania" treats cooperation alongside trade, as a major sphere of external economic relations. The forms of cooperation are not defined in the law, except that it is stipulated that they are to include joint companies in Romania (see below). The Law specifies (Chapter V, Art. 55) the objectives of cooperation in terms which may be paraphrased as follows:

- (a) To intensify Romania's participation in the international division of labor through cooperation with countries "regardless of their socio-political systems";
- (b) To promote the growth of the national economy;
- (c) To improve the structure of trade, especially exports;
- (d) To introduce the latest and most effective foreign technology, in order to raise the technical level of domestic production; and
- (e) To enable Romania to play a more active economic, commercial and financial role abroad.

Romania has in practice defined cooperation broadly. This fact, combined with high-level pressure to record as many cooperation agreements as possible, has resulted in Romanian official figures for numbers of agreements signed (some 250 in 1976) which are considerably higher than the estimates presented in Table 3, based on the ECE definition.

Given the stage of development of the Romanian economy and the continued emphasis on rapid industrialization, it is scarcely surprising that EWIC in the form of acquisition of plant and equipment, with at

<sup>73</sup> Ministry of Finance Decree No. 110 of May 26, 1976.

<sup>74</sup> While no reference is made in the decree to other legislation, it presumably is intended to clarify conditions and procedures on the basis of legal principles regarding foreign investment established in pre-war Polish legislation.

<sup>75</sup> The form and size of joint ventures are also left unspecified. A ten-year limitation is set on the life of such arrangements, subject to renewal.

<sup>76</sup> *Business Eastern Europe*, January 7, 1977, and *East-West Markets*, November 1, 1976.

least partial payment in resulting product, should play a major role in Romanian agreements.<sup>77</sup> In fact, credit extended in the form of equipment and repaid in the form of products and services (a method of long standing in CMEA regional development programs) was proposed in the Romanian submission to the first session of UNCTAD in 1964, and became known as the "Romanian formula". Other principal forms of Romanian EWIC include repayment of licenses and know-how in parts and components, subcontracting and assembly of components supplied by the Western partner. Romanian payment of technology, capital goods and components is also frequently made in agricultural products.

The machine-building industries (especially non-electrical machinery and transport equipment) and chemicals have been the principal objects of Romanian cooperation agreements with Western partners. This emphasis represents not only current, but past, priorities, since these are the industrial sectors in which the Romanian economy is most advanced, and therefore most capable of meaningful cooperation with Western firms.

Other than Law No. 1, already cited, no special Romanian legislation governs non-equity cooperation, and the conclusion of the several contracts which usually make up an EWIC arrangement follows normal commercial and juridical practice.<sup>78</sup> Because of the centralized nature of the Romanian economic system, cooperation agreements (both general and specific) are often concluded with Western firms at the ministerial level. Foreign trade enterprises in Romania are by no means uniformly subordinated to the MFTIEC. Many are attached directly to industrial ministries or to their subordinate production associations ("centrals"). In cases where industrial ministries or their subordinate agencies are partners to cooperation agreements with Western firms, the MFTIEC's role is an indirect one. Together with the Government Commission for Economic and Technical Collaboration and Cooperation, it coordinates EWIC at the national level, including the inputs of various agencies such as the Ministry of Finance and the Romanian Bank for Foreign Trade.

Law No. 1 also created the possibility of establishing joint equity ventures or mixed companies in Romania.<sup>79</sup> These have been the focus of national and international interest in terms of Romanian EWIC opportunities. Romania was the first CMEA country to introduce this possibility, and has continued to regard joint ventures as the "highest form" of cooperation. The nature of joint ventures in Romania, the Romanian government's motives in encouraging them and its initial experience with them, have attracted considerable attention and have been described and analyzed in the English-language literature.<sup>80</sup>

The special feature of the Romanian approach is that it permits the formal establishment of joint companies which are able to engage directly in production operations in Romania.<sup>81</sup> In order to accom-

<sup>77</sup> Based on Romanian statements, and substantiated by both the ECE and Carleton samples.

<sup>78</sup> See the discussion of Romanian foreign trade law by Jay Burgess, in Starr (1974).

<sup>79</sup> In November, 1972, two important decrees were issued, specifying the organization and operation of joint companies in Romania and the taxation of their profits.

<sup>80</sup> See McMillan and St. Charles (1974), Zoubek (1974) and Burgess (1974).

<sup>81</sup> In these respects the Romanian approach contrasts with the approaches to joint ventures adopted by Hungary and Yugoslavia. See McMillan and St. Charles (1974), Chapter 4.

modate them in the centrally planned Romanian economy, Romania has dealt with them in what has come to be known as the "enclave" formula. These companies are not treated like other enterprises in Romania, but stand administratively outside the planned economy, dealing with it like foreign firms through Romanian foreign trade enterprises and maintaining accounts in hard currencies.

Although Romanian legislation permits joint ventures in agriculture, construction, tourism, transport and trade, technical and scientific research and other services, emphasis has been on export-oriented ventures in industry, especially in the machine-building and chemical branches. By the end of 1976, six joint venture agreements had been approved, one each with firms in the US, FRG, Italy, Japan, France and Austria. The Franco-Romanian joint venture, for the production of medical equipment, is reportedly defunct.<sup>82</sup> On the other hand, the slow growth of joint ventures in Romania since 1972 has been given a boost by the recent announcement of a large-scale agreement with Citroën of France to build a jointly owned plant for assembly in Romania of a new Citroën model (a small passenger car) for the Romanian and Western markets.<sup>83</sup>

### *Yugoslavia*

Yugoslav policy with regard to industrial cooperation is based on considerations similar to those present in other Eastern European countries, and in many developing countries. Through acquisition and assimilation of Western technology and know-how, and creation of direct and continuing production and marketing links between individual Yugoslav and Western firms, industrial cooperation is seen as a means to raise the level, and improve the structure, of Yugoslav integration into the international division of labor.<sup>84</sup> The object has been less the attraction of outside capital than the desire to have continued access to the latest technology and to improve, through close contacts with foreign partners, the organizational efficiency of the Yugoslav enterprise.

These general motivations have been supplemented by special considerations, more particular to Yugoslavia. The interest in attracting Western participation in non-equity forms of industrial cooperation and in joint ventures in Yugoslavia, is part of a general policy thrust, stemming from the mid-1960's towards the goal of a market socialist economy. The relaxation of controls on international factor mobility coincided with gradual reductions in controls on external and internal, trade and on domestic investment. Permission, and encouragement, of labor outflows and capital inflows were in consonance with market principles and facilitated attainment of marketization goals. Moreover, they were inter-related. If emigration eased employment problems in the short run, industrial cooperation and foreign investment offered the prospect of longer run domestic employment of Yugoslav workers employed abroad. These employment goals were linked to a further aim. Industrial cooperation and joint ventures were perceived as potential instruments of regional development policies and attempts:

<sup>82</sup> *Business Eastern Europe*, December 24, 1976.

<sup>83</sup> *Business Eastern Europe*, January 7, 1977 and *East-West Markets*, January 10, 1977.

<sup>84</sup> Cf. Bicanic (1973, Chapter 8).

were made (primarily through tax incentives, but also through procedures for federal coordination) to ensure a desired regional impact.

Domestic enterprise autonomy makes legislation the principal mechanism through which national policies on industrial cooperation and joint ventures can be expressed and applied. Two laws adopted in early 1973, attempted to consolidate earlier legislative acts. These two laws remain the basic legislation in both areas.<sup>85</sup> The Federal Government also regulates new agreements through procedures for central approval and registration of contracts; the Federal Committee for Energy and Industry has been charged with coordinating these procedures.

A federal decree on "long-term production cooperation between domestic organizations of associated labor and foreign parties" was issued on January 7, 1973. It defines production cooperation and establishes conditions, procedures and incentives for it. The emphasis is on production specialization and mutual deliveries of industrial components, and the decree seeks to ensure that both new technology and expanded export opportunities accrue to the Yugoslav partner.<sup>86</sup> Agreements are to be concluded for a term of not less than five years, and incentives are provided in the form of special privileges granted to Yugoslav partners in the use of hard currency earnings derived from production cooperation.

A Yugoslav submission to the United Nations reported the conclusion (since 1967, and as of mid-1976) of 478 long-term production specialization agreements with foreign partners<sup>87</sup>. Firms based in Western Europe were the partners in four-fifths of the agreements signed, with FRG partners the most prevalent.<sup>88</sup> An overwhelming proportion (81%) of these occurred in the engineering, or machine-building, industries (45% of total in non-electrical machinery and equipment, including machine tools, and 27% in electronics and electrical equipment). A recent Yugoslav study, indicates that the 1973 decree has had some impact on the rate of participation in industrial cooperation; it reports that one-third of all agreements were concluded in the three years following the decree<sup>89</sup>.

Yugoslavia was the first socialist country to permit and encourage foreign equity investment in the domestic economy, in the form of minority participation in joint ventures. As the first socialist country to have followed this course, and as the socialist country with the most extensive joint venture record to date, Yugoslavia's experience has attracted considerable international attention.<sup>90</sup> This literature documents the legislative conditions imposed by Yugoslavia, and their evolution since 1967. A joint venture must take place within the frame-

<sup>85</sup> Both laws were modified by decrees issued in June and October, 1976, which reportedly tighten conditions for industrial cooperation and foreign investment, to ensure that they in fact serve the intended purposes of strengthening the domestic economy and expanding exports. Preliminary details of these new decrees were reported in *Business Eastern Europe*, July 9 and November 12, 1976.

<sup>86</sup> In 1972, the Federal Chamber of Economy set up an office to promote the use of excess production capacity in Yugoslavia by foreign firms; and by mid-1974, well over 1000 contracts had reportedly been signed, more than half in the machine-building industries. (*Eastern Europe Report*, August 25, 1972 and *East-West Markets*, April 22, 1974.) Through the 1973 decree on production cooperation, the Yugoslav government hoped to encourage partners to move from such simple subcontracting to more ambitious forms of cooperation.

<sup>87</sup> UN, ECE, Trade/AC.3/R.8/Add. 2, September 24, 1976.

<sup>88</sup> Plötz (1974) analyzes FRG participation in production cooperation and joint equity ventures in Yugoslavia.

<sup>89</sup> Reported in *Eastern Europe Report*, June 18, 1976.

<sup>90</sup> Sukijasovic (1973), Plötz (1974), McMillan and St. Charles (1974), Zoubek (1974), OECD (1975), and Leamer (1976) are the major studies.

work of a Yugoslav enterprise; and the "organization of associated labor" (the basic intra-enterprise unit of Yugoslav workers self-management) is here, as in the case of production cooperation, the level on the Yugoslav side at which the relationship occurs. The conditions are set forth in the "Law on Investment of Resources by Foreign Persons in Domestic Organizations of Associated Labor", promulgated on April 13, 1973.

Yugoslav official sources report that 144 joint investment ventures had been concluded with foreign partners between January 1, 1967 and July 1, 1976. A small proportion (5-6%) were either never implemented or have since been terminated. In contrast to the lagging US role in non-equity industrial cooperation agreements (in Yugoslavia and elsewhere in Eastern Europe), US firms have been the principal partners in joint venture activity, representing 23% of foreign investment in Yugoslavia (in value terms), followed by the FRG (21%) and Italy (17%). The principal industrial sectors in which these investments have occurred are (by number of agreements): electrical and electronics equipment (25%), non-electrical machinery and equipment, including machine tools (24%) and chemicals (22%).

Many of these foreign investments have been small in scale. Some three-fourths of the Western partners involved have invested less than one million dollars. More than 80% of investment consists of capitalized technology and know-how rather than direct cash or investment goods.<sup>91</sup> On the other hand, value figures probably understate the significance for the Yugoslav economy of the know-how obtained; and neglect important advantages to Yugoslav enterprises in terms of improved access to international markets.<sup>92</sup> There are some signs that the reluctance of Western firms to risk large amounts of capital in the Yugoslav economy is being gradually overcome. The participation of *Dow Chemical* (US) in two joint ventures in Yugoslavia may be a turning point. In any event, the second venture, concluded in 1976 for a \$700 million petrochemical complex on the island of Krk, near the industrial port of Rijeka, in which Dow has contributed 49% of the equity, is a landmark: the largest US investment and the largest joint venture in Eastern Europe.

Despite tax incentives and the attractions of cheaper labor costs, Yugoslavia has failed to attract significant Western participation in industrial cooperation and joint ventures in the less developed regions of the country. As of mid-1976, 84% of production cooperation agreements and 75% of joint venture contracts, signed since 1967, were located in the more advanced republics of Slovenia, Croatia and Serbia. Slovenia (the richest) alone accounted for about one-third of the agreements in each case.<sup>93</sup>

The question of what impact workers self-management has on industrial cooperation and joint investment in Yugoslavia (and vice-versa) is a contentious one. The problem of potential clashes of interest is most acute in the case of joint ventures.<sup>94</sup> Firms interviewed by

<sup>91</sup> The June, 1976 decree seeks to raise the level of foreign contributions and increase their tangible components.

<sup>92</sup> Their understatement in value measures of foreign investment does not imply that these goals have been realized to a satisfactory degree. Yugoslav concern that they have not is reflected in new conditions imposed in the June, 1976 decree.

<sup>93</sup> *Delegatski Vjesnik*, as reported in *Eastern Europe Report*, June 18, 1976.

<sup>94</sup> The question is analyzed, and some legal solutions proposed, in Glickman and Sukijasovic (1971). See also Plötz (1974, p. 146ff.).

the author tended to discount the problem.<sup>95</sup> While workers must approve the formation of a joint venture and basic policies relating to it, they play little role in day-to-day operations. This suggests that any negative impact is exerted on potential investors rather than on the functioning of existing ventures.<sup>96</sup> On the other hand, there has been concern in Yugoslavia that joint ventures may contribute to the erosion of effective self-management, and the new decree effective in June, 1976, specifies in greater detail the self-management rights to be retained by the Yugoslav partner.

## 6. EXPERIENCE, TRENDS AND PERSPECTIVES

The preceding sections have sought to explain what EWIC is, and how it has manifested itself in different Eastern European countries. The concept has been seen to have strong intuitive appeal, but to what extent has it lived up to its promise? Has it in fact provided a functional solution to many of the problems which have traditionally constrained East-West trade?

Survey research to date has been directed primarily at the motivation, negotiation, form and content of EWIC agreements. Little systematic evidence has been gathered on the operational experience of partners to these arrangements.<sup>97</sup> The experience of some Eastern and Western countries is extensive enough to support such analysis. Systematic research in this area is fraught with practical difficulties, however.<sup>98</sup> Most of the insights to date are based upon partial evidence in the form of case studies.<sup>99</sup>

In this concluding section, we shall survey some of the major operational issues which available evidence on experience to date suggests as important. Lest the patient reader who has reached this point in a long paper cry "enough", it should be explained that we shall only briefly touch on relevant points. Some treatments of operational problems is necessary in order to establish a balance with the theoretical advantages of EWIC emphasized in Section 3.

*a. Problems of Western market access.*—While EWIC agreements undoubtedly serve to increase the non-price competitiveness of Eastern products and to improve entry to imperfectly competitive markets in the West, they by no means resolve all problems of access to these markets. Eastern complaints center on these problems.

Trade and technology transfer under EWIC agreements continue to face formal Western import barriers and export controls. While Western tariffs and quotas have on average been significantly reduced, they remain important in some sectors. They and other non-tariff barriers hit hardest at manufactures, which are the principal object of EWIC agreements. In the field of customs duties, preferential

<sup>95</sup> A recent Business International report confirms this, stating "few Western firms with practical experience report clashes with the workers' council representatives" (*Business Eastern Europe*, July 9, 1976).

<sup>96</sup> Plötz (1974, p. 158), while confirming the absence of problems to date, reports concern on the part of German firms interviewed that the tendency towards increased decentralization within Yugoslav enterprises may lead to difficulties in future relations.

<sup>97</sup> The Indiana and Hamburg studies, however, have sought to cover the operation of agreements. See Chapter 9 of Marer et. al. (1975), and Bolz and Plötz (1974), p. 109ff.

<sup>98</sup> For the most part the data lie in an area regarded by all parties as highly sensitive and confidential, and therefore are shrouded in commercial secrecy. What evidence is available is not only partial, but biased: it is usually those cases whose results are exceptional that are made public. The absence of systematic evidence is all the more serious because the available case study material indicates a high degree of diversity among participating firms and enterprises, in terms of both their goals and their experience.

<sup>99</sup> Business International has documented some useful case studies in its reports. Several interesting studies are included in Saunders (1977).

treatment for industrial cooperation has not been introduced in any Western country. On the Western side, the possibilities of tariff advantages have been limited to existing facilities, such as occasional exemptions and relief, temporary admission procedures, and so forth.<sup>1</sup> These have been of limited usefulness. The Eastern countries have sought to gain improved access for cooperative exports through bilateral agreements with Western governments, and have succeeded in some instances in obtaining special quota exemptions for such products. Eastern countries have also granted customs preferences, especially in the form of duty-free entry for Western intermediate products which are re-exported after processing.<sup>2</sup>

In these circumstances, shifts in Western commercial policy can have an important impact on existing cooperative relationships. The special trade status negotiated in 1972 between Austria and the EEC, reduced the competitiveness of Hungarian exports to Austria, many of which are conducted under cooperation agreements. In addition to the change in tariff structure, new rules of origin have affected the Hungarian content of goods produced cooperatively with Austrian firms.<sup>3</sup>

Eastern countries also complain of the frequent failure of Western partners to live up to purchase commitments under EWIC agreements. The 1974-75 recession in the West served to reinforce any such tendencies. In some instances, the bankruptcies of Western partners have brought an abrupt and untimely end to cooperative plans and hopes.<sup>4</sup>

*b. Accommodation with Eastern planning systems.*—While the planned nature of the Eastern economies provides advantages to cooperating partners, it is also the source of major operational problems. EWIC seeks to link directly partners operating within fundamentally different economic systems, and thereby creates special problems of coordination.

In principle, planners can allocate required inputs at fixed terms; in practice, uncertainties of supply and deficiencies in quality are the subject of recurrent complaints by Western firms. The Eastern response has been to accord EWIC special treatment within domestic and foreign trade plans and to establish material reserves from which cooperating enterprises may draw.

The Eastern system of priority planning can create unanticipated shifts in demand as severe as those encountered in a market system. There have been instances where this has disrupted EWIC arrangements.

While cooperation agreements are intended to cut through the bureaucratic buffer which separates Eastern production units from foreign firms, foreign trade enterprises remain in most cases the immediate parties on the Eastern side. EWIC agreements must contend with other problems of ministerial jurisdictions which they inevitably cut across.

<sup>1</sup> For details, see UN ECE (1973) and also "Economic and Trade Policy of the ECE Countries with Regard to Industrial Co-operation," note by the Secretariat, October 5, 1976 (TRADE/AC.3/R.5).

<sup>2</sup> The membership in GATT of several Eastern European countries has constrained their ability to accord tariff preferences to goods falling under EWIC agreements.

<sup>3</sup> See Horchler (1975). The trade and cooperation of other Eastern European countries were presumably also affected. Moreover, other EFTA countries negotiated agreements with the EEC at the same time as Austria.

<sup>4</sup> The bankruptcy, for example, of *Anker-Werke AG* (FRG) has disrupted an agreement, involving partners in Hungary and the CSSR, which had been often cited as a model arrangement.

Even in the more centralized Eastern economies, there has been a divergence between the interests of the government and those of the enterprises with regard to EWIC. Enterprises have generally lacked the resources, autonomy and incentive to engage in EWIC; and a solid basis at the enterprise level is essential to viable cooperation. Experience has shown that inter-firm cooperation cannot be successfully imposed from above. The problem here is analogous to that of enterprise innovation in the Eastern systems. Like innovation (of which it is in fact a form), EWIC involves risks to enterprises which are inadequately rewarded. In this respect EWIC agreements contrast with domestic and CMEA contracts which, once regularized, tend not only to be more "profitable" but to take care of themselves. The problem of adequate enterprise incentives is of concern in all the Eastern European countries and we have reviewed various country responses in Section 5.

Effective transfer of applied technology is hindered by the Eastern tendency to separate production and R&D functions in different organizational entities. Neither the foreign trade nor the production enterprises which are party to EWIC agreements on the Eastern side may have the interest or the technical capability to ensure that Western technology is assimilated.<sup>5</sup>

Many of these problems reflect the fact that EWIC attempts to establish links with foreign firms of a kind unfamiliar even between domestic enterprises in the more centralized Eastern economies.

*c. Limitations on joint management.*—Shared management of pooled assets has proved more of a promise than a reality in most EWIC agreements. Here systemic differences have compounded the usual cultural and linguistic barriers to effective joint management found in international industrial cooperation in other contexts. Important operational decisions in the East may be taken at levels above the enterprises who are parties to EWIC agreements. The requirements of industrial secrecy and the complexity of bureaucratic channels in the East inhibit free communication, which is the essential basis of coordination. While there are important exceptions, successful cooperation has tended to be limited in these circumstances to those simpler forms and products which have demanded minimal joint management and where on-site quality control has not been required.

*d. Payment problems.*—These too have deep systemic roots. The absence of operational exchange rates linking domestic and foreign prices in Eastern Europe complicates the negotiation of price terms for goods and services obtained with the Eastern economies. It also creates difficult problems of accounting under EWIC agreements. The inconvertibility of Eastern currencies has also inhibited the use of EWIC to expand regional sales by the Western partner. Unless such sales can be made for hard currencies, the Western partner's income from such expansion realizable in hard-currency tends to be tied to the volume of hard-currency earnings from exports to the West under the agreement. While Eastern partners have been anxious to receive at least partial payment for the products of EWIC marketed in the CMEA region in hard currencies or in hard goods, this is often

<sup>5</sup> Hewett (1975) finds evidence of this in Hungary, and one would expect the effect to be stronger in more centralized systems in Eastern Europe.

possible only if they are sold at substantial discounts on world market prices.<sup>6</sup>

*e. Compatibility of objectives.*—Operational problems have also arisen because of the inconsistency of objectives pursued through EWIC. Some of the more important sources of conflict can be briefly cited. Obviously both partners cannot enter into a cooperative agreement solely for the purpose of expanding exports. We have referred to the way in which the need to maintain a balance of hard-currency payments under an agreement can inhibit regional sales expansion. For the Eastern partner, there may also have to be a trade-off between self-financing objectives and the desired infusion of Western plant and technology. The Eastern desire for the latest technology, and the priority placed in the East on EWIC agreements in capital-intensive industries, can conflict with the Western aim of transferring to Eastern locations relatively labor-intensive processes, based on comparatively standard technology. Finally, the problem of coordinating EWIC and CMEA regional specialization goals has not been solved; and the different payments systems, planning procedures and enterprise incentives which are attached to each impede such coordination.

Successful cooperation then is dependent upon the avoidance or resolution of these operational problems. The success of a particular agreement can usually be explained in terms of such factors as the basic compatibility of the specific objectives pursued, strong technical and commercial complementarities between the partners, partner autonomy on the Eastern side and scope for direct contacts. These considerations also explain the evolutionary character of many successful cooperation agreements, which develop as operational obstacles are surmounted. Finally, the human element in this evolutionary process should not be underestimated. Personal rapport between key executives, based on mutual understanding and respect gained through shared experience, can often overcome serious institutional impediments.

Available information indicates that the numbers of new cooperation agreements concluded in a given year have grown rapidly since 1968, albeit from a very low initial level.<sup>7</sup> From 1970 through 1974 there seems to have been a consistent upward trend in this rate of growth. The ECE reports a slight downward trend after 1974, which it attributes to the recession in the West and feels may therefore be temporary.<sup>8</sup>

These observed trends are probably valid, although in the absence of adequate information on the universe of EWIC agreements, they are based on sample data. Apart from the difficulty of precisely dating complex agreements which usually take several years to negotiate, these measures have further important weaknesses. They do not measure growth in the value of EWIC. Even in terms of numbers, they are gross rates of growth, since they do not take account of agreements which have become dormant or have been formally terminated. Most importantly, they fail to capture the internal growth of existing agreements and the progression to new and more complex forms.

<sup>6</sup> EWIC can, however, facilitate Western partner sales outside the agreement precisely for payments reasons. A CMEA buyer may be more willing to purchase equipment, for example, because replacement parts are available in the region on clearing account as the result of an EWIC agreement.

<sup>7</sup> See Table C and associated discussion in McMillan (June, 1976); see also UN, ECE (1976, p. 2).

<sup>8</sup> UN ECE (1976).

It is quite possible that there might have been some leveling off in the growth of new EWIC agreements, even in the absence of recession effects.<sup>9</sup> This writer believes that EWIC will nonetheless continue to develop, and will not prove to have been a transitory phenomenon of the early 1970s. It will grow despite the operational problems and limitations cited above. The forces motivating EWIC, outlined in Section 4, are not temporary. Moreover, international industrial cooperation is a general phenomenon, and its extension to the East-West context can be viewed as a manifestation of the increasing incorporation of East-West relations into the mainstream of the international economy. The future growth of EWIC seems likely to lie as much in the expansion and development of existing arrangements as in the establishment of new links. While the growth of equity forms has been slow, there are signs that they will continue to develop and that the joint venture possibility will spread to other countries in Eastern Europe. Joint companies in the West also seem likely to become increasingly important.

Ironically, systemic effects both impede and stimulate the growth of EWIC. Differences in socio-economic systems lie behind many of the operational problems reviewed in the preceding pages. One may possibly even question, as one Eastern writer has, how extensively forms originally developed in the context of private ownership and free flows of capital and commodities can be applied to East-West relations, where on the Eastern side state enterprises function in the framework of state planning and control.<sup>10</sup> On the other hand, EWIC may also be regarded as a pragmatic response to the systemic factors which have hampered traditional East-West commercial relations.<sup>11</sup> Moreover, the extra-market character of EWIC appeals to planners. A Czechoslovak official has expressed this in the following way, "Trade in products for unknown consumers is usually *short-term, competitive and subject to chance*. The advantages of cooperation are its *planned, far-seeing character, guaranteeing* benefits to both sides for many years."<sup>12</sup>

Most of the attention in studies on EWIC has been directed towards macro-economic considerations in the East and to micro-economic motivations in the West. Western governments have also formally encouraged EWIC, especially through conclusion of bilateral cooperation agreements with Eastern governments, establishment of special machinery under these agreements and extension of active credit policies in support of EWIC. They have done so in the belief that these measures would establish an environment for a more stable development of East-West commercial relations. Concern for future supplies of energy products and other raw materials has further contributed to their interest in industrial cooperation with Eastern countries.

At this juncture, with the attainment of considerable practical experience in EWIC, other policy issues arise. Are government programs in support of EWIC worth the time and effort? In what ways? If EWIC

<sup>9</sup> While slack demand and general uncertainty may have served to discourage Western firms from embarking on new ventures in Eastern Europe, the recession also increased the relative attractiveness of Eastern locations and markets. There is reason to believe that the downward trend after 1974 may have also been caused by the redirection of Western investment interest toward the oil-producing countries in the Near East.

<sup>10</sup> Csikos-Nagy (1976, p. 3).

<sup>11</sup> Cf. McMillan (July, 1976, section E).

<sup>12</sup> Rudolf Kobza, as quoted in *Business International, Doing Business with Eastern Europe*, 1976, IX-3: (Emphasis added.)

is an effective channel for West to East transfer of technology, what are the implications in terms of strategic considerations, in terms of relative East-West international commercial competitiveness? What are the employment effects of transfer of production to Eastern locations? Is the inter-firm bilateralism which EWIC promotes desirable, and what are its implications for Western anti-trust policies? Examination of these policy issues is beyond the scope of this paper, although we have tried to provide a sound informational and analytical base on which they can be usefully explored.<sup>13</sup>

Regardless of possible overstatement of the current significance of EWIC in the estimates of Table 3, hundreds of enterprises in Eastern Europe have now established relationships with Western companies which provide not only for licensing of industrial processes and products, and for transfer of know-how, but for continuing production and marketing cooperation. A great deal more systematic research is required to assess the impact of these relationships on the partners, on their economies and on their economic systems. In no other area would cooperative research between East and West seem more necessary, more appropriate, and more in the interests of both sides.

### I. INTRODUCTION

Commercial contacts between the industrialized nations of Eastern Europe, including the Soviet Union, have developed rapidly. As trade has expanded, the forms of commercial intercourse also have become increasingly varied and complex. While East-West trade in the sixties was characterized primarily by straight buying and selling, East-West trade in the seventies focuses upon economic and industrial cooperation. Prodded by a desire to expand and diversify their national economies, to penetrate new markets, to bridge an ever-widening industrial technology gap with the West, to compensate for their lack of investment capital, and to narrow their trade imbalance with the West, these communist countries have developed new forms of economic cooperation with Western nations, including equity joint ventures.

The approach to economic and industrial cooperation varies from country to country depending on its motivations and particular economic aims. For example, to encourage long-term infusion of Western technology, management and capital, Romania has sanctioned the formation of joint venture enterprises on its national territory. While other communist countries do not permit the full joint ownership and management rights embodied in such joint ventures, they are receptive to other types of economic and industrial cooperation, and in some instances have adopted modified joint venture schemes. Hungary, for instance, has passed a law which permits economic cooperation between Hungarian and foreign firms whereby there is no equity ownership by the foreign investor, but the foreign party is allowed to invest in the joint company, participates in management and shares in company profits. Bulgaria, on the other hand, will not allow Western capital investment on its territory but permits profit sharing from joint cooperation activities. Most recently, Poland passed legislation which opens the door to foreign investment in certain domestic industrial enterprises.

\*Mr. Pompiliu Verzariu, Jr., is a business counselor and Jay A. Burgess is a country specialist in the Bureau of East-West Trade, U.S. Department of Commerce.

Because the term joint venture is used so loosely both in the United States and throughout the world, we must establish definitions for it and other basic cooperation concepts in East-West trade. In this text, we shall use the term "joint venture" to refer only to equity joint ventures where the foreign investor obtains actual ownership rights in the joint company. All other forms of non-equity cooperation—some of which have been called joint ventures, such as the Hungarian example given above—will be referred to generally as joint cooperation agreements or, more simply, joint cooperation.

## II. THE ROMANIAN EXAMPLE

In March 1971, Romania enacted Law No. 1 on "Foreign Trade and Economic and Technico-Scientific Cooperation Activities" which provided, in part, for the establishment of equity joint ventures between Romanian and foreign companies, to operate as corporate bodies under the laws of Romania. This law included only brief and very general provisions, and was intended only as a legal framework upon which contractual negotiations between potential partners would be based. Specifically, Law No. 1 provides for direct contact between Romanian companies and enterprises and foreign companies; permits the formation of joint ventures based in Romania; and guarantees the foreign party's contribution to the joint venture as well as the repatriation of convertible currency profits by the foreign investor.

In response to urgings from Western firms for more specific guidelines and detailed legislation concerning the establishment of joint ventures on Romanian soil, the Government issued two decrees in November 1972. They are Decree No. 424 on the "Constitution, Organization and Operation of Joint Companies in Romania" and Decree No. 425 regarding "Tax on Profits of Joint Companies Constituted in Romania." The Romanians have made clear that these are to be the basic laws regarding joint ventures and there are no present plans to elaborate upon them further. Therefore, what is not found in these legislative acts must be negotiated and written into the individual joint venture contracts.<sup>1</sup>

At present, nine Western companies, Control Data Corporation of the United States, Renk Zahnraederfabrik of West Germany, Romalfa of Italy, Dainippon of Japan, L'Electronique Appliquee (now defunct), Citroen of France, Kohmaier of Austria, General Maritime Co. of Libya and the German-Dutch aircraft company VFW-Fokker have established joint ventures in Romania. Several other Western and U.S. companies are currently in the process of negotiating joint venture agreements.

### *A. Company Activity and Forms of Association*

Decree No. 424 stipulates that joint cooperation may take place in a broad range of economic sectors including industry, agriculture, construction, tourism, transport, and scientific and technological research. The Romanian objectives to be achieved through the joint venture's activity are: (1) expansion and modernization of existing

<sup>1</sup> For a comprehensive review of Romanian Joint Companies, see Verzariu, P. and Burgess, J. A., *Joint Venture Agreements in Romania: Background for Implementation*. Bureau of East-West Trade, U.S. Department of Commerce, Washington, D.C., 1977.

industries; (2) introduction of new technologies; (3) improvement of the technical quality of goods and services; (4) promotion and development of research activities; (5) introduction of modern management methods and production techniques, including training of Romanian managerial and technical personnel; and (6) the promotion of exports including the expansion of markets, diversification of export products and development of collaboration activities in third markets.

Romanian officials point out that, in their view, a principal aim of the joint venture is to develop or increase exports to convertible currency markets. A prospective Western investor must recognize this fact from the outset and determine if such exports to convertible currency markets are to his advantage. A potential problem exists here for the investor in that the joint venture's products could possibly compete in third markets with the Western investor's production from existing plants.

While production for export to convertible currency areas is an objective of the Romanian authorities, penetration of Eastern European markets is a common objective of Western investors. Export penetration of COMECON<sup>2</sup> countries, however, creates special problems, particularly with respect to pricing and profits, which should be addressed in the contract of association.

Joint ventures enjoy the same legal status as Romanian corporate bodies and are governed by the laws of Romania and by the individual company statutes and contracts of association under which they organize. These governing documents are further elaborated upon in appendices which are attached to the statutes and which form an integral part of the total agreement.

A joint venture can be either a joint stock company or a limited liability company. The two types of companies, joint stock or limited liability were proposed in Decree No. 424 because they represent common forms of business association in the West.

The Romanians state that there is no preference on their part regarding the form of association the negotiating parties may choose. Both forms have been adopted by foreign investors in existing joint ventures in Romania, the choice reflecting the manner in which the Western firms are structured in their home countries. For example, the joint ventures established with Control Data, Romalfa, Dainippon; and L'Electronique Appliquee are limited liability companies, while those with Renk and Kohmaier are joint stock companies.

The organizational structure of joint stock and limited liability companies is similar. Both companies operate under the directives of a General Assembly of Partners or Shareholders ("General Assembly"). The General Assembly, among other things, establishes the policies of the joint venture; approves its organizational structure and activity schedule; appoints or dismisses its officers; agrees on the collective labor contract; approves, amends or rejects the balance sheet and income statements; and decides whether to raise new capital. Decisions by the General Assembly regarding changes in the social capital, amendments in the joint venture's contract of association and statutes, and mergers or dissolution and liquidation of the venture require approval by the Romanian Council of State.

---

<sup>2</sup> Council for Mutual Economic Assistance (comprised of Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, Poland, Romania, USSR, Cuba, and Mongolia).

The operations of limited liability joint ventures are directed by the company's Managing Committee in conformity with the decisions and policies set by the General Assembly. On the other hand, the joint stock ventures are responsible to an Administrative Council which also implements the directives of the General Assembly. A Romanian general manager, appointed by the Managing Committee or Administrative Council, runs the daily operations of the joint venture.

It is interesting to note that by virtue of articles which the Romanians propose to include in the statute of a joint stock venture, the liability of that venture is in fact, limited. Thus, the joint venture's property cannot be attached through the personal debts or obligations of the stockholders, and claims by creditors against individual stockholders can be made only on that portion of the company's profit owing to that stockholder or, upon liquidation of the company, on the amount due the stockholder.

### *B. Formation and Organization of the Joint Company*

In order to form a joint venture the parties must first carry out a "study of technical-economic efficiency." Based on the results of this study, the parties draft a memorandum of association expressing their intent to form a joint venture, the economic justification for so doing and the objectives and purpose of the company. This memorandum has no standardized form and, in fact, may consist of a simple exchange of letters indicating an intention to form a joint venture or even a general agreement of economic cooperation, of which a joint venture represents only a part of the envisioned cooperation.

After these two steps have been taken, the parties draw up the contract of association and statutes of the joint venture. The Romanian party next must go through elaborate approval procedures before entering a joint venture. Before execution, the proposed contract and statutes must be reviewed for economic efficiency and approved by the State Planning Committee, the Ministry of Finance, the Ministry of Foreign Trade, the Ministry of Labor, the Bank of Foreign Trade, and other financing banks.

After obtaining the advice and consent of these ministries and state agencies, the parties then must take the four basic documents—feasibility study, memorandum of association, contract of association, and statutes—accompanied by a written request, to the Ministry of Foreign Trade. At this stage the documents are reviewed to insure compliance with domestic Romanian law—the Labor Code, customs laws, currency laws, banking laws, etc.

Once approved and enacted into law, the joint venture must be registered with both the Ministry of Foreign Trade and the Ministry of Finance, the two state organs most concerned with its economic and financial operation. The joint venture formally comes into existence upon registration with the Ministry of Finance and upon the publication of the fact in the *Official Bulletin* of the Socialist Republic of Romania. Any subsequent modification or amendment of either the joint venture's contract of association or statutes must be submitted for approval to the Council of State, after having survived the same lengthy review process described for the initial formation.

It is the contract of association and statutes which are the cornerstones of a joint venture in Romania. Western negotiators must be particularly careful to include in these documents any and all provisions which they deem necessary to the implementation and operations of the joint venture. As with any commercial transaction in Romania, the written word is paramount and nothing should be left to verbal commitments or understandings between the parties.

### *C. Financial and Operational Regulations*

The joint venture's contract of association and statutes list the assets initially contributed to the joint venture, as well as by amendment, those assets which are subsequently acquired. Decree No. 424 notes that capital contributions by the parties may consist of "a financial contribution, a contribution in goods required for carrying out the investment activities in which the company is currently engaged, and a contribution to the industrial property rights or other rights." Furthermore, the Romanian party may include the right to use Romanian land in the joint venture as part of his contribution. If land is not included in the Romanian party's contribution, then the joint venture must pay rent to the state for the use of such land. Various convertible currency prices may be indicated for the property depending on location, value of existing displaced buildings or cultivated areas, and availability of utilities. Such prices reflect an estimated international market value for the real estate. The market value of the site, quoted in convertible currency at "world-market prices," is the result of averaging prices of foreign sites destined for similar utilization in the West. The selection of the sites is usually based on those located in the industrialized Western countries, so that the resulting estimate for the joint venture property is likely to be high.

All cash contributions, as well as contributed goods, are valued in the currency agreed upon in the contract of association and statutes. Since the joint venture must operate in world markets, a foreign convertible currency is used. For purposes of converting lei-valued contributions into convertible currency values, the non-commercial exchange rate of 12.00 lei per U.S. dollar is used as opposed to the commercial exchange rate of 4.97 lei per U.S. dollar used primarily for accounting and foreign trade planning purposes. The value of assets other than cash is determined by using foreign trade prices based on price levels in convertible currency of typical foreign markets.

The Romanian Government guarantees the transfer abroad of both venture profits and contributed capital. Whether capital shares may be transferred to other parties, however, is not clear from Decree No. 424 and, if it is desired, must be established in the contract of association.

All financial transactions of the joint venture, whether in convertible currency or lei, including all transfers of currency, must be conducted through accounts with the Bank of Foreign Trade (or other authorized Romanian banks). Although the joint venture may dispose freely of its accounts, all convertible currency payments by the venture must be drawn from its accounts at the Bank. Interest shall be paid on joint venture funds deposited in Romanian banks. In Decree No. 61 (1974), it was announced that the National Bank and the Bank of Foreign Trade are allowed to pay interest in foreign currency on reserves in

foreign exchange accounts opened by joint ventures. In the event that the joint venture finds it necessary to raise additional capital, then the concurrence of the Bank of Foreign Trade is needed.

Joint ventures are required to prepare both annual and 5-year plans of economic and financial activity, which are subject to the approval procedure outlined in the statutes of the joint venture. Although the precise degree of coordination has not been made clear, Romanian authorities indicate that harmonization with the annual and 5-year national economic plans will be required for government approval.

Decree No. 424 provides general guidelines for accounting procedures, again leaving the precise accounting methods to vary according to the statutes and related appendices of each joint venture. As a result of lengthy negotiations between Control Data and its Romanian partner, the Industrial Central of Electronics and Automatization, two distinct sets of accounting books are being compiled by their joint venture. The joint venture keeps an official set of books, in U.S. dollars, according to American accounting practices. The Romanian party also keeps a separate set of accounting books, in lei, as required by Romanian law. Romanian authorities have indicated that independent auditing of the joint venture's books may be permitted as long as it is agreed to in the contract and statutes and does not preclude in any way the rights of the authorized auditing bodies as established by Romanian law.

Decree No. 424 does provide for the full depreciation of the venture's assets as an expense. The write-off periods are to be established under the statutes or by a general meeting of the parties, but in no case shall these be longer than the "standard operating lifetimes" as stipulated in Romanian law. Romanian practice is to depreciate under the straight line method. The decree also provides that a reserve fund can be created out of the pre-taxed annual profits at a rate not to exceed 5 percent annually until the total reserve comprises 25 percent of the invested capital of the joint venture.

To clarify and eliminate other ambiguities growing from Law No. 1, the Romanian authorities passed, as a companion to Decree No. 424, Decree No. 425 of November 2, 1972, pertaining to the taxation of joint venture profits. The profits tax decree provides for a yearly tax rate of 30 percent, computed on profits before distribution. These profits are based on income less expenses, as determined on the venture's balance sheet, with allowances made for depreciation and the reserve-fund deduction. Furthermore, a 20-percent reduction from the normal 30-percent tax rate is available as a voluntary reinvestment incentive for profits reinvested for at least 5 years in either the joint company itself or other Romanian enterprises. This will result in a 24-percent tax rate for joint ventures following a reinvestment program. In addition to the reinvestment incentives and the reserve fund exclusion, the profits tax decree authorizes the Council of Ministers to grant a full tax exemption through the first year in which the operation generates taxable profits and a one-half tax exemption for the following 2 years.

Regarding the ultimate distribution of profits, Decree No. 425 requires that profits remaining for distribution after deduction of all the above-mentioned items will be subject to an additional 10-percent

withholding tax if transferred abroad. Other costs, in the form of banking charges or fees to handle the conversion of lei into convertible currency, which might further decrease realized profits, should be determined during the negotiation process.

Decree No. 425 also contains administrative procedures regarding profits taxes and provides for registration fees, withholding taxes, and personal income taxes. All taxes are paid through the banking unit which holds the joint venture's account. The appropriate Romanian fiscal departments of the district authority on whose territory the joint venture's registered office is located, as well as the Ministry of Finance, have the authority to order banking units to pay any unpaid taxes, fines, or penalties. The decree also provides that joint ventures must pay an additional one-time tax when they register and file their contract of association and statutes with the Ministries of Foreign Trade and Finance.

Income of joint venture personnel shall be taxed in accordance with Romanian income tax laws in force. Because taxable income in Romania includes both wages and other forms of remuneration, any tax exemption for foreign employees or consultants must be negotiated.

#### *D. Personnel*

Decree No. 424 provides that Romanian personnel are entitled to the same rights and obligations provided in Romanian legislation for personnel employed in the state enterprises. The hiring of Romanian personnel based on individual labor contracts, will be carried out by the general manager and other Romanian members of the Managing Committee or Administrative Councils. Pursuant to Romanian law and Decree No. 424, a joint venture must make a contribution to the Social Insurance Fund—a type of social security including health benefits—for all Romanian employees. The contribution is payable in foreign currency, although benefits obviously will be paid to Romanian employees in lei.

With respect to foreign personnel, Decree No. 424 provides that their rights and obligations will be established by the Administrative Council or the Managing Committee of the joint venture. This provision authorizes foreign personnel to hold managerial positions and permits the transfer of their wages abroad, as provided by the management of the venture.

With respect to salaries, all employees of the venture are paid in the agreed upon convertible currency. Since Romanian law, however, prohibits Romanian citizens from owning convertible currency, except in specially authorized state bank accounts, Decree No. 424 provides that the salaries of Romanian personnel will be computed in the agreed upon convertible currency, but will be paid directly to the bank holding the account of the joint venture, which then will pay the Romanian personnel in lei.

### III. THE HUNGARIAN EXAMPLE

Hungary authorized economic partnership with foreign participation in 1970, by the promulgation of Decree No. 19. This decree was followed by Decree No. 28 in 1972, which contains information on the method of establishing joint cooperation and which provides the financial regulations governing joint cooperation operations.

Compared to the Romanian joint venture law, the Hungarian implementing decree is remarkably brief. The 1972 decree stipulates that the foreign party's share of the joint investment "generally should not exceed 49 percent" and, in this respect, is worded in less stringent terms than its Romanian counterpart. Furthermore, in contrast to Romania where each joint venture is incorporated into Romanian law as a distinct legislative act, operates in a commercial enclave using only convertible currency and allows the foreign investor equity ownership, joint companies in Hungary operate like all other domestic enterprises and are subject to the country's statutory laws. Indeed, the 1972 decree permits only "economic associations" rather than a cooperation based on equity, thus reserving for the Hungarian party the exclusive ownership of the means of production and of capital assets. The return on the foreign party's investment is in a portion of the profits realized by the joint cooperation enterprise, or in the goods produced by the Hungarian party.

In May 1977, the Hungarian Ministry of Finance modified Decree No. 28 by issuing Decree No. 7. The provisions of the new decree allow for joint "production, commercial and service activities," and make it possible for the foreign party, with permission of the Minister of Finance, to become majority shareholder of joint companies engaged in the "financial (banking) and servicing fields."

#### *A. Company Activity and Form of Association*

The forms of association are defined as: share, joint stock, limited liability or joint companies. The form of partnership is optional and is determined in the contract of association.

The scope of activity of these joint cooperation enterprises is to pursue production, commercial and service activities. Under the contract of association, the Hungarian party will generally reserve for itself the rights of production, while the foreign party will likely provide licenses, know-how, special equipment and machinery, components and marketing skills. The Hungarian party may be one or more industrial manufacturers, a foreign trade organization, or Intercooperation Co., Ltd., an enterprise specializing in international collaboration agreements. Since enactment of the 1972 decree, Siemens of West Germany has established a service and marketing joint cooperation with Intercooperation in the field of electronics, capitalized respectively at 49-51 percent. Also Volvo of Sweden has established a joint cooperation with Mogurt Trading Co., and the Csepel Automobile Works for the production by Csepel of 4-wheel drive cars for export purposes only. This joint enterprise acts essentially as a holding and trading company to which Volvo provides (under separate contract) capital (48%), know-how, license and special machinery, while Csepel-Mogurt each provide 26 percent covering production facilities, labor and capital.

In 1975, the first American-Hungarian joint cooperation enterprise was established between Corning Glass; Radelkis, a leading Hungarian electro-chemical instrument manufacturer; and Metrimpex, a Hungarian foreign trade organization specializing in instruments. The new company, Radelcor Instruments, Ltd., is manufacturing blood-gas analyzers under the Corning trademark. Corning owns 49 percent of the new company and is responsible for marketing the instruments in the West.

The Hungarians have considered the formation of other joint cooperation enterprises organized as holding companies. One alternative would have each party retain only a portion of the earned profits, with the difference going to its holding company, thereby creating an incentive for the parties to maximize their income by keeping operation and/or production costs to a minimum. A second alternative would have the holding company buy goods from one party to sell them to the other at agreed upon prices, fixed so as to encourage both parties to keep in-house costs to a minimum.

### *B. Formation and Organization of the Joint Company*

Since a joint cooperation enterprise in Hungary operates like any other domestic enterprise, the Hungarian party must first obtain all permits which apply to regular Hungarian companies. If foreign trade operations are involved, the approval of the Ministry of Foreign Trade, the Bank of Foreign Trade and the National Bank are necessary. In addition, as many as four separate contracts must be signed and submitted for approval to the Minister of Finance. These include the "articles of association" document which provides information necessary for the enterprise's registration; the association contract which defines the rights and obligations of parties; the production contract between the joint enterprise and the Hungarian manufacturer; and the marketing contract which outlines the marketing responsibilities of the parties.

### *C. Financial and Operational Regulations*

According to the 1972 decree, the share of the foreign party "generally should not exceed 49 percent." Since the decree does not strictly limit the foreign party to minority ownership of the shares, it leaves open the possibility that, depending on the value assigned to its contribution, the foreign party might be permitted to control a majority of the joint enterprise's shares without actually owning fixed assets or using domestic means of production. Furthermore, the recent modifications introduced by Decree No. 7 of May 1977, specifically permit foreign majority control of the joint company's shares, subject to approval by the Minister of Finance, for companies in the banking and service fields. The value of the Hungarian contribution is calculated in "forints" at world market prices. The pricing criteria are open to negotiations and are similar to those discussed previously for Romania.

When amortizing fixed assets, Hungarian practice is to depreciate under the straight-line method, according to standard operating lifetimes established by law for individual assets. In the case of the joint cooperation between Siemens and Intercooperation, accelerated amortization was negotiated because the technical equipment involved undergoes rapid depreciation.

The Hungarian National Bank is responsible for all foreign currency operations of the joint cooperation enterprise (e.g., transfer of wages or profit shares abroad). The National Bank, if petitioned at the time of the submission of the joint cooperation enterprise's contract, will guarantee both the foreign party's assets against state actions and the foreign investor's obligations to the Hungarian party. This provision

offers the foreign investor a guarantee against nationalization of the enterprise.

Normally, a joint cooperation enterprise operating in Hungary is not permitted to raise convertible currency funds in foreign markets by itself. If the equity capital of the company warrants it, the National Bank could approve a loan out of its own funds; otherwise the Bank could allow the parties, if advantageous to the undertaking, to raise the capital on their own. Since a joint cooperation enterprise, like any other Hungarian foreign trade enterprise, is an independent legal entity, the state or other state organizations could not be held legally liable for its actions.

The National Bank provides foreign exchange required for Hungarian imports and is the recipient of all convertible funds derived from export sales. Accounts of joint cooperation enterprises and Hungarian companies which trade in Western markets are credited or debited by the Bank in forints at the "foreign trade multiplier" rate (43.2 forints=\$1.00), which amounts to about twice the tourist rate of exchange, and is intended to stimulate Hungarian exports and decrease imports from countries with convertible currencies.

Another important role of the National Bank is to sit in an advisory capacity on the board of the Interministerial Committee on Cooperation, which functions under the Ministry of Foreign Trade. Also represented on the committee are the National Planning Office, the National Committee for Technological Development, the Ministry of Metallurgy and Machine Industry and the Ministry of Finance. The committee is chaired by the Secretary of State for Foreign Trade, and is charged with responsibility to direct, advise and exercise control over all cooperation programs between Hungarian and foreign firms, except joint cooperation enterprises organized abroad.

Accounting procedures of the existing joint cooperation enterprises in Hungary follow local accounting practices. The 1972 decree stipulates that the joint cooperation enterprise is required to set up a risk fund against losses. The fund is accumulated yearly until it amounts to 10 percent of the capitalization funds. As an incentive to its employees, the company can disburse bonuses out of a profit-sharing fund, not to exceed 15 percent of the sum of the annual wages. The profit-sharing fund is established by the enterprise from its annual profits after deduction of the risk fund. The outstanding profit remaining after allocations into these funds is subject to a profit tax.

According to Decree No. 7, the profits of the joint cooperation enterprise are taxed at a 40-percent rate. No other profit taxes are imposed. The Minister of Finance may, at his discretion and upon special application, allow a lower tax duty. In implementing the articles of the decree, the word of the Ministry of Finance is decisive. American companies cannot at present benefit from an agreement on prevention of double taxation since no such treaty has been negotiated or is envisioned in the near future.

Decree No. 7 sets the wage and social insurance tax of personnel working for joint cooperation enterprises in Hungary at a flat rate of 35 percent. This 35 percent wage contribution as in line with payroll taxes of Hungarian enterprises which include a social security contribution which amounts to 17 percent of monthly wages, an 8 percent payroll tax, a 6 percent communal tax and a 1.5 percent commercial tax.

Joint cooperation enterprises in Hungary are exempt from tax on fixed assets and from accumulating a depreciation reserve fund. The exemptions reflect the intent of the 1972 decree not to entitle joint cooperation enterprises to ownership of fixed assets or the use of domestic means of production. If the joint cooperation enterprise sells directly on the Hungarian market, it will be charged a turnover tax. A foreign trade tax at a level individually fixed by the Hungarian Minister of Finance is levied on joint cooperation enterprises active in foreign trade. Settlement of foreign exchange accounts and raising of credits follow the procedures established for Hungarian enterprises.

#### *D. Personnel*

The Workers' Trade Union has a voice in hiring or firing local employees and is responsible for negotiating collective bargaining agreements on behalf of the joint cooperation enterprises' indigenous personnel. The 1972 decree stipulates that employee wages are established by the contract of association or the work contract. Hungarian employees of joint cooperation enterprises are usually paid at levels of existing wages for similar types of jobs in the country. In the case of Volcom-Hungary Ktf., the Volvo joint enterprise, each party fixed the salary levels of its nationals.

Foreign employees of the joint cooperation enterprise are allowed to transfer 50 percent of their income abroad in the currency established in the contract of association, after deduction of local taxes, paid in forints. The income tax deductions of foreign personnel are regulated by Decrees 35 and 36 of 1971 and by the Minister of Finance. Foreign incomes of foreign nationals are exempt from tax in Hungary.

#### IV. OTHER EXAMPLES

Confronted with the same desire for Western capital, technology, management and marketing know-how as the Romanians or Hungarians, Bulgaria and Poland have also passed similar legislation. While the Romanian joint venture law represents a bold attempt to encourage direct infusion of Western investment based on the anticipated desire of foreign investors to preserve ownership of their contributed assets, the Bulgarian and Polish laws reflect a more limited and cautious approach.

In June 1974, Bulgaria issued Decree 1196 on "Economic, Production and Technical Cooperation with Foreign Juridical Entities and Individuals," allowing Western participation in joint cooperation enterprises in that country in return for a share of the jointly realized profits, proportional to the contribution of the parties. More recently, in May 1976, Poland promulgated a decree on the issuance of "Licenses to Foreign Legal and Physical Persons for the Conduct of Certain Types of Economic Activity" within that country. Because the Bulgarian and Polish laws are so recent, there is very little practical experience on which to draw in searching for problems in implementing joint cooperation in these countries. For example, as yet, no U.S. firm has established joint companies in Bulgaria or Poland.

### *A. The Bulgarian Example*

Decree 1196 was followed in August 1975 by the issuance of implementing regulations for cooperation activities. The legislation officially encourages and defines the scope of cooperation projects with foreign firms. However, unlike Romania and Hungary, it does not permit Western capital investment on Bulgarian territory.

In exchange for its involvement, the foreign investor is eligible to receive part of the profits realized from the cooperation, in accordance with his concrete contribution. The pertinent conditions are spelled out in the contract of cooperation. Joint economic activities in Bulgaria are subject to Bulgarian legislation, while those carried out in third countries are subject to conditions as determined in the contract between the parties. The Bulgarian party, while benefiting from the foreign party's contributions, still operates like any other domestic enterprise and is subject to all local Bulgarian regulations and taxations.

#### 1. COMPANY ACTIVITY AND FORM OF ASSOCIATION

Economic, industrial and technical cooperation between Bulgarian economic organizations and foreign parties may involve activities in the fields of industry, construction, agriculture, transport, tourism, trade, credit, etc. This cooperation may assume different forms, such as joint efforts for implementing new production capacity or for reconstructing and modernizing existing ones; joint research and development; joint production and marketing of goods; organizing joint enterprises outside Bulgaria for production or other economic activities.

#### 2. FORMATION AND ORGANIZATION OF THE JOINT COMPANY

Cooperation agreements between Bulgarian economic enterprises and a foreign party require approval by the Council of Ministers or other competent organs as determined by the Council. The request for a permit to implement a long-term cooperation is to be accompanied by a draft agreement and an economic analysis of the proposed joint project, clarifying the objectives of cooperation, responsibilities of the parties, the sourcing of funds, the technical level and quality of production, as well as the marketing plans.

The pertinent conditions for the joint cooperation are spelled out in the contract between the parties. In all cases, however, one or more of the following conditions must exist:

Rapid introduction into production of modern, cost effective technologies or new products which could fulfill local or export market requirements.

Construction of new production capacity, or reconstruction and modernization of existing ones.

Effective utilization of presently available raw materials and development of new local and prime material sources.

#### 3. FINANCIAL AND OPERATIONAL REGULATIONS

The implementing regulations define realized profits as "realized economic effect." Remuneration to the Western party (in the form of

profits, royalties, services and/or goods) will accrue in proportion to its "concrete contribution", which could consist of licenses, know-how, or capital equipment.

The State Planning Committee and the competent industrial ministry will provide financial support and material supplies for cooperation projects. The Bulgarian National Bank and the Bulgarian Foreign Trade Bank may also grant credits on favorable conditions, if petitioned by the Bulgarian party to the joint cooperation.

The foreign investor may supply the Bulgarian enterprise with funds, materials, machinery and equipment imported into Bulgaria on a temporary basis and duty-free. At the termination of the agreement, these items can be repatriated or in the case of capital goods, purchased by the Bulgarian party at residual value. The appraisal of the contributions by the parties to the joint cooperation is to be valued on the basis of international market prices unless otherwise agreed upon in the contract.

#### 4. PERSONNEL

Foreign personnel may be permanently stationed with Bulgarian enterprises to improve labor productivity, introduce new technologies, assist with quality control and marketing of goods abroad. As such, the management role of the foreign personnel appears limited to technical and advisory functions.

The legal and social status of foreign specialists residing in Bulgaria is governed by and specified in the contract between the cooperating parties. Western citizens have the right to transfer abroad through the Bulgarian Foreign Trade Bank up to 50 percent of their salary received from the Bulgarian enterprise.

#### *B. The Polish Example*<sup>3</sup>

The procedures and conditions for the authorization of foreign physical and legal persons to conduct economic activity in Poland are regulated by the Decree of the Council of Ministers of May 14, 1976, concerning the issuance of "Licenses to Foreign Legal and Physical Persons for the Conduct of Certain Types of Economic Activity."

In accordance with this decree, firms having their headquarters abroad, physical persons permanently residing abroad or physical persons with foreign citizenship who have been granted permanent resident status in Poland, and Polish ethnic associations and social organizations with headquarters abroad, can establish and operate artisan, trade, gastronomic and service enterprises in Poland on the basis of a license issued by the appropriate provincial authorities.

The above decree was supplemented on May 26, 1976 by additional legislation of the Minister of Finance. Order 109, issued on that day, concerns permission for foreign investors to open bank accounts in Poland and Order 110 concerns permission for joint enterprises to conduct commercial transactions in convertible currencies.

<sup>3</sup> Part of this material has been extracted from unpublished notes by S. Lotarski, Polish Desk, Bureau of East-West Trade, U.S. Department of Commerce.

The intent of these legislations appears aimed at extending investment possibilities to small or medium sized foreign firms or investors, and to infuse capital and expertise into certain domestic service sectors which traditionally have been short of both. Polish officials point out that the 1976 legislation supplements existing pre-war legislation governing foreign investment in Poland. The pre-war legislation in question are the decrees of the Council of Ministers of 20 December 1928 and 28 March 1934 concerning the conditions for the activity of foreign joint stock and limited liability companies, respectively, in Poland. Furthermore, the Poles indicate that future amendments to the new legislation are possible, provided they will be needed to facilitate foreign investment.

### 1. COMPANY ACTIVITY AND FORM OF ASSOCIATION

Polish regulations provide explicitly for wholly-foreign-owned enterprises in specified sectors (artisan, trade, gastronomic, and service), and leave open the possibility for joint cooperation enterprises with Polish commercial organizations in these and other activities.

According to Polish officials, the 1976 legislation does not necessarily exclude joint cooperation in some confined industrial production endeavors (e.g., in the manufacture of component parts, in apparel manufacturing, in commissioning new production lines in existing factories), as long as the production output is limited and official permission is granted.

### 2. FORMATION AND ORGANIZATION OF THE COMPANY

Permission for foreign investors to conduct economic activities in Poland is granted through a license by the authorities of the province where the new enterprise is established. Licenses can be issued with a validity of up to 10 years, with the possibility of renewal.

Foreigners should appoint a proxy to attend to the formalities relating to the licensing and, later, the management of the enterprise. The proxy should be either a Polish citizen permanently residing in Poland or a foreign citizen who has permission for permanent residence in Poland. The proxy also can be assigned by the Polimar Foreign Trade Enterprise, 20 Marchlewskiego Street, 00-950 Warsaw.

Receipt of a license to operate an enterprise is conditioned upon the presentation of:

- A description and a cost estimate of the investment;
- A guarantee that the full cost of the investment will be covered in convertible currencies; and

- A receipt showing that 30 percent of the cost estimate has been deposited by the applicant in the Bank PKO, S.A., in convertible currencies.

In especially justified cases the license-issuing authority can lower the sum of the obligatory deposit.

### 3. FINANCIAL AND OPERATIONAL REGULATIONS

Financial questions relating to investment and economic activity of foreign physical and legal persons in Poland are regulated by the

Orders of the Minister of Finance of May 26, 1976, published in the *Monitor Polski*—the Official Daily of the Polish People's Republic—No. 25 of June 14, 1976:

Order 109, concerning permission for foreigners holding hard-currency and carrying out economic activity in Poland to open and maintain bank accounts; and

Order 110, concerning permission for mixed-capital partnerships to conduct certain transactions in convertible currencies.

Order 109 concerns the establishment and operation by foreigners of enterprises of an individual ownership character. Investment and operation costs related to the establishment of the enterprise are sourced from a convertible currency account and a separate Polish zlotys account that the foreign investor opens in his own name at the Bank PKO, S.A. Disbursements from the former account are to cover imports of machinery, equipment, materials, and all payments due Polish enterprises which have the right to render their services for convertible currency. Local operational expenses and receipts related to the sale of goods and services transacted in zlotys are to be channeled through the latter account.

Bank PKO has been authorized to exchange in convertible currency and disburse from the zlotys account, on behalf of the owner of the enterprise, a part of the yearly taxed (net) income resulting from the economic activities of the enterprise. The regulations permit the payment in convertible currency of up to 50 percent of the net income annually, however, in a sum not to exceed 9 percent of the value of the capital invested in convertible currencies. The 9-percent limitation will not be applied to enterprises which receive at least 50 percent of their annual turnover from the documented export of goods or services for convertible currencies.

Order 110 of the Minister of Finance concerns joint cooperation enterprises with the participation of Polish and foreign capital which are established for the purpose of carrying out economic activity in Poland.

The foreign investor's share in a joint cooperation enterprise is contributed in zlotys obtained through the exchange of convertible currency in Polish banks. A part of the foreign investor's share can be contributed in a documented, non-monetary form (e.g., machines and equipment). The value of the Polish contribution is calculated in zlotys at world market prices. Profit repatriation of up to 50 percent of the net income for the fiscal year, as well as capital repatriation from the sale of the enterprise is allowed after tax obligations have been fulfilled.

Joint cooperation enterprises can open bank accounts either in the Bank Handlowy, S.A. or in the Bank PKO, S.A. These banks have been authorized to pay out in convertible currencies to the foreign investors the proceeds due them from their participation in the profits of the enterprise. These payments can be made after presentation to the appropriate bank of certification issued by the joint cooperation enterprise, according to the appropriate form established by the bank, and also of receipts for the payment of income tax for the tax year, which are issued by the local administrative organs. Payment in convertible currencies of proceeds due from participation in the profits of a joint cooperation enterprise will be made annually up to a

maximum of 9 percent of the value of the investment contributed by the foreign investor. This limitation does not apply to those joint cooperation enterprises which secure at least 50 percent of their turnover through the documented export of goods or services for convertible currency.

A minimum of 20 percent of the net profit of an enterprise (that is, after deduction of the income tax due from the partnership) ought to be allocated for the reserve fund of the enterprise while the remaining net profit can be allocated for division among the investors.

For purposes of exchanging convertible currencies for zlotys or zlotys for convertible currencies, the banks will apply the special rate established in the exchange rate table of the Polish National Bank plus the premium applicable with the exchange of convertible currencies for foreign tourists; the actual special rate of exchange together with the tourist premium gives an exchange rate of 33.20 zlotys for one U.S. dollar.

Income tax is due on income. Taxable income is calculated by deducting costs from gross revenues (turnover). Income is established either on the basis of accounting records or is estimated as a percentage of turnover using the appropriate rate for a given activity. In establishing the income, depreciation allowances on capital equipment and property are taken into account. The income tax rate for foreign persons is lower than that for persons permanently resident in Poland.

Income tax on foreign persons is based on a progressive rate, with a ceiling of 50 percent of income. Furthermore such persons are exempted from the additional equalization tax. If foreign persons are participants in an incorporated partnership and receive dividends as a result of their participation, income tax of 30 percent is applied to the dividends.

#### 4. PERSONNEL

Polish personnel hired by a joint enterprise are entitled to the same rights and obligations provided in local legislation for personnel employed in state enterprises. Salaries of these personnel are set accordingly, but the company can accumulate funds from taxed profits to distribute as bonuses to its employees.

Foreign citizens may be given permission to reside in Poland to operate commercial enterprises in which they have an investment. The legal and social status of such foreign personnel is specified in the contract between the cooperating parties. Foreign permanent residents of Poland have the right to transfer into convertible currency a part of their profits for a period of 10 years from the date of receiving residence permission. Furthermore, such persons benefit from special income tax reductions for a period of 10 years.

Poland has entered into treaties for the avoidance of double taxation with many countries and specifically with the United States of America, with the German Federal Republic, Austria, and Pakistan. Treaties have been signed but have not yet entered into force with France, Sweden, and Denmark, and negotiation on such treaties have been undertaken with Belgium, Great Britain, Finland, and Norway. These treaties regulate the tax obligation of persons whose residence is in one country and who are conducting economic activities or earning income in the second country.

Those persons residing in any country with which such a treaty has been concluded, upon establishing an enterprise in Poland, will be taxed in Poland on the income from such enterprise, while in the country of their residence such income will not be taxed.

If foreign citizens move permanently to Poland and receive permission for permanent residence but continue to earn income in the country of their former residence of which they are citizens and which income will be taxable in that country, such income will be exempted in Poland from taxation.

#### CONCLUSIONS

In espousing the principles of international economic and industrial cooperation, the East European nations are adopting a capitalistic tradition which is rooted in the historical drive of Western economies to expand their markets. Yet, the basic prerequisite for a successful transnational cooperation effort, i.e., the profit-oriented free flow of capital and goods, is limited in this instance by two factors, namely: the nonconvertibility of COMECON currencies and the centrally programmed development of the markets in these countries. The former limits the desirability to earn profits in local currencies, and the latter restricts these markets to specific categories of goods, mostly of the nonconsumer type.

Also detrimental to the balanced flow of goods to all markets is the East European emphasis on exporting the products of joint cooperation activities to convertible currency markets, which is not usually balanced by a capability to foster export expansion to the COMECON countries. This may conflict with the foreign investor's interests which are generally aimed at establishing new production capacity to serve the local or other COMECON markets.

Finally, an additional dampening factor on the implementation of joint cooperation is provided by the different economic aims inherent in the systems of the cooperating parties. In the centrally planned economies of East Europe, where foreign trade is a state monopoly and where domestic capital and assets are tools of social ownership, production and export policies are tied to specifically programmed aims, while profit considerations, although important, are considered secondary to the attainment of development goals of the domestic economy. It follows that joint cooperation activities between West and East European economic entities are necessarily influenced and limited by the aims inherent to the host country. The disappointing moderate response of Western firms to the opportunity of investing in the centrally planned economies reflects this diversity of aims.

To foster Western interest, additional inducements will have to be provided by the East European Governments, especially because the recent worldwide economic slowdown has compelled Western firms to adopt tight policies of capital investment. The Eastern Europeans could consider giving the ventures new tax rebates, easing the controls and red-tape encountered in the formation of joint ventures, stressing import substitution projects rather than export promotion ones, and easing the emphasis to export the joint ventures products principally to convertible currency rather than COMECON markets.

Other inducements could be the integration of the production from joint cooperation projects into the host country's convertible currency international bilateral trade agreements, and the establishment of "free

trade" zones within the East European countries borders, along the lines of those existing in the United States or in other countries involved in international trade.<sup>4</sup>

Of course, inducements will not be sufficient if they do not result in substantial profit opportunities for Western investors. If the East European Governments want to obtain the infusion of foreign technology, management, marketing expertise and capital and, by virtue of the long-term relationship of a joint company, to assure that such technology is kept current and responsive to world market demands, they must be prepared to pay for these benefits. The present East European attitude, which considers joint cooperation projects as investments which are self-liquidating through convertible currency export promotion, will have to give way to a more realistic one which may require securing the necessary convertible currency to subsidize the operations of those joint projects which will most benefit the host countries' economies. In the meantime, the joint cooperation approach will appeal mostly to foreign firms that are planning plant capacity expansion and decide on the Eastern European locale as a manufacturing site to supply their markets in the West, or to firms engaged in the manufacture of goods that fulfill the Eastern European country's market needs and which would otherwise have to be imported from the West.

---

<sup>4</sup> According to Romania's Law No. 1, such "free trade" zone may be established on Romanian soil.

# AN ANALYSIS OF THE UNITED STATES-ROMANIAN LONG-TERM AGREEMENT ON ECONOMIC, INDUSTRIAL, AND TECHNICAL COOPERATION

### I. BACKGROUND

On November 21, 1976, in Bucharest, U.S. Secretary of Commerce Elliot L. Richardson and Romanian Deputy Prime Minister Ion Patan signed the Long-Term Agreement on Economic, Industrial and Technical Cooperation between the United States of America and the Socialist Republic of Romania ("Long Term Agreement"—See Appendix). The signing marked the end of approximately 14 months of negotiations between the two countries and culminated a period of some four years during which the need for such an agreement had been discussed by the two sides.

Romanian interest in negotiating a long-term cooperation agreement with the United States dates back to the early seventies. In the wake of President Richard Nixon's dramatic visit to Bucharest in August of 1969, the Government of Romania began stressing the importance of normalizing economic and commercial relations between the two countries, and particularly hoped to obtain nondiscriminatory tariff treatment. Romanian officials first suggested negotiating a long-term cooperation agreement to U.S. Government officials during preparations for Romanian President Nicolae Ceausescu's December 1973 visit to the United States. While a number of factors prevented such negotiations at that time, Presidents Nixon and Ceausescu did issue on December 5, 1973, a Joint Statement on Economic, Industrial and Technological Cooperation between the United States of America and the Socialist Republic of Romania ("Joint Statement").<sup>1</sup> This statement established a set of guidelines for the development of economic relations between the two countries which included the facilitation of "cooperation" activities between firms, companies and economic organizations of the two countries in areas of particular interest and the statement that transactions would be effected on a contractual basis.

<sup>1</sup> For full text of the Joint Statement see *American-Romanian Economic Accords, 1973-1974*, U.S. Department of Commerce, March 1975, at page 1.

The subject next came up during the visit of U.S. Secretary State Henry Kissinger to Bucharest in November 1974. He and President Ceausescu agreed that the two countries would negotiate a long-term economic cooperation agreement following negotiation and approval of the U.S.-Romanian Trade Agreement ("Trade Agreement").<sup>2</sup>

In August of 1975, President Gerald Ford visited Romania and together with President Ceausescu signed the documents bringing the Trade Agreement into force. The two Presidents also issued a joint communique which stated that the two countries would begin negotiating a long-term cooperation agreement as soon as possible. Between September and November of that year the two sides exchanged drafts, and at the Second Session of the Joint American-Romanian Economic Commission, held in Washington on November 3-4, 1975, the two sides agreed that direct negotiation of the long-term agreement should begin in January, 1976 (either in Washington or in Bucharest) with the aim of concluding the agreement as soon as possible.<sup>3</sup>

However, further drafts and revisions of the agreement continued to be exchanged through normal diplomatic channels in December, January and later in March and April. It was not until May of 1976 that a small U.S. negotiating team made up of officials from the Departments of State and Commerce journeyed to Bucharest for face-to-face negotiations with the Romanians. Those negotiations lasted three weeks and resulted in agreement on all but a few provisions. The remaining outstanding issues were then resolved in meetings in Bucharest between U.S. Embassy officers and Romanian officials in time for signing during Commerce Secretary Richardson's trip to Romania in November, 1976.

## II. DEFINING COOPERATION AND ITS PLACE IN THE ROMANIAN FOREIGN TRADE SYSTEM

There is no set definition of a cooperation activity and Romanian officials themselves have been known to offer differing views on what constitutes cooperation. A veteran Romanian official from the Department of International Economic Cooperation in the Ministry of Foreign Trade and International Economic Cooperation has written extensively on the subject and has attempted to identify certain characteristics found in cooperation activities. He distinguishes cooperation from traditional economic and commercial exchanges (i.e., the buying or selling of goods and services) by noting that it may involve the transfer of technology and know-how, supply of machinery and equipment, arrangement of financing, product marketing, technical assistance, research and development, etc.—or any combination thereof. He further outlines the more important objectives of cooperation activities as ventures which—

Are to be jointly carried out, during a long period of time, and to be continual;

Contribute to the division of labour, by two or more partners' participation in the production of a product or in performing productive activities;

<sup>2</sup> Officially titled the "Agreement on Trade Relations Between the United States of America and the Socialist Republic of Romania." Signed at Bucharest, April 2, 1975 and entered into force August 3, 1975. For text of the agreement see 26 UST 2305 or TIAS 8159.

<sup>3</sup> See paragraph No. 11 of the Agreed Minutes of the Second Session of the Joint American-Romanian Economic Commission (hereinafter "Agreed Minutes—Second Session"), November 4, 1975.

- Stimulate the joint development of new technological procedures or of improvement of the existing ones;
- Improve the technical level of one of the partners;
- Promote the use of the most advanced technologies;
- Lead to the reduction of production and merchandizing costs;
- Lead to a better production and enterprise organizations; and
- Contribute to the training of specialists for production, enterprise management and organization, merchandizing of goods and market research.<sup>4</sup>

As suggested by this list, cooperation usually involves more than one type of transaction (e.g., a co-production scheme involving a licensing arrangement and defined marketing responsibilities) and very often includes some form of compensation in products to the overseas partner.

Cooperation activities have come to have some significance in Romania's foreign trade system. Driven by a strong desire to expand both her economic and political relations with the West and to industrialize rapidly in the sixties, Romania increased dramatically her foreign trade with the countries of Western Europe. In the seventies these increases extended to the United States and Japan. As her appetite for Western products and technology grew larger, hard-currency imports from the West began running well ahead of Romanian hard-currency exports and the country's hard-currency reserves were depleted. While Romania dealt with this problem in the seventies in a number of different ways, such as by seeking favorable long-term credit arrangements and curtailing low-priority Western imports, cooperation activities represented a very hopeful vehicle for helping Romania correct its hard-currency imbalance in the longer run.

In order to facilitate the establishment of cooperation projects with foreign firms the Government of Romania took a series of legal and administrative steps in the early seventies. Most important was the passage of the Law on Foreign Trade and Economic and Technico-Scientific Cooperation Activities in the Socialist Republic of Romania (Law No. 1) on March 17, 1971.<sup>5</sup> This law detailed the institutional framework and operational structure of Romania's foreign trade system for the seventies, placing special emphasis on cooperation activities and opening the door to direct foreign investment (i.e., equity joint ventures) in Romania. The Ministry of Foreign Trade was even reorganized and given a new name—the Ministry of Foreign Trade and International Economic Cooperation.

During the seventies the Romanian Government made successful efforts to sign cooperation agreements with a large number of developed and less developed Western countries. Agreements with the Federal Republic of Germany, France, the United Kingdom, the Netherlands, and Austria, for example, are very similar in that they are for a 10-year period, identify areas of particular interest for economic and industrial cooperation projects between firms of the two countries, define types of cooperation projects to be carried out (e.g., joint ventures, co-production and product specialization, licensing arrangements, etc.) and stress the importance of obtaining appropriate financing for such cooperation.

<sup>4</sup> "Romania's Economic and Technical Cooperation with West-European Countries"—paper delivered at the International Institute for the Management of Technology—Milan, 1974 by Gigel Cristea, Director, Ministry of Foreign Trade and International Economic Cooperation.

<sup>5</sup> Official Bulletin of the Socialist Republic of Romania, No. 33 (March 17, 1971). In translation, see 11 *International Legal Materials*, No. 1 (January 1972) at p. 161.

### III. ROMANIAN AND U.S. MOTIVATIONS REGARDING COOPERATION

While a long-term cooperation agreement with the U.S. Government has been longer in coming, the Romanian Government has actively and energetically pursued the topic of cooperation with American firms in a number of different forms over the past several years. Recent meetings of the Joint American-Romanian Economic Commission endorsed the development of economic cooperation between the two countries including the establishment of equity joint ventures.<sup>6</sup> Specific areas of interest to the Romanian side for establishing cooperation projects have also been identified at the Joint Economic Commission sessions.<sup>7</sup> The Romanians have used the Joint Economic Commission vehicle to seek U.S. Government support for the concept of joint U.S.-Romanian cooperation projects in third markets.<sup>8</sup> Actual results have been meager, but one of the eight equity joint ventures in Romania is with an American firm,<sup>9</sup> and various other U.S. companies are actively involved in cooperation projects with the Romanians. That Romania is stressing cooperation projects with U.S. firms is clear. Romanian authorities have commented that they expect to negotiate 83 projects during the current Five Year Plan (1976-1980), of which 22 may involve U.S. firms.

The Romanian Government is inclined to believe that its economic interest in cooperation can be promoted through formal agreements with other governments. In Romania's own highly bureaucratized economy, this is true: a document such as an international agreement, approved at the highest levels, can legitimize and justify actions by officials at lower levels.

The United States Government, accustomed to permitting its firms to undertake projects in foreign countries on their own, has been generally unconcerned about the need for an intergovernmental agreement or even for a precise definition of cooperation.<sup>10</sup> However, in the case of Romania, the U.S. hoped to maintain the active development of U.S.-Romanian economic and commercial relations and to strengthen the basis on which firms might negotiate new contracts. U.S. officials felt that U.S. firms would be more willing to enter into longer-term contractual relations with Romanian enterprises if the U.S. could obtain an international commitment by Romania to protect their commercial interests in joint projects. Such formal assurances would also provide the U.S. Government with a stronger basis for defending U.S. firms against possible adverse action by the Romanian Government in the future.

### IV. TEXT OF THE LONG-TERM AGREEMENT

The Long-Term Agreement itself can be characterized as a statement of good intentions which provides a framework for cooperation

<sup>6</sup> See note (3) *supra* and see paragraphs No. 9 and No. 11 of the Agreed Minutes of the Third Session of Joint American-Romanian Economic Commission (hereinafter "Agreed Minutes—Third Session"), November 23, 1976.

<sup>7</sup> See paragraph No. 13, Agreed Minutes—Second Session and paragraph No. 11, Agreed Minutes—Third Session.

<sup>8</sup> See paragraph No. 18, Agreed Minutes—Second Session and paragraph No. 12 in Agreed Minutes—Third Session.

<sup>9</sup> The U.S. partner is Control Data Corporation of Minneapolis, Minnesota. The joint venture, named ROM CONTROL DATA makes computer peripherals and has its plant located in Bucharest.

<sup>10</sup> Prior to November 21, 1976, the U.S. had a long term agreement on "Economic, Industrial and Technical Cooperation" with only one other centrally planned economy country—the Soviet Union. Signed at Moscow, June 29, 1974 and entered into force June 29, 1974. For text of the agreement see 25 UST 1782 or TIAS 7910.

between firms and economic organizations of the two countries, and reaffirms both countries' support for the expansion of their bilateral economic and commercial relations. It provides a sound basis for long-term contractual relations between firms and economic organizations of the two countries on terms familiar to U.S. companies.

The Preamble to the Long-Term Agreement contains several interesting provisions. It notes that the two countries are "taking into account the characteristics and economic potential of the two countries" as well as "their respective levels of economic development." This provision alludes to Romania's status as a developing country, which was recognized in both the Joint Statement of December 5, 1973, and the Trade Agreement.<sup>11</sup> U.S. recognition opened the way for Romania to receive the U.S. Generalized System of Preferences (GSP) when it was inaugurated on January 1, 1976.<sup>12</sup> Since the Long-Term Agreement is for 10 years and since during that period Romania hopes to evolve into a developed country, the language of this provision is couched in terms of "levels of economic development" rather than specifically referring to Romania's current developing country status.

The Preamble also notes that in reaching this agreement the two countries have taken into consideration the provisions of the Trade Agreement. The Long-Term Agreement is intended to supplement, and not to replace, the Trade Agreement by which MFN tariff treatment was extended to Romania. Thus, any cooperation activities which resulted in normal commercial activities, such as exports to the U.S. or the establishment of representative offices, could be affected by both agreements.

Most importantly, the Preamble makes reference to the fact that both parties are "determined to promote in their relations the objectives of the Final Act of the Conference on Security and Cooperation in Europe ("Final Act")<sup>13</sup> and to give full effect to all of its provisions, including those relating to economic, scientific and technological cooperation ("Basket II")." Basket II of the Final Act contains important sections related to business contacts and facilities, industrial cooperation, arbitration and the possibilities for improving cooperation and these and other Basket II provisions were drawn on extensively by both parties in drafting and negotiating this agreement. Thus, several provisions of the Final Act have been given the character of a bilateral commitment in the Long-Term Agreement.

Article I contains assurances by both sides against expropriation and other unreasonable measures that would impair contractual or other legally acquired rights of firms. The language in the provision on expropriation is exactly the same as that found in the Joint Statement of December 5, 1973. These concepts of protection for firms from the arbitrary actions of the State are fundamental to U.S. law and were included in the Agreement to give a measure of reassurance—including the possibility of diplomatic support—to U.S. firms considering long-term contractual relations with Romanian enterprises. Given the Romanian Government's public identification with many communist

<sup>11</sup> See Article I, paragraph No. of the Trade Agreement.

<sup>12</sup> See Title V (Generalized System of Preferences), Sections 501 and 502 of the Trade Act of 1974, 19 USC 2101.

<sup>13</sup> See "Conference on Security and Cooperation in Europe—Final Act," Office of Media Services, Bureau of Public Affairs, U.S. Department of State (Publication No. 8826), August 1975.

and Third World ideological positions, often considered hostile to private enterprise, its acceptance of provisions for protecting firms in this Long-Term Agreement is a measure of its interest in establishing a basis for mutual, long-term trust in its relations with Western companies.

This article also emphasizes appropriate steps to facilitate cooperation between their firms, companies and economic organizations "including those of small and medium size." This specific reference was used to indicate to the smaller U.S. firms, which do not have, in most instances, the resources or East-West trading experience of some of the larger firms, that opportunities exist for them in cooperation efforts with Romania. It also reflects language found in Basket II of the Final Act encouraging greater participation by small and medium size firms in commercial and economic relations between states which participated in the Conference on Security and Cooperation in Europe. Similarly, firms, companies and economic organizations of both sides are assured in this article that the two parties will seek to provide "suitable operating conditions including access to facilities," for the expeditious conduct of business. This assurance, which is commonly referred to as business facilitation, is particularly important to U.S. firms since cooperation activities usually involve medium to long-term commitments of money and manpower in an unfamiliar and less developed commercial environment.<sup>14</sup> Business facilitation was featured prominently in the Trade Agreement<sup>15</sup> and is always a major topic for discussion at meetings of the Joint Economic Commission and the Romanian-U.S. Economic Council. Business facilitation also appears prominently in Basket II of the Final Act.

Article I also contains a provision which calls on each party to facilitate, in accordance with its legislation, all travel of persons engaged in activities consonant with the objectives of this Agreement. This was broadly drafted to expedite not only the travel of businessmen and officials of the two countries in each other's territory, but also to facilitate the travel of local employees who may be working for a foreign firm in a cooperation activity. In Romania, where a cooperation project may necessitate the hiring of Romanian nationals by a U.S. firm (including some involved in management), the ability of these nationals to travel outside Romania for training programs, regional seminars, or consultations at corporate headquarters can be important to the overall success of the cooperation activity.

In several instances in Article I, and for that matter throughout the Long-Term Agreement, there appear references that the parties will take appropriate steps or endeavor to take actions "in accordance with (or sometimes phrased in keeping with) applicable laws and regulations in the two countries." These words show that actions or commitments stemming from this agreement shall not conflict with or override any provisions of local law or regulation. The frequent use of this type of language in the Long-Term Agreement places an obvious premium on both sides learning as much as possible about each country's applicable laws and regulations during the negotiation stage for any cooperation activity.

<sup>14</sup> For example, U.S. firms operating in Romania are often frustrated by the lack of adequate quality office supplies, necessary xerox facilities, sufficient teletype facilities, etc.

<sup>15</sup> See Article IV (Business Facilitation) of the Trade Agreement.

Another provision of Article I relates to tariffs applied to goods produced under cooperation arrangements in the territory of one party which are then imported into the territory of the other party. The U.S. Government was not able to extend non-discriminatory treatment by this clause directly since under the terms of the Trade Act of 1974 this can only be done through a Congressionally approved bilateral agreement (as was done with the Trade Agreement), for a specified length of time, and subject to a number of requirements of the Act.<sup>16</sup> Thus, this clause simply states that imports stemming from cooperation activities shall be treated in accordance with the relevant provisions of the Trade Agreement (i.e., Article I of the Trade Agreement by which MFN was extended) for as long as those provisions remain applicable or as otherwise provided by applicable laws and regulations. Therefore, imports stemming from cooperation activities will be treated no differently than all other imports.

Article II established that cooperation activities shall be based on "contractual arrangements between firms, companies and economic organizations of the two countries" and further provides that general principles for the development and operation of cooperation activities are spelled out in Annex I (see below). This article also lists examples of what cooperation activities may include.<sup>17</sup> The range of activities covered in Article II is wide and yet it is by no means exclusive. The final sub-provision in this list provides that cooperation activities may include "other cooperation activities and forms which may be mutually agreed between participants in the two countries."

An important provision of Article II to the Romanian Government involves an assurance that each party shall arrive at export licensing decisions as expeditiously as is feasible under its established administrative procedures and in conformity with its laws, regulations and international undertakings. This language is clearly aimed at Romania's concern to get U.S. Government export license approval as quickly as possible on imports needed for cooperation activities. While the U.S. side was not willing to provide special treatment to exports to cooperation activities in Romania, it did express its intention to move the decision process as quickly as feasible under its own laws, regulations and administrative procedures as well as those of COCOM.<sup>18</sup>

Other provisions of Article II stress facilitating cooperation between the two countries in the form of joint banking institutions in each other's territory and in joint projects in third markets. The latter represents an effort by the Romanian Government to capitalize economically on the good political relations that Romania has established with the countries of the third world, and particularly those in Africa, Latin America and the Middle East. The Romanians see cooperation with U.S. firms in third world markets, particularly those rich in raw materials, as an opportunity to combine U.S. technology, know-how and managerial expertise with Romanian equipment, materials and manpower in successfully carrying out important

<sup>16</sup> See Title IV (Trade Relations with Countries Not Currently Receiving Nondiscriminatory Treatment), Sections 401-404 and 409 of the Trade Act of 1974, 19 USC 2101.

<sup>17</sup> Some examples are: joint participation in the construction of new industrial facilities, participation in joint companies for the production and/or marketing of goods and services, purchase, sale or lease of machinery and equipment, and licensing of technical information or know-how.

<sup>18</sup> COCOM (Coordinating Committee) is the operating arm of the Consultative Group, an informal international organization concerned with the control of strategic trade by Western nations with the Soviet Union and other communist countries.

projects. They see this form of cooperation as especially appealing in countries where for political reasons U.S. firms might be otherwise reluctant to enter the market. Third country cooperation has been a major topic of discussion at recent Joint Economic Commission meetings<sup>19</sup> and was most recently proposed by the Romanian Government as a topic for discussion at an experts meeting sometime in 1977.<sup>20</sup>

A provision in Article II also addresses what stands as the most often heard complaint by U.S. firms about doing business in Romania (both cooperation activities and non-cooperation trade)—the lengthy and protracted negotiation process, including an excessive number of trips to Bucharest. This provision notes that both parties “agree to encourage and facilitate accelerated negotiations between firms, companies and economic organizations of the two countries.” The language is similar to that found in Basket II of the Final Act. Its inclusion reflects the concern of the U.S. Government that, particularly in cooperation activities where the overall transaction is more complex and may require the ultimate input of a number of Romanian ministries and other economic and financial units, there is a real need to expedite the negotiation process. This topic has been discussed frequently in the Joint Economic Commission<sup>21</sup> and government agencies on both sides are continuing their efforts to remedy this problem.

Article III contains a provision calling for customs and tax exemptions on “equipment, materials and components imported temporarily for purposes related to contracts regarding cooperation activities” no different than the exemptions from customs duties taxes and restrictions granted to like equipment materials and components from any other country. This amounts to an MFN assurance on customs and tax exemptions by both sides.

This article also notes the importance of financing to the development of cooperation and states the parties’ agreement that “such financing as may be extended by them should enjoy conditions as favorable as possible.” The Romanian side had a strong interest in this type of provision because the Romanians see U.S. Eximbank credits as extremely important to the success of cooperation projects between firms, companies and economic organizations of our two countries. The provision in Article III cites the “particular characteristics of each case and the laws, regulations and international undertakings of each country” in reaching a decision to extend credit on conditions as favorable as possible. This conforms with the posture of Eximbank on extending loans. That is, Eximbank loan decisions are made on a case-by-case basis and considerations affecting the terms of these credits include the nature of the transaction, the borrower’s creditworthiness, the state of domestic and international financial markets, and the net economic benefit to the United States.

In Article IV the focus is solely on the provision of economic and commercial information by both countries, all in accordance with the laws, regulations and procedures of each country. Specifically, the article refers to the provision of “economic, commercial and statistical

<sup>19</sup> See paragraph No. 18, Agreed Minutes—Second Session and paragraph No. 12, Agreed Minutes—Third Session.

<sup>20</sup> See paragraph No. 13, Agreed Minutes—Third Session.

<sup>21</sup> See paragraph No. 15, Agreed Minutes—Third Session.

information useful for the development of market forecasts and the expansion of economic, industrial and technical cooperation." The article then lists illustrative types of information included in this definition. Included are statistical data regarding production, national income, budget, consumption, productivity, foreign trade and other information necessary to evaluate cooperation projects adequately, as well as information on firms, companies and economic organizations concerned with foreign trade (such as directories, and lists) and their promotional materials. As U.S.-Romanian commercial relations have improved the U.S. Government has stressed to the Romanian Government the need for an increased flow of economic and commercial information between the two governments. Such information is necessary to attract U.S. firms to cooperation activities in Romania and to facilitate the extension of credits through such vehicles as Eximbank and the U.S. CCC credit program. Information exchange has been a very prominent topic in the recent sessions of the Joint Economic Commission<sup>22</sup> and is a very important feature of Basket II of the Final Act,<sup>23</sup> which was used as a basis for agreement on much of the language of Article IV of the Agreement.

The remaining three articles are rather brief. Article V calls for the Economic Commission to monitor implementation of the Agreement and further notes that the Commission "may establish temporary working groups . . . for purposes related to this Agreement" and "may facilitate the establishment of joint consultative groups consisting of representatives of firms, companies and economic organizations of the two countries" on matters related to the purpose of the Long-Term Agreement. Article VI notes that the Agreement's provisions shall not be construed to impair either side's rights and obligations arising from other agreements and understanding. Finally, Article VII provides that the Long-Term Agreement is to remain in force for 10 years after which it will be automatically extended for successive one-year periods. This article also provides that the Agreement shall enter into force when both parties have received written notice of its approval by the other party which occurred on May 15, 1977.

#### V. ANNEXES TO THE LONG-TERM AGREEMENT

A major distinguishing feature of this long-term cooperation agreement from those which Romania has concluded with other Western countries is Annex I. Basically, this annex sets forth principles, in greater detail than in the body of the agreement, for the organization and operation of cooperation activities, including equity joint ventures. Annex I is divided basically into two parts—(1) provisions dealing with cooperation activities generally and (2) other provisions which specifically address joint ventures. While most of the rights enumerated in Annex I are either customary Western commercial rights or are provided for under local law or in bilateral agreements between the two countries, it serves as an important assurance to that part of the U.S. business community potentially interested in cooperation activities involving Romania. Similarly, since the principles and guidelines endorsed stress familiar Western elements of cooperation and joint ventures—the rights of ownership and management, sanctity of

<sup>22</sup> See paragraph No. 17, Agreed Minutes—Third Session.

<sup>23</sup> See "Business Contacts and Facilities" under item 1. Commercial Exchanges.

contract, competitive procurement, responsibility of management to its stockholders, etc., Annex I provides a common set of objectives from which U.S. firms can negotiate cooperation contracts in Romania. Annex I, then, should be seen as both an attraction and support to U.S. firms interested in cooperation activities with Romanian economic entities.

However, it should not be thought that Annex I benefits only the U.S. side; it is also useful to Romania which is seeking ways to expand its exports to hard currency paying countries and to conserve scarce convertible reserves without reducing importation of Western capital goods and technology. Through cooperation activities and in particular, equity joint ventures, Romania seeks to attract Western cooperation, including direct investment, and to secure guaranteed Western markets. American companies have not, as yet, been particularly active in cooperation and joint venture activities and this may stem, in part, from their lack of understanding about Romania's centrally planned economy and flexibility in negotiating cooperation and joint venture agreements. Thus, by providing American companies with the assurance that they can negotiate cooperation arrangements protecting their basic interests and by permitting them to operate in a legal and commercial environment not wholly foreign to them, Annex I may help to overcome these problems through a pragmatic, business-like approach to cooperation and foreign investment.

In the first part—regarding cooperation—Annex I outlines the rights that nationals, firms, companies and economic organizations of the two countries have in conjunction with cooperation activities—all consistent with applicable laws and regulations of the two countries and with agreements between the parties. Among these are the right to verify compliance with all contractual obligations, to include in cooperation contracts measures necessary to facilitate the hiring and compensation of local staff, and to transfer abroad the net proceeds of rights resulting from distribution of assets upon dissolution of the cooperation project. These are familiar and important principles to any Western firm.

Another important right is to have access to necessary commercial services and facilities no less favorable than those afforded to commercial representations under the Trade Agreement. This is, in effect, an MFN assurance for facilities and services, and it assures that the Long-Term Agreement parallels the business facilities provisions of the Trade Agreement.

Still further rights provide for contact and work with officials and technical personnel of each other's firms, companies and economic organizations engaged in cooperation activities and for the purchase of necessary equipment and materials from both domestic and foreign sources under competitive conditions. The right to contact and work with technical and working level officials may be particularly important to the success of a cooperation project since access to end-users is a frequent problem for Western firms in Eastern Europe. Similarly, the right to competitive purchase should assure both sides that the cooperation activity is enjoying the most advantageous conditions under which to operate and is not being forced into unfavorable arrangements.

With respect to disputes arising in connection with cooperation activities, Annex I first recommends that firms, companies and

economic organizations consider using the conciliation procedures established by the Romanian-U.S. Economic Council.<sup>24</sup> This conciliation mechanism was set up in order to offer an alternative means of settling disputes short of going to arbitration. The conciliation procedures are optional and nothing done in them hinders or prejudices further possible arbitration proceedings. It should be noted here that the Agreement recommends consideration of use of the conciliation procedures but does not endorse their use over any other dispute settlement provisions that the contracting parties might adopt.

Beyond conciliation procedures the Agreement further recommends "the adoption of arbitration under the Arbitration rules of the International Chamber of Commerce in Paris for the settlement of disputes between participants in cooperation activities." Whether this or another forum is ultimately used, Annex I notes that arbitration should take place in a country, other than the U.S. or Romania, that is a party to the Convention for the Recognition and Enforcement of Foreign Arbitral Awards of New York of June 10, 1958. For U.S. firms, arbitration before a known third country seat such as the ICC in Paris or Stockholm is much preferred. Arbitration in Romania, while preferred by Romanian economic organizations, has been generally avoided by U.S. firms.

The second part of Annex I concerns equity joint ventures. Again, the Agreement sets forth a set of general principles for the establishment and operation of these joint companies. Specifically, Annex I recognizes the right of a joint company to hire and compensate directly employees, other than those engaged in management, at rates similar to those predominant domestically in firms engaged in similar activities. This gives U.S. firms the assurance that discriminatory hiring practices and wage rates will not be established by Romanian authorities for local employees who are to work for joint companies.

Annex I also lists a number of rights important to the investors in establishing and operating joint companies. These include the right of investors to share in profits in proportion to their shares in joint company equity, to share in management of the joint company and to assure that management has full powers to direct and organize production, sales and other joint company activities, to limit their liability to the value of their capital participation, and to examine and verify on request the joint company's property and books. Of these the most important are the assurance regarding profits in proportion to one's investment and the assurance regarding participation in management. The latter has been of particular concern to U.S. firms which fear that because of their minority ownership position, they will not be able to exercise effective control of their joint companies.

With respect to disputes arising from investment in a joint company Annex I recommends that such disputes "be submitted for conciliation or arbitration as provided by the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID). While the previous reference (in Annex I) to conciliation and arbitration procedures arising from disputes in cooperation agreements would also be applicable to the joint venture

<sup>24</sup> See "Papers of the Second Plenum—Romanian-U.S. Economic Council, Washington, D.C., May 29-30, 1975," (published by the Chamber of Commerce of the United States), at pp. 6-15 and p. 75, and "Papers of the Third Joint Session—Romanian-U.S. Economic Council, Bucharest, Romania, June 24-25, 1976," (published by the Chamber of Commerce of the United States), at pp. 23-30.

form of cooperation, the ICSID reference seems appropriate in an annex provision relating specifically to investment. Both the United States and Romania are parties to the ICSID Convention which is administered by the International Center for the Settlement of Investment Disputes, attached to the International Bank for Reconstruction and Development.

Finally, the Agreement contains a second annex (Annex II) which identifies areas of particular interest in which to develop cooperation between firms, companies and economic organizations of the two countries. These include:

1. Machine building industry;
2. Electrical and electronic industries;
3. Aviation industry;
4. Chemical and petrochemical industry;
5. Petroleum industry;
6. Mining industry;
7. Construction materials industry;
8. Light industry;
9. Food industry;
10. Telecommunications;
11. Computers and data processing;
12. Agriculture; and
13. Banking.

Of these, items 1, 2, 4, 5 and 6 are probably most important because of priority attached to them in the current Five Year Plan (1976-1980). It should be noted that items 3, 10 and 11 are also important and are really sub-sectors of the Romanian machine building industry. In view of the recent earthquake in Romania, considerably more significance may be attached now to cooperation in the construction materials industry. In any case, the list of Annex II is broad and reflects again the wide scope foreseen for cooperation activities by the Romanian Government at this time.

#### APPENDIX. LONG-TERM AGREEMENT ON ECONOMIC, INDUSTRIAL AND TECHNICAL COOPERATION BETWEEN THE UNITED STATES OF AMERICA AND THE SOCIALIST REPUBLIC OF ROMANIA

The Government of the United States of America and the Socialist Republic of Romania;

Noting with satisfaction the favorable development of economic relations between the two countries;

Resolved to promote economic, industrial and technical cooperation between the two countries on the basis of the principles of international law, respect for national independence and sovereignty, equality of rights, noninterference in domestic affairs and mutual advantage;

Taking into account the characteristics and economic potential of the two countries, and their respective levels of economic development;

Desiring to ensure continuous expansion and diversification of economic, industrial and technical cooperation and provision of information to facilitate such cooperation;

Wishing to enlarge upon the provisions of the Joint Statement of Economic, Industrial and Technological Cooperation between the United States of America and the Socialist Republic of Romania, of December 5, 1973, and taking into consideration the provisions of the Agreement on Trade Relations Between the United States of America and the Socialist Republic of Romania of April 2, 1975;

Determined to promote in their relations the objectives of the Final Act of the Conference on Security and Cooperation in Europe, and to give full effect

to all of its provisions, including those relating to economic, scientific and technological cooperation; and

Considering that expansion and development of cooperation between firms, companies and economic organizations of the United States of America and the Socialist Republic of Romania will serve positively the interests of the two countries and peoples;

Have agreed as follows:

#### ARTICLE I

1. The Parties shall take all appropriate steps to facilitate economic, industrial and technical cooperation between firms, companies and economic organizations, including those of small and medium size, in keeping with applicable laws and regulations in the two countries.

2. The Parties shall endeavor that firms, companies and economic organizations of one country and their representatives residing in or visiting the other country for purposes related to this Agreement will enjoy suitable operating conditions, including access to facilities required for the expeditious conduct of their business, in accordance with applicable laws and regulations.

3. Goods produced under cooperation arrangements in the territory of one Party shall, when imported into the territory of the other Party, be treated in accordance with the relevant provisions of the Agreement on Trade Relations of April 2, 1975, for the period those provisions remain applicable, or as otherwise provided by applicable laws and regulations.

4. Neither Party shall take unreasonable measures that would impair the contractual or other rights legally acquired within its territory, of nationals, firms, companies or economic organizations of the other Party.

5. Except for a public purpose, assets belonging to nationals, companies and economic organizations of one of the two countries will not be expropriated by the other country, nor will they be expropriated without the payment of prompt, adequate and effective compensation.

6. Each Party agrees to facilitate to the maximum extent possible in accordance with its legislation all travel of persons engaged in activities consonant with the objectives of this Agreement.

#### ARTICLE II

1. Cooperation activities shall be based on contractual arrangements between firms, companies and economic organizations in the two countries, in accordance with the laws and regulations in force in both countries. Such contracts will generally be concluded on terms customary in international practice, and may provide for sharing and transfer of benefits, participation in management and procedures to protect the resources committed by each partner in cooperation arrangements including joint companies. General principles for the development and operation of cooperation activities are set forth in Annex I to this Agreement.

2. Such cooperation activities may include:

Joint participation in the construction of new industrial facilities and the expansion and modernization of existing facilities in both countries;

Joint participation, including the formation of joint companies, by firms, companies and economic organizations of the two Parties, in producing and marketing goods and services;

Purchase, sale and leasing of machinery and equipment;

Purchase and sale of industrial and agricultural materials and consumer goods;

Purchase, sale, license or commercial exchange of patent rights, technical information, or know-how, as well as provision of technical services, including training and exchange of specialists and technicians, all in accordance with laws, regulations and procedures assuring that such arrangements are to the mutual advantage of both Parties;

Establishing and operation of offices and representations of firms, companies and economic organizations in the two countries;

Purchase and sale of services, including full and equitable participation by firms, companies and economic organizations of the two Parties in banking, insurance, including marine and air cargo insurance, and other financial services; and

Other cooperation activities and forms which may be mutually agreed between participants in the two countries.

3. Each Party shall arrive at export licensing decisions as expeditiously as is feasible under its established administrative procedures and in conformity with its laws, regulations and international undertakings.

4. The two Parties shall, as appropriate, facilitate cooperation between firms, companies or economic organizations of the two countries in third markets.

5. With a view to encouraging the development of banking services in support of economic, industrial and technical cooperation, each Party shall, where possible, facilitate the establishment and operation in its territory of banking institutions by firms, companies or economic organizations of the other Party in association with domestic firms, companies or economic organizations or individually.

6. All financial transactions shall be made in United States dollars or any other freely convertible currency mutually agreed upon by nationals, firms, companies and economic organizations, unless they otherwise agree.

7. The Parties agree to encourage and facilitate accelerated negotiations between firms, companies and economic organizations of the two countries, so that cooperation projects may be implemented as expeditiously as possible, and possibilities for discussion of new areas of cooperation may be enhanced.

8. The sectors mentioned in Annex II have been identified as areas of particular interest for the development of economic, industrial and technical cooperation between firms, companies and economic organizations of the two countries.

### ARTICLE III

1. The Parties shall take all appropriate steps to facilitate conclusion of contracts regarding cooperation activity between firms, companies and economic organizations of the two countries.

2. The two Parties shall grant to equipment, materials and components imported temporarily for purposes related to contracts regarding cooperation activity the same exemptions from customs duties, and other taxes and restrictions, that are granted to like equipment, materials and components from any other country, to the extent permitted by their laws and regulations.

3. Taking into consideration the importance of financing for the development of economic, industrial and technical cooperation; the particular characteristics of each case; and the laws, regulations and international undertakings of each country; the Parties agree that such financing as may be extended by them should enjoy conditions as favorable as possible.

### ARTICLE IV

In order to assist firms, companies and economic organizations in determining the fields and projects most likely to provide a basis for mutually beneficial contracts, each Party, in accordance with its laws, regulations and procedures, shall, as appropriate, make available upon request by nationals, firms, companies and economic organizations of the other Party, or by the other Party, economic, commercial and statistical information useful for the development of market forecasts and the expansion of economic, industrial and technical cooperation. Such information shall include, but not be limited to:

All statistical data regarding production, national income, budget, consumption, productivity, foreign trade and transfer of technology, necessary to accomplish the objectives of this Agreement.

Other information necessary for adequate evaluation of projects for cooperation, including information concerning laws, regulations and administrative procedures. Such information may relate, *inter alia*, to domestic commerce and foreign trade, including transfer of technology; to compensation of labor; and to banking and finance including the rates of exchange applicable to goods and services required for cooperation activities.

Current lists, directories and descriptions of firms, companies and economic organizations concerned with foreign trade, as well as other information helpful in making commercial contacts, including periodic catalogs and promotional materials of such firms, companies and economic organizations.

### ARTICLE V

1. The Joint American-Romanian Economic Commission, established pursuant to the Joint Statement on Economic, Industrial and Technology Cooperation of December 5, 1973, shall monitor implementation of this agreement.

2. In this respect the responsibilities of the Joint American-Romanian Economic Commission are as follows:

To examine periodically the development of economic, industrial, and technical cooperation between the two countries;

To facilitate the expansion and diversification of economic, industrial, and technical cooperation between the two countries on the basis of mutual benefit, and to identify new areas for such cooperation;

To provide for the regular exchange of views and information on the development of economic, industrial and technical cooperation and on the reciprocal extension of business facilities; and

To consider other matters related to implementation of this Agreement.

3. The Commission may establish temporary working groups in various areas as necessary for purposes related to this Agreement.

4. The Commission may facilitate the establishment of joint consultative groups consisting of representatives of firms, companies, and economic organizations of the two countries on matters of particular interest related to this Agreement.

#### ARTICLE VI

The provisions of this Agreement shall not be construed to impair the rights and obligations of the Parties arising from other agreements or understandings.

Termination of this Agreement shall not affect the validity of contracts or understandings, in force on the date of termination of the Agreement, between nationals, firms, companies, and economic organizations of the two countries, or entered into by either Party.

#### ARTICLE VII

This Agreement shall enter into force on the date on which both Parties have received written notice of its approval by the other Party.

This Agreement shall remain in force for ten years. Thereafter it shall be automatically extended for successive periods of one year, provided that either Party may terminate it at the end of the initial ten-year period or of any successive one-year period by giving six months' written notice to the other Party.

IN WITNESS WHEREOF, the authorized representatives of the Parties have signed this Agreement.

DONE at \_\_\_ on \_\_\_ in two original copies, in the English and Romanian languages, both texts being equally authentic.

PUBLIC OF ROMANIA.

#### ANNEX I

The Parties recognize the desirability of general principles for the development and operation of cooperation activities, as enumerated in Article II of this Agreement, in which nationals, firms, companies and economic organizations of one Party may participate in the territory of the other. Therefore, the Parties recommend the following principles, subject to laws and regulations in force in the territory of the Party where such cooperation activities take place.

1. Such nationals, firms, companies and economic organizations of a Party, consistent with applicable laws, regulations, and agreements between the Parties, should have the right:

A. To be free to transfer abroad, without discriminatory restrictions and fees, and under the conditions stipulated between the participants, net proceeds, and the value of capital participation, of rights resulting from distribution of assets upon dissolution, and of all other rights to which they are entitled, after payment of fees, taxes, contributions to social insurance and satisfaction of other legal and contractual obligations;

B. To verify compliance with all contractual obligations;

C. To include in the contracts of cooperation measures to facilitate hiring and compensation of necessary local staff for implementation of obligations resulting from cooperation projects, in accordance with laws and regulations in force in the two countries;

D. To purchase installations, equipment and materials necessary for cooperation activities from domestic or foreign sources according to competitive criteria;

E. To have access to services and facilities necessary for the conduct of business which is no less favorable than that accorded to firms, companies and economic organizations of any third country;

F. To contact and work with officials and appropriate technical personnel of firms, companies and economic organizations of the other Party engaged in cooperation activities, including as necessary, suppliers of services, supplies and components for cooperation activities, and users of goods produced through such cooperation activities;

G. To enjoy rights and facilities no less than those accorded to representations under the provisions of Annex 2(I) of the Agreement on Trade Relations of April 2, 1975, between the two Parties; and

H. To exercise other rights, and carry out obligations agreed upon between participants in the two countries in their contracts.

2. The Parties recommend that firms, companies and economic organizations give consideration to the use of conciliation procedures established by the Joint U.S.-Romanian Economic Council. The Parties further recommend the adoption of arbitration under the rules of arbitration of the International Chamber of Commerce in Paris for the settlement of disputes between participants in cooperation activities. Such arbitration should take place in a country other than the United States of America or the Socialist Republic of Romania that is a party to the Convention for the Recognition and Enforcement of Foreign Arbitral Awards of New York of June 10, 1958. Participants may mutually agree on any other form or place for the settlement of disputes.

3. The Parties agree that informal government-to-government consultations regarding specific proposals for major cooperation projects between firms, companies or economic organizations of the two Parties, or major investments by firms, companies or economic organizations of one Party in the territory of the other Party, would contribute to achievement of the objectives of this Agreement. Such consultations should take place at the request of either Party prior to conclusion of arrangements for such activities.

4. The Parties also recommend the following general principles for the establishment and operation of joint companies in the territory of one Party, involving capital participation by firms, companies and economic organizations of the other Party. Such joint companies should have the right to hire and compensate directly employees, other than those engaged in management, in conformity with applicable laws and regulations, at rates similar to those predominant domestically in firms, companies or economic organizations engaged in similar activities. Firms, companies and economic organizations participating in such joint companies should have the right, subject to laws and regulations in force in the territory of the Party where the joint company is established:

A. To share in profits in proportion to capital participation in the joint company;

B. To share, in proportion to their capital participation, in assets resulting from termination and dissolution of the joint company;

C. To transfer for value all or part of the rights arising from capital participation, as provided in applicable laws and regulations, and in conformity with the legal instruments establishing the joint company;

D. To examine and verify, upon request, the status of the company's property and books of account, in conformity with the legal instruments establishing the joint company;

E. To participate in management or, to be represented in management in equitable proportion to their capital participation in the joint company in accordance with applicable laws and regulations;

F. To limit their liability for the obligations of the joint company to the value of their capital participation;

G. To enter into arrangements for management of the joint company which will assure that management has full powers, consistent with laws and regulations in force, to direct and organize production, sales and other activities of the joint company; and

H. To exercise other rights and to carry out other obligations agreed upon by participants in the joint company, in conformity with the legal instruments establishing the joint company.

5. The Parties recommend that disputes between one Party and a national, firm, company or economic organization of the other Party which arise out of an investment be submitted for conciliation or arbitration as provided by the Convention on the Settlement of Investment Disputes Between States and Nationals of Other States.

## ANNEX II

In accordance with Article II, paragraph 8 of this Agreement, the following sectors have been identified as areas of particular interest for the development of economic, industrial and technical cooperation between the firms, companies and economic organizations of the two countries:

- Machine building industry;
- Electrical and electronic industries;
- Aviation industry;
- Chemical and petrochemical industry;
- Petroleum industry;
- Mining industry;
- Construction materials industry;
- Light industry;
- Food industry;
- Telecommunications;
- Computers and data processing;
- Agriculture; and
- Banking.

# STRATEGY AND STRUCTURE IN THE ORGANIZATION OF ROMANIAN FOREIGN TRADE ACTIVITIES, 1967-75

BY JOSEF C. BRADA AND MARVIN R. JACKSON\*

IV. Conclusions.....	1276

### I. INTRODUCTION

In the late 1960's and early 1970's most of the socialist states of Eastern Europe undertook significant reforms of their foreign trade organizations. These changes involved the creation of new organizational structures, changes in the price regime and new decision-making criteria and managerial incentives. The existing literature generally describes, but does not subject organizational changes to systematic analysis. By contrast, the second and third categories of systemic changes have been extensively described and analyzed. While this direction of effort is quite explicable as reflecting the usual interests and methodologies of western economists, we consider it to be an anomaly. Considering the body of systemic changes so far undertaken, the attempt to remedy deficiencies in the trade system by changes in organizational structure and organizational units have been more common among the East European countries than have been changes in price regimes, decision-making criteria and management incentives.

The purpose of this paper is to present a conceptual framework for the analysis of organizational change in the structure of East European foreign trade activities and to study the Romanian experience with organizational changes within this framework.

### II. A THEORY OF FOREIGN TRADE ORGANIZATIONS

With a few notable exceptions, the impact of the goals of the socialist countries on the ways in which they are organized and on the consequences of organization for economic behavior have been neglected. In contrast, an extensive literature has evolved regarding the interactions between corporate strategies or goals, the organizational structure of the corporation and the success in achieving corporate

Brada's research was additionally supported by an N.Y.U. School of Business Faculty Research Grant and by the N.Y.U. Project on the Multinational Firm in the U.S. and World Economy.

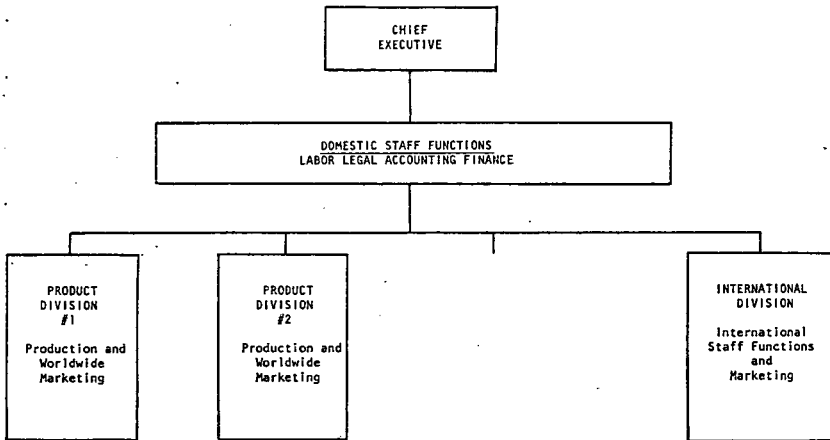

We are deeply grateful to our Romanian colleagues and to Romanian foreign trade officials for many useful interviews on matters discussed in this paper.

strategies.<sup>1</sup> In deference to this literature, we shall develop our theory in terms of a western corporation and only as a last step indicate the relevance of this theory to the experience of the socialist states.

Since we are dealing with the organization of foreign trade, the object of our study will be a corporation just beginning to engage in foreign trade activities. Generally, such firms utilize an international division form of organization as illustrated in Figure 1.<sup>2</sup> The international division orders goods from the product divisions, each of which is responsible for the production and sale of a product domestically, and sells them abroad. This form of organization has a number of behavioral implications. Production is divorced from international markets, since the product divisions sell to the international division. Purchase orders thus flow from one division to another. However, changes in the product to meet the needs of foreign clients, alterations in production schedules to meet foreign needs, etc. involve requests by the international division to top management followed by instructions issued to the producing division. Such requests are likely to be infrequent at first and upper management will generally only concern itself with the aggregate performance (sales and profits) of the international division.

FIGURE 1

## INTERNATIONAL DIVISION STRUCTURE

<sup>1</sup> For a brief survey see Raymond Vernon, *The Economic Environment of International Business*, Prentice-Hall, Englewood Cliffs, New Jersey, 1972, Ch. 11. More detailed presentations may be found in Paul R. Lawrence and Jay W. Lorsch, *Organization and Environment: Managing Differentiation and Integration*, Graduate School of Business Administration, Harvard University, Boston, 1967, and Charles Perrow, *Organizational Analysis: A Sociological View*, Wadsworth Publishing, Belmont, California, 1970.

<sup>2</sup> The classic study on the organization of multinational firms in John M. Stopford and Louis T. Wells, Jr., *Managing the Multinational Enterprise*, Basic Books, New York, 1972. See especially pp. 4-11.

As the international division expands its operations, however, its interactions with the rest of the firm increase in volume and intensity.<sup>3</sup> Upper management comes to view international activities as increasingly significant in overall operations, and will require greater amounts of information from the international division and take foreign developments increasingly into consideration when formulating corporate strategies. Furthermore, the growing power of the international division, coupled with the increased volume of foreign sales relative to total production, lead the international division to increasingly importune top management to alter the activities of the product divisions so as to meet the requirements of the foreign market.

In such a situation the international division tends to create several problems. First of all, communications within the organization tend to become excessive. Top management is now faced with the task of monitoring both domestic product divisions and the sales of those same products in several foreign markets. Furthermore, management's ability to plan effectively for both domestic and foreign operations is hampered by the continual need to mediate between the needs of the international division and the desires of the product divisions.<sup>4</sup> That is to say, top management is involved in solving day to day responses to international events.

At some point, then, the corporation finds its increasingly international strategy inconsistent with its organizational structure, and a new form of organization appears. This form, commonly known as the global structure, dispenses with an international division.<sup>5</sup> Rather, as shown in Figure 2, the product divisions now become fully responsible for both domestic and foreign sales of their output. Consequently, upper management now need only monitor results by product division, without concern for the domestic-foreign dichotomy. Managers of the product divisions, on the other hand, now monitor and respond to international events in the same fashion as they do to domestic events; product design, production schedules, etc. are now influenced by both foreign and domestic requirements. Thus, as the name implies, the global firm makes no distinction between the domestic and the international market.

Both types of organization have inherent strengths and weaknesses! The international division form tends to perform poorly in terms of economics but well in terms of economizing on international expertise. Poor economic performance is, as we have indicated, the result of the separation between the producing division and the international division. Furthermore, any response to international events in terms of corporate strategy or the behavior of the product divisions must be made by top management. Thus, response to such events is likely to be sluggish and to occur only in response to major events. The advantage of the international division is its ability to centralize the corpora-

<sup>3</sup> See John Fayerweather, *International Business Management: A Conceptual Framework*, McGraw-Hill, New York, 1969, Chapter 6.

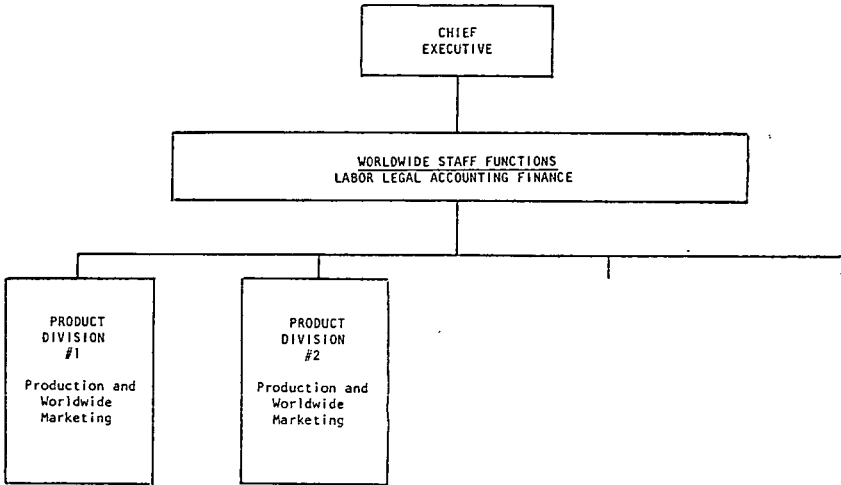

<sup>4</sup> William A. Dymsha, *Multinational Business Strategy*, McGraw-Hill, New York, 1972, Chapter 2.

<sup>5</sup> The creation of the global form comes about not only from an increase in the volume of foreign business but also from increased product diversity. Stopford and Wells, *op. cit.*, p. 30, observe that "... product diversification abroad is associated with the move from an international division to a global structure".

## FIGURE 2

### GLOBAL STRUCTURE

tion's presumably limited expertise on international operations and to apply it to the marketing of the entire assortment of the firm's products. Thus, the firm makes the best possible use of its international expertise.

The global form is superior to the international division in terms of economic performance, but demands as a prerequisite a large number of personnel skilled in international operations. Economic efficiency is the result of the greater responsiveness of the producing divisions to the needs of the international market, the economic stake that each product division has in foreign sales, and the better interaction between sales and producing departments. Overall, such a firm will react quickly and effectively to international events. However, the cost associated with a viable global firm is the need to staff each product division with enough managers skilled in international operations to permit it to effectively undertake foreign sales. If such individuals are lacking, product divisions will not be effective on international markets, and interest in exporting will eventually disappear.

The reader familiar with East European foreign trade organizations will by now have recognized the similarity between the international division form of company and a traditional centrally planned economy. The planned economy has branch ministries whose functions and relationship to the ministry of foreign trade exactly parallel the relationship between the product divisions and the international division. Indeed the complaints regarding problems of foreign trade observed in the East European press are almost identical to complaints heard among executives of western companies with similar organizations.

In the next section of this paper we shall show that sometime after 1965 Romania found the international division form of organization inappropriate in the light of its international strategy. This strategy had two key elements. One was a reorientation of trade toward the west, where the need for effective marketing of Romanian goods was of much greater importance than in intra-CMEA trade. The other element was a greater emphasis on the sale of machinery and consumer manufactures. These, however, are exactly the goods which require the greatest interaction between sales and production and responsiveness to market trends by the producer. Consequently, Romania shifted to a global form of organization by giving enterprises the right to engage in international trade on their own. The means by which this reorganization was carried out and its consequences are detailed in the next section.

### III. REORGANIZATION OF ROMANIAN FOREIGN TRADE ACTIVITIES, 1967-75

Evidence suggests that changes in economic organization were discussed among higher party circles in Romania following Ceausescu's succession to power in 1965. However, open discussion of the question did not occur until after publication of a decision by the Romanian party central committee in October 1967, to follow other socialist countries in the establishment of industrial associations and to undertake other measures to rid the economic management system of "excessive centralization."<sup>6</sup>

The tone of the Central Committee Directives and pronouncements made at the subsequent National Party Conference in December 1967, which affirmed the Directives, suggested that changes in foreign trade organization would be closely connected with creation of the industrial associations. At the Party Conference, Ceausescu said, "Measures are foreseen for the elimination of the phenomena of excessive centralization existing in import and export activities, the passing of a large part of the activities of foreign trade to the responsibilities of the ministries, industrial associations and some enterprises, and the establishment of direct, more operational relations between the economic units and the foreign clients".<sup>7</sup> The Directives had also indicated that the associations would be involved in an expansion of Romania's foreign trade agencies and in the establishment of mixed foreign-based commercial companies with foreigners for promotion of Romania's exports.

Contrary to the occasionally urgent tone of the Directives and the Conference, subsequent organizational changes were not radical and were much delayed. The organization of the system of industrial associations was not undertaken until October, 1969.<sup>8</sup> The resulting

<sup>6</sup> Directives of the Central Committee of the Romanian Communist Party of 5 and 6 October, 1967, "On the Perfection of Management of the National Economy in Keeping with the Conditions of the New Stage of Romania's Socialist Development".

<sup>7</sup> N. Ceausescu, "Raportul cu privire la masurile de perfectionare a conducerii si planificarii economiei nationale si la imbunatatirea organizarii administratie-teritoriale a Romaniei," presented at the National Conference of the R.C.P., 9 December 1967, in *Romania pe drumul desavirisirii constructiei socialiste*, Vol. 2, p. 569. Further references to the volumes of Ceausescu's collected speeches will use the shorter title—*Romania pe drumul*.

<sup>8</sup> "Association" is a common western name given to intermediate units of management, between a ministry and its enterprises, created by the COMECON nations in the 1960s. The actual name and authority varied from country to country. In Romania, the actual name is *centrale*.

associations received far less power in deciding production, supply, or organizational matters than suggested either in 1967 or as provided in the model statutes for the associations published in March, 1969.<sup>9</sup> Furthermore, many details of the new organization were not formalized until October, 1971.<sup>10</sup>

The role of the associations in foreign trade was not formalized until the passing of the foreign trade law in March, 1971.<sup>11</sup> Unfortunately, the importance of the March foreign trade law and the role of the associations in foreign trade have been generally exaggerated by Western observers who have tended to attribute too much foreign trade power to the associations, and who perhaps have been misled by important differences in the apparent legal rights given to the associations in foreign trade and their *de facto* power. It is correct that the March law established, in principle, extensive powers for the associations in foreign trade. However, even before the law was passed, foreign trade had been turned over to the industrial ministries and a completely new financial regime for foreign trade transactions had been established. From this point of view, important "reforms" of the foreign trade system were underway before 1971. Moreover, all rights given in principle to the associations by the Law were subject to specific approval by higher authorities. They were not automatically granted to each association by the Law. As it turned out, limited decentralization of foreign trade decision-making to the associations took place only during a two-year period following the Law and then in 1973 and more seriously in 1975; recentralization occurred.

#### A. The Period of Decentralization—1967-72

Ceausescu's first declaration of a need to change foreign trade organization was made during a meeting with foreign trade personnel in February, 1967.<sup>12</sup> His major concern appeared to be the more rapid growth of imports than exports since 1960 and the large balance of payments deficit in the current five-year plan period. In suggesting remedies for the problem, Ceausescu denounced excessive centralization which impeded exports. He called for a greater role in trade of the industrial ministries and large industrial enterprises and more direct ties between producers and clients.

Between 1967 and 1969, eight foreign trade enterprises were transferred from the foreign trade ministry to the industrial ministries and other central agencies.<sup>13</sup> In 1968, the Romanian Bank of Foreign Trade was established as a central agency to be solely concerned with foreign currency transaction and foreign credits. It is evident that with decentralization of trade transactions, a more specialized agency would be needed to avoid the industrial ministries' independent use of credits and foreign currencies.<sup>14</sup>

<sup>14</sup> Law number 16 of 21 June 1968 published in *Buletin Oficial*, number 80, June 22, 1968.

Other major changes took place in late 1969 when the whole system of central agencies was reorganized. In September, 1969, the ministry of foreign trade was reorganized to stress its new role as general coordinator of the foreign trade system. It was also decreed that beginning January 1970, ten more foreign trade enterprises would be transferred from the foreign trade ministry to the industrial ministries where, in addition, three new, more specialized foreign trade enterprises would be formed.<sup>15</sup> By the time the 1970 foreign trade guide was published, only three foreign trade enterprises specializing in commodity trade remained subordinate to the foreign trade ministry. The industrial ministries now had nearly complete responsibility for direct trade activities. In addition, the number and specialization of their subordinate foreign trade enterprises had been increased, especially for machinery and manufactured consumer goods. These and subsequent changes in the Romanian foreign trade organization are summarized in Table 1.

Establishment of the foreign trade bank in 1968 was but a small part of the needed changes in the financial and planning system required by the dissolution of the ministry of foreign trade monopoly.<sup>16</sup> Hence, a number of other changes were made in late 1969 which remain as the fundamental financial and planning principles of the foreign trade system.<sup>17</sup> These were the following:

(1) Planning targets for "deliveries to the ministry of foreign trade of export goods" were replaced by planning targets for "exports" which became the common responsibility of foreign trade enterprises and industrial associations and enterprises.

(2) The bulk of trade contracts with foreigners were to be signed by the managers of producing organizations so "title" to exports passed directly from producer to foreign buyer with the foreign trade enterprises that arranged the transaction being paid a commission.<sup>18</sup>

(3) Export plans of industrial enterprises, associations and ministries were to be considered as fulfilled only when documents of acceptance by the foreign buyer were presented to the Foreign Trade Bank for collection and, in cases established by the central authorities, when planned average external prices and planned regional distributions of exports were also realized.

(4) A new system of credit, foreign currency controls and transactions between domestic and foreign currency was established.<sup>19</sup>

(5) A new system of internal prices for export goods was established using "calculated prices" (*pretul de calcul*) limiting turnover taxes and profits to ten percent of cost; also in special cases an "export premium" (*premiu de export*) of 4-6% price mark-up could be used as an incentive.

<sup>15</sup> *Viata economica*, 1970/6 (February 6), p. 4 (Reference is to Decree number 622 of 12 November 1969).

<sup>16</sup> At the December, 1968, plenum of the party central committee, Ceausescu said "Measures have been taken for a better organization of the foreign trade sector". He did not specify these measures, but went on to speak of the need to change the financial system, including internal prices, in order to obtain better control and producers' incentives to export. *Romania pe drumul*, Vol. 3, pp. 792-3.

<sup>17</sup> Decree number 2424/69. The decree is discussed more fully in Marvin R. Jackson, "Prices and Efficiency in Rumanian Foreign Trade", in Josef Brada (ed.), *Quantitative and Analytical Studies in East-West Economic Relations*, International Development Research Center, Bloomington, 1976. Also see *Viata economica* 1970:6 (February 6) pp. 3-4 and 1970:15 (April 10) p. 8.

<sup>18</sup> According to *Viata economica*, 1973:6 (February 9), p. 14, the first use of commission contracts between producers and foreign trade enterprises was provided by Decree 2424/1969.

<sup>19</sup> Effected on the basis of Decree 2424/1969 by Ministry of Finance instruction 17/1970, beginning March 1, 1970 (*Viata economica*, 1970:15 (April 10) p. 8).

1968—United Nations, Economic Bulletin for Europe, vol. 24:1 (1973) p. 37.

1969—Economic and Commercial Guide to Romania, 1969-70 (Bucharest) pp. 153-192 which was published Jan. 28, 1969. Between 1967 and 1969, 8 foreign trade enterprises were reported to have been transferred from the Ministry of Foreign Trade to the industrial ministries (Finante si Credit, 1969/12 p. 38).

1970—Romania, Pocket Commercial Guide, 1970 (Bucharest 1970).

1971—Unknown, except for 20 trade organizations reported under the associations by Gaigau, op. cit. p. 17 (as established in Decree No. 28 of 1971).

1972—Numbers in parentheses indicate organizations reported in United Nations, op. cit., p. 37. Total number is explained in the text.

1973—Your Commercial Partners in Romania, 1973 (Bucharest 1973) which contains the same list as in decree No. 465 dated Mar. 3, 1973.

1974—The Economic and Commercial Guide to Romania, 1974 published Dec. 31, 1973, contains the same list as that for 1973 above except that the foreign trade enterprises "Auto-Dacia" and "Universal-Tractor" are separate in 1974. The number given in the table is that given in decree No. 275 dated Mar. 22, 1974 (which modified decrees 28/1971 and 465/1973).

1975—Your Commercial Partners in Romania, 1975 (Bucharest, 1975).

According to the second principle above, the approximately 200 industrial associations which had been formed in 1969 and 1970, and even the more numerous industrial enterprises, were given the right to engage directly in trade. Thus, the principle incorporated later in the 1971 Foreign Trade Law had already been established. However, there is no evidence that such rights, in fact, were given in 1970 or even in early 1971.<sup>20</sup> Following publication of the Foreign Trade Law in March, 1971, the Council of Ministers in a special decree granted twenty associations the right to organize their own foreign trade activities. It was unclear whether these associations did so through internal commercial departments, or through subordinate, but financially independent, foreign trade enterprises.<sup>21</sup>

The available evidence makes it difficult to establish exactly what happened in the remainder of 1971 and 1972.<sup>22</sup> Two clues to the situation are (1) a comment in *Probleme Economice* (1972:12, pp. 28-29) that "over 90 industrial associations and enterprises, as well as specialized enterprises" were authorized to execute foreign trade transactions, and (2) a subsequent interview source who said that in 1971 there were 96 separate organizations involved in export marketing and sales. "Specialized enterprises" in the first reference probably refers to foreign trade enterprises, of which 56 were reported to exist in 1972 (with unknown subordinations). Therefore, it may be surmised that some 34 to 40 industrial associations and enterprises were undertaking foreign trade through their internal departments. Thus, it appears that industrial associations and enterprises acquired important responsibilities for exploring foreign markets, contacting buyers and negotiating trade contracts.

### B. The Period of Recentralization—1973-75

Organization decentralization of foreign trade ended in 1973 when the whole economy was subjected to recentralization. In his speeches to the Central Committee in February and November, Ceausescu voiced dissatisfaction with the new management system,<sup>23</sup> but, while in February he was still talking about "shortcomings in eliminating excessive centralization", in November he called for greater discipline and warned that "democracy does not mean to leave the development of things to an accidental [i.e., unplanned] direction." The atmosphere of 1973 was certainly one of tightening up and the development of more ambitious growth targets leading to the slogan of "fulfillment of the five-year in 4½ years"—that is, by mid 1975. Among the specific

<sup>20</sup> According to a discussion by enterprise directors in one country (*judet*) which was published in *Viata economica*, 1971:5 (January 29), p. 5, the associations had organized sections or compartments for "expediting" (*defacere*) of export goods, but did not have sufficient personnel to undertake other functions such as negotiation of exports contracts, which yet remained in the hands of the foreign trade enterprises under the industrial ministries.

<sup>21</sup> Decree number 28 of January 1971, mentioned in Vasile Galgan, *Organizarea si urmarirea activitatii de comerț exterior ca cenzarala si intrepinderea industriala*, Bucharest, 1973, p. 17. Another source stated that according to this decree, "a large number of the units with foreign trade activities are the producing units or subordinations to the producing units. Thus, corresponding to this decree, activities of importing and exporting . . . are undertaken in the greatest part by the directorates (*directii*) and services (*servicii*) in the associations . . . and in a reduced measure by enterprises subordinated to the ministry of foreign trade". A. Aibu, *et. al.*, *Conducerea si tehnica comerțului exterior*, Bucharest, 1971, Vol. II, p. 80.

<sup>22</sup> Unlike other years since 1970, no foreign trade guides for this period seem to have been published. If, in fact, such guides were not published, it might have indicated a state of change and a situation difficult to describe to foreigners.

<sup>23</sup> Among his criticisms were (1) failure to meet the labor and cost reduction plans for 1972, (2) dispersion of investment funds and failure to fully utilize capital equipment (the latter problem led to a March, 1973 law to increase third-shift operations in all factories) and (3) over staffing of associations, ministries and central agencies with technical-managerial personnel badly needed at enterprises.

changes in general economic management were the following: (1) Imposing a standard internal organizational structure on the associations and enterprises,<sup>24</sup> (2) reducing the number of associations from 200 to less than 100, and increasing the authority of industrial ministries over the association,<sup>25</sup> (3) increasing the number of centrally allocated products in the State Plan for 1974 from 180 to 720,<sup>26</sup> and (4) a sharp reduction in decentralized investments for 1974.<sup>27</sup>

Ceausescu's comments on foreign trade in February, 1973, were his usual urging to do everything better and gave no hint of major organizational changes. The first such indication was provided by Council of Ministers decree nr. 465 of May 3, 1973 which gave direct trade activities to only 20 centrals, 11 of which operated through subordinate departments (or boards) and 9 of which had subordinate foreign trade companies.<sup>28</sup> The foreign trade guide book for 1973 indicated that under the same decree some foreign trade organizations had been combined so the total (including enterprises and boards) had been reduced slightly from 56 in 1972 to 52 in 1973, 32 of which were subordinate to industrial ministries and other central agencies.<sup>29</sup>

In November, Ceausescu announced that the 1974 plan provided for equilibrium in the balance of foreign payments for the first time since the Communists acquired power in August 23, 1944 and indicated that a long term target was proposed to eliminate most foreign debt by 1980. In stating these targets which implied a considerable effort to export, he said it is clear that many managers from enterprises, associations, and even ministries still treat foreign trade as "a peripheral, secondary, occupation". He announced it was necessary, beginning in 1974 to eliminate the distinction between "centralized" and "departmental" imports. To administer the new import system, by December, 1973, a single agency was to be designed to import each product for the whole economy. The formal assignments for imports were announced in a decree of the Council of Ministers dated March 22, 1974, which also listed approximately the same number of subordinations of authorized foreign trade organizations as had been listed in the foreign trade guides published for foreigners in 1973 and 1974.<sup>30</sup>

Ceausescu's speech of May, 1974, to the foreign trade personnel was sharply critical. Among his complaints were: (1) Production of poor quality and outdated products for export, (2) bureaucratic attitudes in dealing with foreign clients, (3) ignoring the dual subordination of trade organizations to the ministry of foreign trade and failure of trade enterprise directors to report shortcomings of the industrial ministries to the foreign trade ministry, (4) too much open talk about imports and exports which are commercial and trade secrets, (5) a tendency to send too many representatives abroad, and (6) too great

<sup>24</sup> Decree number 169 of 22 March 1973 (pr v nd stabilirea normelor unitare de structura pentru unitatile economice) published in *Buletin Oficial*, number 65, May 11, 1973.

<sup>25</sup> Decree number 367 of 9 April 1973 (privind unele masuri de reorganizare a centralelor industriale, unitatilor asimilate acestora, precum si a unor interprinderi de stat) published in *Buletin Oficial* number 128, August 17, 1973.

<sup>29</sup> These numbers will include only organizations engaging in commodity trade.

<sup>30</sup> Decree of the Council of Ministers (HCM) number 275 of March, 1974, "Privind unele masuri pentru imbunatatirea activitatii de comerț exterior". Published in *Buletin Oficial* number 43 of 27 March 1974. Actually the foreign trade guides showed an increase of two foreign trade organizations from 1973 to 1974 and a shift of one organization from an industrial ministry to an association. See your *Commercial Partners in Romania 1973* and *The Economic and Commercial Guide to Romania 1974*.

a tendency to import, including turning some export organizations, even mixed commercial companies abroad, into import organizations. He concluded by stating that the measures for "decentralization" of foreign trade, while in general having a good response, had become distorted. Some foreign trade enterprises were poorly managed and some others were competing with each other. There were too many organizations having the right to conclude contracts and undertake trade. He then urged the ministry of foreign trade to increase its control over trade activities and indicated that the decision had been made (a) to concentrate trade organizations by reduction in their numbers by around forty percent and (b) to increase the number of organizations subordinate to the foreign trade ministry.<sup>31</sup>

The official acts providing for these changes have not been published, but the resulting changes were presented in the foreign trade guide for 1975.<sup>32</sup> As shown in Table 1, the number of trade organizations (in commodity trade) were reduced to 40, a somewhat smaller reduction than indicated by Ceausescu. Moreover, only two more organizations specializing in commodity trade were shifted to the ministry of foreign trade, giving it a total of four. By this time, only four specialized foreign trade organizations remained subordinate to the associations.

Ceausescu's 1975 speech to foreign trade personnel implied greater concern and probable centralization of foreign activities. He specifically stated that, "The correct development of our foreign trade demands that *every economic ministry, every minister, will follow daily* the way in which production for exports is realized, will assure tight control of imports, and will take every measure to ensure in the best way fulfillment of accords and understandings for production cooperation with other countries." Furthermore, he emphasized the "complete" responsibility of the Ministry of Foreign Trade for the development of all trade activities, saying "I believe that, from this point of view, the Ministry can not complain that it doesn't know what it has to do, that it doesn't have clear attributions, or that legislation doesn't give it enough power to fulfill its responsibilities." These remarks seem to leave little doubt but that Romania had returned to a highly centralized system of foreign trade decision making, although a system that differed from the pre-1969 system in demanding greater participation of the producing organizations.

Before discussing why Romania recentralized, one other very important development in its foreign trade system must be mentioned. As already noted, it has been a common tendency for the CPE's to emphasize "economic" or "industrial cooperation" in place of classic trade. But in Romania, the emphasis is especially great as witnessed, among others, by its reputation for insisting upon compensation arrangements in paying for Western machinery imports, and by its leadership in developing joint venture laws and promoting joint venture companies, both in Romania and abroad. In the speech discussed above, Ceausescu emphasized that ". . . today the number one problem of international relations is economic collaboration. Any other way of thinking or of understanding the matter is mistaken,

<sup>31</sup> N. Ceausescu, *Cuvintare la Constatarea cu activul de partid si de stat din domeniul comerului exterior si cooperatiile economice internationale*. May 16, 1974.

<sup>32</sup> *Your commercial Partners in Romania, 1975*. (Bucharest, 1975).

inadequate". One senses that what Romanian leaders would like, in fact, is a wholesale substitution of "cooperation" or classical trade.

### *C. Possible Causes for Recentralization and Emphasis on Cooperation*

There has been a complex of interconnected causes, both economic and political-ideological, why Romania chose to recentralize trade decision-making and to emphasize cooperation over classical trade transactions.

The first cause for recentralization pressures relates to the volume of trade turnover necessary for an economically-sized trade organization. According to a United Nations estimate, in 1971 Romania had one of the largest number of foreign trade organizations in COMECON. Given its relatively low trade dependency, it also had a considerably lower than average trade turnover per organizational unit, in the case of manufactured goods the lowest turnover per unit in COMECON. The same study also suggested that the average trade volume of COMECON export organizations appeared to be of the same order as that of the largest Western export companies.<sup>33</sup>

The United Nations' calculations were based on 56 Romanian trade organizations. This seems to include only specialized foreign trade enterprises. As noted above, there is good reason to believe that in late 1951 and 1972 as many as 90-96 organizations were involved in direct trade, the difference being associations and large industrial enterprises that conducted trade through internal departments. Probably most of the latter were specialized in manufacturers, machinery and consumer goods. If so, the average Romanian trade turnover was possibly as low as one-half the UN estimate.

There is thus a good possibility, that the Rumanians had created too many foreign trade organizations to be profitable given the volume of trade. Moreover, quite apart from the optimal-sized organization unit, probably the fact that the Romanians could observe their comparative position among other socialist countries, must have caused concern that trade organizations were of sub-optimal size. In any case, a major reason for recentralization, given to the authors during interviews in Romania in 1975, was that in 1973 Ceaucescu had ordered all "unprofitable" organizations to be improved or discontinued. Hence, many unprofitable trade organizations were eliminated or merged with others.

A second problem, related to organizational structure, concerns the availability of foreign trade expertise. As seen in section II above, in any case when an organization is changed from the international division form to the global form, one would predict problems in providing product divisions with sufficient foreign trade expertise. In the case of changes in foreign trade organization of Soviet-type economies, these problems may be unusually severe for at least three reasons. First, relatively few persons were trained in foreign trade in the educational systems which emphasized engineering specialities for management personnel in general. Second, experience in foreign trade was very restricted under the orthodox foreign trade ministry monopoly. Third, for political reasons, foreign experts could not easily be integrated into the marketing system.

<sup>33</sup> United Nations Economic Commission for Europe, *Economic Bulletin for Europe*, Vol. 24, No. 1, pp 38-39.

Ceausescu recognized the problem of expertise in his speech to foreign trade personnel in February, 1967, by emphasizing the need for new programs to train persons in foreign trade. He said the chief institution of higher education in economics would have to start training students, not only in economic theory, but also in practical problems for foreign trade, and that short courses in trade should be organized for existing management personnel.<sup>34</sup> By 1970-71 class sizes in the foreign trade faculty were just under 200 students per year.<sup>35</sup> However, increased inputs into the management system from higher education could increase the supply of experienced managers only after a long period. The immediate problem was suggested by an article published in late 1970 which said that among all persons with higher education working in foreign trade, only 10% had studied in the foreign trade faculty.<sup>36</sup>

Following Ceausescu's suggestion, an immediate effort was made to increase the expertise of existing personnel by organizing short courses at educational institutions and by popularizing the subject of marketing. These activities were stepped up in 1970 and have continued in diverse ways since. For example, beginning in 1970 it was announced that the economics academy would organize night courses and also special day courses of 10-45 days duration for personnel temporarily released from work duties.<sup>37</sup> By 1971/1972 special correspondence programs in foreign trade lasting two years were established for persons already graduated in higher education, but who wanted a second specialty in foreign trade. In 1973 total enrollment in these programs was 392, or an average of nearly 200 per year, only slightly less than the output of normal four-year programs. In 1971/72 intensive courses of 3 months duration were also established for persons already from production. In the first two years 130 persons took such courses and in 1973 enrollments were set at 60-80 persons.<sup>38</sup>

Formal courses in marketing, with sections on foreign trade, were also included in the 1971 program of CEPCA, the specialized management training institute organized with cooperation of the International Labor Organization.<sup>39</sup> Enrollments in the marketing program for 1971 was set at 60 persons which included specialists in both domestic and foreign trade.<sup>40</sup>

<sup>34</sup> A small section for foreign trade existed in the faculty of commerce of the chief institutions for higher economics education, The "V. I. Lenin" Institute of Economics of Bucharest, in 1964 (See C. Donescu-Bjuor, *Higher Education in Romania*. (Meridiane Publishing House, Bucharest 1964, p. 53.) It was expanded as part of a general reorganization of the institution in 1968 when its name was changed to the present name of "The Academy of Economic Studies". (See Academia de Studii Economice, *Anuarul, 1966-1969*, Bucharest, n.d. pp. 71-73). In 1972 foreign trade was raised to the status of a separate faculty, and in 1973 as a result of the new emphasis on cooperation, explained above, its name was changed to the faculty of "International Economic Relations". (Interview data).

<sup>35</sup> A total of 774 students spread over class years I-IV, while in 1973 enrollments had increased to 909, or 227 per year and long term requirements based on demands from economic agencies were estimated to be about 250 graduates per year. It is also interesting to note that annual requirements for years 1976-1980 from economic agencies fell about 20-25% between 1972 and 1973, probably reflecting recentralization measures into the latter year. Data for 1970-71 presented in Marvin R. Jackson, "Economic Research and Education in Romania", *The ACES Bulletin* Fall, 1972, pp. 4-6, and other data from interviews in 1974.

<sup>36</sup> *Viata Economica* 1970:40 (October 2) p. 9. This article did not indicate the total number of personnel with higher education in the foreign trade sector so the stock-flow relationship is difficult to measure. It did say that in Bucharest, where 90 percent of foreign trade personnel were concentrated, there were over 12,000 foreign trade personnel, a figure which probably included persons of all educational attainments and specialties.

<sup>37</sup> *Viata Economica*, 1970:40 (October 2) p.9.

<sup>38</sup> Interview data.

<sup>39</sup> For a fuller description of CEPECA, see Jackson, "Economic Research and Education in Romania", *The ACES Bulletin*, Fall, 1972.

<sup>40</sup> Ministry of Labour, Central Institute for the Study of Problems in Economic Management and Labour Organization and for the Further Development of Management, Management Development Center, *Outline of the 1971 Program* (Bucharest, 1970), pp. 12 and 44-46.

Finally, sometime after 1971 there was also established the "Center for Training and Perfecting of Personnel Working in Foreign Trade and International Corporation" under the Ministry of Foreign Trade. The Center provided courses from 5 days up to 4½ months duration. Unfortunately, enrollments of Center were not available.<sup>41</sup>

Thus, the annual output rate of educational programs in foreign trade around 1972 can be estimated at about 200 persons in normal four-year higher education, 200 persons in two-year (second specialty) programs, and 150-350 persons in short courses. Assuming there were about 13,300 persons involved in foreign trade of whom 90 percent, or about 12,000 did not have specialized foreign trade education, it would take 16 years or more to educate them at the given annual rate. Or, assuming there were 90 foreign trade organizations (internal units and independent enterprises), the average employment would be about 148 persons. The average number of newly trained specialists per year per organization would be only 6-7 persons. The educational effort does not appear sufficient when viewed in these terms.

In spite of these efforts, and probably as one would expect given the initial starting point, occasional comments in the economic literature of 1971 suggests the associations and enterprises were having difficulties handling their new assignments due to a lack of trained personnel in international marketing.<sup>42</sup>

In an effort to remedy the problem, beginning January 1, 1972, the associations and the enterprises were ordered to establish marketing bureaus, in addition to their operative trade directorates which were responsible for the dispatch of export deliveries and, in some cases, for negotiating export contracts.<sup>43</sup> In September, 1972 an investigation of the marketing bureaus was published in *Viata Economica*.<sup>44</sup> The results were somewhat contradictory. On the one hand, it showed that associations which conducted trade through their own subordinate import-export directorates were taking a more serious effort to organize marketing in its product, price, promotion and distribution dimensions. The foreign trade enterprises, however, were described as approaching the problem "formally" by assigning marketing to an existing section where the chief concern was physical distribution.

On the other hand, (a) many of the associations had only engineers assigned to marketing, (b) only 20% of the time was used for marketing proper while 40% was used for statistical reports and 30% for physical dispatching, (c) only 25% of the associations undertook their own marketing studies while 30% relied on the International Marketing Institute of the ministry of foreign trade and the Institute of Economic Research of the Academy of Social and Political Sciences and the remaining 45% had none, (d) the usual form of research was to compile files from trade publications, and (e) while most respondents indicated an appreciation for the publications of the International Marketing Institute and the Chamber of Commerce, these were considered too general and most associations considered the best information was that gained by their delegations sent abroad.

<sup>41</sup> Interview material.

<sup>42</sup> *Viata Economica*, 1971:5 (Jan. 29) p. 5; 1971:24 (June 11) p. 4; 1972:7 (February 18) p. 8; and 1972:26 (June 30) pp. 14-15.

<sup>43</sup> *Viata Economica*, 1972:25 (June 30) pp. 14-15. A later issue, 1972:39 (September 29), p. 13, indicated that the campaign to popularize marketing started about a year earlier was moving slowly.

<sup>44</sup> *Viata Economica*, 1972:39 (September 29) p. 13. Marketing bureaus also were organized in ministries, sometimes under the directorate for import-export and sometimes under directorate for development.

Later in the year, at a round-table on foreign trade,<sup>45</sup> an official from the Ministry of Foreign Trade complained that the organization of marketing at the associations and the enterprises "is timid and far from satisfactory". Marketing was often assigned to persons considered inept for negotiating in the operational sections and normally only consisted of (1) obtaining import licenses from the Ministry of Foreign Trade, (2) organizing the details for participation in fairs or international expositions, or (3) preparing some simple notes from statistical sources or translating items from the foreign press.

The problem of expertise at the associations and enterprises had another broader and perhaps more important facet. For the acquisition of foreign market expertise, it was obviously not enough to have persons formally educated in trade procedures and characteristics of foreign markets and to have access to reports and publications on current market conditions. Any western company would consider as foolhardy efforts to sell industrial equipment or manufactured consumer goods without direct contact with customers and direct knowledge of the customer's environment. In this respect the Eastern European economies suffer a distinct disadvantage from their past isolation from international markets. While the situation now varies somewhat from country to country, there is no reason to doubt that their relative disadvantage continues as a result of (1) balance of payments pressures which limit expenditures abroad, (2) general anti-commercial attitudes, (3) political concern about contacts with western life, and (4) a tendency to extend contacts principally in highly organized or formalistic ways through commercial offices, trade fairs and official delegations. As a result there has been a tendency for the focus in East-West Trade to shift to the eastern capitals, especially so in the case of eastern imports, but also with exports. Consequently, very few eastern trade personnel have had extensive direct market contact, although more have had short visits as part of delegations. For the remainder, including managers of plants producing exports, contact is second hand through trade and technical literature, commercial office and trade delegation reports, and visiting foreign businessmen.

Romania, while having a greater relative share of its trade with the West, appears not to have expertise because of its restrictive policies with respect to foreign travel and contacts with foreigners.

Apparent recognition of the need for more contact with foreign markets was contained in the March 1971 trade law. The associations were given rights, in principle, to send abroad commercial agents and to establish in foreign countries commercial and technical bureaus, warehouses, service centers and exhibition centers. It seems that such efforts were taken seriously, for in 1972, an official of the foreign trade ministry stated that the Party leadership had told the ministries and association to prepare "a corps of 'travelling salesmen' (*viajori comerciali*) specialized by product and market who would facilitate the continuity of relations with foreign customers".<sup>46</sup>

Unfortunately there is no data to fully evaluate subsequent Romanian external marketing efforts. Moreover, it is clear that rights of the associations, or even the industrial ministries, to send permanent

<sup>45</sup> *Probleme economice*, 1973:2, p. 111. Also see 1972:12 pp. 95-104; and 1973:1 pp. 110-116 for other parts of the round table.

<sup>46</sup> *Probleme economice* (1972:7, p. 26).

agents abroad, to establish foreign facilities, or to organize joint-commercial companies abroad were subject to strict central control by the ministry of foreign trade and foreign affairs, if not also by the ministry of internal affairs. Without question, such rights were limited even in 1971 and 1972. In the early part of 1973, when the process of recentralization was underway, associations were complaining about their inability to develop better contacts. For example, an association director complained that its export promotion activities, "practically speaking", were restricted only to participation in fairs and conversation with foreign customers at the association.<sup>47</sup> Another said that the greatest need was to create better conditions for its specialists to know their major markets and to directly promote major products. He specifically suggested that it was time to stop the practice of sending abroad to fairs and exhibitions only one person to represent several associations because this person couldn't know separate product lines well enough.<sup>48</sup>

Recentralization by means of restrictions on the associations' rights to conduct trade directly apparently took place in 1973. *Viata Economica*, the weekly economic newspaper, appropriately opened the year with an interview article titled "Subordinate Import-Export Compartments or Specialized Enterprises?"<sup>49</sup> In this and subsequent publications, representatives of the specialized foreign trade enterprises claimed that they were more effective especially in cases of exports of (1) products produced by numerous enterprises in many foreign markets, and (2) complete factories or equipment complexes where many producers here involved. The same representatives, often complained about lack of producer incentives for exports and their own lack of information concerning production capacities and technical characteristics of products. Representatives of the associations, on the other hand, claimed that they had proved their superior ability to handle exporting directly and that they could do an even better job if given better marketing information, more and better trained marketing personnel, and more opportunities to contact buyers abroad. A mid-year investigation by *Viata Economica* of the reforms to bring producers closer to foreign markets was said to have "proved an insufficient fructification of the new system caused by a "too timid" exercise by some economic units of their prerogatives."<sup>50</sup> Yet the dilemma, as stated by the investigation, was that—

The foreign trade enterprise may know the opportunities and limits of foreign markets, but less of production. Inversely, the association may know the opportunities and restrictions of its technical and human potentials, but less those of the market.

One derives from these sources a clear feeling that there was a far from adequate connection to export producers with foreign markets and that a major problem in this regard was continuing inability of the associations to organize their own marketing efforts or to be coordinated with the marketing expertise of the specialized foreign trade enterprise.

The final and perhaps most compelling reason for the recentralization was the chaotic nature of the international economy in the early

<sup>47</sup> *Viata Economica* 1973:12 (March 23).

<sup>50</sup> *Viata Economica*, 1973:18 (May 4) p. 8. Also see *Viata Economica*, 1973:12 (March 23) p. 7; 1973:15 (April 13) p. 4; 1973:16 (April 20) p. 8; 1973:19 (May 11) p. 8; 1973:28 (July 13) p. 2; and *Probleme economice* 1973:1, pp. 112 and 115-6; 1973:2, p. 111 and 113; and 1973:5, p. 97.

1970's. As was pointed out in Section II, one of the characteristics of the global form of organization is that response to international events is automatic and within the ambit of the decision-making powers of lower level units. Obviously such flexibility on the part of associations and ministries is at odds with a strict interpretation of central planning for the domestic economy. However, the Romanian leadership may have been willing to permit economic units flexibility to make the kind of marginal responses which the stability of western currency and commodity markets would have required in the 1960's in exchange for improved export performance.

However, the conditions which the new foreign trade organizations faced on world markets in the early 1970's in no way resembled the placid 1960's. Western markets were beset by the devaluation of the dollar, the collapse of the Bretton Woods system and the floating of the major western currencies. Commodity markets were wracked by shortages and rapidly escalating prices and double digit inflation was common in many of Romania's major western trade partners. These conditions had two consequences. First, the new foreign trade organizations, inexperienced and understaffed, would no doubt have experienced difficulties while learning how to conduct trade under the best of conditions; under the conditions of the 1970's, when even major western banks and experienced multinational firms reeled in confusion, the task of effectively penetrating western markets was beyond the expertise of most Romanian foreign trade organizations.

Secondly, the magnitude of the domestic responses implied by changes in international markets were sweeping, not marginal. Clearly such responses by the associations would have upset domestic planning, imported inflation into Romania, and vitiated any effort by the government to maintain control over the balance of payments. Indeed it is likely that the international division form of organization by buffering domestic activities from external events and emphasizing conscious centralized response to external shocks appeared as the most viable and appropriate organization to the Romanian leadership.

#### IV. CONCLUSIONS

Our analysis suggests that the decentralization of Romanian foreign trade activities was a properly conceived organizational response to the needs of Romania's international strategy of increased trade with the west and of expanded exports of manufactured goods. However, the decentralization was not successful and was eventually abandoned due to internal shortcomings including the inability to provide skilled personnel to operate the new organizations and because of the hostile external environment which greeted the new organizations.

Despite the recentralization, Romania does not appear to have abandoned its foreign trade strategies. However, because the current centralized organization does not appear to be appropriate for this strategy, we anticipate that either strategy or organization or both will be subject to further experimentation. One possibility, alluded to in Section III is the possible use of cooperation to overcome the defects of the current organizational form. Whether cooperation can fulfill these hopes or not is, however, a question only the future can decide.

## I. INTRODUCTION

Since the early 1970's hard currency shortages have limited the ability of the East European<sup>1</sup> countries to purchase Western plant, equipment, and technology.<sup>2</sup> In order to accommodate increasing demands for continuous large-scale, long-term infusions of Western, technology and management techniques, the East European countries use of various forms of countertrade in their commercial dealings with the West began to proliferate.

This paper will discuss: the meaning of the term "countertrade"; the motivations of communist countries and Western firms to engage in this form of trade; the extent of current Eastern European activity in countertrade with the West; and the prospects for its future use. Countertrade is a relatively new development in East-West trade, and although this paper cannot adequately treat every aspect of this complex subject, it attempts to provide a better understanding of countertrade as an important component of the East-West commercial relationship.

## II. DEFINITIONS

Countertrade is a technique of international trade increasingly used by the countries of Eastern Europe in their commercial dealings with the West. While the technique has several objectives, it is primarily a device to enable the communist countries to better cope with their persistent shortages of hard currency, a problem that stems from a significant deficit in their trade with the West over recent years.

Countertrade is generally understood to mean a set of transactions wherein the hard currency claim on a communist country resulting from an import from the West is offset by a complementary or balancing Western purchase of Eastern products. In most countertrade transactions (the exception is barter) the Western good is not directly paid for by the Eastern good. Rather, the Western export is financed partially or in full by Western credit on a contract denominated in hard currency, while the subsequent Eastern exports, under a separate contract, generate hard currency that can be used to make payments against Western credits.

A commercial activity closely related to countertrade is "industrial cooperation". As the phenomenon of industrial cooperation has evolved in an East-West trade context it has gone through many definitional changes. However, as the communist countries view it, industrial cooperation is generally understood to denote the economic relationships and activities arising from contracts extending over a long time period (typically five to ten years) between partners belonging to different economic systems, providing for reciprocal transfer of one or more commercial assets (such as technology, know-how, capital, products, marketing and services), to meet specific objectives of the contracting parties. This relationship is usually one in which the Western partner has no equity interest (currently, only Romania, Hungary and Poland permit joint equity investment and joint management).

<sup>1</sup> The terms Eastern Europe and communist countries are used interchangeably. For the purposes of this paper the countries included are: Bulgaria, Czechoslovakia, G.D.R., Hungary, Poland, Romania, and U.S.S.R.

<sup>2</sup> Technology in the context of this study refers to both embodied and disembodied technology. The former is technology incorporated in machinery and equipment. The latter is technology existing as written data such as technical manuals and blueprints, know-how, managerial skills, and training.

The Eastern European countries identify East-West industrial cooperation primarily with production cooperation, together with certain activities either preceding or following the production process itself. Activities preceding production principally comprise licensing, joint research and development, exchange of information, and supply of complete plants and/or equipment, while those following the production process are normally limited to marketing and after-sales service. In addition, the Western partner may also commit its trademark rights.

Most of the Western technology/equipment purchased by the Eastern European countries under industrial cooperation agreements is financed by Western credit. In order to repay that credit, the Eastern countries must generate hard currency through exporting. Hence, a cooperation agreement also frequently contains a financing element, namely a provision for purchase by the Western partner of goods from the Eastern partner. This financing element is countertrade.

Currently, the payment in product effected under a cooperation agreement does not necessarily refer only to products derived from the plant or equipment supplied by the Western partner (resultant product). However, the communist countries' perception of cooperation seems to be evolving toward an understanding of cooperation as an activity which always involves payment in resultant products. Since this is still only a goal, and since many cooperation agreements do in fact entail payment in non-resultant as well as resultant product, the cooperation agreements discussed in this paper involve payment in both kinds of products, unless otherwise specified.

Countertrade is a heterogeneous class covering a variety of forms and its nature may be better understood if each of its forms is set out in detail. Countertrade normally occurs in one of three forms—barter, counterpurchase, or compensation arrangements (also known as buyback or product payback).

#### A. Barter

A barter transaction is often thought of as the direct exchange of goods for an equal value of goods between an Eastern European and a Western partner, without any flow of money taking place. Because such pure transactions are rare, many feel that a barter transaction is better characterized by the following:

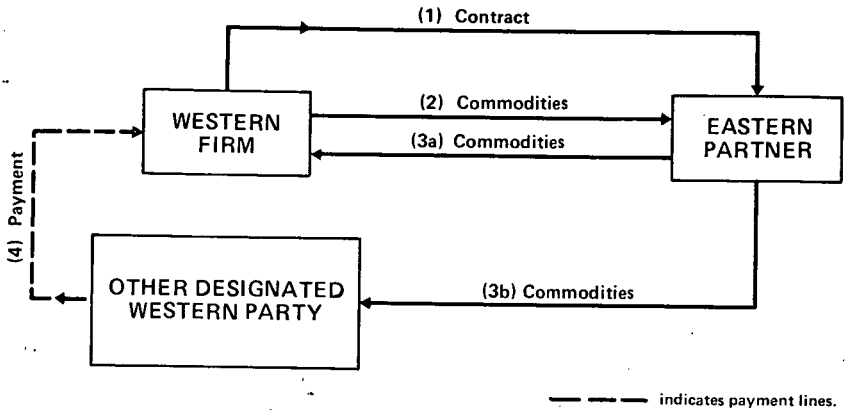

1. It is a one-time transaction rather than an on-going, dynamic relationship.
2. It takes place over a relatively short time (e.g., up to two years). Hence, there is no, or relatively little, time-lag between deliveries of goods by the two trading partners.
3. The Eastern goods to be purchased are specified at the time the Western export contract is signed.
4. Normally, only one contract is involved (covering both sale of Western products and purchase of Eastern products).

Barter is the most seldom used form of countertrade. Figure 1 presents an analytic illustration of a barter transaction scenario.

#### B. Counterpurchase

A counterpurchase transaction is one in which a Western seller provides an Eastern buyer with technology, plant or equipment and

Figure 1  
Analytic Model of a Barter Transaction

*Scenario of Transaction*

- (1). Western firm contracts with Eastern partner for the exchange of mutually desired commodities.
- (2). Western firm delivers commodities to Eastern partner.
- (3). As payment for Western imports, Eastern partner delivers commodities to:
  - (a) Western firm or
  - (b) Other designated Western party.
- (4). If Eastern commodities are delivered to a third party firm, Western firm receives payment from that designated Western party.

agrees to purchase Eastern goods equal to an agreed-upon percentage of the sales contract value. A counterpurchase transaction involves two separate, but inherently linked contracts—one for the sale of Western products and a second for the purchase of Eastern products.

Credit is an integral part of this form of countertrade, since the Eastern purchase of Western goods is normally effected with the use of Western credits. The Western purchase of Eastern goods generates hard currency used by the Eastern partner to repay part or all of the Western credits.

The value of Eastern goods offered as counterdeliveries is generally less than 100% of the original sales contract value. The goods are normally "non-resultant products", i.e., they are not derived from or related to the Western export of technology, plant or equipment. In addition, the Eastern products are generally manufactured or semi-manufactured goods, although raw materials may be provided (notably in the case of Poland). The Eastern goods may be supplied by the original Eastern importing organization, or by another Eastern foreign trade organization (FTO).

Whereas a barter transaction rarely occurs in the context of an industrial cooperation agreement between a Western firm and an Eastern partner, counterpurchase transactions may be involved in such agreements. The exchange of goods under such an arrangement normally takes place over a relatively longer time period (i.e. three to five years) than is the case in a barter transaction. Under a counterpurchase agreement, the Western purchasing commitment may be transferred to a third party—a Western trading house, another Western buyer, or a non-Western buyer.

The scenario of a counterpurchase transaction is presented in Figure 2.

There are two forms of counterpurchase which are mainly distinguished by the method of payment used for the Western export. One form provides that each partner receives full cash payment at the time he makes delivery. In such instances, the Western partner receives immediate payment for his export (usually from a Western lending institution) and the Eastern partner must commit hard currency equal to the total value of the Western import. This is the most frequently used form of countertrade. In terms of dollar value of total trade conducted under such agreements, however, it is not as important as compensation arrangements which will be discussed later.

Under the second type of counterpurchase the Western partner receives only partial payment in cash and part in product although the Eastern partner again receives full cash payment for his deliveries. Thus, receipt of full payment for the Western export is, in effect, deferred until the Western firm finds a buyer for the Eastern goods. Moreover, under this type of agreement, the communist country is required to commit less hard currency than in the former case.

### *C. Compensation Arrangements (also known as buyback and product payback)*

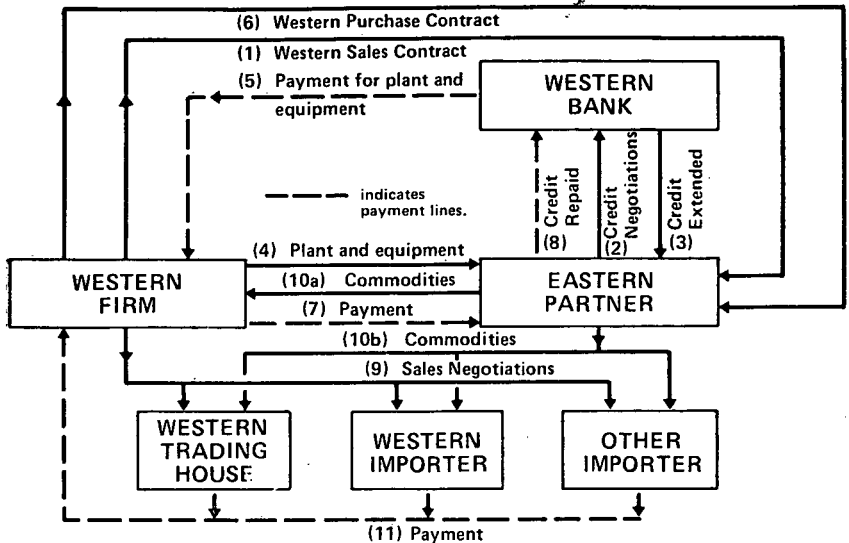

Compensation arrangements involve two separate, but inherently linked, contracts providing for the sale by a Western firm of technology, plant, or equipment and the reciprocal purchase by the Western firm of Eastern goods.

As in the case of the first type of counterpurchase discussed earlier, both the Western and Eastern partners receive full payment in cash for their exports at the time of delivery. As in counterpurchase, the Western purchasing commitment may be transferred to a third party.

Compensation arrangements are distinguished from counterpurchase by these characteristics:

1. The dollar values involved in compensation transactions are usually much larger than those of counterpurchase transactions.
2. Compensation arrangements generally take place over a much longer period, e.g., 10 to 20 years.
3. The Western partner usually purchases resultant products, i.e., products derived directly from, or produced by the Western-supplied technology, plant, or equipment. Thus, there is often a much greater time lag between reciprocal deliveries than is the case with counterpurchase or barter.

Figure 2  
Analytic Model of a Counterpurchase Transaction

The steps illustrated in this model do not necessarily occur in the sequence presented. Some, in fact, often occur simultaneously or in a different order than that presented. Each step is, however, an element of the complete transaction.

#### Scenario of Transaction

- (1). Western firm contracts for the sale of plant and equipment to the Eastern partner.
- (2). Eastern partner negotiates with Western bank for credits with which to purchase Western plant and equipment.
- (3). Western bank extends credits to the Eastern partner.
- (4). Western firm delivers commodities to Eastern partner.
- (5). Western bank makes payment (either full or partial depending upon the type of counterpurchase arrangement involved) to the Western firm for deliveries.
- (6). Western firm contracts with Eastern partner for the purchase of Eastern commodities.
- (7). Western firm pays Eastern partner for commodities.
- (8). Eastern firm repays Western credits.
- (9). If the Western firm cannot use or sell the Eastern commodities, it may negotiate directly with a Western or other firm or with a Western trading house which will handle the sale of the Eastern products.
- (10). Eastern firm delivers commodities to either
  - (a) Western partner or
  - (b) Other designated Western party
- (11). Western firm receives payment either directly from Western or other importer or from Western trading house.

4. The cumulative value of Western purchases over life of the long-term contract is often equal to, or greater than, the value of the Western export contract.

Compensation arrangements are the most rapidly growing form of countertrade, although they presently account for only a small portion of the total East-West trade. A schematic presentation of a compensation agreement is illustrated in Figure 3.

A variation of this form of countertrade involves the purchase by the Western partner of both resultant and non-resultant products, though resultant products usually comprise the bulk of the buyback commitment. Prior to signing a purchase contract for non-resultant products, the Western entity often can negotiate with another Eastern FTO for products which are not under the jurisdiction of the importing Eastern partner. Once suitable products are found, the Western partner contracts with the original Eastern partner, whether the goods come from the original Eastern partner or from another Eastern entity.

### III. EASTERN EUROPEAN MOTIVATIONS FOR COUNTERTRADE

Over recent years, communist country hard currency imports have consistently exceeded their hard currency export earnings. This gap is expected to continue for most of the Eastern European countries for the remainder of the current decade. Although the resulting deficits have historically been covered in large measure by Western credits, such credits have become more difficult to obtain. Thus, the capability of the communist countries to earn hard currency is a key factor in achieving high levels of East-West commercial exchanges.

In this context, countertrade is seen by the Eastern European countries as an instrument for overcoming some fundamental trade and financing problems, both short- and long-term. More specifically, the communist country motivations for participation in countertrade fall into four categories:

1. Balance of payments.
2. Market penetration.
3. Foreign trade planning.
4. Technology updating.

#### *A. Balance of Payments*

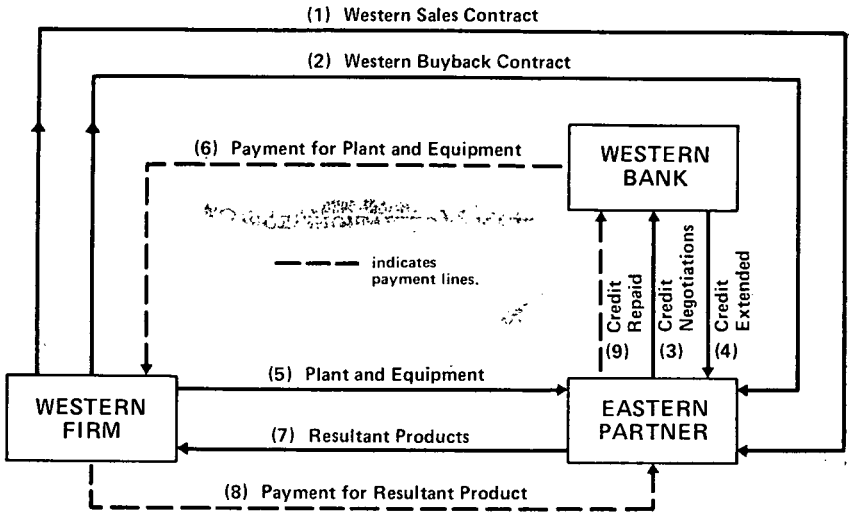

The reciprocal deliveries provisions of a countertrade agreement and the increasing demands made by the East Europeans for such transactions as a condition for Western firms doing business in the East, are indicative of the severity of the Eastern debt and balance of payments problems. By obtaining a commitment from Western firms to purchase Eastern products as part of the transaction, the communist countries are hoping, in the short-term, to relieve their immediate balance of payments problems in trade with the West.

#### *B. Market Penetration*

Countertrade, as it is now being practiced, has a major role to play in realizing the Eastern goal of gaining access to Western markets. While this argument should in no way minimize the significance of the

offset deliveries aspect of countertrade in dealing with the Eastern countries' immediate balance of payments problem, the use of countertrade as a device to achieve longer-term market penetration is equally important.

Figure 3  
Analytic Model of a Compensation Agreement

The steps illustrated in this model do not necessarily occur in the sequence presented. Some, in fact, often occur simultaneously or in a different order than that presented. Each step is, however, an element in the complete transaction.

#### Scenario of Transaction

- (1). Western firm contracts to sell plant and equipment to an Eastern partner.
- (2). Western firm contracts to purchase some of the plant output (resultant product) once production has begun.
- (3). Eastern partner negotiates with Western bank for credits with which to purchase Western plant and equipment.
- (4). Western bank extends purchase credits to Eastern partner.
- (5). Western firm delivers plant and equipment to Eastern partner.
- (6). Western bank pays Western firm for deliveries.
- (7). When production has begun, Eastern partner delivers part of the output to the Western firm.
- (8). Western firm pays Eastern partner for deliveries of product.
- (9). Eastern partner repays Western bank credit.

The communist country hard currency trade deficits are, in large measure, a reflection of their inability to effectively penetrate Western markets. General inexperience with Western marketing, together with quality, style, service, and other problems in their manufactured goods, have handicapped their hard currency export efforts. Frequently, even in the case of raw materials exports, they have found themselves in the position of a residual supplier, and consequently particularly vulnerable to the vagaries of Western business cycles.

To the extent that it establishes a program of assured long-term deliveries of products to a Western market, countertrade accomplishes market penetration and development in several ways:

It "smooths out" sales to the West, avoiding or minimizing the fluctuations to which a residual supplier is most subject.

It provides an opportunity to establish the reliability of Eastern suppliers.

It offers an opportunity to learn about Western marketing techniques.

It may foster improvement of the quality of Eastern finished goods.

### *C. Foreign Trade Planning*

Soviet and Eastern European planners face many uncertainties in projecting future trade balances and financing requirements in their trade with the West. Countertrade transactions with their self-liquidating aspects and specified Western purchase commitments serve to eliminate or reduce uncertainty regarding hard currency income.

Ambitious Soviet investment plans for Siberia, for example, will require the hard-currency income provided by countertrade deals. All the areas listed in the tenth Five-Year Plan as targeted for development in Siberia are represented in actual or proposed countertrade deals between Western firms and the U.S.S.R.

Self-liquidating features of countertrade arrangements are also important for smaller undertakings; the central planners are more likely to include projects in five and one-year plans, or to subsequently approve ad hoc projects not included in the plan, if the projects include return product flows to offset hard currency costs.

Given the excess of communist country import needs over their export capabilities, any hard currency earnings which exceed the financing requirements of the project can be readily applied to other purchases. The very large Soviet and Polish natural resource development transactions typically program offset deliveries to the West which, over time, will significantly exceed principal and interest payments on the credit for the original Eastern import. This is also the case in the Steyr-Daimler-Puch agreement with Poland, and the Katy Industries and Snia Viscosa agreements with Hungary. (See Appendix Tables 3 and 4.) The surplus hard currency earned via these transactions can be used for additional imports from the West which otherwise would require Western credits, or which might have to be deferred or foregone altogether.

### *D. Technology Updates*

Some countertrade agreements specifically provide for a continual updating of technology provided by the Western partner. Agreements

involving production of manufactured goods tend to reinforce technology updates by giving the Western partner a vested interest in the end product. For example, where a Western partner seeks lower cost factors of production in imports from the East, he may be motivated to continuously update technology to obtain the lower cost product from the Eastern source. Similarly, where the Western partner obligates himself to a long-term arrangement to accept manufactured goods that are made obsolete by style or technology changes, he has an interest in a continued updating of the technology furnished the Eastern partner.

A related benefit for the Eastern European countries is the productivity improvement resulting from Western help in producing high quality manufactures. Such improvements in turn may enhance the profitability of marketing operations in Eastern Europe or third world areas which are not covered by the countertrade agreement.

Some advantages and disadvantages of countertrade, as perceived by the communist countries, are presented in Table I.

TABLE I.—*Eastern European perceived advantages and disadvantages of countertrade*

ADVANTAGES	DISADVANTAGES
1. <i>Aid in Improving Balance of Payments.</i>	FTO must be prepared to deal with Western firms' resistance to countertrade demands. With limited demand for many Eastern products in the West, Western firms may prefer cash payments.
2. <i>Vehicle for Penetration of Western Markets.</i> Countertrade provides Eastern goods access to Western markets through offset deliveries provisions of contract.	Eastern countries have been pushing for the inclusion of Western purchase commitment. However, Western firms have offered strong resistance to this tactic.
3. <i>Foreign Trade Planning.</i> Self-liquidating aspects of countertrade may eliminate or reduce uncertainty regarding hard currency income. Extra hard currency earnings from countertrade may be applied to other imports.	Western firms may be reluctant to purchase Eastern goods in excess of 100% of original export contract value.
4. <i>Technology Updates.</i> Countertrade has been an important part of the long-term connections that FTOs are seeking with Western firms for the purpose of obtaining updates of imported technology.	Demands for countertrade may threaten the success of contract negotiations unless particularly attractive Eastern goods are offered as part of the agreement. Western firms have been very reluctant to enter into long-term agreements which entail reciprocal purchases of goods for which there is less than a substantial demand in the West.
5. <i>Creation of Western Interest in the Efficiency and Quality of East European Products.</i> By accepting East European goods as payment for their goods and services, Western firms must be able to rely upon a standard of quality that is competitive with Western standards. From the Western point of view, the profitability of any countertrade agreement must depend in part upon the ability to sell the goods imported from Eastern Europe.	There is the risk of too great a degree of Western influence on the system of socialist production.

#### IV. WESTERN MOTIVATIONS FOR COUNTERTRADE

In the final analysis, Western firms engage in countertrade because they expect it to be profitable. More specifically, however, profits may accrue from one or more of several objectives potentially achievable through countertrade:

1. Access to the Eastern market.
2. Development of an Eastern long-term source of raw or semiprocessed materials.
3. Development of an Eastern source of lower-priced components or manufactured products.

In trade with other market economies Western firms usually accomplish these same "market access" and "raw material/component" objectives through the development of marketing outlets in the country concerned, through contracting directly with firms in the trading partner country and, increasingly, particularly where a long-term relationship seems desirable, through foreign direct investment, i.e., by creating a subsidiary plant and organization in the partner country. Each of these alternatives is, however, generally barred to Western firms in trade with centrally planned economies.

##### *A. Western Access to Eastern Markets*

Many Western firms see countertrade as a strategy to gain or hold markets from which they would be otherwise excluded. They often view the East European region and the U.S.S.R. as a large and relatively untapped market, with a more rapid growth potential than some other world areas. In describing the attractiveness of the Eastern market, an executive of a leading American multinational corporation said: "It is the comparatively big East European market potential, relative to the present degree and rate of industrialization as well as population and resources, that attracts (our) firm to the region and to individual East European countries".<sup>3</sup>

Countertrade may provide access to Eastern markets in several ways: First, for the Western exporter, the initial sale—usually considered the most difficult by Western businessmen dealing with the East—is a penetration of the market. Second, where the initial sale involves a transfer of technology, the Eastern customer may be "engineered" into a longer-term relationship with the Western supplier, generating a potential for additional or new technology and/or for subsequent orders for replacement parts and components beyond the Eastern manufacturing capability, but essential to the finished product.

In addition, countertrade agreements with one communist country may provide access to third country markets, due either to special marketing provisions or unique political/economic relationships. To date, however, there is no evidence that this has actually occurred.

<sup>3</sup> Paul Marer, Indiana University, International Development Institute, "The U.S. Perspective on East-West Industrial Cooperation," (Unpublished), May 1976.

And finally, a countertrade relationship may establish an approved presence in the Eastern market, including a wide range of contacts and information sources that frequently lead to other sales not directly related to the original contract.

### *B. Source of Raw or Semiprocessed Materials*

A further incentive for Western firms to countertrade is the acquisition of a reliable long-term source of raw materials or industrial supplies. This is particularly true of countertrade agreements with the U.S.S.R. and Poland, many of which involve raw material products. The U.S.S.R., unlike Eastern Europe, is especially rich in raw materials and has been willing to negotiate product payback from new natural resources projects, although in the past it has been generally unwilling to export output from existing production facilities. Access to Soviet raw materials is a major motivation for Western European and Japanese participation in Soviet compensation arrangements.

The worldwide shortage of several basic industrial raw materials, e.g., natural gas, in fact may have encouraged such arrangements, which provide guaranteed long-term supply. While many of the Eastern countries cannot offer raw materials as repayment for Western exports, in some instances, notably Poland and Romania, they may offer equally acceptable alternatives. Intermediate industrial products such as petroleum products, petrochemicals, and steel are prime examples.

### *C. Lower Cost Supply of Intermediate Products*

Finally, Western firms seeking relatively lower cost sources of supply for intermediate industrial supplies, manufactured components, and finished goods may be motivated to countertrade in Eastern Europe. Eastern negotiators may sometimes be willing to offer discounts of several percent from world prices to Western firms. In addition, Western firms may be able to take advantage of lower cost factors of production effected by relying on the Eastern partner for components, parts, or assembly of the finished product. While Western firms have some well-founded concerns about the adequacy of Eastern production capabilities, to the extent that countertrade deals can provide dependable, lower-cost supplies of industrial inputs or finished products, Western firms will find them attractive.

Some advantages and disadvantages of countertrade, as perceived by Western firms, are presented in Table II.

TABLE II.—*Western firms' perceived advantages and disadvantages of countertrade*

ADVANTAGES	DISADVANTAGES
<p>1. <i>Market Penetration.</i> Eastern Europe and the U.S.S.R. are often viewed as a large and relatively untapped market, with a more rapid growth potential than other world areas. Countertrade may be the only means of penetrating this market.</p>	<p>The length of contract negotiations, (as much as two to three years), the size of the deals (especially those in Eastern Europe) and the prospective profits may be too small to justify the managerial effort required to consummate a countertrade deal.</p>

TABLE II.—*Western firms' perceive advantages and disadvantages of countertrade—Continued*

ADVANTAGES	DISADVANTAGES
<p>2. <i>Western Business Cycle.</i> Countertrade with the East offers Western firms increased sales opportunities which may help to smooth out the effects of cyclical fluctuations in the world economy.</p>	<p>During Western recessionary periods, Eastern demands for countertrade are at their peak, (nearly 100 percent of the hard currency cost), thus making countertrade potentially less profitable and, therefore, less attractive.</p>
<p>3. <i>Product Life Cycle.</i> Especially in high technology industries, countertrade with Eastern Europe may become particularly attractive late in the life cycle of a product.</p>	<p>Eastern Europe is basically not a consumer market. It is increasingly a market for the sale of technology and know-how rather than the sale of components and finished products. Eastern European countries are interested in the latest technology available sometimes combined with stipulations for the continuous updating of the original technology. Failure to provide these may result in lost sales.</p>
<p>4. <i>Immediacy of Pre-emptive Threat by Competitors.</i> Countertrade may be considered by a Western firm as a negotiating technique, in response to some triggering event, e.g., competitive pressure or threat of loss of market to competitors.</p>	<p>East European countries may attempt to use Western inter-firm rivalry to their advantage by both driving down the cost of Western goods and increasing demands for larger offset purchase provisions.</p>
<p>5. <i>Secure Assured Supply of Raw Materials.</i> Many Western firms view countertrade as a vehicle for obtaining raw and semifinished materials which can be used in their own products.</p>	<p>Most communist countries (the exceptions are Poland and the U.S.S.R.) are increasingly reluctant to include Eastern raw materials as countertrade products. Vigorous demands for inclusion of Eastern manufactures as offset deliveries are being made.</p>
<p>6. <i>Reduce Production Cost.</i> Some Western firms are interested in countertrade as a means of taking advantage of low cost factors of production by relying on Eastern suppliers for components, parts, or assembly of the finished product.</p>	<p>Eastern manufactures are generally not suitable for sale in the West due to poor quality, design, packaging, service, and lack of brand name recognition. Some East European countries permit Western firms a voice in quality control, but the managerial effort required of a Western firm may make the countertrade deal unprofitable. Moreover, Eastern goods under such arrangements may be subject to anti-dumping or countervailing duty regulations.</p>
<p>7. <i>Access to Other Communist Country Markets.</i> A consideration of Western firms sometimes is an interest in using their market position in one Eastern country to gain access and leadership in other Eastern countries. Western firms may be more willing to enter countertrade deals than they otherwise would be in order to increase their chances of entering other markets.</p>	<p>The more Eastern countries in which a Western firm commits itself to pursuing countertrade deals the more complex negotiations, financing, contracts, and repurchase arrangements become. Moreover, there is no evidence that a firm's countertrade activity in one communist country necessarily facilitates its entry into other Eastern countries.</p>
<p>8. <i>Recover R&amp;D Costs of Technology Development.</i> Many Western firms do not consider Eastern Europe a significant market for their products. The sale of technology and know-how through countertrade is seen as an option to recover R&amp;D costs of the technology being sold.</p>	<p>The technology update provisions of most countertrade deals have the dual potential of eliminating the need for future imports of updated technology at some point, and creating a competitor.</p>

## V. EASTERN EUROPEAN PARTICIPATION IN COUNTERTRADE WITH THE INDUSTRIALIZED WEST

Nearly all of the Eastern European countries have practiced countertrade of one form or another since the mid-1960's. However, its use during the 1960's was relatively infrequent and, when applied, was perceived as being peripheral rather than essential to the main commercial activity.

In the early 1970's, however, the communist countries began to reappraise their policies concerning countertrade as they were forced to seek new ways of financing additional imports from the West. They increasingly came to view countertrade as an effective means of meeting their financing needs and, as a result, began to step up their efforts to promote such activities and to exert more and more pressure for countertrade on their Western partners.

Although this study attempts to deal with countertrade as a single concept, there are significant differences of approach as well as varying degrees of reliance on these arrangements among communist countries. The most important countries (excluding Yugoslavia), both in terms of extent of participation and volume of trade conducted via countertrade are the U.S.S.R., Poland, Hungary, and Romania—not necessarily in that order. Bulgaria lags somewhat behind, followed by Czechoslovakia and the German Democratic Republic (G.D.R.). A listing of reported countertrade transactions between the Eastern European countries (excluding the U.S.S.R.) and Western firms is found in Appendix Tables 1 thru 6. The list is by no means complete but does include many of the major countertrade transactions consummated within the last several years. Of the transactions included in the tables, 46 of the 75 countertrade contracts signed for Western plant, equipment or technology since 1974 have involved counterdeliveries of resultant products. This would appear to support the trend observed by Western firms dealing with the Eastern countries. Compensation arrangements are the fastest growing form of countertrade.

Because complete data on the number and value of countertrade transactions are unavailable, a comprehensive analysis of its impact on East-West trade is not possible. However, available data on one form of countertrade, namely compensation arrangements, as a device for financing industrial cooperation projects, indicate that compensation arrangements are developing rapidly and may impact significantly on the development of the East-West commercial relationship.

Based on a June 1976 survey of industrial cooperation activities undertaken by the Economic Commission for Europe (ECE) Committee on the Development of Trade,<sup>4</sup> the supply of plant and equipment or licensing (both with payment in resultant product) occurred in 28.8% and 24.8% respectively of all East-West cooperation agreements. In terms of participation by industrial sectors, it appears that there is a close relationship between licensing and supply of turnkey plants, and certain branches of industry. For example, licensing agreements are particularly common in the mechanical engineering

<sup>4</sup> United Nations Economic Commission for Europe, Committee on Development of Trade "A Statistical Outline of Recent Trends in Industrial Cooperation," Geneva, August 1976.

industry (23%), and the chemical industry (13.5%). On the other hand, agreements for the supply of plant and equipment, with payment in resultant product, are engaged in most often by the chemical industry (over 30%), metallurgy (15.1%), and light industry (11.6%). A country-by-country description of participation in countertrade with the West follows.

#### A. U.S.S.R.

In terms of the dollar volume of Western exports and projected return product flows, the Soviet Union is the most significant communist country participant in countertrade. Soviet participation to date has been almost exclusively limited to compensation arrangements. These usually involve large-scale Western exports for the development of the chemical and steel industries, with return product flows to the West of raw materials or semi-processed industrial supplies derived from the Western supplied installation. In general, the estimated value of such return shipments, over an extended period of time, will most likely exceed the value of the initial Western export.

There is evidence that Soviet planners will increase their reliance on compensation arrangements and they plan for such transactions to account for an increasing portion of Soviet trade with the West in the years ahead.<sup>5</sup>

#### B. Poland

In terms of the volume of trade generated through countertrade, Poland ranks as the second major communist country participant. Poland's interest in countertrade has expanded apace with its debt to the Industrialized West. While Polish countertrade demands presently average 25 to 30% of export contract value, they are expected to reach at least 50% by 1980.<sup>6</sup> Of course, as is the case with all other Eastern European countries, the percentage required is inversely proportional to the priority of the Western import. In compensation arrangements, the Poles generally seek Western purchases which will cover not only 100% of the original sales contract, but interest on the loan as well. The same policy is followed by the U.S.S.R. in compensation trade with the West.

Generally, Polish countertrade demand is greatest for sales of Western plant, technology, or equipment for the electronics and heavy equipment industries. Nearly all Polish purchases of Western electronics equipment require the purchase of goods equal to 10 to 50% of the contract value. Well over half of the heavy industrial equipment sales carry a repurchase requirement of 25 to 30% of contract value, while this figure varies from 15 to 20% for metallurgical machinery and equipment sales, to 25% for the chemical industry.<sup>7</sup>

<sup>5</sup> For a comprehensive discussion of Soviet countertrade practices see "Industrial Cooperation Agreements: Soviet Experience and Practice" by Maureen R. Smith in the *Soviet Economy in a New Perspective*, Joint Economic Committee, October 14, 1976.

<sup>6</sup> Business International S.A., Subsidiary of Business International Corp., New York, "Current Countertrade Policies and Practices in East-West Trade," multi-client supported research study completed November 1976.

<sup>7</sup> Business International, "Business Eastern Europe," October 8, 1976.

Polish goods offered as countertrade are not necessarily restricted to the foreign trade organization which purchased the Western technology, plant or equipment, although that is preferred.<sup>8</sup>

Countertrade transactions do not yet account for a substantial portion of Polish trade with any of its major trading partners in the West. However, they have been used in a growing number of transactions which can roughly be divided into three categories:

1. Major projects involving substantial Polish investment (a probable minimum of \$300 million per contract), with no equity participation by foreign partners. Contracts of this type have been negotiated in the automotive and construction equipment industries and the chemical industry. Ideally, such projects will be self-liquidating and will provide the Poles with at least indirect access to hard currency markets. Two examples of this are the Massey-Ferguson (U.K.) and Creusot-Loire (France) transactions.

The Massey-Ferguson contract with Poland, valued at \$350 million, was signed in 1974. Under terms of the contract, the Poles agreed to purchase equipment for their Ursus tractor plant. The U.K. firm agreed to repurchase Polish diesel engines and tractors over a five-year period (value unknown). Creusot-Loire, in 1976, contracted to supply Poland with \$360 million in equipment and technology for a chemical fertilizer plant. In return, the French firm agreed to market an unspecified portion of the output in a third country.

2. Long-term contracts of moderate value involving foreign supplies of technology and parts which are "repaid" through Polish deliveries of components or complete products. Typically, the percentage of parts furnished by the Western partner decreases over the life of the agreement, although it seldom falls below 50% of the total value of the parts required for each unit. These types of transactions comprise the majority of Polish countertrade activities. Two examples of this are agreements signed with Berliet of France and Westinghouse of the United States.

The 1972 agreement with Berliet of France to purchase licensing and parts for buses and coaches is valued at \$72 million. Under terms of the contract, Berliet agreed to purchase Polish automotive parts for use in its French operations.

An agreement was signed in 1974 with Westinghouse (U.S.) for the sale to Poland of licenses and equipment for semi-conductors and rectifiers valued at \$10 million. The Polish repayment was to be in semi-conductors and rectifiers.

3. Natural resource development projects. The Poles have borrowed substantial sums for copper and coal development projects against future deliveries of resultant product. Western firms are not involved in the extraction of these raw materials. However, according to available information, the loans extended to Poland are reputedly tied to purchases of Western equipment, which is to be used in the development projects. To date, six such agreements have been concluded with Austria, Belgium, France, Italy, the F.R.G., and the Netherlands.

<sup>8</sup> *Business International S.A.*, op. cit., p. 1291.

Under a 1976 agreement signed with Italy, Poland will receive \$150 million in credit for expansion of its coal mining industry. The credits will be repaid with coal exports to Italy. Similarly, the F.R.G. in 1976 extended a \$125 million credit line to help Poland in its copper resources development program. In return, a West German consortium signed a 12-year accord to purchase 40,000 metric tons per year of electrolytic copper (cathodes and wire bars). Annual export value of the copper products is expected to range from \$67 million to \$82 million.

The Netherlands recently concluded a new 10-year agreement to import 750,000 tons of coking coal annually from Poland. The new agreement, replacing one set to expire in mid-1977, will mean annual Polish exports valued at \$45 million. It also provides for an \$85 million loan for the purchase of Dutch steel products to be used in developing the coal industry, as well as a \$50 million untied loan. The untied credit provision represents a unique arrangement for Holland.

In addition to these countertrade transactions, Poland recently entered into an interesting and somewhat unique countertrade project with Cementation International of the United Kingdom. Under terms of this contract, Poland will purchase an airline terminal complex to be built in Warsaw, valued at \$75 million. In return, Cementation International will purchase construction material from Poland, as well as \$35 million worth of Polish construction work on the British firm's contracts with third world nations.

Some additional examples of Poland's countertrade arrangements are presented in Appendix Table 1.

As might be expected, Poland's reliance on compensation arrangements as a device for financing its industrial cooperation projects with the West has grown along with its overall use of the countertrade mechanism. Licensing in exchange for products manufactured under the Western license accounted for over 27% of all such projects involving Polish and Western partners, according to the ECE.<sup>9</sup>

However, it is estimated that Polish goods (both resultant and non-resultant products) delivered as payment to the West under cooperation projects accounted for only slightly less than 2% of total Polish sales westward in 1975.<sup>10</sup> This share is considerably higher for Polish machinery and equipment exported in this context, which was estimated at 10% of total Polish exports to the West in 1974.<sup>11</sup>

In spite of the strides made in the use of this financing mechanism, the average value of Poland's export contracts under cooperation projects with the I.W. is still only about one-fifth that of its similar export contracts with the other communist countries. However, as the self-liquidating aspects of these projects make them more and more attractive, it seems likely that Poland's use of countertrade arrangements in conjunction with cooperation with the capitalist countries will continue to expand.

Expansion of countertrade with Poland during the remainder of this decade is likely to occur through industrial cooperation projects in several areas including:

<sup>9</sup> UNECE, op. cit. p. 1290.

<sup>10</sup> S. Pulawski, B. Sulimierski, "Handel Zagarniczny," No. 1, 1975 in Paul Marer, op. cit., p. 1287.

<sup>11</sup> J. Zelislawski, "Zycie Gospodarze," No. 16 (1179), April 21, 1974 in Paul Marer-op. cit., p. 1287.

*Lumber and pulp industry.*—The Poles are expanding this particular industry with emphasis on modernizing obsolete plants. In addition to seeking sawmill and wood processing equipment and wood treatment centers, Poland plans to construct three new forestry equipment plants.

*Tire industry.*—With the goal of attaining self-sufficiency in tire production within the next few years, the Poles are attempting to modernize existing facilities via imports of Western technology and equipment. Of special interest is modern technology for inner tube and radial truck tire production.

Other areas which will most likely see an increase in countertrade will include the construction, food processing, petrochemical, metallurgy, and copper development industries.

### *C. Hungary*

As is the case with Poland and the other communist countries, Hungarian pressure on Western firms for countertrade depends almost entirely on the nature of the Western import and the strength of the Western and Eastern bargaining positions. Generally, imports for which hard currency has been allocated are typically free from a countertrade commitment. Imports not in the plan, on the other hand, normally require 100% counterdeliveries of Hungarian products to finance their purchase.<sup>12</sup> Western firms' attempts to locate suitable goods, however, are hampered by the rather strict Hungarian practice of restricting purchases of Eastern goods to the original importing FTO.<sup>13</sup>

Hungary is probably the second most active Eastern European country in its use of countertrade. In terms of numbers of countertrade transactions undertaken with Western firms and their value, however, Hungary is still substantially behind Poland. (See Appendix Table 2.) As indicated by the agreements listed in the table, most of Hungary's countertrade transactions involve the purchase of Western licenses, know-how and equipment with payment in resultant product. For example Katy Industries (U.S.) under a 1976 contract will supply \$3.2 million of equipment, management and know-how for the manufacture of women's shoes and will repurchase \$66 million of women's shoes from Hungary.

Generally, the total value of goods exchanged in Hungarian countertrade transactions is much less than is the case with similar Polish agreements, ranging from a low of \$5.8 million in total two-way trade to a high of \$100 million in two-way trade.

At the lower end of this value spectrum, Tokai Metals Co., of Japan contracted in 1977 to supply Hungary with \$4 million worth of equipment for manufacturing aluminum foil. In exchange, the Japanese firm committed itself to purchase \$1.8 million worth of aluminum foil over a six-year period. The largest transaction, on the other hand, was an agreement between Steiger (U.S.) and the Hungarian enterprise Raba, wherein Steiger will provide technology and components for the manufacture of tractors and will purchase from Hungary

<sup>12</sup> Business International, "Business Eastern Europe," October 22, 1976.

<sup>13</sup> Business International, S.A., op. cit., p. 1291.

high-quality tractor axles produced in Raba's plants. The transaction is estimated to be worth \$100 million in two-way trade over a five-year period.

Hungarian countertrade agreements are also distinguished from similar Polish transactions in the length of time covered by the contract. In Hungary, reciprocal deliveries usually take place over a five-year period. In Poland, it is frequently ten years or longer.

In addition to countertrade undertaken in the context of ordinary commercial transactions, Hungarian use of countertrade as the financing element of cooperation agreements has risen rapidly in recent years—from 27 known agreements with I.W. firms at the end of 1967 to some 328 in 1974. Of that number, 154 (43%) involved licensing with payment in resultant product.<sup>14</sup> West German firms have been Hungary's most frequent partners in these activities, followed by Austria, Italy, and France.<sup>15</sup>

According to data compiled for the ECE survey<sup>16</sup> (which was based on a much smaller sample), licensing with payment in product occurred in only 33% of Hungary's total cooperation projects. Turnkey and equipment deliveries with payment in product were even less frequent, only 14% of the total.

The most active industrial sectors in the use of licensing are the mechanical engineering industry and the machine tool industry, which accounted for 31.1% and 17.3% respectively of all Hungarian licensing agreements with the West. The electrical equipment industry (as distinguished from electronics) was the most frequent importer (50% of the cases) of Western plant or equipment with payment in resultant product.

Goods exported to the West as payment for technology transferred under industrial cooperation projects already play a significant role in Hungary's total trade with the West. The share of these exports in total Hungarian exports to the I.W. countries has been estimated at nearly 4% (\$75–80 million) annually.<sup>17</sup> The corresponding figure for their share of Hungary's total industrial exports to the West may be much higher, having been estimated at 15% in 1972.<sup>18</sup>

Hungary's countertrade activity during the current five-year plan is expected to increase overall, with special emphasis on compensation arrangements. Hungary's purchases of industrial machinery from the West are predicted to reach nearly \$3 billion during the 1976–1980 period.<sup>19</sup> (This is nearly one-third of the total amount allocated for special machinery imports under the current five-year plan). Most of the equipment is earmarked for modernizing existing plants and increasing production capabilities for export. It is more than likely that many of the contracts for technology purchased from the West will entail a countertrade requirement.

Those industrial sectors targeted for the highest amount of investment are: electrical power, chemicals, machinery, and food processing. Hungary is currently looking for cooperation partners for projects in all of these areas (with repurchase of part of the output). Particular

emphasis is on mechanization of packaging, materials handling and transport.

#### *D. Romania*

Although Romania still lags behind Poland and Hungary in numbers and value of countertrade transactions, it is making increasing use of this form of trade with the West. Until recently, even though countertrade was involved in a substantial number of Romanian transactions with the West, the countertrade feature was not always a significant element in a given transaction. This appears to have changed, however, and Romania has emerged as one of the communist countries' most adamant adherents to countertrade.

Unlike the other Eastern countries, Romania allows very little flexibility in the repurchasing commitment required of Western firms. Overall, it seeks to obtain the highest percentage of countertrade per transaction of any East European country—100% counterdelivery commitment for nearly all Western imports, even those provided for in the annual and five-year plans.<sup>20</sup> Whether such countertrade demands are met is determined during the bargaining process. Compensation arrangements are preferred.

Indicative of a relatively rigid countertrade system are the guidelines from the various Romanian industrial ministries to the FTOs on countertrade. These set forth fixed overall import and export targets which are to be filled through countertrade.<sup>21</sup> Moreover, in countertrade transactions Romania seeks to have Western firms purchase goods from the original importing FTO. Exceptions can be made, however, upon intervention of the Ministry of Foreign Trade.<sup>22</sup> To facilitate the "linkage" of Western purchases from an FTO other than the original importing FTO, Romania has designated two organizations which act as intermediaries—TERRA and DELTA, the latter established in 1975.

Some examples of Romania's countertrade with Western firms are presented in Appendix Table 3. Because the lack of data on Romania's transactions precludes even the most general observations or analysis, it may be more useful to discuss the extent of Romania's use of the countertrade mechanism as a means of financing cooperation projects with Western nations.

According to the ECE,<sup>23</sup> the supply of plant or equipment with payment in resultant product has frequently been used by Romania (in 36% of the cases surveyed) to finance its industrial cooperation projects with Western partners. Licensing with payment in product in this context has occurred in 19% of the agreements. Romanian goods used as offset deliveries under the former arrangements came mainly from the chemical and mechanical engineering industries which each accounted for 19.1% of the plant and equipment contracts signed. Eastern deliveries made as payment under licensing arrangements were derived primarily from the transport equipment and mechanical engineering sectors. These two industries alone accounted for the lion's share of Romania's licensing agreements (45% and 27.3%, respectively).

<sup>20</sup> Business International, S.A., op. cit., p. 1291.

<sup>21</sup> Ibid.

<sup>22</sup> Ibid.

<sup>23</sup> UNECE, op. cit. p. 1290.

As is the case with Poland and Hungary, Romanian exports used as payment for cooperation projects account for a significant share of Romania's industrial exports to the West. It has been estimated that this share in 1972 amounted to 12 percent.<sup>24</sup>

Romania's reliance on countertrade was expected to remain firm and possibly increase during the remainder of the decade even before the March 4 earthquake struck the country. As a result of the damage inflicted on the economy by the disaster, however, it is very likely that the need for reciprocal purchases will be even stronger than had been previously expected.

Romania faces a major reconstruction effort in rebuilding a domestic economy severely damaged by the quake. The effects of the reconstruction on Romania's trade with the West could be considerable.

Romania's 1977 and 1978 import plans will have to be rewritten to establish new import priorities. The need for materials, goods, equipment and machinery which under ordinary circumstances would not have been considered may put an additional strain on Romania's hard currency earnings. If factories that are traditional hard-currency export producers have been destroyed or badly damaged, Romanian ability to pay for Western imports, without the hard-currency earned from its traditional exports, will be even further constrained.

These factors, coupled with others, such as a possible drop in tourism, may force Romania to seek other means of financing imports and expanding exports. Hence, in addition to requesting more Western credits, the Romanian leadership may continue to press for more and more countertrade with the West.

### *E. Bulgaria*

Although the level of Bulgarian countertrade with the West currently is low relative to its total trade with the West, the emphasis on countertrade transactions is increasing.

As is to be expected of a country with a debt that is large in relative terms (Bulgaria's debt/hard currency export ratio was 4.5 in 1975,<sup>25</sup> the highest of any communist country, including Yugoslavia), Bulgaria exerts more pressure for countertrade than any other communist country except Romania in its commercial dealings with the Western firms. All commercial transactions exceeding \$1 million routinely carry with them a repurchase demand which normally is 40-50% of contract value.<sup>26</sup> The only exception to this appears to be high-priority imports, which may be exempt from any offset purchase requirement.

In order to facilitate this form of trade, Bulgaria allows its FTOs considerable flexibility in their commercial transactions with the West.

<sup>24</sup> UNECE, *op. cit.*, p. 1295.

<sup>25</sup> U.S. Government figures.

<sup>26</sup> Business International S.A., *op. cit.*, p. 1291.

Unlike the communist countries previously discussed, Bulgaria has no special organization responsible for countertrade. Rather, every FTO can participate in such trade. Moreover, countertrade is not restricted to the purchasing FTO and can be arranged with another FTO with much less difficulty than in Poland, Romania or Hungary.<sup>27</sup>

Bulgarian goods offered most frequently as reciprocal deliveries are electrical and transport equipment. Two examples of the latter are presented in Appendix Table 4. The 1975 contract with a French firm for the sale of an ethylene plant valued at \$50 million calls for the repurchase of Bulgarian handling and hoisting machinery. Under the 1976 agreement with G.M./Vauxhall (U.S./U.K.), Bulgaria is to purchase heavy-duty trucks from the British subsidiary of G.M. and in return will supply G.M. with forklift carts and trucks. Chemicals are also used quite often as countertrade.

In fact, chemical imports from the West usually entail a 100% countertrade demand for purchase of Bulgarian chemicals.<sup>28</sup>

Bulgarian countertrade agreements completed to date have been fewer in number although generally of greater value than similar agreements signed by Hungary or Romania. (See Appendix Table 4.) Moreover, they have been aimed primarily at developing finished goods or component manufacturing capabilities. Payment has been in the form of counterpurchase rather than in resultant product, although future transactions will almost certainly increase emphasis on compensation arrangements.

Bulgaria's reliance on countertrade to finance its industrial cooperation projects with Western partners has been proportionately as intense as that of Poland, Hungary and Romania. Most of its agreements with the West in this context have involved either licensing or delivery of plant and equipment, both with payment in resultant product. According to the ECE survey,<sup>29</sup> licensing agreements accounted for 36% of Bulgaria's total cooperation projects undertaken with Western partners; plant and equipment deliveries for 43%. The food and agriculture industry has been the most active participant in licensing, taking a 40% share of all such arrangements.

The remaining 60% of Bulgaria's license agreements have been equally divided among the transport equipment, machine tool, and mechanical engineering sectors.

In spite of Bulgaria's reliance on countertrade as a financing device in East-West industrial cooperation, it is estimated that only 2-3%<sup>30</sup> of Bulgarian exports to Western countries are derived from cooperation projects. However, this share will probably increase concomitantly with Bulgaria's interest in cooperation. Future Bulgarian

<sup>27</sup> Business International S.A., op. cit., p. 1291.

<sup>28</sup> Business International S.A., op. cit., p. 1291.

<sup>29</sup> UNECE, op. cit., p. 1290.

<sup>30</sup> Paul Marer, op. cit., p. 1287.

participation in such undertakings will increasingly emphasize compensation arrangements, particularly in the food processing, tobacco, metallurgy and petrochemical industries.

### *F. Czechoslovakia*

Czechoslovakia lags behind other communist countries in the use of countertrade, although there are indications that this is changing. In the face of a mounting trade deficit and growing indebtedness, plus a need for new infusions of technology, Czechoslovakia is increasing its demands for countertrade. The increased participation of Czechoslovak industrial organizations in such arrangements is receiving serious official attention. Recent administrative reforms have been specifically designed to eliminate bureaucratic bottlenecks and facilitate negotiation of such agreements with Western partners.

Those few countertrade transactions which have been reported involve purchases of non-resultant product. The counterpurchase requirement is normally 30–40% of contract value, but may vary depending on the nature of the Western imports.<sup>31</sup> Although countertrade involving one FTO is encouraged, Czechoslovak goods may be purchased by the Western partner from another FTO.<sup>32</sup> Such transactions may require the assistance of one of two special organizations—Transacta or Fincom. (See Appendix Table 5 for Czechoslovakia's countertrade transactions.)

Czechoslovakia and the G.D.R. are the two least active East European countries in East-West cooperation projects involving offset purchases. Licensing agreements have been the type of payback arrangement preferred by Czechoslovakia in its cooperation with Western firms, accounting for nearly 36% of total agreements signed. The industrial sectors most frequently represented in these licensing transactions are the chemical industry (40%), the transport equipment industry (40%), and the mechanical engineering industry (20%).<sup>33</sup>

The share of cooperation related exports in the volume of Czechoslovakia's trade with the West is far lower than for the other Eastern countries. In 1972, less than 1% of Czechoslovakia's exports to the West were associated with cooperation projects.<sup>34</sup> However, to encourage more participation in such agreements with Western partners, a 1972 law provided that cooperation agreements no longer have to be negotiated at the level of the central government. Rather, they may now be concluded by industrial enterprises, FTOs, or central authorities such as economic ministries. Moreover the Czechoslovak leadership has made clear that long-term cooperation agreements with Western partners will normally entail some purchase of Czechoslovak product.

In addition to growth in the use of countertrade as a means of financing cooperation projects, Czechoslovakia's overall countertrade activity is expected to increase through 1980. Under the current five-year plan, Czechoslovakia's foreign trade goal is to see exports outpace

<sup>31</sup> Business International S.A., op. cit., p. 1291.

<sup>32</sup> Ibid.

<sup>33</sup> UNECE op. cit., p. 1290.

<sup>34</sup> Paul Marer, op. cit., p. 1287.

imports, with particular emphasis on expanding exports of capital goods and equipment to the West. Hence, we can expect to see a greater use of countertrade on the part of Czechoslovakia, and a growth in the volume of capital goods and equipment exports used as reciprocal deliveries.

### *G. German Democratic Republic (G.D.R.)*

Like Czechoslovakia, the G.D.R. has been one of the least active East European countries in countertrade with the West. However, under current G.D.R. policy, commercial transactions with the West are increasingly tied directly to countertrade. Generally, the G.D.R. tries to exact a 40% repurchase commitment from the Western firm.<sup>35</sup>

There are two entities in the G.D.R. which are involved in countertrade. Zentralkommerz GmbH has responsibility for countertrade of almost any nature. Intrac Handelsgesellschaft mbH deals mainly in the purchase and sale of nonferrous metals. (See Appendix Table 6 for G.D.R. countertrade transactions.)

G.D.R. participation in cooperation projects involving product pay-back closely resembles that of Czechoslovakia in that it is generally limited to licensing with payment in product. It is estimated that this mechanism has been used in 43% of all G.D.R. cooperation projects with the West.<sup>36</sup> There are no estimates available on the share of cooperation exports in the G.D.R.'s total exports to the West.

As in the case with the other East European countries, the G.D.R. is seeking to increase exports westward. According to Council of Ministers Chairman Horst Sinderman, the G.D.R. must substantially increase exports in order to insure essential imports. Thus, pressure for countertrade can be expected to increase in commercial negotiations with the G.D.R. In fact, there are indications that this trend has already started. At the most recent Leipzig Fair (held in March 1977), Western businessmen noted that the stance taken by G.D.R. representatives toward countertrade during the 1977 Fair was markedly different from the previous Fair. Countertrade was always the number one topic during commercial discussions. Moreover, it was reported that in most cases, East German officials began with a demand for 100% countertrade, coming down to 40-50% only in certain industrial sectors and only after difficult negotiations.

## VI. PROSPECTS

During the current five-year plan period and into the next decade, Eastern European imports from the West will continue to increase. The future role of countertrade in financing these imports will depend on many variables, the most important of which are:

1. Eastern ability to generate sufficient hard currency without the aid of the countertrade mechanism.
2. Eastern use of other financing mechanisms.
3. Continued Western acceptance of countertrade.

<sup>35</sup> Business International S.A., op. cit., p. 1291;

<sup>36</sup> U.N.E.C.E., op. cit., p. 1290.

### *A. Hard Currency Generating Capabilities*

As we have discussed, the Eastern European countries have come to view countertrade as an effective means of generating hard currency through the offset deliveries provisions of countertrade contracts. The future use of countertrade in this context may be diminished, however, if the Eastern countries find ways of expanding their exports without the "crutch" that countertrade provides.

Given domestic shortages and production difficulties, Eastern ability to generate goods for export appears to be limited.<sup>37</sup>

Aside from these supply constraints, however, Eastern goods often face difficult problems in penetrating Western markets. Until there is an established market in the West for Eastern finished goods, countertrade appears to be seen by the communist countries as one of the best means of access. In view of this, it can be expected that the Eastern European countries will continue to press for more and more countertrade with particular emphasis on compensation arrangements. Not only does this form of countertrade often provide hard currency earnings in excess of the initial Western import cost, but, more than the other forms, it also provides a means of exporting finished goods to the West, since payment is in products derived from the Western-supplied plant, equipment, or technology.

### *B. Eastern use of other Financing Mechanisms*

In addition to expanding countertrade, the Eastern countries may turn to other financing techniques as well. However, the choice of new financing methods is limited. Leasing is one form currently considered by some to have potential in East-West trade. It seems unlikely, however, that leasing will replace countertrade, or significantly reduce its use.

In any case, whether or not the communist countries are successful in finding other means of financing Western imports, countertrade is likely to play an increasingly important role in East-West trade.

### *C. Continued Western Acceptance of Countertrade*

Although the Eastern European countries can be expected to continue stressing countertrade with Western firms, the success of countertrade as an Eastern financing tool depends on the continued willingness of Western firms to use it. The current acceptance of countertrade by Western firms could change to some degree during the remainder of the 1970's and into the 1980's.

Western firms which in the past have agreed to accept Eastern finished goods as payment for plant, equipment, or technology could become increasingly reluctant to do so if they see the goods competing with their own. In addition, Western firms may begin to reappraise their acceptance of countertrade imports when faced with opposition from sensitive domestic industries (as has been seen recently in the textile and shoe industries in several Western nations). In the final analysis, however, Western firms will continue to accept countertrade transactions if they perceive them to be profitable.

<sup>37</sup> For a discussion of Eastern export capabilities see Allen Lenz and Hedija Kravalis "An Analysis of Recent and Potential Soviet and East European Exports to Fifteen Industrialized Western Countries," this volume.

In summary, over the next several years, continued Eastern reliance on countertrade should contribute to the communist countries' ability to minimize hard currency expenditures and increase sales of manufactured products in the West. Even if these countries discover other techniques, they will most likely continue to view countertrade as an integral part of their trade with the West. Western firms, on the other hand, will continue to accept countertrade as long as they perceive it to be profitable for them to do so.

## VII. SUMMARY

During this decade, the countries of Eastern Europe have become increasingly dependent on the technique of international trade known as "countertrade" in their commercial dealings with the Industrialized West. While numerous terms have been used to describe countertrade, in this paper it is defined in three forms: (1) Barter, (2) counterpurchase, and (3) compensation arrangements, also known as buyback or product payback. Countertrade is related to industrial cooperation in that a provision whereby the Western partner purchases Eastern product is often incorporated into cooperation agreements as a financing mechanism.

Western and Eastern motivations for using countertrade differ considerably. Countertrade is attractive to the Eastern European countries as a device for coping with both the short-term problem of balance of payments difficulties and the long-term problem of penetrating Western markets.

In the short-term, countertrade transactions generate for the Eastern countries hard currency earnings to finance a specific project. Quite often, especially in the case of compensation arrangements, they also earn additional hard currency income which can be used for other imports as well. In the long-term, countertrade is viewed as a means of establishing a position in Western markets for Eastern finished goods. Moreover, more and more countertrade agreements call for a continual update of the imported Western technology. This eventually could mean an improvement in Eastern production of high-quality finished goods that would then be more readily marketable in the West.

Western firms may view countertrade as a means, perhaps the only means, of gaining access to the Eastern European market. Additionally countertrade arrangements can be an effective method of obtaining a source of needed raw materials, as well as a source of reasonably lower-priced components of manufactured products.

Eastern countertrade practices vary from country to country. Depending on the Eastern country and the nature of the Western export, however, countertrade demands may range up to 100% or more of the Western export contract value. The most active Eastern participants in countertrade are the U.S.S.R., Poland, Hungary, and Romania, not necessarily in that order.

Although barter transactions are relatively rare in East-West trade, the other forms of countertrade are frequently used. In terms of numbers of transactions, counterpurchase is currently the most widely practiced form of countertrade. Compensation arrangements, however, are generally of larger dollar value and are, in fact, the most

rapidly growing form of countertrade. Moreover, the use of compensation arrangements as a means of financing industrial cooperation projects is developing rapidly and may have a significant effect on future East-West trade.

It can be expected that countertrade will remain an important component of the East-West commercial relationship through 1980. A substantial growth in Eastern ability to export without the crutch of countertrade, or an increasing use by the communist countries of other financing techniques could diminish Eastern reliance on countertrade. However, it seems unlikely that this will happen during the next several years. More likely, the Eastern countries will continue to press Western firms for more and more countertrade, with increasing emphasis on compensation arrangements. Western firms, on the other hand, will continue to accede to Eastern countertrade demands in those situations where they perceive the individual transactions involved to be profitable.

APPENDIX TABLE 1

## IDENTIFIED POLISH COUNTERTRADE TRANSACTIONS WITH THE WEST

Western country	Western supplier	Year signed	Type of Eastern Europe import	Value of Eastern Europe imports (million U.S. dollars)	Type of Eastern Europe export	Value of Eastern Europe exports (million U.S. dollars)	Remarks
United Kingdom.....	Massey Ferguson.....	1974	Equipment for Ursus tractor plant.	350	Diesel engines and tractors.....	(1)	\$257,900,000 credits backed by EGCD. Deliveries for next 5 yr.
Austria.....	Chem-Linz-Voest-Alpine.....	1974	Melanine plant (resin).....	43	Part of plant output.....	(1)	
Do.....	Voest-Alpine.....	1975	Steel products.....	287	Coal.....	* 348	Austrian banks to provide \$287,000,000 to finance Polish purchases over 5-yr period
Belgium.....	(1).....	1975	Coal mining equipment.....	335	1,500,000 tons of coal per year for 10 to 15 yr.	335	Poland received \$335,000,000 in credits.
France.....	(1).....	1975	Equipment.....	(1)	Coking coal.....	(1)	Includes \$1,700,000,000 credit line for Polish purchases.
Sweden.....	Byggnads AB Gunnar Haellstroem.	1974	Prefabricated building elements plant.	9	Prefabricated houses.....	9	
United States.....	Westinghouse.....	1974	License, equipment for semiconductors and rectifiers.	10	Semiconductors, rectifiers.....	(1)	License fees are 30 to 50 pct of production.
Do.....	Clark Equipment.....	1972	License for manufacture of construction equipment.	(1)	Axles.....	(1)	2 separate agreements covering supply of equipment and marketing.
Austria.....	Steyr-Daimler-Puch.....	1975	Licenses, trucks, and know-how.	161	Diesel engines and truck parts..	285	Counterdeliveries will cover 1980-90.
France.....	Westinghouse, C.I.I.	1974	IR 15-80 Computer System.....	10	Computer installations.....	(1)	
United Kingdom.....	Petrocarbon Developments Ltd.	1975	PVC and chlorine plants.....	400	PVC.....	(1)	Japanese firm also involved.
Sweden.....	Stansab-Electronic.....	1975	Equipment for computer monitor systems.	15	(1).....	15	
United States.....	Squibb.....	1975	Antibiotics equipment.....	(1)	Antibiotics.....	(1)	2-way trade worth \$15,000,000.
Do.....	FMC.....	1973	300 mt powdered pectin plant..	2.3	(1).....	(1)	
Do.....	Waterbury Farrell.....	1973	Steel rolling mill.....	4.4	Surface grinding machinery.....	(1)	
Do.....	do.....	1975	Brass and copper strip mill.....	55.4	Miscellaneous products, including copper and brass products.	(1)	
Japan.....	(1).....	1970	Industrial plants.....	100	2,000,000 to 3,000,000 tons of coal per year for 10 yrs.	(1)	\$100,000,000 in private Japanese credits.
United States.....	International Harvester.....	1974	Licensing for manufacture of tractors and accessories.	(1)	Tractors, accessories.....	(1)	Bumar will sell in CEMA; IH will sell elsewhere.
Denmark.....	F. L. Smidth.....	1973	Cement plants (2).....	80	1,250,000 tons of coal per year for 7 to 8 yr.	(1)	Purchases partly financed by Danish Export Credit Council.
Federal Republic of Germany.	Siemens AG; Kabel-und Metallwerke Gutflohnungshutte AG, Norddeutsche Raffinerie, Metallgesellschaft AG.	1976	Expansion of Poland's copper industry.	125	Deliveries of 40,000 tons per year of unfabricated copper with a limited commitment to buy semifinished products such as cathodes and wire bar.	* 804-984	12-yr agreement. Hermes credit guarantees extended.

France	Creusot-Loire	1976	Equipment, technology for fertilizer plant.	360	Fertilizer	(1)	Joint marketing in 3d country.
Do	Produits Chimiques Ugine Kuhlmann.	1976	(1)	(1)	Sulfur	(1)	France and Poles will cooperate in chemical production. 4-yr agreement.
Japan	Mitsui Shipbuilding & Engineering Co.	1976	Know-how and equipment for a chemical equipment manufacturing plant.	3	Chemical equipment	(1)	Part of output will be sold in Japan.
Switzerland	Emil Haefely & Cie AG	1976	High-voltage generator	(1)	Electrical energy	(1)	
Sweden	ASEA	1977	Electrically driven industrial robots.	(1)	Electronic and automation systems.	(1)	Total value of agreement is \$6,000,000.
Do	(1)	1974	Construction of oil refinery with capacity of 10,000,000 ton/per year of crude oil.	333	Resultant produce to Sweden	(1)	To export 50 percent of production to Sweden.
Do	(1)	1976	Licence, know-how and parts for production of electric typewriters.	(1)	Counterdeliveries of parts and components to Sweden.	(1)	
Do	(1)	1975	Licence to produce relay devices for RR signal boxes.	(1)	Counterdeliveries of relay devices to Swedish firms.	(1)	
United Kingdom	Cementation International	1977	Airline terminal complex (Warsaw).	75	Construction by Polish firm on CI's contracts with 3d world nations; CI to purchase construction material from Poland.	* 35	
United States	Katy Industries	1976	Machinery and working programs for shoe production.	(1)	Shoes	(1)	5 yr agreement; some part of production to be sold in United States.
Federal Republic of Germany	ALSA-Schubbedorf GmbH	1976	Licence and know-how	(1)	Ladies shoes	(1)	
France	Berliet	1972	Licence and parts for buses and coaches (rear wheel axles, steering elements).	71.94	Parts for Berliet's French operations.	(1)	In late 1976 this was being expanded to include heavy trucks.
United States	General Electric	1976	Licence and machines for production of medical equipment.	(1)	Joint output; particularly, electrocardiogram meters.	(1)	
Italy	(1)	1976	Equipment	150	Coal	150	\$150,000,000 Italian credit line for Polish purchases.
Federal Republic of Germany	Krupp-led consortium	1976	Coal gasification plants	800	Ammonia, urea, and methanol	(1)	Result: Products to be marketed by joint Federal Republic of Germany-Polish company.
Netherlands	Hoogovens Ijmuiden BV	1977	Steel structures	40	Coking coal	400	10-yr agreements 750,000 mt./yr. of Polish coal exported to Netherlands tied to \$85,000,000 Dutch loan for expansion of coal industry. Dutch Government guarantees extended.
France	Rhone-Poulenc Institut Francais du Petrole.	1975	Chemical products, textile fibers	* 14	Sulfur	(1)	A 10-yr agreement.

<sup>1</sup> Not available.

<sup>2</sup> Over 9-yr period.

<sup>3</sup> Over 12 yr.

<sup>4</sup> In construction at 3d world sites; \$4,500,000 per year purchases by CI.

\* Annually.

Note: While information on these transactions has been taken from published Western sources, the Bureau of East-West Trade cannot vouch for its accuracy.

## I. INTRODUCTION

Since taking power in late 1970, the Gierek regime has imported massive amounts of Western machinery and technology to support an ambitious economic development program. However, Warsaw imported much more than originally planned, largely because of (a) above-plan imports of capital equipment, (b) unanticipated imports of Western grain in 1974-76, and (c) higher prices for imported goods. Although exports to the developed West increased, they did not keep pace with imports. The resulting huge trade deficits forced Poland to borrow more heavily than expected and pushed its net hard currency debt up from \$2 billion at yearend 1973 to \$10.2 billion by yearend 1976 (see Table 1).

TABLE 1.—POLAND: ESTIMATED NET HARD CURRENCY DEBT AND DEBT SERVICE

[In millions of U.S. dollars]<sup>1</sup>

Year:	Outstanding net debt at yearend			Debt service ratio percent <sup>2</sup>
	Total	Known medium- and long-term	Repayments of principal and interest	
1970.....	766	700	210	22
1971.....	798	750	220	20
1972.....	1,088	900	270	19
1973.....	1,893	1,450	540	26
1974.....	3,944	2,500	870	31
1975.....	6,933	4,250	1,300	43
1976 <sup>3</sup> .....	10,200	6,250	1,650	50

<sup>1</sup> Data rounded to nearest \$1,000,000.<sup>2</sup> Scheduled repayments of principal on medium- and long-term debt plus interest payments on total debt as a percent of exports to the developed West. If estimated gross earnings on invisibles are added to exports, the debt service ratio drops to approximately 31 percent in 1975 and 35 percent in 1976.<sup>3</sup> Preliminary estimates.

Warsaw now finds itself in a decidedly uncomfortable financial position. Although Poland has been able to meet its debt service obligations until now, party leader Gierek has to make hard choices to avoid serious future problems. Poland already has announced sharp cutbacks in import growth—the most important factor in its impressive 1971–75 industrial growth—and further cuts are possible. Consequently, Gierek faces the 1976–80 plan period trying to maintain rapid economic momentum—despite cutting import growth—while coping with growing balance-of-payments difficulties and continuing consumer unrest.

Wladyslaw Gomulka, Gierek's predecessor, maintained a tight rein on Polish purchases in the West to keep hard currency debt at a minimum. Poland's trade deficits with the West averaged \$60 million in 1960–69, and its debt to the West stood at only \$800 million at yearend 1970. More than 90 percent of it consisted of medium- and long-term debt, with half in interest-free PL 480 credits. Gierek thus inherited a favorable external financial situation that provided the basis for an expansion of Western imports to support ambitious domestic economic growth policies.

## II. THE GROWING TRADE GAP, 1972–75

Since 1972, Poland's trade deficits with the West have burgeoned (see Table 2). Imports particularly surged, reaching \$5.2 billion in 1974—almost five times the 1971 level. In 1972–74, Poland imported \$4 billion in machinery and equipment (see Table 3).<sup>1</sup> Rapid increases in industrial demand, rising world prices, and reduced Soviet deliveries also led to a ninefold increase in iron and steel imports. Increased purchases of high-priced Western grains and feedstuffs in 1973–74 also contributed to the sharp rise in imports.

<sup>1</sup> See Appendix A for a breakdown of Poland's trade with the developed West by commodity groupings.

TABLE 2.—POLAND: TRADE WITH THE DEVELOPED WEST<sup>1</sup>[In millions of U.S. dollars]<sup>2</sup>

Year:	Imports <sup>3</sup>	Exports <sup>3</sup>	Balance

Source: Official Polish foreign trade statistics.

Poland's exports to the West also rose rapidly in 1972-74—at an average annual rate of 38 percent—paced by brisk sales of coal, chemicals, foodstuffs, and light industrial products. However, more than 40 percent of the rise in export value represented higher export prices. Higher coal prices alone—up from about \$20 a ton in 1973 to about \$35 in 1974—accounted for about one-third of the rise in Poland's exports in 1974.

Poland ended 1975 with a record \$3 billion trade deficit with the West, although imports rose only 16 percent compared with 53 percent in 1974. Imports of machinery and equipment climbed again as deliveries continued on earlier orders. Warsaw also imported more Western grain to raise livestock production, owing to Moscow's suspension of grain deliveries and shortfalls in domestic grain and fodder production. On the other hand, imports of steel products and cement were curbed in the second half of the year.

Poland's exports fared poorly in 1975, rising only 7 percent, to \$3 billion. The relatively poor performance resulted from sluggish Western demand and, in some cases, from reduced prices for Polish textiles, metals, and wood products. For example, falling prices held the rise in

copper earnings to about 6 percent even though export volume rose some 40 percent over the 1974 level. In addition, EC trade barriers, rising domestic demand, and disappointing agricultural performance in 1974 resulted in a 25 percent drop in food exports. Only increased ship sales and high first-half 1975 prices for Polish coal, sulfur, and chemicals kept the value of exports to the West from falling.

West Germany, Poland's largest Western trading partner, accounted for 26 percent of the total trade deficit with the West in 1972-75 (see Table 4). Imports of West German machinery, steel products, and chemicals outstripped West German purchases of Polish foodstuffs, coal, and copper. To curb this growing trade deficit, Warsaw levied a 10 percent surtax on West German imports in 1975 and instructed foreign trade organizations to divert purchases to other Western countries.<sup>2</sup> Although Warsaw managed to hold down West German imports in 1975, Polish-West German trade was given a big boost in late 1975 by the signing of agreements to settle outstanding political differences. In exchange for a West German loan of \$425 million and agreement to pay \$550 million in 1976-78 to the Polish pension fund, Poland agreed to permit the emigration of 125,000 ethnic Germans to West Germany over the next four years.

### III. FINANCING THE DEFICIT

Invisibles have contributed little to help cover Poland's large trade deficits.<sup>3</sup> Net earnings from transportation, tourism, and remittances have been largely offset by net outflows for interest and other services. Thus, in 1972-74, deficits on current account generally were slightly smaller than those on trade, with the net surplus on invisibles averaging \$100 million annually. In 1975, however, soaring interest payments on massive borrowings in 1974 and 1975 probably resulted in a deficit on invisibles (see Table 5). Poland probably registered small hard currency surpluses with developing nations in 1972-75.<sup>4</sup>

<sup>2</sup> "Poland's 1975 Plan Spotlights Exports," *Business International/Eastern Europe Report*, January 10, 1975, pp. 11-12. "Eastern Europe Bilateralism Can Affect Western Sales," *Business Eastern Europe*, December 24, 1976, p. 408.

<sup>3</sup> Estimates of net earnings from invisibles were based on data contained in Maria Rubel, "Bilans płatniczy PRL z krajami kapitalistycznymi," *Bank i Kredyt*, No. 3, March 1972, pp. 398-401. Rubel's series on invisibles were updated with data contained in the following: various volumes of *Rocznik Statystyczny* (for tourism) *Statystyczny Gospodarki Morskiej*, and *Technika i Gospodarka Morska* (for transportation).

<sup>4</sup> It is difficult to determine Poland's net hard currency trade with LDCs. Although a number of LDCs claim to settle in convertible currencies with Poland (as listed in the IMF's *Exchange Restrictions*), barter trade still occurs in many commodities under convertible currency clearing agreements. Moreover, Polish bilateral payments agreements with LDCs—under which trade generally is not settled in hard currency—may contain provisions for the settlement of trade in specific commodities only in hard currency. For example, an LDC trade imbalance with Poland may be settled in commodities (or Poland may extend credits which eventually could be paid off in commodities or hard currency), but Polish shipments of coal to the LDC would have to be paid for in hard currency. In addition, a sizable part of Poland's exports of machinery and equipment to LDCs—the bulk of its exports to LDCs—is probably not paid for in hard currency. Thus, a large portion of any surpluses on trade with convertible currency LDC partners is not available as an offset to deficits on trade with the developed West.

Financed by medium and long-term credits, net <sup>4</sup>	-6	1,750	2,000
Errors and omissions <sup>4</sup>	-137	1,375	1,420

<sup>1</sup> Data rounded to nearest \$1,000,000.<sup>2</sup> Preliminary.<sup>3</sup> Official Polish statistics.<sup>4</sup> Including net transfer payments, both private and government, and other government transactions. Also included is the first West German payment of \$133,033,000 to the Polish pension system in 1976.<sup>5</sup> Includes government-backed export credits, changes in Poland's medium- and long-term net Eurocurrency positions, and estimated Polish medium- and long-term commercial borrowing in the United States and Europe.<sup>6</sup> Errors and omissions consist mainly of short-term borrowing on commercial credits but also include some bank loans of up to 5 years. Also included are hard currency balances with less developed countries and changes in foreign exchange reserves.

Poland has had to draw heavily on official and private sources to finance its deficits and rapidly rising debt-service payments. Medium- and long-term credits backed by Western governments covered a large share of its deficits in 1972-75 (see Appendix B for a list of major government-backed credit extensions). By the end of 1975, the outstanding debt on such credits totaled roughly \$2.5 billion. France, the United Kingdom, and West Germany have been the largest sources of government-backed credits, accounting for roughly two-thirds of the total amount of credits extended.

The primary source of private, nongovernment-guaranteed credits has been the Eurocurrency market. Loans have grown markedly since 1973 (see Table 6). By year-end 1975, Poland's net liabilities on the Eurocurrency markets were \$3.4 billion. In addition to its short-term borrowing, Poland obtained consortium loans with repayment periods up to 10 years at interest rates of 0.5-1.5 points above the London interbank offered rate (see Appendix C for a list of major syndicated Eurocurrency loans.) Major long-term syndications included a \$100 million loan for the development of the Lubin-Glogow copper deposits from a consortium of US and Canadian banks, a \$240 million loan for copper resource development, and a \$100 million loan for development of the Lublin coal fields.

End-September 1976	441	4,866
End-1976	643	5,442

<sup>1</sup> The Western countries reporting by individual East European country are Belgium-Luxembourg, France, Italy, Sweden, the United Kingdom, and West Germany; the Netherlands beginning end-June 1975; and branches of U.S. banks in the Bahamas, Cayman Islands, Panama, Hong Kong, and Singapore beginning end-1975.

Source: Bank for International Settlements data.

Poland also has tapped other foreign sources of financing. For example, Warsaw has received substantial Middle East deposits and may have drawn down part of a \$250 million Iranian credit.<sup>5</sup> Soviet-owned banks in the West, particularly Moscow Narodny Bank in London and Eurobank in Paris, have participated in or comanaged some of Poland's consortium Eurocurrency loans, and presumably have given Warsaw direct lines of credit. At yearend 1975, Poland's indebtedness on hard currency credits from the International Investment Bank (IIB) of the Council for Mutual Economic Assistance (CEMA) totaled an estimated \$130 million.<sup>6</sup> Poland's hard currency indebtedness to CEMA's International Bank for Economic Cooperation totaled roughly \$200 million—mostly short term.

Poland's recent heavy borrowing on the Eurocurrency market resulted from its need for untied credits to take care of immediate financial needs created by large trade deficits and rising debt service obligations. Because much of this borrowing has been short term, Poland's debt maturity structure has been greatly shortened. This situation—because of the need to roll over large amounts of credits on a regular basis—has made Poland more vulnerable to changes in money market conditions. Moreover, heavy use of untied credits probably has weakened Poland's creditworthiness in the eyes of Western lenders and may increase its difficulties in obtaining similar funds in the future.

#### IV. SITUATION IN 1976

Poland's hard currency balance of payments position worsened in 1976 as Warsaw posted a record trade deficit of \$3.3 billion with the developed West. Imports of \$6.7 billion were twice the level of Polish exports, boosting the hard currency debt to \$10.2 billion at yearend. Poland's terms of trade with the West also deteriorated as export prices fell 5 percent and import prices dropped 3 percent.

Cutbacks in purchases of steel, chemicals, and textiles were more than offset by deliveries in the fourth quarter of 1976 of large amounts of consumer goods, US grain, and Western machinery and equipment ordered earlier. But Warsaw did lay the groundwork for further cuts in imports in subsequent years. It canceled \$500 million in projects involving heavy use of imported equipment—including the \$250 million foundry at Stalowa Wola—that will not eventually yield hard currency exports. In addition, Warsaw has postponed other purchases in the West, including the \$700 million General Motors light van project.

Polish export earnings in 1976 were buoyed by higher prices—at least in the first half—for chemicals, ships, and copper. The resumption of sugar exports—curtailed in 1974–75 as a result of poor sugar beet harvests—also boosted earnings. Foreign exchange earnings, however, were held in check by reduced prices for coal, Poland's major hard currency earner. Consumer grumblings over domestic coal shortages in late 1976 also forced some reduction in coal exports. In addition, the need to increase domestic meat supplies—as a result of the June price-rise fiasco—caused a 50 percent reduction in the volume of raw meat exports in 1976.

<sup>5</sup> "Iran—Credit and Trade Deal with Poland," *Middle East Economic Digest*, November 22, 1974, pp. 1416–1417.

<sup>6</sup> This excludes Poland's debt to IIB on hard currency credits for the joint CEMA natural gas pipeline project in the USSR. The value of these credits is unknown.

To cover its \$3.1 billion trade deficit plus an estimated \$1 billion in debt repayments, Warsaw relied heavily on government-backed Western credits and Eurocurrency loans. Poland drew on almost \$2 billion in government-backed export credits in 1976. In addition, it received \$300 million in West German credits and payments to the Polish pension fund and may have drawn down most of the \$250 million Iranian credit extended in 1975. Poland's net liabilities on the Eurocurrency markets rose by \$1.4 billion in 1976.<sup>7</sup>

In 1976, Warsaw found it increasingly difficult to obtain the credits it needed at favorable borrowing rates.<sup>8</sup> Some bankers had become concerned over Poland's large debt and prospects over Warsaw's ability to control its continuing large trade deficits.<sup>9</sup> In addition, last June's food riots and the subsequent cave-in by the government dealt a blow to Warsaw's creditworthiness.<sup>10</sup> Despite Western banker's apprehensions, however, Poland still has been able to obtain substantial funds in the West as long as it is willing to pay the requisite rates.

Despite the optimistic foreign payments picture painted by Polish financial leaders, there were indications in 1976 that Poland was in a payments bind.<sup>11</sup> According to Western news reports, Poland requested some Western banks to extend credits for purchases of steel and other manufactured goods beyond the normal six months to three years.<sup>12</sup> Warsaw has also pressed some Western firms for hard currency credits to cover project-associated local currency costs.<sup>13</sup> Such credits conceivably could be used to meet interest and principal payments on existing debt.

The Soviet economic aid package to Poland—agreed upon during party leader Gierek's visit to Moscow in November 1976—should give Poland's balance of payments a needed shot in the arm in 1977-80, but it is not sufficient to bail Poland out of its present or future financial difficulties. The package included shipments of raw materials above planned levels, increased deliveries of consumer goods, a low-interest 1 billion ruble loan, and the resumption of grain deliveries, which were suspended in 1975-76 as a result of the disastrous 1975 Soviet grain harvest.<sup>14</sup>

## V. PLANS FOR 1976-80

In the revised 1976-80 development program, Polish planners have scheduled industrial production to increase at an average annual rate of 8.5 percent and national income to grow at 7.3 percent.<sup>15</sup> These goals, still ambitious, are lower than the announced 1971-75 achievements of 10.5 percent and 9.7 percent, respectively. Total exports are to increase by 12 percent annually in constant prices, while imports are targeted for a 4.6 percent annual growth. These targets are substantially lower than those announced in December 1975 at the

<sup>7</sup> See Table 6.

seventh party congress.<sup>16</sup> Total exports were to increase at an annual rate of 15.5 percent, while imports were slated for a 9.4 percent annual growth. Targets for trade with the West in 1976-80 were not announced in the revised plan. Preliminary targets, however, were calculated from data contained in the 1975 version of the plan. At that time, the volume of exports to the West was scheduled to rise by 15 percent annually and import volume growth was projected at only 5 percent annually—down from 33 percent annually in 1971-75.

There are indications, however, that the Gierek regime may have adopted a no-growth import policy or even a policy of an absolute decline in imports from the developed West for the remainder of the decade. In discussions of the 1976-80 draft plan before the Sejm (Polish Parliament) in December 1975, the level of imports from the West was described as being "stable" in 1976-80.<sup>17</sup> Given the projected increase in trade with CEMA—especially the Soviet Union—in 1976-80, it would appear that Warsaw is planning to curb sharply its imports from the developed West. Moreover, the 1977 plan calls for a total import growth of only 2.7 percent. This would indicate that Warsaw is planning, at least for 1977, an absolute decline in imports from the developed West.<sup>18</sup>

## VI. PROSPECTS

### A. Trade

It is questionable whether Poland can meet its trade targets with the developed West in 1977-80. Poland has not been able to reap many gains—in terms of increased exports of goods to the West—from its massive purchases of Western machinery and equipment. Deficiencies in Poland's infrastructure have led to numerous construction delays which have lengthened the time to get profitable production underway. Even when highly sophisticated plant and equipment come on stream, poor management often results in below capacity production. Moreover, Poland's ability to increase hard currency exports depends heavily upon Western economic prosperity. Export growth stagnated during the Western recession in 1975 and grew sluggishly in 1976 as recovery faltered.

The projected 15 percent annual real growth in exports to the West appears too ambitious, even if Western economic recovery picks up steam. Estimated export capacity suggests an export volume growth at best of 11 percent to 12 percent. Coal exports, now valued at almost \$1 billion, will continue to be Poland's largest hard currency earner, possibly topping \$1.5 billion by 1980 if Warsaw can reach targeted production of 210 million tons in 1980 and minimize domestic consumption. Long-term coal contracts have assured Warsaw outlets for most of its planned coal exports to the developed West in 1977-80 (see Appendix D). Poland probably will not be able to achieve above-plan coal exports because of limited mining capacity and, despite best efforts to hold down demand, rising domestic consumption. Substantial increases in coal exports will not be attained until the 1980s, when the Lublin mines are operational.

<sup>16</sup> "Poland 1976-80," *Kurier Polski*, Supplement; (Translated in JPRS 67093, April 6, 1976, p. 64).

<sup>17</sup> "Sejm Committees Discuss Draft Laws," December 4, 1976 (FBIS-EEU-76-235, December 6, 1976, Volume II, No. 235, p. G10).

<sup>18</sup> "Resolution of the Sejm of the P.L.R. of December 18, 1976 on the National Socio-Economic Plan for 1977," *Monitor Polski*, No. 43, December 27, 1976.

Exports of copper, sulfur, and zinc should rise rapidly as Warsaw continues its fast pace of resource development. Poland's traditional exports of food and live animals, however, will be constrained by rising domestic demand and trade barriers in the important EC markets. As a result of past and continuing investments—especially of Western equipment and technology—exports of ships and copper should show the greatest growth in this period.

Warsaw also may find it difficult to hold import growth to 5 percent or follow a no-growth import policy if the high growth rates for industrial production and national income are to be achieved. Imports from the developed West represent about 10 percent of Polish national income but are considerably more important in terms of the types of products represented. The productivity of Western equipment is for the most part higher than comparable equipment produced in Communist countries. Other Western producer goods such as specialty steels are critical to Polish production plans.

According to numerous speeches made by party officials, Warsaw recognizes the need to hold down imports of capital equipment to sustain essential imports of grain and raw materials. Such imports can be reduced for a time without affecting economic growth because of the large backlog of equipment not yet in operation and the under-capacity production of existing Western machinery and equipment. Imports of equipment and machinery not expected to generate hard currency exports probably will be the first sacrificed. But given the large orders already placed, machinery and equipment imports will continue to rise in the next year or two, after which they should level off.

Poland cannot curtail imports of industrial raw materials too long without jeopardizing its economic growth plans. Curbs on purchases of raw materials in 1976 already have caused some depletion in stocks and further cutbacks could result in serious production bottlenecks. In addition, the failure to increase imports of industrial goods such as steel could adversely affect export capacity—e.g., in the shipbuilding industry.

The achievement of 1977–80 economic growth targets will also depend on increasing imports of oil from noncommunist sources. Rising world oil prices forced Warsaw in 1975 to scale-down an ambitious oil refinery expansion program, and consequently, to lower projected total crude oil imports in 1980 from 28 million tons to 20 million tons. Imports of Western crude should increase—despite the recently announced boost in Soviet deliveries to Poland—from about 2.4 million tons in 1975 to 7 million tons in 1980.

Poland's reliance on Western grain imports will have to remain high if livestock production for both domestic consumption and export are to be boosted. Even with continued Soviet deliveries of 1 to 1.5 million tons a year—the annual average of Soviet shipments to Poland in 1971–75—and good years in agriculture, Poland will still need to import 2 to 3 million tons of grain each year from the West. Recognizing the need for continued large grain imports, Warsaw has negotiated a long-term grain agreement with the United States guaranteeing access to the U.S. market, its main source of foreign grain. In addition, Warsaw has renewed its three-year grain purchase agreement with Canada.

### B. Impact of Recent Soviet Assistance

The Soviet credit probably will be used to finance above-plan purchases of machinery, raw materials, and possibly grain from the U.S.S.R. in 1977-80. At the very least, Poland should not have to divert exports from the West to pay for the additional Soviet deliveries. The credit may even allow Poland to redirect some of its exports from the U.S.S.R. to other markets. For example, coal and other products could be sold in the West for hard currency.

The resumption of Soviet grain deliveries and increased shipments of raw materials will allow Poland to curb further the growth of its hard currency imports. In 1977 alone, the Soviets will supply Poland with one million tons of grain.<sup>19</sup> Details on raw materials deliveries are sketchy. The Soviets have agreed to boost annual crude oil shipments from 11 million tons to 13 million tons.<sup>20</sup> Soviet shipments of oil products will rise dramatically—from 6.5 million tons to 12 million tons over the period. The Soviets may also have agreed to increase deliveries of raw materials, such as iron ore, that Poland buys from the West for hard currency.<sup>21</sup>

### C. Financing the Deficits

Poland is expected to run large, but declining, trade deficits in 1977-80. Warsaw should be able to avoid serious financial difficulties if it can achieve a 15 percent real annual growth in exports and maintain real import growth below a 5 percent annual level. If export growth should fall below expected levels, Poland almost certainly could not meet its import growth targets because of financial constraints. Specifically, Poland cannot continue to rely heavily on Western commercial bank credits, nor to increase debt service on medium- and long-term debt to a level greatly above the current 50 percent.

Poland has roughly \$5 billion in unused government-backed credits and credit lines to draw on in the next two years. A large part of credits extended over the past 18 months or so were still available as of the beginning of 1977. Among these are a part of \$1.7 billion line from France for a fertilizer plant and other capital equipment, a \$310 million credit from the United Kingdom for a polyvinyl chloride (PVC) complex, and a \$450 million credit from Japan for industrial plant and equipment. In addition, the West Germans have agreed in principle to extend Poland a \$1 billion credit—in large part covered by a government guarantee—for a coal gasification project. Additional credits tied to sales of machinery and some intermediate products such as steel, are likely. Western lenders look especially favorably on credits designed to increase Polish export capacity. But Poland's ability to obtain tied medium- and long-term credits has its limits. A heavy debt service burden has long-term implications for a country's ability to repay its obligations while meeting its import requirements.

<sup>19</sup> E. Gierek, "Report to the Fifth Session of the PZPR Central Committee, December 1, 1976 (Translated in *Summary of World Broadcasts*, EE/5380, December 3, 1976, p. C5).

<sup>20</sup> The Polish-Soviet five-year trade agreement signed in December 1975 called for the Soviets to deliver 50 million metric tons of crude oil to Poland in 1976-80. An additional 1 million tons was to be supplied each year, beginning in 1977, as a payment for Polish construction of the Polotsk oil pipeline in the U.S.S.R. The recent Soviet aid package boosted Soviet crude oil shipments to Poland in 1976-80 by 9 million tons (see "Plans for Polish-Soviet Cooperation in Many Industrial Fields up to 1985," *Trybuna Ludu*, No. 4, January 6, 1976, p. 1).

<sup>21</sup> David Lascelles, "What Went Wrong in Poland—An Exclusive Interview with the Prime Minister," *Financial Times*, December 14, 1976, P. 4.

Moreover, tied credits will not meet Poland's financing requirements. Warsaw will continue to need large untied credits to help cover large trade deficits and meet debt service obligations but undoubtedly will encounter difficulties in raising these funds. Continued heavy untied borrowing will lead to increased Western concern over Warsaw's ability to manage its balance of payments; at a minimum it will be viewed by Western bankers as a sign of financial mismanagement. Banks have become increasingly selective on additional loans to Poland and will favor, those loan requests tied to Polish imports of Western products. A major share of untied credits has come from short-term borrowing, much of which is subsequently rolled over by Warsaw. A second source of untied funds has come from medium- and long-term Eurocurrency syndications.

In the final analysis, Warsaw will be forced to cut its planned economic expansion program. The cuts will have to be handled carefully to minimize their effect on consumers and exports. Just how much freedom of action Polish leaders have in controlling imports that directly or indirectly affect consumption is uncertain, given the sensitivity of the population to any real or perceived reductions in its standard of living. Warsaw could ask Moscow for further assistance which could soften the impact of any reduction in planned growth. But, Moscow probably would want some sort of a quid pro quo in return for any aid. The Soviets probably would not press for greater Polish deliveries of hard goods—such as coal—because this would only aggravate Poland's payments position. At the very least, Polish leaders may feel more obligated to heed Soviet advice concerning management of the Polish economy.

### APPENDIX A

#### POLAND: COMPOSITION OF TRADE WITH THE DEVELOPED WEST ACCORDING TO COMMODITY GROUPS

[In millions of U.S. dollars]

	1970		1974		1975	
	Value	Percent	Value	Percent	Value	Percent

1974.....	200	6.5	8	20	Do.
1975.....	180	6.5	8	20	Do.
1976.....	450	7.5	8	20	Do.
United Kingdom:					
1974.....	304	7	8	15	Ursus tractor plant.
1976.....	310	7.5	8	15	PVC complex.
United States:					
1973.....	55	6	5	10	2 meat-processing plants.
1973.....	63	6-8	3	-----	Commodity Credit Corporation (CCC) credits.
1974.....	44	6	5	10	Copper processing plant.
1975.....	218	8-9	3	-----	CCC credits.
1976.....	188	8-9	3	-----	Do.
West Germany:					
1975.....	425	2.5	25	-----	Financial credit.
1976.....	1,037	NA	NA	-----	Coal gasification plant.
1976.....	124	7	10	-----	Development of copper deposits.

<sup>1</sup> Credit was extended in June 1975 to cover imports of French plant and equipment up to June 1978.

<sup>2</sup> Carries an unspecified floating rate over the base of 7 percent.

## APPENDIX C

## POLAND: MAJOR KNOWN SYNDICATED EURO CURRENCY LOANS

Date	Loan value (millions)	Interest rate (percent) <sup>1</sup>	Grace period (years)	Repayment period
July 1973.....	\$60	0.5-1.0	-----	1974-83:
April 1974.....	75	.625	3	1977-82
May 1974.....	70	.625-.75	3	1977-82
October 1974.....	100	1-1.125	-----	1975-81
April 1975.....	240	1.5	2	1977-83
May 1975.....	50	1.5	-----	1976-80.
June 1975.....	50	1.5	-----	1976-80.
Do.....	50	1.375-1.5	-----	1976-83
July 1975.....	35	1.5	-----	1976-81
October 1975.....	40	1.5	-----	1976-82
March 1976.....	100	1.5	2	1977-82
June 1976.....	140	1.5	3	1979-81

<sup>1</sup> Above London interbank offered rate.

## APPENDIX D

## POLAND: HARD CURRENCY COAL CONTRACTS

Western nation	Quantity to be delivered each year (thousand metric tons)	Length of contract
Austria.....	750	1976-85
Belgium.....	1,000	1977-84
Denmark.....	3,500	1974-80
Finland.....	2,000-4,300	<sup>1</sup> 1977
France.....	3,500	1976-83
Holland.....	750	1977-81
Italy.....	3,000-5,000	1976-87
Japan.....	800	<sup>2</sup> 1977-79
Sweden.....	1,250-2,000	<sup>2</sup> 1977-85
United Kingdom.....	1,500	<sup>2</sup> 1977-79

<sup>1</sup> Quantity exported each year is probably negotiated on an annual basis.

<sup>2</sup> Contract still under negotiation.

# TRADE AND AID IN THE ALBANIAN ECONOMY

### A. THE STATISTICS OF TRADE

The analysis of Albanian external economic relations is severely hampered by the absence of a time-series of trade returns, and it is a further novelty of this paper to provide detailed estimates of aid and trade. When the General Directorate of Statistics began to publish a statistical yearbook, external trade data were at first excluded. A series began in the *Yearbook* for 1959<sup>1</sup> showing total imports and exports, an eleven-country breakdown and certain major traded commodities in physical quantities for 1938, 1945 and 1950 and the individual years 1955-58. A mission of the United Nations Economic Commission for Europe to Albania in 1960, of which the present writer was a member, sought and received corresponding data for 1951-54 which it published in its report,<sup>2</sup> and which later appeared in the yearbook, when in the mid-sixties they reached a maximum of revelation. Not only did they provide a complete total-trade series back to 1945 (though not its direction for the missing years), and detail of exchanges with up to 27 partners,<sup>3</sup> but also a commodity classification in nine groups and the only commodity by country data ever to appear.

When the abstracts became biennial, the supply of foreign-trade statistics was severely reduced and none has contained more than a selection of about thirty individual commodities in physical terms as exports and about twice that number as imports. The abstracts not published in the regular series reduced the release to exported commodities and gave no information whatsoever on imports; one publication did provide for 1973 a breakdown by three commodity groups and separated fabricated from non-fabricated exports.<sup>4</sup> Although no Albanian source has quoted trade values for any year after 1964, the statistical offices of the GDR and of Poland have published import

\*St. Anthony's College, Oxford.

<sup>1</sup> *Anuari statistikor*, 1959, pp. 168-73.

<sup>2</sup> *Economic Survey of Europe in 1960*, Table 8 of Chapter VI.

<sup>3</sup> *Vjetari statistikor*, 1966, pp. 314-5; that for 1964, pp. 316-7 fell short by only one partner's returns.

<sup>4</sup> Both were issued to commemorate a 30th anniversary, respectively the founding of the Party and of the State, *RPSh në jubileun e 30 vjetorit të themelimit të PPSh, 1971*, with data to 1971 and *30 vjet Shqipëri të socialiste, 1974*, with data to 1973 (trade data on pp. 179-80).

and export series (Table 1A) which are not readily compatible with the few Albanian statements on ratios of exports to imports and of annual export increments, from which the extension of the series 1965-70 in Table 1 is derived and on which the series in Table 2 are based. Because neither a quantum nor a unit-value index has ever been published, Table 1 applies the price index recorded for Yugoslavia to the trade composition of which Albania approximates.

The absence of trade returns led the United Nations Economic Commission for Europe to suspend discussion of Albanian foreign trade in its annual *Bulletins* and *Surveys*; <sup>5</sup> because Albania is a member of the United Nations it could not include estimates, although it cites partner data when analysing East-West trade. Two international agencies in which Albania does not participate, GATT and the IMF, make extensive use of partner returns, but do not estimate the large gap in those returns arising because China does not publish the country breakdown of its trade.

## B. FOREIGN AID

In the immediate postwar period UNRRA (chiefly by provision of the United States) and Yugoslavia supplied Albania's import requirements; the termination of United States aid in 1947 and of all UNRRA deliveries in early 1948 was soon followed by the rupture of Yugoslav economic relations in July 1948. UNRRA assistance totalled \$26.3 mn, of which the United States supplied \$20.4 mn. Yugoslav economic aid of 1,650 mn dinars (\$33 mn) had been delivered between 1945 and June 1948. <sup>6</sup> The lack of diplomatic relations with the United Kingdom after 1945 over the Albanian refusal to pay the compensation determined by the International Court of the Hague (for mining two Royal Navy destroyers in the Corfu Channel), the U.K. retention of the Albanian gold reserve, and the refusal of the United States to follow up its wartime military mission with diplomatic representation largely closed access to the West. The USSR rapidly stepped in (as the West was doing for Yugoslavia when it suffered an East European embargo) and, as Table 6 shows, furnished a large volume of supplies against much smaller counter-deliveries. During the 1956-60 Plan it made a very large provision of capital goods for industrial and mining installations and for farm mechanization. Albanian exports to the USSR fell far short of imports thence, as the following figures show in millions of new valuta leks (converting the contemporary data into post 1965 currency units):

Year:	Exports	Imports	Excess of imports
1945.....		5.9	5.9
1950.....	20.3	41.0	20.7
1951-55.....	141.9	423.5	281.6
1956-58.....	186.1	436.9	250.8
1959.....	76.3	240.1	163.8
1960.....	121.0	228.3	107.3
1961.....	105.4	112.4	7.0
1962.....		.1	.1

<sup>5</sup> Except for inclusion of two statistics in a table in the *Survey for 1971* (Part II, Table 2.1) and paragraphs in the *Survey for 1970* (Part II, p. 140) and *Survey for 1976* (p.152).

<sup>6</sup> S. Skendi (ed), *Albania*, New York, 1956, pp.230-1. The only Albanian statistics of trade are that in 1945 21.6 mn leks were exported and 22.4 leks were imported (*Anuari statistikor*, 1969, p. 168).

The USSR ran a visible surplus with Albania of 282 mn leks in the First Five-year Plan and of 522 mn leks in the Second, but the run down as political relations deteriorated is evident from the above data: the trade deficit was a mere 7.0 mn lek in 1961. Overall, an excess of imports of 831 mn leks over exports to the USSR was shown for 1950-61. Until May 1961 the exchange rate was the equivalent of 1 new valuta lek to 0.80 old roubles or \$0.20; at that rate, the Soviet unrequited export to Albania cumulated to \$166 mn.

Between July 1947 and January 1961 the USSR concluded with Albania six credit agreements totalling 623 mn old roubles (\$156 mn). Technical and military assistance was on some estimates around 400 mn old roubles or \$100 mn. Albania was released from repayments of all its debts by the USSR in April 1957 and a further 300 mn credit was offered for the Third Five-year Plan. The offer was withdrawn and all trade with the USSR quickly ceased. During the four years of the Third Five-year Plan for which trade by country is available, the balance with China was as follows (in millions of new valuta leks).

Year	Exports	Imports	Excess of imports
1959.....	12.1	24.1	12.0
1960.....	10.4	34.9	24.5
1961.....	13.9	97.4	83.5
1962.....	58.5	210.7	152.2
1963.....	116.8	208.4	91.5
1964.....	119.6	308.6	189.0

In four years China supplied 533 mn new valuta leks more than it received from Albania, and, deducting the 7 mn deficit with the U.S.S.R. from the 735 mn leks total (Table 2), it must have provided up to 728 leks during the currency of the Third Plan. At a rate of 5 new valuta leks to the dollar for that period (see Table 13), some \$146 mn aid would have been given in 1961-65.

The cumulative import excess over exports in Table 2 was 1,229 mn new valuta leks (\$246 mn) in 1966-70 and 2,213 mn (\$492 mn) in 1971-75: that of 1961-65 (735 mn leks or \$147 mn) was 17.5 per cent of the 15-year deficit (4,177 mn or \$885 mn). The upper limit of an estimate made from the Chinese side of aid is \$420 to \$800 mn to the end of 1975.<sup>7</sup> In the discussion of the direction of trade below, an import excess of \$485 mn is shown for 1971-75 (Table 12), such that the quinquennial provision of unrequited exports by China could be set out in Table 5.

Table V-3 brings together the estimates of aid granted to Albania in the thirty years since World War II. Deflators for the period to 1970 are shown in Table 1 drawn, as already noted from Yugoslav experience of world price movements; those for 1971-75 are in Table 4. In 1970 prices as shown by Yugoslav trends, aid given in the 1971-75 Plan was 45 percent larger than under the preceding Plan, which in turn was 21 percent greater than in the Third Plan, the first for which Chinese aid was afforded.

At current prices Chinese aid during 1971-75 of \$485 mn would have been 39 percent of the import bill and 24 percent of trade turn-

<sup>7</sup> A. F. Cooper, *China's Foreign Aid, 1976*, Table 2-2.

over. A recent study published after scrutiny by the Faculty of Politics and Law of Tirana University by a fervent supporter of the PLA has claimed that Chinese aid has never exceeded 10 percent of turnover:<sup>8</sup> such a ratio could be possible at domestic prices, with Chinese equipment relatively cheap in comparison with other Albanian tradeables, but it seems indefensible at world prices.

### C. THE DIRECTION OF TRADE

Albania has always traded most with the donors of economic assistance. While this pattern is not untypical of the relations prevailing between developing and developed countries, the fundamental framework has always been political. Before World War II, the dominant trading partner was Italy, which supplied 43 percent of Albanian imports in 1938 and provided the biggest export surplus to Albania (covering 30 percent of its total deficit). The relationship became still closer during the Italian occupation (1939-43). Liberation in concert with Yugoslav partisans naturally led to intimate economic ties with postwar Yugoslavia. As has just been noted, Yugoslavia furnished assistance until 1948: in 1945 it monopsonised Albanian exports although furnishing only 28 percent of its imports. The shift to Soviet and Comecon aid after 1948 greatly raised the share of that group, as the following Comecon percentages of total Albanian trade show:

	Imports	Exports
Year:

1960.....	86	92
1963.....	32	39
1964.....	28	47

The contrast between the overwhelming trading links with Comecon in the fifties with their diminution after the turn of the decade reflects the termination of Comecon aid and the total break in Albano-Soviet commercial and diplomatic relations. The other members of Comecon did not, however, cease to trade, as Table 6 shows from Albanian statistics.

When silence enveloped the Albanian trade returns in 1964, China was supplying 63 per cent of Albanian imports and buying 40 per cent of its exports. The second largest partner among Comecon members was Czechoslovakia (10 per cent of imports and 19 per cent of exports). From the date onwards, apart from the series from a GDR source in Table 1A<sup>9</sup>, the precise relationship of which to Albanian data is uncertain, reliance must be made upon partner data. Among the latter, China makes no returns, although Western estimates are available on the direction of Chinese trade.

China has certainly been furnishing at least half of Albanian imports since 1962, when the share leapt to 65 per cent from 27 per cent in 1971.<sup>10</sup> A Soviet reference book wrote of a Chinese share in Albanian turnover 'in excess of 50 per cent' in 1968<sup>11</sup> and the result of deducting

<sup>8</sup> W. Ash, *Pickaxe and Rifle, the Story of the Albanian People*, London, 1976.

<sup>9</sup> *Statistisches Jahrbuch der DDR, 1972*, p. 2A.

<sup>10</sup> *Vjetari statistikor, 1968*, p. 315.

<sup>11</sup> *Ezhegodnik BSE, 1969*, p. 195.

partner data from rough estimates of total Albanian trade (as shown in Table 12) puts China at 53 per cent of imports, 23 per cent of exports and 42 per cent of turnover over the five years 1971-75. As the Appendix shows, the estimates of Chinese assistance in the fifteen years 1961-75 (Table 5) and of Sino-Albanian trade in 1971-75 (Table 12) are compatible with estimates made for China. A report on the latter puts Sino-Albanian turnover at 'an annual average of \$125 mn in recent years',<sup>12</sup> but a hazardous estimate puts 1974 turnover at \$220 mn and 1975 at \$170mn (in round figures). As the Appendix indicates, it could be concluded that Albania made heavy purchases from China on credit in 1974, but cut back its buying sharply in 1975, while making an increase in its exports, possibly to the point at which it repaid a small amount of its previous credits. Because China reduced its trade with socialist partners in 1975, that conclusion does not conflict with facts from the Chinese side. That reduction was part of a Chinese policy which kept its turnover with all partners at around \$14 bn in both 1974 and 1975 at a time of rising prices while cutting its deficit with market economies from \$1.3 bn in 1974 to \$700 mn in 1975.<sup>13</sup> If in 1975 trade with China was reduced from the peak reached the previous year, a similar pattern may be found in Albanian trade with market economies, as the following quarterly returns of partners' trade demonstrate (in millions of dollars):<sup>14</sup>

The dismissal of the three ministers on charge of economic affairs in October 1975 (the Chairman of the Planning Commission, the Minister of Industry and Mining and the Minister of Trade), offers a political context for the sudden halving of imports from the second to the third quarter of that year and the continuing low rate of imports from market economies during 1976. The \$9 mn imported in the first quarter of 1976 was the equivalent of two-thirds of Albanian imports in the first quarter of 1973 if the Yugoslav price index shown in Table 4

<sup>12</sup> Nai-Ruenn Chen, 'China's Foreign Trade, 1950-74', in US Congress, Joint Economic Committee *China: a Reassessment of the Economy*, Washington, D.C., 1975, p. 629.

<sup>13</sup> *Ibid.*, p. 645 and *Financial Times* (London) supplement, 'Trade with China', December 3, 1976, p. 35.

<sup>14</sup> IMF data fund.

is applied. Clearly political changes in both Peking and in Tirana induced a reduction Albanian commerce in 1975.

Yugoslavia is included among the market economies in the quarterly data cited above and participated in Albania's buying spree in 1974. First quarter exports from Yugoslavia to Albania were \$3.2 mn and rose in the next two quarters by \$5.9 and \$7.2 mn. After deliveries of \$3.4 mn in the last quarter of 1974, sales in 1975 ran at \$6.3 and \$4.4 mn in the first two quarters, but collapsed to \$1.9 and \$2.3 mn in the last two. The first two quarters of 1976 were \$1.1 and \$2.0 mn respectively. The trend had been upward since the signature of the first long-term trade agreement covering 1971-75 and envisaging sales in both directions of \$114 mn.<sup>15</sup> The target was all but reached with Yugoslav exports at \$52.4 mn and Albanian counterdeliveries at \$60.0 mn (Table 7).

The other socialist partners listed in Table 7 and 8 are the European members of Comecon, which have continued to trade with Albania even though no commercial relations have existed with the USSR since 1963. During the 1971-75 Plan period Albania probably reduced its imports from that group in real terms: applying the Yugoslav price index (Table 4) to the current values in Table 8, Albanian imports from the six countries fell from \$55 mn in 1971 to \$38 mn in 1974 and \$36 in 1975 in the prices of 1970 although current values rose from \$57 mn to \$73 mn. As Table 12 shows those imports are tentatively estimated at 27 percent of Albanian imports of those five years but it also exhibits a favourable balance in Albania's favour, since cumulative exports were \$366 mn.

The country balances are set out, from partner data in national currencies, in detail in Table 7. Bulgaria, Czechoslovakia, Hungary and Poland consistently bought more from Albania than they sold and Romania only converted its deficit into a surplus with its change of foreign-trade policy announced in February 1974. The latter was to purchase more in Comecon currencies (in which Romania stood in credit) in substitution of those for convertible currencies (in which it was in serious deficit). The GDR steadily ran a surplus with Albania and, as its Statistical Administration does not publish a commodity breakdown with Albania, the precise nature of its trade cannot be stated. Albanian earnings in other Comecon currencies (mostly from sales of consumers' goods, for Albanian cigarettes and brandy are in most East European grocers) are probably offset against purchases of equipment bought in Valuta-Marks, and the cost of shipping that machinery across to Adriatic or Black Sea ports for shipment to Durrës or Vlorë possibly absorbs the remainder. It is unlikely that Albania accumulates Comecon currencies in the way that it has built up a credit position in Western banks.

Albania was a net creditor in the sum of \$48 mn by December 1974 in the banks of the Group of Ten and Switzerland but reduced it during its burst of buying that year and for part of 1976. By March 1976 it was in a net credit of \$31 mn. As Table 9 shows, Albania raised its purchases in industrial countries from a fairly stable level in the second half of the sixties; the mean for 1964-70 had been

<sup>15</sup> R. Marmullaku, *Albania and the Albanians*, London, 1975, pp. 104-5. Marmullaku, a Kosovar occupying a senior Party post in Yugoslavia, estimates total Albanian trade at his time of writing between \$230 and \$300 mn, of which half with China (p.114). The estimate of Table 12 is an average of just on \$400 mn for 1971-75 and rather more if the GDR series of Table 1A is accepted.

\$17 mn, against \$6 mn in 1960, 1962 and 1963, emergency imports to offset the stoppage of Soviet supplies in 1961 having been \$12 mn. Commercial credits, particularly from Italy, enabled it to lag the rise in counterdeliveries, the average annual deficit with those countries running at something like half the value of imports in 1970-73. It stepped up export sales in 1974-5 and thereby reduced the proportion of imports uncovered by exports to one-quarter in 1975. Italy has been Albania's major supplier among market economies since the War, although the doubling of sales in 1971-75 (\$8.4 mn to \$16.6 mn) has probably only kept up with inflation. The termination in 1971 of the formal state of war with Greece (Italian forces occupying a puppet-governed Albania having attacked Greece in 1940), brought trade from zero in the sixties to an average of \$2.5 mn in 1971-75 (\$4.78 mn at its 1974 peak). The absence of diplomatic relations with the United Kingdom and the United States virtually excluded trade with those countries. The United States linked Albania with China in its embargo until the relaxation of 1974, when, and in 1975, the United States sold about \$1 mn to Albania. United Kingdom sales have also risen to above the \$1 mn mark in 1974-5.

At levels such as these, Albania contributes very little to East-West trade. As Table 10 shows, Western Europe's exports to Albania in the second half of the sixties were only 0.3 per cent of East-West European exchanges and imports from Albania were just half that share (0.15 per cent). The disparity even on that modest scale nevertheless built up a trade deficit which a recent study has compiled net of shipment costs. Table 11 indicates that over 1965-70 Albania ran a deficit averaging \$7.7 mn annually. Uncorrected deficit data for subsequent years show the following pattern with the European Economic Community (in millions of dollars):<sup>16</sup>

	1971	1972	1973	1974	1975
EEC exports to Albania (c.i.f.) .....	15	16	17	37	43
EEC imports from Albania (f.o.b.) .....	10	10	13	28	26
EEC surplus with Albania .....	5	6	4	9	17

Albania conducts very few exchanges with less-developed countries (LDCs). Exports from the Arab Republic of Egypt were extraordinarily \$3 mn in 1970 but in other years have not touched \$0.5 mn, and those to Libya have been growing, touching \$1 mn in 1974; there were \$0.6 mn exports to Zambia in 1970. Imports from those countries have been much smaller (a peak of \$1.6 mn from Egypt in 1970 is the only significant sum) but imports from Morocco jumped from \$0.7 mn in 1971-3 to \$3.6 mn in 1974 and \$5.7 mn in 1975.

In sum, the last official statement on the direction of Albanian trade from the Polish Central Statistical Office is for 1964 when 93.4 per cent of turnover was with socialist countries. A statistical compendium compiled by the Soviet Institute of the Socialist World Economy (published by the USSR Central Statistical Administration) put the 1965 share at 93.6 per cent.<sup>17</sup> The estimates made for 1971-75 in

<sup>16</sup> IMF data fund.

<sup>17</sup> *Ekonomika stran sotsializma*, Moscow, 1969, p. 147.

Table 12, transferring Yugoslav turnover of \$112 mn to the socialist group, put that latter at 83 per cent. Albanian trade has diversified to that extent, but remains overwhelmingly linked with countries ruled by Communist Parties.

#### D. COMPOSITION OF TRADE

The most detailed data, by five commodity groups for exports and six for imports, probably related to 1968 (Table 14) but a longer series with only three commodity groups is available for exports to 1973 (Table 5). Apart from processing rather more of its farm produce, its export structure is little changed since 1950. Indeed it exported proportionately less products of mining and manufacturing of industrial origin in 1973 than it did in 1950. It is possible that the sale of primary products against equipment (said to have been the policy of Teng prior to his disgrace in the last year of Mao's life) was a count in the indictment of October 1975 against the three economics ministers (Abdyl Kellëzi, Chairman of the State Planning Commission, Koço Theodhosi, Minister of Industry and Mining, and Kiço Ngjela, Minister of Trade). The dismissals were not reported in the Albanian Press at the time, but reports reaching diplomatic missions in Belgrade suggested that the issue was deep-seated in that up to a quarter of the Albanian administration may have been affected.<sup>18</sup> It is speculation that the issue was the degree of trade dependency or the sort of exports that should be promoted. After a decade of the "regime of economy", a more pronounced opening up of trade might have had its defenders. The check to the outburst of importing was coincident with a deterioration in Albania's terms of trade. The only order of magnitude indicated is that it was—

such as to cost our economy tens of millions of leks, because the negative difference of prices [of imports as related to exports] is subsidized by the state.<sup>19</sup>

The vituperative denunciation of the dismissed economic ministers (though not of the Ministers Of Agriculture and of Education who were dismissed in 1976) suggests that major policy matters were involved. Some sign may be found in the new Constitution adopted after their dismissal which reads:

The granting of concessions to, and the creation of foreign economic and financial companies and other institutions or ones formed jointly with bourgeois and revisionist capitalist monopolies and states as well as obtaining credits from them are prohibited in the People's Socialist Republic of Albania.

No government in the world has ever asked its legislature constitutionally to disbar it from raising an external loan. But Albania, after a decade of encouraging self-reliance, has converted exhortation and policy into its fundamental law.

<sup>1</sup> Repriced at 1958 prices.

Note: The series for 1965-70 in parentheses are from table IA upon the inconsistency of which with Albanian statements the source thereto comments. They are not used for tables 2, 3, 5, or 12.

Source: "Statistical Yearbooks" for the years to 1964. In 1965 a currency reform substituted 1 new lek for 10 old lek, affecting the valuta lek equally (as may be demonstrated from the imports of pharmaceuticals in 1964, which were 35,119,000 leks in "Vjetari statistikor, 1965," p. 341 but 3,512,000 leks in that for 1966, p. 109). The prolongation of the series was by published percentage changes on the data given in old leks (decimated to new leks). 1968 exports were 55 percent and turnover was 47 percent above 1960 (V. Kati in, "Konferenca Kombëtare e studimeve shqiptarë, 1969," Tirana, 1970, pp. 171-2), whence imports in 1968 also. 1969 exports were 7 percent above 1968 ("Ezhgodnik BSE," 1970, Moscow, 1970, p. 202). 1968 exports were 10 percent above 1967 ("Economic Survey of Europe in 1968," p. 176); the corresponding annual increments in 1965 and 1966 were each 5 percent, while imports rose 9.8 percent in 1965 ("Survey for 1966," ch. III, p. 3). 1969 imports were 7.1 times those of 1938 and exports were 11.7 times 1938; exports covered 55 percent of imports in that year ("Statistike ekonomike," Tirana, 1971, pp. 384-5). 1970 exports were 14 percent above 1969 (M. Shehu, "Report to the Sixth Party Congress," Tirana, 1971). The cumulative total 1966-70 so compiled, 1,894 mn leks, is 42 percent above that for 1961-65, which the latter source had stated to be nearly 45 percent above. If nearly 45 was 44 percent (as the "Survey for 1970," pt. II, p. 140 assumes), 1966-70 cumulative exports were 1,918 mn leks. Turnover for that period rose 49 percent (Shehu, op. cit.) implying 5,065 mn leks, and, by difference, cumulative imports of 3,147 mn leks. A later figure for 1968 exports (61.2 percent above 1963) which implied 387.5 mn leks in that year (from A. Hoxhi, "Finansat dhe kreditet në shërbim të revolucionit socialiste në RPSH," Tirana, 1973, p. 210) was used to revise the 1968 estimate, so that it came in line with the aggregate 1966-70 and the statement reproduced in the "Survey for 1968," loc. cit., that exports in that year were 67 percent of imports. To the 1970 derived exports of 453 mn were added the 12 mn leks to make the cumulative total for 1966-70 agree with Shehu's statement. Imports 1966 and 1967 were interpolated and 1970 derived by difference from the cumulative quinquennial total. Indexes of exports and index prices are for Yugoslavia from "Statisticki godišnjak Jugoslavije, 1958," tables 2-177 and 178; 1960, tables 2-226 and 227; 1970, tables 113-3 and 4 and 1975, tables 114-3 and 4. They are not available for years preceding 1948, first appearing in the Yearbook, 1957.<sup>1</sup>

TABLE 1A.—GERMAN DEMOCRATIC REPUBLIC STATISTICS ON ALBANIAN FOREIGN TRADE

1972	180.0	217.1	100.0	120.6	-96.5

Source: Statistisches Jahrbuch der DDR, 1972, p. 24\*. 1974, p. 24\*: 1965-67 data also cited in Rozwój gospodarki krajowej RWP 1950-68, Warsaw, 1969, p. 113. Both are publications of the National Statistical Office. The series is, however, largely inconsistent with the relationships cited in Albanian sources as the following comparisons with those reproduced in the sources to table 1 in the order of statement in the latter. It is possible that Albanian statements which show ratios below those of the GDR series are volume data, whereas the latter are explicitly at current values and that in the one case where the ratio is above the GDR series a price decline took place. Until these issues could be clarified, it was preferred to use the series as derived in table 1. Statements in a publication of the U.S.S.R. Statistical Administration vary the totals put out by the GDR Statistical Office: *Ekonomika stran sotsializma*, 1969, p. 144, put 1965 imports at 97, exports at 57; 1966 imports at 106.2 and exports at 65.7.

	Albanian statement	Derived from GDR series
Exports: 1968/1960	1.55	1.798
Turnover: 1968/1960	1.47	1.753

TABLE 2.—QUINQUENNIAL TRADE VALUES IN ALBANIA

[In billions of new valuta leks at current prices]

	Exports		Imports		Turnover	
	5 yr	Annual	5 yr	Annual	5 yr	Annual
1961-65	1,332	266	2,067	412	3,399	679
1966-70 plan	1,812	363	2,646	529	4,458	892
1966-70	1,918	384	3,147	629	5,065	1,013
1971-75 plan	3,203	640	6,218	1,244	9,421	1,884
1971-75	3,357	671	5,570	1,114	8,927	1,785
1976-80 plan	4,196	839				

Source: Shehu, Report to the Seventh Party Congress, quoted the 1971-75 quinquennial increase in exports to be 75 percent over 1966-70 and the plan for 1976-80 to be 24 to 26 percent (here taken as 25 percent) over 1971-75. Repeating this ratio, Rruga e Partisë, No. 8, 1976, p. 12, added that imports had risen 77 percent over the same period. The 1966-70 plan was for an increase for the quinquennium over 1961-65' of 31 percent for turnover, 36 percent for exports and 28 percent for imports (v. Kati, in Konferenca kombëtare e studimeve shqitorë, 1969, Tirana, 1970, p. 172). The 1971-75 plan was to be for a turnover 86 percent and 67 percent for exports above 1966-70 (Q. Shehu, staff of Ministry of Trade, Albania Today, No. 6, 1972, p.44).

TABLE 3.—*Rough estimates of aid to Albania*

[Millions of U.S. dollars at current prices]

## APPENDIX

## CALCULATION OF ALBANIAN SHARE IN ESTIMATES OF CHINESE TRADE

In the Compendium of Papers submitted to the Joint Economic Committee of the U.S. Congress in 1975, *China: a Reassessment of the Economy* Nai-Ruenn Chen, "China's Foreign Trade, 1950-74" (pp. 617-52) made the following estimates of Chinese trade with Albania, Cuba and Yugoslavia (a group he defined as "other socialist countries"), in millions of dollars.

	Chinese imports	Chinese exports		Chinese imports	Chinese exports
Year:			Year:		
1956.....	5	10	1966.....	110	160
1957.....	5	10	1967.....	100	140
1958.....	5	0	1968.....	85	145
1959.....	0	5	1969.....	95	170
1960.....	40	15	1970.....	100	170
1961.....	95	110	1971.....	95	165
1962.....	100	125	1972.....	70	195
1963.....	95	125	1973.....	145	200
1964.....	105	160	1974.....	320	305
1965.....	125	200			

His practice of rounding to the nearest \$5 mn obscures the detail of the earlier years, but the aggregate of his trade balances given an order of magnitude for confrontation with Table 5 (in millions of dollars at current prices)

	Chen	Kaser
Fiscal year:		
1961-65.....	200	146
1966-70.....	295	207
1971-75.....	1,235	485

1 1971-74.

The excess of Chen's magnitudes over those of the present writer in 1961-70 could be due to assistance to Cuba in the period when Sino-Cuban relations were politically close and the deficiency in 1971-74 to commercial credits by Yugoslavia and a possible repayment of previous credits by Cuba.

Albania can be identified for 1974 and 1975, a particularly crucial period, in Chen's and later estimates of Chinese trade by elimination of other partners. He furnishes estimates of trade with all socialist countries, separating the USSR, six countries of Eastern Europe and the Asian socialist countries. 1974 totals were given as 'provisional', and *Current Scene*, September 1976 (here reproduced from *Financial Times*, December 3, 1976), offers final estimates for 1974 and estimates for 1975. The relevant totals are as follows (millions of dollars):

	Chinese exports to all Socialist countries	Chinese imports from all Socialist countries
Chen:		
1973.....	995	705
1974 <sup>1</sup> .....	1,370	930
C.S.:		
1974.....	1,430	970
1975.....	1,360	1,010

<sup>1</sup> Provisional.

*Current Scene* estimates Chinese trade with socialist partners other than the USSR and the six East European states as below. Chen shows 1974 trade with the Asian socialist partners; 1975 trade with them is estimated pro rata to the change in all Chinese trade with socialist partners (a 5 per cent reduction in Chinese exports and a 4 per cent rise in imports). Cuban trade with socialist countries other than Comecon members was \$185 mn each way in 1974 and \$127 mn exports and \$129 mn imports in 1975 (Comecon Secretariat, *Statistichesky Ezhegodnik, 1975*, p. 325 and *1976*, p. 341 respectively). Three-quarters was assumed to be with China. The balance interpreted as Chinese trade with Albania (in millions of dollars) was as shown below:

	1974		1975	
	Exports	Imports	Exports	Imports
Mongolia, North Korea, and North Vietnam.....	580	155	550	160
Cuba.....	139	139	95	97
Albania (by difference).....	147	72	72	96
<b>Total</b> .....	<b>866</b>	<b>366</b>	<b>717</b>	<b>353</b>

The hazardous estimate of 1975 Chinese trade with the Asian socialist countries renders equally uncertain the residual as derived for Albania, but the evidence is that unless the pattern of trade with the Asian partners altered sharply in 1975, Albania received only half as much imports from China as in 1974 and actually repaid some debts, by selling about one-third more to China than in 1974. The calculation should not be affected by transport charges, since the Chinese estimates are fob for exports and cif for imports, such that the standard East European practice of fob buyer and seller is reflected without adjustment.

## BILATERAL BUSINESS COUNCILS WITH EAST EUROPEAN COUNTRIES

BY EDWARD T. WILSON AND DONALD J. HASFURTHER OF THE  
U.S. CHAMBER OF COMMERCE

Well before the issue of East-West trade became topical in the United States, the Chamber of Commerce of the United States had begun studying the opportunities for trade with the Soviet Union and Eastern Europe and the role the Chamber might play in helping the U.S. business community take advantage of the considerable potential for trade with this part of the world. The uniqueness of the Eastern European trading system, together with the widely held perception in the U.S. that progress in the commercial field must necessarily await progress on political issues, had inhibited a great number of U.S. firms from even considering the opportunities the Eastern European market had to offer. With the exception of a few experienced East-West traders in the United States, these opportunities were going to enterprising firms in Western Europe.

As some of the rigidities in the U.S. relationship with Eastern Europe began to disappear in the 1960's, U.S. business interest in Eastern European markets developed apace. Following an opinion survey which indicated overwhelming support for expanding trade with Eastern Europe among Chamber membership, the Chamber of Commerce decided to embark on efforts to stimulate discussion within the U.S. business community on East-West trade issues. In this context, the Chamber became the first organization of national prominence to come out unequivocally in favor of nondiscriminatory tariff and credit status for the Eastern European nations.

Despite the lack of this status for all of the countries except Poland and Yugoslavia, Eastern Europe as a region had become by the early 1970's the most rapidly expanding market in the world, not only for U.S. agricultural commodities, but also for capital goods. Eastern Europe was also developing into a significant source of needed raw materials and industrial products and, during the energy shortage of the winter of 1973-74, it served as a valuable supplemental and non-OPEC source of energy for the United States.

With this increase of economic activity came a corresponding increase of trade-related problems. The Eastern European market presented American companies with a vast array of unaccustomed trade obstacles. The very fact that market criteria play a limited role in the decision-making process in the economies of Eastern Europe meant that economic data required for market research in the Western sense was generally lacking. Similarly, the lack of information indicating a clear delineation in foreign trade responsibilities for personnel in foreign trade-related enterprises often led to long and unnecessary delays in commercial transactions; sometimes even listings of those individuals with authority to conclude contracts were lacking.

Limitations on access to end-users in Eastern Europe presented additional obstacles to close commercial cooperation. Many of the problems arose simply from unfamiliarity on the part of U.S. business representatives with the nuances of doing business in Eastern Europe, and conversely from Eastern European unfamiliarity with the U.S. market.

After studying these problems, the Chamber of Commerce concluded it was necessary to spend a greater deal of time and energy in promoting a favorable climate for U.S. commercial transactions with Eastern Europe. What was needed was some private sector vehicle to assist the American business community in identifying problem areas and suggesting solutions and to improve the prospects for trade and industrial cooperation. The idea of establishing with the countries of Eastern Europe joint economic councils in order to facilitate more direct contacts between commercial leaders on both sides appeared to lend itself to this need. Such private groups, composed of business leaders in the U.S. and key commercial leaders of Eastern Europe, could provide regular and recognized channels of dialogue—channels which had too often been lacking.

The concept of joint economic councils soon received the endorsement of the United States Government and the governments in Eastern Europe. The next step for the Chamber of Commerce was to contact its counterparts in Eastern Europe in order to further develop this concept and to agree to the creation of bilateral relationships which would provide for the establishment of these councils. The first council to be formed was the Romanian-U.S. Economic Council. The agreement for its establishment was formally signed in December, 1973, in the presence of the President of Romania, Nicolae Ceausescu, a number of ranking Administration officials, business leaders, and the press.

An examination of this agreement reveals some of the means the two chambers of commerce envisaged to achieve their goal of stimulating broader two-way flows of trade and industrial cooperation. As enumerated in the text, these included:

- The publication and regular exchange of economic and commercial information, including commercial catalogues, brochures and other materials for distribution to interested enterprises.

- The organization of round-table and other types of seminars between businessmen and technical experts of the two countries.

- Advising commercial enterprises desiring to establish joint ventures in both countries as well as in third markets.

- Advice and assistance to enterprises interested in opening commercial offices in both countries.

- Promotion of participation in fairs and exhibitions organized in both countries.

Following the signing ceremony, a founders meeting for the U.S. section was held in Washington which elected a six-man Executive Committee, chaired by Gabriel Hauge, Chairman of the Manufacturers Hanover Trust Company of New York. The twenty-five U.S. firms and two trade associations selected to become charter members of the Council were chosen primarily on the basis of their actual or potential involvement in Romania. This involved consultation with knowledgeable Romanian authorities and a conscious effort by the

U.S. section to see that a broad range of commercial sectors was represented. It also involved special attention to geographic representation and to the wish to secure participation by firms of all sizes, not just the largest.

The first plenary meeting of the Council was held in Bucharest in May, 1974. Forty-four executives attended, including many chief executive officers, making it the highest ranking U.S. corporate group ever to visit Romania at one time. During the course of the proceedings, the two sections agreed to consider the exchange of commercial traineeships and the establishment of a commission of experts to facilitate the prearbitral resolution of commercial disputes. The Romanian section also agreed to supply detailed data in order to clarify for the U.S. section certain provisions of the Romanian joint venture legislation. The original U.S. text on the subject, prepared by Mr. Jay Burgess, was subsequently issued as a special publication of the Council: *Romanian-U.S. Joint Ventures: Background for Implementation*. A protocol was also issued at the Council's first joint session condemning artificial restraints to trade and calling for greater cooperative efforts to simplify commercial procedures and practices. The plenum ended on a high note for the U.S. attendees with an invitation from President Ceausescu to meet with him at the presidential palace. This meeting, which lasted over an hour, elicited some useful substantive discussions and demonstrated the continuing interest which the Romanian chief of state had shown in the work of the Council.

With the successful establishment of the Romanian-U.S. Economic Council came increased interest on the part of other Eastern European Chambers of Commerce and governments in forming similar councils for their countries. In September, 1974, Ivan Popov, Deputy Prime Minister and the highest ranking official of the People's Republic of Bulgaria ever to visit Washington, participated in the ceremonies establishing the Bulgarian-U.S. Economic Council. The level of the delegation, as in the case of the Ceausescu visit of the year before, did much to enhance the interest of the U.S. business community in the Council and to escalate the level of corporative commitments in the United States.

The following month, during a visit of First Secretary Edward Gierek of Poland, a third council, the Polish-U.S. Economic Council was formed. Once again, this level of commitment on behalf of an Eastern European government proved invaluable to the success of the Council. This commitment was renewed a year later in September, 1975, during a visit of the U.S. section to Warsaw. First Secretary Gierek was again on hand to greet the delegation and offer his encouragement to the work of the Council.

Joint councils were established with the Hungarians in March, 1975, and with the Czechoslovaks in October, 1975. As in the case of the Romanian-U.S. Economic Council, conscious efforts were undertaken to achieve the broadest possible U.S. participation in terms of industry, size and geographical distribution. Initial recruitment efforts followed a sectoral approach, with an early identification of ten to twenty industrial branches of high priority to the joint trading relationships with each country. Efforts were then undertaken to find several American firms in each of these sectors

which would be willing to commit a top corporate official, preferably one with recognized personal experience in dealing with officials of the country involved. In the interest of establishing direct bilateral contracts, membership efforts were concentrated on U.S.-based executives and firms not involved or third party representation.

The establishment of the five joint councils helped to intensify commercial dialogue between the U.S. business community and the East. Concerted efforts were made to deal with many of the problems acting as barriers to a further expansion of East-West trade and cooperation. American members have urged East European governments to improve the process by which they made available pertinent and timely commercial information. Also the joint council sessions have regularly provided for new clarifications of Eastern European legislation affecting trade and cooperation: for example, the conditions and criteria for establishing Western offices in Eastern European capitals. Similarly, the council sessions have served as fora for explanations of U.S. trade regulations, most importantly those in the area of unfair trade practices, such as antidumping and countervailing duty regulations.

In addition to striving for freer exchanges of commercial information, the joint councils have made concerted efforts in the area of dispute settlement. As an outgrowth of the expansion of commercial contracts between East and West, an increasing number of disputes has arisen over such contract provisions as force majeure, performance guarantees, and compliance procedures. The firms involved in such disputes are often anxious to avoid the time-consuming route of formal arbitral or other legal proceedings. Council members felt a single nonbinding mechanism which could expedite cases rapidly and impartially would be useful, especially if it enjoyed the confidence of business representatives in both countries and the prestige conferred by council sponsorship.

Working with the American Arbitration Association and David Morse, an attorney and former Secretary General of the International Labor Organization, the Council staff developed such a procedure. It consisted of a Conciliation Commission, composed of six members, three American and three Eastern European, appointed for a period of three years by the plenary session of a council. For each dispute a Conciliation Panel is to be established consisting of one conciliator chosen by each party to the dispute from among the members of the Conciliation Commission. After having examined the case, the Panel is mandated to propose a solution to the dispute. To date, numerous Romanian-U.S. commercial contracts contain clauses providing for use of the conciliation procedure adopted by the Romanian-U.S. Economic Council and the U.S.-Romanian Long-Term Agreement on Economic, Industrial and Technical Cooperation refers specifically to this option. Conciliation procedures are also presently under consideration in several of the other joint councils.

The U.S. Chamber-sponsored councils have also undertaken projects to develop lists of common commercial terminology. National sections on both sides have submitted draft lists of terms commonly used in international sales contracts for the purpose of developing a uniform list of such terms. Such lists have already been used to avoid misunderstandings and expedite negotiations.

In connection with the goal of encouraging the broadest possible participation in East-West trade, the councils have sponsored several workshops on doing business with Eastern Europe. The first of these, in May, 1976, offered 83 American firms, many of them small and new-to-market, the opportunity for candid discussions with a number of the most experienced U.S. East-West traders on "Doing Business with Poland." In addition to these executives, the list of speakers included members of the high-level Polish delegation attending the second Polish-U.S. Economic Council joint session as well as U.S. officials responsible in East-West trade. The moderator was Mitchell Kobelinski, Administrator of the U.S. Small Business Administration. The workshop discussions sought to identify the common problems faced by U.S. negotiators in finalizing sales contracts with Polish enterprises as well as those encountered by Polish foreign trade organizations in penetrating the U.S. market.

This workshop was followed by another in December, 1976, co-sponsored by the East-West Trade Council and the Romanian-U.S. Economic Council on U.S.-Romanian trade. Once again the workshop contributed to a remarkably open dialogue on problems arising in trade and cooperation between U.S. and Romanian enterprises. More of these undertakings are expected both in the United States and in Eastern Europe, and they should contribute to wider understanding of the practical, "nuts and bolts" issues involved in East-West commercial cooperation.

Another of the achievements of the joint councils has been their contribution to the two-way flow of people between the United States and Eastern Europe. Hundreds of visits by U.S. business representatives, which might otherwise have been postponed or not taken place at all, can be ascribed to the initiatives of these councils. By the same token, many high-level Eastern European government decisions to send delegations to this country have been based in good measure on the incentive provided by council meetings and related special events. In addition to the doing business workshops, the latter have included speaking engagements and special receptions hosted by council members in various cities of the United States.

In the area of commercial policy formulation, the councils have provided a logical complement to efforts to reach satisfactory resolution of the many complex issues facing government negotiators. Not only have joint council sessions provided useful opportunities for officials on both sides to clarify existing policies and to announce new ones, but also between sessions there has been an almost continuous interface between council members and staff, and the various responsible government agencies. U.S. section members, for example, have benefited from regular briefings by Administration country experts, both in Washington and at U.S. diplomatic posts in Eastern Europe. Upon their return from joint sessions abroad, the U.S. section members have in turn debriefed Administration officials—as members of the Executive Committee of the U.S. section of the Romanian-U.S. Economic Council did with Treasury Secretary Simon in June, 1976.

As a convenient collection point for sounding business community opinion, the views of U.S. council members have frequently been solicited by Administration officials contemplating new policy. For example, on the eve of negotiations on a treaty on the avoidance of

double taxation with Hungary, the U.S. section of the Hungarian-U.S. Economic Council was asked to conduct a referendum on the pros and cons of such an agreement.

With those Eastern European countries where joint economic commissions have been established on the governmental level—Poland and Romania—council reports have been delivered as a regular agenda item for commission meetings, and council members have been asked to assist in the implementation of jointly agreed measures.

This government-private sector interface on the U.S. side has by no means been limited to the Administration. As in the case of the Polish-U.S. Economic Council, members of Congress have been generous in meeting with visiting council delegations, both separately and collectively. Observers from Capitol Hill have been welcomed at council sessions, both in Washington and in Eastern Europe, and members of Congress like Dan Rostenkowski have addressed them.

U.S. sections of the councils have also been asked to testify before Congressional Committees—Senate Finance, House Ways and Means, the Helsinki Commission—and the results have been helpful to all concerned. The Romanian-U.S. Economic Council, for example, played an active rôle in the process leading to the Congressional approval and extension of the U.S.-Romanian Agreement on Trade, which provided for MFN status for Romanian goods entering the United States; the Czechoslovak-U.S. Economic Council was active in efforts to find a common ground between representatives of the Administration and the Congress looking toward a settlement of outstanding claims with Czechoslovakia.

These bilateral business councils are, however, but modest beginnings. There should be no illusions about the roles they can be expected to assume. They are essentially modest undertakings, limited in size and scope of activity. They will not become involved in putting together specific transactions; they are not intended to occupy central clearinghouse functions in the overall U.S. economic relationship with each Eastern European country. Nor can they be expected to replace the policy-making functions of the governments concerned.

The councils are, nevertheless, demonstrable evidence that American business, despite other pressures and conflicting world-wide commitments, is actively interested in maintaining the dialogue with Eastern Europe—that it wants to pursue not just specific deals but an improvement in the entire framework of commercial relations with economic systems radically different from our own.

## EAST-WEST FOREIGN TRADE BOARD

By MARJORY E. SEARING

The formation of the East-West Foreign Trade Board was a direct result of an amendment to the Trade Act of 1974 by Senator Long. The purpose of the amendment, as stated in the Congressional Record of December 12, 1974, "is to establish within the executive branch an interagency board to coordinate and oversee the orderly development of trade with nonmarket countries."

At the time of this amendment proposal there existed a strong Congressional interest in establishing a more formalized review process for U.S. trade relations with the Communist countries. While it was generally conceded that commercial and economic ties with the non-market economy countries could be of mutual benefit to all parties involved, to better protect U.S. national interests, both in terms of security considerations and commercial benefits, a greater degree of review was called for to ensure that trade would proceed in an orderly fashion. The then-recent experience with U.S. grain sales to the U.S.S.R. in 1972 can logically be seen as a motivating force in this thought process.

A mechanism to ensure the safeguarding of American business and consumer interests and to coordinate overall U.S. Government (U.S.G.) policy on East-West trade was felt to be required. At the time the idea of such a mechanism was proposed, responsibility for determining U.S. interests was scattered among the Commerce Department's Bureau of East-West Trade, the National Security Council, the Export-Import Bank, several Congressional committees, and the East-West Trade Policy Committee. The new mechanism was also to function as an assurance that American trade relations with the U.S.S.R., the countries of Eastern Europe, and the P.R.C. would be built upon a foundation of sound commercial principles and mutual benefit. As Senator Long stated in the Senate record, inherent in the American system of business is the primary guideline of making a profitable deal. Our system of free enterprise provides no imposition of duty to act in the national interest regardless of profit. What was envisioned, then, was a body which would determine the national interest, and in light of this definition would monitor trade, technology transfer, and the issuance of U.S.G. credits, guarantees, or insurance.

The product of these Congressional views was the establishment of the East-West Foreign Trade Board. In accordance with Section 411 of the Trade Act of 1974, President Ford established the Board by Executive Order 11846 on March 27, 1975. The organization of the Board follows the organization of its predecessor—the President's Committee on East-West Trade Policy.

President Ford designated former Treasury Secretary William E. Simon as Chairman of the Board; the Assistant to the President for Economic Affairs was named Vice Chairman. In March 1977, President Carter named Treasury Secretary Michael Blumenthal to replace

Secretary Simon as chairman. Other members are the Secretaries of State, Agriculture, Defense, Commerce, and Labor, the Special Representative for Trade Negotiations, the Director of the Office of Management and Budget, the Executive Director of the Council on International Economic Policy, the President of the Export-Import Bank, and the Assistant to the President for National Security Affairs.

Among its statutory functions, the East-West Foreign Trade Board is directed in the Trade Act to:

(1) Monitor trade between persons and agencies of the U.S.G. and nonmarket economy countries to insure that such trade will be in the national interest of the U.S.

(2) Receive reports on the nature and terms of transactions from (a) any person who exports technology to a nonmarket country which is vital to the U.S. national interest, and (b) any U.S.G. agency which provides credits, guarantees or insurance to a nonmarket country in excess of \$5 million during any calendar year.

(3) Submit to Congress quarterly reports on trade between the U.S. and nonmarket countries.

The Board has functioned as a policy formulating and coordinating body since its establishment. Its Working Group, consisting of representatives of the member agencies, usually meets twice monthly to coordinate the development and implementation of East-West trade policies and to refer issues to the Board for decision.

With respect to the Board's responsibility to monitor credits, guarantees, and insurance provided under government programs, the Working Group carries out its responsibilities through oral and written reports from Eximbank, the Commodity Credit Corporation, and the Overseas Private Investment Corporation. There is also coordination between the Working Group and the National Advisory Council. Data from these agencies are summarized in the Board's quarterly reports.

Control of exports of technology to nonmarket economy countries is maintained by the Commerce Department under the authority of the Export Administration Act. To fulfill the requirement that persons who export technology to nonmarket economy countries report to the Board, the Board decided to use the export control mechanism maintained by the Commerce Department. The Board decided to use Commerce's well-established administrative mechanism, rather than establish a new one, because it did not wish to create yet another bureaucracy to levy additional requirements on businessmen. In order to do this, the Board has interpreted Section 411(b) to require that licenses for export of technical data applied for and granted, be reported to the Board by the Commerce Department. In addition, the Board and Working Group have continued the practice of the predecessor Committee by reviewing export license cases of major policy significance.

During the brief period the Board has been in existence, it has dealt with numerous questions of significant import to the development of East-West trade. The most persistent and controversial of these has been the normalization of our commercial relations with the U.S.S.R., the nonmarket economy countries of Eastern Europe, and the P.R.C.

The Board has taken the position that the United States will not realize the full potential benefits of trade with these countries until the impediments to normalized trading relationships are removed.

Among other Board activities, the Board and its Working Group have closely monitored the purchases of grain by the Soviet Union and the negotiation of the U.S.-U.S.S.R. Long-term Grain Sales Agreement. The Board, at the request of the Board of Directors of the Eximbank, has also provided policy advice concerning proposed Eximbank financing of projects in the nonmarket economies.

The Agreement of Trade Relations between the United States and Romania, which entered into force on August 3, 1975, was another of the East-West trade issues which was carefully considered by the Board. The Board actively endorsed the Agreement, and strongly urged its approval.

Finally, the Board has undertaken a number of studies on important East-West trade policy issues, including current studies on the problems of dealing with the nonmarket economy countries and the role of compensation arrangements in East-West trade.

With Secretary of the Treasury Blumenthal as Chairman of the Economic Policy Group as well as the East-West Foreign Trade Board, East-West trade policy is assured the strength of a coordinated role in U.S. Government activities. In addition, the Secretary's membership in the National Security Council fulfills the Board's mandate to monitor trade to ensure that it is in the best national interests of the United States.

While the exact future role of the Board remains undefined, its potential for developing East-West trade to its point of maximum benefit and return for the American public is a considerable one.

## I. INTRODUCTION

This article discusses East European<sup>1</sup> hard currency indebtedness and the factors that led to the buildup of this debt. In view of the fact that insufficient data are available on current account items other than merchandise trade, the discussion will not deal with these balance of payments elements.

\*The author wishes to express her appreciation to Edwin Snell and Kathryn Melson for their assistance in compiling the estimates presented in this article.

<sup>1</sup> Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, and Romania.

## II. BACKGROUND

Heavy borrowing has pushed the hard currency debt of the East European countries up from \$5 billion at the end of 1970 to \$26 billion by yearend 1976. Although these countries had programmed large increases in capital goods imports to be financed largely with Western credits, indebtedness was not expected to reach such proportions. Soaring world commodity prices, the economic recession in the West, and extraordinary grain imports added greatly to the borrowing already planned by the East Europeans to help fuel economic growth.

With heavy debt burdens and continued uncertainties in their Western markets, the East Europeans are faced with difficult choices. In order to keep new borrowing down, they will have to carefully monitor imports from the West while attempting to maximize exports. Since economic growth depends to an important degree on imports of Western capital goods and industrial materials, cutbacks in import growth will impact negatively on the economic health of the East European countries. Maintaining a modicum of growth in consumer welfare will be necessary in order to minimize consumer discontent.

## III. THE DEBT BUILDS UP

### A. 1971-75

The East Europeans sharply boosted imports in 1971-75 to help modernize their economies with Western technology and equipment. They also required increasingly large imports of industrial materials from the West to compensate for a slowdown in the growth of imports from the U.S.S.R.

East European exports to the developed West failed to keep pace with imports throughout the period, growing 20 percent a year compared with 29 percent a year for imports (see Table 1).<sup>2</sup> The East European trade deficit doubled in 1973—mainly due to the nearly quadrupling of the Polish deficit—and again in 1974 as import prices for oil, chemicals, steel, cotton, grain, and soybean meal soared. In 1975 the Western recession caused East European exports to slump, boosting the deficit to a record \$6.8 billion in spite of efforts to cut back on import growth. Poland alone racked up a \$3 billion deficit. Romania, by cutting imports sharply, was the only country able to keep its deficit from rising in 1975.

<sup>2</sup> Trade with the developed West only is used throughout this paper. The data are from East European foreign trade statistics. See Appendix A for a discussion of the difficulties in calculating East European hard currency trade with the less developed countries.

<sup>2</sup> The data for East Germany are estimated.

<sup>3</sup> The data for Bulgaria, East Germany, and Romania are estimated. The data for the other countries are partially estimated.

Source: Official East European foreign trade statistics. All exports and imports are f.o.b. except for Hungary which reports imports on a c.i.f. basis.

As a result of these deficits Eastern Europe had by the end of 1975 accumulated a \$19 billion debt. Poland's debt totaled \$6.9 billion; East Germany and Romania had debts of \$3.8 billion and \$3 billion, respectively (see Table 2). Poland—eager for advanced Western technology and equipment—permitted the fastest growth of its debt. Other countries such as Czechoslovakia, Hungary, and Romania exercised considerably more prudence in borrowing.

<sup>1</sup> The methodology for estimating East European hard currency debt is in app. B.

<sup>2</sup> Preliminary estimates.

The rapid rise in East European imports of Western machinery and equipment was made possible largely by Western extensions of large amounts of government-backed credits. By yearend 1975, the amount outstanding on government-backed credits represented roughly one-fourth of total East European indebtedness.

At the same time, private borrowing from commercial banks—as reflected in Bank for International Settlements (BIS) data—played an increasingly important role as rapidly growing deficits and debt servicing obligations necessitated the greater use of financial credits. A large part of the commercial bank borrowing was on a direct bank-to-bank basis whereby the East Europeans obtained time deposits and other credits.<sup>3</sup> The advantage of such credits is that they can—unlike government-backed and other supplier credits which are tied to specific purchases—be used to cover immediate needs. On the other hand, these credits generally carry higher interest rates and are of shorter duration than government-backed credits.

Total net liabilities to commercial banks are estimated to have accounted for somewhat more than half of total East European indebtedness by yearend 1975, up from roughly two-fifths at yearend 1973.<sup>4</sup> In 1975, reported liabilities on the Euromarket rose by \$4 billion while East European assets rose by \$700 million; reported net liabilities stood at \$8.7 billion at yearend 1975 (see Appendix C).<sup>5</sup> About one-third of the increase in commercial bank borrowing in 1975 consisted of publicized medium- and long-term syndicated loans with repayment periods running up to 7 years (see Appendix D for a partial listing of such loans).

Other sources of financing included direct Middle East placements—largely to Romania—totaling at least \$700 million by yearend 1975: The East Germans benefited from an interest-free West German swing credit, which had accumulated to about \$300 million. The East Europeans also borrowed from CEMA banks and on other non-government-backed supplier credits which do not appear in the BIS statistics. However, data on these sources of financing, as well as on direct Middle East placements, are incomplete. Thus, the estimates of East European debt are probably conservative.

### B. 1976

Burgeoning trade deficits and mounting debts forced the East European countries to take steps in 1976 to reduce these deficits. The results were mixed. For the area as a whole, the trade deficit is estimated to have dropped by \$300 million to \$6.5 billion as exports picked up and import growth slowed down. Bulgaria and Romania—

<sup>3</sup> Some of the East European borrowing from commercial banks was indirect, resulting from the discounting—mostly on a nonrecourse basis—of private supplier credits by Western firms with their bank. Such supplier credits are believed to run up to five years in length. Non-recourse, or a *forfait*, financing is a form of supplier's financing whereby the bank accepting bills or notes from an exporter for discount absorbs the risks of collecting payment from the importer.

<sup>4</sup> The position of the East European countries with Western commercial banks is from data reported by the Bank for International Settlements (BIS). The calculation for total net liabilities to commercial banks includes an estimate for the East European position with banks in Canada, Japan, Switzerland, and the United States, which do not break out their positions with individual East European countries in their reporting to the BIS, and with banks in Austria, which do not report to the BIS.

<sup>5</sup> According to U.S. Treasury and Federal Reserve statistics, U.S.-based banks and their major foreign branches held \$1,188 million in net claims against Eastern Europe at the end of 1975. About three-fourths of these claims were held by the foreign branches.

already carrying heavy debt burdens—and Hungary—usually a cautious borrower—took stringent measures to reduce their trade deficits. All three were able to cut their deficits sharply, with Romania being the most successful. On the other hand, Czechoslovakia, East Germany, and Poland were unable to reduce their deficits, largely because of large imports of grain and fodder necessitated by poor harvests and the suspension of Soviet grain deliveries. By yearend, East European debt had climbed to \$26 billion.

Available information suggests that most East European countries had little trouble in financing their 1976 deficits and meeting mounting repayment obligations. Substantial government-backed credits continued to be available and reported net Euromarket liabilities of Eastern Europe rose by \$3.8 billion as compared with \$3.3 billion in 1975 and totaled \$12.5 billion by the end of the year. About one-third of the rise in Euromarket liabilities consisted of medium- and long-term syndicated loans. Money markets were very liquid as an expected strong competition for funds failed to materialize because of the sluggish Western economic recovery. In general, the East Europeans were able to borrow at the same spreads above the London Interbank Offered Rate (LIBOR) as in 1975, although management and other fees may have been higher.

In spite of the availability of funds, Western bankers began to indicate concern over Eastern Europe's rapidly growing debt. Many lenders became unwilling to extend additional large untied loans—especially to Poland. Some of the project loans have apparently been tied only very loosely to East European purchases in the West, e.g., the \$120 million syndicated loan to Bulgaria for the development of the chemical industry. Others have been extended for specific projects, e.g., the \$100 million syndicated loan to Poland which is to help pay for equipment from the United Kingdom, Japan, and the United States for a polyvinyl chloride plant. But if, as is likely, such loans can be drawn down before the actual delivery of the equipment, they can then be used for immediate balance-of-payments purposes.

Moreover, some banks may be near legal or self-imposed ceilings for individual borrowers on East European financing.<sup>6</sup> The East Europeans, however, may be able to sidestep this problem by having some institution other than the foreign trade banks apply for the financing. In 1976, the Polish shipping enterprise Polska Zegluga Morska took up a \$20 million 5-year loan managed by First Chicago Ltd.<sup>7</sup>

Only Poland is believed to have encountered serious difficulties in meeting its 1976 needs for balance-of-payments financing. Warsaw reportedly has admitted that it is having problems in obtaining large-scale Euromarket loans because of its heavy past borrowing.<sup>8</sup> According to Roman Malesa, President of Bank Handlowy, some Western bankers have been excessive in their demands and in such cases Warsaw has refused to conclude the transaction.<sup>9</sup> The Poles, for example, recently balked at paying a front-end fee of 1.25 percent on top of a 1.5 percent spread over LIBOR<sup>10</sup>. Malesa also said that

<sup>6</sup> *The New York Times*, June 6, 1976.

<sup>7</sup> *Moscow Narodny Bank Press Bulletin*, July 28, 1976, p. 13.

<sup>8</sup> "Enter the Eurorouble," *Euromoney*, January 1977, p. 11.

<sup>9</sup> "Roman Malesa, Bank Handlowy's President and Negotiator," *Euromoney*, January 1977, p. 33.

<sup>10</sup> "The New Sophistication in East-West Financing," *Business Week*, March 7, 1977, p. 40.

Poland would not accept a spread of more than 1.5 percent. It is probable, however, that Poland had to pay an effective rate of more than 1.5 percent counting front-end fees in order to obtain the financing needed in 1976.

#### IV. POLAND

Poland, with a rapidly rising debt and debt service obligations, faces the most difficulty in bringing its external accounts into equilibrium. Gierek—in a reversal of his predecessor Gomulka's more cautious approach—has used Western credits to import large amounts of capital equipment to push rapid economic development and modernize the Polish economy and to raise the standard of living of urban workers. At the same time, Poland has had to sharply increase its imports of Western industrial materials, especially metallurgical products, and in 1975 and 1976 had to import extraordinary amounts of Western grain and fodder.

As a result of the rapid rise in imports, Poland's trade surpluses of the 1960s and early 1970s turned to deficits by 1972. The deficit nearly quadrupled in 1973, in large part because of the deterioration in terms of trade which was mainly due to sharp increases in the prices of imported agricultural products. The trade deficit nearly doubled in 1974. Although the value of exports increased by 39 percent, the volume dropped slightly as a result of the EC ban on beef and cattle imports and the beginning of Western recession late in the year. At the same time, imports rose 53 percent, in large part due to sharp increases in the price of oil and other raw materials. Although as shown in Table 3, the terms of trade improved substantially, the effect of the more rapid increase in export prices was more than offset by the fact that the volume of imports was nearly twice that of exports.

Source: "Terms of Trade in Polish Foreign Trade" by Anna Stepniewska and Hanna Molewicz, "Handel Zagraniczny No. 7," Warsaw, July 1976. (Translated by Joint Publications Research Service.)

Although Poland's import growth slowed to 16 percent in 1975, mostly as a result of a sharp drop in the rate of increase in import prices, the deficit still climbed to \$3 billion. Imports of machinery and equipment continued to soar and those of grain and fodder hit a record 7 million tons due to shortfalls in domestic production and Moscow's suspension of deliveries. Imports of rolled steel, on the other hand, fell. Exports rose only 6 percent (down 3 percent in real terms) as sales of foodstuffs, metallurgical products, and chemicals dropped sharply.

Poland's net indebtedness rose to \$6.9 billion by yearend 1975. Not only did the debt rise substantially, but a much larger share of exports was required to service the debt. Debt service jumped from 27 percent of merchandise exports in 1974 to 43 percent in 1975 (see Appendixes E and F).

: Although still relying heavily on government and government-guaranteed credits<sup>11</sup>—which accounted for nearly two-fifths of the total debt at end 1975—Poland was forced to boost its borrowing on the money market to cover the deficits and meet repayment obligations. In 1975, net private borrowing from commercial banks accounted for more than one-half of the \$3 billion rise in the debt. Of this, some \$500 million was in publicized syndicated loans of five years or more. By yearend, estimated net liabilities to commercial banks hit \$4 billion. In addition, Poland owed about \$400 million on West German supplier credits. Warsaw also reportedly received substantial Middle East deposits. Poland presumably has borrowed more than has been accounted for above. As a result of its heavy use of financial credits, many of which are short-term, Poland's debt structure has worsened. Known long-term debt dropped from about three-fifths of the total in 1970 to roughly three-tenths in 1975 (see Appendix G).

In spite of some recovery in exports and efforts to curb import growth, Poland incurred in 1976 an even larger deficit than in 1975 because it was committed to large imports of Western grain and of machinery and equipment. To reduce consumer grumbling, Warsaw felt the need to reduce exports of coal and meat to make more available at home, while maintaining grain and fodder imports in order to boost livestock production. Import growth was held down to 6.5 percent in the first 11 months of the year but shot up in December apparently due in large part to sharp increases in deliveries of machinery and equipment; the rise in imports for the whole year was 10 percent. Exports also rose 10 percent. In real terms, imports from and exports to the developed West may have grown faster. According to a Polish report, in trade with all non-Communist countries, import prices declined by 3 percent and export prices by 5 percent.<sup>12</sup>

By the end of the year Polish debt probably reached \$10.2 billion. Poland required about \$4.5 billion in financing in 1976 to cover the trade deficit and repayment obligations on earlier debts. Up to \$2 billion in government and government-backed credits, and the \$250 million extended by Iran in 1975<sup>13</sup> were available for use leaving roughly \$2 billion to meet the balance of its financial needs.

Because of the rapid build up of its debt, Poland found it difficult to arrange for Western financial credits. Many lenders had become willing to participate only in credits tied to Polish imports. But, as indicated earlier, Poland may be able to draw down the funds prior to actual delivery of the equipment. In first half 1976, Poland's borrowings on the Euromarket were down substantially, in part because lenders were holding back in anticipation of a greater demand for funds from developed Western countries. When this demand failed to materialize, Poland was able to borrow enough in the second half to bring its net borrowings to \$1.4 billion for the year, although it had to pay a higher interest than most other East European countries—1.5 percent over the London Interbank Offered Rate (LIBOR).

<sup>11</sup> Poland's outstanding indebtedness on U.S. government and government-backed credits at yearend 1975 totaled \$375 million of which \$92 million was on Eximbank credits, \$48 million on CCC credits, and \$236 million on P.L. 480 credits extended in 1957-64.

<sup>12</sup> "Polski handel zagraniczny w 1976 Roku." *Handel Zagraniczny*, Number 3, 1977, p. 18.

<sup>13</sup> *East European Report*, Business International S.A., January 10, 1975, p. 18.

It is uncertain how Poland raised the remaining \$1 billion, but presumably most of it consisted of private borrowing from commercial banks not included in the BIS reporting on Poland.

## V. ROMANIA

Romania has also run up a large hard currency debt because of substantial imports of Western technology and equipment to modernize its economy. Once the biggest borrower in Eastern Europe, Romania managed to keep its debts manageable in the early 1970s by restricting new borrowing and spreading out its debt; long-term debt rose from 20 percent of the total in 1970 to 40 percent in 1975, a higher share than for any other East European country except Hungary.

The strategy began to go awry in 1974, when soaring import prices helped push the trade deficit up to \$500 million. Although the Ceausescu regime cut imports sharply in 1975, Romania again incurred a \$500 million deficit. Imports of Western machinery leveled off after several years of very rapid growth. Exports dropped about 13 percent due to lower Western demand for Romanian products and domestic short-falls in agricultural production. The hard currency debt rose from \$2 billion at yearend 1973 to \$3 billion at yearend 1975. The share of exports required to service the debt rose to 42 percent.

Credits backed by Western governments represented the largest single source of debt financing; in 1975 they accounted for roughly one-third of Romania's total debt. Bucharest's borrowing from Western commercial banks has remained relatively small with estimated net liabilities totaling about \$630 million by yearend 1975. Romania also had outstanding some \$420 million from Iran,<sup>14</sup> \$60 million from Kuwait,<sup>15</sup> about \$145 million on two IMF credits,<sup>16</sup> \$150 million in West German supplier credits, and \$40 million in CCC credits. Moreover, some \$100 million in West German credits extended in 1970 and 1973 to help cover Romanian repayment obligations was still outstanding at the end of 1975. In addition, Romania owed about \$500 million to unidentified sources.

Romania continued to cut imports in the first half of 1976 (as compared with first half 1975) and then permitted a surge in the second half so that total imports for the year were at about the 1975 level. At the same time, exports rebounded and the deficit dropped by 60% to an estimated \$200 million. The Romanians required roughly \$1 billion in new financing to cover the current account deficit and debt repayments in 1976. It is estimated that Bucharest had at most only \$200 million in government-guaranteed credits to draw on. In addition, Romania may have had available more than \$100 million in World Bank credits<sup>17</sup> and drew down \$175 million from IMF standby arrangements.<sup>18</sup> The balance of the required financing apparently was obtained from private banking sources although BIS data indicate that Romania's net borrowing on the Euromarket declined somewhat. Romania's net indebtedness rose to an estimated \$3.3 billion by yearend 1976.

<sup>15</sup> *East-West Markets*, October 20, 1975, p. 7.

<sup>16</sup> *International Financial Statistics*, International Monetary Fund, February 1976, pp. 8-9.

<sup>17</sup> Romania has been granted about \$520 million in IBRD credits since 1973. It is believed that very little of this was drawn down prior to 1976.

<sup>18</sup> *International Financial Statistics*, International Monetary Fund, February 1977, page 10.

## VI. EAST GERMANY

East Germany's debt also has risen sharply as its appetite for Western goods has sharpened and the growth of Soviet deliveries of industrial materials and grain has slowed. By 1973, its trade deficit with the West had already hit \$800 million. Skyrocketing import prices in 1974 and stagnating exports in 1975 boosted the deficit to \$1.0 billion by 1975 in spite of East German efforts to cut back on import growth. Total imports increased only 3 percent in 1975 although imports of grain, machinery, and equipment rose sharply. Exports fell slightly in 1975 mainly due to a sharp decline in exports of iron and steel and of fuels.

The heavy borrowing required to cover the deficits pushed East Germany's hard currency debt up from \$2.1 billion at yearend 1973 to \$3.8 billion at yearend 1975. Liabilities on private borrowing from commercial banks accounted for nearly two-thirds of the total debt at yearend 1975 whereas only 10 percent was in government-guaranteed credits. About one-fourth of the East German debt consisted of net liabilities to West Germany, as shown below:

[In Millions of U.S. dollars at yearend]

	1973	1974	1975	1976
Total net indebtedness.....	2.1	2.8	3.8	4.9
To West Germany <sup>1</sup> .....	<sup>2</sup> 2.6	<sup>2</sup> 2.8	<sup>3</sup> 2.9	<sup>3</sup> 1.1

<sup>1</sup> Converted at the West German exchange rate prevailing at the end of each year.

<sup>2</sup> "Bericht über den innerdeutschen Handel und Aussenhandel der DDR: 10, Bericht", Der Bundesminister für Wirtschaft, Bonn, November 1976, p. 2.

<sup>3</sup> "BMWI Tagesnachrichten", Der Bundesminister für Wirtschaft, Bonn, Mar. 3, 1977, p. 1.

Net East German liabilities to West Germany are referred to as the "cumulative active balance," which represents the balance of transactions processed through the clearing account less East German payments in deutschmarks to a special account. These liabilities consist of the amount outstanding on the interest-free swing credit, on non-guaranteed commercial credits, and on insurance and financing by the West German Gesellschaft zur Finanzierung von Industrieanlagen mbH (GeFi) and Treuarbeit A.G., which provide insurance and financing specifically for exports to East Germany. The amount outstanding on the swing credit at yearend 1975 was about \$300 million.

Available data suggest that the East Germans failed to reduce their trade deficit in 1976. Although exports rose by an estimated 10 percent, the need for large amounts of Western grain helped push total imports up. The East Germans borrowed heavily in the Euro-currency market, increasing their net liabilities by \$940 million in 1976 as compared with \$775 million in 1975. At the same time, net liabilities to West Germany rose by about \$200 million. The debt is estimated to have risen to \$4.9 billion by yearend, up from \$3.8 billion a year earlier, as noted in the tabulation above.

## VII. BULGARIA

Bulgaria managed to keep its hard currency debt under control until 1974-75 when Western inflation, a spurt in imports of machinery and equipment, and stagnating exports caused Bulgaria's trade

deficits to rise almost tenfold to \$800 million. Exports, which had done quite well through 1973, failed to rise in 1974 and declined in 1975. At the same time, total imports more than doubled and imports of machinery and equipment tripled.

The heavy borrowing required to cover the large deficits boosted Bulgaria's net hard currency debt from \$800 million at yearend 1973 to \$1.8 billion at yearend 1975. The debt service ratio skyrocketed from 35 percent in 1973 to 66 percent in 1975 as repayments and interest burgeoned while exports stagnated. Bulgaria has been more dependent on private financing from commercial banks than any other East European country except Hungary. Estimated net liabilities to commercial banks accounted for about four-fifths of Bulgaria's debt by yearend 1975, with government-guaranteed credits accounting for most of the remaining debt.

Bulgaria pushed hard to reduce its 1976 trade deficit; imports were cut by an estimated 22 percent while exports rose roughly 15 percent, thus, Bulgaria could have reduced its trade deficit by about \$300 million to some \$500 million for the year as a whole.

Bulgaria apparently had no difficulty in raising about \$700 million in 1976 to cover its trade deficit and meet repayment obligations. Some government-guaranteed credits and one-half of a \$160-million Iranian loan extended in 1975 were available. Reported net borrowing on the Euromarket rose \$300 million in 1976, down substantially from the \$475 million borrowed in 1975. Bulgaria's debt at the end of 1976 probably totaled \$2.3 billion.

## VIII. HUNGARY

Although conservative in its financial dealings with the West, Hungary had to borrow heavily in 1974-75 to cover large deficits stemming from deteriorating terms of trade,<sup>19</sup> the EC ban on beef and cattle imports,<sup>20</sup> and the weakening of Western demand. Even though Hungary took strong measures to curb imports in the second half of 1975, the trade deficit still hit a record \$700 million for the year. Imports of chemicals and foodstuffs dropped sharply in 1975, but imports of machinery and equipment increased substantially. The sharpest drop in exports in 1975 occurred in metallurgical products, chemicals, and clothing and textiles.

TABLE 4.—HUNGARY: TERMS OF TRADE WITH THE DEVELOPED WEST

<sup>1</sup> Estimated on the basis of Hungarian data.

Sources: "Külkereskedelmi statisztikai evkönyv for 1972, 1974, and 1975." Hungarian Statistical Office, Budapest.

<sup>19</sup> Table 4 shows trends in Hungarian export and import prices in trade with the developed West.

<sup>20</sup> Hungarian exports to the developed West in 1974 and 1975 would have been 7 percent and 10 percent respectively, higher if exports of cattle had remained at the 1973 level.

Hungary's net hard currency debt soared from \$900 million in 1973 to \$2.1 billion in 1975. Debt service climbed from 20 percent to 35 percent of merchandise exports.

More than four-fifths of Hungary's debt outstanding at yearend 1975 consisted of commercial bank loans. Most of the recent increase in the debt was in long-term borrowing—Eurocurrency bonds and loans—which rose from 19 percent of the debt in 1970 to 42 percent in 1975. The relatively low share of government-backed credits (less than 10 percent) reflects not only Hungary's high dependence on the West for industrial materials—for which only short-term supplier credits are generally available—but also the government's policy of importing Western plant and equipment on a selective basis (usually on the expectation of a rapid payoff in exports).

Hungary again took measures to cut its imports in the first half of 1976, but then permitted a rise as exports picked up strongly. For the year as a whole, imports rose 1 percent while exports soared by 18 percent, enabling Hungary to reduce its trade deficit by 24 percent to \$570 million. Imports of machinery and equipment continued to rise, whereas those of industrial materials were held near the 1975 level. Much of the rapid rise in exports came from chemicals and metallurgical products. The Hungarians claim that in their total non-communist trade the volume of imports grew faster than the value as prices declined 4 percent. Export prices rose 4 percent, and the terms of trade improved by 8 percent.

In 1976, known net borrowing on the Euromarket came to \$700 million, up considerably from the \$417 million borrowed in 1975. The debt rose to about \$2.8 billion by yearend. Debt service may have increased to about 40 percent as repayments on the heavy 1975 borrowing began to fall due.

## IX. CZECHOSLOVAKIA

Czechoslovakia has traditionally followed a conservative borrowing policy. Although its debt has risen rapidly in recent years, it is the only East European country whose debt does not substantially exceed annual exports. A rapid rise in imports of Western machinery and equipment helped push indebtedness up from \$300 million to \$800 million between the end of 1970 and the end of 1973.

In 1974, Czechoslovakia—which relies heavily on exports of manufactured goods in exchange for Western raw materials and semi-manufactures—suffered a deterioration in its terms of trade as import prices soared. In 1975 the Western recession took its toll on Czechoslovak exports as well; exports declined 2 percent despite a rise in exports of machinery and equipment. Imports were up slightly as cutbacks in agricultural products and textiles were offset by the continued surge in imports of equipment and steel. Prague ended the year with a \$1.5 billion debt. However, the resulting debt service payments represented only 22 percent of merchandise exports.

At the end of 1975, government-guaranteed credits accounted for perhaps 30 percent of the debt and West German supplier credits for more than one-half. Very little of the Czechoslovak debt consists of obligations to commercial banks; estimated liabilities at yearend 1975 of \$560 million were offset to a considerable extent by assets of \$310 million.

Because of the need for an unusually large quantity of Western grain due to last year's drought, Czechoslovakia was unable to reduce its trade deficit in 1976. Imports rose 9%—slightly more than the 8% increase in exports—and the deficit rose somewhat.

Prague substantially stepped up its Euromarket borrowing. Its known net liabilities rose by \$472 million in 1976. In November it received its second publicized syndicated loan, a five year, \$200 million loan from a consortium of four West German banks. Estimated debt rose to \$2.1 billion by yearend 1976.

## X. NEAR-TERM OUTLOOK

The East Europeans may have some difficult years ahead. Growing debt burdens will require them to cut back on the growth of imports in order to reduce trade deficits and slow the growth of their debts. The East Europeans plan to keep import growth well below that in 1971-75. Poland, for example, plans to hold imports from the West at the 1975 level through 1980. In most cases, however, the import targets are unrealistically low in terms of economic growth goals. These countries are heavily dependent on imports of Western equipment and materials to generate economic growth. Even with the cutback in import growth, East European financing requirements for at least the next year or two would remain near the 1976 level as mounting repayment obligations offset reduced trade deficits.

The situation is further complicated by the fact that the East Europeans will now be relying less on the U.S.S.R. for oil and industrial materials. Moreover, they may have to divert some potential hard currency exports to the U.S.S.R. to cover deficits created by worsening terms of trade resulting from higher CEMA—especially Soviet—prices.

In 1977, Poland, Czechoslovakia, and East Germany will be helped in their quest to restrict the growth of imports by Soviet grain deliveries denied them for part of 1975 and most of 1976. They will then be able to reduce imports of Western grain if they have normal harvests. On the other hand, export growth may be limited if economic recovery in the West continues to lag. In addition, the terms of trade of some of the countries will worsen as prices of imported oil and chemicals rise. Thus, the trade deficit could again exceed \$5 billion. Poland, which may cut its imports in absolute terms, is still expected to incur a deficit in excess of \$2.5 billion.

By the end of the year, net hard currency indebtedness could rise to more than \$30 billion. Although sizable government- and government-guaranteed credits<sup>21</sup> are available, the East Europeans may have to go into the Euromarket even more heavily than in 1976 to meet their growing debt service obligations. But because of growing banker concern some of the countries—notably Bulgaria and Poland—may have difficulty raising all they need even at relatively high interest rates.

### *Beyond 1977*

A critical problem facing the East European leaders is how to keep up the imports of the industrial materials, agricultural products and

<sup>21</sup> Selected Western government and government-backed credit extensions are shown in Appendix H. It is believed that a large part of these credits were not yet drawn down by the end of 1976.

consumer manufactures deemed necessary to meet economic growth plans and consumer requirements. Under the most favorable conditions—a strong recovery in exports and good harvests—most East European countries should be able to import the necessary industrial materials without economic or financial assistance. But they can do this only if they are willing to curb their imports of machinery and equipment. All the East European countries have, in fact, indicated their intention of allowing little if any growth in (or even cutting) imports of Western capital equipment. Such imports can be curbed for a time without much effect on economic growth, especially in Poland where there is a large backlog of equipment not yet in operation.

If recovery in the West is sluggish, the East Europeans face the prospect of having to cut back their economic growth. Poor harvests would make this all the more necessary. Under these circumstances, it is unlikely that the East Europeans could import the necessary industrial materials without outside help. The East Europeans' tendency to overstockpile will ensure an adequate supply of industrial materials for perhaps another year, but thereafter failure to raise imports would result in serious bottlenecks in production.

Moscow apparently is concerned enough about Eastern Europe's economic difficulties—especially those which threaten political stability—to provide some assistance, even at the cost of some of its own hard currency exports. Gierek's recent success in obtaining a large Soviet aid package—including additional deliveries of oil—could set the stage for assistance to other East European countries. Such aid probably would consist mainly of above-plan deliveries of raw materials and permission to continue running deficits in trade with the U.S.S.R. The Soviets also might extend some hard currency credits, but these are not expected to be large. Whatever assistance they provide, however, probably will not be sufficient to free Eastern Europe from the need to closely control imports.

## APPENDIX A

### EASTERN EUROPE: HARD CURRENCY TRADE WITH THE LDCs

Information on how the East European countries earn hard currency from the LDCs is sparse. The largest part is generated from trade and is reflected in the trade balances with multilateral trading partners. Even these probably overstate the amount of Eastern Europe's hard currency trade with the LDCs.

Part of the trade with LDC multilateral partners is on a barter or credit basis. In general, the method of payments is determined by the nature of the commodities involved. For example, a sizeable part of East European exports of machinery and equipment to the LDCs probably is not paid for in hard currency. Thus, a large portion of any surpluses on trade with the multilateral LDC partners is not available as an offset to deficits on trade with the developed West.

Most of the data in the attached table were derived by subtracting from total East European trade with the LDCs that portion which is known to be covered by bilateral clearing agreements. The data for Bulgaria and East Germany, however, were calculated on the basis of reporting on those LDCs with which Bulgaria and East Germany are believed to have multilateral payments agreements. The Bulgarians and East Germans omit from their trade data many of the LDC trading partners—both those with which they have bilateral payments agreements and those with which they presumably settle on a multilateral basis. In the case of Bulgaria, the omitted countries accounted for 25% of exports to and 18% of imports from the LDCs in 1974 and in the case of East Germany for 9% and 14%, respectively.

TABLE A1.—EASTERN EUROPE: TRADE WITH LDC NONBILATERAL TRADING PARTNERS

[In millions of U.S. dollars]

	1973			1974			1975

## APPENDIX B

### EAST EUROPEAN DEBT: SOURCES AND METHODOLOGY

#### *Sources of Information*

Estimates of East European outstanding indebtedness and debt service are derived from a variety of sources. Debt estimates—including short-term (up to one year), medium-term (one to four years for the purposes of this paper) and long-term (more than four years)—are based on incomplete data and thus rely to some degree on estimative techniques and qualitative judgments. The estimates of total outstanding indebtedness are believed to be reasonably accurate; the estimates of debt service are less certain because of the scarcity of data on the debt structure.

The major sources of financial data are:

1. Summary financial information provided quarterly by Western commercial banks to the Bank for International Settlements (BIS). BIS reports show member bank assets and claims vis-a-vis the individual East European countries. The BIS data presumably include assets resulting from (1) bank-to-bank credits, (2) bank participation in consortium loans, (3) bank re-discounting of East European commercial paper on a nonrecourse basis, and (4) time deposits placed with individual East European countries. The reporting suffers from several shortcomings:

- (a) There is no breakout of commercial bank asset and claim positions for individual reporting countries vis-a-vis individual East European countries.

- (b) There is no breakout by term (short-term, medium-term, long-term) and no mention of average interest rates.

- (c) Some major lenders to Eastern Europe including Austria and various Middle Eastern nations do not report to the BIS. The positions of banks in Switzerland, Canada, Japan, and the United States are not broken out by East European country, leaving a residual category in the BIS reporting, which also includes the positions of Japanese and Swiss banks with the USSR. Moreover, the positions of banks in the Netherlands were included in the residual until end-June 1975. Also branches of U.S. banks in the Bahamas, Cayman Islands, Panama, Hong Kong, and Singapore did not report to the BIS until end-December 1975.

- (d) No summary data by individual East European country are available prior to 1974.

2. Information pertaining to East European orders for Western equipment, which often contains financial data, is culled from a variety of sources, including newspapers and East-West trade publications. Although it is apparent that a major share of orders have been identified, financial and delivery information is sometimes unavailable.

3. Firm commitments on Western government-guaranteed credits at year-end 1975 are presented in Chase World Information's *East West Markets* of

September 20 and October 4, 1976. This source also shows estimated amounts not yet drawn by the end of 1975. The data presented by Chase are not available for any earlier years.

Beyond these summary statistics, information from a variety of sources is used: East European trade data, Western trade statistics, East European specialized journals and newspapers, and Western financial and trade publications.

### *Methodology*

The methodology employed in estimating East European indebtedness and debt service, with those exceptions noted below, relies heavily on BIS statistics and financial information associated with orders placed in the West. Independent checks on debt estimates are made on the basis of changes in current account balances when possible.

(a) A variety of collateral data has led us to assume that the East European countries finance all machinery and equipment imports from the West on a supplier credit basis. Because East European data on imports of Western machinery and equipment are in most cases not detailed enough, Western trade statistics are used to determine the total amount of equipment imports financed in this manner. Known sales contracts are matched with export statistics. Financial information is used when available to determine the down-payment and the repayment period. When financial information is lacking for a specific contract, the terms are assumed to be the same as those generally applied by the exporting country's guaranteeing organization. In some cases, such as the purchase of a merchant ship, a contract is presumed by analogy with the usual practice. The financing of that portion of equipment imports for which no contract information is available is judged to be split between short- and medium-term credits. Except in the case of Hungary, the bulk of the estimated amount outstanding on credits to finance machinery and equipment is backed by Western governments.

(b) A second methodology is employed to estimate indebtedness resulting both from credits drawn by the East European states to finance balance-of-payments deficits and from credits for machinery imports which appear in East European but not Western trade statistics. This portion of East European indebtedness is judged to be largely represented by the net East European liabilities to banks as reported by the BIS. The BIS figures are adjusted to allow for the reporting of those BIS member countries (Canada, Japan, Switzerland, and the United States) which do not break out their assets and liabilities by individual East European countries, and estimates are also made for East European indebtedness to Austrian banks.

(c) An aggregation of the two indebtedness figures—estimated supplier credits for financing of equipment imports and the adjusted BIS statistics—together with other known and estimated sources of financing provides a total indebtedness figure. Debt service figures on this debt are necessarily rough estimates; information with respect to terms is available for only a portion of commercial bank lending reported to the BIS and of supplier credits for financing equipment imports.

Outstanding indebtedness at yearend 1975 on government-guaranteed credits as presented by Chase World Information is used as the basis for an approximation of the share of government-guaranteed credits in total East European indebtedness. Because only a small amount of Western government-backed credits is believed to appear in the BIS reporting, the adding of East European net liabilities with Western commercial banks to those outstanding on government-backed credits results in negligible double-counting.

The general methodology described above is modified to incorporate various additional information available for individual East European countries. The treatment of special factors is presented below:

(a) Estimates of the indebtedness of Bulgaria for recent years represent Western government-guaranteed credits outstanding, liabilities to Western commercial banks as reported by BIS and adjusted for gaps, and a loan from Iran. Bulgaria is not believed to be heavily involved in the nonrecourse market.

(b) The indebtedness of Czechoslovakia at yearend 1975 represents government-guaranteed credits outstanding, liabilities to Western commercial banks as reported by the BIS and adjusted for gaps, and West German supplier credits. The indebtedness for earlier years is estimated from published official figures for 1967 (corrected for clearing balances with developing

countries) and an Austrian estimate for 1973.<sup>22</sup> Czechoslovak debt for other years is interpolated and extrapolated from the given figures by estimated changes on current account, adjusted (as necessary) for the revaluation of debts in dollars as a result of shifts in exchange rates.

(c) The total debt of East Germany is estimated as the sum of the known indebtedness to West Germany on clearing account, outstanding guaranteed credits from other Western countries, and the estimated East German position with Western Banks.<sup>23</sup> West German published estimates on East German debt are roughly consistent with our estimates.

(d) The indebtedness of Hungary represents estimated outstanding indebtedness on Western government-guaranteed credits and on West German supplier credits plus the position with Western banks as reported by BIS, adjusted for the usual gaps. Hungary is reliably reported to have had no obligations (through 1975) on the nonrecourse market.

(e) Estimates of Poland's indebtedness represent the sum of liabilities to the United States under PL 480 and CCC, estimated outstanding credits for machinery and equipment, and the position with Western commercial banks as reported by BIS and adjusted for gaps (see Table B1). No allowance has been made for indebtedness on nonrecourse paper held by nonbank creditors in Austria and Switzerland; this may be significant, and Poland's debt, therefore, probably is somewhat understated.

TABLE B1.—POLAND: ESTIMATED STRUCTURE OF THE HARD CURRENCY DEBT AT YEAREND 1975

[In millions of U.S. dollars]

	Liabilities	Assets	Net liabilities
Machinery and equipment <sup>1</sup> .....	2, 225	0	2, 225
Short-term.....	383	0	383
Medium-term.....	1, 041	0	1, 041
Long-term.....	801	0	801
West German supplier credits.....	420	160	260
Medium- and long-term.....	(100)	0	(100)
Public Law 480 (United States).....	236	0	236
U.S. Commodity Credit Corporation.....	48	0	48
Private credits from Western commercial banks.....	4, 620	610	4, 010
Known medium-term.....	(74)	0	(74)
Known long-term.....	(950)	0	(950)
West German official financial credit.....	130	0	130
Kuwait Investment Co.....	24	0	24
Total.....	7, 703	770	6, 933

<sup>1</sup> This figure corresponds closely to the amount believed to be outstanding on Western government-guaranteed credits.

(f) Estimates of Romanian indebtedness are based on a Romanian figure given for the end of 1973 and extrapolated on the basis of estimated current account balances. The Romanian debt includes estimated western government and government-guaranteed credits outstanding, the estimated position with Western commercial banks, West German supplier credits, drawings from the IMF and IBRD, CCC credits, and available information on direct borrowing from the Middle East. Only 85 percent of the debt at yearend 1975 can be accounted for by known sources. The remainder probably consisted of unreported OPEC credits and Western government financial credits in addition to that known to have come from West Germany, and nonrecourse paper held by nonbank creditors in Austria and Switzerland.

<sup>22</sup> By Adam Zwass, whose estimates are believed to come from East European sources. His estimates for other countries are good approximations.

<sup>23</sup> Through 1975, West German banks made no loans to the GDR.

## INTRODUCTION

Estimates of East European indebtedness in hard currency<sup>1</sup> are founded on a few main sources of information. The two most important are quarterly reports by the Bank for International Settlements (BIS) of the assets and liabilities of commercial banks in 11 Western countries and data issued by the export credit guarantee organizations of Western governments. Other sources include occasional information on bank assets and liabilities from Western countries not reporting to the BIS, West German reports of the cumulative balance on clearing account with East Germany and on "official" long-term assets with the rest of Eastern Europe, reports by U.S. government agencies on outstanding credits given to finance agricultural exports, and data for the International Bank for Reconstruction and Development (IBRD) and the International Monetary Fund (IMF) on sums advanced to Romania. Published sources do not cover credits held by Western suppliers at their own risk, *a forfait* credits held outside commercial banks, and outstanding hard currency claims of East European countries on Western customers, but partial estimates can be made. Estimates are not included for East European indebtedness in hard currency to CEMA's International Bank for Economic Cooperation (IBEC) and International Investment Bank (IIB).

The above remarks apply generally to the sources and limitations of estimates of CEMA countries' indebtedness, including those of Lawrence Brainard, formerly with the Chase Manhattan Bank and presently with Bankers Trust; Professor Gaetano Stammati, President of the Banca Commerciale d'Italia; and those of Janos Fekete of the National Bank of Hungary. All such estimates reflect chiefly information that is widely circulated, most of it published. To be sure, confidential information is also used to bridge some of the numerous gaps in information. But it is now true, as it was not until quite recently, that most of the data needed are published.

Accordingly, a procedure has been outlined for estimating East European assets and liabilities in hard currency at the end of 1975, using published information. It should be borne in mind that other estimates are obtained somewhat differently, with the help of confidential information. Nevertheless, the following exercise brings out most of the considerations involved and draws on the greater part of the data used in making such estimates.

The description of how estimates are obtained begins with a consideration of assets and liabilities of Western commercial banks, continues with government guaranteed and associated supplier credits, and concludes with the numerous special topics mentioned above. Assets and liabilities are then totaled to obtain East European indebtedness, which is broken down by type, by creditor country, and among short-, medium-, and long-term obligations.

#### ASSETS AND LIABILITIES OF WESTERN COMMERCIAL BANKS WITH EASTERN EUROPE

Information published by BIS for the end of 1975 (Table 1) shows the assets and liabilities with individual East European countries and

<sup>1</sup> And on clearing account between East and West Germany.

the U.S.S.R. of commercial banks in seven major West European countries, plus US offshore banks.<sup>2</sup> The entries for the U.S.S.R. also include the assets and liabilities of banks in the U.S. and Canada. A nonitemized residual includes the assets and liabilities of Swiss and Japanese banks with the U.S.S.R. and Eastern Europe, those of banks in the U.S. and Canada with Eastern Europe, and those of most reporting countries (apparently all but those in the U.K. and the Netherlands and U.S. offshore banks) with the CEMA banks.

TABLE 1.—ASSETS AND LIABILITIES<sup>1</sup> OF BANKS IN 11 WESTERN COUNTRIES WITH THE U.S.S.R. AND EASTERN EUROPE AS SHOWN BY THE BANK FOR INTERNATIONAL SETTLEMENTS<sup>2</sup> (END 1975)

[In millions of dollars]

U.S.S.R.....	* 7,597	* 2,854
Residual.....	† 2,499	† 688
Total.....	21,589	6,301

<sup>1</sup> In domestic and foreign currencies.

<sup>2</sup> The basic source for such data, since early 1976, is the BIS quarterly press release. The above data are the same as those published in the "Forty-sixth Annual Report/1st April 1975—31st March 1976," Basle, June 14, 1976, p. 86, apart from the figures for the GDR, which were later revised. Except for the U.S.S.R. and the residual (see footnotes 3 and 4.) the figures reflect reporting of 7 European countries (excluding Switzerland) plus U.S. offshore banks.

<sup>3</sup> Figures for the U.S.S.R. cover reports from 7 European countries and U.S. offshore banks, plus the United States and Canada.

<sup>4</sup> The residual covers assets and liabilities of banks in Switzerland and Japan with the U.S.S.R. and Eastern Europe; those of banks in Canada and the United States with Eastern Europe; and those of all reporting banks except those in the United Kingdom and Netherlands and U.S. offshore banks with CEMA banks.

There is a strong presumption that the commercial bank assets reported to and by the BIS normally include (in addition to deposits in foreign banks) only loans and credits at the banks' own risk. Beyond doubt, reported claims on foreign banks (and non-banks) exclude bills and notes issued to finance exports that have been accepted (discounted) at the seller's risk; in such a case the bank's claim is against the seller, not the foreign importer or his bank. Similarly, in the case of government guaranteed seller credits, the bank's claim lies against the seller, and in the case of non-payment, against the government guarantee facility. In the case of government guaranteed buyer credit and loans to foreign banks (or import organizations), the bank's claim is against the foreign borrower, although in case of default, the government will reimburse the bank (to the amount specified). Presumably because the government guarantee organization bears the ultimate risk, these claims too are very largely—and probably entirely—excluded from the assets reported to the BIS.

The published evidence, unfortunately, is not conclusive. So far as is known, government guarantees have been available (through 1975) for buyer credits and loans only in domestic currency. The total assets of the eight reporting European countries in domestic currencies, between about \$3.3 billion and \$3.8 billion at the end of

<sup>2</sup> The West European countries are Belgium-Luxembourg, France, West Germany, Italy, the Netherlands, Sweden, and the U.K. The U.S. offshore banks are those in the Bahamas, Cayman Islands, Panama, Hong Kong, and Singapore.

1975,<sup>3</sup> were large enough so that they could easily have included all government guaranteed loans, which at most ran to two hundred million dollars. The \$3.3 billion—\$3.8 billion total, however, is very unevenly distributed by reporting country, the largest part being held in West German banks.

At the beginning of 1975, West German bank assets with Eastern Europe, the U.S.S.R., and the CEMA banks amounted to about 3.9 billion DM (then about \$1.7 billion).<sup>4</sup> At least three-fourths, or 2.8 billion DM, was in domestic currency—some 2.7 billion DM (\$1.1 billion) in the form of bank credits to finance West German exports, all evidently in Deutschemark,<sup>5</sup> and a negligible amount (up to 0.1 billion DM) in government guaranteed buyers credit in DM.<sup>6</sup> The remainder, in foreign currencies, at most 1.1 billion DM (\$0.5 billion), included perhaps 0.1 billion DM participation in loans to CEMA banks,<sup>7</sup> with the rest in *a forfait* credits extended to finance U.S. machinery reexported to Eastern Europe and the U.S.S.R. and subscriptions to syndicated loans to the U.S.S.R. and Eastern Europe. The West German balance of payments surplus with the U.S.S.R. and Eastern Europe was about 7.9 billion DM in 1975,<sup>8</sup> of which over 80 percent was financed by West Germany, the greater part with bank credit. At the end of the year as at the beginning, probably over three-fourths of the 8.3 billion DM (\$3.2 billion) in bank assets, or more than 6.2 billion DM (\$2.4 billion), was in domestic currency. After subtracting again a small amount (up to 0.2 billion DM) of government guaranteed buyer credit in Deutschemark,<sup>9</sup> at least 6.0 billion DM (\$2.3 billion) presumably would be reported to the BIS, or 60–70 percent of the estimated domestic currency assets of the eight reporting European countries.

Most of the remaining \$1 billion to \$1.5 billion in assets in domestic currencies held—probably somewhat unequally—by the other seven reporting European countries doubtless represent bank credits to support their domestic exports (other than sizeable machinery orders). That obviously does not exclude the possibility that some part was in unpublicized government-guaranteed buyer credits or loans. The possibility of a significant overlap of this kind has been discounted as slight, however, in making the present estimates—there is no possibility in the case of the U.S., Canada, and Japan—although the subject must remain open without an authoritative statement from the BIS.

In order to approximate assets and liabilities of Western commercial banks with East European countries, the first step is to

<sup>3</sup> Total assets of the eight reporting European countries were between \$18.9 billion and \$19.4 billion—the total of \$19.1 billion itemized in Table 1, above, plus the \$1.3 billion estimated for Switzerland (Table 2, below), less assets of \$0.4 billion of U.S. banks with the U.S.S.R. (*Treasury Bulletin*, December 1976, pp. 88, 91), perhaps \$0.1 billion of Canadian banks with the U.S.S.R., and \$0.5 billion to \$1 billion of U.S. offshore banks with the U.S.S.R. and Eastern Europe. Of this total, \$15.6 billion was in foreign currencies (BIS, *Forty-sixth Annual Report/1st April 1975–31 March 1976*, Basle, 14 June 1976, p. 83). Domestic currency assets are estimated as the difference.

<sup>4</sup> Representing 8.3 billion DM at the end of 1975 less 4.5 billion DM loaned during the year (*Monthly Report of the Deutsche Bundesbank*, Vol. 28, No. 7, July 1976, pp. 14–15, and Appendix, 1976).

<sup>5</sup> At the end of the first quarter, the amount was 3.5 billion DM; the amount at the beginning of the year is extrapolated. *Frankfurter Allgemeine Zeitung*, 21 May 1975, p. 11. Attributed to the Bundesverband deutscher Banken.

<sup>6</sup> Total amount of government-guaranteed buyers credit and loans authorized under Plafond C, Ausfuhrkredit-Gesellschaft mbH (AKA), *Geschäftsbericht 1974*.

<sup>7</sup> Based on estimated West German banks' participation in the \$350 million loan to IIB at the end of 1975.

<sup>8</sup> *Monthly Report of the Deutsche Bundesbank*, cited above.

<sup>9</sup> Extensions under Plafond C (at the end of 1975) are given as 19 percent of about 1.21 billion DM or 0.23-billion DM. AKA, *Geschäftsbericht 1975*, p. 30.

estimate those included in the nonitemized residual in the BIS data. The assets break down about as follows:

	[In billions of dollars]	
United States.....		0. 50
Assets with CEMA banks.....		. 35
Canada and Japan.....		. 34
Switzerland.....		1. 31
		2. 50

Except for the assets of banks in the U.S. with Eastern Europe, taken from the *Treasury Bulletin*<sup>10</sup> (the source of the BIS figures), these positions are estimated.

Assets with CEMA banks, insofar as included in the BIS residual, are estimated at one-half the consortium loans of about \$700 million outstanding to the two banks.<sup>11</sup> The total is calculated from eleven syndicated loans issued from 1972 through 1975, on the assumption that the \$350 million loan to IIB publicized in October 1975 was drawn down by the end of the year.<sup>12</sup> A list of participating banks available for this \$350 million loan indicates that something less than one-half of the total amount is excluded from the CEMA residual.<sup>13</sup> In the usual loans, much smaller, the participation of the UK banks alone would probably run close to 40 percent of the total, and the excluded amount, all told, might come to over one-half.

The claims of Canada and Japan against Eastern Europe, unlike those of banks in the US, which arise to a substantial extent from US exports, reflect very largely participation in publicized syndicated loans in foreign currencies. These are estimated, approximately, at \$320 million dollars.<sup>14</sup> An additional \$20 million is added arbitrarily for claims of Japanese banks against the U.S.S.R.

The residual, amounting to \$1.31 billion, is assumed to represent Swiss claims against East European and Soviet banks. The net claims of \$1.1 billion (after subtracting liabilities, estimated below) are in about the same proportion to the Soviet-East European import surplus in 1973-75, after subtracting Swiss machinery and equipment sales, as is the case with Austria.<sup>15</sup> So the estimate of gross assets is probably a fair approximation.

The liabilities in the residual represent chiefly short-term deposits and short-term East European claims arising from exports, together with deposits of the CEMA banks in the countries whose positions with these banks are included in the residual. East European short-term deposits in the US of \$90 million are given country by country in the "*Treasury Bulletin*"<sup>16</sup> and cover all liabilities of US banks to Eastern Europe.

<sup>10</sup> Revised figures in "*Treasury Bulletin*," December 1976, pp. 88, 91.

<sup>11</sup> The total amount owed by the CEMA banks was much greater, some \$1.2 billion at the end of 1975, to judge from their published balance sheets; the \$500 million difference is assumed to reflect short-term borrowing on the Eurocurrency market, almost entirely, one may be sure, in London and thus excluded from the BIS residual. For the CEMA bank balances, see "Deyatel'nost' MIB v 1975 godu," *Ekonomicheskaya gazeta*, April 1976, p. 21 and "Deyatel'nost' mezhduнародnovo ekonomicheskovo sotrudnichestva v 1975 g.," *Den'gi i kredit*, August 1976, pp. 83-85.

<sup>12</sup> The assumption is based on the increase in IIB's reported borrowing and loans received in 1975, from 102.7 million rubles to 495.5 million rubles, or \$527 million. The consortium loans drawn, including one of \$70 million in April 1975, amounted to \$420 million gross, strongly indicating that the \$350 million loan was drawn down and that IIB additionally borrowed a considerable amount, probably on short-term.

<sup>13</sup> Tombstone in London, *Financial Times*, 19 December 1975, p.17. The assets excluded are those of banks in the U.K. and Netherlands and offshore U.S. banks, as noted earlier, together with banks in Australia, Austria, New Zealand, and Portugal—countries that do not report to the BIS.

<sup>14</sup> See distribution, Table 2, p. 1375.

<sup>15</sup> See p. 1375.

<sup>16</sup> Figures for the six countries are shown in *Treasury Bulletin*, for example, December 1976, p. 84.

Deposits of CEMA banks (chiefly IIB) in the West were substantial, about \$540 million, according to their balance sheets.<sup>17</sup> For purposes of a rough estimate it is assumed that about one-half of Western liabilities to the CEMA banks (the same proportion as used for the assets) is included in the liabilities reported in the residual. Liabilities of Canadian banks to Eastern Europe and Japanese banks to the USSR and Eastern Europe are very small. Only Czechoslovakia, Poland, and the USSR are assumed to have significant deposits in these countries; minimum estimates are made. The remainder is assigned to Swiss banks; these liabilities may be underestimated.

The allocation of the above estimates of assets and liabilities by individual East European country is bound to be somewhat less accurate than the totals, except for liabilities of banks in the US with Eastern Europe, which are given, as already noted, in the *Treasury Bulletin*. Assets of banks in the U.S. are broken down by East European country from incomplete unpublished information from banks. Assets of Canadian and Japanese banks reflect chiefly estimates of their participation in Eurocurrency loans, which accounts for all but \$20 million, arbitrarily allocated as Japanese assets with the U.S.S.R. (very small apart from government guaranteed credits). The parallel liabilities, very small, as noted, are broken down in proportion to Canadian and Japanese exports to the East European countries. Net Swiss bank assets are broken down on the same basis shown for Austria, below, and gross assets and liabilities estimated in the same proportion.<sup>18</sup>

The results, shown in Table 2, give an approximate idea of the positions vis-a-vis the East European countries included in the BIS residual. The results obtained in this involved way differ from those obtained by Chase World Information Corporation<sup>19</sup> which assigned the BIS residual in the same proportion as for the country figures broken out by BIS. The comparison follows:

[In billions of dollars]

	Present estimates		Chase World Information	
	Assets	Liabilities	Assets	Liabilities
Albania.....	0.09	0.04	.10	0.04
Bulgaria.....	1.85	.32	1.81	.32
Czechoslovakia.....	.52	.31	.32	.28
German Democratic Republic.....	3.20	.62	2.91	.62
Hungary.....	2.46	.78	2.48	.84
Poland.....	4.40	.61	4.38	.57
Romania.....	1.05	.42	1.00	.42
U.S.S.R. (and CEMA banks).....	8.03	3.20	8.59	3.21
Total.....	21.59	6.30	21.59	6.30

<sup>1</sup> Rounding results in a discrepancy between the addenda and the sums.

The present estimate of assets with the U.S.S.R. (and CEMA banks) is lower;<sup>20</sup> estimated assets with the other East European countries—except Hungary—higher, by \$200 million for Czechoslovakia and by almost as much for the GDR. Differences are significant

<sup>17</sup> See p. 1373.

<sup>18</sup> See p. 1375.

<sup>19</sup> *East-West Markets*, 9 August 1976, p. 9. The figures shown there have been rounded to the nearest \$0.01 billion.

<sup>20</sup> Also those with Albania, for which no adjustment was made in the figures shown by the BIS.

in the liabilities of Czechoslovakia and Poland (higher) and those of Hungary (lower), though the absolute amount of these differences is of course small.

TABLE 2.—ALLOCATIONS BY COUNTRY OF THE ASSETS AND LIABILITIES IN THE BIS RESIDUAL FOR THE USSR AND EASTERN EUROPE<sup>1</sup> (END 1975)

(In billions of dollars)

	Banks in the United States <sup>2</sup>		Canadian and Japanese banks <sup>3</sup>		Swiss banks	
	Assets	Liabilities	Assets	Liabilities	Assets	Liabilities
Bulgaria.....	0.10	0.02	0.06	( <sup>4</sup> )	0.09	0.02

Total.....	.50	.19	.34	.04	1.31	.19

<sup>1</sup> Derived in general as described in the accompanying text. Assets and liabilities with the CEMA banks are not included.

<sup>2</sup> Figures reported to the BIS do not include data for "nonbanking concerns" in the United States, as is evident from a comparison of data for all foreign assets and liabilities given in the "Treasury Bulletin" and as shown in BIS press releases.

<sup>3</sup> The bulk of the assets of Canadian and Japanese banks, as explained in the text, is accounted for by syndicated loans. 4 of the 5 to Bulgaria involve Japanese banks; 1 of the 2 to the German Democratic Republic involves Canadian, the other Japanese banks; of the 7 to Hungary, 4 involve Canadian banks, 2, Japanese banks, and 1, banks from both countries; of the 6 to Poland, 4 involve Canadian, 1, Japanese banks, and 1, both. All date from 1973-75 except 1 from Bulgaria (1972), 1 for the German Democratic Republic (1972), and 1 for Hungary (1971).

<sup>4</sup> Negligible.

<sup>5</sup> Assets and liabilities of banks in the United States with the U.S.S.R. are broken out in the BIS figures.

The only other West European country for which it is feasible—and quite desirable—to make estimates is Austria. The estimates for Austrian banks, already referred to, are deduced from a published statement that the indebtedness of the CEMA countries at the end of 1975 was "some £400 million" (presumably between \$800 million and \$900 million).<sup>21</sup> On the basis of analogy with West Germany, the figure is interpreted as representing net, rather than gross assets. A figure of \$800 million is distributed by country, somewhat arbitrarily, by calculating the import surplus of the East European countries and the USSR in 1973-75 (from their own data)<sup>22</sup> and subtracting Austrian machinery and equipment exports, assumed to be financed under government guarantee. The resulting figures indicate little or no net Austrian assets with either Romania or the USSR. For the remaining countries, the cumulative import surplus, which, as it happens, is about \$800 million, is reallocated in part from Poland to Hungary and to a smaller extent to the GDR, on the assumption that a good deal of Polish paper is held, but none from Hungary and little from the GDR, outside the banking system. The results are shown in Table 3. There is not even a slender basis for calculating Austrian banks' liabilities to Eastern Europe. In view of banking and insurance activities in Vienna and the importance of switch-trade they are probably higher than those of Switzerland.

<sup>21</sup> *The Financial Times*, 25 June 1976, p. 31.

<sup>22</sup> An estimate is involved, since the GDR has not yet published figures on imports (only on turnover) by country, and Bulgaria has published nothing at all. Estimates are made of changes relative to 1974 by means of CEMA statistics on these countries' trade with EFTA. The same thing is done above in comparing East European and Soviet imports from Switzerland in 1971-75.

TABLE 3.—*Estimated net assets of Austrian banks with East European countries*<sup>1</sup>  
(End 1975)

Czechoslovakia.....	38
GDR.....	232
Hungary.....	233
Poland.....	215
Romania.....	(2)
Total.....	800

<sup>1</sup> As explained in the text.<sup>2</sup> Negligible.

The only other published information on positions of Western commercial banks with Eastern Europe relates to loans extended (or notes purchased) by Iran and Kuwait. Iran agreed to extend a loan of \$185 million to Bulgaria in late 1974 to finance joint projects and a second of \$160 million in early 1975 to finance "production and transport to Iran of Bulgarian livestock and agricultural products."<sup>23</sup> Half of the latter is assumed to have been drawn by the end of 1975; considerably more time presumably would be needed to work out the joint projects to be financed under the former, of which \$50 million for a food packaging complex is assumed to have been drawn in 1975. Iran also extended in 1974-75 a loan of \$420 million to Romania, all assumed to have been drawn by the end of 1975.<sup>24</sup> It is further assumed that no repayments were made on these loans by the end of 1975. There also have been reports<sup>25</sup> of a large loan (\$350 million) by Iran to Poland—\$250 million for expanding the food industry and \$100 million for a joint project to build a paper plant. These reports go back to late 1974, but press reports suggest that the agreed projects were not actually underway by the end of 1975. Provisionally, therefore, the loan is regarded as not yet drawn.

The Kuwait Investment Company (KIC) has also been involved in four known deals with Eastern Europe. Two of them involve Hungary. In November 1974, KIC managed a \$40 million loan issue for Hungary and in the summer of 1975 a second of \$60 million.<sup>26</sup> It is indicated that a considerable part of the \$100 million was subscribed by KIC and other OPEC banks; in the absence of other information, the share is assumed to be at least one-half, all still outstanding at end 1975.

Later in 1975, KIC also extended a \$60 million credit to the Romanian foreign trade bank, to help finance expansion of petrochemical capacity in Romania.<sup>27</sup> In this case it seems clear from the reporting that KIC provided the funds.

Finally, late in the year, KIC apparently arranged a loan for the equivalent of \$23.9 million for Poland; again it may be inferred that the money came from OPEC sources.<sup>28</sup>

In addition to OPEC loans not publicized, the East European countries may have obtained hard currency loans elsewhere in the

<sup>23</sup> Moscow Narodny Bank, *Press Bulletin*, 18 December 1974, p. 10, and 26 March 1975, p. 7.<sup>24</sup> Moscow Narodny Bank, *Press Bulletin*, 7 December 1975, p. 2.<sup>25</sup> For example, *Business Eastern Europe*, 19 November 1976, p. 364.<sup>26</sup> *East-West Markets*, 16 December 1974, p. 7; Moscow Narodny Bank, *Press Bulletin*, 13 August 1975, p. 12.<sup>27</sup> *East-West Markets*, 20 October 1975, p. 7.<sup>28</sup> *East-West Foreign Trade Bulletin*, 14 January 1976, p. 9.

world, as, for example, in Latin America, Hong Kong, Singapore, or European countries (apart from Austria) not reporting to the BIS. The amounts would probably not have been so very large. Similarly, deposits with and from banks in these countries would not greatly affect total Western bank assets and liabilities, certainly not on a net basis.

Approximate totals for assets and liabilities of Western banks with East European countries are obtained by adding the estimates for banks in countries reporting to BIS, those for Austrian banks, and those for Iran and Kuwait, as follows:

[In billions of dollars]

	Assets				Liabilities (in countries reporting to BIS)
	In countries reporting to BIS	In Austria <sup>1</sup>	In OPEC countries	Total	
Bulgaria.....	1.85	0.08	0.13	2.06	0.32
Czechoslovakia.....	.52	.04	-----	.56	.31
German Democratic Republic.....	3.20	.23	-----	3.43	.62
Hungary.....	2.46	.23	.05	2.74	.78
Poland.....	4.40	.22	.02	4.64	.61
Romania.....	1.05	-----	.48	1.53	.42
Total.....	13.48	.80	.68	14.96	3.06

<sup>1</sup> Net assets.

#### GOVERNMENT GUARANTEED CREDIT AND ASSOCIATED SUPPLIER CREDITS

For a time, through the mid-1960's, the big factor in expanding East-West trade, and with it East European indebtedness, was the growing availability of government guaranteed and supplier credits for machinery and equipment sales. Such credits are still growing, and important, although in the 1970's they have run a poor second to bank loans and credits.

The various government organizations that guarantee export credit have not published much information about aggregate extensions to the individual East European countries. The U.S. Export-Import Bank is a notable exception. For the end of 1975, however, fairly comprehensive information is available. This information, shown in Table 4, summarizes the "firm commitments" of the major government guarantee organizations to the U.S.S.R. and East European countries. "Firm commitments" include, in addition to credits outstanding (principal drawn or disbursed less repayments), the balance of approved credits for which contracts have been signed but deliveries—and disbursements—not yet made. So far as is known, only the Export-Import Bank also shows data for amounts outstanding. But Chase World Information Corporation, the source of the data in Table 4, has calculated the undrawn balance, thus providing estimates of the credits outstanding at the end of 1975. The undrawn balances can often be estimated with fair accuracy from information on the specific contracts signed in the recent past; a check of export statistics will usually show what deliveries have actually been made.

<sup>1</sup> From "East-West Markets," Sept. 20, 1976, p. 9 (Poland) and Oct. 4, 1976, p. 8 (other countries). The former includes data for the U.S.S.R. and both include entries for bank assets and liabilities shown (in more detail) on p. 1374 and estimates of supplier credits shown on p. 1388.

<sup>2</sup> The original includes total West German assets in the intra-German clearing account, discussed separately.

<sup>3</sup> The amounts presumed drawn are not shown in the original.

Since export guarantee organizations have generally not published such figures as those in Table 4, and since on occasion there has been some question about their consistency, an alternative approach has been developed. This approach involves, first, matching known sales contracts with export statistics, and applying the stated factors<sup>29</sup> for the share of downpayment and self-financing. The resulting credit estimates are then run out over the appropriate repayment period, either according to the terms specified or under the standard practice of the guaranteeing organization at the time. A few contracts are inferred, in the absence of reports, by analogy with the usual practice, as, for example, for the sale of a merchant ship.

The resulting figures are almost certain to be well under the amounts actually outstanding under government guarantee; many smaller orders for which there is no information are covered by government guarantees—the minimums vary from one exporting country to another. Accordingly, exports of machinery and equipment (SITC 7) from the principal exporting countries<sup>30</sup> not allocated to contracts are assumed to be financed, half on medium term (average 3-year) and half on short-term (average 6 month) credit. When the resulting balances are run out and added to the balances due under known and presumed contracts, the total could be expected to include practically all government guaranteed credits outstanding for machinery sales, plus self-financing and an additional, though probably not large, element of supplier credit. From year to year, especially since 1971, the totals carried over as well as the repayments themselves, all kept in terms of dollars, must be revalued to allow for shifts in exchange rates relative to the dollar. Several of the main currencies—notably the Austrian schilling, the Deutschemmark, the Swiss franc, the French franc, the Japanese yen, and the Swedish krona—appreciated relative to the dollar in 1971–1974, while the British pound

<sup>29</sup> Or those normally used by the appropriate export guarantee organization.

<sup>30</sup> OECD countries except Greece, Portugal, Spain, and Turkey.

and the Italian lira depreciated. In 1975, the dollar appreciated relative to most currencies (particularly the end of year position). The rule of thumb used approximates the changes in the U.S. dollar/SDR rates. The results are shown in Table 5.

TABLE 5.—ALTERNATIVE ESTIMATES OF GOVERNMENT-GUARANTEED AND ASSOCIATED SUPPLIER CREDITS OUTSTANDING TO EASTERN EUROPE (END 1975)

[In millions of dollars]

	Long term	Medium term	Short term	Total
Bulgaria.....	181	169	95	445
Czechoslovakia.....	175	378	152	705

Poland.....	801	1,041	383	2,225
Romania.....	446	362	146	954
Total.....	1,924	2,384	939	5,247

<sup>1</sup> Excluding intra-German trade.

There are various sources of potential error in this procedure. The general assumption is that all exports reported under SITC 7, and only those, are covered under government-guaranteed credits together with self-financing by suppliers. On the one hand, then, it is assumed that exports *not* included in a Western country's export statistics are *not* covered by the country's government guaranteed credits or by self-financing. Such exports to Eastern Europe are assumed, instead, to be financed, if at all, by *a forfait* credits in a third country (often enough, no doubt, through a third country affiliate of the exporter's bank). If anything, this assumption could result in some understatement of the volume of supplier credit; some deliveries covered by government guarantees may have been entered as exports to a third country simply because they were sent there for transshipment. On the other hand, some reported exports of machinery and equipment to Eastern Europe have almost certainly been financed in third countries in Western Europe, as indicated, for example, by West German statistics.<sup>31</sup>

Another source of errors, relatively minor, is the omission from Western export statistics of the value of licenses, blueprints, installation services, and the like covered in some export contracts. The error resulting from this omission would vary from negligible in exports to Hungary up to a couple of percent in exports to Poland.

More serious errors may result from the arbitrary and equal allocation to medium- and short-term credits of exports not accounted for under known or presumed contracts. Most countries in fact are prepared to guarantee credits—long-, medium-, or short-term, as the case may be—on all but the smallest deliveries, up to given limits for each East European country. In general, moreover, these upper limits are rarely approached; West Germany is the notable exception. But the percentage of exports actually covered, and the actual terms of repayment, are likely to vary considerably from those assumed for

<sup>31</sup> West German exports to Eastern Europe (excluding the GDR) by country of purchase (e.g. finance) in 1975 were \$323 million less than by country of destination. Of the total difference, one-half was in exports to Poland, one-fifth in exports to Czechoslovakia, and smaller amounts in exports to other countries. See Aussenhandel, Reihe 1, *Zusammenfassende Übersichten*, December 1975, pp. 25, 27. The differences are explained in that (of opposite direction) for West German exports to Switzerland, and the smaller one for exports to Austria.

medium- and short-term credits. Another possible error could arise from the inclusion of exports financed by Western banks and therefore already covered in BIS reports. Some West German and a little U.S. machinery is in fact financed in this way, so there is some overlap, but probably small, as suggested by a comparison of "firm commitments" with the present estimates.<sup>32</sup> In addition, some machinery may be financed at the supplier's own risk, but this creates no problem, since supplier credit is separately estimated only for West Germany, as a residual after subtracting other types of credit, including the present estimates of government guaranteed credits.

Still another type of error results from the increased use by East Europeans of bank loans as an alternative to government guaranteed<sup>1</sup> (and supplier) credits. In coming years allowance will have to be made systematically for this factor, but through 1975, the only East European country that made substantial use of Western bank loans for this purpose was Hungary, and only an *ad hoc* allowance need be made.

Information and time are lacking to make detailed comparisons of the estimates arising from the approach outlined above with estimates based on official data for "firm commitments." A comparison for the six East European countries indicates at least that the differences between the two sets of estimates are random rather than systematic. As shown in Table 6, the approach outlined above yields higher figures for Bulgaria, Czechoslovakia, and Hungary, but lower figures for the GDR, Poland, and Romania than the estimates of Chase World Information. The totals for the six countries are close—\$5.25 billion using the present approach, as against \$5.03 billion obtained by Chase World Information.

TABLE 6.—ESTIMATES OF GOVERNMENT-GUARANTEED CREDITS TO EASTERN EUROPE: CALCULATIONS FROM "FIRM COMMITMENTS" AND ALTERNATIVE ESTIMATES<sup>1</sup> (END 1975)

[In millions of dollars]

Total.....	5, 029	5, 247

<sup>1</sup> From table 4.

<sup>2</sup> From table 5.

Done with the same care, the discounting of official data for "firm commitments" should yield better estimates, if the official data are consistent from country to country—and are properly interpreted. On these assumptions, the estimates of Chase World Information are to be preferred. But quite apart from these assumptions, there remains the problem, already noted, of the availability of official data on "firm commitments." U.S. government estimates have been made without them, and until their continued availability is assured, it seems preferable to continue using the independently obtained series.

<sup>32</sup> See Table 7.

Comparisons of the 1975 estimates from this series with the "firm commitments" of West Germany indicate, however, that not only the estimate for Hungary but also that for Bulgaria is too high. As a result of this comparison, shown in Table 7, the overall totals for both countries are reduced. Known export contracts for Hungary are so few that there is no obvious basis for discounting the estimates; the same problem evidently faced Chase World Information in calculating undrawn credits. In view of the relatively small orders, no great lag need be involved; moreover, as shown below, Hungary has relatively large debts to West German suppliers.<sup>33</sup> Accordingly a rough estimate of \$180 million is made (out of \$241 million in "firm commitments") as against the Chase World Information estimate of \$168 million.<sup>34</sup> In the case of Bulgaria, it seems sufficient to discount the estimate only enough to allow for an average lag in deliveries under West German "firm commitments"; a substantial lag is shown for other countries. The estimate is therefore cut by \$45 million to \$400 million (as against the \$359 million estimated by Chase World Information).

TABLE 7.—COMPARISON OF ALTERNATIVE ESTIMATES FOR WEST GERMAN GUARANTEED AND ASSOCIATED SUPPLIER CREDITS WITH WEST GERMAN "FIRM COMMITMENTS" (END 1975)

<sup>1</sup> From table 4.

## OTHER ASSETS AND LIABILITIES

### *East-West German Clearing Account*

Of the other assets and liabilities mentioned at the outset, the most discussed are those in intra-German trade. The only accounting available is for assets and liabilities for transactions (including the services covered) entered in the clearing account kept by the two state banks. These are by no means complete, but most other transactions have been financed through third countries (notably Austria and Switzerland) and thus are largely covered in the assets (and liabilities) of banks in those countries.<sup>35</sup>

Information about the status of assets and liabilities under the clearing account is not actually published by the West German government (nor, needless to say, by East Germany). Rather information is provided now and then to newspapers, economic institutes, and authors.

<sup>33</sup> See p. 1382.

<sup>34</sup> An allowance is also made for a small overstatement of Austrian credit to Hungary.

<sup>35</sup> Sometimes for goods licensed to pass directly in intra-German trade, sometimes for goods transhipped through (or delivered from/to) third countries. West German banks doubtless play an important role in such transactions through their foreign affiliates. A reported example involves credits of 500 million DM to the GDR through affiliates in Switzerland and the Bahamas of the Landesbank Rheinland-Pfalz. A question was raised whether such a transaction should be cleared, as those of domestic West German banks must be, through the Bundesbank. See *Düsseldorfer Handelsblatt*, 30 June 1976, p. 6.

Such information has been rather more scarce than usual since 1975, when the last known accounts were shown, for mid-1974, as follows:<sup>36</sup>

[In billions of Deutschemarks]

	West German assets	West German liabilities	Net
Short term.....	1.0	0.3	0.7
Medium term.....	.5	.1	.4
"Swing" balance.....	.6	.....	.6
Total.....	2.1	.4	1.7

The net total—net West German assets—in this accounting is called the "cumulative active balance," which represents the balance of transactions processed through the clearing account (on occasion including retrospective adjustments for service payments), less East German payments in DM to the "special account" S.<sup>37</sup> At the end of 1975, this balance was about 2.4 billion DM (\$0.9 billion), and West German assets (gross) were 3.3 billion DM (\$1.3 billion).<sup>38</sup>

The gross West German assets include commercial credits without guarantee as well as those insured and financed by special official organizations—the Gesellschaft zur Finanzierung von Industrieanlagen mbH (GEFI), set up to parallel the regular export credit organization (HERMES Kreditversicherungs-Aktiengesellschaft), and Treuarbeit AG, set up to parallel the export credit financing corporation (Ausfuhrkredit-Gesellschaft mbH, or AKA). In addition it includes the "swing" balance, for which the maximum in 1975 was 790 million DM. Estimates of the total assets and liabilities at year end 1975 are as follows:<sup>39</sup>

[In billions of Deutschemarks]

	West German assets	West German liabilities	Net
Short term.....	1.6	0.7	0.9
Medium term.....	.9	.2	.7
"Swing".....	.8	.....	.8
Total.....	3.3	.9	2.4

<sup>36</sup> Gerhard Ollig, "Rechtliche Grundlagen des innerdeutschen Handels," in C. D. Ehlermann et al., *Handelspartner DDR—Innerdeutsche Wirtschaftsbeziehungen*, Baden-Baden, 1975. Dr. Ollig was for many years the deputy chief of the division in the Economics Ministry in Bonn responsible for intra-German trade.

<sup>37</sup> For anyone wishing to check the "cumulative active balance" against the transactions in the clearing account (as published in the *Bundesanzeiger*), it may be noted that GDR cash payments from 1967 through 1975 were roughly as follows;

	Million Deutschemarks:
1967.....	100
1968-72.....	100
1973.....	300
1974.....	235
1975.....	100

In addition, the GDR was credited with 250 million DM on the S account in 1971 in consideration of claims for underpayment of postal services to West Berlin since 1966, but this amount also was credited to the GDR on the clearing account. See Bundesminister für Wirtschaft, *10. Bericht über den innerdeutschen Handel und den Aussenhandel der DDR*, November 1976, p. 3; and Horst Lambrecht, "Innerdeutscher Handel—Entwicklung, Warenstruktur, wirtschaftliche Bedeutung," in C. D. Ehlermann, et al., *Handelspartner DDR—Innerdeutsche Wirtschaftsbeziehungen*, Baden-Baden, 1975, p. 84. See also DIW, *Wochenbericht*, 12 April 1973, p. 120; 29 May 1973, p. 170; and 11 March 1976, p. 87.

<sup>38</sup> See, for example, Deutsches Institut für Wirtschaftsforschung (DIW), *Wochenbericht*, 11 March 1976 p. 87.

<sup>39</sup> Apart from the totals and the swing balance, all probably rounded upward from the precise figures, these estimates are guesses based on the last known figures and the increases in trade.

## West German Official Credits to Eastern Europe

Another special case of West German credits is that of the "official" long-term credits to Eastern Europe shown by the Deutsche Bundesbank, furnished by Kreditanstalt für Wiederaufbau (KfW).<sup>40</sup> The outstanding credits, which amount to about 0.8 billion DM (\$0.3 billion) at the end of 1975,<sup>41</sup> include 262 million DM (\$100 million) owed by Romania; <sup>42</sup> the remainder apparently was owed by Bulgaria and Poland. The development of this account since 1967 is shown in Table 8.

TABLE 8.—WEST GERMANY'S LONG-TERM OFFICIAL CREDITS TO EASTERN EUROPE<sup>1</sup> 1967-75  
[In millions of Deutschmarks]

Year:	Disbursed	Repaid	Net	End of year balance <sup>2</sup>
1967	NA	NA	-----	260
1968	40	0	40	300
1969	35	0	35	335
1970	100	0	100	435
1971	0	30	-30	405
1972	0	130	-130	275
1973	200	15	185	460
1974	0	0	0	460
1975 <sup>3</sup>	340	0	340	800

<sup>1</sup> The yearly disbursements and repayments for "state-trading countries" as a group are shown in the balance of payments accounts published in the West German statistical yearbooks. Entries for 1965-67 are zero or negligible. Entries are also shown in appendix, 1973 and later years, broken down among USSR, Eastern Europe, and "other" state-trading countries, but only beginning in 1968.

<sup>2</sup> The year-end positions in 1967 and later years are deduced from the disbursements and repayments and the end-year position in 1975.

<sup>3</sup> The position at the end of 1975 is shown only to the nearest 100,000,000 Deutschmarks. "Monthly Report of the Deutsche Bundesbank," vol. 28, No. 7, July 1976, pp. 11, 14. Some small amounts owed by "other" Communist countries may be included.

In early 1970, Romania could look forward to having to pay some 200 million to 230 million DM to West Germany by 1972, limiting "the possibility for future imports in exchange for convertible currency."<sup>43</sup> As a result the Romanians asked for help, and the West German government provided 100 million DM to help cover payments coming due.<sup>44</sup> This proved not to be enough, and in addition to other help from West German and other sources, the West German government advanced another 200 million DM in 1973.<sup>45</sup> Of the 300 million DM total, 38 million DM apparently were repaid; the remainder is repayable by 1980.

The residual of about .54 billion DM seems to reflect two situations that arose, with Bulgaria in the mid-1960's and with Poland in 1974-75. In 1964-67, Bulgaria's hard currency debt rose rapidly. A great

<sup>40</sup> As in the cases cited below of the 200 million DM to Romania in 1973 and the 340 million DM for Poland in 1975.

<sup>41</sup> The balance outstanding with "centrally planned economies" is shown as a long-term credit in *Monthly Report of the Deutsche Bundesbank*, Vol. 28, No. 7, July 1976, p. 14. The attribution to Eastern Europe, of virtually the entire amount is inferred from the breakdown of annual changes shown in *Appendix to Statistical Supplement to the Monthly Reports of the Deutsche Bundesbank, Series 3, Balance of Payments Statistics*, No. 7, July 1973, 1974, 1975, and 1976 (herein after *Appendix*).

<sup>42</sup> *Wirtschaftswoche*, 21 May 1976, p. 29.

<sup>43</sup> *Düsseldorfer Handelsblatt*, 15 December 1969.

<sup>44</sup> Published reporting refers only to the fact, not the amount. But the amount itself is shown in the 1973 *Appendix*. The same amount and probably the same general terms are discussed in the above cited article from *Handelsblatt*, suggesting that the matter may already have been under advisement.

<sup>45</sup> The amount is shown in *Appendix 1975*, and attributed in the press to refinancing aid for Romania. For the latter, see Adam Zwass, *Zur Problematik der Währungsbeziehungen zwischen Ost und West* (No. 5 in *Studien über Wirtschafts- und Systemvergleiche*, a series of the Vienna Institute for International Economic Comparisons), Vienna, 1974, p. 164, citing *Süddeutsche Zeitung*, 27 July 1973, p. 1.

deal of this indebtedness was to West German suppliers. Bulgaria urgently needed some help with refinancing these debts, and it is a fair guess that a large part—if not all—of the West German official credit of about 260 million DM outstanding to “state trading countries” at the end of 1967 went to Bulgaria, along with smaller official credits of 40 million and 35 million DM granted in 1968–69. All other East European countries can be eliminated—Czechoslovakia by its published balance of payments accounts, the GDR as ineligible, Hungary and Poland as not needing such credits, and Romania—for the greater part—by the known 1975 level.<sup>46</sup>

For several years thereafter—through 1973—Bulgaria in fact succeeded in improving its position with West Germany, while beginning to raise funds on the Eurocurrency market. Repayments of 137 million DM in 1971–73 shown by the Deutsche Bundesbank<sup>47</sup> reflect Bulgaria’s improved position, leaving Bulgaria with remaining liabilities estimated at about 198 million DM (\$75 million) in the mid-1970’s.

A final official credit of 340 million DM (\$130 million) shown in 1975<sup>48</sup> is to be explained in the same way, as help in refinancing very large obligations to West German suppliers. The beneficiary of this credit was Poland; the amount represents the first tranche of a 1 billion DM credit from KfW, drawn 15 November 1975.<sup>49</sup>

#### *U.S. (and Canadian) Agricultural Credits*

Monthly data are available on US agricultural credits to the East European countries. The largest at the end of 1975 was still the \$246 million owed by Poland under PL 480. Poland may not consider this credit part of its hard currency obligations. It represents the unpaid balance on a very long-term interest-free line of credit used in 1957–64 to finance deliveries of grain and other agricultural products to Poland. By agreement, payment has been in part in zloty for use in Poland by the US Embassy, for paying social security pensions of US retirees that have gone back to Poland, and for financing US-supported projects in Poland. The amount outstanding is included here, however, in Polish liabilities in hard currency; the balance, if not paid in US dollars, will largely replace dollars that the US would have had to spend in Poland.

In addition, the US Commodity Credit Corporation (CCC) has extended credits to Hungary, Poland, and Romania to finance sales of agricultural products, partly on short-term (in the case of Poland) but mainly with 3-year repayment. At the end of 1975, Hungary owed less than \$0.5 million; Poland, nearly \$47.6 million; and Romania, nearly \$40.8 million.<sup>50</sup>

The Canadian government’s Export Credit Insurance Corporation (ECIC), which extended similar credits to Czechoslovakia and Poland

<sup>46</sup> The precise allocation of drawings in the 1960’s and repayments in the 1970’s between Bulgaria and Romania are uncertain but not the end positions.

<sup>47</sup> *Ibid.* Total payments by East European countries (excluding the USSR) less repayments attributed to Romania. These repayments are the main basis for attributing to some East European country the implied balance outstanding at the end of 1967.

<sup>48</sup> *Monthly Report of the Deutsche Bundesbank*, Vol. 28, No. 7, July, 1976, p. 11.

<sup>49</sup> FBIS, *Daily Report*, Eastern Europe, 10 October 1975, p. G2, quoting a full report of DPA, including the text of the agreement with Poland.

<sup>50</sup> Information from Agricultural Stabilization and Conservation Service (ASCS/FI/FAB), Department of Agriculture.

in the 1960's, again extended credit to Poland to cover grain sales from 1973/74 through 1976/77.<sup>51</sup> So far as is known neither ECIC nor the Canadian Wheat Board has published data showing the amount, if any, outstanding at the end of 1975. An estimate could be made from trade data, but given that the amount is not so very large—at the end of 1975—none is made here.

### *Romanian Drawings on IMF and IBRD*

Romania's drawings on IMF through the end of 1975 include a gold tranche of 47.5 million SDR and first credit tranche of 47.5 million SDR, both in the spring of 1973, and a drawing of 40 million SDR in November 1975 under a standby credit.<sup>52</sup> All told, the drawings come to 135 million SDR, or (at the conversion rate for end 1975) \$158 million.

IBRD had approved \$350 million in projects for Romania by the end of 1975, but only about \$36 million had been drawn.<sup>53</sup>

### *Supplier Credits Not Elsewhere Covered*

A considerable volume of supplier credit is not included in the above accounts—credits advanced at the supplier's risk and a *forfait* credits sold (rediscounted) by banks to private investors. The transactions covered include some sales of machinery and equipment, but for the most part such credits originate from sales of metals, chemicals, and other basic materials. In general, there is little that can readily be done to estimate the volume of these credits outstanding, but for West Germany—by far the most important source—a calculation can be made.

TABLE 9.—BREAKDOWN BY MAJOR COMPONENT OF WEST GERMAN ASSETS WITH THE EAST EUROPEAN COUNTRIES<sup>1</sup>  
(END 1975)

[In billions of Deutsche marks]

	Bank credit and loans <sup>2</sup>	Government guaranteed credit <sup>3</sup>	Official credit <sup>4</sup>	Supplier credit <sup>5</sup>	Total <sup>6</sup>
Bulgaria.....	0.45	0.25	0.20	0.20	1.1
Czechoslovakia.....	.35	.55	-----	2.50	3.4
Hungary.....	.55	.10	-----	.95	1.6
Poland.....	1.75	1.35	.35	.75	4.2
Romania.....	.40	.55	.25	.40	1.6
Total.....	3.50	2.80	.80	4.80	11.9

<sup>1</sup> Except the German Democratic Republic. The column of totals is given to the nearest 100,000,000 Deutsche marks, as in the source. Estimates in other columns to the nearest 50,000,000 Deutsche marks.

<sup>2</sup> As noted in the text, the estimates of bank assets with individual countries are intermediate in ranges indicated by minima (stated increases in 1975) and maxima (for Bulgaria, Czechoslovakia, and Romania), after allowing for current account balances in previous years (except 1974, when there appears to have been little change). The total is estimated from the total for the entire Sino-Soviet area by means of changes for major parts of the area since the late 1960's.

<sup>3</sup> See pp. 1380-1381.

<sup>4</sup> See pp. 1383-1384.

<sup>5</sup> Residual.

<sup>6</sup> From "Business Eastern Europe," 27 August 1976, p. 266. The sum of 11,900,000,000 Deutsche marks plus the 8,500,000,000 Deutsche marks given by the same source for the USSR, or 20,400,000,000 Deutsche marks, is significantly larger than the 19,600,000,000 Deutsche marks shown for all "centrally planned economies" in Monthly Report of the Deutsche Bundesbank, vol. 28, No. 7, July 1976, p. 14. Moreover, the latter source (p. 15) indicates a total of less than 10,000,000,000 Deutsche marks for Eastern Europe. The differences appear to reflect different estimates (by different sources) of supplier credits ("trade credits"). The higher estimates are more likely, but by no means certain, to be closer to reality.

<sup>51</sup> See, for example, Reuters, *East-West Trade News*, 13 December 1973, p. 7.

<sup>52</sup> IMF, *International Financial Statistics*, February 1976, pp. 8-9.

<sup>53</sup> IBRD: *Statement of Loans*, 31 December 1975.

This calculation, shown in Table 9, distributes the total indebtedness to West Germany of the East European countries (excluding the GDR) at the end of 1975, approximately 11.9 billion DM (\$4.5 billion), among bank credits and loans, government guaranteed credits and loans, official credits, and supplier credits—the residual. Figures on the indebtedness of one or more East European countries to West Germany have occasionally been published. But totals for all countries were made known for the first time in the summer of 1976 by the CDU *Fraktion* in the Bundstag to support its contention that the indebtedness should not be allowed to rise further.<sup>54</sup>

West German bank credits to the East European countries can be estimated roughly. The regional breakdown of the West German balance of payments has for some years shown data for capital accounts with the East European countries separately from those for the USSR and “other” centrally planned economies.<sup>55</sup> The share of the East European countries in the total for all centrally planned economies at the end of 1975 can be estimated with fair accuracy. Estimates for the several countries are inevitably less accurate; they depend on a partial breakdown for 1975, and the annual current account balances for the individual countries,<sup>56</sup> together with limits indicated by other data. In particular, data on West German banks’ participation in syndicated loans help to narrow the range somewhat.

Estimates of government guaranteed credits, shown and discussed earlier, should be reasonably accurate.<sup>57</sup> Official credits outstanding should be nearly exact, on the assumption that the inferences as to attribution are correct.<sup>58</sup>

Accordingly, the estimates of “other” supplier credits should be acceptably close, especially that for Czechoslovakia, which accounts for over one-half of the total, followed by those for Hungary and Poland, which account for most of the remainder. After ample allowance for error, it is still striking that Bulgaria and Romania, having earlier owed West German suppliers substantial amounts, owed very little by 1975. Much of the effort of both countries in the 1970’s to hold down their debts to the West has been directed specifically at reducing debts to West German banks and suppliers. Romania’s debt to West Germany, which peaked at 2 billion DM in 1972, dropped to below 1.9 billion DM by the end of 1973 and to 1.6 billion DM at year 1975.<sup>59</sup>

Czechoslovakia, Poland, and Hungary, on the other hand, much increased their drawings on West German supplier credits, especially in 1974. Czechoslovakia, in particular, has relied on such credits in preference to borrowing in the Eurocurrency market. But even Hungary and Poland, the East European leaders in obtaining syndicated loans, also ran up substantial debts to suppliers. In the case of Czechoslovakia and Poland, but apparently not of Hungary, much

<sup>54</sup> See, for example, *Business Eastern Europe*, 27 August 1976, p. 266.

<sup>55</sup> Appendix, 1973 and later years.

<sup>56</sup> *Monthly Report of the Deutsche Bundesbank*, Vol. 28, No. 7, July 1976, pp. 15, 13. The limit for Czechoslovakia is total bank assets reported by BIS for 7 reporting countries and US offshore banks, less the reported assets of UK banks. Limits are set for Bulgaria and Romania by total indebtedness to West Germany and by other components.

<sup>57</sup> See p. 1381.

<sup>58</sup> See pp. 1383–1384.

<sup>59</sup> The balance at the end of 1972 (or early 1973) is from *Eastern Europe Report*, 13 July 1973, p. 197. At end 1973 Romania owed “somewhat less” than the 1.9 billion DM then owed by Yugoslavia. *Frankfurter Allgemeine Zeitung*, 30 January 1974, p. 17. The amount at end 1975 is given in *Business Eastern Europe*, 27 August 1976, p. 266, as cited above.

of the outstanding credit probably consists of rediscounted *a forfait* credits held privately. The relief provided Poland in 1975 in the form of an "official" credit<sup>60</sup> presumably led to some reduction in these liabilities on "other" supplier credits.

Against these debts should be set, of course, any such assets held by Eastern Europe. West Germany shows liabilities of 2.4 billion DM in "trade credits" with the "centrally planned economies" (still excluding the GDR), all but 0.3 billion short-term.<sup>61</sup> It is assumed that these are roughly in proportion to West German imports from these countries, and they are broken down accordingly—the medium- and long-term liabilities in proportion to machinery imports and the rest in proportion to other imports. The results for the East European countries are shown in Table 10.<sup>62</sup>

TABLE 10.—*Estimates of West German liabilities to East European countries on "trade credits"*<sup>1</sup> (end 1975)

	<i>Deutsche-</i> <i>marks</i> (billions)
Bulgaria.....	0. 05
Czechoslovakia <sup>2</sup> .....	. 375
Hungary <sup>2</sup> .....	. 25
Poland <sup>2</sup> .....	. 425
Romania.....	. 20
<b>Total</b> .....	<b>1. 30</b>

<sup>1</sup> Excluding the German Democratic Republic. The total for the "centrally planned economies" is 2,400,000,000 Deutschmarks (*Monthly Report of the Deutsche Bundesbank*, cited above), of which 25,000,000 Deutsch marks is attributed to the CPR and "other," and 85,000,000 Deutsch marks to the U.S.S.R., based on imports, with the U.S.S.R. credited with 50,000,000 Deutsch marks medium and long term for machinery imports. Of the remaining 25,000,000 Deutschmarks in medium- and long-term liabilities, the shares are allocated as indicated below in footnote 2; the remaining short-term liabilities allocated according to the share in imports.

<sup>2</sup> Czechoslovakia, Hungary, and Poland are credited with 100,000,000, 5,000,000, and 1,000,000 Deutsche-marks, respectively, on medium and long term for machinery sales.

When West German assets and liabilities with the East European countries on supplier credits are converted to dollars and set side by side, the results are as follows:

[In billions of dollars]

	West German assets	West German liabilities
Bulgaria.....	0. 08	0. 02
Czechoslovakia.....	. 95	. 14
Hungary.....	. 36	. 10
Poland.....	. 29	. 16
Romania.....	. 15	. 08
<b>Total</b> .....	<b>1. 83</b>	<b>. 50</b>

Chase World Information has published estimates of supplier credits from West Germany, presumably derived from the same total for

<sup>60</sup> See p. 1384.

<sup>61</sup> *Monthly Report of the Deutsche Bundesbank*, Vol. 28, No. 7, July 1976, p. 16.

<sup>62</sup> It is worth noting that the West German liabilities to these countries are in much the same proportion to imports as those to East Germany, shown on p. 1382.

“centrally planned economies.”<sup>63</sup> These compare as follows with the above estimates:

[In millions of dollars]

	Chase World Information	Above estimates
Bulgaria.....	100	80
Czechoslovakia.....	600	950
Hungary.....	0	360
Poland.....	580	290
Romania.....	120	150
Total.....	1,400	1,830

The total given by Chase World Information probably is based on a lower total for East European debt to West Germany than that shown in Table 9.<sup>64</sup>

*Polish Obligations on a Forfeit Credits Outside Banks in Austria and Switzerland*

A parallel allowance is made for obligations held outside banks in Austria and Switzerland, but only for Polish obligations. Other countries—except Hungary—also have obligations of this sort, but these are probably much smaller, and no estimate is made for them. But Polish obligations of this type run to several hundred million dollars, at a guess. Based on the downward adjustment made above in estimating Polish obligations to Swiss and Austrian banks,<sup>65</sup> one might estimate that Poland owed non-bank creditors in Switzerland at least \$100 million, in Austria at least \$250 million. These conservative estimates are added to total Polish obligations.

*East European Supplier Credits to Developing Countries*

A word should be added on East European claims arising from substantial deliveries of machinery and equipment on credit to developing countries. Some East European countries, notably Czechoslovakia and Romania, claim large exports, and export surpluses, in convertible currency with developing countries in the 1960's and early 1970's, but there is little reason to suppose that machinery sold on medium- and long-term credit has been paid for in hard currency. In the case of sales to countries with which there was no clearing agreement, special compensation deals were involved, and this probably was the case with large sales even to countries with which clearing agreements still existed.

The only significant hard currency assets would have arisen from sales of military end items on credit. Czechoslovakia in particular has earned substantial amounts of hard currency for selling military end items to all comers, and some part of the balance on credit sales to developing countries should be considered a hard currency asset. The amount outstanding has declined since 1967, when Czechoslovakia claimed \$146 million in long-term hard currency assets with the West,

<sup>63</sup> From “East-West Markets”, Sept. 20, 1976, p. 9 and Oct. 4, 1976, p. 8. The entry for Poland includes some supplier credit from Japan.

<sup>64</sup> See footnote 6 to table 9.

<sup>65</sup> See pp. 1373, 1375.

of which some considerable part represented balances due for military end items.<sup>66</sup> A rough estimate, based on calculations through 1974,<sup>67</sup> would put the amount at about \$50 million. The balances for other countries would be much smaller, and no attempt has been made to estimate them.

### *Debts to IIB and IBEC*

Some of the East European countries owe substantial amounts to the CEMA banks. East European debts to IIB undoubtedly ran well over \$100 million by the end of 1975.<sup>68</sup> They have greatly increased since then, of course, as a result of commitments to the Orenburg pipeline. Debts to IBEC in 1975 may have run several hundred million dollars. Such debts evidently have a bearing on the credit-worthiness of the East European countries. As a practical matter, however, their total liabilities to the CEMA banks cannot be estimated from published information. Until the Soviets become more open about such matters, the East European countries' liabilities to CEMA banks—as well as their access to IBEC funds to ease balance of payments pressures—will remain an open question.

### *Aggregate East European Assets and Liabilities*

Estimates from the various sources used above are totaled in Table 11 (East European liabilities) and Table 12 (East European assets). The resulting net liabilities at the end of 1975 are as follows:

[In billions of dollars]	
Bulgaria.....	2. 27
Czechoslovakia.....	1. 71
German Democratic Republic.....	4. 17
Hungary.....	2. 40
Poland.....	7. 15
Romania.....	2. 47
Total.....	20. 17

<sup>66</sup> See, Miroslav Koudelka, Dušan Libnar, Miroslav Havel, "Peněžní vstahy v ČSSR," enclosure to *Hodpodářské noviny*, No. 47, 6 December 1968, p. 6.

<sup>67</sup> From a manuscript dealing with Czechoslovakia's balance of payments.

<sup>68</sup> The \$170 million borrowed long-term through April 1975 probably covered the bulk of what was spent in hard currency through 1975. The two known items are some 25.3 million rubles (roughly \$30 million, at the conversion rate of 1971-72) to Czechoslovakia, and 46.3 million rubles to Poland (\$55 million—\$60 million at the average rates in 1971-74). See, for example, *Die Wirtschaft*, 17 January 1973, p. 22; *Nowe drogi*, April, 1975, p. 64.

TABLE 11.—AGGREGATE LIABILITIES OF THE EAST EUROPEAN COUNTRIES IN HARD CURRENCY<sup>1</sup> (END 1975)

[In billions of dollars]

	Bank loans and credit <sup>2</sup>	Government- guaranteed credit <sup>3</sup>	Supplier credit <sup>4</sup>	Other	Total

<sup>1</sup> Together with German Democratic Republic liabilities under the clearing account with West Germany.<sup>2</sup> Including assets of banks in countries reporting to the BIS and Austrian banks and estimated drawings on known OPEC credits; from p. 1377.<sup>3</sup> And associated supplier credit ("self-financing"). For Czechoslovakia, the German Democratic Republic, Poland, and Romania, estimates are from table 6 for Bulgaria and Hungary. See p. 1381.<sup>4</sup> Supplier credits not included in other entries; only from West Germany. See p. 1387.<sup>5</sup> For Bulgaria, "other" liabilities are estimated West Germany "official" credit; see p. 1384.<sup>6</sup> Discrepancy between the addenda and the sums caused by rounding error when converting Deutschmarks into dollars.<sup>7</sup> The figure for government-guaranteed credit owed by the German Democratic Republic excludes credit from West Germany, covered in the overall liabilities separately entered. See footnote 8.<sup>8</sup> Total liabilities to West Germany under the clearing account are entered here. See p. 1382.<sup>9</sup> Negligible.<sup>10</sup> The entry includes West Germany "official" credits to Poland, Poland's liabilities to the United States under Public Law 480 and CCC program (see p. 1384) and liabilities to other than banks in Austria and Switzerland (p. 48).<sup>11</sup> Rumania's "other liabilities" include those to West Germany under official credit (p. 1388), to the United States under CCC (p. 1384) and drawings from the IMF and IBRD (p. 1385).TABLE 12.—AGGREGATE ASSETS OF THE EAST EUROPEAN COUNTRIES IN HARD CURRENCY<sup>1</sup> (END 1975)

[In billions of dollars]

	With Banks <sup>2</sup>	Supplier Credits <sup>3</sup>	Other	Total
Bulgaria.....	0.32	0.02	-----	0.34
Czechoslovakia.....	.31	.14	4.05	.50
German Democratic Republic.....	.62	( <sup>4</sup> )	6.34	.96
Hungary.....	.78	.10	-----	.88
Poland.....	.61	.16	-----	.77
Romania.....	.42	.08	-----	.50
Total.....	3.06	.50	.39	3.95

<sup>1</sup> Together with German Democratic Republic assets under the clearing account with West Germany.<sup>2</sup> Assets with banks in countries reporting to the BIS and in Austria.<sup>3</sup> Estimated supplier credits outstanding to West Germany; see p. 1387.<sup>4</sup> Estimated claims in hard currency on developing countries for sales of military end items on credit.<sup>5</sup> German Democratic Republic supplier credits to West Germany are shown under "other"; see footnote 6.<sup>6</sup> West German liabilities of 900,000,000 DM (see p. 1382) converted at the end year rate (2.6223 DM-\$1).

The accuracy of these estimates varies according to the principal sources used for East European liabilities, as follows, in order of probable accuracy:

(a) U.S. government agricultural credit, the balance of the intra-German clearing account, West German official credits and Romanian drawings on IMF and IBRD—all official sources presumed to be accurate to the degree specified.

(b) Assets and liabilities of commercial banks in countries reporting to the BIS and those in Austria—the totals for Eastern Europe are correct almost within the range of original reporting error; the estimates for most countries—all but Czechoslovakia—have a range of error of perhaps 1-3 percent.

(c) Supplier credits from West Germany (excluding intra-German trade)—error could be largely balanced by offsetting errors in government guaranteed credits.

(d) Government guaranteed and related supplier credits—the estimates for the GDR, Poland, and Romania are probably correct within 10 percent as a result of the high proportion of known credits; estimates for Bulgaria, Czechoslovakia, and Hungary are less accurate.

(e) Loans from OPEC countries—drawings on publicized loans by the end of 1975 are in some cases uncertain, and other loans (and perhaps deposits) may have been made to East European banks; no range of error can be assigned.

On the basis of these considerations, the estimate of liabilities for the GDR is considered probably the most accurate, followed by that for Poland—both probably accurate within 5 percent. Those for Bulgaria, Czechoslovakia, and Hungary follow, probably accurate within 10 percent. The range is much higher for Romania because of heavy use of OPEC credits and the likelihood of other refinancing in addition to that from West Germany. The estimate may be low by 15 percent or more.

These remarks relate only to estimates of the sources used. Bank and supplier credits from other sources—including the CEMA banks—would add an unknown amount to East European liabilities.

More or less the same judgments for net liabilities result from comparison with cumulative current account balances. The estimates of these balances for 1959–71, published in 1974,<sup>69</sup> have been revised and updated through 1973 or 1974; they are intended for eventual publication, after further correction and updating. The principal revisions have dealt with balances with developing countries. The continuation of the series for the GDR, Hungary, and Poland, with minor revisions, results in cumulative balances fairly consistent with estimated net liabilities, allowance being made for known changes from 1974 to 1975. Data problems remain in the series for Bulgaria and Czechoslovakia; as the series stand, they indicate significantly lower estimates of net indebtedness than those shown above. The series for Romania, after substantial revision, appears fairly solid; the cumulative balance indicates a substantially greater figure for net liabilities than shown above.

### *Structure of Gross Liabilities*

Some knowledge of the type, sources, and maturities of East European liabilities to the West evidently is necessary for considering their economic and political implications. Unfortunately, the structure, or composition, of the liabilities is even harder to estimate than the totals.

The data used to estimate total liabilities obviously provide some materials for analyzing the debts by type. But the largest element, bank credits and loans, represents a mixture of two quite different kind of liabilities—from credits directly related to specific exports and from credits and loans not so related. This distinction is important, even though there is a gray area—clean credits and syndicated loans are often extended with some understanding about what the money

<sup>69</sup> Edwin M. Snell, "Eastern Europe's Trade and Payments With the Industrial West," *Reorientation and Commercial Relations of the Economies of Eastern Europe*, published for the Joint Economic Committee, August 16, 1974, pp. 682–724.

will be spent for. In general, credits and loans in domestic currencies are directly related to exports;<sup>70</sup> most of the remainder, not so related. For Eastern Europe and the USSR together, it has been estimated that at the end of 1975, the European BIS members held \$3.3 billion to \$3.8 billion of their assets in domestic currencies, as against \$15.6 billion in Eurocurrencies.<sup>71</sup> That is, up to 20 percent of the assets was directly related to specific exports; 80 percent or more, not so related. Data for the individual East European countries have not been released; it is not even practicable to make comparable estimates for earlier years.

On the assumption that roughly 20 percent of East European liabilities to European commercial banks, or about \$2.3 billion, was in domestic currency, and with the addition of short-term liabilities to the US and most liabilities to Austria, or about \$1 billion, a total of about \$3.3 billion in bank credits was directly connected with specific exports. To this could be added government guaranteed credits of almost \$5 billion, supplier credits of nearly \$1.8 billion, GDR liabilities of almost \$1.3 billion to West Germany, a little over \$0.3 billion owed on US agricultural credits, and Polish liabilities of \$0.4 billion to non-banks in Austria and Switzerland to make all told \$12.1 billion in liabilities directly connected with Western exports, or 50 percent of total gross liabilities. For Bulgaria, the GDR, and Romania, the share is probably somewhere between 40 percent and 50 percent; for Czechoslovakia and Poland, considerably higher; for Hungary, much lower.

A partial breakdown by Western creditor follows readily enough from the available data. It is not practicable to break out bank credits by country for Belgium-Luxembourg, France, the Netherlands, and Italy; accordingly, no effort to break out government guaranteed credits for these countries is attempted. A breakdown of assets and liabilities to commercial banks is shown in Table 13; one for government guaranteed credits, in Table 14; and one for all liabilities and assets, including other types, in Table 15. The largest shares are that of West Germany, nearly one-fourth, followed by the UK, just under one-fifth. France doubtless follows. No other country probably holds as much as 10 percent of the debt; the US share is only 4 percent.

<sup>70</sup> There are counter examples, of course, such as the 100 million DM in Hungarian notes issued on the West German market in 1975. *Duesseldorfer Handelsblatt*, 29/30 August 1975, p. 10. These notes apparently were bought up by West German banks. A special case is that of subscription by banks in the US to syndicated loans denominated in dollars.

<sup>71</sup> See footnote 3, p. 1372. The figures include assets with the U.S.S.R.

TABLE 13.—BREAKDOWN OF ASSETS OF COMMERCIAL BANKS WITH EAST EUROPEAN COUNTRIES BY WESTERN COUNTRY<sup>1</sup> (END 1975)

[In billions of dollars]

	Bulgaria	Czecho- slovakia	German Democratic Republic	Hungary	Poland	Romania	Total
West Germany.....	0.17	0.13	(*)	0.21	0.67	0.15	1.33
United Kingdom <sup>2</sup> .....	.60	.10	1.04	.64	1.41	.30	4.09
Switzerland.....	.09	.23	.43	.18	.25	.07	1.25

Total.....	1.93	.56	3.43	2.69	4.62	1.05	14.28

<sup>1</sup>Based on totals reported to BIS by countries (table 1), estimates for the United States, Canada/Japan, and Switzerland (table 2), estimates for Austria (table 3), and West German assets (table 9, converted to dollars at 2.6223 Deutschmarks=\$1). Excluded are assets of OPEC countries—see table 16.

<sup>2</sup>West Germany does not report bank assets and liabilities with the German Democratic Republic; those not included in the clearing account were probably still very small in 1975.

<sup>3</sup>United Kingdom assets and liabilities are only for Eurocurrencies, but those in sterling are probably very small. Assets are given as reported in the Bank of England Quarterly Bulletin, table 21. Data include assets and liabilities of "certain other institutions" (than banks); a comparison of assets and liabilities in foreign currencies with "nonresidents" as reported in the Quarterly Bulletin and in BIS press releases shows that these other institutions are included in reporting to and by the BIS.

<sup>4</sup>Assets of Austrian banks are shown net, not gross.

<sup>5</sup>Negligible.

<sup>6</sup>Residual for those countries reporting to the BIS not separately shown above; the numbers perforce include the very small United Kingdom assets and liabilities in sterling.

TABLE 14.—BREAKDOWN OF GOVERNMENT GUARANTEED CREDITS TO EAST EUROPEAN COUNTRIES BY WESTERN COUNTRY (END 1975)

[In billions of dollars]

	Bulgaria	Czecho- slovakia	German Democratic Republic	Hungary	Poland	Romania	Total

United States.....	.10	(*)	.11	.01	.56	.18	.96	4
Canada/Japan.....	.10	.04	.12	.08	.35	.11	.80	3
OPEC countries.....	.13			.05	.02	.48	.68	3
IMF/IBRD.....						.19	.19	1
Total.....	2.61	2.21	5.13	3.28	7.92	* 2.97	* 24.12	10

<sup>1</sup> From tables 13 and 14, above, plus items entered under "supplier credit" and "other" in table 11.<sup>2</sup> Negligible.<sup>3</sup> Sums of addenda differ from totals because of rounding.

Such a breakdown of overall assets by creditor country is in fact rather misleading in that a very substantial part of the total held by banks in Western Europe arises from the funds of foreign-owned banks—notably, but by no means exclusively, US and Communist banks. The policies are made, and the risks assumed, in the country of ownership, not that of location, although the history and general banking policy of the UK, for example, are influential in making London a center of international banking.

A breakdown by maturities would surely be the most useful of all, but there is not enough information, least of all about the assets of Western banks, to work out a schedule of repayments. The long-term element of bank credit and loans can be approximated from publicized Eurocurrency loans, although terms of payment—especially grace periods—are not always available. Long-term government guaranteed credits and loans can be estimated from Table 5, above, to which OPEC loans, Romanian drawings on IMF (in part) and IBRD, West German official credit, and Polish obligations under PL 480 should be added. The resulting estimates of long-term credits and loans outstanding are shown in Table 16, in total amount and shares of aggregate obligations. The shares range widely, from 40 percent for Romania to 8 percent for Czechoslovakia and 9 percent for the GDR. For the other three countries, the share is close to one-fourth. It is a bit less than that for East European obligations as a whole. Perhaps two-thirds of the long-term obligations shown will fall due by 1980.

TABLE 16.—LONG-TERM OBLIGATIONS AS A SHARE OF TOTAL EAST EUROPEAN LIABILITIES (END 1975)<sup>1</sup>

(Dollar amounts in billions)

	Bulgaria	Czech- oslovakia	German Demo- cratic Republic	Hungary	Poland	Romania	Total
Syndicated credits and loans <sup>1</sup>	\$0.23		\$0.11	\$0.76	\$0.98		\$2.08
Government-guaranteed credits and loans <sup>2</sup>	.18	\$0.18	.36	.08	.80	\$0.45	1.93
OPEC loans <sup>3</sup>	.13			.05	.02	.48	.68
IMF/IBRD drawings <sup>4</sup>						.13	.13
West German "official" credits <sup>5</sup>	.08				.13	.10	.31
Polish obligations under Public Law 480 <sup>6</sup>					.25		.25
Total long term	.62	.18	.47	.89	2.18	1.18	5.40
Total obligations <sup>7</sup>	2.61	2.21	5.13	3.28	7.92	2.97	24.12
Long-term obligations as percentage of total obligations	24	8	9	27	28	40	22

<sup>1</sup> Based on reports in financial journals and East-West trade publications, together with more comprehensive aggregate data in OECD Financial Statistics, the IMF Survey, and bond prospectuses issued by the National Bank of Hungary. Cover obligations with repayment terms of over 5 years.

<sup>2</sup> From table 5, above, except for the GDR. The entry for the GDR includes an estimate of outstanding long-term credit in intra-German trade, from Treuarbeit AG (credit insurance organization for intra-German trade). Semiofficial breakdowns, of the clearing balances with the GDR (as shown on p. 1382) indicate only short- and medium-term credit is provided but Treuarbeit AG can provide credit of up to 8 yr.

<sup>3</sup> From p. 1377.

<sup>4</sup> Include gold and credit tranches from the IMF, but not drawings on standby credit. Drawings on IBRD credit are all long term. See p. 1385.

<sup>5</sup> See pp. 1383-84.

<sup>6</sup> See p. 1384.

<sup>7</sup> From table 11.

To divide the large remainder between medium-term and short-term obligations is scarcely possible. One may guess—on the strength of US and West German data—that from one-third to one-half of all bank credits directly connected with exports, or from \$1.1 billion to \$1.8 billion, is short-term. Perhaps one-third of West German supplier credits, another \$0.6 billion, is short-term, and perhaps \$0.6 billion to \$0.7 billion in Western government guaranteed credits. Finally, a very uncertain amount of Eurocurrency liabilities, from \$2 billion to \$4 billion, would be short-term, mainly under lines of credit renewed (rolled over) from period to period. Thus from \$4.3 billion to \$7 billion, more or less, or from 20 percent to nearly 30 percent of all liabilities are short term. The share is probably less than 20 percent for Hungary, Poland, and Romania.

The remainder, ranging from 40 percent for Romania to between 60 percent and 70 percent for Czechoslovakia and the GDR, is made up of medium-term credit, that is, credit running from over 1 year up to 5 years. In order to calculate debt service, schedules of liabilities in this range would be especially necessary. That is least of all practicable at the moment. Since a great deal of the borrowing in this range occurred in 1974-75, it is a fair guess that a great deal of it will have been repaid within another year.

# THE MFN IMPACT ON U.S. IMPORTS FROM EASTERN EUROPE

## 1. INTRODUCTION AND SUMMARY

The thaw in East West relations which began in the late 1960s has led to greatly increased trade between the CMEA<sup>1</sup> nations and the industrialized West. The United States, however, has lagged behind the other Western countries in developing inter-governmental commercial agreements with the communist countries, in liberalizing export restrictions, in granting financial concessions, and in reducing discriminatory restrictions against CMEA country imports.

At present, the United States is the only major Western industrialized country which has not granted Most Favored Nation (MFN) tariff treatment<sup>2</sup> to all of the communist countries discussed in this paper. Poland has been receiving MFN treatment from the United States since 1960, and Romania since mid-1975. None of the other communist countries receives MFN from the United States.

Official representatives of the Soviet Union, and of other Eastern European communist countries that do not receive MFN treatment from the United States, frequently assert their belief that the granting of MFN would enable their countries to increase greatly their exports to the United States. In addition, they see in MFN a political signal of more relaxed relationships.

This paper treats only the economic aspect of MFN. It attempts to answer two questions:

1. How much greater would U.S. imports from Bulgaria, Czechoslovakia, the German Democratic Republic (G.D.R.),

\*The authors wish to thank Anne Griese and David Sanderson for their statistical assistance.

<sup>1</sup> CMEA stands for the Council for Mutual Economic Assistance also known as COMECON. The members are Bulgaria, Cuba, Czechoslovakia, the German Democratic Republic (G.D.R.), Hungary, Mongolia, Poland, Romania, and the U.S.S.R.

<sup>2</sup> "Most Favored Nation" is not an apt description of the set of tariff rates that the expression designates. The United States as well as other Western countries provide still more favorable rates than the "Most Favored" rates for selected trade partners. A better nomenclature might be "Non-discriminatory" tariff treatment, which is to say, not adversely discriminatory against communist countries per se.

Hungary, Romania, and the U.S.S.R. have been in 1974 and 1975, if these countries had been receiving MFN tariff treatment from the United States in these two years;<sup>3</sup> and

2. How much lower would U.S. imports from Poland have been in these two years had Poland not been receiving MFN treatment.

The model used is of a comparative statics type, which means that estimates include the total impact of MFN, after all of its effects had been realized, given the other conditions pertaining in 1974 and 1975. The validity of our model for predicting the impact upon U.S. imports from the communist countries if MFN is granted at some future time is discussed in the final section of the paper.

The model provides an econometric estimation of the relative shares of the Industrialized Western<sup>4</sup> (I.W.) countries in the total I.W. imports of any given product from a given Eastern country. The share of a particular I.W. country is assumed to be explicitly dependent upon several variables, among them the tariff it raises against the given product from the given Eastern country. Once the parameters of the relationship have been estimated from actual data, a hypothetical tariff rate can be inserted into the equation, in place of the actual rate, and the corresponding new share calculated. The model is described in detail in Section 3.

Calculations were made for the years 1974 and 1975 for a substantial portion of the exports to the West of each of the Eastern countries, at the 4 or 5-digit SITC<sup>5</sup> level of product disaggregation. The results obtained for U.S. imports from the Eastern countries under the assumption that MFN had been granted to all of them indicate generally modest rises in total imports, but marked rises for a small number of products. The model indicates that, given MFN, total imports from the U.S.S.R. would have risen 7-9 percent, the lowest percentage rise of the six countries; imports from the G.D.R. would have risen well over 200 percent, the largest percentage rise of the six. But the percentage rises ran roughly inversely to the value of total U.S. imports from each country. The predicted percentage rises generally translated into a rise in imports from each country of about \$30 million, yielding a rise in total imports from the six countries, in both 1974 and 1975, of roughly \$185 million, an amount equal to 30 to 40 percent of the actual totals for these years. The estimated increases for each country may be found in Table 1 of Section 4.

On the individual product level, the greatest effects would have been on clothing; zinc, aluminum and copper; wooden furniture; and iron and steel (not high carbon or alloy) semimanufactures. The model indicated that U.S. imports of these items from most of the Eastern countries would have increased noticeably. In addition, rises were pre-

<sup>3</sup> Romania has been receiving MFN tariff treatment since August 3, 1975. To the extent that the granting of MFN affected U.S. imports from Romania during the last half of 1975, our prediction of the rise is already incorporated in the actual data. It is our belief that the total impact would not be felt until several years after MFN had gone into effect, and this supposition would appear to be borne out by comparison of actual 1975 U.S. imports from Romania and the predicted increase, provided in Table 8 of Section 4.

<sup>4</sup> The group of countries herein designated as "Industrialized Western" (I.W.) consists of Austria, Belgium, Canada, Denmark, The Federal Republic of Germany (F.R.G.), France, Italy, Japan, Luxembourg, the Netherlands, Norway, Sweden, Switzerland, the United Kingdom and the United States. Belgium and Luxembourg report trade data as a combined customs union.

<sup>5</sup> SITC is the Standard International Trade Classification nomenclature used by the United Nations. The highest level of disaggregation is the 4-digit level for some types of products and the 5-digit level for others. Successive digits added to a given numerical code signify successive subcategories of the class with the same initial digits. There are a total of 56 2-digit divisions, subdivided down to 1312 items at the 4- to 5-digit level.

dicted for such country specific products as canned vegetables from Bulgaria, hops and ferro-alloys from Czechoslovakia, cameras from the G.D.R., and alumina from Hungary. Details are provided in Tables 3 through 9 of Section 4.

Finally, it would appear from our analysis that if Poland had not been receiving MFN treatment in 1974 and 1975 then total U.S. imports from Poland would have been only 2 to 3 percent lower.<sup>6</sup> Clothing items, as usual, were the big gainers from MFN. Zinc, copper, synthetic rubber, and foundry equipment would also have been affected.

## 2. COMPARISON WITH PREVIOUS WORK

Earlier predictions of the MFN-induced rise in aggregate U.S. imports from Bulgaria, Czechoslovakia, the G.D.R., Hungary, Romania, and the U.S.S.R. ranged from a low of 0 to 19 percent,<sup>7</sup> through 129 to 194 percent,<sup>8</sup> to a still higher-reaching span of 103 to 252 percent.<sup>9</sup> All three of these sets of estimates apply to the year 1971, three to four years earlier than the period examined in the present paper. These percentage rises may be compared with our estimates of 30 to 40 percent, higher than the lowest range previously predicted, but considerably lower than the other two sets of results.

The study by Jelacic, which indicates the smallest estimated impact, was based on data for total imports from each European CMEA country by each of twelve Western countries; there was no commodity disaggregation. The Wolf study, with intermediate range results, disaggregated U.S. imports to the SITC 2-digit level, but part of his analysis depended on data at a higher level of aggregation. The third study, by Elias and Searing, remained consistently at the 2-digit level. Our study, on the other hand, examines products at the SITC 4 or 5 digit level, a much higher degree of disaggregation than that of any previous quantitative study, and a level close to that upon which the tariff structures of the Western countries actually impinge.<sup>10</sup>

Because we have adapted elements from each of these previous studies, we will briefly outline their approaches to the MFN problem.

The Wolf study, resulting in the intermediate range of estimated percent rise in imports, was the earliest of the three. Wolf decomposed the MFN impact into two theoretical effects: (1) The substitution of lower cost (because of lowered tariff) communist products for import-

<sup>6</sup> These results, obtained here from cross-section analysis, reinforce previous work on the Polish response to MFN based on time series analysis, that discerned very little MFN sensitivity. See Thomas A. Wolf, *Effects of U.S. Granting of Most Favored Nation Treatment to Imports from Eastern Europe: The Polish Experience*, International Institute of Management, Berlin, (February, 1973).

<sup>9</sup> Thomas A. Wolf "The Impact of Formal Western Restraints on East-West Trade: An Assessment of Existing Quantitative Research" in John P. Hardt, ed., *Tariff, Legal and Credit Constraints on East-West Commercial Relations* Institute of Soviet and East European Studies, Carleton University, Ottawa, Ontario, Canada (1975).

<sup>10</sup> Professor Wolf has written a number of papers on various aspects of East-West trade barriers, and is a leading authority on the subject.

<sup>11</sup> Andrew Elias and Marjory E. Searing "A Quantitative Assessment of U.S. Constraints on Trade with Eastern Europe and U.S.S.R." in John P. Hardt, ed., *Reorientation and Commercial Relations of the Economies of Eastern Europe*, Joint Economic Committee of Congress (Aug. 16, 1974) pp. 599-661.

<sup>12</sup> In the United States, the Tariff Schedule (T.S.U.S.) applies at the 5-digit level of disaggregation, but the T.S.U.S. nomenclature differs from the SITC nomenclature. The tariff rates applicable to those 5-digit T.S.U.S. categories which concord with a given 4 or 5-digit SITC category had to be averaged in order to be applied to data expressed in SITC nomenclature. It was necessary to use SITC nomenclature throughout because only then could the data of the various Western countries be compared. Other Western nomenclature is similarly country-specific, and also needed to be converted to a common nomenclature.

competing products produced in the United States, and (2) the substitution of lower cost communist products for imports from foreign countries that had already been enjoying MFN in the U.S. market. The second effect was taken into account by a market shares approach, since estimates of elasticities of substitution were lacking.<sup>11</sup> For each 2-digit SITC product group, the communist country market share in a group of other Western markets where communist products received MFN treatment (the O.E.C.D. countries other than the United States) was compared with its share in the United States. The share in the other Western markets was taken to correspond to the U.S. MFN share provided that: (1) The difference between U.S. and other Western market shares was above average; (2) the product was one of "rapid" growth in communist country exports; (3) the discriminatory tariff rate was more than twice the MFN rate; and (4) the product was not subject to "high" transport costs. The results of this market share approach were then augmented by a rough evaluation of the first substitution effect—substitution of communist country products for domestically produced products—for those products not subjected to the market share approach. These remaining products were assumed not to be candidates for displacing other foreign imports. Their MFN response was calculated using elasticity estimates for five major product groups.<sup>12</sup>

Wolf's market shares approach bears a strong relationship to the approach used in the present paper. To put it very simply, he supposes that, subject to meeting provisos (1)–(4) above, the communist product market share in the United States under MFN will be given by:

$$(2.1) \frac{\text{Communist country} \rightarrow \text{U.S.}}{\text{World} \rightarrow \text{U.S.}} = \frac{\text{Communist country} \rightarrow \text{Other West}}{\text{World} \rightarrow \text{Other West}}$$

where the arrow signifies direction and value of export flow of a given product. We may rearrange this equation to read:

$$(2.2) \frac{\text{Communist country} \rightarrow \text{U.S.}}{\text{Communist country} \rightarrow \text{Other West}} = \frac{\text{World} \rightarrow \text{U.S.}}{\text{World} \rightarrow \text{Other West}}$$

In other words, if each Western country, the United States included, were to grant the same tariff rates to the communist country as to the world as a whole, and if provisos (1)–(4) above were satisfied by the product in question, then the distribution of the Eastern export between the United States and the other Western countries would be the same as the distribution between these two regions of exports of this product from the world in total. The explicit modifying con-

<sup>11</sup> The market shares approach in fact incorporates the first effect as well, namely substitution of lower cost imports for domestic goods.

<sup>12</sup> The market share approach accounted for 86.8 percent of the total MFN-induced rise in U.S. imports estimated by Wolf. This large percentage of the rise was attributable to only those 10 SITC 2-digit groups (of the total 56) that passed his four stringent provisos. If he had relaxed his criteria for applying the market share technique (as, we shall see, Elias and Searing did), the elasticity approach would have dwindled away, and his total estimate would have been a good bit larger. It should be noted that the remaining 13.2 percent of the total rise accounted for by the direct elasticity approach was spread out in exceedingly small quantities over the remaining 46 product groups. If the size of these predictions of domestic product displacement are an indication of the portion of the market share approach predictions that might be attributable to displacement of domestic (rather than other foreign) products in the U.S. market, then domestic producers on the whole would have little cause for alarm.

ditions (provisos (1)-(4)) pertain chiefly to supply availability of communist country product and acceptibility of the product in the West; a sufficiently significant U.S. discriminatory tariff to suggest that a change in share is likely to follow its removal; and a transport cost factor. Equation (2.2), plus qualitatively similar but econometrically specified modifying factors, form the foundation of the model used in the present paper.<sup>13</sup>

Jelacic's model, like ours and unlike Wolf's, is econometric. Both Jelacic's model and ours apply multivariate regression analysis. Jelacic's model produced the lowest estimates of MFN effect, and ours are also on the low side. But Jelacic did not make use of market shares, and this difference in form is fundamental. Furthermore, his model considered only total imports while ours is highly disaggregated; and his model treats MFN as an "on-off" dummy variable, while ours deals in actual tariff rates.

In a cross-sectional analysis of twelve Western countries' imports from nine communist countries, Jelacic regressed imports against the GNP of the exporting country (a proxy for supply capabilities), GNP of the importing country (representing market size), economic distance between the two countries, and a dummy variable indicating the existence or denial of MFN treatment.

A relationship which links the importing and exporting countries in this fashion, i.e., a relationship dependent only upon the characteristics of the specific exporting and importing countries, does not specify a redistribution of product flows affecting third parties. One could, of course, add such a specification to this model. On the other hand, a market shares approach unavoidably includes such induced readjustments, because market shares must of necessity continue to sum to 100 percent.

Despite the differences of approach, the Jelacic model, and its selection of variables, had a significant input into our treatment of the problem.

<sup>13</sup> Another aspect in which the present study differs from Wolf's is in the degree of disaggregation. Disaggregation in and of itself can significantly affect the results. Consider the following hypothetical example: suppose one wants to predict U.S. imports of SITC 01 from Country X, using Country X shipments of this commodity to Western Europe as the reference market. SITC 01 is subdivided into subgroups 011, 012, and 013. Assume that the shares of Country X in the reference market are as follows:

	West Europe import value	Country X market share 3-digit level
SITC 011:		
World to Western Europe.....	\$20	1/20=0.05
Country X to Western Europe.....	1	
SITC 012:		
World to Western Europe.....	50	1/50=0.02
Country X to Western Europe.....	1	
SITC 013:		
World to Western Europe.....	30	3/30=0.10
Country X to Western Europe.....	3	

At the 2-digit level, the share of Country X in the reference market would be  $(1+1+3)/(20+50+30) = .05$ . If, then, the total dollar value of U.S. imports from the world of SITC 01 were \$100, a model formulated at the 2-digit level would predict that country X would supply \$5 of this total after MFN was granted. But suppose that the U.S. has different preferences for SITC commodities 011, 012, 013 than does West Europe. If, for example, the entire \$100 of U.S. imports from the world of SITC 01 were in category SITC 012, then a model formulated at the 3-digit level would predict U.S. imports of SITC 01 from country X, following the granting of MFN, to be only \$2. At the other extreme, the prediction could rise as high as \$10. The higher the degree of disaggregation, the more specifically tailored the model will be to actual U.S. demand.

See footnote 27 below, for a flagrant example of an aggregation error that the authors of this paper came close to committing.

The Elias and Searing article appeared at about the same time as the Jelacic study. Their attempt to isolate the MFN impact was, like ours and Wolf's, based on a market shares approach. Elias and Searing reasoned that if normalized trade relations were to exist between the United States and the communist countries, then the communist countries would be able to capture the same percentage of the U.S. market as they in fact capture in some analogous reference market that has no discriminatory trade barriers. In fact, this is Wolf's trade shares model again, in slightly altered form. Two reference markets were used: (1) Canada—the basis for their low estimate, and (2) the EEC 6<sup>14</sup> plus the United Kingdom—the basis for the Elias and Searing high estimate. By multiplying the communist share in the reference market by the total imports the United States takes from the world market, they obtained an estimate of "normalized" trade. This figure was then compared to actual trade for the given year, to estimate the trade barrier differential. Finally, in order to separate out the effect of non-tariff barriers, the portion of the differential attributable to discriminatory tariffs alone was taken to be equal to the percentage of U.S. imports from these countries subject to a greater than 5 percent differential between MFN and non-MFN tariff rates.

As a lead into our own model, we will elaborate the Elias and Searing model a bit further. The basic equation for the "high" estimate of their model may be written:<sup>15</sup>

$$(2.3) \quad \frac{[\text{Communist country} \rightarrow \text{U.S.}]_N}{\text{Communist country} \rightarrow \text{W.E.}} \quad [(\text{World-Canada}) \rightarrow \text{U.S.}] \\ = \frac{\quad}{\text{World} \rightarrow \text{W.E.}}$$

where the arrow is again used to signify the value and direction of trade in a given product. "W.E." signifies seven Western European countries, the EEC original six plus the U.K. Finally, the subscript "N" indicates that "normal" trading conditions are assumed. Eq. (2.3) may be rewritten as:

$$(2.4) \quad \frac{[\text{Communist country} \rightarrow \text{U.S.}]_N}{(\text{World-Canada}) \rightarrow \text{U.S.}} \quad = \frac{\text{Communist country} \rightarrow \text{W.E.}}{\text{World} \rightarrow \text{W.E.}}$$

which in effect states the following:

After subtracting out its imports from Canada, the fraction of U.S. imports from the remainder of the world that will originate from a given communist country under "normalized" trade conditions will be equal to the fraction of total "West European" imports from the world of that commodity that derives from that communist country. This is the basic assumption of the "high" version of the Elias-Searing model.

The removal of imports originating in Canada from the United States' total was deemed necessary because, according to Elias and Searing, the Canada-U.S. proximity results in transportation cost savings, long established trading relations, and U.S. ownership of

<sup>14</sup> The EEC original six are Belgium, the Federal Republic of Germany, France, Italy, Luxembourg and the Netherlands.

<sup>15</sup> See Elias and Searing, *op. cit.*, page 612.

numerous Canadian enterprises. But it must be pointed out that some of these arguments may be called forth to explain the relatively high share of East European products in the total imports of, say, the Federal Republic of Germany. The proximity of Western to Eastern Europe in itself should, by this line of reasoning, enhance the share of East European socialist country products in West European imports relative to their shares in U.S. imports. This effect is roughly captured by Elias and Searing by applying the equal share rule only to the non-Canadian fraction of total U.S. imports. The present paper, however, proposes, among other things, a more specific approach to accommodation of the effects of distance.

A rearrangement and modification of Eq. (2.4), that includes relative distances in a more systematic way, is:

$$(2.5) \quad \frac{[\text{Communist country} \rightarrow \text{U.S.}]_N}{\text{Communist country} \rightarrow \text{W.E.}} = \frac{\text{World} \rightarrow \text{U.S.}}{\text{World} \rightarrow \text{W.E.}} \left[ \frac{\text{Distance (Communist country, U.S.)}^a}{\text{Distance (Communist country, W.F.)}} \right]$$

That is to say, given "normalized" trading conditions, the relative distribution of socialist country exports of a given product between any two importing areas, compared to the relative distribution of total world exports of these products, will be a function of the relative distances between the socialist country and the two areas. (The exponent attached to the distance term allows the relationship to be different from simple proportionality.)

Eq. (2.5) would be the model used in the present paper provided U.S. tariff and non-tariff barriers to trade with the communist country did not exist.<sup>16</sup> The model actually used adds further terms to the right-hand-side of Eq. (2.5), accounting for actual tariff differentials and non-tariff barriers. The left-hand-side of Eq. (2.5) is thereby converted into an actual, rather than a "normalized", ratio, and the parameters of the equation can be estimated by multivariate regression techniques. The model is explained more fully in the following section.

### 3. ESTIMATION OF MFN IMPACT

#### A. The Model

The model we have chosen to use estimates the share that will be imported by each Industrialized Western (I.W.)<sup>17</sup> country out of the sum total of exports to the Industrialized West of a given product from a given communist country. The share of each I.W. country is assumed to depend upon (1) its share in world exports of that product to the I.W. as a whole, (2) the tariff rate raised by the particular I.W. country against the given product from the given communist country, (3) the existence or absence of quantitative restrictions (QRs) on that product specifically directed against the given communist country, and (4) the distance between the I.W. country and the communist country.

<sup>16</sup> The model used in this paper also substitutes the "Industrialized West" (see footnote 4 above) for "W.E." in Eq. (2-5).

<sup>17</sup> See footnote 4.

We have avoided making any estimate of a possible increase in total communist country supply to the I.W. as a whole, consequent upon the lowering of tariffs by any one I.W. country. This has probably biased our estimates downward. If one looks beyond the mid-1970s, then there is reason to believe that supply will become more elastic, particularly as mounting hard currency deficits force the CMEA countries to export more to creditor nations. It is likely that those export sectors that are most profitable for sales in the West will be preferentially developed. However, we believe that because of plan and bureaucratic rigidities the supply response will be slow.

Our model, at any rate, addresses itself only to the redistributive effects following a change in tariff rate.

Four forms of the relationship between I.W. shares and the independent variables were tested, two linear and two log linear. The theoretically preferred form of each pair imposed a coefficient of unity upon the share from the world,<sup>18</sup> and in most cases it was this form that gave the most statistically satisfactory results. In almost every case in which the coefficient of the world share was not precisely unity, it was close to that value.

Our estimating equations were:

$$(3.1) \quad CS_{ij,p} = A_0 + A_1 WS_{i,p} + A_2 Dist_{ij} + A_3(1+t_{ij,p}) + A_4 QR_{ij,p}$$

$$(3.2) \quad CS_{ij,p} - WS_{i,p} = A_0 + A_2 Dist_{ij} + A_3(1+t_{ij,p}) + A_4 QR_{ij,p}$$

$$(3.3) \quad \text{Ln } CS_{ij,p} = A_0 + A_1 \text{Ln } WS_{i,p} + A_2 \text{Ln } Dist_{ij} + A_3 \text{Ln } (1+t_{ij,p}) + A_4 \text{Ln } QR_{ij,p}$$

$$(3.4) \quad \text{Ln } CS_{ij,p} - \text{Ln } WS_{i,p} = A_0 + A_2 \text{Ln } Dist_{ij} + A_3 \text{Ln } (1+t_{ij,p}) + A_4 \text{Ln } QR_{ij,p}$$

where

$CS_{ij,p}$  = Share of I.W. country  $i$  in exports by Communist country  $j$  of product  $p$  to the I.W. as a whole;

$WS_{i,p}$  = Share of I.W. country  $i$  in world exports of product  $p$  to the I.W. as a whole;

<sup>18</sup> We may assume that the share of Western country  $i$  in the exports of product  $p$  to the I.W. as a whole, coming from any other country or region, depends upon two types of factors: (1) factors that depend only upon characteristics within the importing countries (country  $i$  and the other I.W. countries) and not upon any characteristics of the exporting country or region; and (2) factors that relate to the exporting country or region or to relationships between exporter and importer. We have explicitly identified distance between exporter and importer, and tariffs and QRs raised against the export product by the importer as factors of the second type. If these were to exhaust the possible factors of type 2 (either directly or as proxies), then factors such as relative demand for product  $p$  by country  $i$ , compared with the I.W. as a whole, independent of the source of the product, would still need to be factored in.

Suppose the two types of factors are additive (we could equally well have assumed a multiplicative relationship). Then

$$\frac{\text{Country } j \rightarrow \text{Country } i}{\text{Country } j \rightarrow \text{I.W.}} \equiv CS_{ij,p} = f_1(\text{relative demand}_{i,IW,p}, \dots) + f_2(\text{distance}_{ij}, \text{tariff}_{ij,p}, QR_{ij,p});$$

and

$$\frac{\text{World} \rightarrow \text{Country } i}{\text{World} \rightarrow \text{I.W.}} \equiv WS_{i,p} = f_1(\text{relative demand}_{i,IW,p}, \dots) + f_2(\text{distance}_{iW}, \text{tariff}_{iW,p}, QR_{iW,p}).$$

Rearrangement of the second equation and substitution into the first yields

$$CS_{ij,p} = WS_{i,p} + f_2(\text{distance}_{ij}, \text{tariff}_{ij,p}, QR_{ij,p}) - f_2(\text{distance}_{iW}, \text{tariff}_{iW,p}, QR_{iW,p}).$$

- Dist<sub>*ij*</sub> = air distance between the capitals of countries *i* and *j*;  
 $t_{i,p}$  = ad valorem equivalent tariff rate (expressed as a fraction) imposed by I.W. country *i* on product *p* of Communist country *j*.  
 $QR_{i,p}$  = a dummy variable expressing the existence or absence of any type of quantitative restriction<sup>19</sup> on product *p* imposed by I.W. country *i* specifically against Communist country *j*.

It is most important to note that we have not included in these equations a built-in mathematical condition that causes the predicted shares to sum to 100 percent after the coefficients have been estimated or the values of the independent variables altered.<sup>20</sup> In every case, it is the relative values of  $CS_{i,p}$  that are provided directly by the equations, and a change in any variable for any one I.W. country necessitates the recalculation of relative shares for all 14 I.W. countries, so that the sum of the recalculated shares (which may add up to less or more than 100 percent) may be used to normalize the total to 100 percent again.

The interpretation of Eqs. (3.1) and (3.3) differs somewhat from that of Eqs. (3.2) and (3.4). The equations which constrain the coefficient of the world share to unity predict that if all tariffs and QRs were identical in all of the I.W. countries, then the (linear or ratio) differentials between world shares and communist country shares would be a function of distance alone. But where the coefficient  $A_1$  is different from unity, the world shares may be taken to represent relative strength of demand (or market size) in the different I.W. countries; it would then be quite reasonable to find that their contributions to the relative shares from the communist countries have a higher or lower weight than unity.

A few words must be said about the concept of "distance". Distance is a proxy for freight charges, but it is also a measure, albeit imperfect,

<sup>19</sup> The use of a 2-valued dummy variable leaves a great deal to be desired. It does not distinguish between the various types of QRs nor does it determine how stringently each QR is being applied. QRs may comprise complete prohibition, country-specific quotas, global quotas, seasonal restrictions, discretionary licensing, monopsonistic trading arrangements, etc. Nevertheless, it was deemed better to enter some QR variable into the model, rather than to allow its total effect to be blended in an ill defined way with the effects on trade flows of the remaining variables. However, none of the equations of appendix B contains QR terms.

Our sources for information on QRs in effect in 1974 and 1975 were:

(1) *Official Journal of the European Communities* Vol. 17 No. L 358 (31 December 1974).

(2) Materials reported by the Joint Working Group on Import Restrictions in the GATT document COM.IND/W/117-COM.A.G/W/94 (30 December 1975).

(3) Additional collated material provided by personnel in the Bureau of East-West Trade.

<sup>20</sup> A linear regression, which is what we employ in this article, preserves the sum of the dependent variables. In the case of Eq. (3.1), this means that

$$1 = \sum_i^N CS_{i,p} = \sum_i^N \widehat{CS}_{i,p} = NA_0 + A_1 \sum_i^N WS_{i,p} + \dots + A_2 \sum_i^N (1+t_{i,p}) + A_4 \sum_j^N QR_{i,j,p}$$

where a variable with a hat signifies an estimated variable. But if any one of the tariff rates were to alter, the right hand side would no longer sum to unity. If we were to use a tariff variable represented by

$$\frac{N}{(1+t_{i,p}) \sum_i^N (1+t_{i,p})}$$

in place of the tariff variable of Eq. (3.1), then the denominator of the variable would alter whenever any of the tariff rates were changed and the revised estimates of the dependent variables would continue to sum to unity. There would then be no need to calculate the shares of all the other I.W. countries in order to properly scale the newly estimated U.S. share (with the MFN tariff rate). Furthermore, the equation for any other I.W. country would also immediately reflect the change in share of this other country consequent upon a change in U.S. tariff rate. The same argument would hold for Eq. (3.2).

However—although we did not give the matter intensive thought—we could not perceive a modification of Eqs. (3.3) and (3.4) that would similarly preserve the sum of shares. The dependent variables are in these cases logarithms of shares: the linear regression technique, while preserving the sum of the logarithms of the shares, thereby alters the sum of the shares themselves.

We therefore routinely recalculated all equations and scaled the sums to unity.

of a number of important intangibles. Proximity is a determinant of political and cultural relations, of long acquaintance and historical traditions. It is an ingredient in the formation of informal business ties, and easy access for information, negotiation, and post-contract servicing. For all of these reasons, we feel that freight distance is not necessarily the most significant type of distance.

### B. The Estimating Procedure

For each product and for each Eastern European Communist country (including Poland and the U.S.S.R.), actual data for each of the 14 I.W. countries (including the United States) for the year 1974 was entered into variant forms of the estimating equations.<sup>21</sup> Although 1975 data was available, 1974 was selected for two reasons. In the first place, 1975 was a year of marked decline in the rate of increase of total I.W. imports from the communist countries, a reflection of the 1974-1975 recession in the West. The actual values of the relative shares,  $CS_{i,p}$ , fluctuated noticeably between 1973 and 1975, while the relative shares from the world,  $WS_{i,p}$ , remained fairly stable. To smooth the fluctuations in the shares of the communist country exports, we used 3-year (1973-1975) averages for their values.

Second, the only available I.W.-wide set of ad valorem equivalent tariff rates concurred to our 5-digit SITC data had been calculated using 1972 world trade figures as conversion weights (conversion from specific tariffs to ad valorem equivalents, where necessary, and conversion from individual country product classes to Brussels Tariff Nomenclature groupings). Given time and other input constraints, we could neither update the weighting nor convert it to communist country trade rather than world trade weights.<sup>22</sup> At any rate, the basic 1972 rates were generally applicable in 1974,<sup>23</sup> and relative weights within each B.T.N. classification had probably changed little, for most relevant product categories, by 1974.

For each product, the 14 sets of data were run through Eqs (3.1)-(3.4) plus variants of these four equations that omitted one or more of the independent variables. The criteria for acceptance of the results were conformity of coefficients to expected signs and t-tests at the 0.1 or better level of significance. Beyond that, if several variants met both tests, selection was made on the basis of the number of variables included in the model, the theoretical structure of the variant (equations of type (3.2) or (3.4) were preferred), and the value of  $\bar{R}^2$ , in roughly that order. In a few instances, marginally acceptable equations were admitted.<sup>24</sup>

<sup>21</sup> In addition to Eqs. (3.1)-(3.4), various deletions of the explanatory variables were also tested; many of the combinations did not prove to have all of the estimated coefficients significant at the 10 percent level.

<sup>22</sup> Actually, world trade weights may be preferable to communist country trade weights for an I.W. country whose imports from the communist country are distorted by lack of MFN. Among other things, tariff averages based on imports from the world will include products that may come from the communist country once MFN is granted, but have been completely excluded without MFN.

<sup>23</sup> The 1972 ad valorem equivalent tariffs for the I.W. countries were obtained from the GATT Tariff Study tapes. The 1972 tariffs were revised to account for the tariff relations within EEC, within EFTA, and between EEC and EFTA. For example, the average tariff that an EEC member country placed on a given 4- or 5-digit product that it imported from the world was decomposed into the weighted sum of imports at zero rates from the other EEC countries, the applicable rates for 1974 for imports from EFTA countries, and the higher than average rates (the "MFN" rates) paid by the rest of the world, including the communist countries.

<sup>24</sup> All of the equations used in this study are displayed in Appendix B, with their statistical characteristics.

The product sample used in our analysis covers the top 50 exports of each Eastern European communist country to the I.W. as a whole, as ranked by value in 1975. Obviously, this selection procedure excludes a large number of goods from consideration. However, any cut-off point short of complete enumeration is arbitrary. We believe that a sample consisting of the top 50 products is large enough to strike a judicious balance between breadth of coverage and manageability of research proportions. On a dollar value basis, the top 50 items constituted between 60 and 88 percent of the exports of each CMEA country to the I.W. in 1975.<sup>25</sup>

From this initial sample, we weeded out those commodities for which the difference between the U.S. discriminatory and MFN tariff rates did not exceed 5 percent,<sup>26</sup> those which were not included in the U.S. tariff nomenclature at all (ships other than pleasure craft, and made-up canvas goods), and those for which the U.S. share of the world's exports to all of the I.W. was zero (whalemeat)<sup>27</sup> or less than 0.05 percent (sunflower seed oil) in 1974 and 1975.

Once the most acceptable estimating equation and its coefficients were derived for each product and each communist country, the U.S. MFN tariff value (or, in the case of Poland, the discriminatory value), along with the other relevant U.S. data, was inserted into the equation. All I.W. shares had to again be revised so that the total would sum to 100 percent; the new predicted U.S. share minus the old was then the predicted change in share. For the years 1974 and 1975 this change in share was multiplied by actual total I.W. imports of the product, to arrive at our estimate of the MFN-induced increase (or, for Poland, decrease following a hypothesized absence of MFN) of U.S. imports of the product from the particular communist country.

To arrive at the final MFN estimate, the sum of the top 50 sample product results had to be extended to the entire set of imports. Clearly there were items below the top 50 which were tariff sensitive despite their omission from the sample tested. To compensate, we scaled up the sample results, multiplying by the following ratio:

$$\frac{\text{value of total imports from communist country by U.S.}}{\text{value of I.W. top 50 items imported from communist country by U.S.}}$$

This procedure assumed that the distribution of tariff sensitive items among the remaining products was the same as that for the sample products. In most cases, the total value of the sample products imported by the U.S. was in excess of 70 percent of the value of total imports, so that the bulk of the product value had in fact been tested. The total values tested, and total imports, are provided in Tables 3 through 9 of Section 4.

<sup>25</sup> For complete listings of the 1975 top 50 exports to the I.W. by each communist country, see the article by Lenz and Kravalis elsewhere in this volume.

<sup>26</sup> The ad valorem equivalents of U.S. MFN (column 1) and non-MFN (column 2) tariff rates used in this study are provided in Appendix A.

<sup>27</sup> SITC 01189 comprises "Meat and Edible Offals, not elsewhere specified." It occurs among the U.S.S.R. top 50 exports to the I.W. in 1975. Furthermore, the United States imports substantial quantities of products that fall into this category. Our model, mechanically applied, predicted increases of about \$1.5 million in U.S. imports of SITC 01189 from the U.S.S.R. in 1974 and 1975 had MFN been in effect.

On closer examination, it turned out that almost the entire amount of I.W. imports of SITC 01189 from the U.S.S.R. is whale meat. In 1972 the U.S. Congress passed the Marine Mammals Protection Act which, *inter alia*, forbids the importation of whale meat or any other parts of whales into the United States. We scratched our prediction.

## 4. THE PREDICTED MFN IMPACT

Table 1 shows the predicted changes in U.S. imports from each of the seven Eastern European CMEA countries under non-MFN and MFN conditions.

TABLE 1.—U.S. IMPORTS FROM EASTERN EUROPEAN CMEA COUNTRIES AND THE U.S.S.R. UNDER MFN AND NON-MFN CONDITIONS

[Dollar amounts in thousands]

	1974			1975		
	Actual	Estimated MFN increase	Percent rise	Actual	Estimated MFN increase	Percent rise
Bulgaria.....	\$8,399	\$11,602	138.1	\$20,217	\$9,128	45.1
Czechoslovakia.....	45,562	33,039	72.5	34,629	59,535	171.9
German Democratic Republic.....	14,129	39,081	276.6	11,250	27,439	243.9
Hungary.....	75,407	32,387	42.9	34,652	29,276	84.5
Romania.....	130,516	34,211	26.2	132,956	38,729	29.1
U.S.S.R.....	349,518	31,832	9.1	254,199	18,989	7.5
Total.....	623,531	182,152	29.2	487,903	183,096	37.5

	Actual	Non-MFN decrease	Percent fall	Actual	Non-MFN decrease	Percent fall
Poland.....	\$265,931	\$7,271	2.7	\$243,079	\$5,246	2.2

<sup>1</sup> Calculated on the assumption that the extraordinary \$50,600,000 gold coin imports of 1974 would not have been increased by MFN (metal coins are duty-free, with or without MFN).

<sup>2</sup> Part of the estimated increase may already be incorporated in the actual 1975 imports from Romania, since MFN was in effect as of Aug. 3, 1975. The percent rise would thus be greater (the same increase divided by a smaller base). Judging, however, from table 8 the granting of MFN does not appear to have had much impact during 1975 on those items among the 1975 I.W. top 50 that were judged to be MFN-sensitive.

<sup>3</sup> Because of the granting of MFN to Romania in 1975, part of this increase may already be included in total actual imports, and may therefore represent a slightly higher percent rise. See footnote 2.

In 1974 the United States imported \$889.5 million worth of goods from these seven countries. Of this total, \$265.9 million came from Poland, which had long been receiving most favored nation tariff treatment. If the other six countries had also been receiving MFN tariff treatment from the United States for some years, the 1974 imports from these six, according to the methodology of this paper, would have been larger than the actual value of imports from the six by \$182.2 million. This represents a 29.2 percent increment in imports from the six affected countries.<sup>28</sup>

In 1975, U.S. imports from the seven countries dropped to \$731.0 million, despite the fact that Romania was granted MFN status as of August 3 of that year. Overall, the impact of the U.S. recession overshadowed the MFN action; imports from Romania scarcely rose (from \$130.5 million in 1974 to \$133.0 million in 1975).

Had MFN been in effect for all the Eastern CMEA countries for the entire year 1975, our model predicts that U.S. imports from these countries would have been higher by a total of \$183.1 million, a rise of 37.5 percent of actual 1975 imports from the six countries affected by the granting of MFN.<sup>29</sup>

<sup>28</sup> It is quite likely that most of the predicted rises represent displacement of imports from other foreign countries rather than either displacement of domestically produced goods or an absolute increase in U.S. imports. See footnote 12, above for a discussion of Wolf's investigation of this question.

<sup>29</sup> The percentage rise is probably exaggerated because part of the increase predicted for Romania may have already been incorporated into the 1975 imports from Romania.

On the other side of the coin, our calculations indicate that U.S. imports of Polish goods in 1974 were \$7.3 million higher than they would have been had Poland not been receiving MFN treatment. In 1975, the differential was \$5.2 million. These values represent only 2.7 percent and 2.2 percent, respectively, of actual U.S. imports from Poland in 1974 and 1975.<sup>30</sup>

When considering these results, it should be kept in mind that the granting of MFN to these countries may possibly induce increased U.S. export sales to these countries as well as increased imports. Even without U.S. export increases, however, the 1974 and 1975 U.S. export surpluses in trade with the U.S.S.R. would still have been large; we would have run very small surpluses or deficits in total in trade with the other five countries, but if Poland is included, in the aggregate the U.S. surplus with East Europe (without the U.S.S.R.) would have remained large. The figures are provided in Table 2.

TABLE 2.—U.S. IMPORTS, EXPORTS, AND SURPLUSES UNDER MFN, 1974 AND 1975

[In millions of dollars]

	1974			1975

<sup>1</sup> Assumes no increase in purchases from the United States by the Eastern countries in response to the granting of MFN.

<sup>2</sup> Assumes that none of the predicted Romanian increase was already incorporated into actual 1975 U.S. imports from Romania. To the extent that MFN already had an impact, these figures would be smaller.

The discussion below elaborates the item by item details for each of the seven countries.

### *Bulgaria*

The 50 largest dollar value Bulgarian exports to the I.W. cluster into the following groups: food, wine, tobacco and other plant products (26 items); semi-fabricated ferrous metal products and steel scrap (5 items); nonferrous metals (5 items); clothing (5 items); non-electric machinery (3 items); electrical machinery and equipment (2 items); and chemicals (3 items). The remaining item in the top 50 is distillate fuel.

Of the 50 items, 39 bear a U.S. non-MFN tariff differential greater than 5 percent, indicating the possibility of a significant change in U.S. imports due to granting MFN. Of these, one (sunflower seed oil) is not imported in significant amounts by the United States. Of the remaining 38 items, 16 yielded equations with tariff term coefficients statistically significant at the 10 percent level or better. The 16 items are shown in Table 3.

<sup>30</sup> See footnote 6.

Total U.S. imports from Bulgaria		8,399	11,602	20,217	9,128
Estimated percent increase with MFN		138.1		45.1	

<sup>1</sup> The predicted increase in U.S. imports of tomatoes from Bulgaria is probably not reliable. Several MFN tariff rates are applicable to tomatoes depending upon the season, with the lowest rates applying during the winter. Since we uniformly took column 1 (MFN) rates to be the average rate applied to imports from the world, and since U.S. tomato imports derive almost entirely from Mexico, we have very likely applied an MFN rate 40 percent too low. Alternative column 1 rates are not usual, and we do not think that this particular problem arose in other cases.

It should not necessarily be expected that the greatest impact of MFN would fall upon those commodities with the greatest differences between the non-MFN and MFN tariff values. Differing elasticities of response to changing prices, as well as other factors discussed earlier, also affect the total impact. However, in the Bulgarian case the predicted effect of MFN roughly follows the size of the tariff differences.

As a group, the highest tariff differentials occur for the clothing items, with differences of about 35 to 40 percentage points between the ad valorem equivalent tariffs for column 1 (MFN) and column 2 (non-MFN). Four of the five clothing items turned out to be tariff-sensitive at acceptable levels of significance (although the predicted incremental imports for two of the four categories were less than \$500).

The machinery group, with tariff differentials of about 25 to 30 percentage points, contributed four tariff-sensitive items.

Tariff rate differentials for almost all of the other items among the top 50 ranged between 0 and 15 percentage points, with the exception of several agricultural products. Three of the six agricultural items that were sensitive to tariff change (processed food items) had tariff differentials between 24 and 34 percentage points; the one with the highest spread—canned vegetables—contributed about 40 percent of the total predicted MFN-induced increase in imports from among the products tested (the top 50 Bulgarian exports to the I.W.).

The remaining items among the I.W. top 50 for which MFN increases are predicted are iron and steel (except high carbon or alloy) plates and sheets, and unwrought zinc.

## Czechoslovakia

Czechoslovak exports to the West are much more diverse than Bulgarian exports. Nine items fall into the semi-manufactured ferrous metal products category, six into clothing (including footwear), six into coal and petroleum products, four each into food products and wood products, and successively smaller numbers of items are found in the fabrics, refractories, chemicals, electric and non-electric machinery, motor vehicles, furniture, glassware, rubber tire, aluminum, travel bags and printed matter categories.

Of the 50 top items, the U.S. tariff differential exceeds 5 percent for 35, and 13 of these yielded equations with tariff term coefficients significant at the 10 percent level or better. See Table 4 for an itemization.

	Total U.S. imports from Czechoslovakia.....	45,562	33,039	34,629	59,535
	Estimated percent increase with MFN.....		72.5		171.9

Among the top 50, illuminating glassware incurs the highest U.S. tariff differential (50.2 percentage points), and this item is among the tariff-sensitive, although not with the greatest increment, either in absolute value or percentage-wise.

The next highest U.S. tariff differentials occur in the clothing category (about 35 to 40 percentage point differentials). Three of the six clothing items gave evidence of substantial MFN-induced increases.

The very largest MFN-induced increases, however, are predicted for the ferrous semi-manufactures. Although their tariff percentage spreads are only 6 to 15, four of these items account for more than half of the total predicted MFN-induced increase for the I.W. top 50 items, in each of the two years.

The other items of Table 4 show tariff differentials ranging from 6 to 28 percentage points, while a few items with large percentage spreads (e.g., glass tableware and furniture, with differentials of about 36 points) do not show up for increased Czechoslovak sales to the U.S.

## G.D.R.

The G.D.R. exports to the West somewhat resemble those of Czechoslovakia. Here, however, machinery predominates, with 4 items each in the non-electric and electric machinery categories. There are 7 agricultural items, 4 semi-manufactured ferrous metal products, 4 chemical products plus synthetic rubber, 4 items in the coal and petroleum products category, 3 each in the glass and ceramics category, wood products, and toys and decorations, and 2 furniture items. Finally, there are furskins, regenerated fibers, tires, knit fabrics, refined silver, railroad locomotive parts, ships and boats, travel bags, cameras, pianos, and printed matter.

It must be noted that "the West", in the case of our G.D.R. statistics, does not include the Federal Republic of Germany (F.R.G.) which in actuality imports roughly half of the G.D.R.'s exports to the total I.W. The F.R.G. does not report trade with the G.D.R. as foreign trade, and the required data were not easily available.

The U.S. tariff differential exceeds 5 percent for 34 items of the top 50, and of these, 17 produced equations with tariff terms acceptable at the 10 percent or better level of significance. The results are shown in Table 5.

Total U.S. imports from German Democratic Republic.....		14,129	39,081	11,250	27,439
Estimated percent increase with MFN.....			276.6		243.9

Of the 17 items, all except oilseeds and synthetic rubber are manufactured goods in SITC 6-8, and all of these, except for rubber tires (with U.S. tariff differentials of 6 percentage points) and cameras (15 percentage point spread), have tariff differentials exceeding 24 percentage points. Furniture items, toys, and cameras show the largest predicted MFN-induced increases in U.S. imports from the G.D.R.

The predicted percentage rise in U.S. imports is larger for the G.D.R. than for any of the other countries. The absolute values of

the predicted MFN induced increases were comparable to those for the other CMEA countries; but the actual U.S. imports from the G.D.R. were lower than the imports from any of the others except Bulgaria. Considering the size and advanced degree of industrial development of the G.D.R., it seems likely that the current low values of U.S. imports are due largely to the underdeveloped state of U.S.-G.D.R. political and commercial relations. The effect upon imports attributed by our model to the granting of MFN probably includes some of the impact of normalizing trade channels, quite apart from tariffs and quantitative restrictions.

To a lesser degree, these comments apply as well to the results obtained for Czechoslovakia.

### Hungary

Twenty-two of the top 50 Hungarian exports to the West are in the agricultural category, 8 are in clothing, and 5 in ferrous metal semi-manufactures. These numbers are similar to those for Bulgarian exports. There are in addition 3 chemical items, 3 electrical machinery items, and 3 wood product items. Two fabric items plus aluminum, chairs, feathers, and metal-working machine tools complete the list.

Of the top 50, 41 have U.S. tariff differentials greater than 5 percent, but one of these is not imported in substantial quantity by the U.S. (sunflower seed oil)<sup>1</sup>. Of the remaining 40 items, 14 proved to be MFN-sensitive. (See Table 6.)

<sup>1</sup> The extraordinary \$50,600,000 of gold coins imported in 1974 incurred no duty and would not have been affected by MFN. The estimated percent increase noted in parentheses is the percent rise over the 1974 imports exclusive of the gold coins.

Surprisingly, considering that almost half of the Hungarian top 50 exports to the West are agricultural, only one such product (oilseeds) was among these 14. Instead, close to half of the items fall into the clothing category, covering a wide range of under- and outerwear,

including articles of furskins. Clothing items, on the whole, have the highest differentials between MFN and non-MFN tariff rates.

With tariff differentials of 14-15 percentage points, electric light bulbs and alumina are relatively high in predicted import increases under MFN, while chairs, household linens, refrigerators, and electric power machinery, all with differentials of about 30 points, are also MFN sensitive; machinery imports, however, do not rise noticeably above zero. Oilseeds and feathers, with tariff differentials of only 6 percentage points, complete the list.

### Poland

Agricultural products comprise 12 of the 50 top Polish exports to the West, clothing contributes 6 items, 5 items are machinery, 5 are iron and steel products, 4 are in the coal and petroleum category, 4 are chemicals (including synthetic rubber), 3 are lumber products, 3 are nonferrous metals (silver, copper, and zinc), and 2 each are in the furniture and fabrics categories. Ships, sulfur, furskins, and automobiles are the remaining items.

Of the 50 items, 19 have U.S. tariff differentials of less than 5 percentage points. Only 7 of the remaining 31 produced equations with statistically acceptable tariff terms. Three of these are clothing items, two are nonferrous metals (copper and zinc), and the others are metallurgical machinery and synthetic rubber. (See Table 7.)

	Estimated percent decrease without MFN.....		2.7		2.2

### Romania

Agricultural products, with 10 items, is the largest single export category among Romania's top 50 exports to the I.W. in 1975. Clothing is next with 8 items, and petroleum products, wood products, and ferrous metal semi-manufactures have 5 items each. There are 4 chemical items, including synthetic rubber, and 2 furniture items. Tractors, motor vehicle parts, ships and boats, metal-working machine tools, electric power machinery, carpets, cotton fabrics, aluminum, unwrought silver, glassware, and basketwork are the remaining items.

Of the top 50, 35 were subject to U.S. tariff differentials greater than 5 percent, but one of these (sunflower seed oil) is not imported

in significant quantity by the U.S. Of the 34 remaining items, 15 provided equations with statistically acceptable tariff term coefficients.

Five clothing items, two furniture items, two items of wood paneling, and basketwork are items of high U.S. tariff differentials that proved to be tariff-sensitive. Three food items, ferrous metal plates and sheets, and aluminum metal, all with tariff differentials between 6 and 12 percentage points, comprise the remaining items. (See Table 8.)

TABLE 8.—U.S. IMPORTS FROM ROMANIA, 1974 AND 1975: ACTUAL IMPORTS AND ESTIMATED MFN-INDUCED INCREASES

[In thousands of dollars]

SITC	Description	1974		1975

89922	Basketwork.....	145	805	229	1,126
	Subtotal for MFN-sensitive items among 1975 IW top 50.....	6,884	30,885	6,788	34,479
	Subtotal for all 1975 IW top 50.....	117,827	30,885	118,366	34,479
	Total U.S. imports from Romania.....	130,516	34,211	132,956	38,729
	Estimated percent increase with MFN.....		26.2		29.1

<sup>1</sup> Because of the granting of MFN to Romania as of Aug. 3, 1975, part of the estimated increase may already be included in total actual imports, and may therefore represent a slightly higher percent rise.

<sup>2</sup> See footnote to table 3.

### U.S.S.R.

The Soviet top 50 exports to the West are extraordinarily high in natural resources. Ten of the items are coal, coke and petroleum products. Seven items are non-ferrous metals, and 3 more are metallic ores (iron and chrome). Six items are wood or paper products. There are 4 agricultural items, 4 chemical items, 3 items of ferrous metal semi-fabricates and scrap, 3 in the fish and crustacea category, 2 fur-skin items, diamonds, natural phosphates, asbestos, automobiles, tractors, ships and boats, metal-working machine tools, and carpets.

Of the top 50 export items in the Western trade, only 17 are subject to U.S. tariff differentials greater than 5 percent; of these, sunflower seed oil is not imported in significant quantity by the U.S., while whale meat is forbidden by law.<sup>31</sup> Thus, only 15 items are even candidates for increase under MFN status, according to our criteria, and only six of these proved to be tariff sensitive. All six fall into the class of semi-manufactures (SITC 6). These are, roughly in order of decreasing MFN-induced rise, refined copper, unwrought aluminum, plywood and veneer, ferro-alloys, kraft paper and paperboard, and dressed furskins. (See Table 9.)

<sup>31</sup> See footnote 27.

### Product Comparison

Combining the results of MFN-induced rises in exports to the United States from the six relevant CMEA countries, the largest total rise, in both 1974 and 1975, is predicted for the clothing category. In 1974 the calculated rise in U.S. clothing imports would have amounted to something over \$29.8 million, representing a rise of 387 percent of the actual U.S. imports of clothing from these six CMEA countries in 1974, but only 1.3 percent of the actual U.S. imports of clothing from the world.<sup>32</sup> (U.S. imports of clothing from the six countries in 1974 was \$7.7 million, or three-tenths of one percent of total U.S. clothing imports.) The figures for 1975 are similar: the \$6.0 million of actual clothing imports from the six CMEA countries would have increased by 477 percent,<sup>33</sup> or \$28.6 million, representing 1.1 percent of actual 1975 U.S. clothing imports from the world.

The next largest total increases come in the iron and steel (except high carbon or alloy) and the non-ferrous metals categories, with the latter dominating in 1974 and the former in 1975.

The non-ferrous metals that account for the rises are aluminum, copper and zinc. (It should be noted that imports of aluminum oxide—which belongs to a different category—are also predicted to rise significantly.) Other non-ferrous metals that are important in the Eastern trade are not subject to discriminatory tariffs. U.S. imports of non-ferrous metals in 1974 would have increased by \$26.2 million, according to our results (aluminum by \$11.4 million, copper by \$13.5 million, zinc by \$1.3 million); this would have represented an 1141 percent rise in actual U.S. imports of the three metals from the six countries in 1974, but only 1.3 percent of U.S. imports of the three metals from the world. In 1975, the rise would have dropped to \$14.5 million (\$12.7 million for aluminum, \$1.4

<sup>32</sup> The United States is a signatory of the Multifiber Textile Agreement of the GATT. Conformable with GATT specifications, the United States has already negotiated bilateral agreements with several Eastern European countries restraining the textile trade. It is unlikely that the predictions of this paper would in fact be fully realized, because of the demonstrated vigilance of the U.S. clothing industry in pressing for Q.Rs.

<sup>33</sup> This percentage increase is probably exaggerated, because Romania enjoyed MFN status during the second half of 1975, and therefore part of the predicted rise must already be incorporated into the actual 1975 clothing imports. Similar remarks must be understood for the other product categories as well.

million for copper, and \$0.5 million for zinc), representing a 14,000 percent rise in U.S. imports of the three metals from the six countries but only a 1.3 percent rise in imports of the three metals from the world. The U.S. recession caused a cutback in industrial materials imports that fell much more than proportionately upon the CMEA countries.

In 1974, U.S. imports from the CMEA six of iron and steel (none of high carbon or alloy steel) bars, rods and plates would have increased by 101.6 percent, or \$19.3 million; in 1975 the rise would have come to 161.2 percent of actual imports, or \$24.5 million. These rises would have constituted, respectively, 0.4 percent of the 1974 U.S. iron and steel imports from the world, and 0.5 percent of the 1975 imports.

Furniture comes next in order of predicted import increases, with incremental values of \$14.8 million and \$17.8 million in 1974 and 1975, respectively. The 1974 rise would have been equivalent to a 550 percent rise in actual imports from the CMEA six, and 3.3 percent of imports from the world. The 1975 rise would have represented a 711 percent rise in CMEA six furniture sales to the U.S., and a 4.4 percent rise in U.S. furniture imports from the world.

Beyond this, the values and percentages fall off markedly, even at the SITC 2-digit level that we have in fact been dealing with in this discussion (iron and steel=67, non-ferrous metals=SITC 68, furniture=SITC 82, clothing=SITC 84).

Table 10 provides a tabulation of the chief components of the total predicted MFN-induced rises in U.S. imports from the six: expressed at the 2-digit level, it becomes possible to compare the predicted relative distributions among product categories with those of previous investigators.

TABLE 10.—PERCENT OF TOTAL MFN-INDUCED RISE IN U.S. IMPORTS FROM 6 CMEA COUNTRIES<sup>1</sup>—CONTRIBUTED BY SELECTED SITC 2-DIGIT GROUPS

[In percent]

<sup>1</sup> Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, Romania, and U.S.S.R.

<sup>2</sup> "High" and "Low" for the Elias-Searing model represent their high and low estimates of the total value of the MFN-induced increase in U.S. imports. The percentage of the low total contributed by a given product category may of course exceed its percentage contribution to the high total.

<sup>3</sup> Negligible.

<sup>4</sup> Percent of total MFN-induced rise for the IW top 50 items, contributed by those items among the IW top 50 falling into the specified 2-digit groups.

All three sets of investigations predict that iron and steel products and clothing will be most strongly affected. Wolf's results, however, give iron and steel roughly double the proportion accorded it in both the Elias-Searing study and in the present one; Wolf also has

non-metallic mineral manufactures taking a significantly higher proportion than the other studies indicate. The present paper, on the other hand, stresses non-ferrous metals and furniture to a much greater extent than the earlier studies, while they give some weight to footwear and we do not. The three distributions are similar with regard to meat preparations, non-electric and electrical machinery, transport equipment, and miscellaneous manufactured articles.

Despite similarities in distribution among products, the overall impact of granting MFN is estimated to be much stronger by these two previous studies than by the present study, as was pointed out in Section 2. Since neither of those studies is econometric, there is no way of knowing how reasonable their estimates are. More precisely, those studies fail to provide a criterion for determining the correctness of the assumption of equality between a CMEA country share in some reference Western market and the CMEA country share in the U.S., once the U.S. has granted MFN. By way of contrast, the use of regression analysis allows us to estimate the parameters of the relationship between these two types of shares, and to make probabilistic statements about their reliability. Thus we believe that our model in effect examines the validity of the basic assumption underlying both the Wolf and the Elias-Searing models.<sup>34</sup> The Western group that we selected as a reference group (the "Industrialized West") is intermediate between Wolf's reference group (OECD minus the United States) and that of the Elias-Searing "high" model (the original EEC six plus the U.K.). In almost every case, our results gave a CMEA share in U.S. imports, with MFN status granted, that was intermediate between its share without MFN and its share in the I.W. market.<sup>35</sup>

## 5. DISCUSSION

The credibility of the predicted 1974 and 1975 U.S. import increases in response to MFN depends upon—

- (1) The cogency of the model;
- (2) The accuracy of the data;
- (3) The degree of disaggregation;
- (4) The variability of the independent variables; and
- (5) The indices of statistical significance.

Given some confidence in their validity, the applicability of our ex post historical predictions to projections into the future introduces further considerations. We group the latter under three headings:

- (1) Future changes in the values and the product mix of CMEA country total exports to the I.W., including the introduction of new types of products;

<sup>34</sup> See Section 2.

<sup>35</sup> For most products, we found that at MFN tariff rates the U.S. share in communist country exports to the I.W. remained smaller than the U.S. share in world exports to the I.W. It would then follow that the communist share of total U.S. imports of the product would remain less than the communist country share of I.W. imports of the product:

$$\frac{\text{Communist country} \rightarrow \text{U.S.}}{\text{Communist country} \rightarrow \text{I.W.}} < \frac{\text{World} \rightarrow \text{U.S.}}{\text{World} \rightarrow \text{I.W.}}$$

implies that

$$\frac{\text{Communist country} \rightarrow \text{U.S.}}{\text{World} \rightarrow \text{U.S.}} < \frac{\text{Communist country} \rightarrow \text{I.W.}}{\text{World} \rightarrow \text{I.W.}}$$

Equality is therefore predicted not to hold true despite the granting of MFN by the U.S. To be sure, equality was only intended as a rough approximation in previous studies. Furthermore, in a number of cases the inequality went the other way for our estimates, and the communist country was predicted to capture a larger share of the U.S. market than of the reference market. There is, of course, nothing surprising about either result.

(2) Future changes in relative total demands for each product, or shares from the world, of the I.W. countries; and

(3) Future changes in non-tariff barriers on the part of the I.W. countries, as well as future changes in tariffs by I.W. countries other than the U.S.

These three factors are, however, interrelated.

Leaving aside the cogency of the model, the accuracy of the data, and problems of disaggregation, which have been mentioned in earlier sections, we must pass judgment on the other items.

The problem of variability is as follows: if, say, the tariffs of all the I.W. countries were identical for a given product from a CMEA country, then there would be no way to estimate from the data what response to expect from a change in one of the tariffs: if no such response is recorded in the actual set of data observations, then no coefficient can be estimated for the tariff term. Even when there is variation in the tariffs of the data set, if the range of variation does not extend as far as the hypothetical change in tariff being tested, then the coefficient of the tariff term may not be properly applicable to the larger change. For almost every product examined in this paper, the tariff and distance variables showed a wide enough range among the I.W. countries to allow their coefficients to be estimated. Furthermore, the hypothetical change from a non-MFN tariff rate—included in the data set for estimating the coefficients—down to an MFN rate constituted a change within the data range in every case. On the other hand, the Polish equations may provide poorer estimates of the response to absence of MFN, both because the hypothetical higher tariff exceeds the range of the observations, and because the observations display low variability.

But the problem of data variability appears to be most pressing for the QRs. For all of the CMEA countries, including Poland, so few CMEA-specific quantitative restrictions were discovered that we strongly suspect that the general absence of statistically significant QR terms in our equations is more due to the inadequacy of our treatment of the data than to the unimportance of QRs. First of all, as already noted, the use of a two-valued dummy variable obscures the actual range of variability. Secondly, it is quite possible that general QRs affect CMEA country products to a degree comparable to country-specific QRs, and we did not attempt to include these in our observations. A great deal more work needs to be done on QRs.

As for statistical reliability, a glance at the equations in Appendix B reveals that a number of them have low  $\bar{R}^2$  values, despite the statistical significance of all of the explanatory variables. This was not unexpected. The values of  $\bar{R}^2$  would have been higher if (1) we had chosen to work at a higher level of aggregation (at which item-specific variation tends to cancel out), (2) we had conducted a time series analysis (with more homogeneous underlying conditions) as opposed to a cross section analysis; and most importantly, (3) we had isolated more of the non-economic factors impinging on trading patterns. Ultimately more will have to be said about the evolution of trading patterns over time, and modeling refinements will have to be made to take into account non-economic realities. Nevertheless, at a minimum, we have isolated and quantified a likely estimate of the impact of tariff changes, and demonstrated the statistical reliability of the coefficients.

The real payoff is the extent to which historical results can be used for projective purposes. The applicability of our results to the situation that will exist by the time MFN for CMEA countries other than Poland and Romania should become a reality will depend, as we have said, upon underlying changes that will have taken place in the meanwhile in CMEA supply conditions, in Western barriers to the Eastern trade other than the U.S. tariff, and in relative demand in the West, reflected, in our model, by changes in world shares. Almost three years have already passed since 1974, the year of the data from which our coefficients were estimated.<sup>36</sup> Market conditions have already changed to some extent, and the course of some of the trends may themselves be projected into the future.

One preliminary point must be made. Our model is cross sectional, which is to say, it is a comparative statics model. It asks the question: If the U.S. tariff for a certain import had been as low as the tariff of some other I.W. country for as long as that other tariff had been at that low level—with all of the concomitant commercial and political relationships that an already abiding lower tariff implies—what then would be the U.S. share of that import? A comparative statics model has the history of the comparison countries built in. The predictions of the model are thus tailored to a post-adjustment time, and incorporate the full impact of the tariff change, to which the situation would have settled down by 1974 had the change in tariff occurred earlier. The predicted impact is therefore in all likelihood greater than what would be experienced during the transition phase by a newcomer to more normal tariff levels.

The first of the three underlying trends that affect the applicability of our predictions to the future is CMEA country supply. Our basic model is framed in terms of the relative shares among the I.W. countries in the absolute flows of the various products that emerge from the East; strictly speaking, we have avoided the problem of predicting these absolute quantities. However, this is not the end of the matter. The major goal of our project was to estimate the overall percentage rise in U.S. imports from a CMEA country consequent to granting it MFN. Even if we were to correctly predict the U.S. shares in each CMEA country export to the I.W., a preferential change in the relative mix of its export products towards those products which show the greatest tariff sensitivity and for which the U.S. MFN, non-MFN tariff differential is greatest would strongly increase the overall percentage rise in U.S. imports from a CMEA country accorded MFN. The question, then, is whether the products itemized in Tables 3 through 9, the products which, *ceteris paribus*, would increase most strongly among U.S. imports under MFN, are likely to increase their relative shares in total CMEA country exports to the I.W. We have not studied this question.<sup>37</sup> It is possible that some of the items will see a relative increase.

It is reasonable to expect that Eastern exports of clothing, processed food, copper, aluminum, and wood and paper manufacturers will increase over the coming decade: these are items which feature among the major turnkey and compensation projects underway in the East.

<sup>36</sup> By late summer 1977 we will have estimates based upon 1976 data.

<sup>37</sup> But see the paper by Lenz and Kravalis, elsewhere in this volume.

On the other hand, other products among those examined in this paper, not subject to U.S. discriminatory tariffs, are also undergoing rapid development in the East. These include sulfur, nickel, petroleum, tractors, and fertilizers. In any event, it is difficult to foresee any great swing in export mix during the next five years which would markedly change the percentage of MFN-sensitive goods in total U.S. imports from the CMEA countries. Of course, the "lumpiness" of changes in product mix, as new projects come on-stream, can cause occasional large swings in the composition of Eastern exports to the West.

One further question arises in connection with production developments in the CMEA countries and market shares of the Western buyers. Compensation or buy-back agreements are becoming increasingly common forms of Western-financed projects in the East. These involve some degree of pay-back in the product of the installation once it comes on-stream. It is possible that the U.S. granting of MFN to a communist country could be crucial in some instances to the ability of U.S. firms to participate in major Eastern development projects and to the amounts of product imported under U.S. buy-back agreements.

It must, however, be appreciated that whether a U.S. or a French business firm acts as broker for disposal of the buy-back product, the export destination of the product may still be the same, namely, the market in which profits are maximized. Thus, the incremental flow of product to the U.S. under MFN may be expected to be far more influenced by the fact that either a French firm or an American firm would do better in the U.S. market given MFN, than by the fact that the middleman is American rather than French. There will perhaps be a more direct influence on relative shares if the buy-back deal is for parts and accessories specifically designed to be incorporated into a U.S. finished product, but here, too, it would more likely be the tariff lowering, rather than the U.S. nationality, that would clinch the deal. In a comparative statics model like ours, the effects of industrial cooperation as displayed in the past are already included in predictions for the future.

The second underlying trend that affects the applicability of our model to the future is changes in relative demands for each product, or shares from the world, of the I.W. countries.

Relative shares of the I.W. countries in imports from the world as a whole, for the products examined in this paper, can be predicted with greater confidence to remain fairly stable. Without performing statistical tests on the world shares, we judged them to be sufficiently steady over the three years 1973-75 not to warrant averaging for the purposes of our model. Objections can always be raised for individual products, but we believe that relative tastes and strengths of demand among the I.W. countries, product by product, change but slowly for the vast majority of products.

Finally, we come to what we believe is the most variable element in the underlying universe of our model: changes in the tariffs of other I.W. countries, and changes in quantitative restrictions of various sorts throughout the I.W., the U.S. included. The tariff changes are fairly uniform and foreseeable. Changes in QRs are the most unstable aspect of the picture, the least well handled in our model (in our judgment), and yet the most certain in predictability of outcome once they are imposed.

Western tariffs are being slowly lowered, on the whole. It is rare for a tariff to rise. The Kennedy round of tariff cuts in the MFN rates of the GATT members promises to be succeeded by the Tokyo round. If the United States maintains its column 2 (non-MFN) rates intact, and fails to grant MFN to those communist countries that do not now have it, more and more of the affected CMEA goods may be expected to seek outlets in other Western markets. From the tariff point of view alone, as time passes without the granting of MFN by the U.S., the U.S. share of tariff-sensitive CMEA country exports would be expected to fall; if, then, MFN is granted at some future time, the proportional rise in U.S. import share would be so much the greater—especially since the U.S. MFN rates would also have fallen in the meanwhile.

But quantitative restrictions change the whole picture in an unpredictable way. Unilateral quotas of various types, bilateral agreements, and multilateral guidelines all restrict the trade in any specific category of product for any reason of national interest. European Community restrictions on foodstuff imports suddenly lead to surges in CMEA sales to other I.W. countries, and there is a reverse effect when the U.S. negotiates quotas on footwear. No matter how strong the statistical indicators of tariff sensitivity may appear to be, the repercussions of granting MFN can be quickly modified, and the econometric predictions negated, by market disruption proceedings.
